		<p>Consequently, we recommend combining R1 and R2 to state: “Each responsible entity (BA, RC, TOP, DP, and GOP) shall have documented communication protocols for the communication of Operating Instructions. This protocol should contain following elements: ...”</p> <p><b>Response: R1 and R3 are applicable to entities that issue and receive Operating Instructions, while R2 and R4 are applicable to entities that only receive Operating Instructions. Combining the requirements would cause the DP and GOPs to develop protocols they would never use.</b></p> <p>ï€ In order to improve readability we recommend that the Sub-Requirements R1.1 through R1.9 be re-arranged and grouped. For example, R1.7 and R1.9 deal with information receiving. They should be combined into one with two sub-requirements or bullets. The same can be done with R1.3, R1.6 and 1.8 which deal with issuing Operating Instructions.</p> <p><b>Response: The SDT respectfully prefers the order it created in draft 3 keeping three part communication and all call together.</b></p> <p>ï€ Requirement 1.6: We suggest that for clarity purposes the SDT rewords the first bullet as follows: “Confirm that the recipient’s response of the Operating Instruction as per R1.7 was accurate, or”</p> <p><b>Response: The SDT adopted the language for 1.6 and 1.7 from COM-002-3 due to comments from industry on draft 2 of the standard that expressed confusion over different language for three part communication requirements.</b></p> <p>ï€ Requirement 1.9: The requirement asks the recipient to request clarification when the communication is not understood. We believe that the requirement is not measurable and as such it should be deleted. Additionally, it represents common sense because in any type of communication if one party does not understand all or part of the conversation, it is natural that he/she will ask for clarification.</p> <p><b>Response: The SDT believes it is measureable and agrees that it is common sense to</b></p>

Organization	Yes or No	Question 2 Comment
		<p><b>ask for clarification.</b></p> <p>ï€ Requirement 2.2: Hydro One recommends deleting this section for the same reasons mentioned in our comment for Requirement 1.9 (measurability).</p> <p><b>Response: Please refer to our response to 1.9</b></p> <p>ï€ It must be made clear in the requirements that functional entities can incorporate exceptions in their protocols, for example, to address emergencies. As proposed, both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.</p> <p><b>Response: The SDT believes the language of the requirement allows the entity to address exceptions.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Associated Electric Cooperative Inc - JRO00088</p>	<p>No</p>	<p>AECI believes the sub-parts of this requirement to be overly prescriptive, whereas communication clarity should be the stated requirement. The sub-parts should appear only as examples of elements to be considered for improving clarity. Less is better, as evidenced by additional qualifiers already necessary to sub-requirement R1.1. (see suggested language in comment 5 below.)</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p>		
<p>ISO/RTO Standards Review Committee</p>	<p>No</p>	<p>The SRC fully supports the concept that certain aspects of our business are better viewed based on the internal controls used by the entity. The SRC recognizes that the intention of the SDT is to be flexible. However, the nature of a standard is to eliminate that flexibility by not addressing how compliance will be monitored in the</p>

Organization	Yes or No	Question 2 Comment
		<p>controls approach and by prescribing specific items for inclusion in the protocols.</p> <p><b>Response: The SDT simultaneously considered and changed the RSAW for COM-003-1 as it developed draft 3 and believes the two documents do address how compliance will be monitored. The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p> <p>An entity is less likely to create a highly sophisticated best practice protocol if the RSAW subjects that entity to penalties for implementing that protocol. While presenters at the COM-003 Webinar presentation stated that violations are not based on implementing the steps of the protocols, the draft RSAW (dated July 2012) states: If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations. If changes to the entity’s process are not implemented to identify, assess and correct deficiencies, the Auditors may make a determination of possible non “ compliance with Requirement 3, Part 3.4.</p> <p><b>Response: The Webinar also addressed the RSAW language you reference. An entity that does not improve a deficient process, (R3.4 or R4.4) after a considerable amount of opportunity in a non PV environment, and chooses to ignore modification which would be required to improve that process; or does not provide justification to why the entity decided not to modify the process may and should be subject to a finding of non compliance.</b></p> <p>(The proposed requirements R1 and R2) are a significant improvement from the previous postings. Requirement R1 is still too prescriptive. The elements within R1 make the requirement a checklist of rules and do not add to the reliability of the power system and do not address the reliability needs requested in Recommendation</p>

Organization	Yes or No	Question 2 Comment
		<p>26 and Order 693. The reliability need for clear protocols was in reference to “situational awareness” issues (i.e. when is the system in jeopardy and who makes that decision to respond - See references provided below). The reliability need was not related to common verbal mistakes. The proposed requirements do not address those needs. The SRC believes that IRO-016-1 does address those issues and needs.</p> <p><b>Response: The SDT has read IRO-016-1 (To ensure that each Reliability Coordinator’s operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations) and view it as a requirement for RCs to work together to preserve system stability. COM-003-1 is being developed to tighten communications. The SDT does not discern the linkage.</b></p> <p><i>2003 Blackout Report Section:</i></p> <p><i>Data Exchanged for Operational Reliability (pages 50-51)</i></p> <p><i>Voice Communications: Voice communication between control area operators and reliability is an essential part of exchanging operational data. When telemetry or electronic communications fail; some essential data values have to be manually entered into SCADA systems, state estimators, energy scheduling and accounting software, and contingency analysis systems. Direct voice contact between operators enables them to replace key data with readings from other systems’ telemetry, or surmise what an appropriate value for manual replacement should be. Also when operators see spurious readings or suspicious flows, direct discussions with neighboring control centers can help avert problems like those experienced on August 14, 2003.</i></p> <p>SRC COMMENT - This is clearly focused on establishing communications where they potentially may not occur. It is not focused on prescribing particular terminology or protocols based on the belief that existing practices are inadequate.</p> <p><b>Response: The SDT interprets this as data entry under contingency operations and</b></p>

Organization	Yes or No	Question 2 Comment
		<p><b>does not discern linkage to Communication protocols.</b></p> <p><i>Page 109 Effectiveness of Communications Under NORMAL conditions, parties with reliability responsibility NEED TO COMMUNICATE important and prioritized information to each other in a timely way, to help preserve the integrity of the grid. This is especially important in emergencies. During emergencies, operators should be relieved of duties unrelated to preserving the grid. A common factor in several of the events described above was that information about outages occurring in one system was not provided to neighboring systems.</i></p> <p>SRC COMMENT - The above discussion is not related to terminology or repeating information. The concern focuses on the failure to provide appropriate information, which, as discussed above, as well as in Order 693, is focused on “important” and “prioritized” information. This is a limited set of communications that the proposed standard’s new term Operating Instruction exceeds in scope.</p> <p><b>Response: The SDT agrees with the remarks from page 109, but fails to discern the linkage to Operating Personnel Communications Protocols. The SDT believes the important and prioritized information in an Operating Instruction is critical and must be addressed.</b></p> <p><i>Pages 161-16226. Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate. NERC should work with reliability coordinators and control area operators to improve the EFFECTIVENESS of internal and external communications during alerts, emergencies, or other critical situations, and ENSURE that all key PARTIES, including state and local officials, RECEIVE timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date.</i></p> <p><i>On August 14, 2003, reliability coordinator and control area communications</i></p>

Organization	Yes or No	Question 2 Comment
		<p><i>REGARDING CONDITIONS in northeastern Ohio were in some cases ineffective, unprofessional, and confusing. INEFFECTIVE COMMUNICATIONS contributed to a LACK OF SITUATIONAL AWARENESS and PRECLUDED EFFECTIVE ACTIONS to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability. Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties are able to give and receive timely and accurate information.[</i></p> <p>SRC COMMENT: Recommendation 26 is clearly about communicating information about “conditions” and not about communicating the commands to a particular “asset”. The proposed standard is unresponsive to the issues raised in the Blackout and by FERC. By not addressing the core reliability issues raised by the very report that drove this Project, the SDT is jeopardizing the reliability of the power system. The SRC strongly urges the SDT to reconsider this posting and to either rescind the Project and accept that IRO-016-1 has adequately responded to the Blackout Report, or to revise its proposal to directly address the issues noted above. If R1 is not rescinded as suggested above, then the prescriptive subparts 1.1 thru and including 1.6 should be removed.</p> <p><b>Response: The SDT believes Recommendation 26 is about tightening communications by consistent application of effective communication protocols. This is further amplified by FERC order 693 and is memorialized in the SAR. The project was initiated with the approval of the Standards Committee.</b></p> <p><b>The SDT, respectfully, will not reconsider this posting and will not rescind the Project and will not accept that IRO-016-1 has adequately responded to the Blackout Report. The SDT does not have the authority or the inclination to do either. The SDT requests that you consider our positions and assist us in making this an effective and fair standard.</b></p>

Organization	Yes or No	Question 2 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>FirstEnergy</p>	<p>No</p>	<p>We support many of the protocols as a minimum to standardize communications across the industry. However, we believe some of the sub-parts of R1 contain language which may be too prescriptive and in some cases language is missing for special situations.</p> <p>ï,§ 1.2 - We understand the importance of knowing the time of day but an operator can specify “am” or “pm” instead of using the 24 clock format. The requirement should be less prescriptive to allow this.</p> <p>ï,§ 1.3 - This requirement as written may confuse the parties communicating. We suggest it be reworded in a simple fashion as follows: “Assure both parties understand the correct time being used in the communication.”</p> <p>ï,§ When the receiver of an operating instruction is unable to comply they should be allowed to notify the operator of the restriction (e.g. based on safety, loss of life, or damage to equipment) so that the operator is able to implement other actions to perform the desired operation. This should be added in the language requiring three-part communication in requirements R1 and R2.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The only concern the SDT has with what you suggest is the use of a 12-hour format with AM/PM designation. The SDT believes this can easily be misunderstood, creating increased potential for a miscommunication The SDT knows of no entity that uses an ‘am – pm’ term for critical communications. The SDT, based on the revised format of draft 3 of the standard, believes an entity would have the flexibility to incorporate your suggestions for emergency situations into the entity’s documented communication protocols (R1 and R2).</b></p>		
<p>PPL Corporation NERC Registered Affiliates</p>	<p>No</p>	<p>The PPL Companies do not agree with the proposed requirements as they are administrative in nature.</p> <p><b>Response: The SDT notes having documented communication protocols (R1 and R2) may appear to be administrative in nature, but they represent a preliminary</b></p>

Organization	Yes or No	Question 2 Comment
		<p><b>element for the process to identify, assess and correct deficiencies for adherence to documented communication protocols.</b></p> <p>Should the requirements remain, we suggest the following be considered:</p> <p>R.1. Each Responsible Entity shall implement, in a manner that identifies, assesses and corrects deficiencies, one or more documented communication protocols that address each of the following Requirements.</p> <p>R1.1 through R1.3 applicable to such Responsible Entity:</p> <p>R1.1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed pursuant to an Operating Instruction, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the communication as an Operating Instruction to the recipient.</p> <p>R1.2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Instruction shall repeat, restate, rephrase or recapitulate the Operating Instruction.</p> <p>R1.3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Instruction shall either:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Operating Instruction (in accordance with Requirement R1.2) was accurate, or</li> <li>o Reissue the Operating Instruction to resolve any misunderstandings.</li> </ul> <p>For purposes of clarity, the term “implement” in Requirement R1 does not mean that there were no failures to follow the protocol in specific cases.</p> <p>The following language is suggested for the measures related the proposed R1.1 through R1.3:</p> <p>Measures: The Responsible Entity shall have documented communications protocols developed for Requirements R1.1 through R1.3. Additional examples of evidence may</p>

Organization	Yes or No	Question 2 Comment
		<p>include, but are not limited to, the Responsible Entity:</p> <ul style="list-style-type: none"> <li>o trained or otherwise educated the affected personnel about the protocols</li> <li>o established controls to identify failures to follow the protocols</li> <li>o assessed identified failures to follow the protocols</li> <li>o took appropriate actions to correct the identified failures</li> </ul> <p><b>Response: The SDT has considered your recommendations but believes the draft 3 language more comprehensively covers communication protocols.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
SPP Standards Review Group	No	<p>The wording in R2.1 is awkward, we suggest the following:</p> <p>When receiving an oral two party, person-to-person Operating Instruction, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction.</p> <p><b>Response: The wording is the same language as the requirements in COM-002-3. The OPCPSDT incorporated this language into the standard based on industry comment on draft 2 stating that the different language for the two standards caused confusion.</b></p> <p>The one-way burst messaging in R1.9 and R2.2 is confusing to us in that we don't understand how you request clarification over a one-way messaging system.</p> <p><b>Response: It the obligation of the recipient to contact the issuer if the recipient does not understand the Operating Instruction.</b></p> <p>As written there is no 'out' for an entity that cannot perform the Operating Instruction as given. An entity has the option of not performing a Reliability Directive if that directive violates regulatory, safety, equipment, or statutory requirements (TOP-001, R3). A similar exemption needs to be incorporated into COM-003.</p>

Organization	Yes or No	Question 2 Comment
		<p><b>Response: COM-003-1 covers communication protocols not the action required. TOP-001-1, R3 and IRO-001 R1 govern the obligation to act.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Bonneville Power Administration</p>	<p>No</p>	<p>In R1.5, BPA disagrees with the mandatory use of alpha numeric communication protocols for internal communications. BPA believes that these communication protocols should apply only to external communications between system operators for the TOP, GOP, and BA.</p> <p>BPA suggests that the drafting team update R1.5 to specify that “Transmission Operators and Balancing Authorities may adopt methods other than alpha-numeric clarifiers to ensure accurate communication of Operating Instructions for internal operations.”</p> <p><b>Response: The SDT agrees that these communication protocols apply only to external communications between system operators for the TOP, GOP, and BA. It would only make sense to have them apply internally but that is the entity’s option. Most entities use all or some of these communication protocols already.</b></p> <p><b>The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p> <p>BPA suggests that R1.1 should be modified to make clear that the use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. In response to Draft 2, Essential Power LLC commented that “The use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. Allowing an entity to use a language other than English when communicating with regions where English is the required language is counter to the purpose of the Standard and could in fact jeopardize</p>

Organization	Yes or No	Question 2 Comment
		<p>reliability through miscommunication.” The SDT stated that it “agreed with (Essential Power, LLC’s) comments (shown below) and clarifies that is the intent of the requirement”, but this intent is not clear in the requirement as written because it does not specify that the language mandate needs to apply to both entities. Additionally, there is no expressed limitation that the language(s) acceptable in these circumstances be limited to only the language(s) specified by such law or regulation. To resolve these issues, we propose that COM-003-1 R1.1 be modified to read as follows:</p> <p>Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation FOR BOTH ENTITIES; IN WHICH CASE, ACCEPTABLE USE IS EXPANDED TO INCLUDE THOSE SPECIFIED LANGUAGES. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.</p> <p><b>Response: The SDT appreciate your proposed recommendation but believes the language in draft 3 is clear and unambiguous. The English language is required with appropriate exceptions.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
PacifiCorp	No	<p>PacifiCorp does not feel that the requirements listed in R1.5 regarding the use of alpha-numeric clarifiers when issuing an oral Operating Instruction is warranted. The requirements listed in R1.6, and R1.7 requiring the strict used of three-way communication should alleviate any possibility of miscommunication, which PacifiCorp understands to be the drafting team’s intent in the development of separate Requirement R1.5. Also, implementing the use of alpha-numeric clarifiers poses additional risk due to the introduction of ambiguous language.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes alpha-numeric clarifiers are important tools for entities conveying information that contains alpha-numeric identifiers. The SDT also believes they reduce ambiguity.</b></p>		

Organization	Yes or No	Question 2 Comment
Southern Company	No	Southern supports having a documented communications protocol, but we do not support the prescriptive elements of this version of the standard. The protocols should give the entity the flexibility to define the conditions where they expect 3-part communications and the verbal cues they use to tell the recipient they expect 3-part communication or that action is required. Southern suggest the following changes to R1 and R2 and could support these changes in future drafts of this new standard.
<p><b>Response: The OPCSDT thanks you for your comments. The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop. Beyond the frame specified in the parts an entity has the flexibility to develop the protocols to fit their particular situation.</b></p>		
Liberty Electric Power, LLC	No	The SDT shift from a zero-tolerance standard to a procedure required standard is admirable. Thank you for the open-mindedness and willingness to change direction after much hard work went into the original proposal. However, the requirements for specific content in the required procedure still goes beyond the proper role of the standard. Suggested revision - eliminate R1 and R2, replace with new R1:"Each (covered entity) shall have documented procedure(s) for communications with other users of the Bulk Power System. Such procedure(s) shall have provisions which, in the judgment of the registered entity, reduce the opportunity for miscommunications."This lowers the chances of miscommunications without dictating the content of business practices.
<p><b>Response: The OPCSDT thanks you for your comments. The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p>		
NERC - Investigations Group	No	Requirement R1.6 provides inadequate protection against a misunderstanding when directives are issued. Granted, the Requirement does obligate the party receiving the directive to repeat back the directive. However, if the recipient repeats the directive

Organization	Yes or No	Question 2 Comment
		<p>back to the person issuing the directive, and the "repeat back" indicates the recipient has misunderstood the directive, this Requirement merely obligates the person issuing the directive to state the directive again. The Requirement places no obligation on the person issuing the directive, who knows he has been misunderstood, to explicitly and clearly bring to the attention of the recipient that the recipient has misunderstood. All the party issuing the directive has to do is repeat what he has already said. The party issuing the directive is under no obligation to make it clear that there has been a misunderstanding. With respect, I suggest having the person issuing the directive merely repeat it if he's been misunderstood, with no explicit statement that there has been a mistake, leaves open the potential for the recipient to be unaware he has misunderstood and to execute a misunderstood directive. As an example, consider the following exchange. Transmission Operator to Field Operator: "Jim, open Breaker 104-696". Field Operator repeats back "I understand open Breaker 104-699". Transmission Operator, noting the error, states "Open Breaker 104-696". The field operator, having not been explicitly made aware there has been an error, opens Breaker 104-699. (Presumably, he would not do so had the Transmission Operator made him aware of the misunderstanding with an explicit statement that there has been an error.) Suggestion: Add verbiage to R1.6 obligating the person issuing the directive to make an explicit statement to the recipient that there has been an error if the recipient repeats the order back incorrectly. Presently, the standard imposes no such obligation on the person issuing the directive. One possible way to re-word the standard might be: "...shall ensure the recipient of the directive repeats the information back correctly; and, if the repeat back is correct, shall acknowledge the response as correct. If the repeat back is incorrect, the person issuing the directive will state "You are wrong and have misunderstood the directive". The person issuing the directive will then repeat the directive correctly. This process will continue until the recipient repeats the directive back correctly.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT has used the same three part communication requirement language as contained in COM-002-3 because of industry comments on draft 2 citing confusion between the two standards caused</b></p>		

Organization	Yes or No	Question 2 Comment
<p>by different language for the same requirement. The SDT refers you to R1.1.7- it requires the repetitive process until the correct information is communicated. The entity could account for this in their documented communication protocols (R1 and R2).</p>		
<p>Hydro Quebec TransÉnergie</p>	<p>No</p>	<p>It must be made clear in the requirements that functional entities can incorporate exceptions (to address emergencies for example) in the protocols that are developed. Both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.</p>
<p><b>Response:</b> The OPCPSDT thanks you for your comments. The SDT believes the language of the requirement R1 and R2 permits the entity to assess whether variations from the required protocol are valid.</p>		
<p>TransAlta Centralia Generation LLC</p>	<p>No</p>	<p>Clarification is needed regarding what GOP procedures are to cover, ref. our comments to question #1 above.</p>
<p><b>Response:</b> The OPCPSDT thanks you for your comments. The GOP is a receiver of Operating Instructions and is subject to R2 and R4 which are focused on the requirements for entities who only receive Operating Instructions.</p>		
<p>ReliabilityFirst</p>	<p>No</p>	<p>Requirements R1 and R2 require the responsible entities to have documented communication protocols for Operating Instructions, but does not require the responsible entity to implement the protocols. Absent implementation of the protocols, there is no need for the protocols themselves if the responsible entity is not required to follow them. ReliabilityFirst recommends the following wording as an example for Requirement R1: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have and implement a documented communication protocols for Operating Instructions...”</p>
<p><b>Response:</b> The OPCPSDT thanks you for your comments. The SDT has changed the standard. The SDT believes the language changes to draft 4 will address your concern.</p> <p>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities</p>		

Organization	Yes or No	Question 2 Comment
<p>that include the following:"</p> <p>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</p> <p>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p>		
<p>Independent Electricity System Operator</p>	<p>No</p>	<p>We disagree with the need to repeat and confirm operating instructions (Part 1.6 to 1.9 and R2) meant to be used for normal operating system conditions. As indicated in our previous comment, the term Reliability Directives and the recently approved COM-002-3 cover instructions not only emergency conditions but also conditions that can result in Adverse Reliability Impact. Requiring operating entities to exercise 3-part communications (repeating and confirming) for routine operating instructions that maintain the states or do not change the status of the BES Facilities, or simple actions such as removing a transmission line which has no impact on the BES, or simple switching, or adjusting a small amount of generation output, is totally unnecessary, and can in fact overburden System Operators and harm reliability. And we respectfully disagree with the SDT's response to our previous comment regarding the applicability of the term "Reliability Directive" in which the SDT claims that the term "Reliability Directive" in the approved version of COM-002-3, "...in the context of COM-002-3, is specifically for Emergency operating conditions" and "...covers a very narrow band of low frequency, high impact events. The definition covers not only emergency, but also Adverse Reliability Impacts" Further, the definition does not explicitly indicate, nor is it implied, that such conditions are "of low frequency, high impact events."To address the BoT's concerns expressed when approving the interpretation of COM-002-2, the term Reliability Directive now defined in COM-002-3 together with the NERC Operating Committee's guideline on System Operator Verbal Communication fully cover the condition under which 3-part communication need to be (to address Adverse Reliability Impacts) or should be (where deemed</p>

Organization	Yes or No	Question 2 Comment
		<p>appropriate) exercised. We do not see the need for having a standard requirement for 3-part communication for conditions other than when Reliability Directives are issued. Regarding the other parts in Requirement R1, i.e. 1.1 to 1.5, these are good operating practices but are not absolutely necessary the “must follow” protocols that rise up to a continent-wide reliability standard level.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT respectfully disagrees that COM-003-1, based on your comments, is not needed. The interpretation of COM-002-2a, 2R combined with COM-002-3 as a replacement leave a gap that was covered by COM-002-2a, R2 before the Interpretation. COM-003-1 will cover the gap. Three part communication is an effective protocol that reduces miscommunication. Removing the wrong transmission line at the wrong time because of a miscommunication reduces reliability under any operating condition.</b></p>		
Lincoln Electric System	No	<p>LES requests the drafting team provide additional clarification regarding R2.1 as it relates to “oral two party, person-to-person” communication occurring between the System Operators and field crews. Does the drafting team intend for the communication protocols to be used for all communications between the System Operators and field crews (such as for normal day-to-day switching of distribution elements) or only as it occurs between defined functional entities? Within the Draft 2 consideration of comments under “Outstanding Unresolved Issues”, the drafting team states that “The SDT clarified that COM-003-1 only applies to communication between functional entities. For example, if a TOP System Operator is issuing an Operating Instruction to an individual that is internal to that TOP, three part communication is not required by this standard”. Although LES supports this clarification, it’s incorporation into the requirement is not obvious. Recommend the drafting team modify R2.1 as follows to ensure this clarification remains evident within the standard going forward:</p> <p>R2.1. When receiving an oral two party, person-to-person Operating Instruction between functional entities, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction.</p>

Organization	Yes or No	Question 2 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT has added language to R1 and R2 clarify that they are applicable to Operating Instructions between Functional Entities.</b></p>		
<p>NextEra Energy Inc.</p>	<p>No</p>	<p>NextEra opposes any communication protocol in COM-003-1 that is not mirrored in COM-002-3. NextEra views the implementation of two different communication protocols -- one for Reliability Directives and one for Operating Instructions as problematic and not consistent with the promotion of a reliable Bulk Electric System. This concern is heightened by the fact that there are more specific protocols for Operating Instructions which are lower in the communication hierarchy when compared to Reliability Directives. Such a model is counterintuitive. If implemented, this model will also likely be counterproductive, increase confusion among System Operators and may unnecessarily cause a risk to the Bulk Electric System. The inherent risk caused by the lack of synergy and consistency between COM-003-1 and COM-002-3 could be resolved by combing the Standard Development projects and having the SDTs work together to produce one uniform work product. Therefore, NextEra urges the COM-003-1 SDT to request that the Standards Committee join the COM-002-3 and COM-003-1 efforts, so that one uniform three-way communication protocol can be developed and implemented that promotes reliability.</p> <p><b>Response: The SDT does not disagree, but that is outside the scope of the SAR for this project The OPCPSDT has adopted the exact language for three part communication for COM-003-1 as COM-002-3 to reduce confusion. The documented communication protocols apply to Reliability Directives that change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.</b></p> <p>Further, in addition to comments that NextEra has previously submitted, it asks that the following changes be made:</p> <p>R1.1 Delete “between functional entity” as unnecessary and delete the second sentence altogether (or clarify it), because it is unclear and may add confusion. In the</p>

Organization	Yes or No	Question 2 Comment
		<p>context of an Operating Instruction, it is best that English be used between Transmission Operators and Balancing Authorities for external and internal communications related to Operating Instruction. To allow for alternative languages to be used internally when an Operating Instruction is given will likely result in difficult transitions between internal and external conversations which may unintentionally result in a risk to the Bulk Electric System via an external miscommunication using a language other than English. Thus, NextEra prefers that English be promoted and used for internal and external communications related to Operating Instructions.</p> <p><b>Response: The SDT believes if an entity is externally communicating to you in a language other than English that entity would be deficient. The receiving entity should request the issuer use the English language, based on requirement R2. The SDT added “between functional entities” to the body of both requirements.</b></p> <p>R1.4 Add a comma after “Facility” in the fourth line. The</p> <p>R1.8 Use the term “entities” instead of “parties” in the second line. Entities is a more widely recognized term than parties in the context of the Reliability Standards. Also, for clarity, re-write the end of 1.8 to read “. . . confirm receipt from each entity.” The current wording states “confirmed receipt from one or more receiving parties” seems to miss the point that what the sender needs is confirmation from each entity that was sent the message.R1.9 Similarly, replace the term “parties” in line two with “entities”.</p> <p><b>Response: The SDT added the comma and will retain the term “parties” as some addressees may not be functional entities.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Northeast Utilities	No	<p>R1.2 Prescribed use of a 24 hour clock format seems over-bearing</p> <p><b>Response: The SDT believe it provides clarity to the time element.</b></p>

Organization	Yes or No	Question 2 Comment
		<p>R1.3 The use of “functional entities”- includes more entities than the applicability section and uses terms from the functional model which goes beyond registered entities, may be some confusion here.</p> <p><b>Response: The SDT has deleted the term “functional entities” from R1.3 and has incorporated it in R1 and R2.</b></p> <p>R1.4 Transmission interface Element Transmission interface Facility These terms may need to be defined. They may be ambiguous to some entities as to what is intended</p> <p><b>Response: The SDT believes these are commonly used terms in the electric utility industry.</b></p> <p>R1.5 Use of alpha-numeric clarifiers in some instances inhibit efficient communication, without increasing the effectiveness of the communication or reducing the risk to the BES. In keeping with the requirement of entities to document its protocols, it should be left to the entities of regions to define this.</p> <p><b>Response: The SDT believes alpha-numeric clarifiers are important tools for entities conveying information that contains alpha-numeric identifiers. The SDT also believes they reduce ambiguity.</b></p> <p>R2 Is missing a sub-requirement that requires a clarification of two party communications that is not understood.</p> <p><b>Response: R2.2 contains the clarification language you have referenced.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
American Electric Power	No	<p>AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, also disagrees with requiring that entities have documented communication protocols as proposed.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT believes three part communication is a proven, effective tool</b></p>		

Organization	Yes or No	Question 2 Comment
<b>that prevents mistakes caused by miscommunication.</b>		
Brazos Electric Power Cooperative, Inc.	No	See ACES comments. Additionally, if it is determined that all of the elements need to be kept in the standard, the list of elements needs to be improved. Some of the elements are noun phrases (e.g., 1.1 and 1.2) and some are instruction statements. All elements should be noun phrases. It is grammatically improper for a list to have more than one type of phrase and, more significantly, may lead to confusion about compliance obligations. Instruction statements could be construed to require perfect performance of those elements, but that does appear to be the intent of the SDT.
<b>Response: The OPCPSDT thanks you for your comments. The SDT agrees and has changed the wording of the subparts.</b>		
Ameren	No	See response to question 5.
<b>Response: The OPCPSDT thanks you for your comments. Please see our responses to question 5.</b>		
Essential Power, LLC	No	Clarification is needed regarding what GOP procedures are to cover, ref. our comments to question #1 above.
<b>Response: The OPCPSDT thanks you for your comments. Please see our response to your comments in question one.</b>		
Texas Reliability Entity	No	<p>This Standard does not address electronic Operating Instructions, thus creating a possible gap. For example, ERCOT (acting as the BA) uses ICCP links to issue electronic dispatch instructions to generators (ERCOT Protocol 6.5.7.4). The recipient of the electronic dispatch instruction must acknowledge receipt of the dispatch instruction to ERCOT electronically, within one minute and must include the receiving operator’s identification with the electronic acknowledgement (ERCOT Protocol 6.5.7.8(5)).</p> <p>ERCOT regional rules have similar language as current NERC standards regarding compliance with dispatch instructions, which include electronic dispatch instructions (ERCOT Protocol 6.5.7.9). Consider adding “Reliability Coordinator” or “Functional</p>

Organization	Yes or No	Question 2 Comment
		Entities” in 1.1 statement where TOPs and BAs are singled out: "Transmission Operators and Balancing Authorities may use an alternate language for internal operations."
<p><b>Response: The OPCPSDT thanks you for your comments. COM-003-1 deals with people to people not people to machine or machine to machine communication.</b></p>		
Consumers Energy	No	We believe this is a standard that requires procedures or documents but has nothing to do with performance. These types of standards lead to auditors making a wide range of interpretations.
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT disagrees; it has to do with establishing a process to correct deficiencies and to improve the effectiveness of an entity’s communications to improve reliability. It permits an entity to correct deficiencies in an environment without a finding of non compliance for every deficiency.</b></p>		
Xcel Energy	No	See comments under question # 5.
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses to question 5.</b></p>		
Public Service Enterprise Group	No	There should not be a requirement for entities in R1 and R2 to have documented communications protocols. The subparts specify the protocol requirements. R1 should merely state: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall use the following communication protocols for Operating Instructions:” R2 should be similar involving DP and GOP functions
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes the language changes to draft 4 accomplishes this.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as</b></p>		

Organization	Yes or No	Question 2 Comment
<p>developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency. R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p>		
Cowlitz County PUD	No	<p>This requirement will be burdensome to small Distribution Providers where communications from a System Operator will not ever occur. Requiring entities to prepare for nonexistent reliability gaps is not acceptable. DPs should be allowed to document via RC, TO, and BA letters of agreement that establishes System Operator communication protocol is not required. These small DPs can only shed load in a reliability emergency, and in some cases would need to do so manually. Further, such load would be more effectively dropped by the TOP functioning as the DP's Transmission Service Provider.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. If a DP has never or will never receive an Operating Instruction it would not be an applicable entity. If the DP has or could receive Operating Instruction it must comply with the standard. The DP would have to confirm their situation with the CEA.</b></p>		
Exelon	No	<p>Exelon agrees with all requirements except R1.1.3 and R1.1.4. We disagree that R1.1.3, "include time zones" when issuing operating instructions is necessary. Operating instructions are typically issued in real time; an instruction to do something "now" or at the "top of the hour" does not require the use of time zones. 1.1.4 has the effect of requiring verbatim use of a specified name; this should not be a requirement as long as the transmitter and receiver use three way communications effectively to assure understanding of the element to be operated. Additionally, TOP-002-R18 already requires use of "uniform line identifiers when referring to transmission facilities of an interconnected network". The statement to use the TO specified name or a mutually agreed to name is not necessary in light of TOP-002.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes that if an entity uses a clock time a time zone reference</b></p>		

Organization	Yes or No	Question 2 Comment
<p>must be included if entities are in different time zones. Times designated on a relative basis (execute in five minutes) would not require a time zone.</p> <p>TOP-002 R18 is being eliminated by another project. The SDT believes neighboring entities should have a clear understanding of each other's BES Elements and BES Facilities to increase situational awareness and to shorten response time.</p>		
<p>Indiana Municipal Power Agency</p>	<p>No</p>	<p>IMPA believes it should be made clear that Operating Instructions and the use of documented communication protocols are required by these two requirements for when Operating Instructions are given by a Balancing Authority, Reliability Coordinator, or Transmission Operator to a Distribution Provider or Generator Operator. The current requirements could apply to a generator station (Generator Operator) who receives Operating Instructions from its Market Operations (also the same Generator Operator entity). The Market Operations would not need to follow the communication protocol since it is issuing the Operating Instructions, but the generator station would have to follow the communication protocol since it is receiving the Operating Instruction. IMPA does not believe that the SDT intended to include communications between a Generator Operator's Market Operations and its remote power plant.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The GOP is subject to the standard and must comply with applicable requirements. The SDT believes that is specified in the standard. Market Operations that are not acting as a GOP are not an applicable entity so communications with its Market Operations is not subject to standard.</b></p>		
<p>MISO</p>	<p>No</p>	<p>MISO does not agree with the proposed requirements of COM-003-1, R1 and R2. Although MISO agrees that clear communications are important to system reliability, it respectfully submits that any requirement for System Operators to have a communication protocol should allow the subject System Operators to define when and how the protocol would apply. In addition, MISO respectfully submits that System Operators should retain greater flexibility in deciding which elements to include in their respective protocols. For instance, the protocols should allow the System Operator to outline how and when to use blast calls and messaging systems.</p>

Organization	Yes or No	Question 2 Comment
		<p>Thus, despite its conceptual support for a communication protocol for System Operators, MISO is concerned that the requirements currently set forth in COM-003-1 are, in many cases, overly-prescriptive, and, rather than enhancing system reliability, could actually undermine it. As explained above, because the definition of the term “Operating Instruction” is overly broad and ambiguous, System Operators may treat most, if not all, communications as Operating Instructions. Applying the required elements of the communication protocols for Operating Instructions to most communications would be inefficient and could adversely affect the ability of System Operators to perform their reliability functions. Indeed, while MISO agrees that clear communications in system operations are important, an excessive reliance on the three-way communications protocols detailed in the proposed standard can be an unnecessary distraction for personnel operating the Bulk Electric System, hampering as opposed to enhancing overall system reliability.</p> <p><b>Response: The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p> <p><b>The SDT believes an entity has great flexibility with creating the documented communication protocols in R1 and R2 to address its own particular situation. The SDT believes use of the protocols will become natural for System Operators and will result in consistent, universal communication protocols that will promote reliability on the BES. The new language in draft 4 addresses your concerns.</b></p> <p>MISO’s primary point of disagreement with the current Standard is therefore one of scope. MISO recommends that the SDT replace “Operating Instruction” with the existing proposed definition for the term “Reliability Directive” in Project 2006-06, Reliability Coordination. Limiting the scope of applicability for utilization of the communication protocol required by COM-003-1, R1 and R2 would prevent System Operators from applying the communication protocol to virtually all communications out of an abundance of caution and, unlike the current draft of COM-003-1, would not be an undue distraction from the reliability functions performed by these</p>

Organization	Yes or No	Question 2 Comment
		<p>operators.</p> <p><b>Response: The SDT’s intention is for entities to develop these protocols for all communications that command changes on the BES. The command to change BES configuration carries some risk no matter what operating state exists. The SDT believes such protocols will become routine for operators as they are for pilots, the military and air traffic controllers.</b></p> <p>Further, as explained in its comments on Draft 2 of COM-003, MISO does not support including certain of the proposed required elements in the communication protocol for Operating Instructions and does not believe these issues have been sufficiently addressed by Draft 3. First, MISO does not agree with the proposed requirement to indicate time zone and Standard or Daylight Saving Time when issuing an oral or written Operating Instruction between functional entities in different time zones. This requirement would result in the expenditure of significant time, resources and attention by System Operators for a minimal benefit to reliability. Accordingly, this modification appears to place upon operators an unjustified, onerous requirement. MISO respectfully requests that the SDT reconsider this requirement.</p> <p><b>Response: The SDT believes the time element of an Operating Instruction is a critical component. Switching at the wrong time could create a disastrous event. The SDT believes such protocols will become routine for operators as they are for pilots, the military and air traffic controllers.</b></p> <p>Second, MISO continues to believe that the requirement to use alpha-numeric clarifiers when issuing Operating Instructions to or Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format is ambiguous and could lead to unintended compliance burdens. MISO respectfully submits that if alpha-numeric clarifiers are to be required, NERC should adopt a uniform set of clarifiers to ensure that all System Operators communicate efficiently and effectively. However, MISO reiterates its belief that mandating the use of alpha-numeric clarifiers will have, at most, a minimally beneficial impact on</p>

Organization	Yes or No	Question 2 Comment
		<p>reliability while requiring Registered Entities to expend substantial additional resources.</p> <p><b>Response: The SDT believes the use of clarifiers is important because of human voice differentiation such as acuity, accents, volumes, pitch and others. Also communication equipment often has degraded performance that creates misunderstandings. The SDT originally proposed the NATO radiotelephony phonetic alphabet which was widely disapproved as too prescriptive by draft 1 commenters.</b></p> <p>Finally, MISO disagrees with the proposed requirement that Operating Instructions reference the name specified by the owner for a Transmission interface Element or Transmission interface Facility. To date, System Operators have identified equipment by to/from station and voltage level. Such identification has been sufficient to ensure the accurate identification of Transmission interface Elements and Facilities. Additionally, MISO notes that internal identifiers utilized by owners may result from internal coding or naming conventions that would not be known by or comprehensible to external entities. Hence, MISO cannot support this requirement, based on the potential adverse impacts to reliability that could result.</p> <p><b>Response: A provision for a separate mutual agreement is contained in R1.1.4.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
ERCOT	No	<p>The overarching premise of NERC standards is that they typically establish the “what” and not the “how” (Order 672 at P 260). The proposal to mandate specific communication protocols contravenes that approach and undermines the value inherent therein. Allowing entities to establish their own protocols to meet a desired end result facilitates means that best suit particular entities and also allows for improvements based on experience. Prescribing specific protocols would preclude such benefits. The proposed requirements are better suited as non-binding illustrative approaches / best practices. These could be presented as suggested approaches, for example, in an attachment to a standard that establishes a general</p>

Organization	Yes or No	Question 2 Comment
		<p>requirement to have communication protocols in place, but they should not be mandated. FERC did state that in some cases it may be appropriate to prescribe specific implementation rules in the standards if the how is inextricably linked to the standard and may need to be specified by the ERO to ensure the enforcement of the Reliability Standard. The Commission went on to note that for some standards leaving out implementation features could:</p> <ul style="list-style-type: none"> <li>(1) sacrifice necessary uniformity in implementation of the Reliability Standard;</li> <li>(2) create uncertainty for the entity that has to follow the Reliability Standard;</li> <li>(3) make enforcement difficult; and</li> <li>(4) increase the complexity of the Commission's oversight and review process.</li> </ul> <p>None of these conditions apply to communication protocols. For this matter, a general requirement relative to reliability directives is adequate with implementation left to the functional entities. This is already addressed in COM-002 R2, and, therefore, COM-003 is not needed. Communication protocols are more appropriately addressed by an entity's internal controls rather than a Reliability Standard, because this approach provides the benefits described above (i.e. 1) application of suitable protocols based on an entity's structure and relationships and other relevant rules and 2) flexibility for improvement of such protocols over time). The proposed standard eliminates these benefits by prescribing specific items for inclusion in the protocols. Again, the scope of the proposed standard is askew relative to the reliability concern at issue. The proposed standard is unresponsive to the issues raised in the Blackout and by FERC. By not addressing the core reliability issues raised by the very report that drove this Project, the SDT is jeopardizing the reliability of the power system.</p> <p><b>Response: The SDT believes the 4 criteria ERCOT has listed above justify the inclusion of the elements in R1 and R2. There must be a high degree of communication uniformity and consistency among applicable entities for</b></p>

Organization	Yes or No	Question 2 Comment
		<p>communication to be effective. The standard’s draft 3 format permits great flexibility in developing those protocols and to add more content to accommodate their own particular circumstance, if entity chooses.</p> <p><b>Response: The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p> <p>Accordingly, the focus of the proposed standard is misplaced and, if approved, will do nothing to address the reliability concerns identified in the blackout report and Order 693, but rather will do nothing but impose ineffective and inappropriate obligations that will create liability risk with no corresponding reliability benefit. ERCOT strongly urges the SDT to reconsider this posting and to either rescind the Project and accept that IRO-016 has adequately responded to the Blackout Report, or to revise its proposal to directly address the issues noted above. If R1 is not rescinded as suggested above then the prescriptive subparts 1.1 thru and including 1.6 should be removed, and R1 should be revised to include "applicable communication protocols".</p> <p><b>Response: The SDT believes it is addressing reliability concerns raised by the Blackout Report, Recommendation 26 and is tightening communications by consistent application of effective communication protocols. This is further amplified by FERC order 693 and is memorialized in the SAR. The project was initiated with the approval of the Standards Committee.</b></p> <p><b>The SDT, respectfully, will not reconsider this posting and will not rescind the Project and will not accept that IRO-016-1 has adequately responded to the Blackout Report. The SDT does not have the authority or the inclination to do either. The SDT requests that you consider the importance of the standard and assist us in making this an effective and fair standard.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		

Organization	Yes or No	Question 2 Comment
<p>Oncor Electric Delivery Company LLC</p>	<p>No</p>	<p>According to the 2003 Black Out Report, “Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communication protocols, particularly during alerts and emergencies, is essential to reliability” Oncor is not aware of any evidence to support the position that lack of communication protocols contributed to the NE Black Out of 2003, the 2008 Florida Black Out or the more recent SW Black Out. Oncor also takes the position that many of the ideas prescribed within the standard are already being effectively implemented as industry Best Practice. Oncor is concerned that implementing the specific elements as prescribed in the standard will result in confusion, and could compromise personnel safety. Oncor offers the following alternative language.</p> <p>R1 “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient. “</p> <p>Oncor also offer the following alternative language for R2”</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Operating Communication.”</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes the excerpt you cite from the 2003 Black Out Report regarding “Ineffective communications” indicates there is a major concern over communications that requires a higher degree of communication discipline.</b></p> <p><b>The SDT believes the standard encourages the use of best practices and the entity has the flexibility to include them in its documented communication protocols.</b></p> <p><b>The SDT believes that communication protocols will eliminate confusion and mistakes.</b></p> <p><b>Thank you for the suggested language, but the OPCPSDT has added clarifying language to the definition for draft 4 which is now:</b></p>		

Organization	Yes or No	Question 2 Comment
<p><i>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</i></p>		
City of Austin dba Austin Energy	No	
CenterPoint Energy Houston Electric, LLC.	No	
Pepco Holdings Inc	No	
Central Lincoln	Yes	We appreciate the work the SDT has done to ensure the standard is not about having zero communication defects, and is more about process.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Occidental Energy Ventures Corp.	Yes	Although in general, OEVC does not believe that process documents should be the primary reliability consideration, it is the appropriate strategy in this case. Clearly, all of us want to eliminate Operator miscommunications - which make up nearly 20% of all BES mishaps - but it is impossible to assure 100% compliance over the course of thousands of System Operator communications. Furthermore, the effort required to capture the evidence needed by audit teams would overwhelm our resources, as well as those of the Regional compliance organizations. In our view, the path chosen by the drafting team is consistent with NERC’s Risk-based Compliance program. It drives attention in areas that reliability data shows to be deficient, but recognizes that the benefit of COM-003-1 must outweigh the costs and resources required to implement it.

Organization	Yes or No	Question 2 Comment
<b>Response: The OPCPSDT thanks you for your comments.</b>		
Idaho Power Co.	Yes	It will require us to write a communications protocol.
<b>Response: The OPCPSDT thanks you for your comments.</b>		
The United Illuminating Company	Yes	R1.3 should allow the use of prevailing time in addition to Daylight Savings and Standard time. Prevailing time eliminates the need to differentiate between daylight savings or standard time in notices and reduces confusion since the clocks are changed at a scheduled time by the US Government.
<b>Response: The OPCPSDT thanks you for your comments.</b>

3. The SDT has proposed requirements (COM-003-1, R3 and R4) for applicable entities to implement a process to identify, assess and correct deficiencies related to the entity's documented communication protocols; and to evaluate that process based on deficiencies found externally from the process. Do you agree with the proposed requirements? If not, please explain in the comment area of the last question.

#### Summary Consideration:

Many commenters, even those who voted no on Question 3 supported the SDT's decision to incorporate internal controls. Some of their concerns were if regional CEAs are "onboard" with the SDT's approach. **The SDT has collaborated with NERC compliance and jointly developed the RSAW for COM-003-1. NERC compliance and NERC executives have been speaking to industry, Regional Entities and regulators to advocate for control based standards citing the absolute need for this approach to address burdensome and unreasonable requirements and to promote a more efficient use of resources.**

A large number of commenters, for various reasons recommended that the SDT consider using a similar format and language to emulate the CIP v.5 standards and to address concerns over their understanding of R3 and R4. The commenters stated that it would be more consistent and less confusing. **The SDT discussed the commenters' concerns and concluded that adopting the same general format for COM-003-1 would add value by improving consistency and remaining effective as a standard to improve communication and reliability on the BES.**

**"R1 (and R2-DP and GOP). Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:"**

**R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.**

Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	It is unclear what identified reliability gap this Standard's development project is intending to fulfill given the recent adoption of the new COM-002-3 along with the OC white paper on communications protocols.
<p><b>Response: The OPCSDT thanks you for your comments. The reliability gap is the coverage of communication protocols that cover Operating Instructions during normal operating levels. COM-002-3 is only applicable to Adverse Reliability Impacts and Emergencies. The OC White Paper cites studies that put communication mistakes as a significant contributor to BES mishaps.</b></p>		
ACES Power Marketing Standards Collaborators	No	<p>(1) We support the concept of internal controls that the SDT has proposed. We agree that finding a violation for each instance is burdensome and unreasonable and evaluating internal controls is a more efficient use of resources. However, we are concerned about the evaluation of internal controls from Regional audit staff. How is NERC planning to train the Regional auditors to ensure consistency during compliance audits? There is too much room for auditor subjectivity, especially when evaluating whether a single communication was deficient. There are so many communications that could occur on a daily basis and there is not clear guidance when the Regions will find or not find a possible violation in an audit.</p> <p><b>Response: During the September 6, 2012 Webinar representatives of the EROs Compliance group cited ERO's hiring of career auditors, increased training and reaching out to industry with the development of the RSAW and the standard simultaneously.</b></p> <p>(2) In the webinar, SDT chair stated that a registered entity that catches a high percentage of deficiencies, then their process is working, but if the entity is only catching 50% then the entity needs to correct the process. There is currently no percentage or other guideline or metric to determine if an entity's process is sufficient. If this is the SDT's intent, please provide further detail.</p> <p><b>Response: The SDT did not address the degree of disparity. The auditor does have some subjectivity. The SDT points out there is not generally a finding of non</b></p>

Organization	Yes or No	Question 3 Comment
		<p><b>compliance even when the number of deficiencies is deemed excessive by a CEA. The entity then must evaluate its process for effectiveness and make modifications or demonstrate why no modification is necessary.</b></p> <p>(3) We recommend the SDT provide additional information in the Rationale and Technical Justification document to include a guideline to show how the Regional auditors would assess compliance with a control-based standard. It seems that the trend in both COM-003-1 and CIP v5 is to find the errors and fix them without the need to self-report. How are the Regions going to determine when a PV is to be issued? The Technical Justification and the RSAW do not provide enough information when a communication deficiency crosses the threshold of becoming a violation. How does a registered entity know when to self-report?</p> <p><b>Response: The SDT believes there is enough information in the standard and the RSAW to demonstrate when a PV would be issued. A finding of non compliance will generally occur when an entity fails to implement the modifications it developed during the evaluation of its process or has not provided a compelling reasoning why they determined modification was not required.</b></p> <p>(4) We recommend adding more detail, perhaps including an application guidelines section as other risk-based standards, for acceptable remediation of deficient communications. For example, if an operator failed to use the 24-hour clock during an Operating Instruction, would a simple reminder be sufficient or would the operator need to attend a full-blown training session? What documentation would be required? It seems that a reminder would remedy the deficiency, but then that would have to be documented. The internal controls used to remedy deficiencies could turn into another documentation exercise instead of focusing on effective communication. We recommend the SDT consider ways of satisfying remediation without creating an unnecessary administrative burden for maintaining compliance.</p> <p><b>Response: The SDT leaves this up to the entity as it develops its process. If a simple reminder to use the 24 hour clock proves effective in eliminating or reducing the</b></p>

Organization	Yes or No	Question 3 Comment
		<p>deficiency that is acceptable. It would have to be documented but generally most contemporary performance and training programs have the necessary elements to determine what internal remedies are required to train individuals to improve individual performance.</p> <p>(5) Please clarify R3, part 3.4, “deficiencies found external to Part 3.1.” Does the SDT mean that there would be deficiencies found in an audit? Who is the external entity finding these deficiencies? Does the SDT intend for registered entities to hire external consultants? Is this the RC notifying the DP that it has not communicated appropriately? Would these externally found deficiencies result in audit report recommendations?</p> <p><b>Response: Generally CEA would be the source of externally found deficiencies. Neither the SDT nor the standard specify a requirement to hire outside auditors. Many entities hire outside auditors to provide a third party review of its processes and for compliance issues. Other entities have separate specialized internal audit groups that survey a wide range of corporate and operational processes and activities on behalf of the executive leadership or their board. These would all be sources external to the entity’s internal processes. The standard requires the entity to evaluate its process if external deficiencies are found outside the process. The discovery of externally found deficiencies could possibly result in audit report recommendations.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Detroit Edison	No	<p>All actions that result in a potential violation must be reviewed and analysed to identify and correct deficiencies. Communication issues are no different. Requirements 3 and 4 are not required.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT points out in COM-003-1 that the deficiencies that are identified, assessed and corrected by the entity are not potential violations.</b></p>		

Organization	Yes or No	Question 3 Comment
		<p>The SDT believes the language changes to draft 4 will address your concern.</p> <p>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</p> <p>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</p> <p>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p>
<p>SERC OC Standards Review Group</p>	<p>No</p>	<p>We would suggest changing R3 and R4 to align with our suggestions for R1 and R2: “R3. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process for identifying deficiencies with adherence to their documented communication protocols that each entity developed in accordance with Requirement R1 that:”</p>
		<p>Response: The OPCPSDT thanks you for your comments. The SDT believes the language changes to draft 4 will address your concern.</p> <p>“R1. Organization	Yes or No	Question 3 Comment
Dominion	No	<p>No, Dominion does not agree that these requirements are needed. As part of any certification to R1 and R2, we would expect the entity to perform some sort of analysis to determine whether its communication protocols meet the intent of the purpose stated for this standard. We do not believe imposing a mandatory requirement to perform this analysis inherently increases reliability.</p>
<p><b>Response:</b> The OPCSDT thanks you for your comments. The SDT believes the language changes to draft 4 will address your concern.</p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p>This change was made to use standard language and methodology for control based standards. The COM-003-1 RSAW has been updated to reflect this change.</p> <p>Additionally, in line with our comment regarding R1 and R2 we believe that these two requirements should be combined as well. We would like to propose following wording: “Each responsible entity shall develop and implement a process for identifying and addressing deficiencies found in the adherence to the documented communication protocol specified in Requirements R1 and R2.”</p> <p><b>Response: The SDT believes that the separated requirements are necessary because it is the only manner in which to clearly define requirements R1 and R2 for issuer-receivers and for receivers only. It also reduces the opportunity for double jeopardy if one entity cannot or is not able to comply with the requirement they are responsible for executing.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		

Organization	Yes or No	Question 3 Comment
ISO/RTO Standards Review Committee	No	<p>The SRC fully supports the concept that functional entities’ internal controls be used to monitor the effectiveness of their own protocols. The SRC suggests that any requirement to implement a plan may significantly reduce the incentives to create more effective protocols because of the Compliance uncertainty related to measuring effective internal controls. Requirement 3 requires entities to implement their process and to identify deficiencies with adherence to the protocol. The less complex a plan is the lower the number of deficiencies and therefore the lower the number of reports. Moreover, the RSAW states that the applicable entity could be found non-compliant if the entity did not follow an auditors suggested changes to remedy those deficiencies. Thus this standard would incent writing simple protocols.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The entity has full discretion on how to develop the process required in R3 and R4. The CEA will gauge effectiveness based on results of the process.</b></p> <p><b>The finding of non compliance can only exist if the entity totally disregards improving its process. The SDT anticipates entities collectively possess a high level of professionalism and will develop a robust process and strive to continually improve it.</b></p>		
PPL Corporation NERC Registered Affiliates	No	<p>The PPL Companies agree with the concept of internal controls and/or the elimination of zero defect requirements. However, the concept of internal controls to identify, assess, and correct deficiencies related to documented communications protocols should be imbedded in R1 as proposed in our response to question 2. We do not agree with the specific details in the internal controls/elimination of zero defect language that is currently included in R3.1 - R3.4 and R4.1 - R4.4. Incorporating the new language proposed by the PPL Companies in R1 makes COM-003 more consistent with the approach being followed in the NERC CIP Version 5 standards. The added language proposed by the SDT in R3 and R4 creates uncertainty as to whether COM-003 is imposing greater requirements than CIP Version 5 regarding identifying, assessing, and correcting deficiencies and the documentary evidence that is required.</p>

Organization	Yes or No	Question 3 Comment
		<p>Response: The OPCPSDT thanks you for your comments. The SDT believes the language changes to draft 4 will address your concern.</p> <p>“R1. Organization	Yes or No	Question 3 Comment
<p>that include the following:"</p> <p>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency. R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p>		
<p>Liberty Electric Power, LLC</p>	<p>No</p>	<p>There is no statement of periodicity in R4, leaving entities guessing until the time of audit regarding the criteria for sufficient review. R4 also would appear to require a great deal of review of communications in order to satisfy the requirement to identify potential defects. One of the suggestions on the NERC Webinar for COM-003 was to review a "half-hour of communications" every week. This is especially intrusive on smaller entities with a single compliance individual, as more than an hour of that person's work-week would be spent randomizing, retrieving and listening to routine communications. This effort would reduce the reliability of the bulk power system as efforts with greater effect are reduced to comply with this requirement. Suggest requiring an annual review of communications procedures with staff instead.</p>
<p>Response: The OPCPSDT thanks you for your comments. The SDT in draft 3, believes the entity should determine the frequency, sample size and methodology. The SDT believes the entities should create robust controls to reduce deficiencies and reduce miscommunication on the BES.</p>		
<p>Hydro Quebec Trans Energie</p>	<p>No</p>	<p>It is unclear what identified reliability gap this Standard's development project is intending to fulfill given the recent adoption of the new COM-002-3 along with the OC white paper on communications protocols.</p>
<p>Response: The OPCPSDT thanks you for your comments. The gap is a need to tighten communication protocols in all operating levels. COM-002-3 is only applicable to Adverse Reliability Impacts and Emergencies. The OC White Paper cites studies that put communication mistakes as a significant contributor to BES mishaps.</p>		

Organization	Yes or No	Question 3 Comment
Occidental Energy Ventures Corp.	No	<p>OEVC supports the concept underlying R3 and R4, but believe that far more detail must be provided in the measures and/or the RSAW. In general, we read these requirements as pertaining to System Operator monitoring and feedback processes that take place either in real-time or after the fact through the review of recordings. However, there may be other suitable options such as comprehensive Operator logging or even regular awareness training. Our concern is that without further clarification, auditors may choose to interpret these requirements to mean that 100% of all conversations must be monitored and assessed. This would result in a cost-prohibitive situation, with little incremental improvement in reliability. Every effective quality program relies on statistically significant sample assessments - and there must be an acceptable sample size defined.</p> <p><b>Response: The CEA, by direction in the RSAW is supposed to understand the process, but is limited to the results of the process and testing the effectiveness of the process. This is all accomplished in a non zero defect environment.</b></p> <p><b>The SDT does not believe it has stipulated that 100% of all conversations must monitored and assessed. It is not stated as such in the standard and the webinar on September 6, 2012 where the need for suitable sampling models were discussed.</b></p> <p>Furthermore, OEVC would like to see the Cost Effective Analysis Process (CEAP) used in this initiative. Our initial assessment is that at least one resource will need to be added at our four generation facilities in order to supplement our Operator quality monitoring program to accommodate COM-003-1. However, this is based upon our assumptions of a statistical monitoring method - which is very sensitive to the number of samples required. If other industry stakeholders come to the same conclusion, the result could drive upward pressure on electricity rates - and should be compared to the expected benefits of the initiative.</p> <p><b>Response: The SDT does not contemplate applying CEAP to this standard. The SDT also believes the entity has much license to develop the Identify, Assess and Correct process including sample sizes based on statistical modeling. Based on the</b></p>

TransAlta Centralia Generation LLC	No	<p>There is no statement of periodicity in R4, leaving entities guessing until the time of audit regarding the criteria for sufficient review.</p> <p><b>Response: The entity is to determine the sample size and frequency of review. The auditor will understand the entity’s process, but will only validate the results, not the entities controls.</b></p> <p>R4 is also open-ended regarding scope, potentially requiring review of every voice communication for every plant for the audit period. Everyday communications do not merit such scrutiny, which would reduce rather than improve the attention that can be given to matters of significance. All standards (not just COM-003-1) should clearly specify pass/fail criteria and the associated evidence requirements.</p> <p><b>Response: The SDT disagrees. It is up to the entity to develop the process. The CEA will audit against the results, not the process.</b></p> <p>R4 should be split into DP and GOP sections, with the GOP requirement being:</p> <p>R4. Each Generator Operator shall conduct in each calendar year a review session with the operations function for registered entities, regarding the documented communication protocols specified in Requirement</p> <p>2. Corrective action shall be implemented and documented for any potential deficiencies coming to light as a result of this review.</p> <p><b>Response: The SDT believes the DP and GOP are properly classified under the same requirements. They are both receivers of Operating Instructions and are subject to the same communication protocols.</b></p> <p><b>The SDT believes the entity will determine the frequency and sample size under</b></p>

Organization	Yes or No	Question 3 Comment
		draft 3 of the requirement. More robust controls will reduce deficiencies.
Response: The OPCPSDT thanks you for your comments. Please see our responses above.		
ReliabilityFirst	No	ReliabilityFirst believes the words “identifying deficiencies” (within R3 and R4) is ambiguous and could be open to interpretation. ReliabilityFirst believes the drafting team should further clarify the deficiencies in which will be required to be identified in Requirement R3 and R4.
Response: The OPCPSDT thanks you for your comments. Deficiencies are instances where System Operators do not adhere to the entities documented communication protocols specified in R1 and R2.		
Independent Electricity System Operator	No	We do not see the need for these two requirements at all. Assuming Requirements R1 and R2 were to stay (which we disagree), Responsible Entities need to comply with these requirements to develop documented communication protocols for Operating Instructions that incorporate all parts in R1 and R2. Any deficiencies with adherence to the documented communication protocols specified in R1 and R2 will be assessed non-compliance, and sanction and remedial actions will be imposed to correct such deficiencies. Having two requirements to obligate entities that already violated the standard is totally unnecessary, and redundant and may result in double jeopardy.
<p>Response: The OPCPSDT thanks you for your comments. No, you are incorrect. There is no finding of non compliance if the entity identifies, assesses and corrects the deficiency.</p> <p>The SDT believes the language changes to draft 4 will address your concern.</p> <p>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</p> <p>This change was made to use standard language and methodology for control based standards. Organization	Yes or No	Question 3 Comment
		<p>The SDT believes the entity has the discretion to set the frequency and sample size under draft 3 of the requirement. More robust controls will reduce deficiencies.</p>
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
Texas Reliability Entity	No	<p>If a deficiency is identified and then training is provided to attempt to correct it, what happens if the same deficiency is identified again? Is the entity considered to have failed to correct its identified deficiency? Does the entity need to file a self report when the second deficiency occurs? Texas RE agrees with the premise of having a process for identifying issues, but at some point if a pattern of deficiencies continues, when does a violation occur?</p>
<p>Response: The OPCPSDT thanks you for your comments. As long as the entity is identifying assessing and correcting the deficiency there is no need to self report. If the deficiency continues as a result of the entity not evaluating its process or not making modifications it has identified; or not providing documented justification why modifications are not required, a finding of non compliance may be awarded, based on specific circumstances.</p>		
GTC	No	<p>The current wording necessitates creating a process to evaluate a process that evaluates protocols. We believe this is unnecessarily cumbersome and confusing. The addition of extra controls from the last version to this version lends nothing to improving reliability or improving the function of the standard. Accordingly, the NERC SC recently approved the SAR for the Paragraph 81 initiative to eliminate certain requirements from the Reliability Standards with little effect on reliability. The SAR identifies criteria to be used to identify those requirements that could easily be identified for removal. It would seem that the draft R3 and R4 would meet the criteria identified for P81. GTC recommends the deletion of R3 and R4.</p> <p>Response: The SDT believes the protocols and the required process improve reliability by creating universal and consistent communication protocols that prevent miscommunication of Operating Instructions on the BES. The SDT believes the requirements of COM-003-1 are not trivial or administrative.</p>

Organization	Yes or No	Question 3 Comment
		<p>Alternatively, at a minimum, we suggest improvements to requirements R3 and R4 as currently drafted. We suggest changing all instances of the word “process” to “protocols” in both part 4s and also removing “found external to Part 4.1” from both part 4s. Finally we suggest removing parts 2 and 3 simply to keep the requirements from becoming redundant with the changes made to their respective part 4s.</p> <p><b>Response: The SDT appreciates the alternative language but implementing it would preclude the standard from being able to improve communication protocols outside of a zero defect environment.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Public Service Enterprise Group</p>	<p>No</p>	<p>These questions apply equally to R3 and R4. In R4.1, what is a “potential” deficiency?</p> <p><b>Response: The SDT believes the initial designation of “potential” should describe the deficiency until the “assessment” confirmed it.</b></p> <p>In R4.3, how can one correct a deficiency since that happened in the past?</p> <p><b>Response: The SDT intends for the entity to assess and correct the deficiency. The SDT believes to correct a deficiency means to take measures to correct the cause of the deficiency in a manner that it is not repetitive. Examples of which are, but not limited to, training, process change, performance documentation evaluation, counseling and other measures that would prevent future occurrences.</b></p> <p>In R4.4, how does one evaluate the process based on deficiencies identified that are “external to Part 4.1”? (Part 4.1 is the process for identifying deficiencies.)</p> <p><b>Response: The entity compares the deficiencies found externally to determine why they were not identified by the entities internal process. The entity then makes proper modifications to its process to improve its performance for finding deficiencies.</b></p> <p>We are also concerned about the draft RSAW for R3 and R4. The RSAW has two</p>

Organization	Yes or No	Question 3 Comment
		<p>bullets for R3 and R4. One states</p> <p><i>“Where the auditor can verify that the entity is identifying, assessing, and correcting its own deficiencies, the auditor will not have a finding of non-compliance.”</i> The second bullet states <i>“If an auditor cannot verify that the entity is adequately identifying, assessing, and correcting its own deficiencies due to limitations in its process, the auditor will not have a finding of non-compliance.”</i> The auditor will provide the entity with recommendations as necessary.”</p> <p>Per the RSAW for R3 or R4, how will an auditor verify that an entity is not “adequately identifying, assessing, and correcting its own deficiencies due to limitations in its process”? In other words, what evidence will be required by the auditor, and how many months of communications records should be kept?</p> <p><b>Response: the auditor for draft 3, R3 and R4 will require the results of the process and the evidence requirement is 90 days. This is articulated in draft 3 of COM-003-1. The RSAW was posted and comments for the RSAW were to be entered there.</b></p> <p>Because of the volume of communications, sampling may be required. Unless one listens to 100% of communications recording, one cannot be sure one is identifying all deficiencies. Is 100% deficiency detection the goal?</p> <p>Furthermore, M3 or M4, which only require the entity to provide the results of its process in R3 and R4, are not mentioned in the RSAW. Measures are supposed to represent one acceptable from of compliance and should be acceptable in the RSAW.</p> <p><b>Response: The standard does not specify a goal. The goal should be a function of the entities desire to eliminate mistakes caused by miscommunication.</b></p> <p><b>The Measures, M3 or M4, are the results of the process as stated in the standard.</b></p> <p>Finally, if R1 and R2 are changed as recommended in #2 above (i.e., remove the requirement for an entity to have documented communications protocols and just require it to adhere to protocols n R1 and R2), incidents of non-compliance with the</p>

Organization	Yes or No	Question 3 Comment
		<p>protocols will be detected via R3 and R4.</p> <p>We first recommend that M1 and M3 have the same measures - M1 and M2 would both read “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its process developed for Requirement R3.” The same would apply for M2 and M4, which would both read “Each Distribution Provider and Generator Operator shall provide the results of its process developed for Requirement R4.” If this were done, the draft RSAWs two bullets discussed should have these phrases modified for R3 and R4, with the modification shown in capital letters:</p> <ul style="list-style-type: none"> <li>o In R3, modify “the auditor will not have a finding of non-compliance FOR EITHER R1 OR R3” in two bullets.</li> <li>o In R4, modify “the auditor will not have a finding of non-compliance FOR EITHER R2 OR R4” in two bullets.</li> </ul> <p><b>Response: The SDT believes the language changes to draft 4 may address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p>

Organization	Yes or No	Question 3 Comment
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
Cowlitz County PUD	No	See response to question two.
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses to question 2.</p>		
Indiana Municipal Power Agency	No	<p>IMPA recommends adding clarification to the words “deficiencies found external to Part 3.1 (4.1)” so that entities and auditors know that these requirements allow deficiencies found outside of the entitie’s process including deficiencies that had previously passed the entity’s process) will be able to go through the entity’s process of assessing and correcting without the auditor giving a finding of non-compliance, since the entity itself failed to identify the potential deficiency in R3.1. or R4.1. The clarity can be added in the standard itself or in the RSAW- it currently is not stated in the standard and it is especially absent in the RSAW under Section 2 on page 4 of 5 or Section 2 page 5 of 5.It is also not clear how many times an entity will be allowed to identify, assess, and correct the same deficiency or similar deficiencies before an auditor can find an entiy in non-compliance with R3 and R4 (including subrequirments of each). It appears that the SDT is saying that as long as an entity is making the changes provided in the feedback by the CEA to its process to identify, assess and correct that it will not be found non-compliant for all same or similar deficiencies that continue to occur - there is no set number as long as the entity is trying to improve its process or communication protocols, is this correct? If so, IMPA supports this practice and would like to see clarity added.</p>
<p>Response: The OPCPSDT thanks you for your comments. Your comments referring to 3.1 to 3.3 and 4.1 to 4.3 are correct. R3.4 and R4.4 require the entity to evaluate its process if deficiencies are discovered externally. The entity must implement modifications if the entity determines modifications are required or justify why the entity determines no modification is required. If the entity does not comply with these subrequirements it may be subject to a finding of non compliance. The SDT believes the standard draft3 and the RSAW convey this.</p>		

Organization	Yes or No	Question 3 Comment
MISO	No	<p>MISO respectfully submits that COM-003-1, R3 and R4 require clarification in two regards. MISO first notes that requirements R3.4 and R4.4, which require Registered Entities to evaluate “the process based on deficiencies found external to [R3.1/R4.1],” are written in a confusing manner. More specifically, it is not clear what the phrase “found external to” means and, therefore, Registered Entities cannot know or understand when their compliance obligations under these requirements are applicable.</p> <p><b>Response: The SDT has changed the language changes to draft 4.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p> <p>In addition, MISO respectfully submits that the SDT must add clarifying language to COM-003-1 to clarify that an individual failure to execute elements of a System Operator’s communication protocol is not, on its own, a compliance violation, provided that the System Operator evaluates adherence to its protocol as required by Requirements R3 and R4.</p> <p><b>Response: The SDT believes that is stated in the standard and supported in the RSAW.</b></p>

Organization	Yes or No	Question 3 Comment
		<p>MISO is concerned that the current draft of COM-003-1 could give rise to double penalties for individual failures to execute one of the elements of a communication protocol. Without clarifying language in the Reliability Standard itself, any Registered Entity that fails to adhere to its communication protocol required by COM-003-1, R1 and R2 would likely self-report this failure, and would subsequently complete a mitigation plan that addresses -- and implements new processes to prevent the repetition of -- the failure. An additional requirement to evaluate adherence to the communication protocol would be redundant and would not increase or bolster reliability - and, further, would only increase the potential for Registered Entities to violate yet another requirement of a Reliability Standard. Thus, unless COM-003-1 is revised to clarify that a Registered Entity's failure to implement an element of its communication protocol for Operating Instructions is not a compliance violation in and of itself and, therefore, is not subject to self-reporting under NERC and Regional Entities Compliance Monitoring and Enforcement Program ("CMEP"), MISO cannot support proposed Requirements R3 and R4 at this time.</p> <p><b>Response: The SDT believes the language changes to draft 4 may address your concern.</b></p> <p><b>"R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:"</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. 		003-1 RSAW has been updated to reflect this change.
Response: The OPCSDT thanks you for your comments. Please see our responses above.		
ERCOT	No	<p>ERCOT agrees with the SRC comments, and has these additional comments: ERCOT fully supports the concept that functional entities’ internal controls be used to monitor the effectiveness of their own protocols. However, these matters are not suitable for reliability standards. Imposition of mandatory controls applicable to all functional entities is inappropriate because of the wide variety of organizational structures that necessarily requires flexibility with respect to developing appropriate controls for each entity’s specific circumstances.</p> <p><b>Response: The SDT believes the draft standard provides great flexibility to all of the applicable entities and believes that the standard focuses on the results of an entity’s process for identifying, assessing and correcting deficiencies all in the interests of improving reliability.</b></p> <p>Furthermore, entities’ internal controls are beyond the scope of the Section 215 reliability purview generally, and they are inconsistent with the risk based initiative being pursued by NERC because they do not impact/are not related to actual reliability impacts.</p> <p><b>Response: The SDT disagrees and does not discern the linkage to Section 215 and points out the standard is not focused on internal controls, but on improving communication clarity to avoid problems on the BES which has a dramatic impact on reliability.</b></p> <p>Furthermore, this deficiency review process is ambiguous and, accordingly, lends itself to inefficient and ineffective CMEP results. As an initial matter, what constitutes a deficiency will be an issue that is vulnerable to subjective disagreements. Even assuming there is agreement on that issue, what constitutes an appropriate remedy for a deficiency in terms of assessment and correction will</p>

Organization	Yes or No	Question 3 Comment
		<p>similarly be susceptible to subjective disagreements.</p> <p><b>Response: The SDT does not believe the evaluation process is ambiguous and believes the implementation of this standards approach to standard development will enhance the effectiveness of NERC’s CMEP program.</b></p> <p>Finally, with respect to the obligation to evaluate the deficiency identification process itself, again, the potential for the introduction of subjective compliance review will be problematic in practice in terms of reviewing whether the decision whether to implement a modification or not, and, if a modification is implemented, whether the revision is adequate.</p> <p><b>Response: The SDT believes there has to be a level of accountability for an entity that cannot or will not take measures to improve its process. The SDT believes the requirements that require the evaluation are clear and fair. The entity can make any decision to modify or not to modify; the later requires documented justification.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Oncor Electric Delivery Company LLC</p>	<p>No</p>	<p>Oncor also takes the position that all of the ideas prescribed within these requirements including the implementation, assessment, evaluation and correction of communication protocols, are already being effectively implemented as industry Best Practice. In addition, Oncor requests that NERC substitute the CIP v.5 'zero defects' (Each Responsible Entity shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented processes) language in COM-003 in order to minimize potential confusion.</p> <p><b>Response: The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies,</b></p>

Organization	Yes or No	Question 3 Comment
		<p>documented communication protocols for Operating Instructions between Functional Entities that include the following:"</p> <p>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</p> <p>Oncor offers the following substitute language for R3 and R4.</p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or               <ul style="list-style-type: none"> <li>• Reissue the Operating Communication to resolve any misunderstandings.</li> </ul> </li> </ul> <p>Response: R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. 		Version 5's draft (for ballot), and similarly format these requirements. However please see AECI's general observations concerning COM-003-1 in comment 5 below.
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT will respond to AECI's comments and observations in 5 below.</b></p>		
FirstEnergy	Yes	FirstEnergy supports this new concept being introduced by NERC. It allows entities to sharpen their internal controls while not being penalized for minor non-compliance situations that do not impact the BES. The only question we raise is how this will be implemented in the CEAP. The draft RSAW for COM-003-1 is silent on this issue and we ask that NERC give more guidance on it as this paradigm develops.
<p><b>Response: The OPCPSDT thanks you for your comments. CEAP at this writing is still under development and to the best of the SDT's knowledge is not deployable yet.</b></p>		
Florida Municipal Power Agency	Yes	<p>we commend the SDT for doing a good job of writing a difficult standard and avoiding the "zero-defect" problem (the problem of just having just one violation in tens of thousands be punishable by fines) and we support the approach taken. If we think of managing operations, we think of the process:</p> <p>Step 1 - Vision, goals, policies - what do we want to accomplish?</p> <p>Step 2 - Protocols, plans, procedures, programs, processes, methodologies - how will we do it and who will do what?</p> <p>Step 3 - Do it</p> <p>Step 4 - Measure, monitor - did we accomplish what we set out to do?</p> <p>Step 5 - Learn, adjust, back to 1.</p> <p>The problem with the prior draft of COM-003, before this latest draft, is that the standard essentially micromanaged industry by causing auditors to monitor actual communications, e.g., the auditors would be doing step 4, which ends up with the zero-defect problem. We have seen other standards that have this zero defect</p>

Organization	Yes or No	Question 3 Comment
		<p>problem, e.g., PRC-005 has a requirement for step 2 of the process above, to have a program, and then for step 3 of the process, to do it in accordance with the program, which results in the zero-defect problem. We've seen still other standards avoid the zero defect problem by only requiring step 2, but with no requirement to actually do it, e.g., the currently enforceable CIP-001 has requirements for step 2 of the process above for sabotage reporting procedures, but, has no requirement to actually follow those procedures if a sabotage event occurs, which leaves questions of accountability. The SDT for COM-003 is doing the appropriate thing and backing up one level to measure how effectively we are managing our own operations, and this is the first time I've seen a standard developed in this clever fashion of developing requirements for Step 2 (protocols) and Steps 4 &amp; 5 (measure, monitor, learn, adjust) of the process above, but not Step 3 of the process. However, Step 3 would need to be performed for the entity to comply with Steps 4&amp;5, meaning we are still accountable for "doing it".</p> <p>The method that the SDT is using to ensure we have the appropriate operations management mechanisms in place seems a clever and pragmatic approach. We have one suggestion to improve R3. R3 requires entities to “implement” a process for identifying deficiencies. Use of the word “implement” implies that all deficiencies must be identified, which means that the auditors would need to independently identify deficiencies and compare notes, which reintroduces the "zero-defect" problem. FMPA recommends replacing "implement" with “institute”.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT believes the word implement means to develop and initiate the process. The “how to” of that process will be determined by the entity. We believe R3 provides latitude to determine the means and methodologies to develop how it will identify, assess and correct deficiencies and does not specify or even imply a 100% identification of deficiencies. A robust sampling of Operating Instructions based on statistical modeling would be a more efficient and effective means of developing controls for identifying deficiencies.</b></p>		
Southern Company	Yes	Provided that the SDT incorporate the changes suggested for R1 and R2, Southern generally agrees with the concept of implementing a process to identify and correct

Organization	Yes or No	Question 3 Comment
		deficiencies without compliance exposure for each deficiency. However, this is a new concept and we do have questions as to how it will be implemented. For example, how many discrepancies would it take for an entity to identify before requiring a self report rather than waiting to present the log of deficiencies found and corrected during an audit?
<p><b>Response: The OPCPSDT thanks you for your comments. As long as the entity is identifying, assessing and correcting deficiencies and evaluating its process (R3.4 and R4.4) and improving it to reduce deficiencies there is generally not a finding of non compliance. The entity must evaluate its process if deficiencies are discovered externally. The entity must implement modifications if the entity determines modifications are required or justify why the entity determines no modification is required. If the entity does not comply with these sub requirements it may be subject to a finding of non compliance. The SDT believes the standard draft3 and the RSAW convey this.</b></p>		
NIPSCO	Yes	These appear to be Internal Controls and they look good.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
The United Illuminating Company	Yes	United Illuminating supports the language in COM-003 R3 and R4. Since the quantity of Operating Instructions will be very large it is more important to have a process to monitor the communication protocols and correct deficiencies.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
CPS Energy	Yes	The proposed requirements (COM-003-1, R3 and R4) are in line with Risk-Based Reliability Compliance Monitoring.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Exelon	Yes	Exelon agrees with the proposed requiremnt but thinks it could be improved before final adoption. The Requirement as written is confusing. For example, R3 is to identify deficiencies with respect to the entities protocols. R3.1 addresses “potential”

Organization	Yes or No	Question 3 Comment
		<p>deficiencies. It is unclear what a potential deficiency is. We suggest using deviations from the entities protocol in place of deficiencies or potential deficiencies. Similarly we question how an entity will demonstrate that modifications to their program are not required in light of the assessment being done in response to deviations from the protocol. We believe R3.4 should be clarified. We believe its purpose is to direct an entity to take action if an external entity (auditor) identifies a deviation from the entity protocol. We do not think the response to identifying a deviation / deficiency should vary based on how it was identified. Once identified (R3.1), a deviation / deficiency should be assessed (3.2) Corrected (3.3) and when necessary (3.4) the program should be modified to account for the deficiency. Since a similar effort to utilize an internal controls approach is underway in the CIP Version 5 drafting, it may be valuable for COM-003 to also utilize the same language of “in a manner that identifies, assesses, and corrects deficiencies.” Exelon supports the effort to utilize an internal controls approach but remains concerned compliance auditing and the potential for interpretations related to the requirement. We urge NERC, in collaboration with the Regional Entities to develop a clear roll out plan prior to implementation of COM-003 so that stakeholders and auditors understand the compliance obligations for this new approach.</p>
<p><b>Response:</b> The OPCSDT thanks you for your comments. The SDT believes the language changes to draft 4 may address your concern.</p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1</b></p>

4. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?

**Summary Consideration:** The Structure of COM-003-1, draft 4 has changed dramatically. There are now two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates industry input on this question for draft 3.

The new draft 4 language is:

“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”

R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.

Organization	Yes or No	Question 4 Comment
ACES Power Marketing Standards Collaborators	No	<p>(1) We agree with the VRF classifications.</p> <p>(2) We agree with the VSLs for R1 and R2. We note that there is a typo in Severe VSL for R2 - there is no part 2.3 in the standard.</p> <p><b>Response: Thank you, the SDT has corrected the error.</b></p> <p>(3) We disagree with the Time Horizons for R1 and R2. Developing documented communications protocols are not long term planning, these activities are operations planning.</p> <p><b>Response: The SDT believes Long Term Planning is the proper Time Horizon based</b></p>

Organization	Yes or No	Question 4 Comment
		<p><b>on the NERC guidance document.</b></p> <p>(4) We disagree with the VSLs for R3 and R4. In particular, the binary nature of implementing communication protocols needs to be reconsidered. During the September 6 webinar, both Gerry Cauley and Mike Moon stated that internal controls should focus on fixing deficiencies and auditors were not to find PVs for single instances of noncompliance. Based on these statements, the VSLs should not be binary if the auditors are not to find PVs for single instances. Also during the webinar, Mike Moon stated that the auditors are to make recommendations in their audit reports to improve their processes, and not to be an “enforcement hammer” for each individual deficiency. The way the VSLs are drafted, each instance will be severe. We recommend that the SDT revise the VSLs to allow for auditors to make recommendations instead of findings of potential noncompliance.</p> <p><b>Response: The SDT believes that the Standard language supports the correction of deficiencies rather than finding PVs. The entire identify, assess and correct process is the core emphasis of the standard.</b></p> <p><b>The finding of non compliance and the commensurate Severe VSLs only occur after an entity that does not improve its process when it has demonstrated that improvement is required. This sets the stage for creating a risk for miscommunication to cause errors on the BES. The SDT believes this will be an unlikely exception because it would occur only if the entity disregards the poor performance of their process and their own findings to improve it. To reach this point would be the result of a long chain of failures and a near complete disregard of the requirement on the part of the entity.</b></p> <p>(5) R3 VSL, “The Responsible Entity did not demonstrate that no modification to the process was necessary to address the deficiencies found external to Part 3.1.” This is a documentation issue and should not result in a severe VSL classification.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The SDT does not believe it is a documentation issue. An entity, which does not improve its process when the process is unable to identify deficiencies, is creating a risk for miscommunication that will cause errors on the BES. If the entity disregards or refuses without justification to make those modifications the CEA must have the authority to elevate level of compliance.</b></p> <p>(6) There was a lot of discussion in the webinar about Regional auditors not finding a violation, but there needs to be clear guidelines describing when an auditor will find a PV. The VSLs currently describe a violation when a deficiency is not remediated, but that same instance could result in no finding at all, depending on how the individual auditor interprets the situation. This level of subjectivity is too high; the SDT needs to revise the VSL table to reflect a more reasonable approach, perhaps by including more information and examples of situations that might be viewed as non-compliance (communication breakdown) but because of internal controls, there should be no finding of non-compliance. In the alternative, the SDT could develop a guidance document outlining when an auditor is to find a PV and include examples to ensure consistency. The RSAW does not provide any additional clarity.</p> <p><b>Response: The SDT refers to its responses to 4 and 5 above. The SDT does not believe the level of subjectivity is high. The identify, assess and correct aspect of the requirement is at the core of the standard. If an entity does this and has a strong process and controls that capture deficiencies in a manner that can be verified by external agents, there are generally no findings of non compliance. If an entity does not make modifications to their process that they have identified or do not make modifications and do not justify why they believe modifications are not required they have approached a status where they could be subject to a finding of non-compliance. This is an area where an entity with a compromised internal process which the entity is not improving and, therefore, is not realistically managing the risk of miscommunication that could impact the BES.</b></p> <p>(7) In the webinar, there were several references to “systemic or chronic” communication deficiencies. The VSLs do not reference any types of trends, but that</p>

Organization	Yes or No	Question 4 Comment
		<p>seems to be the focus of compliance. We suggest revising the VSLs to focus on broader issues, such as systemic deficiencies that remain unresolved.</p> <p><b>Response: The SDT believes Requirements R part 3.4 and R part 4.4 will be instrumental in revealing systemic or chronic communication deficiencies. To the extent an entity modifies the process and strengthens their controls, improvements to the process and corrections of deficiencies can be generally be accomplished without a finding of non compliance.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
Detroit Edison	No	<p>Analysis during Annual Review of work procedure for R1 and R2 automatically includes an analysis of the process and development of corrective actions.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
Duke Energy	No	<p>1) Consistent with our comment to Question 2 above regarding changing the word “incorporate” to “address” in Requirements R1 and R2, this change should also be made in the VSLs for R1 and R2, changing the word “include” to “address”.2) The Severe VSL for R2 incorrectly references a Part 2.3, whereas it should just refer to both Parts 2.1 and 2.2</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT changed the word to “include” in all cases. There has to be a level of uniformity of communication protocols among functional entities to create universal communication protocols.</b></p> <p><b>The SDT has corrected the error you indicated. (R2 incorrectly references a Part 2.3, whereas it should just refer to both Parts 2.1 and</b></p>		

Organization	Yes or No	Question 4 Comment
<p>2.2)                      The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</p>		
Dominion	No	For the reasons cited in the comments above
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Associated Electric Cooperative Inc - JRO00088	No	It could be appropriate, were the expectations properly bounded similar to the wording outlined for Question 5 below.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
ISO/RTO Standards Review Committee	No	The SRC does not agree with the VSLs of R3 and R4 . The SRC feels that it is not binary and actually fits the Requirements with Parts that Contribute Unequally to the Requirement in the VSL guideline document. While part 3.3 is the most critical, an entity would certainly not get any reliability benefit if you don't do parts 3.1 - 3.3 or 3.3 in itself, which could be a severe VSL. But if an entity performs parts 3.1 - 3.3 and does not perform part 3.4, it should not be a severe VSL because you are getting a substantial amount and majority of the reliability benefit from performing 3.1-3.3. Failure to do part 3.4 should be a high VSL perhaps, but it is not all binary. If an entity fails to do 3.2, it may be a medium only.
<p><b>Response: The OPCPSDT thanks you for your comments. The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
SPP Standards Review Group	No	The Severe VSL for R2 contains a typo and should be reworded to read: 'The

Organization	Yes or No	Question 4 Comment
		<p>responsible entity did not include Parts 2.1 to 2.2 of Requirement 2...’We would suggest that the VRFs for R3 and R4 be reduced to Low. The VRFs for R1 and R2 are Low. R3 and R4 are processes that monitor R1 and R2; therefore, they should not be treated more severely than R1 and R2.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Thank you for pointing out the error. We have corrected it.</b></p> <p><b>The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
<p>Bonneville Power Administration</p>	<p>No</p>	<p>BPA does not agree with the VRFs and VSLs. R3 &amp; R4 should include a range of VSLs. A documentation error such as a failure to record that modification of a process was not necessary would not merit a severe VSL if training was implemented as an appropriate solution to an identified deficiency.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes it is not just a documentation issue. An entity that does not improve its process when it has demonstrated that improvement is required is creating a risk for miscommunication that would contribute to errors on the BES.</b></p> <p><b>The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
<p>PacifiCorp</p>	<p>No</p>	<p>It is not clear to PacifiCorp why the VSLs are so much higher for R2 when R1 applies to Balancing Authorities, Reliability Coordinators, and Transmission Operators, and thus has a potentially broader application than R2. R2 applies to Distribution Providers and Generator Operators.</p> <p><b>Response: There are more parts in R1 – nine, as opposed to two in R2.</b></p> <p>Also, it is not clear why the R2 VSL R2.3, as there is no R2.3 in the current draft.</p>

Organization	Yes or No	Question 4 Comment
		Response: Thank you for pointing out the error. We have corrected it.
Response: The OPCPSDT thanks you for your comments.		
Independent Electricity System Operator	No	We do not agree with the need for most if not all of these requirements, and therefore do not agree with the proposed VRFs and VSLs.
Response: The OPCPSDT thanks you for your comments. The SDT notes your comments. The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.		
NextEra Energy Inc.	No	NextEra does not support VSLs that are checklist or document related. Rather NextEra favors VSLs that balance results and performance against reliability risk. As drafted, the current VSLs are a checklist approach to measuring reliability risk and compliance, which is not particularly helpful or meaningful. Thus, NextEra suggests that VSLs be re-drafted to measure whether the entity posed an actual risk to the Bulk Electric System based on how it delivered or received an Operating Instruction.
Response: The OPCPSDT thanks you for your comments.  The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.		
Northeast Utilities	No	VRF R3 & R4 NERC VRF Discussion:  R3 (4) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this

Organization	Yes or No	Question 4 Comment
		<p>requirement is “Medium” which is consistent with NERC guidelines.</p> <p>The violation of R3 (R4) does not result in informal communication; it results in not identifying it. It is not a failure to identify that poses the risk to the BES, but the actual communication. The process implemented in R3 (R4) identifies, assesses, and attempts to correct deficient communication practices in an attempt to make future communications better. The process in R3 (R4) has no real-time impact on the BES, it aims at having real-time impact on operators who have real-time impact on the BES. For these reasons the VRF should be “Low”</p> <p><b>Response: The SDT disagrees. The purpose of the process is not just to identify non adherence to protocols, but ultimately to correct it to reduce the opportunity for a miscommunication which can lead to unintended consequences in the operation of the BES. The SDT believes the process will have an ultimate effect on real time communication and elects to maintain the medium VRF.</b></p> <p>FERC VRF G1 Discussion:</p> <p>Discussion references wrong FERC Recommendation; should have referenced Recommendation 26 rather than 24.</p> <p><b>Response: The SDT has corrected the error. Thank you for bringing it to our attention.</b></p> <p>Additionally, the SDT wrongly implies that Recommendation 26 applies to COM-003-1. Recommendation 26 “Tighten communications protocols, especially for communications during alerts and emergencies...” applies to COM-002, thus removing it from FERC VRF G1 allowing for a VRF of “Low” to be assigned.</p> <p><b>Response: The SDT believes Recommendation 26 does apply to tightening communications and that is what COM-003-1 does – it tightens communications.</b></p> <p>FERC VRF G3 Discussion:</p> <p>Though analogous to R2 of COM-002-2 they are not the same. One can argue that</p>

Organization	Yes or No	Question 4 Comment
		<p>the importance of “directive” to the BES is greater than the importance of an “Operating Instruction” to the BES and thus the risk to the BES is less for R3 (R4) of COM-003-1, and accordingly should be assigned a lower VRF than R2 of COM-002-2 to promote consistency between the standards, while also elevating the importance of COM-002-2 over COM-003-2. Said another way (Though each requirement addresses communication protocol, the potential effects of the failure to follow the protocol are different in that one deals with Directives and Emergency conditions and the other with Normal operations. So the VRF's shouldn't necessarily be the same.)</p> <p><b>Response: The SDT disagrees. The risk of the same miscommunication either during an emergency (COM-002 family) or during normal operations can negatively impact BES reliability. If the issuer of a directive, “Reliability Directive” or “Operating Instruction” states: “Open switch RA50” and the receiver hears “Open switch RA15” because “50” and “15” sounded the same and no protocols were utilized, the resulting impact to the BES would be the similarly disastrous, no matter if the system was operating under normal, emergency or alert conditions.</b></p> <p>FERC VRF G4 Discussion: The violation of R3 (R4) does not result in informal communication; it results in not identifying it. It is not a failure to identify that poses the risk to the BES, but the actual communication. The process implemented in R3 (R4) identifies, assesses, and attempts to correct deficient communication practices in an attempt to make future communications better. The process in R3 (R4) has no real-time impact on the BES, it aims at having real-time impact on operators who have real-time impact on the BES. For these reasons the VRF should be “Low”</p> <p><b>Response: The COM-003 standard proposes to reduce the risk to the BES by ensuring operators use communication protocols that clarify important elements of an Operating Instruction. If operators are not conditioned to utilize the protocols properly they will not use them properly in a Real Time environment. The SDT has elected to maintain the medium VRF.</b></p> <p>FERC VRF G5 Discussion: The SDT has argued that R3 &amp; R4 each contain only one</p>

Organization	Yes or No	Question 4 Comment
		<p>objective (identification of deficiencies).An Alternative read suggests the R3 &amp; R4 as written each have six objectives:</p> <ol style="list-style-type: none"> <li>1. Identify deficiencies in 3-part communication as defined by protocols in R1</li> <li>2. Assess identified deficiencies in 3-part communication</li> <li>3. Correct identified deficiencies in 3-part communication</li> <li>4. Identify deficiencies in process implemented in R3 (R4)</li> <li>5. Assess identified deficiencies in process implemented in R3 (R4)</li> <li>6. Correct identified deficiencies in process implemented in R3 (R4)</li> </ol> <p>VSL Justification R3 (R4)</p> <p>The SDT has argued that R3 &amp; R4 each contain only one objective (identification of deficiencies).An Alternative read suggests the R3 &amp; R4 as written each have six objectives:1. Identify deficiencies in 3-part communication as defined by protocols in R12. Assess identified deficiencies in 3-part communication3. Correct identified deficiencies in 3-part communication4. Identify deficiencies in process implemented in R3 (R4)5. Assess identified deficiencies in process implemented in R3 (R4)6. Correct identified deficiencies in process implemented in R3 (R4)</p> <p>Because there are multiple objectives in R3 (R4) there is an opportunity for more granularities to the proposed VSL.</p> <p><b>Response: The SDT sees only the one objective of reducing communication errors on the BES.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p> <p><b>The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. Ameren	No	See response to question 5.
<b>Response: The OPCPSDT thanks you for your comments. Please see our responses to question 5.</b>		
Essential Power, LLC	No	The VRFs and VSLs are divided into long-term planning and operation planning categories. These terms are not explained in the standard, so the difference between them is unclear. They do suggest however that, in accordance with our comment #1 above, this standard is not meant to apply to routine transmission system operator-to-plant communications.
<b>Response: The OPCPSDT thanks you for your comments. The terms are contained on the NERC website. The only way the standard could be made Real Time is in a zero defect environment. Please see our response to your comments on Question 1.</b>		
Texas Reliability Entity	No	R2 Severe VSL references “Parts 2.1 to 2.3 (3)” when a “2.3” does not exist (this issue is also in the VRF/VSL Justification document). The VSLs for R3 and R4 say nothing

Organization	Yes or No	Question 4 Comment
		about assessing and correcting identified deficiencies per 3.2, 3.3, 4.2 and 4.3.
<p>Response: The OPCPSDT thanks you for your comments. The SDT has corrected the error.</p> <p>The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</p> <p>“R1 (and R2 – DP and GOP). Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</p> <p>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</p> <p>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p>		
GTC	No	<p>The VSLs for requirements R3 and R4 are too severe. We understand that they were designated as binary, which led them to automatically be designated as severe VSLs. However, it is our position that these requirements are no more binary than requirements R1 or R2 and that their VSLs should be rewritten.</p> <p>We propose:</p> <p>Moderate VSL: The responsible entity did not include one (1) of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement R1.</p> <p>High VSL: The responsible entity did not include two (2) of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement</p>

Organization	Yes or No	Question 4 Comment
		<p>R1.Severe VSL: The responsible entity did not include three (3) or more of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement R1 or did not have such a process.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The Structure of COM-003-1, draft 4 has changed dramatically there are only two requirements and the scope of each is different enough to warrant significant changes to the VRFs and VSLs in draft 4. The SDT will post draft 4 and request new comments on the VRFs and VSLs. The SDT appreciates your input on this question for draft 3.</b></p>		
<p>MISO</p>	<p>No</p>	<p>MISO appreciates the changes that the SDT has made to the VRFs and VSLs in response to comments and to ensure that the VRFs and VSLs are consistent with FERC and NERC guidelines. However, MISO cannot support either the VRF or the VSLs for R3 and R4 as it does not agree:</p> <ul style="list-style-type: none"> <li>(1) that there is a direct impact on reliability that result from an entity’s internal self-assessment and</li> <li>(2) with the expressed rationale.</li> </ul> <p>Further, MISO notes that COM-003-1, R3 and R4, primarily require internal administrative processes or documentation thereof. MISO respectfully submits that internal administrative processes have not previously been linked to direct impacts on the reliability of the BES.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes there is a very direct impact on BES reliability from improved operating communication because there is a reduced opportunity for miscommunication that would harm the BES. The BES does not see COM-003-1 as simply an administrative process. It is a mechanism to condition and develop System Operators to a uniform and consistent level of communication discipline utilizing their documented communication protocols. The additional feature of this standard is that it can be managed normally in a “non-zero defect” environment. The SDT believes the process is pre-emptive in nature which means an entity develops measures that reduce the risk of mistakes that harm the BES.</b></p>

5. Do you have any other comments or suggestions to improve the draft standard?

**Summary Consideration:**

The SDT refers the reader to the consolidated summary where the key items to Question five covered.

Organization	Yes or No	Question 5 Comment
Texas Reliability Entity		<p>(1) Requirements R2 and R4 should also apply to Load-Serving Entities (TOP-001-2 R1, VAR-001-3 R5), Purchasing-Selling Entities (VAR-001-3 R5), and Generator Owners (VAR-001-3 R11, VAR-002-1.1b R5) so that all entities receiving Operating Instructions are covered. For M3 and M4 the process should be included as well as results.</p> <p><b>Response: The originating SAR did not include LSEs, GOs and PSEs. The SDT discussed their inclusion and could not justify applicability for them.</b></p> <p>(2) Capitalize “responsible entity” in VSL language for R1 and R2 as was done in R3 and R4.</p> <p><b>Response: Thank you for pointing that out. We have corrected the error.</b></p>

Organization	Yes or No	Question 5 Comment
		<p>(3) RELIABILITY GAP: We believe a reliability gap exists because no standard generally requires compliance with Operating Instructions, Reliability Directives and other valid instructions. We realize this issue may be considered to be outside of the scope of this project, but we are quite concerned that reliability is compromised because operating entities can elect to ignore valid instructions for economic or other reasons, and that much more attention is being given to the form of the instructions than to requiring that they be obeyed.</p> <p><b>Response: The SDT believes the standard language and the definition do make it mandatory for applicable entities to comply with Operating Instructions.</b></p> <p>VRF/VSL JUSTIFICATION:</p> <p>(4) In the VRF/VSL Justification document there is only reference to 3 requirements in the COM-003-1 Standard (page 5). There are 4 requirements.</p> <p><b>Response: The SDT has corrected the error. Thank you for finding it.</b></p> <p>(5) The “Low” VRF rating for R1 and R2 seems unjustified based on the following points:</p> <p>1) In the VRF/VSL Justification document there is the following statement at the top of page 5: “Requirements R1, R2 and R3 were assigned a “Medium” VRF.”</p> <p><b>Response: Thank you, that was part of the same error you indicated previously. The SDT has corrected the error. It now reads:</b></p> <p><i>“R1 and R2 are assigned a “Low” VRF, and R3 and R4 are assigned a “Medium” VRF.”</i></p> <p>2) In the Rationale and Technical Justification document there is the following statement: “Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties,</p>

Organization	Yes or No	Question 5 Comment
		<p>especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems."</p> <p>If there is not a process, would there not be more errors?</p> <p><b>Response: The SDT believes there would most likely be more errors without the process. The SDT believes that R1 and R2 should be assigned a "Low" VRF, and R3 and R4 should be assigned a "Medium" VRF based on NERC and FERC guidelines.</b></p> <p>3) In the VRF/VSL Justification document there is the following statement: "In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System" and "Communication protocol and facilities" is listed. R1 and R2 attempt to address this issue.</p> <p><b>Response: The SDT agrees that when integrated into the process, R1 and R2 attempt to address the issue. The SDT believes the low VRF is appropriate for R1 and R2 because it calls for having Response: The SDT has corrected the error. a document(s). R3 and R4 fit the criteria for a medium VRF based on NERC and FERC guidelines.</b></p> <p>(6) In the VRF and VSL Justification document, at page 15 and page 20, the FERC VRF Guideline 3 Discussion is inconsistent with R3 and R4 language respectively (R3 and R4 do not call for "use of formal three part communication").</p> <p><b>Response: The SDT has corrected the error. Thank you for bringing it our attention.</b></p>

Organization	Yes or No	Question 5 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>ACES Power Marketing Standards Collaborators</p>		<p>(1) If the Regional auditor is to make recommendations to registered entities on how to improve the COM-003-1 internal controls, would the Regions allow an initial safe harbor to assess the entity’s program? If Regional auditors find PVs on the initial audit, that practice would go against the spirit of self-correcting and would stifle the entity’s actions to monitor, assess, and correct deficiencies. The SDT should consider this sort of initial assessment in the implementation plan.</p> <p><b>Response: The SDT does not believe there will be a need for a safe harbor based on how the requirements are structured. It would be unlikely the CEA would find PVs on the initial audit if the entity is identifying, assessing and correcting deficiencies. If the process was weak the entity would still have an opportunity to evaluate it and improve it without a finding of non compliance.</b></p> <p>(2) If there is discussion of combining COM-002 and COM-003 in the future, why not combine them now? It would be a better use of the ERO’s resources to produce a single communication standard while both SDT projects are in development instead of going back through the entire process at some point in the future.</p> <p><b>Response: The SDT does not disagree with your comment, but that is outside the scope of the SAR for this project. Combining the two standards has been formally proposed at Standards Committee meetings.</b></p> <p>(3) A Reliability Directive appears to be a subset of the Operating Instruction definition, which is basically an Operating Instruction that occurs during an Emergency. We suggest collaborating with the RC SDT to clarify the bounds of each definition to avoid overlap. As discussed above, it would be appropriate to combine the COM-002 and COM-003 and associated definitions to avoid confusion.</p> <p><b>Response: The OPCPSDT has coordinated with the RCSDT and has defined those boundaries in two webinars and two postings.</b></p>

Organization	Yes or No	Question 5 Comment
		<p>(4) There is no requirement for data retention for R1 or R2. Again, we recommend striking these requirements.</p> <p><b>Response: The entity must have the documented communication protocols. The evidence is the entity's documented communication protocols.</b></p> <p>Thank you for the opportunity to comment.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Ameren</p>		<p>(1) We believe the drafting team has made some great strides to get this to be a useful standard for industry. The idea that we have a process for self-correction instead of self-reporting is a good concept. However, the reasons for our “No” vote is that the current wordings in the latest draft still need some changes to provide clarification. In this regard, we agree in principle with alternate language provided by NextEra (which we have modified slightly) and have also provided additional clarifying comments and recommendations.</p> <p>(R1) When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Instruction, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Instruction to the recipient.</p> <p>(R2) Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Instruction shall repeat, restate, rephrase or recapitulate the Operating Instruction.</p> <p>(R3) Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Instruction shall either:</p> <ul style="list-style-type: none"> <li>(a) Confirm that the response from the recipient of the Operating Instruction (in accordance with Requirement (R2)) was accurate, or</li> <li>(b) Reissue the Operating Instruction to resolve any misunderstandings.</li> </ul>

Organization	Yes or No	Question 5 Comment
		<p><b>Response: The SDT appreciates your recommendation but adopting it would dramatically alter the standard making it less effective as an opportunity for improving communication protocols.</b></p> <p>(2)Along with the revised language proposed above, we request the drafting team to clarify the concept of what constitutes an Operating Instruction (or command) because the current understanding is too broad. We strongly believe that it should focus only on instructions related directly to BES reliability and which are not considered Reliability Directives covered under COM-002, and that it should not include normal or routine dispatching instructions of generators.</p> <p><b>Response: The SDT believes Operating Instructions are very specific as defined. A command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System is very explicit. It is focused on actions that dictate changes to the BES that if misunderstood undermine the reliability of the BES. Also see our response to your comment below. We have changed the language to achieve more specificity.</b></p> <p>(3)Given the revised language proposed in comment (1) above, the definition of Operating Instruction should be revised to replace the term 'System Operator' with 'Reliability Coordinator, Transmission Operator, or Balancing Authority', since these functions are the ones who will initiate the Operating Instruction.</p> <p><b>Response: The SDT received many comments and Quality Review recommendations to include the defined term System Operator. The SDT changed the proposed wording as follows:</b></p> <p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not</i></p>

Organization	Yes or No	Question 5 Comment
		<p><i>considered Operating Instructions.</i></p> <p>The italicized portion highlights the proposed changes which the SDT believes will address Ameren’s comments.</p> <p>(4)"Transmission interface Element" and "Transmission interface Facility" both are not in the NERC glossary as defined terms and they need to be added to the NERC glossary or clearly defined in the standard.</p> <p><b>Response: The SDT believes all of those terms, except for “interface,” are in the NERC glossary. The term “interface” describes the population of Transmission system Elements and Facilities that are immediately adjoining between neighboring functional entities and that both entities must refer to when issuing or receiving “Operating Instructions.” The SDT believes the dictionary definition for “interface” is clear and unambiguous.</b></p> <p>(5)We suggest a 24 month Implementation Plan upon approval of COM-003. This would allow Registered Entities time to develop their compliance processes.</p> <p><b>Response: The SDT has already extended it to 12 months. 24 months is too long.</b></p> <p>(6)We request that the drafting team consider the possibility of substituting the CIP v.5 'zero defects' language in COM-003 in order to minimize potential confusion.</p> <p><b>Response: The SDT did evaluate that and has made that change in order to create consistent language among standards.</b></p> <p>(7)We request that any of the "violations" shown in the VSL table on pages 7, 8, and 9 should not qualify for a high or severe level and at the most these should either be categorized as low or, but no more than, moderate level.</p> <p><b>Response: The SDT considered your recommendation but believes the binary nature of some of the requirements’ parts warrants a severe VSL. There would have to be a very high disregard by an entity to improve their process to achieve the “Severe” VSL.</b></p>

Organization	Yes or No	Question 5 Comment
		<p>(8)In the VSL table for R2, in the column under Severe VSL, it states that "The responsible entity did not include Parts 2.1 to 2.3 (3) of Requirement R2..." Requirement R2 does not have a Part 2.3, only 2.1 and 2.2.</p> <p><b>Response: Thank you for pointing this out. The SDT has corrected the error.</b></p> <p>(9)If the drafting team retains the current language we are concerned about the prescriptive language in R1 and R2. We request that the drafting team in both R1 and R2 have the word "incorporate" changed to "consider" or "address", thereby making the requirements less prescriptive.</p> <p><b>Response: The SDT considered your recommendation, but used the word include" to make it less prescriptive, and to also maintain uniformity. The SDT believes consistency to be a key element of effective communications</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Central Lincoln		<p>1) We note that per the proposed definition of Operating Instruction, only commands regarding the states of BES Elements or Facilities are covered. We also note that per the Statement of Compliance Registry Criteria, Distribution Providers need not own or operate BES Elements or Facilities in order to be registered as DPs. This puts DPs without these facilities in the position of documenting protocols for and processes for finding deficiencies for communications that don't occur.</p> <p>We note the SDT stated in the last Consideration of Comments "DPs that operate BES Facilities or BES Elements and receive Operating Instructions are subject to the need for clear communication to avoid misunderstandings that could impact the BES", and we agree.</p> <p>We suggest: "4.1.2 Distribution Provider that operates Bulk Electric System Facilities or Elements and receives Operating Instructions"</p> <p><b>Response: The SDT considered your suggested language and has elected not to incorporate it. The SDT believes that DPs who shed load would also be subject to</b></p>

Organization	Yes or No	Question 5 Comment
		<p>the standard’s Requirements R2 and R4. Those DPs that do not own or operate BES facilities; do not shed load or would not receive an Operating Instruction would not be subject to COM-003-1.</p> <p>2) The references to Part 3.1 in Sub-requirement 3.4 and Part 4.1 in Sub-requirement 4.4 make no sense, since the standard has no such sections. We assume the SDT meant Sub-requirements 3.1 and 4.1 respectively, and suggest that “Part” be replaced by “Sub-requirement.”</p> <p><b>Response: The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p> <p>3) We agree with the SDT’s attempt to move away from zero defect compliance, and Requirements 1 and 2 and the RSAW all support this. We’re afraid the CEA may still be able to find non-compliance for a single defect based on the language of R3 or R4. For example a CEA finds a single OI that referred to a 12 hour clock time in violation of the entity’s protocol developed under R1.2. This is not a violation, but the CEA goes on to discover that the entity failed to identify the deficiency under R3.1. While</p>

Organization	Yes or No	Question 5 Comment
		<p>the entity can show they have a process that has in fact identified and corrected deficiencies, the CEA maintains they failed to implement the process for this one instance and finds a violation. When the entity points to the RSAW that states the CEA should make recommendation rather than finding a violation, the CEA states they audit to the language of the standard requirement as stated in Footnote 1 of the very same RSAW.</p> <p><b>Response: The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
American Electric Power		<p>AEP does not agree with the perceived necessity of this standard, but does support the overall concept of the drafting team’s building controls into the standards as well as proposing RSAWs during the comment that perpetuate the ideas and concepts of the drafting team.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes COM-003-1 is an important element to improve BES</b></p>		

Organization	Yes or No	Question 5 Comment
reliability.		
Northeast Utilities		<p>Applicability Section: Functional Entities Section may not be broad enough to capture all entities participating in communication for example a TO may have a switchman receiving Operating Instructions from a TOP; the way the standard is written the TO would not be required to participate in 3-part communication making it difficult for the TOP to fully implement its Communication Protocols.</p> <p><b>Response: There is much flexibility in how entities may construct their documented communication protocols to account for arrangements with their own internal operations as well other entities they must work with to communicate BES operations. There is nothing to stop an entity from making the document communication protocols effective internally.</b></p> <p>M3 &amp; M4 impose more requirements on the registered entity than are required in R3 &amp; R4 respectively. For example R3 requires the implementation of a process, the measure looks for the results of the process, and the measure should be measuring the implementation not the result of the process.</p> <p><b>Response: The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. 		<p>protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</p> <p>M3 and M4 have been eliminated.</p>
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
<p>ERCOT</p>		<p>As discussed above, the proposed standard is not consistent with the reliability issue/concern raised in the blackout report, and, therefore, in Order 693, given that the 693 discussion was relative to the concern raised in the blackout report. The mandates in the proposed standard do not provide reliability value. COM-002 and other standards that address situations that pose actual reliability risks already requires appropriate entities to communicate with each other during emergencies, which is the real focus of the blackout report and Order 693. In those circumstances 3-part communications are required in a clear, concise and definitive manner. This effectively ensures that the recipient understands the communication, which practically obviates the need for specific, mandatory terminology, practices and protocols. Accordingly, for these reasons and the reasons discussed above, the need for COM-003 is suspect. In fact, it is arguable that it provides marginal to nil reliability value, but yet presents potential liability exposure to the relevant functional entities. The SDT should consider another approach to addressing the concerns in the blackout report and Order 693. Specifically, any responsive effort should focus on ensuring communications occur relative to specific system conditions that truly reflect reliability concerns, and any such communications should be appropriately distributed to ensure dissemination is only to appropriate entities that may be impacted and/or can assist in remedying the situation. In the alternative, the proposed standard should be revised consistent with these comments, and in accordance with the principle that a reliability standard should establish the what, not the how.</p> <p>Response: The SDT has addressed this comment in the last two postings. These</p>

Organization	Yes or No	Question 5 Comment
		<p>documents and the originating agencies that developed them actually sanction the development of COM-003-1. Additionally the ERO’s governing bodies (the Board of Trustees and the Standards Committee) have directed the OPCPSDT to proceed with COM-003-1. The SDT does not have the authority or the inclination to rescind the standard.</p> <p>In addition, the ERCOT offers the following specific comments. As noted above, as drafted the term Operating Instruction is overly broad relative to the scope intended by FERC and the Blackout Report, and, in fact, could include purely market related discussions that have no reliability impact. Yet, the proposed standard requires 3-part communication for all such interactions. There is no reliability value to 3-part communications for such interactions. Accordingly, this requirement should be removed.</p> <p><b>Response: The SDT believes the definition is not broad and that the Applicability section precludes market related discussions as the definition describes a command from a System Operator.</b></p> <p>The proposed standard also requires entities issuing an all-call, or similar multiple party communication, to receive confirmation, electronic or verbal, from at least one of the recipients that the message was received. The nature of all calls provides a structural means to distribute messages to a host of recipients. The mediums used for this purpose ensure that the messages are delivered. There is no need to require confirmation as proposed in the standard. Furthermore, there is little reliability benefit. Accordingly, for these types of communications confirmation should not be required.</p> <p><b>Response: All call messages feature diverse media and technology. The entity has the flexibility to develop and account for those differences with system functionality within its documented communication protocols described in COM-003-1, draft 3.</b></p> <p>Finally, 1.9 requires recipients of multi-party communications to ask for clarification if</p>

Organization	Yes or No	Question 5 Comment
		<p>they do not understand the message. It is difficult to understand how compliance with this requirement will be reviewed, and what value it will have. For example, if an entity never asks for clarification but an audit determines the entity failed to follow a directive, the CEA staff may question whether the entity complied with the obligation to request clarification, but the entity may believe that clarification was not necessary and failure to follow the instruction was due to some other reason. As with other aspects of the proposed standard, this lends itself to subjective disagreements in practice. Furthermore, it is unnecessary, because an entity that does not understand a directive will ask for clarification.</p> <p><b>Response: The SDT believes that whether the receiving entity did or did not request clarification the CEA at worst case would cite it as a deficiency found external to the process. If the entity identified, assessed and corrected the deficiency there would generally not be a finding of non compliance.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
The Empire District Electric Company		As stated drop requirements R3 and R4 as they seem redundant with the overall NERC program of reporting and mitigation plan approval.
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. Organization	Yes or No	Question 5 Comment
<p>RSAW has been updated to reflect this change.</p>		
<p>FirstEnergy</p>		<p>i,§ To have clear communication protocols NERC must develop clear and concise standards that include non-prescriptive language that provides entities with the latitude to operate their systems as they are accustomed to while requiring a heightened awareness of the importance of clear communications while operating those systems. From discussions in various industry forums, there seems to be much confusion as to the intent of COM-003 versus COM-002. For instance, is a Reliability Directive as defined by the Project 2006-06 team in COM-002-3 a subset of an Operating Instruction as defined in COM-003-1? If so, then we recommend the retirement of COM-002-3 as a standard since COM-003-1 covers all communications. One standard that requires 3-part communication is sufficient and no reliability gap would exist if COM-002-3 is retired. FE and the industry want to contribute to effective reliability and believe tight standardized communication protocols are critical. But if confusion and needlessly burdensome requirements result from the development of these COM standards, we believe this could have an adverse affect on reliability. In COM-002-3, requiring an operator to pause to determine if he or she should utter the phrase “this is a Reliability Directive” can escalate an emergency situation and not help alleviate it. Regardless of the situation, when the Operator issues a command it must be carried out by the receiver with confirmation that the receiver has understood what needs to be done and when it needs to be done. COM-003-1, with some wording adjustments, accomplishes this reliability goal. We support COM-003-1 Draft 3, on its own without COM-002-3, along with some adjustment to requirement language to relieve prescriptiveness and needless language while adding some clearer guidance on the internal control requirements detailed in R3 and R4.</p> <p><b>Response: The SDT does not disagree with your comments, but it is beyond the scope of the SAR for this project.</b></p> <p>ï,§ The measures as proposed simply reiterate the requirement and provide no useful information. We suggest they either be removed or be elaborated to include</p>

Organization	Yes or No	Question 5 Comment
		<p>useful examples of evidence and possibly incorporate some of the information found in the RSAW.</p> <p><b>Response: The SDT believes the Measures are suitable for each requirement and adequately support the requirements. Requirement R1 and R2 call for the entity's documented communication protocols.</b></p> <p><b>The SDT believes the language changes to draft 4 will address some of your concerns.</b></p> <p><b>"R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:"</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. <p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Indiana Municipal Power Agency</p>		<p>IMPA believes the best quality of evidence for proving compliance to most of the sub-requirements under R1 and for requirement 2.1 will be voice recordings. IMPA agrees with keeping this evidence for 90 days, but to keep these voice recordings for potential 6 years (back to our last audit date) will be very costly when it comes to storage. We understand that other evidence can be used to show compliance back to our last audit date, but what other quality evidence besides voice recordings will</p>

Organization	Yes or No	Question 5 Comment
		<p>be acceptable to prove compliance to these requirements? IMPA recommends making the data retention of this standard just 90 days regardless of the last audit date. Performance should be focused on the short past time of 90 days and not what the entity did five or six years ago, which is irrelevant when one is forward looking or wanting to improve.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT set the standard retention period for the most recent 90 days. The entity would always have its documented communication protocols required for M1 and M2. Training records, performance evaluations, disciplinary records, employee counseling records that address deficiencies and corrections would also provide evidence that would substantiate corrections.</b></p>		
<p>Dominion</p>		<p>Implementation plan - page 1; Revisions or Retirements to Approved Standard - Proposed Replacement Requirement(s), states; "COM-003-1 Requirement R1 Part 1.1.1 R1. Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall have documented communications protocols that incorporate the following:" Distribution Provider and Generator Operator needs to be removed, also after communications protocols, 'for Operating Instructions' needs to be added (to match the R1 Requirement, if accepted as written).</p> <p><b>Response: Thank you for pointing out the errors. The SDT has corrected them.</b></p> <p>Mapping document, Page 1; Comments, states: "R1 Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, Transmission Operator, and Transmission Owner shall have documented communications protocols that incorporate the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ]" Distribution Provider and Generator Operator needs to be removed. Also after communications protocols, 'for Operating Instructions' needs to be added (to match the R1 Requirement, if accepted as written).</p> <p><b>Response: Thank you for pointing out the errors. The SDT has corrected them.</b></p>

Organization	Yes or No	Question 5 Comment
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
<p>Associated Electric Cooperative Inc - JRO00088</p>		<p>In general, AECI believes that NERC and FERC should completely reevaluate the necessity of COM-003-1. COM-003 still appears to overreach the cited 2003 blackout recommendation #26, whereas industry-approved changes to COM-002 do meet the expectation, pertaining to verbal communication protocols: "Tighten communications protocols, especially for communications during alerts and emergencies..."</p> <p><b>Response: The SDT has previously addressed this same comment in previous postings. The SDT disagrees with the comments and believes COM-003-1 will properly tighten communication protocols.</b></p> <p>However AECI also offers the following observations:</p> <p>1) Recommendation #26 is hardly top of the list. (Lessons-learned is that future industry recommendations really must be careful in what they recommend for improvements, because those can and will be extrapolated into future requirements.)</p> <p><b>Response: The SDT respectfully disagrees.</b></p> <p>2) Recommendation #26 "especially" highlights alerts and emergencies, not normal operational communications, yet the scope of COM-003 pertains to any normal communication that would alter the state of anything BES, including mundane operational conditions that have questionable effect upon the BES reliability.</p> <p><b>Response: The SDT believes there is nothing mundane about actions to reconfigure the BES. Miscommunication during normal BES operations can create an unintended risk to reliability.</b></p> <p>3) In AECI's opinion, there is greater risk of non-compliance with this standard for the industry, than non-compliance with the NERC BOT in their insistence to move it forward. The EEI suggested wording, recited below, helps to mitigate this risk, but still at cost of additional and often unnecessary communication overhead. Specific to the wording of COM-003-1 draft, AECI does believe the direction of EEI's wording,</p>

Organization	Yes or No	Question 5 Comment
		<p>submitted in comment response to this draft, could help the industry with mitigating some risk of non-compliance to the proposed standard. In lieu of our being able to view EEI's posted comments, we recite them below::</p> <p>=====Begin the EEI draft as circulated in emails earlier this week=====</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient.</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Operating Communication.</p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or</li> <li>o Reissue the Operating Communication to resolve any misunderstandings.</li> </ul> <p>R4 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R1 or R3 and its sub requirements shall be found, provided that the Balancing Authority, Reliability Coordinator, and Transmission Operator has implemented a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 and R3 that:</p> <ul style="list-style-type: none"> <li>4.1. Identifies potential deficiencies,</li> <li>4.2. Assesses the deficiencies found,</li> <li>4.3. Corrects the deficiencies, and</li> <li>4.4. Evaluates the process based on deficiencies found external to Part 3.1 and either</li> </ul>

Organization	Yes or No	Question 5 Comment
		<p>â™™ implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or                      â™™ demonstrates that no modification to the process is necessary to address the deficiencies.</p> <p>R5 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R2 and its subrequirements shall be found, no violation of R2 and its subrequirements shall be found, provided that the Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that:</p> <p>5.1. Identifies potential deficiencies,                      5.2 Assesses the deficiencies found,                      5.3. Corrects the deficiencies, and                      5.4. Evaluates the process based on deficiencies found external to Part 3.1 and either</p> <p>râ™™ implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or                      â™™ demonstrates that no modification to the process is necessary to address the deficiencies.</p> <p>====End the EEI draft as circulated in emails earlier this week=====</p> <p><b>Response: The SDT believes many elements of the EEI draft mirror COM-003-1, draft3. Draft 3 has more parts that not only deal with three part communication but also deal with communication protocols that provide additional clarity and uniformity.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		

Organization	Yes or No	Question 5 Comment
APPA, LPPC and TAPS		<p>In response to comments received during the last comment period and in an effort to draft a standard that focuses on risk control rather than zero tolerance metrics, the drafting team has taken a new approach to COM-003-1. This version requires responsible entities to establish communication protocols and then implement a process for identifying, assessing, and correcting deficiencies with adherence to those communication protocols. This new standard is drafted such that the entity is to ensure that its process is working, rather than requiring the demonstration of absolute compliance with communication protocols at all times and identifying each deficiency as a possible violation. In addition, this version of the standard was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). The parallel development of the standard and the RSAW provided the opportunity for the drafting team to consider the compliance implications of the language in the standard and to offer input into the language of the RSAW. APPA staff, LPPC and TAPS have reviewed the proposed standard and have not identified any material concerns and support the drafting team's new approach. We of course urge the drafting team to give full consideration to all substantive comments on the proposed standard and RSAW. We do anticipate that commenters will identify editorial changes that will clarify the proposed standard. Such changes are unlikely to affect our support for the standard.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The comments accurately frame the intent of the standard changes.</b></p>		
PPL Corporation NERC Registered Affiliates		<p>It appears the SDT may be basing the perceived need for communication protocols during normal operations on a misunderstanding of the findings in an EPRI report. The SDT responded to multiple comments questioning the need for communication requirements during normal operations by quoting a paper (Bilke, T., Cause and prevention of human error in electric utility operations, Colorado State University, 1998) that cited an EPRI study. The SDT stated, “[w]e believe the more relevant and significant conclusion to be that, of 400 switching mishaps, 19% were caused [by] communication failures.” It is concerning that the SDT may be basing their conclusions</p>

Organization	Yes or No	Question 5 Comment
		<p>on erroneous data. The EPRI report in fact indicates only 14.5% were “cited” as “faulty communication”, not necessarily “due to” or “caused” as the SDT response would indicate. Nearly half of those 58 (14.5%) of the 399 incidents reviewed resulted from most commonly not communicating “critical information”, i.e. failing to “call in” or communicate in the first place. The EPRI report reads as follows: “Faulty communications were cited [emphasis on “cited”] in 58 (14.5%) of the 399 incidents reviewed. The most common kind of communication error was failure to communicate critical information, which occurred in 22 (39%) of the 58 cases. Examples are: failure to conduct a thorough pre-job briefing, failure to call in before operating a switch, failure to communicate about equipment problems, or failure to question some unusual aspect of an order. “Mandating “how” communications occur will not address the failure of “what” critical information needs to be communicated. Furthermore, it is concerning that the SDT “believes that the potential for risk” necessitates requirements applicable to all operating communications as stated in their response to comments during draft 2. It is impossible to eliminate the potential for risk in all circumstances. What is important is that the SDT assess risk to the BES as a result of certain actions or inactions and that the Reliability Standard reduce that risk in an efficient and cost effective manner.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT cited those figures from a commenter who appended an Industry white paper (by the same author) to the draft comment form. The SDT responded after reading it. Even if the mishap rate for communication issues is 14.5% that is a significant impact on BES reliability that will be addressed by COM-003-1.</b></p>		
<p>The United Illuminating Company</p>		<p>It is not clear whether the protocols in COM-003 apply to Reliability Directives in Com-002. It can be reasoned that a Reliability Directive is a form of Operating Instruction. A double jeopardy situation is created.</p> <p><b>Response: the SDT included exclusionary language in draft 2 of COM-003-1 to separate the two terms. The SDT presented a Webinar that focused on the applicability and the relationship between the two terms and standards. The moment an RC declares a “Reliability Directive” the requirements of COM-002-3 are</b></p>

Organization	Yes or No	Question 5 Comment
		<p>applicable. The functional entity would at that time be subject to a zero tolerance set of requirements to be compliant with the protocols of COM-002-3. When the Emergency or ARI ceases COM-003-1 is applicable.</p> <p>Also the COM-003 R3 and R4 requirements would be inappropriately applied to Reliability Directives. UI believes there is a difference between Reliability Directives and Operating Instructions and the difference should be maintained.</p> <p>A Directive occurs during an Emergency and has a higher risk than an Operating Instruction. Directives should be limited in occurrences and therefore is not conducive to sampling or error correction as opposed to Operating Instructions which occur multiple times in a day and are numerous.</p> <p><b>Response: If R3 and R4 are applied to “Reliability Directives” because the entity created a documented communication protocol to manage the relationship between the two standards and specified circumstances when each would be used, consistent with the two standards, that would be acceptable.</b></p> <p><b>Is your use of the capitalized word “Directive” to be understood as “Reliability Directive?” There is no glossary term “Directive” nor is it referenced in a standard.</b></p> <p><b>It would also be acceptable to include Operating Instructions that happened to be a Reliability Directive in sampling for R3 and R4. For example, if an RC omitted three part communication as specified in COM-002-3 during a Reliability Directive with another functional entity they would likely be found to be non compliant under COM-002-3. There would be no double jeopardy with COM-003-1 because the same incident would be a deficiency that would be addressed (identify, assess, correct) by the process in R3.</b></p> <p>The data retention requirement of 90 days is reasonable. But UI is concerned with the approach to monitoring requiring an inventory of every conversation that occurred in that 90 day period to identify it as an Operating Instruction.</p> <p><b>Response: The entity can select its own sample size to identify deficiencies related</b></p>

Organization	Yes or No	Question 5 Comment
		<p>to Operating Instructions.</p> <p>Finally UI supports EEI's comment.</p> <p><b>Response: The SDT believes many elements of the EEI draft mirror COM-003-1, draft3. Draft 3 has more parts that not only deal with three part communication but also deal with communication protocols that provide additional clarity and uniformity.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
Lincoln Electric System		<p>LES believes additional clarification is needed to more clearly delineate who is considered to be the Generator Operator (the power plant operator vs. system operator) responsible for compliance with COM-003-1. As currently drafted, the Generator Operator, as the recipient of Operating Instruction, must have and utilize documented communication protocols per R2. In the event generation re-dispatch were to be requested, is it the power plant operator performing the task or the system operator requesting the execution of the task responsible for using the documented communication protocols?</p>
<p><b>Response: The OPCSDT thanks you for your comments. The definition specifies a System Operator. R1 and R2 have added language to specify Operating Instructions between functional entities. The entity may reflect what communication protocols would be applicable internally.</b></p>		
MidAmerican Energy		<p>MidAmerican would recommend the following changes to R3 as a primary consideration to allow COM-003-1 to move forward. COM-003 is only acceptable as a non-zero defect standard.</p> <p>R3 should be rewritten as follows:</p> <p>Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement R1 in a manner that identifies, assesses, and corrects deficiencies if any. Where the entity is identifying, assessing, and correcting deficiencies, the entity is</p>

Organization	Yes or No	Question 5 Comment
		<p>satisfactorily performing the requirement.</p> <p>Make similar changes to R4.</p> <p><b>Response: The SDT believes the language changes to draft 4 will address your concern.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p> <p>R3 as posted requires implementing a deficiency process, which puts the focus of R3 on a deficiency process and not on implementing R1. The proposed language changes focus the requirement to implement R1 and does not require a specific process for deficiencies. This is consistent with CIP standards Version 5 draft 3 and Generally Accepted Government Auditing standard strategies (the yellow book or GAGAS). The proposed second sentence provides clarity on satisfactory performance expectations in the requirement.</p> <p><b>Response: The process is similar, but the need to have protocols developed by the entity necessitates the difference in language with CIP v.5.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		

Organization	Yes or No	Question 5 Comment
Georgia System Operations		<p>Modify R1 accordingly...</p> <p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have and follow documented communication protocols for Operating Instructions that incorporate the following:</p> <p>R3 &amp; R4 Delete R3 and R4 and M3 and M4 and associated VRFs and VSLs.</p> <p>Although R1 and R2 provide for better communications, R3 &amp; R4...</p> <ul style="list-style-type: none"> <li>o Have little or no impact to the protection or reliable operation of the BES in the event that no responsible entity performed the requirement</li> <li>o Have little, if any, value as a reliability requirement Are requirements for monitoring and enforcing Reliability Standards and do not provide for Reliable Operation...</li> <li>o Including without limiting the foregoing, requirements for the operation of existing Facilities</li> <li>o Including cyber security protection, and</li> <li>o Including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation</li> </ul> <p>M1 should read...</p> <p>o M1. The COM-003-1 RSAW has been updated to reflect this change.</b></p>		
ITC Holdings		<p>Nowhere in the Blackout Report, Order 693, nor the SAR does it indicate that communication protocols used during normal and emergency operations need to be identical - only that there are standardized communications for normal operations and standardized protocols for emergency communications.</p> <p><b>Response: The SDT believes all of those documents do support the SDT’s requirements in COM-003-1 for both normal and emergency operations.</b></p> <p>The term Operating Instruction as included in the requirements of the draft standard does not take into consideration that communications during alert or emergency</p>

Organization	Yes or No	Question 5 Comment
		<p>conditions have a heightened need to be effective (Blackout Report Recommendation 26). A much better approach is to rely on operating personnel to determine when an Alert or Emergency condition exists to change from standardized communication used for normal operation to a different standard protocol for emergency operation. Operating personnel have substantial training requirements, including explicit requirements for training on emergency operations, which provide the basis for allowing operating personnel to make this determination. A standard phrase to identify that protocols for Alert or Emergency conditions are to be used (such as "I am issuing a Reliability Directive") would trigger the need to switch from protocols for normal operation to protocols for emergency conditions. This approach also addresses concerns that complacency will set in if identical protocols are used for normal and emergency communications. Active listening is much more likely when using a protocol that is used only for emergency conditions which occur much less frequently than normal operations.</p> <p><b>Response: The SDT believes that the same communication protocols used during normal operations enable a focused transition to communications in an emergency. The comments on page 161 of the 2003 Blackout Report support this.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Pepco Holdings Inc		<p>Operating Instructions are issued in real time and are expected to be implemented promptly. Including the "time zone" in oral communications is not necessary. COM-003 and COM-002 need to fully coordinate.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT contends that the time zone reference must be used when an actual clock time (e.g. 2255 or 0800) is referenced when the communicating functional entities are issuing or receiving Operating Instructions across two different time zones.</b></p>		
Public Service Enterprise Group		<p>PSEG fully supports the use of 3-part communications. In our previous comments, we stated "This standard (COM-003-1) should be combined with COM-002-3 and issued</p>

Organization	Yes or No	Question 5 Comment
		<p>as one standard to require ONE 3-part communications protocol for both Reliability Directives and non-Reliability Directives.” We reiterate that request and believe that the SDTs should be combined into a single SDT and develop one standard. COM-002-3 addresses Reliability Directive communications, while COM-003-1 addresses Operating Instructions communications. The same Registered Entities are subject to both standards. Both require 3-part communications (a “protocol”), but COM-003-1 has more extensive requirements.</p> <p>Having two standards is harmful for these reasons:</p> <ul style="list-style-type: none"> <li>o The lack of a common protocol would result in communications confusion among these entities for this reason: some Operating Instructions are Reliability Directives, but not all Reliability Directives are Operating Instructions.</li> <li>o Finally, without a common communications protocol, entities would need to be concerned about what protocol they are using for compliance purposes; this would hinder the efficiency of communications and therefore reliability.</li> </ul> <p>The single SDT should be charged with the following tasks:</p> <ol style="list-style-type: none"> <li>1. Both draft standards have pluses and minuses listed below, and the SDT shall consider these and take the best from each to develop a single standard with a common protocol.             <ol style="list-style-type: none"> <li>a. Both standards require 3-part communications (a “protocol”), but COM-003-1 has more extensive requirements, such as the use of alpha-numeric clarifiers and a 24-hour clock format. [PSEG prefers the COM-002-1 simplified protocol.]</li> <li>b. Reliability Directive communications need to be identified as such by the sender as part of its protocol; Operating Instructions do not contain a similar requirement. [PSEG prefers that both Reliability Directives and Operating Instructions be identified by the sender.]</li> <li>c. The protocol for Operating Instructions explicitly addresses both written and oral communications; the protocol for Reliability Directives is not specific. [If identified as</li> </ol> </li> </ol>

Organization	Yes or No	Question 5 Comment
		<p>such by the sender, PSEG does not object to written and oral communications being addressed in a single standard; however, only oral communications should require the use of 3-part communications.]</p> <p>d. The protocol for Operating Instructions exempts “one-way burst messaging” from a requirement for 3-part communications with one practical exception - the receivers must request clarification from the sender if the communication is not understood; the protocol for Reliability Directives does not address explicitly exempt such communications, implying that 3-part communications is required for them. [PSEG prefers the “one-way burst” language in COM-003-1 for both Reliability Directives and Operating Instructions.]</p> <p>e. The Operating Instructions protocol must be separately documented by each entity; no such documentation is required for Reliability Directives. If documentation is required in a posted standard developed by the SDT, the SDT shall explain the reliability benefits of documentation and why the protocols in the standard, which are themselves communications performance requirements, are insufficient as “documentation.” [PSEG prefers no documentation of protocols since they are performance requirements in the standard.]</p> <p><b>Response: The SDT does not disagree with PSEG that the standards should be combined. The SDT has collaborated and cooperated with the RCSdT. The OPCPSDT believes that both standards can coexist and be mutually supportive.</b></p> <p>2. COM-003-1 requires a process for identifying and correcting deficiencies.” COM-002-3 does not. [Instead of the COM-003-1 language, PSEG prefers a requirement that adopts the CIP version 5 language: “R#. Each applicable entity shall have a process that identifies, assesses, and corrects deficiencies in the use of communication protocol.”]</p> <p><b>Response: The SDT believes the language changes to draft 4 will address some of your concerns.</b></p>

Organization	Yes or No	Question 5 Comment
		<p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p> <p><b>3. The SDT shall describe the potential measure or criteria for success for determining the successful implementation of the single standard.</b></p> <p><b>Response: The SDT believes it does that presently.</b></p> <p><b>4. “Generator Operator” is included the Glossary definition of “System Operator,” which in turn is used in the Operating Instruction definition. “System Operator” shall be replaced by “Balancing Authority, Reliability Coordinator, or Transmission Operator” in the Operating Instruction definition. Generator Operators receive Operating Instructions but do not issue them. See also Project 2010-16: Definition of System Operator - the goal of this project is to remove Generator Operator from the definition of System Operator.</b></p> <p><b>Response: The SDT has changed the language of the definition to read:</b></p> <p><b>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status,</b></p>

Organization	Yes or No	Question 5 Comment
		<p>output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. <i>Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</i>"</p> <p>The new language is italicized.</p> <p>This change is consistent with your recommendation.</p> <p>(The Standards Committee should consider increasing the priority of this project so that this problem is addressed systematically in the System Operator definition.)</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Puget Sound Energy Inc.</p>		<p>Puget Sound Energy appreciates the opportunity to submit comments on the proposed standard, as well as the work of the standards drafting team in developing a workable approach to the implementation of operating communication protocols. The purpose statement in the proposed standard uses the term "System Operators". As defined in the NERC Glossary, System Operators include individuals who work for Balancing Authorities, Transmission Operators, Generator Operators and Reliability Coordinators. However, the standard also applies to Distribution Providers, an entity not covered by the term System Operator. As a result, I recommend that the standard drafting team expand the purpose statement to accurately reflect the applicability of the standard. Perhaps the statement could be revised to begin "To provide individuals who may issue or receive Operating Instructions with uniform communications protocols..."</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Some Distribution Providers do own and operate BES Facilities and Elements and a significant number have load shedding obligations making them subject to Operating Instructions. The SDT has changed the language of the definition to read:</b></p> <p><i>"Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential</i></p>		

Organization	Yes or No	Question 5 Comment
<p><i>options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i>                      The new language is italicized.                      This change is consistent with your recommendation. Note the reference to: “<i>where action must be taken by the recipient.</i>”</p>		
<p>City of Austin dba Austin Energy</p>		<p>Regarding Q2, Austin Energy (AE) believes that parts 1.1 through 1.5 of R1 are unnecessary. Three-part communication, as described in parts 1.6 through 1.9, is the preferred method for ensuring that both parties understand an Operating Instruction. It provides a sufficient mechanism for clear, concise and accurate communication. AE believes that creating a protocol that requires System Operators to essentially relearn the way to speak (specifically using alpha-numeric identifiers) will only create confusion as operators try to follow protocol and catch/correct themselves. Additionally, the constant use of alpha-numeric identifiers in transmission switching orders that contain many, many steps will become burdensome. AE believes that its current use of three-part communication during these switching orders is more effective.</p> <p><b>Response: The SDT agrees with your use of three part communication , but also believes other protocols that contribute to clarifying communications should be part of a comprehensive communication standard.</b></p> <p>Regarding Q4, the phrase “Parts 2.1 to 2.3 (3)” in the Severe VSL for R2 should be “Parts 2.1 and 2.2”</p> <p><b>Response: Thank you for pointing out the error. The SDT has corrected it.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>South Carolina Electric and Gas</p>		<p>Regarding R1.4, drafting team should clarify whether "interface" means interfaces between neighboring entities or between functional entities.</p> <p><b>Response: The SDT has added “between functional entities” to R1 and R2 to encompass Part 1.4.</b></p> <p>Regarding R1.8, does the drafting team have an appropriate response time-frame for</p>

Organization	Yes or No	Question 5 Comment
		<p>the confirmation to occur from recipients?</p> <p><b>Response: The SDT believes that would be too prescriptive. The entities can address that in their documented communication protocols.</b></p> <p>Regarding R1.9 and R2.2, these requirements seem unnecessary and unauditible. An audit team can evaluate whether the documented communications protocol contains language to address these requirements; however, evaluating the actual execution would be subjective. It is not possible to determine whether a recipient understood a message clearly and whether clarification was required.</p> <p><b>Response: The industry asked the OPCPSDT to address all calls in several postings of previous drafts. The SDT believes it is auditible.</b></p> <p>Further, it will be difficult for entities to identify deficiencies with this requirement, as required by R3, for the same reasons.</p> <p><b>Response: The SDT disagrees. Most entities to varying degrees are monitoring the performance of operators. There are operating guidelines developed by industry that can provide guidance and develop best practices that support reliability.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
ReliabilityFirst		<p>ReliabilityFirst thanks the SDT for their work but has a question related to the Implementation Plan. The SDT indicated in the consideration of comments report (from the draft 2 posting) the standard’s six calendar month implementation time frame has been extended 12 calendar months to provide an adequate amount of time for training and implementation. As noted above, there is a conflict since the draft standard does not require implementation of the protocols. ReliabilityFirst believes absent any implementation requirement, the six calendar month implementation time frame is adequate for an entity to have documented communication protocols for Operating Instructions.</p>

Organization	Yes or No	Question 5 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT agrees, but wanted to give the industry adequate time to implement the entire standard. Previous commenters stated that six months was not long enough.</b></p>		
CPS Energy		<p>Requirement R1.5 should be an optional step to assist in resolving any misunderstanding found in requirement R1.6. Alpha-numeric clarifiers, Requirement R1.5, in every three part communication of an operating instruction is an activity that adds little if anything to promote the protection of the BES and can hinder/distract from the reliable operation of the BES.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes identifying and accurately communicating nomenclature of the Facilities and Elements prevents mishaps that compromise the BES.</b></p>		
Manitoba Hydro		<p>Section C. Measures: The measures are unclear as to what exactly the requirement to ‘provide’ entails? Would this be upon request or periodically? Please clarify.</p> <p><b>Response: Normally, an entity would provide the results of its process during an audit, but it could be part of an investigation or a spot check.</b></p> <p>Section D. Compliance: Compliance Enforcement Authority is defined as CEA and then the full term Compliance Enforcement Authority is continually used throughout. The acronym or words should be used consistently.</p> <p><b>Response: The SDT acknowledges your comments.</b></p> <p>Section D. Compliance: There is no specification for R1 and R2 retention.</p> <p><b>Response: An entity would have to have documented communication protocols in force in perpetuity. Many entities have those in their existing operations procedure manuals.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Wisconsin Electric Power Co.		<p>The definition of Operating Instruction introduces a “Command” as opposed to COM-</p>

Organization	Yes or No	Question 5 Comment
		<p>002 that defines and requires identification of a “Reliability Directive”, yet there is no obligation to follow a Command nor to identify the communication as containing a Command. Fatal flaw with the proposed definition.</p> <p><b>Response: The SDT believes when a definition stipulates a command that its context within a requirement means that a command must be obeyed.</b></p> <p><b>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.</b></p> <p><b>Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</b></p> <p>The requirement to have a protocol is likely an ok approach with an objective to achieve well understood communications and without the laundry list of things that must be in the document. Then given the RC-BA-TOP have stringent training requirements in PER-005, duplicating the requirements for good training and personnel proficiency evaluation lends itself to mandate a how to accomplish this for a specific task. In addition, the type of oversight implied in COM-003 is overreaching by NERC.</p> <p><b>Response: The parts of the requirement are stipulated in order to ensure entities have a frame to build protocols that address communications in a uniform and consistent manner.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Public Service Company of New Mexico</p>		<p>The issuance of a draft RSAW in combination with the draft standard helped clarify the audit approach for some of the more subjective requirements such as R3 and R4 and how instances of deficiency will not be considered violations of the standard.</p>

Organization	Yes or No	Question 5 Comment
		<p>PNMR, Inc. and its two utility subsidiaries operating in TRE, SPP and WECC would like to encourage other SDTs to follow the lead of this SDT with respect to understanding that the RSAW is a critical piece of the Standards Development process.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT agrees with your comments.</b></p>		
<p>Liberty Electric Power, LLC</p>		<p>The need for a prescriptive standard remains in doubt. The SDT has responded to comments questioning this need with a cite of a single study. The applicability of this study to GOPs is unclear.</p> <p><b>Response: The SDT believes it has dramatically reduced the prescriptive nature of draft 2. The GOP receives Operating Instructions so it is an applicable entity.</b></p> <p>We do not know the details, and question the number of cited miscommunications which involved GOPs. Further, we are unclear as to the number of miscommunications which involved two entities, as opposed to an entity giving direction to their own field operator. Such single-entity communications would not be covered by the proposed standard. Lowering miscommunications is an admirable goal, and again the SDT deserves commendation for their willingness to rethink the direction of the proposed standard. However, the standard, if needed, should be limited to requiring an entity to have communications procedures, and to reinforce those procedures on a periodic basis. The content of those procedures should properly be left to the best judgement of the individual entity.</p> <p><b>Response: The SDT appreciates your encouragement and believes there is a need for a collective set of protocols for entities to communicate on the BES which has become and continues to become more tightly interwoven.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>MRO NSRF</p>		<p>The NSRF would like to thank the SDT for allowing entities to identify, assess, and correct deficiencies per R3 and R4. The proposed COM-003-1 uses the verb of</p>

Organization	Yes or No	Question 5 Comment
		<p>“issuing” in R1.1, 1.2, 1.3, 1.4, 1.5, 1.6, and 1.8, and uses the verb of “receiving” in R1.7, 1.9, 2.1, and 2.2. Since these are real-time actions and FERC Order 693, section 532 states in part, “This will eliminate ambiguities in communications during normal, alert, and emergency conditions”, The NSRF recommends that the proposed definition of Operating Instruction have the words “in Real-time” at the end of the definition. The definition of System Operator also uses the term in real time in its definition.</p> <p><b>Response: The SDT believes some “Operating Instructions” can be issued outside as well as in the Real Time horizon.</b></p> <p>The SDT has changed the language of the definition to read:  <i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p> <p>The new language is italicized.  This change is consistent with your recommendation.</p> <p>R1.3 Some entities already have an agreed upon time zone standard such as MISO. MISO operates on Eastern Standard Time (EST) and has a business practice manual stating that. Suggest the requirement be modified to state: “that unless the operating entities already have an agreed upon operating time zone” then operations occurring across time zone boundaries should include a time-zone designation.</p> <p><b>Response: The SDT believes an entity can accommodate these type of arrangements within its documented communication protocols.</b></p> <p>R1.5 Naming conventions for terminal equipment can be long. For example, switch,</p>

Organization	Yes or No	Question 5 Comment
		<p>P2ZDQEN. In a switching order, this switch name may be mentioned several times and with each communication there is a required echo. The Alpha-numeric requirement is a one-size fits all solution and is not needed in all situations. Recommend the following as an alternative to the above language; The risk of unclear communication is addressed by R1.6 and R1.7. R1.5 should be reworded to require alpha-numeric clarifiers when reissuing an Operating Instruction to resolve a misunderstanding (per R1.6).</p> <p><b>Response: The SDT believes the use of proper clarifiers leaves no doubt as to the content in an Operating Instruction. This would be especially true with switch Papa – two - Zulu-Delta-Quebec-Echo-November.</b></p> <p>R1.4 The SDT has not made the case for the reliability benefit of the requirement for standardized names. Again, this requirement is being retired from TOP-002. “TOP-002-2a Requirement R18 on the basis that “This requirement adds no reliability benefit. Entities have existing processes that handle this issue.” This requirement creates a compliance process where one is not needed. Each entity will be required to document and maintain each facility name and who is the responsible owner for the facility name. Suggest this requirement be removed. A list would be required for “every” element of the BES between entities to assure that the proper names are used in all Operating Instructions. The NSRF does not see the reliability benefit of using this naming convention since TOP-002 is already enforceable.</p> <p><b>Response: TOP-002, R18 is being eliminated by the RTOSDT. The OPCPSDT believes that an entity’ familiarity with its neighbor’s Facilities and Elements increases situational awareness and reduces response times.</b></p> <p>R.1.8 and R.1.9, The NSRF feels this would create an unnecessary burden to document routine notifications that rely on a burst messaging system and do not have any effect on the Bulk Power System. A one-way burst messaging system is typically used to quickly inform/advise. It is designed as one-way to provide efficiency and should not be used for Operating Instructions. It would be much</p>

Organization	Yes or No	Question 5 Comment
		<p>simpler to state that, “for the communications of Operating Instructions (regardless of the technology employed), the message must be repeated or confirmed by the recipient, and validated by the sender.” This approach focuses on “Operating Instructions” and not the technology employed. The requirement as currently written does not allow for exceptions due to routine or informative communications. (Example: NERC Alerts to the Industry based are based on severity level and do not always require receipt of message by the Registered Entity). R1.8 states in part, “When issuing an oral Operating Instruction through a one-way burst messaging system...”. The NSRF does not understand how an oral Operating Instruction can be made through a one-way messaging system? Unless, the Operating Instruction was captured on an answering machine or on an un-listened to voice mail message system. The NSRF views this as an electronic source to electronic source, as explained in the “note to auditor” within the proposed RSAW states, “Communication that is generated by an electronic source to another electronic source is not to be included as “oral or written Operating Instruction”. If the NSRF is correctly assuming this, then no verbal or electronic confirmation is required. Please clarify.</p> <p><b>Response: Many entities use all call for “Operating Instructions”. Protocols would not apply to casual notifications and helpful information. The fact that in some cases it would be difficult, if not detrimental, to wait for responses from multiple parties. Some all call systems are an automated telephone call that is “shot gunned” to receivers. Your comments about electronic to electronic (machine to machine) communication not being addressed in this standard are correct. COM-003-1 deals with human to human communication.</b></p> <p>R2. As stated in the Purpose statement, “To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.” The NSRF concurs with this statement but questions why “all” DPs and GOPs are included in COM-003-1, Applicability section? The NSRF recommends that the Applicability section have</p>

Organization	Yes or No	Question 5 Comment
		<p>4.1.2 updated to read “For Distribution Providers, and Generator Operators that operate BES Elements shall have documented communication protocols for Operating Instructions that incorporate the following”.</p> <p><b>Response: GOPs and DPs are receivers of Operating Instructions and are applicable entities. If a DP or GOP do not have BES equipment or BES obligations such as load shedding the requirement would not apply.</b></p> <p>On page 7, under Severe VSL it states: “The responsible entity did not include Parts 2.1 to 2.3 (3) of Requirement R2, in their documented communication protocols”, part 2.3 does not exist; please clarify if this is to mean “part 2.2”?</p> <p><b>Response: Thank you for pointing this out. The SDT has corrected the error.</b></p> <p>The NSRF recommends R3 to be updated to state: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement R1 in a manner that identifies, assesses, and corrects deficiencies, if any. Where the entity is identifying, assessing, and correcting deficiencies, the entity is satisfactorily performing the requirement.</p> <p><b>Response: The SDT recognizes the language from CIP v.5. The SDT believes the language changes to draft 4 will address some of your concerns.</b></p> <p><b>“R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”</b></p> <p><b>This change was made to use standard language and methodology for control based standards. It is the same language as developed in the CIP v.5 standards. The SDT received many comments from industry requesting the CIP format for consistency.</b></p> <p><b>R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity’s implementation of the communication</b></p>

Organization	Yes or No	Question 5 Comment
		<p><b>protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW has been updated to reflect this change.</b></p> <p>Justification for R3. The above rewrite requires implementing a deficiency process, which puts the focus of R3 on a deficiency process and not on implementing R1. The proposed language changes says to implement R1 and does not require a specific process for deficiencies. This is consistent with CIP standards Version 5 draft 3 and Generally Accepted Government Auditing standard strategies (the yellow book or GAGAS). The proposed second sentence provides clarity on satisfactory performance expectations in the requirement. Note this proposed language should also be applied to R4.</p> <p><b>Response: The SDT intends that the entity needs to “have” communication protocols as directed in R1 and R2. The process to identify, assess and correct is the mechanism for adherence to those protocols. Also see the comment above.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
SPP Standards Review Group		<p>The processes outlined in R3 and R4 would be sufficient in themselves but with the requirements of PER-005 regarding identifying gaps and training to eliminate those gaps, it would appear that R3 and R4 add unnecessary duplication. Why do we need to have the same requirements in two different standards? Do some of the issues that are being addressed in the Paragraph 81 project come into play here?</p> <p><b>Response: The SDT does not believe the context of training gaps is synonymous with deficiencies based on adherence to communication protocols. The standard does not specify how the entity corrects the deficiency. This is where PER-005 may come into play.</b></p> <p><b>The Paragraph 81 Project is still a work in progress. The SDT believes COM-003-1 and its elements would be retained after any paragraph 81 review. The opportunities for mistakes on the BES due to miscommunication are tremendous. A</b></p>

Organization	Yes or No	Question 5 Comment
		<p>commenter on the COM-003-1, draft 2 posting calculated, after some assumptions that 35 million Operating Instructions per year occur on the BES. The exposure to risk should not be trivialized by suggesting these protocols and the process required in COM-003-1, draft 3 are only administrative and would be grist for elimination.</p> <p>Given the approval of COM-002-3 which places requirements on the DP and GOP when receiving a Reliability Directive, there appears to be the possibility of confusion regarding specific requirements on the DP and GOP in COM-003. During the COM-003 webinar, the comment was made that if COM-003 is approved, there may be a new project that would attempt to more efficiently coordinate the two standards. We would be supportive of that effort.</p> <p><b>Response: The SDT will not disagree that there is an opportunity to combine the two standards.</b></p> <p>The papers referenced in the Rationale and Technical Justification document supporting the need for this standard should be made available for review if the drafting team is using them as support for the justification for COM-003.</p> <p><b>Response: The reference the SDT used was contained in a industry white paper initiated by a member of the OC and was appended in its entirety to the COM-003-1, draft 2 comments which is posted on the NERC website for project 2007-02.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Florida Municipal Power Agency</p>		<p>The RSAW seems to re-introduce the “zero-defect” problem by directing auditors to sample actual recordings of communications to see if the entity identified all deficiencies. The RSAW ought to be changed to get away from sampling actual voice communications altogether and simply review the evidence of the entity doing its own internal monitoring. For instance, the entity might decide to randomly sample a few hours a month itself and identify deficiencies in those hours, that should be the only voice recorded evidence required and not any other hours that the entity did not</p>

Organization	Yes or No	Question 5 Comment
		<p>randomly sample. In addition, the evidence for correction of deficiencies is not more voice recordings, but rather evidence of revised protocols, processes, procedures, or evidence of disciplinary action. So, FMPA believes the RSAW needs a lot of work.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The SDT believes that there has to be a test of the entity’s process to make sure it is functioning effectively. It makes perfectly good sense for the CEA to sample the evidence over the same period to see if similar results are obtained. If the CEA discovers many deficiencies are not identified the standard requires the entity to evaluate its process to improve it. Possible non compliance can only result if the entity does not implement its own identified modifications or cannot justify why no modifications are required.</b></p>		
<p>MISO</p>		<p>The RSAW states that the applicable entity could be found non-compliant if the entity did not follow an auditor’s suggested changes to remedy those deficiencies. This requirement is not found in COM-003-1 itself, and the RSAW therefore includes requirements that are beyond the scope of the Standard it supports.</p> <p><b>Response: Please reference 3.4 and 4.4. The entity can only be found non compliant when the entity does not implement its own identified modifications or cannot justify why no modifications are required. For an entity not to legitimately address these elements it would be a violation.</b></p> <p>The draft RSAW also introduces subjective concepts that place uncontrolled discretion in the hands of auditors. For instance, the RSAW states that the size of the sample of the entity’s communication activities reviewed to verify whether the entity is identifying, assessing, communicating and correcting deficiencies “will be based on the auditor’s confidence in the entity’s ability to identify, assess, and correct its deficiencies.” MISO submits that sample size should be determined mathematically and in a manner that can itself be audited. Indeed, NERC’s own Sampling Methodology Guidelines and Criteria states that "Statistical sampling helps ensure a high confidence level of compliance for the larger population of documents when a smaller population is statistically sampled . . . Statistical sampling should be employed when auditing all processes, procedures and any documentationâ€related evidence</p>

Organization	Yes or No	Question 5 Comment
		<p>(documents, logs, voice recordings, etc.) when a sample is required because the entire population cannot be audited." Allowing an auditor to determine sample size based on an abstract concept such as confidence is contrary to NERC's own sampling methodology; would prevent Registered Entities from challenging such sample sizes; and could allow auditors to make such decisions punitively.</p> <p><b>Response: A statistical modeling approach is what the SDT contemplated in developing these requirements. NERC compliance and auditing professionals understand and would welcome such an approach. The SDT does not want to dictate the process controls but believe the structure you propose is sensible and if it was found to be effective, could be developed as a best practice by the industry. The OC has developed operating guidelines that could serve as an incubator for best practices.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Essential Power, LLC</p>		<p>The SDT received many comments questioning the need for the standard. They are relying on a single EPRI study that claims 19% of 400 studied switching errors (76 events) resulted from miscommunication, but this statistic is meaningless without context. Specifically:-Did any of these 76 events involve GOPs? If not, is it appropriate to make COM-003-1 applicable to these entities at all, much less for routine communications of minor importance? -How many events involved oral communication, vs. written miscommunication? Of the oral miscommunications, how many involved miscommunication between separate entities, as opposed to internal entity miscommunication? After all, internal miscommunications, which may be the vast majority of the events, will not be covered by the standard.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. There were two studies cited by the SDT. Both studies were contained in the OC White Paper which a commenter appended to the COM-003-1, draft 2 industry comments. The passage discussing the studies did not go into the detail you request in your comments. The SDT believes any entity is susceptible to communication errors and that the general percentages over the cases study are clear indicators that communication is a significant factor</b></p>		

Organization	Yes or No	Question 5 Comment
<b>impacting reliability.</b>		
SERC OC Standards Review Group		<p>The SERC OC Standards Review Group does not agree that the mandatory/prescriptive procedure for three part communications in essentially all oral communications will improve reliability of the BES. The standard needs to be changed to better reflect industry comments from this comment period and the previous ballot. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes communication errors reduce reliability on the BES. The SDT has changed the standard dramatically to reflect industry comments.</b></p>		
ISO/RTO Standards Review Committee		<p>The SRC requests that the SDT include a milestone in the implementation plan that requires NERC and the industry to reach agreement on how internal controls will be monitored by the CEAs BEFORE this standard is effective.</p> <p><b>Response: The SDT has integrated the RSAW review to the process. This is a transparent outreach to industry to create a better standard.</b></p> <p>The SRC believes that this standard could be improved by modifying the subparts of R1 and R2 to include parts that are communication protocols directly relevant to the improving situational awareness and shortening response time.</p> <p><b>Response: The SDT believes most of the protocols do just that. The SDT would appreciate any recommendations for additional or supplementary protocols from the ISO/RTO Standards Review Committee.</b></p> <p>Requirements R1.1, 1.2 in theory shorten response time by providing a commonly understood language and clock format for Operating Instructions but are unnecessary in practice.</p>

Organization	Yes or No	Question 5 Comment
		<p><b>Response: These may be basic protocols but they are important. They should be relatively easy to implement.</b></p> <p>The modification includes the removal of:</p> <ul style="list-style-type: none"> <li>o R1.3 as it does not improve situational awareness or shorten response time. This is such a small population of Operating Instructions and any real time Operating Instructions will be immediate. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of.</li> </ul> <p><b>Response: The SDT realizes the population may be small but the time element of an event is critical to an Operating Instruction.</b></p> <ul style="list-style-type: none"> <li>o R1.4 as it does not improve situational awareness or shorten response time. It may actually confuse entities that have established practices that may have to make changes to accommodate this requirement part. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of.</li> </ul> <p><b>Response: The SDT believes familiarity with a neighboring entity’s Facilities and Elements shortens response time and improves situational awareness.</b></p> <ul style="list-style-type: none"> <li>o R1.5 as it does not improve situational awareness or shorten response time. It may actually confuse entities that have established practices that may have to make changes to accommodate this requirement part. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of.</li> </ul> <p><b>Response: Clarifiers ensure an accurate issuance and reception of alpha-numeric information contained in an Operating Instruction. The benefit of which is reduced errors operating the BES.</b></p> <ul style="list-style-type: none"> <li>o R1.6 and R1.7, and 2.1 as it does not improve situational awareness or shorten response time. It actually lengthens response time and does not improve situational</li> </ul>

Organization	Yes or No	Question 5 Comment
		<p>awareness as it does not address the content of the communication. This is already addressed through COM-002-3 and will only add to confusion for entities to have a COM-003-1 requirement in the overlap it creates. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of where lack of 3 part communication directly contributed to a adverse reliability impact on the BES. The NERC OC established guidelines that outline best practices for industry and are sufficient to communicate such best practices. As the drafting team has communicated in its previous white paper, a significant amount of industry already employs 3 part communication during normal and emergency situations.</p> <p><b>Response: The SDT believes three part communication is an effective and proven tool that ensures communications are clear and unambiguous.</b></p> <p>Requirements R1.8, 1.9, and 2.3 could shorten response time by providing a protocol for quickly disseminating information from one to multiple parties.</p> <p>The drafting team should craft the standard to address communication between functional entities and not within entities to properly address FERC Order and Blackout Recommendation that clearly speaks to communication protocols between entities. To not do so is expanding upon the scope of the SAR, creates confusion, and is not focusing on the reliability concerns cited in the FERC Order 693 and Blackout Report Recommendation #26.</p> <p><b>Response: The SDT has changed the language to Requirement R1 and R2 adding “to between functional entities” which is consistent with your comment.</b></p> <p>The draft RSAW introduces subjective concepts as well as a new requirement.</p> <p>An auditor is to:</p> <ul style="list-style-type: none"> <li>o The CEA is to ...</li> <li>o Understand the process ....</li> <li>o The CEA is to review a sample of the entity’s communication activities to verify</li> </ul>

Organization	Yes or No	Question 5 Comment
		<p>whether the entity is identifying, assessing, communicating and correcting deficiencies. If the entity had implemented corrections, the sample is to be pulled from activities conducted after any corrections to the entity’s process were implemented or, if the correction had been recently implemented, the CEA is to consider the impact the correction will have when reviewing the samples. This sample size will be based on the auditor’s confidence in the entity’s ability to identify, assess, and correct its deficiencies.</p> <p>o Where the auditor ... o If an auditor cannot verify that the entity is adequately identifying [SRC: suggest changing “is” to “is not”], assessing, and correcting its own deficiencies due to limitations in its process, the auditor will not have a finding of non-compliance. The auditor will provide the entity with recommendations as necessary. If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations.[“same or similar deficiencies” is subjective and opens the compliance to CEA vision of what is “similar”.]</p> <p>New Requirement: If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations. If changes to the entity’s process are not implemented to identify, assess and correct deficiencies, the Auditors may make a determination of possible non-compliance with Requirement 3, Part 3.4.</p> <p><b>Response: The SDT does not interpret this as a new Requirement. It is guidance for the CEA on how to professionally audit Requirement 3, Part 3.4. This RSAW was developed in collaboration with the SDT and both parties believe the guidance provides the auditor specific instructions that actually reduce subjectivity.</b></p>

Organization	Yes or No	Question 5 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Northeast Power Coordinating Council</p>		<p>The white paper written by the OC addressed the issues covered by this Standard.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes those documents, while relevant and well written do not carry the authority of an approved standard.</b></p>		
<p>Hydro One</p>		<p>The white paper written by the OC addressed the issues covered by this Standard.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes those documents, while relevant and well written do not carry the authority of an approved standard.</b></p>		
<p>Hydro Quebec TransEnergie</p>		<p>The white paper written by the OC addressed the issues covered by this Standard. Also the requirements 1.6, 1.7 and 2.1, 2.2 seem to be redundant with the requirement R2 of COM-002-2. Both touch on the issue of ensuring misunderstandings by requiring the parties to repeat, restate, rephrase or recapitulate the information transmitted/received. If adhering to the philosophy of Project 2013-02 Paragraph 81 of FERC, we should remove unnecessary requirements as part of NERC,s Find, Fix and Track Process</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes those documents, while relevant and well written do not carry the authority of an approved standard. COM-002-2a, 2R will be retired when COM-002-3 and COM003-1 are approved by FERC. Paragraph 81 is still under development and will likely not apply to COM-003-1.</b></p>		
<p>Consumers Energy</p>		<p>This is an attempt to make a requirement for 3 way communication for all operating communications. Not all operating conversations avail themselves to that format. The concept is good but allowances must be made for other situations.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT has pointed out that these protocols are targeted only for</b></p>		

Organization	Yes or No	Question 5 Comment
<b>Operating Instructions that command direct changes to the BES, not all operating communications and casual conversations.</b>		
JEA		We believe that three-part communications should only be necessary for directives. Also COM002 and COM003 should be merged into one standard.
<b>Response: The OPCPSDT thanks you for your comments. The term Operating Instruction is a directive in nature. Its definition uses the term “command” which is a strong form of a directive.</b>		
Independent Electricity System Operator		We do not see the need for this standard. We feel that Reliability Standards should have performance based objectives, rather than prescriptive requirements that outline “how” to meet an objective. This draft is not consistent with this approach. If the majority of the industry also express a similar view, we urge the SDT to bring this to the Standards Committee’s attention, and seek its advice on way forward, including stopping this project altogether.
<b>Response: The OPCPSDT thanks you for your comments. The SDT stands by this draft of the standard and has not received any disapproval from the Standards Committee. The Standards Committee has reaffirmed the present course of the standard at its October 10, 2012 meeting.</b>		
NIPSCO		We want to see COM-002 and COM-003 combined, therefore we voted Negative. The Internal Controls in R3 & R4 are workable.
<b>Response: The OPCPSDT thanks you for your comments. The SDT cannot disagree with combining the two standards, but it is outside the scope of the SAR for this project.</b>		
Exelon		We would like to point out that the OI definition includes another defined term, “System Operator”. In the Glossary, this is defined as is an individual at a control center, including a Generator Operator. Control center is not currently defined but has a proposed definition in CIP version 5 that puts limits on which generator operators (# of units) work in “control centers”. If approved as part of CIP version 5, this definition of Control Center is likely to cause confusion when applying this and

Organization	Yes or No	Question 5 Comment
		<p>other standards. Will OI apply to all Generator Operators or just those working in "Control Centers" as defined by CIP ver. 5. In spite of our concerns with the current draft, Exelon intends to vote affirmative on this ballot for COM-003. Significant improvements have been made but there is opportunity to make additional changes before the final ballot.</p>
<p><b>Response: The OPCSDT thanks you for your comments. GOPs that receive Operating instructions from other Functional Entities would be subject to the protocols .</b></p>		
<p>Southern Company</p>		<p>While Southern agrees that 3-part communications is a good utility practice that has been used by operating entities for many years, Southern disagrees with the broadness of the types of communications the SDT is suggesting for requiring 3-part communications. In some of these cases, 3-part communications are not required to protect the reliability of the system. In fact, this prescriptive requirement, if used on all communications that could fall under "Operating Instructions" (which can be very general information at times), would take System Operators time away from other tasks that are more critical to maintaining reliability.</p> <p><b>Response: Based on the definition of Operating Instructions the SDT cannot see any remote reference to general information. The SDT has responded to comments in the last 3 drafts that it applies to a command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. The term command is very clear and distinct in meaning and strength. A command is not a discussion of general information. The definition has been modified to add clarity.</b></p> <p>Please note that there are numerous (i.e. in the millions) of conversations between operating entities each year and some important tasks could be missed or delayed if required to follow a standard script for everything.</p> <p><b>Response: The SDT believes just the opposite will happen. Communications will be more structured and focused on a professional exchange of commands to operate</b></p>

Organization	Yes or No	Question 5 Comment
		the BES reliably.
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
City of Tallahassee		<p>While TAL is voting affirmative, we still have some reservations that Compliance Enforcement will cite specific instances of non-3-way communications as violations. However, we are ready to codify the need for standardized communications as defined in the purpose of the standard and Blackout recommendation #26 and thank the drafting team for their hard work in avoiding a “zero-defect” standard.</p>
<p>Response: The OPCPSDT thanks you for your comments. The SDT believes that CEA is supportive of this form of standard and is confident it will be a superior alternative to zero defects.</p>		
Xcel Energy		<p>Xcel Energy feels this new draft of COM-003-1 is greatly improved than prior versions. We are especially in favor of the internal controls approach the team has taken. However, while we have identified several areas of concern with this latest draft, our issue with R1.5 is the single item that is preventing us from voting affirmative. As indicated in our previous comments, our issue is that we do not believe alpha-numeric identifiers should be required for all oral Operating Instructions. Instead, we feel this should be an optional tool that the operator may use where clarity in the Operating Instruction is needed or anticipated. (For example, the operator may use alpha-numeric clarifiers to restate the original Operating Instruction, when it was apparent from the receiver’s repeat back that the details of the Operating Instruction were not accurately understood.)</p> <p>Response: The SDT intends for alpha numeric clarifiers only to be used only when alpha-numeric information is contained in the “Operating Instruction.” The SDT believes that use of these clarifiers prevent miscommunication that would negatively impact the BES. e.g. switch 15 R vs.50 R, “15 and 50” sound alike and could easily be miscommunicated.</p> <p>Below are additional issues and modifications Xcel Energy would like to see</p>

Organization	Yes or No	Question 5 Comment
		<p>addressed:</p> <p>1) Since a Distribution Provider may issue Operating Instructions that would impact the BES, we feel they should be added to the applicability under R1 and R3.</p> <p>2) We recommend that the term “functional entities” be capitalized in R1.1, and a reference added to Section A4 of the standard. This way it is clear that the term includes all entities under the standard (Section 4) and not just the entities under R1.</p> <p><b>Response: The SDT believes the DP is a receiver of Operating Instructions. The SDT would appreciate if you could provide examples of issued Operating Instructions by a DP the SDT would like to consider the proposal.</b></p> <p><b>The SDT made corrections to R1.1. Thank you for bringing it to our attention.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Arizona Public Service Company		no
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Southwestern Power Administration		No additional comments.
Brazos Electric Power Cooperative, Inc.		See ACES comments.
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses to ACES Comments.</b></p>		
Edison Electric Institute		EEI generally supports the proposed COM-003 structure and content. We believe that COM-003 will provide a good response to both FERC Order No. 693 (P. 540) and Blackout Recommendation #26 in the U.S./Canada joint Blackout Report. EEI

Organization	Yes or No	Question 5 Comment
		<p>commends the drafting team for its work and for laying out a pragmatic framework for tightened communications protocols.</p> <p>Since the new proposed draft marks a significant change from the previous direction, EEI understands that some issues need to be considered. Some can be addressed by the drafting team and others are likely beyond the scope of the team. In general, companies seek to ensure that mandatory requirements when applied in the future will avoid causing confusion in real-time. For example, the definition of “Operating Instruction” in draft COM-003-1<sup>(2)</sup> may need some clarification to make sure that it sufficiently differentiates such communications from a “Reliability Directive” issued under COM-002-3.<sup>(3)</sup></p> <p><b>Response: The SDT believes the requirements of COM-002-3 define the circumstances when a Reliability Directive becomes active. The Functional Entity announces it when an Emergency or Adverse Reliability Impact is occurring or has occurred. COM-003-1 is focused on having an entity having a process that it uses to ensure it adheres to its own documented communication protocols by identifying, assessing and correcting deficiencies.</b></p> <p>Clarification may be needed to synchronize the COM-003 process requirements with protocols in already-approved COM-002-3<sup>(4)</sup>. We view these as relatively minor changes that would not require substantial changes to the draft COM-003 language.</p> <p><b>Response: The OPCSDT has adopted the same language for three part communication as written in COM-002-3, R2 and R3 to be consistent and to avoid</b></p>

<sup>2</sup> Proposed COM-003-1: [http://www.nerc.com/docs/standards/sar/COM-003-1\\_20120821\\_Clean.pdf](http://www.nerc.com/docs/standards/sar/COM-003-1_20120821_Clean.pdf)

“**Operating Instruction** — Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

<sup>3</sup> Pending COM-002-3: [http://www.nerc.com/docs/standards/sar/COM-002-3\\_Standard\\_20120607\\_Clean.pdf](http://www.nerc.com/docs/standards/sar/COM-002-3_Standard_20120607_Clean.pdf)

<sup>4</sup>“**Reliability Directive:** A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.”

Organization	Yes or No	Question 5 Comment
		<p><b>confusion.</b></p> <p>In addition, companies also have questions regarding language referred to as ‘internal controls’ or ‘zero defects’ language, and how NERC and the regions will apply various judgments on potential violations under this new and untested concept. While both CIP v.5 and draft COM-003 take aim at certain symptoms, it is difficult for companies to see how NERC will actually perform these tasks since no field experience has been tested or broadly communicated with stakeholders. Instead of this piecemeal approach, EEI has strongly believed for several years that NERC should address this issue as a strategic matter and develop a comprehensive plan that would set both compliance and enforcement on a more sustainable foundation. The resources being applied to compliance and enforcement across the electric industry need to be efficiently applied. EEI continues to urge NERC to make commitments to develop a comprehensive framework that will redesign the program.</p> <p><b>Response: NERC leadership has been communicating the need and intent of control based standards and is advocating it through CIP v.5 and COM-003-1. The SDT will pass your comments to NERC executive leadership for further action.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		

END OF REPORT

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, Initial Ballot closed September 20 2012.

#### **Description of Current Draft:**

This is the fourth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

#### **Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Second Successive Ballot of Standards	November 2012
2. Recirculation ballot of standards.	January 2013
3. Board adopts standards.	February 2013

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

**Operating Instruction** —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

**A. Introduction**

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.

4. **Applicability:**

**4.1. Functional Entities**

- 4.1.1 Balancing Authority
- 4.1.2 Distribution Provider
- 4.1.3 Generator Operator
- 4.1.4 Reliability Coordinator
- 4.1.5 Transmission Operator

5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

6. **Background:**

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying “implement” as follows:

Each ... shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the “. . . identifies, assesses, and corrects deficiencies, . . .” elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following: [*Violation Risk Factor: Medium* [*Time Horizon: Long-term Planning* ]
- 1.1.** Use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation.
  - 1.2.** Use of the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.
  - 1.3.** Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between Functional Entities in different time zones.
  - 1.4.** Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility when referring to a Transmission interface Element or a Transmission interface Facility-in an oral or written Operating Instruction , unless another name is mutually agreed to by the Functional Entities.
  - 1.5.** Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format (. for example if an entity designated a circuit breaker “One twoBravo” (12B). One two Bravo would need alpha-numeric clarifiers if used in an oral Operating Instruction)
  - 1.6.** When issuing an oral two party, person-to-person Operating Instruction, require the issuer to:
    - Confirm that the response from the recipient of the Operating Instruction was accurate, or
    - Reissue the Operating Instruction to resolve a misunderstanding.
  - 1.7.** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
  - 1.8.** When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (. for example an all call system), verbally or electronically confirm receipt from one or more receiving parties.
  - 1.9.** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (. for example an all call system), request clarification from the initiator if the communication is not understood.

**R2.** Each Distribution Provider and Generator Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:  
[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning ]

- 2.1.** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- 2.2.** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.

### **C. Measures**

- M1.** Evidence must include each applicable entity's documented communications protocols developed for Requirement R1 and must demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies.
- M2.** Evidence must include each applicable entity's documented communications protocols developed for Requirement R2 and must demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

##### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for Requirement R1 Measure M1 for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for Requirement R2 Measure M2 for the most recent 90 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**Compliance Monitoring and Assessment Processes**

Compliance Audit

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

Operating Instruction — A Command ~~from~~ by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.

4. **Applicability:**

- 4.1. **Functional Entities**

- 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator

5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

6. **Background:**

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a sole basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying “implement” as follows:

Each ... shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the “. . . identifies, assesses, and corrects deficiencies, . . .” elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

## 5. \_\_\_\_\_

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, have documented communication protocols for Operating Instructions between functional entities that ~~incorporate~~ include the following: [*Violation Risk Factor: Medium Low*] [*Time Horizon: Long-term Planning*]
- 1.1.** Use of the English language when issuing or responding to an oral or written Operating Instruction ~~between functional entities~~, unless another language is mandated by law or regulation. ~~Transmission Operators and Balancing Authorities may use an alternate language for internal operations.~~
  - 1.2.** Use of the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.
  - 1.3.** Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time When issuing an oral or written Operating Instruction that refers to clock times between ~~functional entities~~ Functional Entities in different time zones, ~~when referring to clock times include the time, the time zone where the action will occur and indicate whether the time is daylight saving time or standard time.~~
  - 1.4.** Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility When referring to a Transmission interface Element or a Transmission interface Facility ~~(when issuing)~~ in an oral or written Operating Instruction ~~between functional entities, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility~~, unless another name is mutually agreed to by the functional Entities.
  - 1.5.** Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format (~~e.g. (for example)~~) if an entity designated a circuit breaker "One two(12)Bravo" (12B). ~~One two Bravo~~ would need alpha-numeric clarifiers if used in an oral Operating Instruction)
  - 1.6.** When issuing an oral two party, person-to-person Operating Instruction, require the issuer to:
    - Confirm that the response from the recipient of the Operating Instruction was accurate, or
    - Reissue the Operating Instruction to resolve a misunderstanding.
  - 1.7.** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
  - 1.8.** When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time

period (e.g. ~~for example~~) an all call system), verbally or electronically confirm receipt from one or more receiving parties.

- 1.9. When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. ~~for example~~) an all call system), request clarification from the initiator if the communication is not understood.

**R2.** Each Distribution Provider and Generator Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, ~~have~~-documented communication protocols for Operating Instructions; ~~between Functional eEntities,~~ that ~~incorporate~~ include the following: [*Violation Risk Factor: ~~Low~~Medium*] [*Time Horizon: Long-term Planning* ]

- 2.1. When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- 2.2. When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.

~~**R3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]~~

~~3.1. Identifies potential deficiencies;~~

~~3.2. Assesses the deficiencies found;~~

~~3.3. Corrects the deficiencies, and~~

~~3.4. Evaluates the process based on deficiencies found external to Part 3.1 and either~~

~~• implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or~~

~~• demonstrates that no modification to the process is necessary to address the deficiencies.~~

~~**R4.** Each Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]~~

~~4.1. Identifies potential deficiencies;~~

~~4.2. Assesses the deficiencies found;~~

~~4.3. Corrects the deficiencies, and~~

~~4.4. Evaluates the process based on deficiencies found external to Part 4.1 and either~~

- ~~• implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or~~
- ~~• demonstrates that no modification to the process is necessary to address the deficiencies.~~

## C. Measures

~~**M1.** Evidence must include each applicable entity's documented communications protocols developed for Requirement R1 and must demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies. Each Balancing Authority, Reliability Coordinator, and Transmission Operator, shall provide its documented communications protocols developed for Requirement R1.~~

~~**M1.M2.** Evidence must include each applicable entity's documented communications protocols developed for Requirement R2 and must demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies.~~

~~**M2.** demonstrating Each Distribution Provider and Generator Operator, shall provide its documented communications protocols developed for Requirement R2.~~

~~**M3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its process developed for Requirement R3.~~

~~**M4.** Each Distribution Provider and Generator Operator shall provide the results of its process developed for Requirement R4.~~

~~**M5.**~~

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

#### 1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement

Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for Requirement ~~R3-R1~~ Measure ~~M3-M1~~ for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for~~for~~ Requirement ~~R4-R2~~ Measure ~~M4-M2~~ for the most recent 90 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Unofficial Comment Form for Standard COM-003-1  
Operating Personnel Communications Protocols

Please **DO NOT** use this form to submit comments. Please use the [electronic comment form](#) to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by 8 p.m. ET **December 13, 2012**.

If you have questions please contact Joseph Kriasiak at [Joseph.Kriasiak@nerc.net](mailto:Joseph.Kriasiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

## Background Information

Effective communication is critical for real time operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the Bulk Electric System (BES).

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American BES will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. FERC Order 693 paragraph 532 amplifies this need and applies it to all Operating Instructions. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions. The OPCS Standards Drafting Team (SDT) believes the Alert Level Guidelines, while valuable, belong in a separate standard and has petitioned the Standards Committee to approve the transfer to another standard or to start a separate project.

The upgrade of communication system hardware where appropriate is not included in this project (it is included in NERC Project 2007-08 Emergency Operations).

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators (GOPs), and Distribution Providers (DPs). These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The Purpose statement of COM 003-1 states: “To provide system operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.”

1. **New NERC Glossary terms:** The SDT has changed the definition of “Operating Instructions” proposed in the Standard version 3 and added *additional language to clarify its meaning and intent*.

Operating *Instructions* differentiates the broad class of communications that deal with changing or altering the state of the BES from general discussions of options or alternatives. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

This term is proposed for addition to the NERC Glossary to establish meaning and usage within the electricity industry.

2. **R3 and R4 are eliminated, there is proposed new language for R1 and R2:** *“Implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:”* The OPCP SDT is proposing this language change because of strong industry comment requesting it, because it is consistent with language in other control based standards and because it conveys the same approach to identifying, assessing and correcting deficiencies. The SDT would also note the reference to *“for Operating Instructions between Functional Entities”* for additional industry comment.
3. **Documented Communication Protocols:** The OPCP SDT has incorporated a requirement for an applicable entity to implement documented communication protocols that incorporate the following elements:
  - a) **English language:** Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation.

- b) **24 hour clock R1 Part 1.2 and Time zone reference R1 Part 1.3:** Use the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.

Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between Functional Entities in different time zones.

The OPCP SDT proposed this change to address comments by industry while adhering to the recommendations of the August 14<sup>th</sup>, 2003 task force report.

- c) **Line and Equipment Identifiers:** Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility when referring to a Transmission interface Element or a Transmission interface Facility (when issuing) in an oral or written Operating Instruction, unless another name is mutually agreed to by the Functional Entities.
- d) **Alpha-numeric clarifiers:** Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements are in alpha-numeric format (e.g. if an entity designated a circuit breaker “12B”, 12B – one two bravo – would need alpha-numeric clarifiers if used in an oral Operating Instruction).
- e) **Three-part Communication:**
- When issuing** an oral two party, person-to-person Operating Instruction, require the issuer to:
- Confirm that the response from the recipient of the Operating Instruction was accurate, or
  - Reissue the Operating Instruction to resolve a misunderstanding.
- When receiving** an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- f) **One-way burst messaging system to multiple parties (all call):** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- g) **Three-part Communication: For DPs and GOPs:** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- h) **One-way burst messaging system to multiple parties (all call): For DPs and GOPs:** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.

4. **Violation Severity Level (VSL) and Violation Risk Factor (VRF) Changes from version three:** The OPCP SDT reviewed the VRFs and VSLs associated with R1, R2, and made changes to more closely conform to NERC and FERC guidelines.

**The SDT is proposing to retire Requirement R4** from COM-001 and incorporate it into Requirement R2 of this draft COM-003-1. Since Requirement R4 from COM-001-1 carries over essentially unchanged there is no specific question related to it in this Comment Form.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Instructions. Requirements R1 and R2 are assigned a Medium Violation Risk due to their potential direct impact on BES reliability.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R1 and R2 must be implemented in long term planning operations and therefore were assigned a Time Horizon of Long Term Planning.

**Questions:**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

Please review the request for an interpretation, the associated standard, and the draft interpretation and then answer the following questions.

- 1. Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a “A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”) to be added as a term for the NERC Glossary? If not, please explain in the comment area of the last question.**

Yes

No

Comments:

- 2. The SDT has proposed new language in COM-003-1, R1 and R2: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:” R3 and R4 from draft 3 are eliminated. Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question.**

Yes

No

Comments:

- 3. Do you agree with the VRFs and VSLs for Requirements R1 and R2?**

Yes

No

Comments:

- 4. Do you have any other comments or suggestions to improve the draft standard?**

# Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft 4

## Rationale and Technical Justification

The Quality Review team for the draft 2 posting of COM-003-1 highly recommended that the OPCPSDT provide a justification or rationale document to aid reviewers in their examination of this draft of COM-003-1. The OPCPSDT agrees with the QR recommendation and has developed the following to support the standard and to help stakeholders understand the intent and scope of the standard. This version of the standard features a non traditional approach to standards that could alleviate concerns that surfaced in comments in drafts one, two and three.

### **Requirement R1**

Requirement R1 requires entities that can both issue and receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies. Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.<sup>1</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems.<sup>2</sup> The necessary protocols include the use of the

<sup>1</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

<sup>2</sup> Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

English language (from COM-001-1.1 R4), time formatting, mutually agreed nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three part communications.

### ***Requirement R2***

Requirement R2 requires entities that only receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies .

The two protocols (R2 , Parts 2.1 and 2.2) required are repeat back for three part communication and clarification if an “all call” communication is unclear.

### ***Rationale***

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying “implement” as follows:

Each ... shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the “. . . identifies, assesses, and corrects deficiencies, . . .” elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

## **Project 2007-2 – Operating Personnel Communications Protocols**

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

**Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

**Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are two requirements in COM-003-1, draft 4. Requirements R1 and R2 are assigned a “Medium” VRF. The elimination of draft 3 R3 and R4 and the language change to R1 and R2, which now reads: *“Each ..... shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following: ”*, warrants raising the VRF to “Medium” because it makes the requirement more than just administrative as it now features an evaluative process that would have a deeper impact on the reliability of the BES.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

## **FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

### **Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

### **Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
<b>Proposed VRF</b>	Medium
NERC VRF Discussion	R1 is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The VRF for this requirement is “Medium” which is consistent with NERC guidelines.
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is “Medium” which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the implementation of documented communication protocols that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.

## **Project 2007-2 – Operating Personnel Communications Protocol**

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are ~~three~~ two requirements in COM-003-1, draft 41. Requirements R1, and R2 are assigned a "Medium" VRF, and R3 were assigned a "Medium" VRF.

The elimination of draft 3 R3 and R4 and the language change to R1 and R2 which now reads: "Each ..... shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following: " may-warrants raising the VRF to "Medium" because it makes the requirement more than just administrative as it now features an evaluative process that would have a deeper impact on the reliability of the BES.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

## **FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

### **Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

### **Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	<del>Low</del> Medium
NERC VRF Discussion	R1 is a requirement in a planning time frame that, if violated, <del>would not</del> could, under <del>the</del> emergency, abnormal, or restorative conditions anticipated by the preparations, <del>be expected to directly and</del> adversely affect the electrical state or capability of the bulk electric system, <del>or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del> The VRF for this requirement is “ <del>Medium</del> Low” which is consistent with NERC guidelines
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is “ <del>Medium</del> Low” which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the <del>establishment</del> implementation of <del>documented</del> communication protocols that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.

VRF and VSL Justifications – COM 003-1, R1

<p>FERC VRF G4 Discussion</p>	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                  Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “ <u>Medium</u> <del>Low</del>” which is consistent with NERC guidelines</p>
<p>FERC VRF G5 Discussion</p>	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                  COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.</p>

## Project 2007-02 Operating Personnel Communications Protocols

Successive Ballot and Non-binding Poll now open through Thursday, December 13, 2012

### Now Available

A successive ballot of COM-003-1 – **Operating Personnel Communication Protocols** and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now open through **8 p.m. Eastern on Thursday, December 13, 2012.**

In response to comments received during the last comment period and other input, the drafting team has adopted many of the recommendations of commenters and incorporated them into draft 4 of COM-003-1, as summarized below:

- Combined Requirements R1 and R3, and R2 and R4 to emulate CIP version 5. The language calls for an applicable entity to “implement documented communication protocols in a manner that identifies, assesses and corrects deficiencies.....”
- Added additional language to clarify the definition of “Operating Instructions,” as commenters expressed concerns over the scope of the term.
- Clarified that R1 and R2 now apply to Operating Instructions between Functional Entities.

This version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). Changes were made to the RSAW to reflect the changes in draft 4 of COM-003-1 and changes suggested by some commenters. The RSAW is posted for an informal comment period along with COM-003-1.

### **Instructions**

Members of the ballot pools associated with this project may log in and submit their vote for the Standard and opinion in the non-binding poll of the associated VRFs and VSLs by clicking [here](#).

### **Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

## Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination standard drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is:

*“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”*

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Additional information is available on the [project page](#).

### **Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Project 2007-02 Operating Personnel Communications Protocols

**Formal Comment Period Now Open: November 14, 2012 – December 13, 2012**

**RSAW Posted for Industry Comments: November 14, 2012 – December 13, 2012**

**Upcoming:  
Successive Ballot and Non-binding Poll: December 4 – December 13, 2012**

### **Now Available**

A formal comment period for **COM-003-1 – Operating Personnel Communication Protocols** is open through **8 p.m. Eastern on Thursday, December 13, 2012.**

A successive ballot of COM-003-1 and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted **Tuesday, December 4, 2012 through 8 p.m. Eastern on Thursday, December 13, 2012.**

In response to comments received during the last comment period and other input, the drafting team has adopted many of the recommendations of commenters and incorporated them into draft 4 of COM-003-1, as summarized below:

- Combined Requirements R1 and R3, and R2 and R4 to emulate CIP version 5. The language calls for an applicable entity to “implement documented communication protocols in a manner that identifies, assesses and corrects deficiencies.....”
- Added additional language to clarify the definition of “Operating Instructions,” as commenters expressed concerns over the scope of the term.
- Clarified that R1 and R2 now apply to Operating Instructions between Functional Entities.

This version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). Changes were made to the RSAW to reflect the changes in draft 4 of COM-003-1 and changes suggested by some commenters. The RSAW is posted for an informal comment period along with COM-003-1.

### **Instructions for Commenting**

A formal comment period on the draft standard is open through **8 p.m. Eastern on Thursday, December 13, 2012**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at [wendy.muller@nerc.net](mailto:wendy.muller@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

A comment period on the draft RSAW is open through **8 p.m. Eastern on Thursday, December 13, 2012**. The draft RSAW is posted on the NERC Compliance Reliability Standard Audit Worksheet page. Please submit comments on the draft RSAW by using the RSAW feedback form on the [project page](#) and sending to: [RSAWfeedback@nerc.net](mailto:RSAWfeedback@nerc.net).

### **Next Steps**

A second successive ballot of COM-003-1 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Tuesday, December 4, 2012 through 8 p.m. Eastern on Thursday, December 13, 2012**.

### **Background**

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The

RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is:

*“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”*

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

## Project 2007-02 Operating Personnel Communications Protocols

### Successive Ballot and Non-binding Poll Results

#### [Now Available](#)

A successive ballot for **COM-003-1 – Operating Personnel Communication Protocols** and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) concluded at **8 p.m. Eastern on Thursday, December 13, 2012.**

Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results.

Approval	Non-binding Poll Results
Quorum: 76.78%	Quorum: 77.22%
Approval: 53.57%	Supportive Opinions: 57.91%

#### Next Steps

The drafting team will consider all comments received during the formal comment period to determine the next steps.

#### Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related

requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination standard drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is:

*“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”*

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Group
Southern Company
Antonio Grayson
No
The proposed definition can be improved by clarifying some of the language. First, a command is given in order to direct a recipient to take one of two actions - to either change or preserve the state, status, output or input of an Element or Facility. However, as drafted, it appears that there may be three responses: (i) to act; (ii) to change; or (iii) to preserve. Therefore, in order to avoid any ambiguity or confusion, Southern suggests the following change to the first sentence: "A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, in order to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System." In addition, the last sentence is helpful to clarify that certain activities are not considered "commands" under this definition. However, this sentence may create ambiguity beyond this definition by stating that certain actions are not "commands". In fact, these actions may be "commands" in other contexts. Therefore, in order to not create ambiguity between definitions or standards, Southern suggests that this sentence should be re-worded to avoid any future ambiguity or confusion. "For purposes of this definition, the term "command" shall not include discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions." Lastly, the Operating Instruction definition does not place an eminent time frame on the action. A communication could take place with the action expected to take place days or weeks later. Three part communication in this instance should not be required.
No
Southern believes that the requirements should clearly list which Functional Entities may issue and receive Operating Instructions (See COM-002-3). As currently drafted, it is not clear what happens when one of the five Functional Entities listed in these two requirements give an Operating Instruction to an entity not listed. The 9 requirements in R1 remain too prescriptive. A more acceptable solution would be for R1 to require "a plan" and for that plan to either address those 9 requirements or to refer to the guideline document that was developed at NERC's direction. Furthermore, we continue to believe a prescriptive use of the word "include" should be removed. We would suggest using the word "consider" or "address." Southern suggests that R2 is not necessary because the issuer of an Operating Instruction is required per sub part 1.6 to confirm that the response from the recipient of the Operating Instruction was accurate, or reissue the Operating Instruction to resolve a misunderstanding. As such this standard should not be applicable to a DP or GOP. From a compliance perspective, the new language proposed for R1 and R2 is consistent with the manner in which internal

controls have been incorporated into Version 5 of the CIP Standards. While Southern believes that internal controls are an integral element of an effective internal compliance program, we are generally not in favor of incorporating internal controls into the NERC Reliability Standards on a requirement-by-requirement basis. Southern believes a more effective way to ensure that Registered Entities develop and implement effective internal controls is to address the issue holistically and provide guidance to the industry. This guidance may very well provide examples of internal controls on a requirement-by-requirement basis, but ultimately the make-up and implementation of internal controls should be decided by the Registered Entity. Note that the question incorrectly references R2 which includes the DP and GOP.

No

Southern disagrees with the explanation of why the VRF for both R1 and R2 were changed from "Low" to "Medium" and believes that these continue to be administrative requirements justifying a "Low" VRF.

Southern agrees with the SDT that each area should have a protocol that is uniform and clear and that increases reliability. Moreover, Southern agrees with the SDT that when a Balancing Authority, Reliability Coordinator or Transmission Operator operates in two different time zones it should establish in its documented communications protocol the applicable time zone (see, e.g., SDT Consideration of Comments dated November 2, 2012, pp 60-61). However, with regard to Requirement R1, subpart 1.3, Southern believes that the standard is too prescriptive when it requires the use of "the time zone where the action will occur". Southern operates across multiple time zones utilizing a common EMS system. This provides for a uniform and clear understanding for all functional entities. However, to require the use of the time zone in which the functional entity resides could require the use of instructions that require the use of different time zones. This would not increase reliability, but would increase the risk to reliability. Further, if the time zone (including whether daylight savings time or standard time is used) is defined in the communications protocol, the BA, RC or TOP should not be required to expressly state the time zone and indicate whether the time is daylight savings time or standard time when issuing an Operating Instruction. Southern utilizes a common EMS system and "Operating Time" (which addresses the applicable time zone and whether daylight savings time or standard time is used) for operational communications. This "Operating Time" is understood by the entities within the Southeastern RC area. Thus, this established protocol provides for a uniform and clear understanding for all functional entities. As such, Southern suggest that if entities have mutually agreed upon a protocol (e.g., an "Operating Time") and this operating time is defined in the documented communications protocols, the BA, RC or TOP should not be required to expressly state the time zone when issuing an Operating Instruction. Therefore, in order to remove any ambiguity, an unnecessary risk to reliability and to insure that the standard is consistent with the SDT's statements, we suggest the following language: "Use of a mutually agreed upon operating time, or in the absence of a mutually agreed upon operating time, use of the time, the time zone and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between Functional Entities in different time zones." In addition, Southern believes that the requirements under Requirement R1, subpart 1.5 are too prescriptive and may create an unnecessary burden on Balancing Authorities, Reliability Coordinators and Transmission Operators. Instead, it would be more appropriate to require that the protocol clearly address the format to be used when communicating oral Operating Instructions. In the event the issuer must reissue the Operating Instruction under subpart 1.6, at that point, if the Facility or Element is in alpha-numeric format as set forth in subpart 1.5 (i.e., "12B"), the issuer would then be obligated to say "one-two Bravo".

No

(1) We request for the SDT to clarify the portion of the definition of Operating Instruction which reads "Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions". (2) We believe that an Operating Instruction should serve a reliability need. For example, instructions given that are based on economics, should not be included. To be absolutely clear, each Operating Instruction should

always be identified, by BA, RC, or TOP, that, "this is an Operating Instruction" when issuing such an instruction.

No

(1) We request that this be re-written to clarify what "implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols" means? What is required of an entity? Does the SDT mean the communication protocols or the manner that identifies assesses and corrects deficiencies? Can this be broken into two sentences? We would also note that implementing in a manner that identifies assesses and corrects deficiencies implies two requirements; implementation and deficiency correction. If that is required of entities for compliance in an RSAW or audit, the SDT should separate these two requirements in order to explicitly define what is necessary. (2) In addition we believe that the nine subsections in R1 are too prescriptive. The wording "that includes the following" should be changed to say ", that address the following".

No

(1) We believe that the VSLs for the requirement are too severe. We request that the VSL table for VRF #2, the Violation Severity Levels should read as follows: (a) Lower VSL - The Responsible Entity documentation protocol does not include one of the following in R2: a manner that identifies or assesses or corrects deficiencies for R2.1 and/or R2.2. (b) Moderate VSL - The Responsible Entity documentation protocol does not include two or more of the following in R2: a manner that identifies or assesses or corrects deficiencies for R2.1 and/or R2.2. (c) High VSL - The Responsible Entity documentation protocol does not include R2.1 or R2.2. (d) Severe VSL - The Responsible Entity does not have a documented communication protocol. (2) In addition, we disagree with the explanation of why the VRF for both R1 and R2 were changed from "Low" to "Medium" and believe that these continue to be administrative requirements justifying a "Low" VRF.

(1) The Responsible Entities addressed in R1 should be directed to state when giving an Operating Instruction (OI) to a GOP or DP in R2 whether or not a requested action would be deemed an OI. (a) The reason for this is that GOPs receiving OIs are not able to see the BES and therefore would not know if a call by the TOP, RC or BA would be considered an Operating Instruction. (b) If this is not stated a GOP or DP could consider all communications received from the RC, BA and TOP as Operating Instructions and this would create an undue burden on both RE's in R1 and R2. We do not believe this was the intent of the SDT or of this standard. (2) It is not clear from the proposed RSAW what will be audited and how it relates to the actual requirements; the RSAW states: "Review a sample of the entity's Operating Instructions to verify whether the entity is implementing its documented communication protocols". Are the Operating Instructions actually being audited? We are under the impression that the entities "identifying, assessing and correcting", was the requirement. We believe what is being audited is not clear between the Standard and the RSAW and the requirement should be re-written for clarity of intent.

Group

Northeast Power Coordinating Council

Guy Zito

No

The proposed definition as worded can be misconstrued to mean a command made by System Operator to a Reliability Coordinator, or to a Transmission Operator, or to a Balancing Authority. Propose to change the wording to the following: Operating Instruction —A command by a Reliability Coordinator System Operator, a Transmission Operator System Operator, or a Balancing Authority System Operator, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

Yes

Yes

Functional entity is capitalized throughout the Standard, yet functional entity is not a defined term in the NERC Glossary. Propose changing the wording in Requirement R1 to the following: R1. Each

Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communication protocols that include identification, assessment, and correction of deficiencies for Operating Instructions between functional entities that include the following: [Violation Risk Factor: Medium [Time Horizon: Long-term Planning ] The Sub-requirements introduce too much detail into the Standard. This detail dictates "how" something is to be done, rather than "what" is to be done. Following are comments to be considered on the sub-requirements should they remain in the Standard. Propose changing the wording in Sub-requirement 1.1 to the following: 1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation or agreement. Propose changing the wording in Sub-requirement 1.3 to the following: 1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between functional entities in different time zones, unless time protocols are defined in written agreements between the functional entities. Regarding Sub-requirement 1.5, the use of alpha-numeric clarifiers should be no more than a best practice. In case of uncertainty, 3 part communication as specified in Sub-requirement 1.6 would catch any ambiguities. Propose changing the wording in Sub-requirement 1.8 to the following: 1.8. When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (for example an all call system), verbally or electronically confirm receipt or that communications paths were established to receive the message from one or more receiving parties. Regarding the Time Horizons for Requirements R1 and R2, they should be Real-time Operations since the communications are occurring in real time, and the implementation of the protocol is the intent of R1 and R2. Suggest that the Standard be further clarified so that the intended purpose is to ensure that an entity has implemented a communications protocol with various core attributes, such as three part communication. We believe that it is not the SDT's intent that an entity will be found out of compliance for instances when an operating instruction was given which did not conform to its implemented protocol. Compliance will only be assessed if the Protocol procedure itself was not formally implemented and not to individual violations of such procedure which will be handled by internal controls to track and address any deficiency. In the context of implementation, sufficient implementation as used in this Standard could be demonstrated by management approved protocol procedures issued to the appropriate individuals in the organization and documented training. The Standard is not envisioned to be a zero-defect Standard however, and unless entities and audit staff have clear understandings of what "implement" means there may be instances when an auditor may find non-compliance beyond the intent of the Standard's Purpose and the Reliability Assurance Initiative concept being brought forward with this Standard. Suggest clarification to the word implement as it is used in the Standard and what activities in the compliance area will ensure proper audit expectations are set.

American Electric Power

No

While AEP would not argue against the definition of "Operating Instruction" as proposed, we object to its inclusion as we disagree with the concept of requiring three part communications for more routine operations. Our efforts in this regard should first be focused solely on Reliability Directives before expanding this work, and creating similar requirements for all other Operating Communications. Requiring three part communications for every scenario might be considered a best practice by some, but making it a mandatory practice for routine operations emphasizes the manner of communications rather than the operations themselves. In addition, requiring three part communication in such a broader scope could actually diminish the perceived urgency during more urgent situations where such communications are more appropriate. In any event, requiring three part communications for Reliability Directives will likely result in more widespread usage for more routine operating communications, without making it a requirement.

No

AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, also disagrees with requiring both that entities have documented communication

protocols, as well as implement a process for identifying deficiencies with adherence to the documented communication protocols specified.
No
AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, has no comment at this time on the proposed VRF's and VLS's.
AEP does not agree with the perceived necessity of this standard, but does support the overall concept of the drafting team's building controls into the standards as well as proposing RSAWs during the comment that perpetuate the ideas and concepts of the drafting team. As stated in the previous comment period, AEP believes that there should not be multiple project teams proposing concurrent changes to COM-001, COM-002, and COM-003. Unless there are overwhelming reasons for not doing so, these efforts should be consolidated and managed by a single project team. In addition, current efforts on COM-003 need to be co-located with the proposed changes to COM-002 within a single standard. Having multiple project teams proposing concurrent changes results in problems such as this, where a) changes are proposed to the same standard or b) similar changes are proposed to separate standards. AEP cannot support revisions on these matters until they are managed by a single project team.

I feel that an additional term is unnecessary. The defined term "Reliability Directive" should be sufficient to accomplish the goal.
No
I feel that this could lead to very inconsistent auditing on not only this standard but CIP version 5 as well. My thoughts on identification, assessment and correction of deficiencies may certainly not be that of the auditors thus leading to the potential for a NOPV. I suggest language to the affect "shall implement communication protocols in accordance with NERC guidelines for internal controls....."
No
The Responsible Entity did not implement, in a manner that identifies, assesses and corrects deficiencies, their documented communication protocols as required in Requirement R2 Suggest to allow for a less subjective audit environment. The Responsible Entity did not include methods for, identifying, assessing and correcting deficiencies, in their documented communication protocols as required in Requirement R2
Combine with COM-002 ASAP Really take a close look at how R2.2 is worded. State clearly the recipient is to call the sender back after the call if they did not understand. Require the sender of the blast call to issue contact information if questions arise. Blast calls do not fit Mcdonalds three part communication model so often used.. Blast calls are very efficient just that not a precision communication tool by any means..
Group
pacificorp
ryan millard
Yes
Yes
No
It is not clear to PacifiCorp why the VSLs are so much higher for R2 when R1 applies to Balancing Authorities, Reliability Coordinators, and Transmission Operators, and thus has a potentially broader application than R2. R2 applies to Distribution Providers and Generator Operators.
PacifiCorp does not feel that the requirements listed in R1.5 regarding the use of alpha-numeric clarifiers when issuing an oral Operating Instruction is warranted. The requirements listed in R1.6,

and R1.7 requiring the strict use of three-way communication should alleviate any possibility of miscommunication, which PacifiCorp understands to be the drafting team's intent in the development of separate Requirement R1.5. Also, implementing the use of alpha-numeric clarifiers poses additional risk due to the introduction of ambiguous language.

Support previous comments submitted by Central Lincoln, do not believe the comments were adequately addressed as the SDT refused to incorporate language suggested for DPs with few BES assets.

Group

Associated Electric Cooperative, Inc. - JRO00088

David Dockery - NERC Reliability Compliance Coordinator

No

While AECI deeply appreciates and has carefully considered this SDT's latest effort to contain scope of this definition, we feel it still fails to appropriately balance the risk to the BES, against anticipated Industry compliance assurance costs as well as non-compliance risks. This is primarily due to an anticipated high-volume of very low BES impact Operating Instructions within our own operating environment.

Yes

AECI appreciates the SDT's willingness to move away from zero-defect language.

No

So long as DPs, GOs, small TOs and small BAs are within the scope of this Standard, and the scope of Operating Instruction does not necessarily impact BES reliability, any Severity or Risk assessment greater than Low, forces an Entity's risk of non-compliance with documentation far above actual risk to the Bulk Electric System. AECI cannot agree with such inequity.

AECI remains resolute that COM-002 provides a more appropriate balance between BES reliability risks associated with human-to-human communications within our industry, and industry costs to monitor for compliance with required communication practices.

(1) We appreciate all of the efforts the drafting team has expended in developing this proposed standard. The drafting team has done an excellent job in balancing the various diverse opinions and interests. We believe the standard is moving in the right direction; however, we still believe there are additional needed improvements. Another round of commenting and balloting may be necessary to capture all stakeholder viewpoints. (2) The current definition of Operating Instruction, particularly "command from a System Operator" is too similar to a Reliability Directive. (3) We recommend the standard drafting team revise the SAR of COM-003-1 to retire the definition of Reliability Directive and COM-002-3. There is no better time to rewrite the standards than when they are in development. (4) There is no delineation between when COM-003-1 and COM-002-3 would apply, which could potentially subject registered entities to double jeopardy. Assume a switching order is an Operating Instruction; would those communications become a Reliability Directive if the switching order resulted

in an emergency or was part of a standing operating guide to resolve the emergency, or would it still be an Operating Instruction? There is still gray area in this standard that needs to be clarified. We appreciate the slides that were shared during the recent webinar; however, the words in the current definitions do not clearly state when an Operating Instruction ends and a Reliability Directive begins. (5) A "command" is a synonym of a directive, not an instruction. We recommend revising the definition to capture the proper intent of the standard. (6) We find the use of input of an Element odd in the Operating Instruction definition. We understand the output of an Element such as the MW output of a generator? However, we are not sure what is intended by the input of an Element? What would the input be on Element? For a generation unit, does the fuel supply constitute input? It would be unusual for a TOP, BA, or RC to issue an operating instruction regarding fuel. For what would be the input on a transformer, transmission line, circuit break, bus section, etc. that a TOP, RC or BA would issue an operating instruction? (7) The "expected to act" and "preserve the state, status, ..." parts of the definition conflict with one another. If an entity is preserving the state or status, action often is not required. For example, would an operating instruction ever be issued to maintain a circuit breaker in the closed position? No action is required in such a situation? When would the drafting team anticipate action to be required to maintain the state, status, output or input? Are these parts intended to cover anticipation by the BA, TOP or RC that the state, status, output or input may move? For instance, if a generator is expected to ramp up based on the unit commitment and dispatch plan but the BA, TOP, or RC determines that the units needs to maintain its current output. We think some explanation and/or examples in a guideline section would be helpful.

No

(1) We agree with the drafting team's decision to remove Requirements R3 and R4, as they were unnecessary. However, we still have concerns with the standard as our comments explain below. (2) We recommend that the SDT consider removing or revising the sub-parts of R1 and R2 to allow registered entities flexibility to define their own communications protocols based on internal policies and procedures. The registered entity should have the freedom to decide what elements are to be included in its communication protocols based on its system, location and configurations. A large entity may have more elements in their communication protocol than the 9 sub-parts, while a small cooperative may need less because of their impact on the BES. We would like the SDT to reconsider each sub-part and revise the requirements in such a way that allows more flexibility for smaller entities, while possibly requiring other registered functions, such as an RC to have more elements in their communication protocols. There is more discussion on each sub-part below. (3) R1, part 1.1, use of the English language. This Part either needs to be eliminated or restructured to place the burden only on those entities that are from areas of North America where English is not the predominant language. The amount of resources expended documenting compliance with this requirement simply is not commensurate with the reliability benefit. There have been audits conducted in which every piece of evidence was presented in English, all audit participants used English exclusively, and control room conversations witnessed by auditors were in English. Yet, when the time came to sign off on compliance with this requirement, auditors expected to find inclusion of a statement in procedures that the English language was not used. Please eliminate this unnecessary expenditure of resources by eliminating the requirement or only requiring those areas where English is not the predominant language to include this in their communication protocols. (4) R1, part 1.3, Use of time zone and Daylight Savings or Standard Time. Contrary to the statements in the response to comments this sub-part prevents the use of relative time, such as "perform an action in 5 minutes" or at the very least complicates it with superfluous information. Specifically, this requirement compels the use of the time zone and daylight savings times in all Operating Instructions. While its does not specifically exclude that RC, BA or TOP from stating that an action must be performed in 5 minutes, it would require the RC to include the time zone and whether it is Daylight Savings or Standard time. For example, the TOP would have to say, "Open breaker one in five minutes in the CST time zone." This does not make sense. (5) R1, part 1.4, Transmission interface Element or Facility. The language used in this sub-part is overly complex. Specifically, the statement "unless another name is mutually agreed by the Functional Entities" is problematic. If that is the case, the mutually-agreed upon name obviates the need for having the sub-part. Also, Project 2007-03 eliminated TOP-002 R18 which referred to the same concept as part 1.4, "uniform line identifiers when referring to transmission facilities." The reason the Real-time TOP SDT removed the language from the new standard was because the "requirement adds no reliability benefit. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue." To be consistent with other approved standards, we recommend striking this sub-part in its entirety. (6) R1, part 1.8 and 1.9,

One-way Burst Messaging. The drafting team should revise this sub-part to state that compliance with this sub-part is optional, depending on whether the entity utilizes burst messages. These sub-parts need additional information for clarity. Same comment for DP/GOP below.

No

(1) We disagree with the VRF classifications being medium. We ask the drafting team to clarify why they decided to raise the risk factor when the requirement still addresses the same activity. Further, with internal controls, this requirement should be low because the majority of deficiencies would not have an adverse impact on the reliability of the BES and would not result in a violation. It appears that the VRF was raised to medium because R3 and R4 were medium and now are incorporated into R1 and R2. We disagree with the justification that correcting deficiencies warrants a medium risk factor. This is illogical and argues that every requirement that includes the "assess, correct, identify" language should be medium. Further, it does not seem consistent with the next paragraph. (2) We disagree with the Time Horizons for R1 and R2. Implementing communications protocols are not long term planning, these activities are operations planning. The requirement is no longer a documentation requirement, this is an operations planning requirement. Furthermore, the communications that are governed by the document occur in the real-time operations time frame. Using the logic that is applied to identify long-term planning as the time frame means that every requirement that will be monitored via internal controls and subject to the "identifies, assesses and corrects" language will be long term planning. This makes no sense and is inconsistent with the approach of the CIP SDT. CIP standards have requirements that did not have the long-term planning horizon. CIP-003-5 R2 is one example. (3) There was a lot of discussion in the recent drafting team webinar about Regional auditors not finding a violation, but there needs to be clear guidelines describing when an auditor will find a PV. The VSLs currently describe a violation when a procedure is deficient, but does not clearly explain when a communication deficiency is not remediated. A deficient communication could result in no finding at all, depending on how the individual auditor interprets the situation. This level of subjectivity is too high; the SDT needs to revise the VSL table to reflect a more reasonable approach, perhaps by including more information and examples of situations that might be viewed as non-compliance (communication breakdown) but because of internal controls, there should be no finding of non-compliance. In the alternative, the SDT could develop a guidance document outlining when an auditor is to find a PV and include examples to ensure consistency. The RSAW does not provide any additional clarity. (4) In the webinar, there were several references to "systemic or chronic" communication deficiencies. The VSLs do not reference any types of trends, but that seems to be the focus of compliance. We suggest revising the VSLs to focus on broader issues, such as systemic deficiencies that remain unresolved. Furthermore, this would make the VSLs more consistent with the data retention section which focuses on retaining "evidence of its manner that identifies, assesses, and correct deficiencies."

(1) In the Background section of the standard, we would like the standard drafting team to provide more details on what "compliance management activities" include as stated in the last sentence of the section. We would like the team to provide examples of these activities for clarity. (2) We support the concept of internal controls that the SDT has proposed. We agree that finding a violation for each instance of deviation from the requirement is burdensome and unreasonable and evaluating internal controls is a more efficient use of resources. However, we are concerned about the consistent evaluation of internal controls. How is NERC planning to ensure that all Regional auditors consistently evaluate internal controls during compliance audits? Currently, there is too much room for auditor subjectivity, especially when evaluating whether a single communication was deficient. There are so many communications that could occur on a daily basis and there is no clear guidance when the Regional Entities will find or not find a possible violation in an audit. (3) In the webinar, SDT chair stated that a registered entity that catches a high percentage of deficiencies, then their process is working, but if the entity is only catching 50% then the entity needs to correct the process. There is currently no percentage or other guideline or metric to determine if an entity's process is sufficient. If this is the SDT's intent, please provide further detail. (4) We recommend the SDT provide additional information in the Rationale and Technical Justification document or in an application guidelines section of the standard to include a guideline to show how the Regional auditors would assess compliance with a control-based standard. It seems that the trend in both COM-003-1 and CIP v5 is to find the errors and fix them without the need to self-report. How are the Regions going to determine when a PV is to be issued? The Technical Justification and the RSAW do not provide enough information when a communication deficiency crosses the threshold of becoming a violation. How

does a registered entity know when to self-report? (5) We recommend adding more detail, perhaps including an application guidelines section as other risk-based standards, for acceptable remediation of deficient communications. What evidence is necessary that the registered entity identified, assessed, and corrected a deficiency with the communications protocol? The data retention section only requires the manner in which the entity identifies, assesses, and corrects to be documented. It does not require retention of any actual instances. We believe this is appropriate and that a few examples of corrections as supporting evidence may be warranted. However, there is no explanation in the standard that makes this clear. An application guideline would be useful in providing an explanation. Without these explanations, the internal controls used to remedy deficiencies could turn into another documentation exercise instead of focusing on effective communication. We recommend the SDT consider ways of satisfying remediation without creating an unnecessary administrative burden for maintaining evidence of compliance. (6) If the Regional auditor is to make recommendations to registered entities on how to improve the COM-003-1 internal controls, would the Regions allow an initial safe harbor to assess the entity's program? If Regional auditors find PVs on the initial audit, that practice would go against the spirit of self-correcting and would stifle the entity's actions to monitor, assess, and correct deficiencies. The SDT should consider this sort of initial assessment in the implementation plan. (7) The response to comments regarding combining COM-002 and COM-003 beyond the scope of the SAR. The comments also cited that the Standards Committee considered combining them. It is our understanding that the Standards Committee rejected SARs to consider combining the standard projects because they were not driven from within the standards drafting team. Scopes can be adjusted by submitting new SARs and SDTs have authority to submit new SARs. If the SDT agrees that combining the standards makes the most sense for reliability, please submit a SAR to combine the standards. (8) Thank you for the opportunity to comment.

Individual

Randi Nyholm

Minnesota Power

No

Minnesota Power supports moving away from zero-defect Requirements, but as currently written the language "in a manner that identifies, assesses and corrects deficiencies" does not allow for the identification of deficiencies without the assessment of a severe severity level within the VSLs. We recommend that, at a minimum, the VSLs be modified to allow for this flexibility similar to what was done in the CIP Version 5 Standards.

No

The Standard does not state that switching is only required when issuing instructions for interconnected systems and not for the day to day switching on our system as was stated during the recent COM-003 webinar. Additionally, we do not support the use alpha numeric identifiers to solve a perceived problem that does not exist on our system.

ATC respectfully submits the following comment for SDT's consideration regarding Draft #4 of COM-003-1: (Ref. Redline for Requirement 1.3 below) 1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time wWhen issuing an oral or written Operating Instruction that refers to clock times between functional Functional entities Entities in different time zones, when referring to clock times include the time, the time zone where the action will occur and indicate whether the time is daylight saving time or standard time. ATC recommends Requirement 1.3 above be revised and/or rewritten as follows: 1.3. "Use of a mutually agreed, prevailing system time zone when issuing an oral or written Operating Instruction between Functional Entities in different time zones." Basis for the comment • The need for time conversion when Operating the BES, injects an opportunity for an error that could potentially cause unintended System configuration, or even an Adverse Reliability Impact. Protocols should be set to eliminate those negative opportunities.

1. The expression, "repeat, restate, rephrase, or recapitulate," in R. 1.7 and R2.1 would be clearer if shortened to, "repeat or summarize." 2. The revised standard is much improved by focusing on continuous improvement instead of making each communication imperfection a violation, but no guidance is provided as to how rigorous the improvement program must be to be deemed sufficient. M1 and M2 should have added at the end the statement, "Acceptable means of identifying, assessing and correcting deficiencies include the following: • Review of voice logs, for at least one hour per year for each person issuing commands or responses (as applicable) • Personal monitoring of communications, for at least one hour per year for each person issuing commands or responses (as applicable) • Annual refresher training, including a quiz on proper commands or responses, for each person issuing commands or responses (as applicable) (as applicable) 3. Failures of GO and DP operators to repeat or summarize Operating Instructions are easily detectable (R2.1); but it would not ordinarily be possible for a person monitoring COM-003 compliance to detect a lack of understanding accompanied by failure to request a clarification (R2.2), since the resultant silence on the part of the operator is the same reaction associated with clearly understanding the Operating Instruction. M2 should be shortened to, "Evidence must include each applicable entity's documented communications protocols, which must include a provision requiring the recipient of an operating instruction to seek clarification from the initiator in the event of an unclear instruction." 4. From the RSAW: "If the CEA finds in subsequent audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made based on prior recommendations. If the entity did not implement changes to identify, assess and correct deficiencies, the CEA may make a determination of possible non-compliance" The issue here is potential for disagreement on "deficiencies". There are some conversations between GOPs and TOPs which are market driven, but could be read by an auditor as an "operating instruction". Some adjustment to the definition of "operating instruction", or some adjustment to the requirement that an entity address the "recommendation" from the region, may be in order here.

This needs further work. As written, there is still potential for a TO to call a GOP to address a market concern, and trigger the standard. Discussions which are purely for market concerns are not properly part of the standards, but an auditor could read such conversations as "Operating Instructions". Suggest that there be a specific clause excluding such discussions from the definitions.

No

The revisions proposed are a significant positive step, and I thank the SDT for their work. However, there are still some issues with the proposed requirements. Requirement 2.2 states "When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.". This requirement cannot be audited as written, as there is no way to determine if a communication is understood by a particular

operator. Further, the concept of three-part is to allow the initiator to determine if the instruction is understood. Instructions disseminated across an All-Call are understood to be crafted in such a way as to avoid such misunderstandings. Suggest elimination of R 2.2, and suggest adding language to the RSAW that considers protocols for resolving misunderstandings as a mitigating factor in determining the sample size pulled for audit purposes. R1.8 as written would only require the issuing entity to confirm receipt from one entity. Receipt confirmation is not needed in a standard written to cover understanding communications, and the requirement should be eliminated.

No

A BA who excludes three-part communication requirements from their communication protocols is assessed a lower VSL. A GOP who does exactly the same thing is assessed a High VSL.

The need for this standard still has not been demonstrated, and will merely add paperwork and confusion due to the existence of COM-002, and the questions which will inevitably arise over which standard, or if any standard, covers any particular conversation. The SAR should be withdrawn and a new SAR requiring a communications protocol designed to "mitigate the possibility of misunderstandings during communications between entities" should be added.

Individual

Michael Falvo

Independent Electricity System Operator

No

The IESO does not have an opinion on whether or not the definition is proper; the IESO is opposed to having this term defined and added to the NERC Glossary. As indicated in our previous comments, the term does not need to be defined. For years, system operators deal with operating instructions on a daily if not minute basis. Having a defined term, and calling such communication as "Command" is unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. We appreciate the SDT's response to our previous comments, and its effort to add clarifying language by adding the second, qualifying sentence. In fact, the additional clarifying language may cause more confusion to the operators than the purpose it is intended to serve. We therefore continue to respectfully disagree with the need for this definition and the standard as a whole, in particularly the requirement on 3-part communication for operating instructions. We continue to disagree with the need for this standard on the basis that the industry-approved COM-002 together with the NERC OC's operating guide on operator communication already provide the necessary requirements and guideline to fill any potential reliability gaps that may arise due to operator communication. Requiring 3-part communication for routine operating instructions, despite the additional wording in R1 ("in a manner that identifies, assesses and corrects deficiencies") and provisions made in the RSAW, is still a zero defect requirement that would add undue burden to the operators, which is a potential cause of unreliable operations. We therefore continue to disagree with the need for this standard as it adds little to reliability over what COM-002 and the operating guide have already accomplished.

No

Notwithstanding our disagreement with the need for this standard, the phrase "in a manner that identifies, assesses and corrects deficiencies" is vague, not measurable and inconsistent with the results-based standard concept which emphasizes the inclusion of a performance or reliability outcome in the requirement. A more direct and clear requirement would be to simple require "implement documented communication protocol....". We appreciate the SDT's intent for adding this phrase, but it does little to ease the concerns of the commenters. Instead, the addition introduces an immeasurable phrase that may in fact make the requirement more ambiguous and unclear.

No

As expressed previously, we continue to respectfully disagree with this standard and therefore we continue to disagree with the VRFs and VSLs.

a) We appreciate the SDT's hard work and dedication to develop this standard in response to the SAR and the recent BoT directives. Unfortunately, the need for this standard has been overtaken by event (the definition of Reliability Directives and COM-002-3, and the OC's operating guide on operator communication). The BoT, unfortunately, is still under the perception that COM-003 is the answer to the potential reliability gap that was discussed when it approved the COM-002 R2 interpretation. The

two balloting results and the two sets of industry comments suggest that many in the industry share our view. Hence, we believe the industry should attempt to convince the BoT that the potential reliability gap has been duly addressed and therefore COM-003 is no longer needed. We understand the SDT has little to no option, we therefore suggest that the SDT present the results of this round of ballot, if it still fails to make the 2/3 approval rate, to the Standards Committee and ask for its permission to put a hold on further work until the BoT has heard the industry's concern and makes a policy decision on the way forward. Further revision to this standard and posting for industry commenting and balloting will only waist the SDT's effort and industry resource, without a fruitful outcome. b) Notwithstanding the above, the proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in the Effective Dates Section (P. 2 of the Implementation Plan) and in Section A5 of the standard, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities."

Duke Energy

Greg Rowland

No

The revised definition still lacks clarity needed to distinguish Operating Instructions from Reliability Directives. The SDT revised definition of Operating Instruction is too wordy and adds significance by using the word "command" versus "communication" as is used in the definition of Reliability Directive. Including the phrase "preserve the state" also adds significance and could be interpreted as an Emergency and take on the meaning of a Reliability Directive. The definition should not include the second part regarding what is not considered an Operating Instruction. The definition of Operating Instruction should be patterned after the BOT approved definition of Reliability Directive, with the only difference being that Operating Instructions address normal system conditions and Reliability Directives address an Emergency or Adverse Reliability Impact. Suggested wording: "Operating Instruction — A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority, where the recipient responds to a request to take action by changing the status, output, or input of an Element or Facility of the Bulk Electric System under normal system conditions."

No

In Requirements R1 and R2, the word "include" should be changed to "address". This change will align the language of the requirements with the language of the RSAW, providing flexibility to entities in how their communications protocols will be structured. For example, on page 3 of the Comments Report, in reference to use of the 24-hour clock, the SDT states: "The SDT points out in this response that these protocols are to be used only when a specific clock time is cited. The SDT accepts relative time such as: " in the next 10 minutes, on the hour or half hour" as clear and unambiguous and not requiring the use of the 24 hour clock and time zone references." However it's not clear to us that R1.2 and R1.3 allow that flexibility.

No

Consistent with our comment to Question 2 above regarding changing the word "include" to "address" in Requirements R1 and R2, this change should also be made in the VSLs for R1 and R2, changing the word "include" to "address".

SCE&G's supports the SERC OC in the following response "We believe that the definition should indicate the timeframe in which the entity "is expected to act." We believe that this language is too wide and can be interpreted in many ways. Furthermore, we continue to believe that prescriptive

communications protocols are unnecessary for routine Operating Instructions. Many Operating Instructions, such as economic loading of resources, do not have a reliability impact to the BES and the entities should not be held accountable to the requirements of this standard."

No

SCE&G support the SERC OC in the following response" We believe that the requirements should clearly list which Functional Entities when the communications protocols should be utilized, for example, what happens when one of the five Functional Entities listed in these two requirements give an Operating Instruction to an entity not listed. Note that the question incorrectly references R2 which include the DP and GOP. Furthermore, while we agree with the concept of identifying, assessing, and correcting deficiencies, we continue to believe a prescriptive use of the word "include" should be removed. We would suggest using the word "consider" or "address."

No

SCE&G supports the SERC OC in the following response "We disagree with the explanation of why the VRF for both R1 and R2 were changed from "Low" to "Medium" and believe that these continue to be administrative requirements justifying a "Low" VRF."

SCE&G is concerned with similarities between Operating Instructions and Reliability Directives. It also appears that the language in the RSAWs would require an entity to keep a log of all Operating Instruction. This would be overly burdensome to the industry and is not included in the requirements.

Individual

Patricia Metro

National Rural Electric Cooperative Association (NRECA)

No

NRECA is concerned that the proposed definition of an "Operating Instruction" is too similar to the definition of a "Reliability Directive" specifically with the inclusion of "command from a System Operator".

No

NRECA agrees with the decision to remove R3 and R4 from COM-003 draft 4, but is concerned with the incorporation of the internal controls language in R1 and R2. These changes don't resolve the concerns provided in comments to the previous draft of the standard. Although internal controls are important, NRECA believes that before such language is added to standards guidance/criteria needs to be developed on how Regional Entities will consistently review internal controls during compliance audits. NRECA suggest removing the language "implement, in a manner that identifies, assesses and corrects deficiencies" until the Reliability Assurance Initiative (RAI) effort to change the compliance/enforcement process to be more focused on a risk-based model and the effectiveness of a registered entity's internal controls/compliance program is implemented.

ReliabilityFirst
Yes
Yes
a. ReliabilityFirst generally agrees with the language in R1 and R2, but believes the intent would be clarified if the structure of the words were shifted around. ReliabilityFirst recommends the following language for R1 for consideration (R2 would be similar): "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its documented communication protocols for Operating Instructions, in a manner that identifies, assesses, and corrects deficiencies, between Functional Entities that include the following:"
Yes
ReliabilityFirst abstains and offers the following additional comments for consideration: 1. Requirement R1 and R2 Time Horizons a. ReliabilityFirst believes the Time Horizons (Long-term Planning) for Requirement R1 and R2 are incorrect. Requirement R1 and R2 deal with implementing communication protocols for Operating Instructions which is more of a real time activity. Thus ReliabilityFirst recommends changing the Time Horizons to "Real-time Operations" or at a minimum "Same-day Operations" or "Operations Planning". 2. The term Functional Entity a. Since the term "Functional Entity" is used throughout the standard, ReliabilityFirst recommends adding the word "applicable" in front of it to help clarify that it is referring to the Functional Entities as outlined in the Applicability Section. Without this distinction, individuals may think this term is referring to all Functional Entities as outlined in the NERC Function Model.
Individual
Michelle R. D'Antuono
Occidental Energy Ventures Corp (OEVC)
Yes
OEVC believes that the clarifications that the drafting team has added to the definition of Operating Instruction are helpful. First they have eliminated ambiguity concerning which entities would issue such instructions – in a manner consistent with their function. In addition, we agree with the addition of the statement excluding those conversations which would not be considered an Operating Instruction. This allows us to differentiate between those communications which require action from those which are less consequential; improving the chances that the proper care is applied when reliability information is exchanged.
Yes
OEVC agrees that reliability is not best served by Compliance focus on the execution of every Operating Instruction in 100% accordance with the communications protocol documents. The attainment of perfection is always the ideal, but not realistic in any operating environment. Conversely, the establishment of high, but attainable, internal controls effectiveness goals is a proven method used in other industries to drive down process defects.
Yes
Since the execution of the internal controls process is part of COM-003-1's intent, OEVC believes it is appropriate that R1 and R2 be assigned a Medium VRF.
Although we believe that the latest version of COM-003-1 is ready for adoption by the NERC BOT, OEVC cannot approve the standard until the RSAW is also completed. In our view, the addition of the new risk-based language is the only reason that COM-003-1 is acceptable – but is incomplete without a fully vetted RSAW. There are still too many questions that remain about the audit process – and the success of the entire program hinges on its implementation.

No
<p>Seattle City Light commends the Standard Drafting Team on the changes to draft Standard COM-003-1, in particular the use of non-zero defect language that is the same as used in the CIP v5 Standards. Use of common language will help entities apply the new "identify, assess, and correct" approach consistently across Standards. Common language also will help ensure that regulators audit the new approach consistently. Seattle City Light is concerned, however, with the Standard Drafting Team's use of the term "Functional Entity" as establishing the bodies among which communications must meet the requirements of COM-003-1. Seattle has several objections. First, although "Functional Entity" is capitalized in the draft Standard, this term is not defined in the NERC Glossary of Terms. It appears the Standards Drafting Team may have used the term in error, because they were not aware it was not a Glossary-defined term during the COM-003-1 webinar held November 27, 2012. A second objection is that "Functional Entity" in this role does not add clarity to the Standard. "Functional Entity" is defined in the NERC Reliability Functional Model as "the term used in the Functional Model which applies to a class of entity that carries out the Tasks within a Function." This definition refers to other terms defined only with the Functional Model document ("Task," "Function"). It is not illuminating as to defining the bodies among which communications must meet COM-003-1. The third and strongest objection is that use of the term "Functional Entity" in requirements of the draft Standard is incorrect and inconsistent with the NERC Functional Model, and as such creates confusion about Standard obligations for entities registered for more than one function. The NERC Functional Mode Version 5 (November 30, 2009) explicitly does not require any particular organization or assignment of functional Tasks for any multi-function entity. Functional tasks exist undifferentiated across an entity as a whole, and the NERC Functional Model document states clearly that no further differentiation is expected, required, or implied. (See, for example, p. 7 "The Functional Model describes a functional entity envisioned to ensure that all of the Tasks related to its Function are performed. The Model, while using the term 'functional entity', is a guideline and cannot prescribe responsibility" and p.8 "The Model is independent of any particular organization or market structure.") Seattle City Light, for example, is a vertically integrated municipal utility registered for 11 functions: BA, DP, GO, GOP, LSE, PC, PSE, RP, TO, TOP, and TP. Registration is made without differentiation: no particular sub-organization within Seattle City Light is identified as performing BA tasks, as performing TOP tasks, and so on. The Model is simply that Seattle City Light or any other multi-function entity performs these Tasks as a unit. By contrast the draft Standard relies upon differentiation of Functions within an entity, so that it can be determined if a communication occurs between the Functional Entities covered by COM-003-1 or not. Such differentiation is outside the Model and introduces complexities and unintended consequences not envisioned by the Functional Model and the term "Functional Entity." The suggestion made by a member of the Standard Drafting Team during the November 27, 2012, webinar, that the nature of the communications would indicate if COM-003-1 applies or not (i.e., that an Operating Instruction from a System Operator to a Field Operator both working within the same vertically integrated entity could be presumed to be a communication from a TOP to a TO), is neither a sound nor clear basis to resolve the confusion introduced by the incorrect use of "Functional Entity" in the draft. Under such an approach an Operator of a multi-function entity has the extra burden of having to parse with limited or no guidance each communication as to applicability to COM-003-1. Such a burden does not promote timely communications nor reliable, consistent operations. Auditors and regulators assessing compliance with COM-003-1 will face the same confusion, and there is no assurance that different auditors and regulators from different regions will interpret communications the same way, even from</p>

one Operating Instruction to another. It is simply a misreading, tempting as it may be, to presume that Functional Entity Tasks are assigned with greater granularity than to an organization as a whole. To resolve the matter, Seattle City Light recommends simply that the term "Functional Entity" be deleted from within the Requirements of COM-003-1, with the end result that Operating Instructions will apply to BES Facilities and Elements regardless of entity involvement. The term "Functional Entity" is superfluous to the Standard. This suggestion involves changes to R1, R1.3, R1.4, and R2, as follows: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions ... that include the following 1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times ... in different time zones. 1.4. Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility when referring to a Transmission interface Element or a Transmission interface Facility-in an oral or written Operating Instruction , unless another name is mutually agreed to ... . R2. Each Distribution Provider and Generator Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions ... that include the following... (where ... indicates removal of "between Functional Entities" language)

No

The term "Responsible Entity" is not defined within the NERC Glossary and should not be capitalized in the VSLs. It is a leftover term from earlier versions of the NERC Functional Model (see discussion in Version 5, footnote pp.7-8 regarding use of Functional Entity and Responsible Entity).

Joseph DePoorter

No

See last question for comments.

Yes

The NSRF agrees with the language "...shall implement, in a manner that identifies, assesses and corrects deficiencies,..." However, the NSRF has concerns on how CEA's will audit to this requirement. The NSRF requests the SDT to provide information or a guideline that would demonstrate how a Regional Entity would assess and the type of evidence a registered entity would be required to show to demonstrate compliance. Please provide guidance on this topic.

No

For the VSLs, the NSRF is seeking clarification how an auditor will assess the "...identifies, assess and corrects deficiencies..." The VSL is severe if any one of the elements is missing and the NSRF believes that further guidance is needed to understand how a CEA will assess compliance on the control elements of this standard. For example, when would a CEA find a PV for a process that identifies, assess and corrects, however a System Operator does not follow their operating communication protocols on given Operating Instruction. The time horizon - Long-term Planning is incorrect, suggest Real-time Operations or Same-Day Operations. System Operator instructions will pertain to Real-Time or near Real-Time operations.

The NSRF understands that the SDT has discussed the combining of COM-002-3 and COM-003-1 issue (and still unresolved) in the past however the NSRF recommends the standard drafting team amend the SAR of COM-003-1 to combine or withdraw Reliability Standard COM-002-3 protocols. Having two standards covering System Operator communications can lead to confusion and have the unintended consequence of reducing clarity of System Operator communications thus, not supporting the reliability of the BES. For example, when does an Operating Instruction end and a Reliability Directive begin? The registered entity is now faced with possibility of double jeopardy. COM-003-1 has the language "...shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions." However, COM-002-3 does not have the same language. This presents a conflict when managing compliance for each of these standards. For example, a mistake with one of COM-003-1, R1 protocols does not automatically result

in a possible violation, however, in COM-002-3 each and every error would result in a possible violation. As COM-002-3 is written, when a Reliability directive is given, it does not need to follow any of the protocols established in COM-003-1. Again, the NSRF urges the drafting team to combine COM-002-3 and COM-003-1 into one standard. Issue: Defined term of Operating Instruction: "planning instructions verse orders in real-time" concerning issuing a start and stop times of a generation unit. In the draft 3 comments, the NSRF requested that the words "Real-time" be added to the definition of "Operating Instruction" and the OPCSDT stated on page 186 of the Consideration of Comments that "The SDT believes some Operating Instructions can be issued outside as well as in the Real Time horizon". Please clarify the difference between a planning instruction and a real-time Operating Instruction. Without the proper wording within this Standard, all CEA's may interpret this however they see fit. Recommend that "real-time" be added top the definition of Operating Instruction. R1.3: As written, R1.3 does not allow for any entities to have a documented communication protocol to address the issuing of an Operating Instruction between Functional Entities in different time zones without stating the time and time zone where the action is to occur. The NSRF recommends that R1.3 be worded parallel to R1.4 by adding the wording of; "unless there has been an established time and time zone protocol between Functional Entities in different time zones" or "unless a pre-defined approach is used for communicating time and time zones is within an established communication protocol". The above addition would allow different Functional Entities to agree beforehand of what timing system will be used. The NSRF believes that the intent of R1.3 is to have two separate Functional Entities (in two different time zones) in synch with each other so that there can be no misunderstanding of when an Operating Instruction is to occur. There are many Entities who already have these protocols established. Further, R1.3 states, "Use of the time, the time zone where the action will occur..." An RC operating across several time zones will need to know which time zone the entity is in that is receiving the Operating Instruction. Switching from an entity in one time-zone to another entity in another time-zone opens the door for more confusion than using an already established and documented protocol. R1.4 The NSRF recommends removal of sub-requirement 1.4. It has been establish over several commenting periods that Project 2007-03 eliminated TOP-002 R18 which referred to common names and line identifiers, The TOP SDT removed the language from the new standard was because the "This requirement adds no reliability benefit. Entities have existing processes that handle this issue." R1.5 The Alpha-numeric requirement is a one-size fits all solution and is not needed in all situations. The NSFR recommends removing the sub requirement or as an alternative,R1.5 should be reworded to state, "require alpha-numeric clarifiers when reissuing an Operating Instruction to resolve a misunderstanding". The risk of unclear communication is addressed by R1.6 and R1.7. Currently there is not a definition for "...is in alpha-numeric format". The NSRF requests clarification on where and how to apply alpha-numeric clarifiers. For example: Current System Operator communication: RC to GOP – Move generation from 500MW on Big Lake to 350MW at 1200 - time zone understood to be EST from established and documented protocol. Under COM-003-1. Move generation from five, zero, zero on Big Lake to three, five, zero at one, two, hundred hour central daylight time or Move generation from Big Lake to three, five, zero at one, two o'clock, charlie, delta, tango. GOP – is that two o'clock? Again, the purpose is to "reduce the possibility of miscommunication" Is ok to say twelve hundred (1200) ? Or only ok to be used for time? Is ok to say three hundred and fifty (350) MW? Is 350MW and alpha-numeric number? The NSRF agrees with the language "...shall implement, in a manner that identifies, assesses and corrects deficiencies,..." However, the NSRF has concerns on how CEA's will audit to this requirement. The NSRF requests the SDT to provide information or a guideline that would demonstrate how a Regional Entity would assess and the type of evidence a registered entity would be required to show to demonstrate compliance.

Some clarity in the definition of Operating Instruction is necessary. The definition suggests that only a System Operator, Reliability Coordinator, Transmission Operation or a Balancing Authority could issue an Operating Instruction. Are Distribution Providers and Generator Operations only recipients? Also, is an Operating Instruction limited to communications between Functional Entities? The requirements state this, but the definition does not.
No
Use of the phrase "implement in a manner that detects, assesses and corrects deficiencies..." is difficult to interpret and therefore creates uncertainty as to what is required. The Background section of the standard indicates that the SDT intended the phrase to be aimed at "deficiencies in the implementation of certain requirements". However, it is inconsistent to require "implementation" in a manner that does not require implementation, leaving the interpretation of this standard unclear. It appears also that the SDT did not want implementation failures to constitute violations. However, as drafted, the standard can still be interpreted to require an entity to implement its policies. It simply places an additional obligation on a Responsible Entity to detect and correct implementation failures. If the SDT wishes to eliminate violations for failure to implement a policy, then there should be a requirement to simply adopt a policy (covering specific subject matter) and a separate requirement to detect, assess and correct deficiencies in implementation.
Yes
No comment.
(1) R1 1.3 – The word 'and' should replace the comma between 'time, the time zone'. (2) R1, 1.8 – We believe that confirmation of receipt should be required from ALL receiving parties, not 'one or more'. (3) R1, 1.9 – The word 'issuer' could replace 'initiator' to be more consistent with the wording of the other requirements. (4) Measures – Both M1 and M2 are awkwardly worded. We suggest that they be rephrased to read 'Each Functional Entity, as applicable, must provide evidence of....' (5) Measures – Further to the comment in (4), we would be concerned about how an entity would be able to demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects. How exactly could it be demonstrated that a deficiency has been corrected through the manner in which the protocol was implemented? (6) Compliance, Data Retention – The statements that entities should retain evidence 'of its manner that identifies, assesses and corrects deficiencies' does not seem complete. The statements should line up with the language of the requirement/measure. For example, that the entities shall retain evidence that the documented communications protocols were implemented in a manner that....

We believe this is a standard that requires procedures or documents but has nothing to do with performance. These types of standards lead to auditors making a wide range of interpretations.
This is an attempt to make a requirement for 3 way communication for all operating communications. Not all operating conversations avail themselves to that format. The concept is good but allowances must be made for other situations.

Technically the definition is an improvement. The issue is with the need for this definition. The NBSO is opposed to having this term defined and added to the NERC Glossary. The term operating instruction does not need to be defined. System operators deal with operating instructions on a daily if not minute basis. Having a defined term, and calling such communication as "Command" is unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. The NBSO prefers that the objectives of the SAR (communications protocols) be handled through means other than a Standard (e.g. the Operating Committee's Reliability Guidelines on

Communications). Industry, NERC and the Regional Entities should focus on more productive reliability issues.
No
The requirement still includes the verb "implement". That phrase, as part of a mandatory standard, will require a zero-defect environment. The phrase "in a manner that identifies, assesses and corrects deficiencies" is vague, not measurable and inconsistent with the results-based standard concept which emphasizes the inclusion of a performance or reliability outcome in the requirement. A more direct and clear requirement would be to simply require "implement documented communication protocol....".
The SDT has been effective in responding to the Industry's concerns on the issue of "one-way" messaging. Communications Protocols are not documents that are suitable as "Standards" for a mandatory reliability standard. The zero-defect, self-reporting nature of such standards conflicts with the nature and impact of the violations that get reported. Protocols are internal controls that an entity imposes on itself. Protocols allow an entity to self-regulate itself and to decide if the monitored deviations from their own protocols warrant further action. To mandate such protocols are implemented removes the allowance for "impact to reliability". To mandate that an entity have protocols is a better approach. To create a new category for Protocols that do not carry the same level of monitoring and reporting as standards is an even better approach.
Individual
Barbara Kedrowski
Wisconsin Electric Power Company
No
NO do not support the revised definition. Although the addition of the last sentence helps, the drafting team has yet to differentiate an Operating Instruction command, from the already approved standards that refer to "directive, direct, direction" which may not be a "Reliability Directive" and will fall under, for instance IRO-001 R1 & R2. There needs to be a clear bright line between command and direct, direction.... The expression, "repeat, restate, rephrase, or recapitulate," in R. 1.7 and R2.1 would be clearer if shortened to, "repeat or summarize."
No
The revised standard is much improved by focusing on continuous improvement instead of making each communication imperfection a violation, but no guidance is provided as to how rigorous the improvement program must be to be deemed sufficient. M1 and M2 should have added at the end the statement, "Acceptable means of identifying, assessing and correcting deficiencies include the following: • Review of voice logs, for at least one hour per year for each person issuing commands or responses (as applicable) • Personal monitoring of communications, for at least one hour per year for each person issuing commands or responses (as applicable) • Annual refresher training, including a quiz on proper commands or responses, for each person issuing commands or responses (as applicable) (as applicable)
The revised standard, an improvement, yet falls short by opening the door for compliance enforcement to have a mechanism to apply communications and performance from other standards to commands issued under COM-003. Failures of GO and DP operators to repeat or summarize Operating Instructions are easily detectable (R2.1); but it would not ordinarily be possible for a person monitoring COM-003 compliance to detect a lack of understanding accompanied by failure to request a clarification (R2.2), since the resultant silence on the part of the operator is the same reaction associated with clearly understanding the Operating Instruction. M2 should be shortened to, "Evidence must include each applicable entity's documented communications protocols, which must include a provision requiring the recipient of an operating instruction to seek clarification from the initiator in the event of an unclear instruction." From the RSAW: "If the CEA finds in subsequent audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made based on prior recommendations. If the entity did not implement changes to identify, assess and correct deficiencies, the CEA may make a determination of possible non-compliance" The

issue here is potential for disagreement on "deficiencies". There are some conversations between GOPs and TOPs which are market driven, but could be read by an auditor as an "operating instruction". Some adjustment to the definition of "operating instruction", or some adjustment to the requirement that an entity address the "recommendation" from the region, may be in order here.

Yes

The problem is that Reliability Directives will have two inconsistent standards applicable to them, i.e., all Reliability Directives (COM-002) are Operating Instructions (COM-003), so, Reliability Directives will need to comply with both COM-002 and COM-003. COM-003's implementation plan should retire COM-002. FMPA is voting negative because two inconsistent standards applying to the same action, especially one as important as a Reliability Directive, is bad for reliability. The most glaring inconsistency for Reliability Directives are one-way burst communications (e.g., Party lines, or All Call), where COM-002 and COM-003 would treat the communications differently. If a Reliability Directive is given to all BAs in the region something like "due to capacity energy emergency, we need X MW shed within Y minutes in accordance with our previously approved allocations in procedure Z", COM-002 seems to say that each BA in the region would need to separately perform 3-part communication with the RC, whereas COM-003 would only require 3 part communication if the message was not understood. It would seem that during an Emergency, speed is of the essence, so, should the RC and BAs (who then need to spend time directing the DPs) spend the time doing separate 3 part communication with each BA, or should a one-way burst messaging occur with clarification only for those who do not understand? If there are dozens of BAs within an RC, COM-002 mode of communication could consume all the time of the Emergency and bad things can happen. FMPA recommends that COM-003 address Reliability Directives, which are a subset of Operating Instructions in a similar fashion to IROs being a subset of SOLs and how they are treated throughout the standards. BY doing so, COM-003 can retire COM-002 such that only one standard applies to Reliability Directives.

Individual

Ken Gardner

AESO

The AESO maintains that "alpha-numeric clarifiers" may be part of good operating practices, but the AESO does not support mandating the use of these identifiers as included in requirement R1.5 to be a mandatory obligation enforceable by law.

The proposed definition of an "Operating Instruction" continues to require clarification. First, the focus of COM-003 is on operations, and therefore the communications subject to the COM-003 requirement should be those requiring action in the Real-time operations time horizon — i.e., actions required within one hour or less. (See definition provided in a NERC document at: <a href="http://www.nerc.com/files/Time_Horizons.pdf">http://www.nerc.com/files/Time_Horizons.pdf</a> ). During the Q/A portion of the November 27th conference call hosted by the SDT, the SDT stated that they intended to narrow the focus of the timeframe of an Operating Instruction to the real time operating horizon. Nevertheless, the definition has not been so revised. Second, a "Reliability Directive" under COM-002 will necessarily fall within the definition of an "Operating Instruction" under COM-003. Because of this overlap, entities subject to the standard would be subject to two Reliability Standard violations – one under COM-002 and another under COM-003 – should the entity deviate from required protocols when either issuing or responding to a Reliability Directive. To avoid this overlap, the SDT should exclude a COM-002 Reliability Directive from the definition of an Operating Instruction under COM-003. Accordingly, PPL Companies suggest the following definition to address the above issues: "Operating Instruction" – Command, other than a Reliability Directive, from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System in which action must be taken within one hour. Alternatively, the SDT could recommend retirement of COM-002 upon the effectiveness of COM-003. If COM-002 is retired then the need to exclude "Reliability Directives" from the definition of an "Operating Instruction" would be unnecessary.

No
Hydro One continues to disagree with the need for this standard on the basis that the industry-approved COM-002 together with the NERC OC's operating guide on operator communication already provide the necessary requirements and guideline to fill any potential reliability gaps that may arise due to operator communication (see our response to Question #4 for more details). Notwithstanding above, we'd like to submit following comment in relation to this question. We believe that the proposed definition as worded can be misconstrued to mean a command made by System Operator to a Reliability Coordinator, or to a Transmission Operator, or to a Balancing Authority. Hydro One proposes the following wording: Operating Instruction —A command by a Reliability Coordinator System Operator, a Transmission Operator System Operator, or a Balancing Authority System Operator, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.
No

Hydro One appreciates the SDT's introduction of additional language in order to effectively make this standard not zero-defect. Unfortunately, since our issues are with the core need for this standard rather than its details we feel that the above mentioned change is not sufficient for us to reconsider our position.

Yes

- Hydro One continues to disagree with the need for this standard on the basis that the industry-approved COM-002 together with the NERC OC's operating guide on operator communication already provide the necessary requirements and guideline to fill any potential reliability gaps that may arise due to operator communication. Requiring 3-part communication for routine operating instructions, despite the additional wording in R1 ("in a manner that identifies, assesses and corrects deficiencies") and provisions made in the RSAW, is still a zero defect requirement that would add undue burden to the operators, which is a potential cause of unreliable operations. We therefore continue to disagree with the need for this standard as it adds little to reliability over what COM-002 and the operating guide have already accomplished. - We appreciate the SDT's hard work and dedication to develop this standard in response to the SAR and the recent BoT directives. Unfortunately, the need for this standard has been overtaken by event (the definition of Reliability Directives and COM-002-3, and the OC's operating guide on operator communication). The BoT, unfortunately, is still under the perception that COM-003 is the answer to the potential reliability gap that was discussed when it approved the COM-002 R2 interpretation. The two balloting results and the two sets of industry comments suggest that many in the industry share our view. Hence, we believe the industry should attempt to convince the BoT that the potential reliability gap has been duly addressed and therefore COM-003 is no longer needed. We understand the SDT has little to no option, we therefore suggest that the SDT present the results of this round of ballot, if it still fails to make the 2/3 approval rate, to the Standards Committee and ask for its permission to put a hold on further work until the BoT has heard the industry's concern and makes a policy decision on the way forward. Further revision to this standard and posting for industry commenting and balloting will only waist the SDT's effort and industry resource, without a fruitful outcome. - Notwithstanding the above, the proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in the Effective Dates Section (P. 2 of the Implementation Plan) and in Section A5 of the standard, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." - Functional entity is capitalized throughout the Standard, yet functional entity is not a defined term in the NERC Glossary. - Propose changing the wording in Requirement R1 to the following: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, have documented communication protocols that include identification, assessment, and correction of deficiencies in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between functional entities that include the following: [Violation Risk Factor: Medium [Time Horizon: Long-term Planning ] - The Sub-requirements introduce too much detail into the Standard. This detail dictates "how" something is to be done, rather than "what" is to be done. Following are comments to be considered on the sub-requirements should they remain in the Standard. - Propose changing the wording in Sub-requirement 1.1 to the following: 1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation or agreement. - Propose changing the wording in Sub-requirement 1.3 to the following: 1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between functional entities in different time zones., unless time protocols are defined in written agreements between the functional entities. - Regarding Sub-requirement 1.5, the use of alpha-numeric clarifiers should be no more than a best practice. In case of uncertainty, 3 part communication as specified in Sub-requirement 1.6 would catch any ambiguities. - Propose changing the wording in Sub-requirement 1.8 to the following: 1.8. When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (for example an all call system), verbally or electronically confirm receipt or that communications paths were established to receive the message from one or more receiving parties. - Regarding the Time Horizons for Requirements R1 and R2, they should be Real-time Operations since the communications are

occurring in real time, and the implementation of the protocol is the intent of R1 and R2.

Yes
No
CenterPoint Energy appreciates the revisions made to the current draft of COM-003 based on stakeholder feedback and has voted AFFIRMATIVE. However we remain concerned over the final manner in which this standard will be audited. The determination of the appropriate identification, assessment, and correction of deficiencies necessary to meet compliance can be subjective. Additionally, if an entity does not identify any deficiencies during its review process, there's the concern that an auditor may interpret that as insufficient Internal Controls rather than exemplary entity performance.

Yes
Yes
The problem is that Reliability Directives will have two inconsistent standards applicable to them, i.e., all Reliability Directives (COM-002) are Operating Instructions (COM-003), so, Reliability Directives will need to comply with both COM-002 and COM-003. COM-003's implementation plan should retire COM-002. FMPA is voting negative because two inconsistent standards applying to the same action, especially one as important as a Reliability Directive, is bad for reliability. The most glaring inconsistency for Reliability Directives are one-way burst communications (e.g., Party lines, or All Call), where COM-002 and COM-003 would treat the communications differently. If a Reliability Directive is given to all BAs in the region something like "due to capacity energy emergency, we need X MW shed within Y minutes in accordance with our previously approved allocations in procedure Z", COM-002 seems to say that each BA in the region would need to separately perform 3-part communication with the RC, whereas COM-003 would only require 3 part communication if the message was not understood. It would seem that during an Emergency, speed is of the essence, so, should the RC and BAs (who then need to spend time directing the DPs) spend the time doing separate 3 part communication with each BA, or should a one-way burst messaging occur with clarification only for those who do not understand? If there are dozens of BAs within an RC, COM-002 mode of communication could consume all the time of the Emergency and bad things can happen. FMPA recommends that COM-003 address Reliability Directives, which are a subset of Operating Instructions in a similar fashion to IROs being a subset of SOLs and how they are treated throughout the standards. BY doing so, COM-003 can retire COM-002 such that only one standard applies to Reliability Directives.

No
1. We voted against this draft because the relationship between Reliability Directive in COM-002-3 and Operating Instruction remains a serious problem and needs to be clarified. Is a Reliability Directive also an Operating Instruction, or is it a distinct type of communication? Do the provisions of COM-003-1 apply to Reliability Directives, or are they subject only to COM-002? 2. The added sentence added to the end of the definition is unnecessary, it is potentially ambiguous, and it provides no enhancement to reliability. The sentence will open the door for disputes about whether communications are Operating Instructions or something else.

No
We believe that the definition should indicate the timeframe in which the entity "is expected to act." We believe that this language is too wide and can be interpreted in many ways. Furthermore, we continue to believe that prescriptive communications protocols are unnecessary for routine Operating Instructions. Many Operating Instructions, such as economic loading of resources, do not have a reliability impact to the BES and the entities should not be held accountable to the requirements of this standard.
No
We believe that the requirements should clearly list which Functional Entities when the communications protocols should be utilized, for example, what happens when one of the five Functional Entities listed in these two requirements give an Operating Instruction to an entity not listed. Note that the question incorrectly references R2 which include the DP and GOP. Furthermore, while we agree with the concept of identifying, assessing, and correcting deficiencies, we continue to believe a prescriptive use of the word "include" should be removed. We would suggest using the word "consider" or "address."
No
We disagree with the explanation of why the VRF for both R1 and R2 were changed from "Low" to "Medium" and believe that these continue to be administrative requirements justifying a "Low" VRF.
We continue to believe that this standard is too prescriptive as noted in question #2 above and in its current draft appears to us to be not much different than when issuing Reliability Directives. We have discussed in our group that if this standard is implemented as proposed that there would no longer be a need for COM-002-3. In addition, in the proposed standard Background section it states "that these requirements should not focus on individual instances of failure as a basis for violating the standard." But, the draft RSAW states that the CEA: "Review a sample of the entity's Operating Instructions to verify whether the entity is implementing its documented communication protocols," which appears to be contradicting the language in the Background section. It also appears that the language in the RSAWs would require an entity to keep a log of all Operating Instruction. This would be overly burdensome to the industry and is not included in the requirements. The reference in R1 Part 1.3 to specify different time zones is indicative of the overly prescriptive nature of all nine parts of the requirement. Entities that already have protocols of handling different time zones may have negative reliability impacts when required to use a different convention. For example, entities operating across different time zones may rely on their EMS time and requiring the use of a different time zone convention would be confusing. Entities should be able to determine what works best.

Suggested improvement: We recommend separate requirements for: 1. Documentation and implementation of communication protocols. 2. Documentation and implementation of control processes for the identification, assessment, and correction of deficiencies. In addition, we recommend adding the following to the draft standard: 1. It should be noted that individual failures to use the documented communication protocols should not be considered violations of the implementation of communication protocols. 2. It should be noted that individual failures of control processes for the identification, assessment, and correction of deficiencies should not be considered violations of the implementation of the control processes for the identification, assessment, and correction of deficiencies.

ERCOT supports the SRC comments and has additional comments. For this question, see the comments in the comment area of question 4.
No
The VSL's do not match up with CIP v5 standards. Listing "The Responsible Entity did not implement, in a manner that identifies, assesses and corrects deficiencies, their documented communication protocols as required in Requirement R1" as a severe VSL distinguishes the activities as a singular and separate activity which is inappropriate. CIP v5 more appropriately incorporates it at each VSL level as a part of each VSL which reflects the language in the requirement "in a manner that". If the standard passes, VSLs should be modified like those in CIP v5. Example: The Responsible Entity did not include one (1) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols and did not identify, assess, or correct the deficiencies.
1.) While the proposed definition of "Operating Instruction" reflects improvement in that it helps to clarify exclusion of particular communications not intended to be regulated by the standard, the definition still should not be included because it is unnecessary to address the SAR. This definition supports this standard which is solely focused on reducing miscommunication (incorrect communications) and does not, in ERCOT's opinion, address the Blackout Recommendation and FERC Order which this project is intended to address, as identified in the SAR. As proposed, the term "Operating Instruction" could include communications that have nothing to do with reliability - e.g. communications that are market related and have no impact on system reliability. That outcome is inconsistent with FERC's direction in Order No.693. FERC's discussion of this issue in Order 693 focuses on alerts and emergencies as follows- "We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies..." (693 at P 531) "Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies." (693 at P 535) In addition, the scope of FERC's concerns is limited to communications that impact the reliability of the BPS - "We note that the ERO's response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System." (693 at P 531) "...we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System." (693 at P 532) During the recent webinar, it was evident that confusion still exists and that this proposed standard does not resolve the confusion. In fact, the proposed standard and definition contribute to the confusion. Primarily, the definition should not be made applicable to system operators within the same company and control room who are registered as multiple functions. ERCOT ISO does not have separate desks or operating personnel that perform a single function but performs its functions simultaneously by multiple system operators. The functional entity is not an individual but the entity registered for that function. 2.) ERCOT fully supports the concept that functional entities' internal controls should be used to monitor the effectiveness of their own protocols. However, these matters are not suitable for

reliability standards. Imposition of mandatory controls applicable to all functional entities is inappropriate because of the wide variety of organizational structures that necessarily requires flexibility with respect to developing appropriate controls for each entity's specific circumstances. Furthermore, entities' internal controls are beyond the scope of the Section 215 reliability purview generally, and they are inconsistent with the risk-based initiative being pursued by NERC because they do not impact/are not related to actual reliability impacts. Furthermore, the deficiency review process is ambiguous and, accordingly, lends itself to inefficient and ineffective CMEP results. As an initial matter, what constitutes a deficiency will be an issue that is vulnerable to subjective disagreements. Even assuming there is agreement on that issue, what constitutes an appropriate remedy for a deficiency in terms of assessment and correction will similarly be susceptible to subjective disagreements. Finally, with respect to the obligation to evaluate the deficiency identification process itself, again, the potential for the introduction of subjective compliance review will be problematic in practice in terms of reviewing the decision whether to implement a modification or not to implement a modification; and, if a modification is implemented, whether the revision is adequate. ERCOT is encouraged to see NERC's willingness to explore new ways to move away from a zero defect mentality, but does not understand nor agree with the approach of including such provisions in the standards. The reliability standards should be left as performance-based, not be administrative or prescriptive, and have clear measures. This standard is administrative, prescriptive, and solely focused on miscommunications (incorrect communications) which is a subset, if that, of the "communication protocols" intended by the FERC Order 693 and subsequent Blackout Recommendation. This disconnect is specifically why it has been difficult to garner industry support on this proposed standard. 3.) If the standard were based on effective communication protocols and not specifically miscommunication (incorrect communication) protocols, it would be clearer and more supported than what has been presented to industry for comment and each of the ballots. The SDT, while being very responsive to certain comments that keep its focus on miscommunications, has not been responsive to the industry comments supporting that the proposed requirements are unnecessary and a call for requirements directly responsive to FERC Order 693 and the subsequent Blackout Recommendation related to this project which are related to "effective" communications. The SDT has repeatedly focused on miscommunications rather than on "effective" communications protocols. Effective protocols would constitute communications protocols related to what information needs to be communicated, who needs the information, when they need it particularly during alerts and emergencies. Common phrases, terms, means, etc. can be employed to produce uniformity. As the Blackout Recommendation stated "Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability." When the Blackout report is read it is evident, this had no stated relationship to miscommunications, but instead to the reliability content of the communications, responsibilities, and speed at which communications occurred. This proposed standard also gives no emphasis to Alerts and Emergencies which is another indicator that it has missed the intended objective of the FERC Order and subsequent Blackout Recommendation. ERCOT respectfully recommends a renewed focus on communication protocol requirements related to promoting "effective" communications and not solely focused on miscommunications. Recent event investigations have only continued to support this concept as recommendations have been made to improve communication protocols that do not have any relation to preventing miscommunications. Examples below: Feb 2, 2008 Cold Weather Event Report Recommendations: 21.) Balancing Authorities should improve communications during extreme cold weather events with Transmission Owner/Operators, Distribution Providers, and other market participants. (page 218) 22.) ERCOT should review and modify its Protocols as needed to give Transmission Service Providers and Distribution Service Providers in Texas access to information about loads on their systems that could be curtailed by ERCOT as Load Resources or as Emergency Interruptible Load Service. (page 218) 23. WECC should review its Reliability Coordinator procedures for providing notice to Transmission Operators and Balancing Authorities when another Transmission Operator or Balancing Authority within WECC is experiencing a system emergency (or likely will experience a system emergency), and consider whether modification of those procedures is needed to expedite the notice process. (page 219) 24. All Transmission Operators and Balancing Authorities should examine their emergency communications protocols or procedures to ensure that not too much responsibility is placed on a single system operator or on other key personnel during an emergency, and should consider developing single points of contact (persons who are not otherwise responsible for emergency operations) for communications during an emergency or likely emergency.

(page 219) Arizona San Diego Outage Report Recommendations 15. On September 8, 2011, at least one affected TOP lost the ability to conduct RTCA more than 30 minutes prior to and throughout the course of the event due to the failure of its State Estimator to converge. The entity did not notify WECC RC or any of its neighboring TOPs, preventing this entity from regaining situational awareness.

Cogentrix Energy Power Management, LLC

1. The expression, "repeat, restate, rephrase, or recapitulate," in R. 1.7 and R2.1 would be clearer if shortened to, "repeat or summarize." 2. The revised standard is much improved by focusing on continuous improvement instead of making each communication imperfection a violation, but no guidance is provided as to how rigorous the improvement program must be to be deemed sufficient. M1 and M2 should have added at the end of the statement, "Acceptable means of identifying, assessing and correcting deficiencies include the following: • Review of voice logs, for at least one hour per year for each person issuing commands or responses (as applicable) • Personal monitoring of communications, for at least one hour per year for each person issuing commands or responses (as applicable) • Annual refresher training, including a quiz on proper commands or responses, for each person issuing commands or responses (as applicable) (as applicable) 3. Failures of GO and DP operators to repeat or summarize Operating Instructions are easily detectable (R2.1); but it would not ordinarily be possible for a person monitoring COM-003 compliance to detect a lack of understanding accompanied by failure to request a clarification (R2.2), since the resultant silence on the part of the operator is the same reaction associated with clearly understanding the Operating Instruction. M2 should be shortened to, "Evidence must include each applicable entity's documented communications protocols, which must include a provision requiring the recipient of an operating instruction to seek clarification from the initiator in the event of an unclear instruction." 4. From the RSAW: "If the CEA finds in subsequent audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made based on prior recommendations. If the entity did not implement changes to identify, assess and correct deficiencies, the CEA may make a determination of possible non-compliance" The issue here is potential for disagreement on "deficiencies". There are some conversations between GOPs and TOPs which are market driven, but could be read by an auditor as an "operating instruction". Some adjustment to the definition of "operating instruction", or some adjustment to the requirement that an entity address the "recommendation" from the region, may be in order here.

City of Austin dba Austin Energy

Yes

Yes

Austin Energy is pleased the SDT changed the internal control language to be consistent with CIP v5 language.

Yes

(1) The SDT requested industry comment on the reference to "Operating Instructions between Functional Entities." Industry discussions indicate that entities interpret this phrase in different ways. Austin Energy (AE) agrees the use of the term "Functional Entity" is confusing. As noted during the 11/27/12 webinar, Functional Entity is not defined in the NERC Glossary but, instead, only in the functional model. As described by the speakers at the webinar, this language requires protocols for communication between RC and TOP entities or TOP and TO entities, but does not require the same

protocols for TOP-to-TOP communications. This implies that vertically integrated companies should designate certain employees as part of one Functional Entity and other employees as part of another Functional Entity. In the case of AE, this would show up as some employees being "TOP" and others being "TO" and still others as "DP" or "GOP." In reality, all employees are AE employees and it is impractical and confusing to designate them any other way. AE holds one registration with NERC for five different functions (TO, TP, DP, LSE and TOP) and a second registration for the GO and GOP functions. This is due to Regional Entity requirements at the time of registration. AE, as a municipal utility, performs all of those functions but is not organized in a way as to label each employee as fitting under a particular function. The confusion continues when considering communications between companies. In the ERCOT Region, approximately 15 local control centers and ERCOT are all registered as "TOP." One might interpret the webinar discussion to require that communications between neighboring TOPs or ERCOT and one of the local control centers are not subject to the requirements of COM-003-1 because these are TOP-to-TOP communications. AE suggests the SDT greatly simplify COM-003-1 and require entities to "implement, in a manner..., protocols that include three-part communication for Operating Instructions." In other words, omit the reference to Functional Entity. Alternatively, if the SDT wants to limit the protocols to communications between companies (another common interpretation), simply state the requirement that way. (2) AE believes the specificity in the subparts of R1 is unnecessary. Three-part communication is the preferred method for ensuring that both parties understand an Operating Instruction. It provides a sufficient mechanism for clear, concise and accurate communication. AE believes that creating a protocol requiring System Operators to essentially re-learn how to speak (specifically using alpha-numeric identifiers) will only create confusion as operators try to follow protocol and catch/correct themselves.

Marie Knox

MISO

No

The definition of "Operating Instruction" as proposed in this draft standard is overly broad and ambiguous and will result in everyday operations communications being subject to each entity's "documented communications protocols" unnecessarily, diverting real-time operations resources from monitoring BES reliability and ensuring that changes necessary for reliability are properly understood and implemented. In particular, based on the definition, it is unclear as to whether a discussion regarding implementation of an operating guide would be an "Operating Instruction". More specifically, an operating guide is a common, known, and agreed upon operational action that an entity will take in response to identified system conditions. However, such guide is not normally implemented until the condition manifests itself. Accordingly, based on the definition of "Operating Instruction", it is unclear as to whether a discussion between entities regarding implementation of such an operating guide once the associated condition manifests itself would be considered a "command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System". This uncertainty can only result in affected entities being overly conservative and applying the requirements of COM-003 to a vast majority of communications, resulting in a significant divergence of resources as described above. MISO cannot support the proposed draft standard given the current level of ambiguity, the potential impact upon real-time operations, and the potential for such impact to detract from BES reliability.

No

It is unclear what is meant by "shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities". In particular, there is no established criteria regarding what constitutes "a manner that identifies, assesses and corrects deficiencies". Further, there is no documentation nor rationale provided to support the assignment of a severe VSL to the failure of a Registered Entity to implement its documented communication protocols in "a manner that identifies, assesses and corrects deficiencies". Without a clear criteria, the potential for subjective interpretation of this portion of the requirement is significant and such subjectivity would be associated the most severe VSL possible without justification. Accordingly, MISO cannot support this portion of R1 within this draft proposed

standard.

No

Requirement 1 and 2 do not have a direct effect on the reliability of the BES. Requirement 1 provides clarity for Operating Instructions and Requirement 2 ensures implemented communication protocols are documented. Because R1 and R2 are administrative in nature, we recommend the "Lower" instead of "Medium."

MISO appreciates the time and effort expended by the SDT in revising the proposed draft standard in response to prior comments. However, the ambiguity and absence of justification still present within and associated with this draft, proposed standard prevent MISO from providing its support for COM-003. Additional comments regarding specific sub-requirements are provided below: R1.1 provides that English shall be used "unless another language is mandated by law or regulation. This requirement should be modified to require that operators use English for oral Operating Instructions, even if it is not the required primary language pursuant to law or regulation. R1.2 requires the use of a 24-hour clock for all times. This requirement would result in the expenditure of significant time, resources and attention by System Operators for a minimal benefit to reliability. To date, the use of the 12-hour clock time has not been demonstrated as problematic or as having an adverse impact on reliability. MISO notes that the use of the 24-hour clock time in communication is inconsistent with the 12-hour clock time currently utilized by most systems. The system time characteristics, which are primarily based on 12-hour clock time, should inform the communication protocols regarding time. Accordingly, this requirement appears to place upon operators a requirement that is not justified and onerous. MISO respectfully requests that the SDT consider removal of this requirement. R1.3 states: Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between Functional Entities in different time zones. We recommend this be clarified. The requirement should say that the time zone be specified when communicating across zones "unless a pre-defined approach is used for communicating time in the protocols". R1.4 requires the use of the name specified by the owner(s) for each Transmission interface Element or Transmission Interface Facility in an oral or written Operating Instruction. MISO respectfully submits that this requirement is already addressed in TOP-002-2b, R18. Further, MISO respectfully comments that, to date, System Operators have identified equipment by to/from station and voltage level. Such identification has been sufficient to ensure the accurate identification of Transmission interface Elements and Facilities. Additionally, MISO notes that internal identifiers utilized by owners may result from internal coding or naming conventions that would not be known by or comprehensible to external entities. Hence, MISO cannot support this requirement based on the potential adverse impacts to reliability that could result. R1.5: MISO reiterates its comments in Round 2 and 3 that the requirement to use alpha-numeric clarifiers format is ambiguous and could lead to unintended compliance burdens. For instance, it is ambiguous whether alpha-numeric clarifiers would be necessary when referring to commonly-accepted voltage levels, such as 138kv (alpha-numerically as follows: "One-tree-eight-kilo-victor"). MISO argues that in this case that the communication would be less clear and more likely to be misunderstood or misconstrued. MISO also respectfully points out that there is an extra period and space at the beginning of the parenthetical in the draft version of the R1.5. R1.6 and R1.7: Given the broad applicability of R1.6 and R1.7 as a result of the definition of Operating Instruction, the split of compliance obligations into multiple sub-requirements may result in entities being assessed violations for multiple requirements as a result of 1 (one) communication or operating event. While MISO appreciates the clarity in roles and responsibilities the split provides, it is concerned about the future application and feasibility thereof. Please refer to MISO's comments regarding the definition of Operating Communication for more detail on the likely adverse impact to reliability that will result from the diversion of time and resources the split will require. Overall, MISO supports the need to ensure good communications among users, owners, and operators of the grid, but believe the standard, as drafted is misdirected. As drafted, this standard can actually impede reliability as there are, at times, better ways to communicate when group action is needed and there are times when speed or "give and take" are needed. The definition of Operating Instruction could be construed and is sufficiently ambiguous to results in the applicability of COM-003 to common operational communications including non-requests / non-directives diverting time and attention away from ensuring that changes necessary for reliability are properly understood and implemented. MISO cannot support the current version of COM-003-1. Though MISO is voting negative this round, we would respectfully request that the SDT add the following language for the next round of comment

consideration and balloting: "Electronic means of communication can be used in lieu of oral when the clarity of the electronic communication is sufficient to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES."

Comments already provided through the ISO/RTO Standards Review Committee

It is not clear why the Time Horizon is identified as "Long-term Planning" for requirements R1 and R2, since this seems to be a "Real-Time" communication standard.

No

Technically the definition is an improvement and the SRC would agree with the proposed changes, if the definition were needed. The issue is with the need for this definition, and the continuing debate this definition is generating. The SRC is opposed to having this term defined and added to the NERC Glossary. The term operating instruction does not need to be defined. For years, system operators deal with operating instructions on a daily if not minute basis. Having a defined term, and calling such communication as "Command" is unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. While the SDT has found that their previous definitions were not appropriate for a NERC standard, and subsequent incremental changes are useful, the debate itself does not seem to be a productive use of the SDT's or the Industry's time. The SRC would prefer that the objectives of the SAR (communications protocols) be handled through means other than a Standard (e.g. the Operating Committee's Reliability Guidelines on Communications). The reason being, a standard requires zero-defect compliance, data retention, self-reporting, and requires these debates over the proposed terms such as "Operating instruction" which diverts the Industry, NERC and the Regional Entities from focusing on more productive reliability issues.

No

The SRC appreciates the SDT's initiative but points out that the requirement still includes the verb "implement". That phrase, as part of a mandatory standard, will require a zero-defect environment. The phrase "in a manner that identifies, assesses and corrects deficiencies" is vague, not measurable and inconsistent with the results-based standard concept which emphasizes the inclusion of a performance or reliability outcome in the requirement. A more direct and clear requirement would be to simply require "implement documented communication protocol....". We appreciate the SDT's intent for adding this phrase, but it does little to ease the concerns of the commenters. Instead, the addition

introduces an immeasurable phrase that may in fact make the requirement more ambiguous and unclear. The SRC realizes the SDT is trying to mandate a Communications Protocol, and would therefore suggest if the SDT still believes a Standard is necessary, then the SDT need only require each entity "have communications protocols, that include periodic monitoring, assessments, and procedures for mitigating violations of those protocols."

The SDT has been effective in responding to the Industry's concerns on the issue of "one-way" messaging. Communications Protocols are not documents that are suitable as "Standards" for a mandatory reliability standard. The zero-defect, self-reporting nature of such standards conflicts with the nature and impact of the violations that get reported. Protocols are internal controls that an entity imposes on itself. Protocols allow an entity to self-regulate itself and to decide if the monitored deviations from their own protocols warrant further action. To mandate such protocols are implemented removes the allowance for "impact to reliability". To mandate that an entity have protocols is a better approach. To create a new category for Protocols that do not carry the same level of monitoring and reporting as standards is an even better approach. The SRC recognizes that the SDT has submitted an RSAW that is designed to mitigate the zero-defect impacts. However, as is stressed by NERC, RSAWs are not requirements. The only requirements are those in the approved standard itself.

NPCC RSC

No

We support the comment submitted by the NPCC RSC. It is unclear if a definition of operating instruction is necessary as many entities may use this term and apply it for each unique organization. However NPCC has proposed an alternate definition that should be considered.

Yes

We agree with the proposal to remove R3 and R4. The revisions to R1 and R2 are an improvement. However, it remains unclear whether a communication protocol should be a standard or a guideline. We continue to look for evidence that this type of requirement would have directly prevented a previous event, as there is no published reports today.

We support the set of comments provided by the NPCC RSC and are repeated below: Functional entity is capitalized throughout the Standard, yet functional entity is not a defined term in the NERC Glossary. Propose changing the wording in Requirement R1 to the following: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communication protocols that include identification, assessment, and correction of deficiencies for Operating Instructions between functional entities that include the following: [Violation Risk Factor: Medium [Time Horizon: Long-term Planning ] The Sub-requirements introduce too much detail into the Standard. This detail dictates "how" something is to be done, rather than "what" is to be done. Following are comments to be considered on the sub-requirements should they remain in the Standard. Propose changing the wording in Sub-requirement 1.1 to the following: 1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation or agreement. Propose changing the wording in Sub-requirement 1.3 to the following: 1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time when issuing an oral or written Operating Instruction that refers to clock times between functional entities in different time zones, unless time protocols are defined in written agreements between the functional entities. Regarding Sub-requirement 1.5, the use of alpha-numeric clarifiers should be no more than a best practice. In case of uncertainty, 3 part communication as specified in Sub-requirement 1.6 would catch any ambiguities. Propose changing the wording in Sub-requirement 1.8 to the following: 1.8. When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (for example an all call system), verbally or electronically confirm receipt or that communications paths were established to receive the message from one or more receiving parties. Regarding the Time Horizons for Requirements R1 and R2, they should be Real-time Operations since the communications are

occurring in real time, and the implementation of the protocol is the intent of R1 and R2. Suggest that the Standard be further clarified so that the intended purpose is to ensure that an entity has implemented a communications protocol with various core attributes, such as three part communication. We believe that it is not the SDT's intent that an entity will be found out of compliance for instances when an operating instruction was given which did not conform to its implemented protocol. Compliance will only be assessed if the Protocol procedure itself was not formally implemented and not to individual violations of such procedure which will be handled by internal controls to track and address any deficiency. In the context of implementation, sufficient implementation as used in this Standard could be demonstrated by management approved protocol procedures issued to the appropriate individuals in the organization and documented training. The Standard is not envisioned to be a zero-defect Standard however, and unless entities and audit staff have clear understandings of what "implement" means there may be instances when an auditor may find non-compliance beyond the intent of the Standard's Purpose and the Reliability Assurance Initiative concept being brought forward with this Standard. Suggest clarification to the word implement as it is used in the Standard and what activities in the compliance area will ensure proper audit expectations are set.

Michiko Sell

Public Utility District No. 2 of Grant County, WA

Yes

No

The term Functional Entities is not a defined term within the NERC glossary nor is it a newly defined term in the proposed Standard language. Grant echoes Seattle City Lights concern with the use of this term.

No

Grant only has concern with the use of "Responsible Entity" within the VSL language since it also is not a recognized defined term.

Grant recognizes the tremendous effort set forth by the Standards Drafting Team in response to comments received on this Standard. Grant is also appreciative of the inclusion of non-zero defect language promoting entities to identify, assess and correct deficiencies in support of reliability improvement.

Alice Ireland

Xcel Energy

Yes

Yes

Yes

Xcel Energy is voting negative, again, because we continue to believe that some of the individual protocols are too prescriptive. We strongly believe that some of these protocols would be more effective if used in certain circumstances, instead of at all times. In particular, we do not agree with 1.5 being required on all Operating Instructions. Here are some specific perspectives: 1) If field personnel are working from a written copy of a switching request, and they confirm the switching request number, revision, etc., we believe there should be an exception from the use of alpha-numeric clarifiers when the operator and field person are confirming the steps. Do they consider this "oral" communication and thus meeting compliance of 1.5? 2) The use of alpha-numeric clarifiers does not always make a communication more clear. The intent of the standard is to improve a misunderstanding, not create misunderstanding when giving the instruction. As stated previously, we

feel that the use of alpha-numeric clarifiers should be a tool available to the operator when the original communication was not correctly understood. We recommend that R1.5 be reworded to something like this: 1.5 Circumstances where personnel should use alpha-numeric clarifiers, when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format.

Jason Snodgrass

Georgia Transmission Corporation

No

GTC is concerned that the proposed definition of an "Operating Instruction" is too similar to the definition of a "Reliability Directive" specifically with the inclusion of "command from a System Operator". GTC recommends an additional statement such as "The term does not include commands specified as Reliability Directives".

No

GTC agrees with the decision to remove R3 and R4 from COM-003 draft 4, but is concerned with the incorporation of the internal controls language in R1 and R2. These changes don't resolve the concerns submitted on the previous draft of the standard. GTC believes that internal controls should be implemented based on a registered entities' assessment of risk and should not be subject to fines and penalties if a regional entity does not agree with a registered entity's control design or control effectiveness. We also question whether the current set of auditors have the appropriate skill set to assess internal control. We believe an assessment of internal controls is appropriate in determining the depth and breadth of audit testing, but strongly disagree that regional entity's should have the authority to, in effect, dictate internal control design. Furthermore, if this language is incorporated, GTC believes that there is too much uncertainty on how Regional Entities will audit internal controls during compliance audits and what a violation will look like. For example, suppose a Registered Entity confirmed that its Operating Instructions between Functional Entities were implemented correctly 100% of the time during a specified reporting period. Would this entity then be designated as non-compliant since zero deficiencies were identified via the control method and thus there wasn't a need to correct? As such, GTC strongly encourages that the internal controls language "in a manner that identifies, assesses and corrects deficiencies" be removed from COM-003 in order to allow the Reliability Assurance Initiative (RAI) effort to be fully developed and implemented with industry involvement to define how a risk-based model will work and how a registered entity's internal controls will be assessed.

No

See example above identifying the possibility that an entity could perform Operating Instructions 100% correctly, yet could be designated as a Severe VSL since the control manner didn't identify any deficiencies.

Group

Boneville Power Administration

Jamison Dye

Yes

No

BPA does not agree with the use of the phrase "between Functional Entities" in R1 and R2 because one organization can have multiple Functional Entities within it. BPA believes that an organization should be able to establish its own internal communication protocols. In consideration of comments, the drafting team stated "The SDT agrees that these communication protocols apply only to external communications between system operators for the TOP, GOP, and BA. It would only make sense to have them apply internally but that is the entity's option. Most entities use all or some of these communication protocols already." However, the language of the standard and the November 27 webinar indicate otherwise. During the webinar an industry representative asked, "Consider a

vertically integrated utility performing functional roles of a BA, TOP, and GOP. Is it required to have communication protocols for operating instructions between the different system operator desks." Both presenters answered "Yes," and explained that separate functional entities within a company would need to comply with this requirement. (11/27 Webinar recording at 1:04/1:30) BPA suggests that the term "external" be added before "functional entities" or another phrasing change be incorporated into the standard to eliminate this potential interpretation.

Yes

Individual

Warren Rust

Colorado Springs Utilities (CSU)

No

CSU appreciates the difficulty the SDT faces in drafting and pursuing approval of this Standard and its Requirements and the hard work of the members. "Operating Order" is a better term than "Operating Instruction" as "instruction" has the connotation of advice or guidance, where I believe the SDT means to convey a sense of "being told to do something ... as in, this is an 'order'." System Operator is already defined in the NERC glossary as, "An individual at a control center <<sic\*>> (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time." Therefore, the first sentence of the definition is redundant. If the point is to exclude Generator Operators at Control Centers (not sure why that should be), then it would seem easier to simply state that. Facility is also already defined in the NERC glossary as, "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)" and, so, should already be covered by the phrase, "of an Element of the Bulk Electric System," in that, by operating an Element, one would, of necessity, be operating one or more of any Facilities comprising that Element. Also, it is possible that the recipient may not be the person actually taking the action, but may need to pass the Operating Order on for action. Suggest that a more concise definition might be along the lines, "Operating Order - A command by a System Operator with the expectation that the recipient is to take or ensure action is taken to change or preserve the state, status, output, or input of an Element of the Bulk Electric System. Discussions of general information and of potential operations or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions." \*Control Center is a defined term.

Yes

Specifically, agree with the removal of R3 & R4.

No

Having and implementing a "communications protocol" are administrative in nature and the mere fact of not having or implementing such a protocol is not sufficient to "directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system." The VRFs for these two requirements should be LOW. The VSLs, as drafted, focus specifically on the contents of the "communications protocol," but they should address implementation, since that is the active verb in both of the requirements; "shall implement."

Again, I appreciate the hard work required of the members of this SDT to formulate these drafts in the midst of wildly differing expectations and also appreciate the opportunity to express my opinions in this comment. 1) In Consideration of Comments to Draft 3, the SDT stated "... COM-003-1 only applies to communication between functional entities. For example, if a TOP System Operator is issuing an Operating Instruction to an individual that is internal to that TOP, three part communication is not required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual in another TOP or another functional entity (e.g. Distribution Provider, Generator Operator), then three part communication is required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual that is not in a functional entity, then three part communication is not required by this standard." and; In response to Bonneville Power Authority comment, "In R1.5, BPA disagrees with the mandatory use of alpha numeric communication protocols for internal communications ..." Response: The SDT agrees that these communication

protocols apply only to external communications between system operators for the TOP, GOP, and BA ...” [Comment] It is not clear in the language of the standard that the requirements apply only to external communications. The standard should explicitly state so. The requirement should apply only to communications between separate Registered Entities, vice Functional Entities. Within a single control room (same room) there may be Transmission System Operators, Distribution System Operators, and Generator Operators. If the CEA considers that those individuals represent different Functional Entities (even though all work for the same Registered Entity), and takes into consideration the above guidance, one “TSO” could issue an instruction to another “TSO” or to an individual in the field (ostensibly not a Functional Entity) without needing to show compliance with any of the minimum Communication Protocol requirements, but would have to show compliance when giving an order to the “DSO” or “GSO” at the next desk over. And, does the SDT have a suggestion for how the various “Communications Protocol” requirements be evidenced for compliance when communication between “in-house” Functional Entities is face-to-face? 2) From the Consideration of Comments, Summary p.4, “Commenters in draft 3 argued that “alpha-numeric clarifiers” are of no value and could only lead to confusion and delays by System Operators. The SDT has chosen to retain the inclusion of alpha-numeric clarifiers as a means of clarifying Operating Instructions. The use of such clarifiers, which an entity can develop to suit their preferences, eliminates the ambiguity of similar sounding letters and numbers. Their use, based on the experience of other organizations that use them, becomes a natural part of communication language.” [Comment] There are situations where the use of such clarifiers would exacerbate ambiguity or unnecessarily complicate or burden the communication leading to just as much risk of misunderstanding. Does “develop to suit their preferences” give room for an entity to state in its Communications Protocol that the use of “clarifiers” is required in Operating Instructions only when it is obvious they are necessary to ensure clarity? From the Consideration of Comments, in response to ACES Power Marketing Standards Collaborators comment; “Response: The requirement does allow an entity to develop its own protocol around alpha numeric clarifiers. The protocol should be uniform, clear and must increase reliability. ” [Comment] It appears, from the language in the draft, that the only flexibility might be in deciding what “clarifiers” are to be used (Alpha vs Adam, etc.). Is it the SDT’s intention that an Entity could address alpha-numeric clarifiers in its Protocol by stating they do not need to be used, or only as necessary to ensure clarity? Also, in my opinion, it is not sufficiently clear that such clarifiers are necessary to increase BES reliability in the first place. CSU agrees with the numerous commentators on the previous draft as well as any on the current one that the use of “alpha-numeric identifiers,” while appropriate in certain, if not many, circumstances; may not be appropriate in all and may, indeed, be counter to productive and clear communication in some, if not many, circumstances. 3) And, in response to PPL Corporation NERC Registered Affiliates’ comment in regards to the use of the EPRI study, “Response: The OPCPSDT thanks you for your comments. The OPCPSDT cited those figures from a commenter who appended an Industry white paper (by the same author) to the draft comment form. The SDT responded after reading it. Even if the mishap rate for communication issues is 14.5% that is a significant impact on BES reliability that will be addressed by COM-003-1.” The SDT continues, in their consideration of comments to Draft 3, to rely on an EPRI study which does not support the conclusions they wish to draw from it. “Failure to use `alpha-numeric clarifiers’” was not one of the identified communications deficiencies in the EPRI study and therefore it is misguided to cite this study in defense of requiring the use of such `clarifiers’ in Operating Instructions. Indeed, none of the proposed requirements can be found as cited deficiencies in that report. The study depended on voluntary reporting by only a portion of EPRI members, and was not designed to be scientifically valid study. The introduction to the study itself acknowledged that the sample was self-selected and not random, so, therefore, “not representative of the industry as a whole, or even the membership of EPRI.” The report also goes on to state there may be reporting bias in the data submitted (e.g, utilities may have been motivated to participate by their own high error rates, while those with low rates may have chosen not to participate). Also, the data submitted were a result of each utility’s internal investigations – not necessarily consistently performed even within the same utility, and most probably not between different utilities. The SDT is relying on the contribution of communications deficiencies in 14.5% of the reported events (which, by the way, is not an error RATE, much less an “impact to BES” rate) to justify communications protocols that will not address the majority of the communications error types which made up that contribution in that report. 4) The OPCPSDT, in my opinion, has not adequately justified retaining R1.4 in the face of the elimination of the exact same requirement in TOP-002 R18.

Individual

Jen Fiegel
Oncor Electric Delivery
Yes
No
Oncor supports the shift in compliance to the internal controls approach and we looks forward to NERC providing a programmatic/principles framework in a collaborative approach with the industry. In the absence of this framework, it is unknown how the concept of "identify, assess and correct" will evolve. As the framework is developed including the "identify, assess and correct" concept, Oncor requests that continuous focus be placed on implementing principles including this concept and not requiring or specifying internal controls which would place additional compliance burden on entities. The internal controls principles/framework should enable entities to establish internal controls model utilizing deficiency correction approach but should not mandate the approach at the Standard/Requirement level. Internal Controls Program needs to be defined by an Entity, it is not a "One Size Fits All". The standards/RSAs should reflect this understanding.
Yes
The SDT requested industry comment on the reference to "Operating Instructions between Functional Entities." Industry discussions show that entities interpret this in different ways, and Oncor agrees that the use of the term "Functional Entity" is confusing. Functional Entity is not defined in the NERC Glossary. The NERC Webinar 11/27/12 stated this language requires protocols for communication between RC and TOP entities or TOP and TO entities, but it does not require the same protocols for TOP to TOP communications. This would require entities with multiple registration functions to designate personnel by functional entity and in turn, personnel would have to identify which functional entity each person they interface with. It is impractical and inefficient to require Entities to re-organize all personnel which would foster an inefficient structure and could potentially lead teams to not communicate effectively. In addition, this could have a negative impact on communications between companies. For example, in the ERCOT region, there are approximately 15 local control centers and ERCOT who are all registered as TOPs. One might interpret the webinar discussion to say that communications between neighboring TOPs or ERCOT and one of the local control centers are not subject to the requirements of COM-003-1 since these are TOP to TOP communications. We strongly recommend the SDT review this to greatly simplify COM-003-1. Potential alternative to the current language would be "require entities to implement, in a manner ..., protocols that include three-part communication for Operating Instructions" and eliminate the reference to Functional Entity. Alternatively, if the SDT is trying to limit the protocols to communications between companies (another common interpretation), simply state it as such. In addition, Oncor believes the specificity in the subparts of R1 is unnecessary. Three-part communication is the preferred method for ensuring that both parties understand an Operating Instruction and it provides a sufficient mechanism for clear, concise and accurate communication. In creating a protocol that requires System Operators to essentially relearn the way to speak (specifically using alpha-numeric identifiers) will only create confusion and inefficiency as operators try to follow protocol and catch/correct themselves.

Additional Comments Received:

**Brett Holland**  
**KCPL – Operations Compliance**

1. Do you agree with the changes made to the proposed definition "Operating Instruction" (now proposed as a "A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the

Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”) to be added as a term for the NERC Glossary? If not, please explain in the comment area of the last question.

Yes

**No**

Comments: Would suggest the language read as follows: “An order by a System Operator of a Reliability Coordinator, Transmission Operator, or of a Balancing Authority, where the recipient of the order is expected...” for clarity. Operating Instructions, this term should not be added to the NERC Glossary to bring all Operating Instructions into scope.

2. The SDT has proposed new language in COM-003-1, R1 and R2: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:” R3 and R4 from draft 3 are eliminated. Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question.

Yes

**No**

Comments:

R1.8, R1.9, and R2.2 need further clarification. The specific vehicle for information delivery in these 3 particular requirements is via “one-way burst messaging” systems, which obviously do not allow for 2 way communication. Acceptable means of verbal and/or electronic confirmations and clarification requests need more definition.

R1.8 addresses confirmation requirements when utilizing one-way burst messaging systems for communication with multiple parties. We are not sure why we would only request one or more confirmations in this case as it is possible that one or more parties, but not all, would receive the intended message. This leaves the possibility open for potential mis-understanding or lacks of information for one or more of the potential multiple parties receiving the message.

This language (identifies, assesses and corrects deficiencies) should not be added to the standard as it introduces internal controls into the requirements. Internal controls are a strengthening of a compliance program and support a strong culture of compliance, however, are not mandatory and enforceable. This will introduce a precedent that we are not prepared as an industry to deal with or respond to in order to satisfy compliance and enforcement.

While we are glad to see an effort on the part of the drafting team and NERC to move away from ‘zero tolerance’ requirements and move toward internal controls to address deficiencies, we are concerned as to how this process will be implemented if it is approved. For example, if our process calls for a 2% sampling size and the sample is presented to the CEA, what prevents the CEA from saying that the sample size is too small and finds us in violation because of it. Also, if our process does not uncover any discrepancies is it because there are no discrepancies or is it because our process is flawed and we missed something? We are concerned about how a CEA will respond to such a situation. Perhaps we need a more descriptive methodology of how this process will actually work in the field.

No

Comments:

The third component of the Severe VSLs of R1 and R2 should read:

“The Responsible Entity did not implement documented communication protocols in a manner that identifies, assesses and corrects deficiencies in those protocols as required in Requirement 1.”

“The Responsible Entity did not implement documented communications protocols in a manner that identifies, assesses and corrects deficiencies in those protocols as required in Requirement 2.”

4. Do you have any other comments or suggestions to improve the draft standard?

Comments:

- We are not sure which time zone is required in R1.3. For example, if two facilities are physically located side-by-side in the Mountain Time Zone but are controlled by

different GOPs, one in the Central Time Zone and the other in the Eastern Time Zone, which time zone should be used in the Operating Instruction?

- Delete the extra space following 'Instruction' in the 4<sup>th</sup> line of R1.4.
- R1.5 should be read:

“Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format. (For example, if an entity designated a circuit breaker “One two Bravo” (12B), one two Bravo would need alpha-numeric clarifiers if used in an oral Operating Instruction.)”

- Delete the “. “ in the parentheticals in the 3<sup>rd</sup> lines of both R1.8 and R1.9
- R1.9 and R2.2 should be expanded to clarify what the recipient should do in the event the communication via a burst messaging system is not understood. We propose the following for both R1.9 and R2.2.

“When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), if the communication received is not understood, subsequent to the call, the recipient is to call the initiator and request clarification.”

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.

**Description of Current Draft:**

This is the fifth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Drafting team considers comments, makes conforming changes, and requests SC approval to proceed to pre-ballot comment period.	February 2013
2. Third Successive Ballot of Standards	March 2013
3. Recirculation ballot of standards.	April 2013
4. Board adopts standards.	May 2013

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

**Operating Instruction** —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

### A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To provide System Operators predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator
5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

### B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning* ]

- 1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation.
- 1.2. Instances that require time identification when issuing an oral or written Operating Instruction or Reliability Directive, and the format for that time identification.
- 1.3. Nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction or Reliability Directive.
- 1.4. Instances where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction or Reliability Directive, and the format for those clarifiers.

Implementation means (in R1, R2 R3 and R4) incorporating the communication protocols into processes, policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1).

- 1.5. Instances where the issuer of an oral two party, person-to-person Operating Instruction is required to:
  - Confirm that the response from the recipient of the Operating Instruction was accurate, or
  - Reissue the Operating Instruction to resolve a misunderstanding.
- 1.6. Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.
- 1.7. Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.
- 1.8. Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.
- 1.9. Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols.
- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Operations Assessment* ]
- R3.** Each Distribution Provider and Generator Operator shall develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where applicable, the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning* ]
  - 3.1. Use of the English language when responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation.
  - 3.2. Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.
  - 3.3. Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.
- R4.** Each Distribution Provider and Generator Operator shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to

meet the expectations in its documented communication protocols developed for Requirement R3. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning /Operations Assessment* ]

**C. Measures**

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that it implemented its documented communication protocols that it developed for Requirement R1 which may include, but is not limited to, its policies, procedures, and or operator training.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R2.
- M3.** Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R3. Each Distribution Provider, and Generator Operator shall provide evidence that it implemented its documented communication protocols that it developed for Requirement R3 which may include, but is not limited to, its policies, procedures, and or operator training.
- M4.** Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

**1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R1 Measure M1 for the most recent 90 days.

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R2 Measure M2 for the most recent 180 days.

Each Distribution Provider and Generator Operator shall retain evidence for Requirement R3 Measure M3 for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence for Requirement R4 Measure M4 for the most recent 180 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, ~~Initial~~ Ballot closed September ~~2022~~, 2012.
9. Version 4 draft of Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.

#### Description of Current Draft:

This is the ~~fourth~~fifth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

#### Future Development Plan:

Anticipated Actions	Anticipated Date

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To provide System Operators ~~uniform~~predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator
5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption. \_\_\_\_\_

### ~~6. Background:~~

~~The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying “implement” as follows:~~

~~Each ... shall implement, in a manner that identifies, assesses, and corrects deficiencies, ...~~

~~The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the “... identifies, assesses, and corrects deficiencies, ...” elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.~~

## B. Requirements

**R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following: ~~:[Violation Risk Factor: *Medium-Low*] [Time Horizon: Long-term Planning ]~~

**1.1.** Use of the English language when issuing or responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation.

~~1.~~ Use of the 24-hour clock format when referring to clock times Instances that require time identification when issuing an oral or written Operating Instruction.

~~1.2.~~ Use of the time, the or Reliability Directive, and the format for that time zone where the action will occur and indication of whether the time is daylight saving time or standard time identification.

~~1.2.1.3.~~ Nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction ~~that refers to clock times between Functional Entities in different time zones or Reliability Directive.~~

~~2.~~ Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility when referring to a Transmission interface Element or a Transmission interface Facility in an oral or written Operating Instruction , unless another name is mutually agreed to by the Functional Entities.

~~1.3.1.4.~~ Use of Instances where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction ~~for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric or Reliability Directive, and the format (for example if an entity designated a circuit breaker “One two Bravo” (12B). One two Bravo would need alpha-numeric those clarifiers if used in an oral Operating Instruction).~~

~~1.4.1.5.~~ When issuing Instances where the issuer of an oral two party, person-to-person Operating Instruction, ~~require the issuer~~ is required to:

- Confirm that the response from the recipient of the Operating Instruction was accurate, or
- Reissue the Operating Instruction to resolve a misunderstanding.

Implementation means (in R1, R2 R3 and R4) incorporating the communication protocols into processes, policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1).

1.5.1.6. ~~When receiving~~ Require the recipient of an oral two party, person-to-person Operating Instruction, ~~require the recipient~~ to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.

1.6.1.7. ~~When issuing~~ Instances where the issuer of an oral Operating Instruction ~~through~~ Reliability Directive using a one-way burst messaging system ~~used~~ to communicate a common message to multiple parties in a short time period (~~for example~~ e.g. an all-call All Call system) ~~;~~ is required to verbally or electronically confirm receipt from at least one or more receiving parties party.

1.8. ~~When receiving~~ Require the receiver of an oral Operating Instruction ~~through~~ Reliability Directive using a one-way burst messaging system ~~used~~ to communicate a common message to multiple parties in a short time period (~~for example~~ e.g. an all-call All Call system) ~~;~~ to request clarification from the ~~initiator~~ issuer if the communication is not understood.

1.7.1.9. Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols.

R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Operations Assessment ]

R2.R3. Each Distribution Provider and Generator Operator shall develop and implement, in a manner documented communication protocols that identifies, assesses and corrects deficiencies, outline the communications expectations of its operators. The documented communication protocols for Operating Instructions between Functional Entities that include will address, where applicable, the following: [Violation Risk Factor: MediumLow] [Time Horizon: Long-term Planning ]

3.1. ~~When receiving~~ Use of the English language when responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation.

3.1.3.2. Require the recipient of an oral two party, person-to-person Operating Instruction, ~~require the recipient~~ to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.

3.2.3.3. ~~When receiving~~ Require the receiver of an oral Operating Instruction ~~through~~ Reliability Directive using a one-way burst messaging system ~~used~~ to communicate a common message to multiple parties in a short time period (e.g. an ~~all-call~~ All Call system) ~~;~~ to request clarification from the ~~initiator~~ issuer if the communication is not understood, ~~if required by the issuer.~~

R4. Each Distribution Provider and Generator Operator shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R3. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning /Operations Assessment ]

## C. Measures

- M1.** ~~Evidence must include each applicable entity's~~Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1 ~~and must demonstrate.~~ Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that ~~the protocols have been~~it implemented in a manner-its documented communication protocols that identifies, assesses and corrects deficiencies.-it developed for Requirement R1 which may include, but is not limited to, its policies, procedures, and or operator training.
- M2.** ~~Evidence must include each applicable entity's~~Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R2.
- M3.** Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement ~~R2 and must demonstrate~~R3. Each Distribution Provider, and Generator Operator shall provide evidence that ~~the it implemented its documented communication~~ protocols have been implemented in a manner that identifies, assesses and corrects deficienciesit developed for Requirement R3 which may include, but is not limited to, its policies, procedures, and or operator training.
- ~~M2.~~**M4.** Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

~~The Regional Entity shall serve as~~As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority-(CEA) unless" means NERC or the ~~applicable entity is owned, operated, or controlled by~~Regional Entity in their respective roles of monitoring and enforcing compliance with the Regional Entity. ~~In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.~~

NERC Reliability Standards.

#### 1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence ~~of its manner that identifies, assesses and corrects deficiencies~~ for Requirement R1 Measure M1 for the most recent 90 days.

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R2 Measure M2 for the most recent 180 days.

Each Distribution Provider and Generator Operator shall retain evidence ~~of its manner that identifies, assesses and corrects deficiencies~~ for Requirement ~~R2~~R3 Measure ~~M2~~M3 for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence for Requirement R4 Measure M4 for the most recent 180 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

## Implementation Plan

Project 2007-02 - Operating Personnel Communications Protocols

### Implementation Plan for COM-003-1 – Operating Personnel Communications Protocols Standard

#### **Approvals Required**

COM-003-1 – Operating Personnel Communications Protocols Standard

#### **Prerequisite Approvals**

None

#### **Revisions to Glossary**

The following term is proposed for addition to the NERC Glossary of Terms:

#### **Operating Instruction —**

Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

#### **Applicable Entities**

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### **Revisions or Retirements to Approved Standards**

Approved Requirement to be Retired	Proposed Replacement Requirement(s)
<p>COM-001-1.1 Requirement R4</p> <p>R4.Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation</p>	<p>COM-003-1 Requirement R1 Part 1.1</p> <p><b>R1.</b> Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented</p>

<p>control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations</p>	<p>communication protocols will address, where applicable, the following:[<i>Violation Risk Factor: Low</i>] [<i>Time Horizon: Long-term Planning</i> ]</p> <p>1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation</p>
---	---

***Conforming Changes to Other Standards***

None

***Effective Dates***

COM-003-1 shall become effective the first day of first calendar quarter, twelve calendar months following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve calendar months from the date of Board of Trustee adoption.

COM-001-1.1 Requirement R4 shall expire midnight of the day immediately prior to the Effective Date of COM-003-1 in the particular Jurisdiction in which COM-003-1 is becoming effective.

COM-003-1 shall become effective the first day of first calendar quarter, twelve calendar months following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve calendar months from the date of Board of Trustee adoption.

COM-001-1.1 Requirement R4 shall expire midnight of the day immediately prior to the Effective Date of COM-0031-12 in the particular Jurisdiction in which COM-0031-12 is becoming effective.

# Unofficial Comment Form

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

Please **DO NOT** use this form. The drafting team is posting the draft COM-003-1 Operating Personnel Communications Protocols standard for industry comment for a 30-day comment period. Please use the [electronic comment form](#) located at the link below to submit comments. Comments must be submitted by **April 5, 2013**. If you have questions please contact Joseph Kriasiak at [Joseph.Kriasiak@nerc.net](mailto:Joseph.Kriasiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### **Background Information:**

Effective communication is critical for Bulk Electric System (BES) operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions. The Standard Drafting Team (SDT) believes the Alert Level Guidelines, while valuable, belong in a separate standard and has petitioned the Standards Committee to approve the transfer to another standard or to start a separate project.

The upgrade of communication system hardware where appropriate is not included in this project (it is included in NERC Project 2007-08 Emergency Operations).

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators (GOPs), and Distribution Providers (DPs). These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The Purpose statement of COM 003-1 states: “To provide System Operators predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.”

- 1) **New NERC Glossary terms:** The SDT has maintained the definition of “Operating Instructions” proposed in the Standard version 4.

Operating *Instructions* differentiate the broad class of communications that deal with changing or altering the state of the BES from general discussions of options or alternatives. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

This term is proposed for addition to the NERC Glossary to establish meaning and usage within the electricity industry.

- 2) **COM-003-1, Draft 5 now features 4 requirements:** The “*Implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities*” language has wide acceptance within industry, but concerns over compliance with internal controls caused great concern for some draft 4 commenters. The requirement structure and language has been changed in draft 5 based on changes to the standard recommended by Industry representatives at the “Communications in Operations Conference” of February 14-15, 2013 in Atlanta to allow applicable entities more flexibility to develop their communication protocols and to develop methods to assess operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols. Implementation means incorporating the communication protocols into policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1). The OPCP SDT believes draft 5 shifts the focus to improving the entity’s communication protocols, from a focus on whether the entity’s internal controls are “compliant”.

3) **Documented Communication Protocols:** The OPCP SDT has incorporated requirements R1 and R3, for an applicable entity to develop and implement documented communication protocols that **address**, where applicable, the following elements: ( note: the word address was recommended by draft 4 commenters and by a consensus at the “Communications in Operations Conference” of February 14-15, 2013 in Atlanta).

- a) **English language:** Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation.
- b) **Time Identification:** Instances that require time identification when issuing an oral or written Operating Instruction or Reliability Directive, and the format for that time identification.
- c) **Line and Equipment Identifiers:** Nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction or Reliability Directive.
- d) **Alpha-numeric clarifiers:** Instances where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction or Reliability Directive, and the format for those clarifiers.

**e) Three-part Communication:**

Instances where the issuer of an oral two party, person-to-person Operating Instruction, is required to:

- Confirm that the response from the recipient of the Operating Instruction was accurate, or
- Reissue the Operating Instruction to resolve a misunderstanding.

Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.

**One-way burst messaging system to multiple parties (all call):** Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.

Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the initiator if the communication is not understood.

- f) **Three-part Communication: For Distribution Providers (DP) and Generator Operators (GOP):** Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.
  - g) **One-way burst messaging system to multiple parties (all call): For Distribution Providers (DP) and Generator Operators (GOP):** Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the initiator if the communication is not understood, if required by the issuer.
  - h) **Uniformity of communication protocols among entities:** Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols.
- 4) **Violation Risk Factor (VRF) and Violation Severity Level (VSL) changes from version three:** The OPSDT reviewed the VRFs and VSLs associated with R1, R2, R3, R4 and made changes to more closely conform to NERC and FERC guidelines.

The SDT is proposing to retire Requirement R4 from COM-001-1.1 and incorporate it into Requirement R1 and R3 of this draft COM-003-1. Since Requirement R4 from COM-001-1.1 carries over essentially unchanged there is no specific question related to it in this Comment Form.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Instructions. Requirements R2 and R4 are assigned a Medium Violation Risk due to their potential direct impact on BES reliability.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R1 and R3 must be implemented in long term planning operations and therefore were assigned a Time Horizon of Long Term Planning. R2 and R4 must be implemented in Operations planning and Operations Assessment Time Horizons.

## Questions

1. The SDT has proposed new language in COM-003-1, R1 and R3: *“Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following:”* (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a *“A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”*) to be added as a term for the NERC Glossary? Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question.

- Yes  
 No

2. The SDT has proposed new language in COM-003-1, R2 and R4: *“Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols.* (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). ” Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question.

- Yes  
 No

3. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?

- Yes  
 No

4. Do you have any other comments or suggestions to improve the draft standard?

Comments:

# Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft 5

## Rationale and Technical Justification

The Quality Review team for the draft 2 posting of COM-003-1 highly recommended that the OPCPSDT provide a justification or rationale document to aid reviewers in their examination of this draft of COM-003-1. The OPCPSDT agrees with the QR recommendation and has developed the following to support the standard and to help stakeholders understand the intent and scope of the standard. This version of the standard features a non traditional approach to standards that could alleviate concerns that surfaced in comments in drafts one, two, three and four.

### **Background**

Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.<sup>1</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems.<sup>2</sup>

---

<sup>1</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

<sup>2</sup> Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

**Requirement R1**

Requirement R1 requires entities that can both issue and receive Operating Instructions to develop and implement documented communication protocols that outline the communications expectations of its operators. The protocols address the use of the English language (from COM-001-1.1 R4), time formatting, nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three part communications. There are added protocols to address operator training periodicity and to address the need for entities to coordinate their protocols for consistency among affected applicable entities. Only applicable protocols need to be addressed.

**Requirement R2**

Requirement R2 requires entities that both issue and receive Operating Instructions to develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1.

**Requirement R3**

Requirement R3 requires entities that only receive Operating Instructions to develop and implement documented communication protocols that outline the communications expectations of its operators. Only applicable protocols need to be addressed. The first protocol requires the use of the English language. The two other protocols (R3, Parts 3.2 and 3.3) are repeat back for three part communication and clarification if an "all call" communication is unclear.

**Requirement R4**

Requirement R4 requires entities that only receive Operating Instructions to develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R3.

**Rationale**

The SDT has maintained within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to assess and correct deficiencies in the communication practices. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on assessing communication practices and correcting deficiencies to reduce the possibility of miscommunication.

The term implement means incorporating the communication protocols into, but not limited to policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1).

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the "... assessment and correction, ..." elements, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

The changes and rationale for draft 5 were a result of stakeholder comment and participation in the Communications in Operations Conference held on February 14 and 15, 2013. Stakeholders and the ERO conducted informational sessions, expressed concerns and conducted a workshop that provided guidance to the OPCPSDT to prepare draft 5. The changed language was a collaborative effort between industry and ERO.

# Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft ~~35~~

## Rationale and Technical Justification

The Quality Review team for the draft 2 posting of COM-003-1 highly recommended that the OPCPSDT provide a justification or rationale document to aid reviewers in their examination of this draft of COM-003-1. The OPCPSDT agrees with the QR recommendation and has developed the following to support the standard and to help stakeholders understand the intent and scope of the standard. This version of the standard features a non traditional approach to standards that could alleviate concerns that surfaced in comments in drafts one, two, ~~and three~~ and four.

### **Background**

Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.<sup>1</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems.<sup>2</sup>

<sup>1</sup> [Beare, A., Taylor, J. Field Operation Power Switching Safety, WO2944-10, Electric Power Research Institute.](#)

<sup>2</sup> [Bilke, T., Cause and prevention of human error in electric utility operations, Colorado State University, 1998.](#)

**Requirement R1**

Requirement R1 requires entities that can both issue and receive Operating Instructions to develop and implement documented communication protocols that outline the communications expectations of its operators in a manner that identifies, assesses, and corrects deficiencies. The necessary protocols include address the use of the English language (from COM-001-1.1 R4), time formatting, mutually agreed nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three part communications. There are added protocols to address operator training periodicity and to address the need for entities to coordinate their protocols for consistency among affected applicable entities. Only applicable protocols need to be addressed.

**Requirement R2**

Requirement R2 requires entities that both issue and receive “Operating Instructions” to develop method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1. perform a quarterly assessment of its System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1.

**Requirement R2-R3**

Requirement R2-R3 requires entities that only receive “Operating Instructions” to develop and implement documented communication protocols that outline the communications expectations of its operators implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies. Only applicable protocols need to be addressed.

The first (R3, Part 3.1) protocol includes requires the use of the English language. The two other protocols (protocols (R2, R3, Parts 2.3.1-2 and 2.3.23) required are repeat back for three part communication and clarification if an “all call” communication is unclear. There is an added protocol to address the training periodicity.

**Requirement R4**

Requirement R4 requires entities that only receive Operating Instructions to develop method(s) to assess operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for perform a quarterly assessment of its operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R3.

**Rationale**

The SDT has incorporated-maintained within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct

deficiencies in the communication practices~~implementation of certain requirements the standard's requirements~~. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying~~assessing~~ communication practices~~operator performance~~, and correcting deficiencies to reduce the possibility of miscommunication~~improve operator performance~~. It is presented in those requirements by modifying "implement" as follows:

~~Each ... to perform a quarterly assessment of its System Operators' communication practices and implement corrective actions necessary shall implement, in a manner that identifies, assesses, and corrects deficiencies, ...~~

The term implement means incorporating the communication protocols into, but not limited to policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1).

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the ". . . identifies, assesses~~assessment~~, and correction s deficiencies, . . ." elements ~~described in the preceding paragraph~~, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

The changes and rationale for draft 5 were a result of stakeholder comment and participation in the Communications in Operations Conference held on February 14 and 15, 2013. Stakeholders and the ERO conducted informational sessions, expressed concerns and conducted a workshop that provided guidance to the OPCPSDT to prepare draft 5. The changed language was a collaborative effort between industry and ERO.

## Project 2007-02: Operating Personnel Communication Protocols

### Mapping Document

#### 1. Mapping Document Showing Translation of COM-001-1.1, R4– Telecommunications into COM-003-1–Operating Personnel Communications Protocol

Requirement in Approved Standard	Translation to New Standard or Other Action	Comments
<p>R4.Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations</p>	<p>Moved into COM 003-1 R1.1</p>	<p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following:[Violation Risk Factor: Low] [Time Horizon: Long-term Planning ]</p> <p>1.1. ## **Project 2007-2 – Operating Personnel Communications Protocol**

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

## VRF for COM-003-1:

There are four requirements in COM-003-1, draft 5 with the addition of R3 and R4. Requirements R1 and R3 are assigned a "Low" VRF. R1 and R3 now read: *"Each ..... shall develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where applicable, the following: "* Requirements R2 and R4 are assigned a "Medium" VRF. and the language change to R2 and R4, which now reads: *"Each ..... shall perform a quarterly assessment of its System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement RX "*; warrants raising the VRF to "Medium" because it features evaluation and correction of operating performance that would have a deeper impact on the reliability of the BES.

## **NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

Project YYYY-##.# - Project Name

		requirement.	
--	--	--------------	--

### **FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

#### **Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

#### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

#### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	Low
NERC VRF Discussion	R1 is a requirement in a long term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “Low” which is consistent with NERC guidelines
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 establishes communication protocols, which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the development and implementation of documented communication protocols by entities that will both issue and receive “Operating Instructions” that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.
FERC VRF G4 Discussion	<b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>

VRF and VSL Justifications – COM 003-1, R1			
	Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “ Low” which is consistent with NERC guidelines for similar requirements.		
FERC VRF G5 Discussion	<b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.

## **Project 2007-2 – Operating Personnel Communications Protocol**

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

### **Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are ~~two~~ four requirements in COM-003-1, draft 4.5 with the addition of R3 and R4. Requirements R1 and ~~R2-R3~~ are assigned a "Low" VRF. ~~because they are now administrative. R1 and R3 now read:~~ *"Each ..... shall develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where applicable, the following: "* Requirements R2 and R4 are assigned a "Medium" VRF. ~~The elimination of draft 3 R3 and R4 and the language change to R1-R2 and R2R4, which now reads:~~ *"Each ..... shall perform a quarterly assessment of its System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement RX shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following: "*, warrants raising the VRF to "Medium" because it ~~makes the requirement more than just administrative as it now features~~ evaluative evaluation and correction of operating performance process that would have a deeper impact on the reliability of the BES.

### NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in

full intent of the requirement.	significant value in meeting the intent of the requirement.	The performance or product has limited value in meeting the intent of the requirement.	meeting the intent of the requirement.
---------------------------------	---	--	--

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	Low
NERC VRF Discussion	R1 is a requirement in a <u>long term</u> planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “ <del>Medium</del> <u>Low</u> ” which is consistent with NERC guidelines
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 <del>establishes communication protocols, falls under Recommendation 24 26 of the Blackout Report. The VRF for this requirement is “Medium</del> <u>Low</u> ” <del>because of its administrative nature, which</del> is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b>

VRF and VSL Justifications – COM 003-1, R1			
	<p><u>This requirement calls for the development and implementation of documented communication protocols by entities that will both issue and receive “Operating Instructions” that</u> reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.</p>		
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                      Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “<del>Medium</del> <u>Low</u>” which is consistent with NERC guidelines <u>for similar requirements that are administrative.</u></p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                      COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.</p>		
Proposed VSL			
Lower	Moderate	High	Severe
<p><u>The Responsible Entity did not address one (1) of the nine(9) parts of Requirement R1 in their documented communication protocols as required in Requirement R1</u></p>	<p><u>The Responsible Entity did not address two (2) of the nine (9) parts of Requirement R1 in their documented communication protocols as required in Requirement R1</u></p>	<p><u>The Responsible Entity did not address three (3) of the nine (9) parts of Requirement R1 in their documented communication protocols as required in Requirement R1</u></p>	<p><u>The Responsible Entity did not address four (4) or more of the nine (9) parts of Requirement R1 in their documented communication protocols as required in Requirement R1</u></p>

## Frequently Asked Questions – Addendum

### COM-003, Draft 5

This document is being provided to assist commenters' understanding of COM-003-1, draft 5 based on inquiries received by the drafting team and the Standards Committee.

1. How would you differentiate between slips of the tongue and “deficient communication practices” without involving subjective judgments? The same is true for attempting to identify changes in an operator’s degree of understanding, especially when doing so through the numbing process of making before-and-after voice recordings comparisons.

**Response:** The criteria for System Operator/operator performance should be established by the applicable entity. The Operating Personnel Communications Protocols Standard Drafting Team (OPCPSDT) believes it is the discretion of the applicable entity to set its expectations of its operating personnel with regard to communication protocols and then to monitor and if necessary improve their performance. There will be less subjective judgment if the entity develops strong communication protocols and structured programs to evaluate and improve System Operator/operator performance. The OPCPSDT acknowledges there are many forms of programs and methods an entity might employ to accomplish this, but it does not want to dictate a one size fits all process.

2. If the goal is to have strong internal controls where the detective control of periodically sampling conversations allows the Generator Operator (GOP) to detect and correct communications, why would the GOP need documentation other than to note they found nothing, or to note they found one issue and made the operator retake training?

**Response:** If the entity, in this case a GOP, during the audit period, found nothing or they found one issue and made the operator retake training, the documentation supporting those circumstances would suffice. M4 only asks for “*the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented)*”.

3. Does R4 leave GOPs open to the auditor’s interpretation of the sufficiency of the corrective program? Or is it intended that GOP and Distribution Provider (DP) have the authority to develop their own programs without the risk an audit will find it insufficient.

**Response:** The OPCPSDT intended that entities develop their own programs that support the requirements of COM-003-1. There are many methods available to entities to accomplish this and the OPCPSDT does not want to dictate a one size fits all approach to monitoring and improving operator communication protocol performance. M4 only asks for “*the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented)*” The important focus are the results of its periodic assessment and of any corrective actions. The OPCPSDT believes entities will develop or already possess evaluation and training programs and

would advocate for improving operator communication protocol performance on the Bulk Electric System (BES) based on the desire to avoid communication mishaps.

4. The Reliability Standard Audit Worksheet requires the GOP to turn over records of monitoring communications (which is a large compliance burden, especially for smaller entities) as well as records of corrective actions and then proof the “problem” is not still in place. Turn over records to whom? How many records? How do you prove it has stopped? Where does the paperwork stop?

**Response:** The records are to be provided to the CEA for review and verification. The CEA needs to review and understand the entity’s monitoring program(s) and to review the instances where corrective action was warranted. The CEA should expect to see evidence needed to be assured that the assessment and corrective program exists and is being implemented. Such evidence could consist of review logs noting the communications that were reviewed (e.g. date, time, and reviewer) and descriptions and evidence of the corrective actions take, if any. The entity should establish its own measure of effectiveness to determine if an operator meets the entity’s expectations. This makes it less murky for the CEA and reduces subjectivity.

5. Who determines the GOP and DP personnel who are subject to R3 and R4? Are the GOP personnel those in a control room in the plant? For a DP are they distribution dispatches? Is there a way to clarify who the Standard is applicable to?

**Response:** The criteria for which GOP and DP personnel subject to R3 and R4 of COM-003-1 would be an operator who would receive either a:

*Operating Instruction: A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions or a*

*Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.*

**Response part two:** Distribution system dispatches by a DP would not be applicable. COM-003-1 is applicable to BES communications as defined by Operating Instructions and Reliability Directives. The OPCPTSDT would encourage communication protocols for verbal switching on the distribution system because they improve reliability.

6. How can three-way communication be used for “a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system)” -- to those on the receiving end, it does not seem possible under the current technology used for these oral messaging systems to have three way. Please explain how three-way can be used for one way burst messaging systems?

**Response:** The Standard *does not require three part communication for “a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system)”* because obtaining a response from all of the multiple receivers would create considerable delays and potential confusion defeating the speed and efficiency an all call type of message provides.

R1 Part 1.8 and R3 Part 3.3 require the receiver of an oral Operating Instruction or Reliability Directive using an all call system to request clarification from the initiator if the communication is not understood, if required by the issuer.

7. It appears consistent with Order 743 and FERC’s ruling that only generator dispatch operators be trained on implementing directives and instructions to also limit COM-003 to FERC’s ruling in Order 743, which would apply COM-003 generation dispatchers who (at a centrally-located generation dispatch center or at a dispatch center at the same site as a single generation plant) either:
  - a. Receive direction and then develop specific dispatch instructions for plant operators under their control or
  - b. Determine the best way to deliver that generation from its portfolio of units. Was this the intent of COM-003 to be consistent with Order No. 743 and the work on PER-005?

**Response:** COM-003-1 is compliant with the FERC’s ruling in Oder 743. The standard is clear that generator operators that receive or will receive Operating Instructions and Reliability Directives from a Balancing Authority, Reliability Coordinator or Transmission Operator are applicable entities and must be compliant.

The issue of how communication protocols are established and managed within the GOP’s organization can be addressed within the scope of the entity’s documented communication protocols. The GOP is encouraged to make them uniform to prevent confusion within its organization.

8. The latest version of COM-003-1 appears to introduce a potential conflict with COM-002-3 related to use of one-way burst messaging systems to issue a Reliability Directive. In other words, COM-003-1 allows one-way burst messaging to be used for Reliability Directives and prescribes:
  - a. issuer to confirm receipt from at least one receiving party
  - b. receiver to request clarification from the issuer if the communication is not understood

However, COM-002-3 has the following requirements:

R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase, or recapitulate the Reliability Directive.

R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either:

- a. Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or

b. Reissue the Reliability Directive to resolve a misunderstanding.

In other words, in the case of a one-way burst messaging used for Reliability Directives, COM-002-3 does not appear to allow for only those responses required in COM-003-1 but instead requires a full 3 way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002-3 if they respond to a one-way burst messaging Reliability Directive as the requirements indicate in COM-003-1. In order to be fully compliant with both standards, the receiver would have to contact the issuer, repeat what was said on the original burst message, and then the issuer would confirm that the response was accurate before acting on the message. Is this correct?

**Response:** The COM-002 team addressed the Reliability Directive “all call” issue in the consideration of comments for COM-002-3, found on the project page:

[http://www.nerc.com/filez/standards/Reliability\\_Coordination\\_Project\\_2006-6.html](http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html)

The COM-002-3 drafting team envisioned that Reliability Directives could/would be issued using “blast call”/“all call” capability. They also clearly tied their response to COM-003-1, saying that Project 2007-02 would resolve the issue. The current draft of COM-003-1 resolves the issue by allowing entities to create a procedure to allow flexibility on how this will be achieved. The procedure must require an issuer of a “blast call”/“all call” to confirm receipt from at least one receiving party (R1.7) and for the receiver to request clarification from the issuer if the communication is not understood (R1.8). The consideration of comments will be filed with COM-002-3 and will become part of the development record of COM-002-3, and as such can be referenced by entities for their compliance in COM-002-3 and COM-003-1. For COM-003-1 to not cover “all call” scenarios for Reliability Directives would leave a gap for entities in compliance with COM-002-3.

For draft 5 of COM-002-3, the following comment and response was provided:

**Comment:** *The Standard is not clear as to what each entity is to do when more than one entity receives a Reliability Directive at the same time (e.g. during a RC area teleconference call). Is, for example, a roll call of receiving entities expected to be held so that they individually can repeat, restate, rephrase or recapitulate the Reliability Directive followed by individual confirmation required in R3?*

**Response:** The question about whether a roll call of receiving entities is expected to be held is asking for prescription of “how” to accomplish what is required. The RCSDT recognizes that there is more than one way to accomplish the confirmation when more than one entity received a Reliability Directive at the same time. What is required is for the recipient to respond in such a way that the issuer may determine whether the message has been properly understood. One way for that to occur would be, as you suggest, for the entities to individually respond. Another way would be for a pre-established protocol or procedure (e.g. roll-call, all-call, etc.) to be in place and used in such cases. The RCSDT has determined that prescribing “how” to ensure that “what” is required has been accomplished is not required and that the individually adopted procedures or protocols could offer many different ways to ensure effectiveness. No change made. The RCSDT concept is

that “All Call” compliance is related to having a document that explains how the entity responds. No change made.

[http://www.nerc.com/docs/standards/sar/Project\\_2006\\_06\\_Response\\_to\\_Comments\\_2012\\_06\\_12.pdf](http://www.nerc.com/docs/standards/sar/Project_2006_06_Response_to_Comments_2012_06_12.pdf) (page 173)

For draft 4 of COM-002-3, the following comments and responses were provided:

**Comment:** *Requirements for using three-part communication: It is our opinion that the standard needs language that clearly states that during a Blast Call three-part communication is not required. Blast Calls are used when information needs to be disseminated quickly to a large number of entities. Strictly enforcing the use of three-part communication under these circumstances has the potential to be more harmful to reliability than helpful.*

**Response:** The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols would be addressed in the COM-003 standard being developed in Project 2007-02.

[http://www.nerc.com/docs/standards/sar/Consideration\\_of\\_Comments\\_Initial\\_Ballot\\_2006-06\\_071411.pdf](http://www.nerc.com/docs/standards/sar/Consideration_of_Comments_Initial_Ballot_2006-06_071411.pdf) (page 44)

**Comment:** *We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear.*

**Response:** The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. However the essence of accurately implementing Reliability Directives is accomplished by use of 3-part communications. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols requiring for issuing alerts will be addressed in the COM-003 standard being developed in Project 2007-02.

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

**Successive Ballot and Non-binding Poll now open through April 5, 2013**

### [Now Available](#)

A successive ballot of COM-003-1 and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now being conducted through **8 p.m. Eastern on Friday, April 5, 2013**.

In response to comments received during the last comment period and other input, the drafting team has adopted many of the recommendations of commenters and attendees of the “Communications in Operations Conference” of February 14-15, 2013, in Atlanta, and incorporated them into to COM-003-1, draft 5.

The Operating Personnel Communications Protocols Standard Drafting Team has created four requirements for COM-003-1, draft 5. Requirements R1, R2, R3, and R4. The new R1 and R3 language calls for an applicable entity to *“develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following: (protocols)”*. The new R2 and R4 language calls for an applicable entity to *“develop method(s) to assess System Operators’ communication practices and perform corrective actions necessary to meet the expectations in its documented communication protocols”*

This version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). Changes were made to the RSAW to reflect the changes in COM-003-1, draft 5 and changes suggested by some commenters. The RSAW is posted for informal comments along with COM-003-1.

Background information for this project can be found on the [project page](#).

### **Instructions**

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking [here](#).

**Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

**Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Project 2007-02 Operating Personnel Communications Protocols

Formal Comment Period and RSAW Posted for Industry Comments: March 7 – April 5, 2013  
Successive Ballot and Non-binding Poll: March 27 – April 5, 2013

### Now Available

A formal comment period for COM-003-1 – Operating Personnel Communication Protocols (OPCP) is open through **8 p.m. Eastern on Friday, April 5, 2013.**

A successive ballot of COM-003-1 and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted beginning on Wednesday, March 27, 2013 through 8 p.m. Eastern on Friday, April 5, 2013.

In response to comments received during the last comment period and other input, the drafting team has adopted many of the recommendations of commenters and attendees of the “Communications in Operations Conference” of February 14-15, 2013, in Atlanta, and incorporated them into to COM-003-1, draft 5.

The OPCP Standard Drafting Team (SDT) has created four requirements for COM-003-1, draft 5. Requirements R1, R2, R3, and R4. The new R1 and R3 language calls for an applicable entity to “*develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following: (protocols)*”. The new R2 and R4 language calls for an applicable entity to “*develop method(s) to assess System Operators’ communication practices and perform corrective actions necessary to meet the expectations in its documented communication protocols*”

This version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). Changes were made to the RSAW to reflect the changes in COM-003-1, draft 5 and changes suggested by some commenters. The RSAW is posted for informal comments along with COM-003-1.

Background information for this project can be found on the [project page](#).

### **Instructions for Commenting**

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at [wendy.muller@nerc.net](mailto:wendy.muller@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

A comment period on the draft RSAW is open through **8 p.m. Eastern on Friday, April 5, 2013**. The draft RSAW is posted on the NERC Compliance RSAW page. Please submit comments on the draft RSAW using the RSAW comment form to [RSAWfeedback@nerc.net](mailto:RSAWfeedback@nerc.net).

### **Next Steps**

A successive ballot of COM-003-1 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on Wednesday, March 27, 2013 through 8 p.m. Eastern on Friday, April 5, 2013.

*For more information or assistance, please contact Wendy Muller,  
Standards Development Administrator, at [wendy.muller@nerc.net](mailto:wendy.muller@nerc.net) or at 404-446-2560.*

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

### Successive Ballot and Non-binding Poll Results

#### [Now Available](#)

A successive ballot of COM-003-1 and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) concluded at **8 p.m. Eastern on Friday, April 5, 2013.**

Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the successive ballot.

Approval	Non-binding Poll Results
Quorum: 78.39%	Quorum: 77.97%
Approval: 57.50%	Supportive Opinions: 54.28%

Background information for this project can be found on the [project page](#).

### Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Internal controls-like language was first introduced into draft 3, R3 and R4. We note that after the technical conference held in Atlanta – Feb 2013, draft 5, R2 and R4 appear to still have remnants of this control language. As discussed in length, it is not appropriate to have such control language in reliability requirements. As GSOC recalls, insertion of R2 and R4 was not discussed or agreed upon at the conference. GSOC recalls that statements were made by participants that it was pre-mature to

include controls language in the standard/requirement at this time. So it appears that revisions to the contrary when were made when in fact NERC statements were made that the full RAI process would not be in place until 2016. GSOC still supports the RAI as it "proposes to transition away from a process-driven enforcement strategy to a proactive, risk-based strategy that clearly defines, communicates, and promotes desired entity behavior in an effort to improve the reliability of the BPS." However, this transition has not been implemented yet. Until NERC transitions the Compliance Monitoring and Evaluation Program (CEMP) to the risk-based strategy, we are still under the past/current process-driven enforcement strategy. A primary concern of GSOC is that until the RAI is developed and provides audit guidance regarding treatment of entity control measures, then auditor subjectivity may creep into the audit process. GSOC believes that once a transition to a risk-based strategy is complete, only then will there be an established "set of parameters" to "guide the exercise of enforcement discretion." "The parameters that would guide the exercise of discretion as well as the protections" "would be in place to ensure due process and to ensure that enforcement decisions are sound and reflect a consistent application of the ERO enterprise enforcement strategy." More specifically, The "decline to pursue option" will have replaced Find, Fix, and Track "after necessary training of [NERC and Regional] personnel, industry and stakeholder outreach, and development of process improvements." At that time, "for those violations that pose a serious or substantial risk, or are not proper candidates for the exercise of enforcement discretion, the ability to impose penalties up to the statutory maximum or adopt increased monitoring and broader audit scope must be retained." At that time, internal controls will be the way to do business (operations/planning) and the process-driven zero-tolerance enforcement process will only apply to those serious or substantial risks. Regarding zero tolerance, some in industry have the false perception that putting internal controls-like language in a reliability requirement NOW will subsequently allow auditors to apply non-zero tolerance. To the contrary, GSOC believes the current process-driven CMEP inclusive of requirements with controls-like language actually requires zero-tolerance treatment. If this standard is passed in its present form an auditor will not have the discretion to "decline to pursue" and must treat every possible violation the same. Of course, NERC/Regional compliance enforcement can now treat some possible violations as applicable to Find, Fix, Track. But that does not require controls language in a requirement. Accordingly, mitigating COMPLIANCE risk has been and still is a driver for the industry's compliance programs. Once the CMEP is transitioned to the risk-based strategy, then such language will be in place with the CMEP and the industry can focus more on RELIABILITY risk and less on COMPLIANCE risk. In addition, GSOC notes that controls-like language is a requirement which is administrative and therefore meets the criteria under P81 for exclusion from reliability requirements. It is not a risk-based reliability requirement. A reliability requirement is one that is (as the statutory definition says) a requirement to provide for reliable operation of the bulk-power system. A reliability requirement includes requirements for the operation of existing bulk-power system facilities, including cyber-security protection, and the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system. This administrative requirement does not meet the criteria for being a reliability requirement.

No

R2 & R4 - we believe without any definitive guidance from NERC's still-undeveloped RAI, auditors will apply subjective judgment as to the adequacy of controls used to perform periodic assessments and therefore VRF and VSL are not appropriate.

GSOC recommends that only R1 and R3 survive; eliminate R2 and R4.

No

Yes for R1 and R3. No for the definition of "Operating Instructions". It is not written very well and is difficult to understand. The language below is offered as a suggestion to simplify the definition. Operating Instruction —A command by a System Operator of a Reliability Coordinator, Transmission Operator, or Balancing Authority where the recipient is instructed to change or preserve the state, status, output, or input of any portion of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are

not considered Operating Instructions.

This will require each entity to develop its own unique protocol. This will not "tighten up" communications. Having each entity follow its own protocol will complicate and confuse communications. One entity will be attempting to communicate with another entity which is not familiar with the protocol being used by the first entity because the second entity uses a different protocol. Protocols if required should be standardized. Moreover, the proposed language requires a protocol that "meets the expectations of its System Operators". The plain meaning of that sentence as written is that the protocol meet the expectations of the individual workers, not the entity itself. If this change is going to be approved, should not it read "Each (entity) shall develop protocols that PROVIDE ITS expectations of its System Operators"?
Yes
Yes
Requirement (R1.5) provides inadequate protection against a misunderstanding when directives are issued. Granted, the Requirement does obligate the party receiving the directive to repeat back the directive. However, if the recipient repeats the directive back to the person issuing the directive, and the "repeat back" indicates the recipient has misunderstood the directive, this Requirement merely obligates the person issuing the directive to state the directive again. The Requirement places no obligation on the person issuing the directive, who knows he has been misunderstood, to explicitly and clearly bring to the attention of the recipient that the recipient has misunderstood. All the party issuing the directive has to do is repeat what he has already said. The party issuing the directive is under no obligation to make it clear that there has been a misunderstanding. With respect, I suggest having the person issuing the directive merely repeat it if he's been misunderstood, with no explicit statement that there has been a mistake, leaves open the potential for the recipient to be unaware he has misunderstood and to execute a misunderstood directive.

Due to the manner in which the sub-requirements for R1 are written, there could be misinterpretation at which entities plan would require those sub-requirements. We assume that requirements R1.6 and R1.8 apply to an entity that in that instance is *receiving* an Operating Instruction where Requirement R1.2, R1.3, R1.4, R1.5, R1.7 are reserved for only those cases where an entity is *issuing* the Operating Instruction. As currently drafted, R1.6 and R1.8 could be interpreted as somehow requiring an entity that would normally be issuing an instruction (such as an RC) to implement documented communication protocols for an outside receiving entity (such as a Balancing Authority). A potential solution would be to restructure R1 and R3 in such a way that it is based on entities that would be issuing instructions in one requirement and entities that would be receiving instructions in a separate requirement. AEP strongly disagrees with R 1.9, requiring coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols. For AEP, this requirement would

require coordination among numerous entities, and keeping all those protocols in sync would be a significant logistical challenge that does not appear to proportionately improve reliability. In addition, exactly what kind of coordination is needed? R1.1 through are robust enough that adding R1.9 is totally redundant and unnecessary. If beyond R1.1 through 1.8 there are additional, specific needs that still need to be addressed, those should be identified so that specific requirements could be developed if necessary. For this requirement alone, AEP must vote negative on this proposed draft.

No

If an entity has a control in place, but that control is somehow not viewed favorably during an audit, is that entity potentially in violation of an additional requirement? R2 and R4 appear to have potential double jeopardy implications.

It needs to be acknowledged by the project team that there are overlapping requirements between COM-003-1 and COM-002-3. Although the project webpage states that "COM-003-1 establishes the practice of using communication protocols for all Operating Instructions", COM-003-1 explicitly includes Reliability Directives along with the Operating Instructions. We understand Reliability Directives to be a subset of Operating Instructions, so with respect to Reliability Directives, there are unnecessary overlaps which will only cause confusion in adhering to the standard. In short, COM-003-1 should only be adopted with the understanding that the overlapping requirements in COM-002 would then be retired. AEP supports the forward-looking approach advocated by NERC's Reliability Assurance Initiative. We believe this proposed standard puts "the cart before the horse" in that it mandates internal controls for a limited number of requirements rather than taking a holistic approach where internal controls are generally required for all standards and where that language is housed outside of the standard itself. AEP believes this R 1.3 is redundant with TOP-002 R18. Other requirements in this proposed standard are already in place to drive clarity of communication.

We found what we believe to be a typo in the definition of "Operating Instruction." The defined term "Operating Instruction" has this phrase: "...where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System." The comma after "act" should be removed because it is not grammatically correct. If removed, the phrase would become: "...where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

Yes

The purpose statement needs to have "System Operators" limited to just those of RCs, TOPs, and BAs. The definition of "System Operators" in the NERC Glossary includes GOPs. The capitalized language added to the Purpose statement below would clarify this: Purpose: To provide System Operators OF RELIABILITY COORDINATORS, TRANSMISSION OPERATORS, AND BALANCING AUTHORITIES predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.

The latest version of COM-003 introduces a potential conflict with COM-002 related to the use of one-way burst messaging systems to issue a Reliability Directive. In COM-003, the follow Requirements apply: R1.7 Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short

time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party. R1.8 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. R3.3 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. In other words, COM-003 allows one-way burst messaging for Reliability Directives and prescribes:

- the issuer confirm receipt from at least one receiving party
- the receiver request clarification from the issuer if the communication is not understood

However, COM-002 has the following requirements: R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase, or recapitulate the Reliability Directive. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either:

- Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or
- Reissue the Reliability Directive to resolve a misunderstanding.

In other words, in the case of a one-way burst message used for Reliability Directives, COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3 way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst message Reliability Directive as the requirements indicate in COM-003. In order to fully comply with BOTH standards, the receiver would have to contact the issuer and repeat what was said on the original burst message; then, the issuer would confirm the response was accurate before acting on the message.

Electric Reliability Compliance

Yes

Yes

No

The VSLs give a higher violation to a GO than a BA for exactly the same error, even though the consequences with the BA are much greater. A GO who fails to require 3-part responses when requested is tagged with a Moderate violation, the BA with a lower. We believe the VRF should be Low rather than Medium for R4.

R4 should be eliminated and R3 should end after the first sentence. GOs do not issue Operating Instructions. They only receive instructions from others. GOs should have a communications procedure as part of their operations. However, the methods used are properly business decisions made by the GO. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an internal compliance program.

Requirement 3 is an administrative requirement that does little to benefit the reliable operation of the BES. By specifically calling out "Directives" in the requirement it creates the potential for double jeopardy with other requirements such as COM-002, IRO-001 and TOP-001 which all speak to following Directives. Requiring a documented communications protocol when the only responsibility is repeat back the instruction as received and seek clarification if the directive is misunderstood is beyond the intended scope of the reliability program in general. This requirement should be removed. Requirement 4 should be removed because it is unnecessary and excessive. The smaller entities that this will affect do not record phone conversations and it would be difficult to assess performance based on the very low number of "Operating Instructions" or "Directives" that these entities actually receive. The performance of "Operating Instructions" should be the proof. A better approach would be to amend the above mentioned standards (IRO, TOP, COM) to include "Operating Instructions" along with Directives. The term "All Call" is used in Requirement 1 Part 1.8. It should be defined in the NERC Glossary. If it isn't to be defined, then it should not be capitalized. Regarding Requirement 1 Part 1.8, and Requirement 3 Part 3.3, the receiver of an oral Operating Instruction or Reliability Directive from a one-way burst messaging system is "to request clarification from the issuer if the communication is not understood." What if the receiver never gets the issued Operating Instruction or Reliability Directive? Regarding Requirement 1 Part 1.8, and Requirement 3 Part 3.3, suggest changing "using" to "from" to make them read "Require the receiver of an Oral Operating Instruction or Reliability Directive from a one-way burst..."

CenterPoint Energy appreciates the opportunity to comment. The Company recognizes the work of the SDT however CenterPoint Energy still has large concerns with Draft 5. Specifically: 1) The addition of the term "Reliability Directive" to COM-003-1. 2) R1.9 coordination with other entities. 3) The addition of specifying the alpha-numeric format in R1.4. 4) The VSL's. 1) The addition of the term "Reliability Directive" to COM-003-1 introduces a potential conflict with the already industry and NERC BOD approved COM-002-3. Requirements R1.7 of the current draft of COM-003-1 states: "Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party." (emphasis added) Requirements R1.8 and R3.3 of the current draft of COM-003-1 allow the recipient of a Reliability Directive from a one way burst messaging system communication to "...request clarification from the issuer if the communication is not understood." (emphasis added) COM-002-3 makes no such distinctions regarding the issuing or receiving of Reliability Directives. COM-002-3 is clear; whether an entity is issuing or receiving a Reliability Directive 3-part communication must be employed. The Company firmly believes this conflict could easily cause entities to follow COM-003-1 yet be non-compliant with COM-002-3. In addition, since COM-002-3 already addresses emergency communications and has been reviewed and approved by industry stakeholders as well as the NERC BOD CenterPoint Energy believes there is no additional reliability benefit to adding "Reliability Directive" to COM-003-1. CenterPoint Energy strongly recommends deleting "Reliability Directive" from COM-003-1. 2) CenterPoint Energy has strong concerns regarding the addition of R1.9 to Draft 5 of COM-003-1. R1.9 requires that an entity's documented communication protocols address coordination with affected RC's, BA's, TOP's, DP's, and GOP's communication protocols. For responsible entities that have interconnections with multiple entities, this will be the equivalent of

“herding cats”. The Company does not believe it will be possible to coordinate with and come to a common agreement regarding the items in R1.1 – R1.8 with multiple parties. For example: R1.4 requires the documented communication protocols to address the format to be used when alpha-numeric clarifiers are necessary. Where a responsible entity is a TOP and is interconnected with multiple other TOP’s, DP’s, GOP’s as well as its RC, and BA, it will be extremely difficult for all parties to agree to a common alpha-numeric format. In addition, coordination will become an issue when any of the parties decide to revise or amend its communication protocols. This will be an on-going management issue for all entities. CenterPoint Energy strongly recommends R1.9 be deleted from COM-003-1. 3) CenterPoint Energy believes the addition to R1.4 requiring a responsible entity to specify the format to be used where alpha-numeric clarifiers are necessary is an unnecessary and burdensome requirement. The Company agrees with the SDT’s decision to add to R1 and R3 language that allows an entity to address, where applicable, the items in the sub-requirements instead of requiring these items to be in the communication protocols as it was in Draft 4. However, the addition of specifying the format for those clarifiers is a step backwards. Draft 4 did not require documenting a specific format and therefore would have allowed an entity the flexibility to use, for example, “Baker” or “Bravo” for the letter “B”. The Draft 5 version now sets up an operator for a possible violation if the protocol specifies “Baker” and the operator inadvertently uses “Bravo”. The purpose of using alpha-numeric clarifiers is to ensure the recipient understands that the alpha component, in this case, is the letter “B” and not “E” or “D”. The use of “Baker” or “Bravo” accomplishes that purpose. The Company believes having to specify a format to use does not result in any reliability benefit and therefore CenterPoint Energy strongly recommends the deletion of the format requirement from R1.4. 4) CenterPoint Energy firmly believes there should be no High or Severe VSL for simply failing to document a process, policy, or procedure. High or Severe VSL’s should only apply to the most egregious violations that have a high impact on the reliability of the BES. As NERC has stated on many occasions, the purpose of the Reliability Standards is to enhance the reliable operation of the BES. Where an entity is performing the process, procedure, or task required in an applicable Standard and therefore is reliably operating its portion of the BES, yet has failed to document that process, procedure, or task, penalizing that entity with a High or Severe VSL will not result in improved reliable operation of the BES. CenterPoint Energy recommends no VSL’s higher than Moderate. CenterPoint Energy supported Draft 4 of COM-003-1 however, the changes made by the SDT in Draft 5 has caused the Company to rethink its position. If the SDT were to make the recommended changes CenterPoint Energy would be able to support the Standard.

See comment #3 in the comment area of the last question

1) In the COM-003 FAQ document the response to question 5 states that R3 and R4 apply to the “recipient of the command” where the recipient is “expected to act, to change or preserve the state, status, output, or Element of the [BES] of Facility of the [BES]. In many Registered Entity organizations, the commands from a TOP, BA or an RC typically go through an intermediary dispatch control center. Then, if necessary, the commands are passed through to the associated DP or GOP. How does COM-003 apply to such organizations with respect to R3 and R4? 2) In the COM-003 FAQ document the response to question 3 states that entities “develop their own programs that support the requirements of COM-003.” Suggest that the SDT clarify that recorded lines are not specifically required and that other tools such as documented direct supervisory observation could be used. 3) In R3 and R4 the term ‘operators’ is used, in generation stations this term is widely used and relates to different job functions. Suggest clarifying the term by stating ‘operators who receive Operating Instructions or Reliability Directives from a Balancing Authority, Reliability Coordinator or Transmission Operator’. 4) The COM-003 language that includes ‘reliability directives’ has the potential to create a compliance issue with COM-002 related to “all calls” since some Transmission Operations use ‘all calls’ or ‘one way burst messaging’ to communicate reliability directives. These

communication methods typically do not allow for a response or repeat back or for an acknowledgement of the response accuracy. The problems with COM-002 cannot be solved by making edits to COM-003. Instead, changes to COM-002 should be made to clarify that "all calls" or burst messaging systems can be used to deliver Reliability Directives.

No

We do not agree with the revisions to the language of R1 and R3. The changes are a lowering of the bar for reliability. Earlier versions identified specific communication protocols for each BA, RC, and TOP. These specific requirements would have resulted in a consistent approach to communications between all system operators. The proposed revisions couple result in varying procedures that do not close the gap in communications. The watered-down versions of the requirements are essentially a fill-in-the-blank type of standard allowing each applicable entity to develop their own protocols.

Yes

No

Based on the changes we believe are necessary for Requirements R1 and R3, we believe the VSLs should be changed accordingly.

The apparent conflict between COM-002-3 and COM-003-1 needs to be addressed. The information provided in the Frequently Asked Questions document was helpful but it is not clear that a drafting team response to a frequently asked question can alter what is required in another standard. It is not clear that developing a communications protocol that says three-part communication is not necessary for a one-way burst message is going to relieve a BA, RC, or TOP from the requirement to use three-part communications for all Reliability Directives. If the position is that three-part communication is not required for one-way burst messages, this exception should be included in COM-002-3.

Group

Seattle City Light

paul haase

seattle city light

Yes

Yes

Seattle City Light is supportive of the proposed "assess and implement" approach to compliance for COM-003 R2 and R4.

No

The VSLs give a higher violation to a GO than a BA for exactly the same error, even though the consequences with the BA are much greater. A GO who fails to require 3-part responses when requested is tagged with a Moderate violation, the BA with a lower. Both should be lower.

Seattle City Light is concerned about the conflict between COM-002 and COM-003 regarding responses to Reliability Directives. In the case of a one-way burst messaging used to issue a Reliability Directive, COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3-way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst messaging Reliability Directive as the requirements indicate in COM-003. In order to be fully compliant with BOTH standards, the receiver would have to contact the issuer, repeat what was said on the original burst message, then the issuer would confirm that the response was accurate before acting on the message. Seattle City Light appreciates the responsiveness of the OPCPSDT in quickly posting an FAQ once the COM-002/COM-003 issue was raised. The opinion of the OPCPSDT notwithstanding, Seattle is not reassured by the secondary documentation cited in the FAQ when the plain language of the two Standards are in conflict. Past experience, such as illustrated in the 2008 PacifiCorp case, shows that where Standards are unclear or in conflict, auditors have been prone to take the language at face value and disregard secondary documents. In addition, entities charged with implementing the Standards are prone to change practices to avoid ambiguous areas and compliance risk, which in this case could result in the phase-out of effective all-call or burst messaging systems for announcing reliability Directives. As a result, Seattle is sufficiently concerned about the audit and reliability implications created by the present draft of COM-003 to change from a YES position to NO at this time. Seattle is prepared to support COM-003 once this conflict is addressed. A simple solution would be to eliminate the words "Reliability Directive" from COM-003, which after all is designed to address "Operating Instructions." Inclusion of Reliability Directive language in COM-003 creates an additional complication, by making R1.8 incomplete. R1.8 require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. This language does not address the next step: if an entity receives a burst message from its RC that is unclear, and is unable to reach the RC for clarification (perhaps because the RC is busy handling the emergency situation), what is the entity to do? Implement to Reliability Directive to its best understanding? Wait until it can clarify the Directive? Do nothing? Serious reliability and compliance risks attend all of these possibilities, and the Standard should be clear as to which is preferred. Seattle again recommends removing "Reliability Directive" language from COM-003 as a simple solution. If the Reliability Directive language remains in COM-003, this potentiality should be addressed in the Standard as to which approach is preferred.

Please see comments: NEW NERC RELIABILITY STANDARD – COM-003-1 – Version 5 Version 5 comments R1.1 and R3.1 Proposed Updated Language: Use of English language when issuing or responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation, or as otherwise agreed to by the parties. Comment: The Western Interconnection is interconnected with Mexico, south of the California, Arizona and New Mexico borders and with Canadian provinces north of the Washington, Idaho and Montana borders. SDG&E, which is located at the California-Mexico border, communicates almost daily with the Mexico utility located in Baja California, CFE. When the standards became mandatory and enforceable, in compliance with COM-001, R4, SDG&E maintained an agreement with CFE which documents that English will typically be used, but in instances where communicating in Spanish is more effective in ensuring system reliability, the personnel involved will use Spanish given that all parties involved are fluent in Spanish. CFE does not have a mandate to be in compliance with the U.S. NERC Reliability Standards. The native language in Mexico is Spanish, and SDG&E staffs its Electric Grid Operations department with personnel who are fluent in Spanish, therefore its agreement with CFE is managed to insure that all communications with its neighbor to the south are clear, concise, and understood. In addition, there are at least two generation stations located south of the California border, interconnected with SDG&E, and the employees at those stations are fluent in Spanish, therefore, because those generation station personnel will also communicate with the California ISO and the WECC RC on occasion, those entities need the flexibility provided in COM-001 R4 to be carried through to COM-003-1, R1.1. & R3.1. All policies and procedures developed by power company entities south of the border are written in Spanish, and at times, written communication between U.S. and entities in Mexico are in Spanish. Since SDG&E's neighbors to the south do not have to comply with U.S. NERC Reliability Standards, and U.S. entities are required to comply with U.S. NERC Reliability Standards, SDG&E proposes the revisions to COM-003-1 R1.1 and R3.1 as identified above. This proposed revision provides for the flexibility that already exists in COM-001 R4 that has effectively worked over the last several years. R1.2 Proposed Updated Language: Instances that require time identification when issuing an oral or written Operating Instruction or Reliability Directive, and the format for the time identification specified uses a 24-hour clock format and the Entity's time zone. Comment: SDG&E prefers the language proposed above. The proposed language leaves NO doubt associated with how to reference a specific time for ALL entities. If one entity uses the 24 hour clock, and another is using a.m. and p.m., it simply leaves the opportunity for some confusion that can be eloquently avoided when stating that a 24 hour clock is to be used.

No
See answer to 4 below.
The SRT agrees with the concepts put forth in COM-003, but have some concerns, particularly with the proposed administrative burden associated with the Standard. The SRT offers to following comments: 1. R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP

communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities' communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden. 2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations, however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity's internal compliance program. 3. R4 raises the question of sufficiency of an entities corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the "problem" is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program. 4. The SRT recommends that the language to M4 be changed as follows: M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following: -Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session) -Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session) -Documented annual training Examples of sufficient corrective action programs include, but are not limited to, the following: - Documented refresher training -Documented meeting -Documented "hot box" communication 5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is tagged with a Moderate violation, while the BA would receive a Lower. 6. In the RSAW, the following passage should be expunged; "Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected." Differentiating between slips of the tongue and "deficient communication practices" involves subjective judgments. The same is true for attempting to identify changes in an operator's degree of understanding, especially when doing so through the numbing process of making before-and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.

Individual

Ronnie Hoeinghaus

City of Garland

Yes

No

R2 & R4 Requirements are written assuming that corrective actions will be necessary. Should be written to state corrective actions "if necessary"

1)COM-003 now includes "Reliability Directives" which is why COM-002-3 was developed and approved – COM-002-3 does not need to exist if Reliability Directives are covered in COM-003 2)In the Background Section of the "Unofficial Comment Form", it is stated that the final goal of this standard was to implement 3 part communication. It would seem that it would be simple to state in a requirement that the entity has to develop a procedure to use 3 part communications for Operating Instructions using English except where prohibited by law or regulation and then a 2nd requirement to develop an assessment process with a corrective process if necessary. It is totally unnecessary to write a requirement with 9 sub parts that must be accounted for in a policy and procedure for an industry wide practice that already exists. As written, it only add burdensome and unnecessary

paperwork to operations and compliance departments that has to be maintained and audited – again for a process that already exists industry wide. 3) Why is the Time Horizon stated as "Long Term Planning" instead of "Real-Time"

No

We do not believe that we need a definition for the term "Operating Instruction" and we would like to see this defined in the entities protocol. However if a definition is included, we ask the SDT to require an RC, TOP, or BA to identify when an Operating Instruction is used to communication to a GOP or DP.

No

We ask the SDT to delete requirements R3 and R4 because they are redundant and may cause double jeopardy for entities as these requirements are addressed in requirements R1 and R2 for the BA, RC, and TOP communication protocols with DPs/GOPs.

No

Concerning the VRF and VSLs we ask the SDT to review the severity levels because we do not believe that any violations of this standard should be at either a High or Severe level since these are documentation requirements.

We would ask the SDT to consider for clarity to this standard that COM-002 only address Reliability Directives and COM-003 only address Operating Instructions.

Regarding question #1, the SERC OC Review Group agrees with the definition of Operating Instruction. While we also can agree to the changes made to R1, we feel R3 in its entirety is unnecessary and duplicative. Removal of the word "develop" would eliminate double-jeopardy concerns. R3 could be acceptable if "develop and" are omitted and "as developed in R1" is inserted after "protocols" and before "that." It should be noted that this suggestion only applies to the sub-requirements in R1 that correspond to the proposed sub-requirements in R3. Regarding question #2, R2 is acceptable and R4, as stated above for R3, is unnecessary and duplicative. Regarding question #3, we agree with the VRFs and VSLs for R1 and R2. Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed. Additional SERC OC Standards Review Group supporting these comments are James Wood

with Southern Company and Kelly Casteel with TVA. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

See comments below.

Yes

Yes

Occidental Energy Ventures Corp. ("OEV") is firmly on board with the strategy taken by the drafting team to incorporate structure in the communication of Operating Instructions, while allowing each entity some flexibility in the process. As a GOP, we take very seriously our responsibility to accurately capture and execute all instructions from RCs, BAs, and TOPs that may affect the state of the Bulk Electric System. This approach will allow us to differentiate between instructions issued orally, via email/messaging, and one-to-many broadcasts – which change rapidly as new communications technologies are introduced. In addition, we agree that a risk-based compliance method is necessary – particularly in the case of oral communications. Even the most perfectly trained operators can stumble on occasion, and the result should not be a compliance violation unless the errors continue to manifest themselves. Furthermore, the amount of overhead necessary to ensure that every oral instruction is repeated back with time stamps, equipment identifiers, and alpha-numeric clarifiers is

extraordinary in the zero-defect model. However, we are not convinced that these excellent intentions are captured in a manner that will assure consistent assessments by Compliance Enforcement Authorities. It is clear from our reading of the FAQs recently posted by the drafting team that many industry respondents are unclear how auditors will interpret COM-003-1's requirements over a wide range of operating scenarios – a concern that we share. This means that a common understanding must be reached in an enforceable document that both operators and CEAs can rely on for consistency. In our view, the RSAW is the logical vehicle for this approach. It is a fundamental audit tool and has been traditionally used as a semi-binding reference in the evaluation of reliability compliance. In addition, the concurrent development of the RSAW with COM-003-1 was instituted precisely to ensure uniformity between the SDT's intent and the standard's enforcement. This implies that the RSAW must contain a greater level of detail to address multiple situations – and we have provided specific suggestions in our RSAW feedback form along these lines. Lastly, we do not have a clear understanding how Requirement R1.9 will be implemented. As it is presently written, it would seem that GOPs should expect some notification from their RCs, BAs, and TOPs that communication policies are to be "coordinated." Our experience has been that some entities simply post instructions on their web-sites hidden among many other documents – which does not count as coordination in our view. However, we are not sure that the issuers' policies are consistent with all of R1's other sub-requirements. As such, OEVC recommends that R1.9 be removed.

UI as its functional role of DP is voting No because of the conflict between COM-003 R 1.7, R1.8 and R3.3 with COM-002 R2. COM-003 allows for the RC/TOP/BA communication protocol when issuing Reliability Directives to override the clearly stated requirement of COM-002 R2 that a DP SHALL REPEAT, RESTATE, REPHRASE, OR RECAPITULATE the Reliability Directive. There is no leeway in COM-002 R2 to allow for solely providing an affirmation of receipt of a verbal reliability directive or not repeating back the message when the RC/TOP requests no repeat. As a DP, UI is placed in a position of attempting to comply with two opposing requirement in the two standards. If the RC/TOP communication protocol clearly stated that there will be no repeat back when receiving a verbal Reliability Directive and COM-003 requires a DP to comply with the RC/TOP communication protocol, UI would have to choose between violating COM-002 or COM-003. Since the VRF for COM-002 R2 is HIGH indicating a greater risk to reliability than COM-003 VRF LOW, UI would comply with COM-002 R2. This issue can be resolved either by correcting COM-002 by assigning the flexibility of opting out of repeat back to the RC/TOP/BA function, or removing the words "Reliability Directive" from COM-003.

Group

pacificorp

ryan millard

pacificorp

No

PacifiCorp supports the proposed language referenced under R1 and the definition of "Operating Instruction" but does not support the following language proposed under R1.4: "Instances where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction or Reliability Directive, and the format for those clarifiers." Under the proposed draft, instances where alpha-numeric clarifiers are "necessary" are not clearly defined. In the absence of a clear definition, the identification of such instances is open to interpretation by both the entity and the auditor. Moreover,

requiring the use of alpha-numeric clarifiers is not warranted when the requirements listed in R1.5 - R1.8 (requiring the strict use of three-way communication) alleviate any possibility of miscommunication, which PacifiCorp understands to be the drafting team's intent in the development of separate Requirement R1.4. PacifiCorp believes implementing the use of alpha-numeric clarifiers poses additional risk due to the introduction of ambiguous language.

No

PacifiCorp does not support the following language referenced under R2 (with substantially similar language in R4) as it pertains to the Balancing Authority, Reliability Coordinator, Transmission Operator, Generator Operator, and Distribution Provider: "...shall develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1." In the absence of any proposed criteria for measuring how the aforementioned method(s) are developed, determining whether an entity has successfully met the expectations it has established in its communication protocols is subject to a multitude of interpretations. Moreover, Measures M2 and M4 are focused exclusively on the results of an entity's periodic assessment and corrective actions. PacifiCorp believes that a results-based review of an entity's assessment fails to provide any insight into the quality of the assessment itself.

No

PacifiCorp does not support the VRFs and VSLs for Requirements R2 and R4. In keeping with PacifiCorp's comment in Question 2, a method of assessment that is not explicitly defined and cannot be measured against a clear set of criteria makes it difficult for an entity or auditor to determine whether any of the corrective actions taken by an entity have fulfilled the expectations documented in their communication protocols. Assigning a severity level based on a percentage of completion is redundant when an entity cannot determine what a "complete" assessment is or the criteria by which it is measured.

MRO NSRF

Russ Mountjoy

MRO

Yes

Yes

Yes

The NSRF recommends the following issues be addressed in order to provide a less ambiguous Requirement. Regarding R1 and the term; 'implement'. The "Blue Box" explanation is not carried forward when the standard is filed with the Commission. The "Blue Box" explanation greatly expands the meaning "and implement". Our understanding of 'implement' is that you will use the documented communication protocols in the manner outlined in your System Operator communications protocols.

Training is not a demonstration of implementing. Only actual System Operator communications demonstrating the use of the communication protocols is demonstrating implementation. Recommend that "training" be removed from the blue text box since training is inherent to assuring that protocols are followed. The Training issue will also need to be removed from the RSAW. Suggest R1.8 be removed. This requirement cannot be measured. How do you prove compliance? An entity will be asked to prove the negative and demonstrate that my System Operators were not confused? I can see where I might have to provide an attestation that states: "My System Operators were not confused on any one-way burst messages." This proposed requirement is a common sense issue. R1.9, R3.3: the word "coordination with affected" is vague and open to many interpretations. Suggest this requirement be deleted. Should the requirement be kept, suggest clarifying what is intended in the requirement. Such as "RC, TOP's BA's... shall share their communication protocols with applicable RC, BA, TOP, ... " The NSRF does not understand if the intent is to share or coordinate protocols? Both have different outcomes, please clarify. The NSRF believes that the infrequent communications to a Distribution Provider, that are not already in scope of COM-002-3, do not carry any considerable risk to the BES. The administrative burden on the Distribution Provider should be greatly reduced, as there would not be a measurable gain in reliability by requiring them to formally document communication protocols and establish a monitoring program. To address these concerns, we recommend that Distribution Provider be removed from the applicability in R3 and R4. Secondly, we suggest that an R5 be created similarly to COM-002-3, R2. Recommend the following for how the new R5 might read: R5. Each Distribution Provider that is the recipient of an oral Operating Instruction, other than Reliability Directives, shall: 5.1 Use the English language, unless another language is mandated by law or regulation. 5.2 Repeat, restate, rephrase, or recapitulate the oral Operating Instruction, excluding oral Operating Instructions issued as a one-way burst message.

Individual

Michael Falvo

Independent Electricity System Operator

No

We agree with most of the changes made. We offer a preferred wording for Part 1.4, and have a concern over the ambiguity of Part 1.6 and Part 1.8. Part 1.4 states that: 1.4 Instances that alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction or Reliability Directive, and the format for those clarifiers. A preferable description would say that the protocol should address the risk of miscommunication arising from alpha-numeric identifiers. This could be addressed through the use of the phonetic alphabet or through different means if local conditions dictate a different approach. As noted above, we are concerned over the ambiguity of Part 1.6, which states that: 1.6 Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer. When read together with the last sentence in R1, "The documented communication protocols will address, where applicable, the following:", this part is unclear as to whether it is to identify the instances that the repeat is required, or that the documentation needs to include explicit statements that the issuer needs to request a repeat when issuing an operating instruction or reliability directive which the issuer feels a repeat is necessary. This sub-requirement part, as written, is ambiguous and appears to be more applicable to the instruction recipient than the issuer. When read together with Part 3.2, Part 1.6 appears to be requiring the issuer to identify the instances that a repeat is required. We therefore suggest the SDT to revise Part 3.2 as follows: 1.6 Instances where it requires the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer. Similar concerns with Part 1.8 except the mirror part 3.3 does not contain the wording "if requested by the issuer". Hence, we assume that the recipient is required to request clarification from the issuer if the communication is not understood without having to be asked. Therefore, we propose Part 1.8 be revised as follow: 1.8 A stipulation that the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.

Yes
(1) Definition "Operating Instruction" - reference is made to both 'Bulk Electric System' and 'BES'. For consistency, either the words or acronym should be used.
No
(1) Compliance Data Retention, 1.2 – COM-001 and COM-002 standards both read 3 months or 90 days for the retention of evidence. It is unclear as to why the retention has been doubled in this standard to 180 days for R2, M2 and R4, M4. For consistency and simplicity, 90 days should be used.
Yes
Although Manitoba Hydro is in general agreement with the standard, we have the following clarifying comments: (1) VSLs, R1 – the Severe category is missing the concept of 'The Responsible Entity did not implement four or more documented communication protocols as required in Requirement R1'. As written, it skips from 'three or more' to not implementing any of them. There is a gap if there is a Responsible Entity that failed to implement for example, 5 of the protocols. (2) VSLs, R3 – for readability, the first paragraph should be written 'The Responsible Entity did not address any parts of Requirement R3 in their documented communication protocols as required by Requirement R3.'.
(1) 'Reliability Directive' is referred to in R1, 1.1 of the COM-003-1 standard but is not currently a FERC approved definition, defined in the Glossary of Terms. (2) R1, 1.3 and Rationale and Technical Justification documents - reference is made to 'interface', which is not a defined term. Accordingly, its meaning is questionable. Consider removing or clarifying. (3) R1, 1.6 and 1.8 – requirement language is not consistent. For example, 'recipient' and 'receiver' are used but have the same meaning. Suggest beginning the requirements with the following text "Instances where....". (4) R2, R4 - the word 'periodically' should be inserted before 'assess' in each of these requirements for consistency with the Measures and VSLs, which refer to 'periodic assessments'. (5) R2, R4 - the phrase 'necessary to meet the expectations in its documented communication protocols' is ambiguous and will be difficult to interpret when assessing compliance. Is this statement to be the interpretation of the drafter of the protocols as to what is, in their opinion 'reasonably necessary'? (6) R3, 3.2 and 3.3 – requirement language is not consistent. For example, 'recipient' and 'receiver' are used but have the same meaning. Suggest beginning the requirements with the following text "Instances where....". (7) General Measures – there is lack of guidance with respect to both who the documentation is to be provided, and when. For example, periodically, upon request, etc. (8) M1 and M3 – ' / ' should be placed between the words 'and' and 'or'. (9) Section D, Compliance, 1.1 – the paraphrased definition of 'Compliance Enforcement Authority' from the Rules of Procedure is not the standard language for this section. Is there a reason that the standard CEA language is not being used?

ERCOT recognizes and commends the drafting team's efforts to respond to industry comments and is supportive of draft 5 of COM-003-1. It should be clear in the definition and the standard that electronic systematic interchanges are not Operating Instructions. Please consider modifying the last sentence of the definition for Operating Instructions as below: "Discussions of general information and of potential options or alternatives to resolve BES operating concerns as well as electronic, system to system, interchanges are not commands and are not considered Operating Instructions." ERCOT ISO also maintains that the sub-requirements for R1 and R3 are not the "communication protocols" that FERC Order 693 and Blackout Recommendation #26 intended to be addressed as they are solely focused on "miscommunication". However, ERCOT ISO believes that the structure of COM-003-1, in allowing an entity to address subrequirements through development of its own documented communication protocols and identification of the instances of needing to use such protocols, allows for future revisions to focus on the subrequirements, as needed, leaving the construct in place to easily add, modify, or delete such parts as necessary through such subsequent revisions. An example of such a revision is where IRO-014-1 R1 has a similar construct and was modified to include an additional subrequirement (R1.7) in version 2. ERCOT believes that oral and written operator communication requirements should be in a single reliability standard and supports further refinement of the requirements and combining COM-002 and COM-003 into a single reliability standard.

SMUD would like to thank the Drafting Team for their efforts. While we agree with the intent of COM-003 SMUD believes the requirements R1.5 & R1.5 are too vague. Requiring the receiving party to repeat back the Operating Instruction only (emphasis added) if requested does not provide insurance that the receiving party would have a clear understanding of the necessary actions intended by the issuing party.
SMUD would like to thank the Drafting Team for their efforts. While we agree with the intent of COM-003 we would like the Drafting Team to provide input on a possible conflict between the Board approved COM-002-3 Requirement and Draft #5 of COM-003-1 Requirements R1, Part 1.7 & R3, Part 3.3. It appears that a "One-way" burst messaging that includes either oral or electronic Operating Instructions or Reliability Directives as depicted in the current COM-003 does not require practice of 3-way communication prior to taking action. Since COM-002 Requirement R2 specifies that the recipient "shall repeat, restate, rephrase, or recapitulate the Reliability Directive" it is unclear whether or not the receiving parties of a blast message adhering to the COM-003 Standards would be in compliance with COM-002 requirement R2.

1) R3 (formerly R2) apparently now applies to all of a DP's or GO's operating communication expectations, and not just to Operating Instructions or Reliability Directives. We fail to see what Reliability objective is accomplished by entities presenting all their communication protocols for audit, when the only real reliability concern is if the entity responds appropriately to an Operating Instruction or Reliability Directive. Although 3.1, 3.2, and 3.3 deal only with Operating Instructions and Reliability Directives, R3 itself does not share this limitation. 2) We also note that by removing the "in a manner that identifies, assesses and corrects deficiencies" language, R3 becomes a zero defect requirement and an entity becomes subject to sanction for a single failure to implement the developed protocol. We don't believe this was the SDT's intent, but this was the effect of moving the language to R4. R4 is simply an additional separate requirement an entity must comply with. Taken together, we believe most auditors would look first to find failures to implement procedure under R3. If any failure was found, they would assign a violation and move on to R4 to look for evidence of corrective action following the occurrence. If none were found, a second violation would be assigned. 3) We suggest: "R3. Each Distribution Provider and Generator Operator shall develop and implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols that outline the communications expectations for receipt of Operating Instructions and Reliability Directives by its operators," and that R4 be removed.

This standard is becoming overly complicated. The reason this COM standard is being developed is to reduce the possibility of miscommunication of information when the BES is being altered. This proposed standard is an administrative burden. Operators will be fearful that they will cause a NERC Compliance Violation every time they communicate. Their focus will be on communicating compliantly and not on operating the BES. Consideration should be given to simplifying this standard. Below is an unrefined proposal for consideration: R1: Applicable REs shall have a procedure that requires its personnel (whether as a receiver or as an initiator) to use three-part communication when altering the state of the BES. Three-part communication is defined as when an initiator issues a command, the receiver repeats the command back, and the initiator confirms. Any misunderstandings are resolved during the repeat back. (3-part communication is the only proven way to mitigate miscommunication. If personnel use three way communication then all issues related to alpha-numeric clarifiers, time, etc

should be resolved naturally during the repeat back/confirmation. Additionally, this requires operators and field personnel to remember one thing: when changing the state of the BES they must use 3-part communication.) R2: Each calendar month REs required to comply with R1 shall assess a random sample of communications that occurred over the month to ensure that three-way communication was properly being utilized, when the BES was being altered. In instances where deficiencies are found, REs shall require remedial training to be completed by the individuals involved in the deficient communication. (Remedial training will act as a deterrent for those who get lazy about using three-part communication. Additionally, peers will be aware of who had to undergo remedial training, which will further act as deterrent. Requiring remedial training would be an incentive to using three-part communication properly)

EMMT agrees with the concepts put forth in COM-003, but have some concerns, particularly with the proposed administrative burden associated with the Standard. EMMT offers the following comments: 1. R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden. 2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations, however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity's internal compliance program. 3. R4 raises the question of sufficiency of an entities corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the "problem" is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program. 4. EMMT recommends that the language to M4 be changed as follows: M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following: Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session) Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session) Documented annual training Examples of sufficient corrective action programs include, but are not limited to, the following: Documented refresher training Documented meeting Documented "hot box" communication 5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is tagged with a Moderate violation, while the BA would receive a Lower. 6. In the RSAW, the following passage should be expunged; "Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected." Differentiating between slips of the tongue and "deficient communication practices" involves subjective judgments. The same is true for attempting to identify changes in an operator's degree of understanding. especially when doing so through the numbing process of making before-

and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.

The SRC recognizes and commends the Drafting Team’s efforts to respond to Industry comments and to offer a revised pragmatic solution for this Project. The proposed changes do not create a common results-based standard that addresses let alone resolves any identified reliability problem. The SRC is concerned that the posting as proposed the standard creates a fill-in-the-blanks solution that could discourage a functional entity from employing anything more than a least common denominator solution. Technically the definition and proposal are improvements and the SRC would agree with the proposed changes, if the definition and proposal were needed. The issue is with the need for this definition, and the continuing debate this definition is generating. The SRC is opposed to having this term defined and added to the NERC Glossary. The term operating instruction does not need to be defined. For years, system operators deal with operating instructions on a daily if not minute-to-minute basis. Having a defined term, and calling such communication as “Command” is unnecessary, and potentially could confuse operators from what they understand to be the meaning of operating instructions. While the SDT has found that their previous definitions were not appropriate for a NERC standard, and the subsequent incremental changes are useful, the debate itself does not seem to be a productive use of the SDT’s or the Industry’s time. The SRC would prefer that the objectives of the SAR (communications protocols) be handled through means other than a Standard (e.g. the Operating Committee’s Reliability Guidelines on Communications). The reason being, a standard requires zero-defect compliance, data retention, self-reporting, and requires these debates over the proposed terms such as “Operating instruction” which diverts the Industry, NERC and the Regional Entities from focusing on more productive reliability issues. The proposed RSAW wording must be more objective as the current test contains too many subjective requirements: Page 3 • “... Identification of instances ...” – will this be viewed as identification of every instance or will one instance be sufficient? • “...when....necessary...” – who decides when there is a necessity? The auditor or the functional entity? Page 4 • “...may include...” – this phraseology may be seen as meaning the listed following items are among the items that are required but are themselves insufficient to meet the requirement. Page 5 • “...reviews of System Operator voice recordings...: - it should be made clear that the “review” is of the sampled recordings used by the entity in its own self-assessments, and not a “review” of any voice recording. • “Where practicable” is subjective and inappropriate for a standard. To avoid confusion and misapplication of the standard, the RSAW should include a statement that messaging systems are not oral communication and not evaluated under the standard.

ACES Standards Collaborators

Ben Engelby

ACES

Yes

(1) We appreciate the efforts of the drafting team in developing this standard and the steps the team took to resolve industry’s concerns. (2) We continue to have concerns that the glossary term “Operating Instruction” overlaps with “Reliability Directive.” The standard as written allows flexibility on how to deal with these two terms/situations and gives the registered entity the responsibility to

handle these types of communications in its protocol. Because of the flexibility and in the spirit of moving forward, we can support the approach by the drafting team that would allow NERC to address FERC concerns. This represents a good balance.

Yes

(1) We appreciate the drafting team allowing the registered entity to have the flexibility in determining the assessment methods and corrective actions to implement. Further, we appreciate that the measures for these requirements state that the assessment should be "periodic" but do not impose any strict timeline. We recommend that the RSAW state the same or similar language, as the entity should be able to dictate how often the assessments occur in their protocols, policies, and procedures.

No

(1) There are a few changes that need to be made in the severe VSLs for R1 and R3. The severe VSL states, "The Responsible Entity did not implement any documented communication protocols as required in Requirement R1." This statement is in direct conflict with the lower, medium and high VSLs because if an entity violated at least one documented communication protocol (low VSL), or two protocols (medium VSL), or three protocols (high VSL), then the entity violated "any." We recommend striking the statement in the severe VSL to avoid this conflict.

(1) The sub-parts of the protocols have grammatical errors, where the sub-parts do not correlate to the lead-in sentence. We recommend replacing the phrase "Require the recipient/receiver..." that is stated in sub-parts 1.6, 1.8, 3.2 and 3.3 with "Instances in which the recipient/receiver is required to..." in order to maintain consistency throughout the standard. Leaving these sections as mandates (verb phrases) could confuse auditors into thinking that these are zero defect requirements.

No

The COM-003-1 standard needs to an independent document used to audit entities and the RSAW should not be used to address items not covered in the standard as to what is acceptable and what is not acceptable when it comes to instances when three-part communication is not properly followed by an entity during an audit. IMPA is concerned that an entity has one instance of a missed repeat back and per the entity's plan they address it and re-train for it; NERC could still call it a violation. The standard language needs to be clear about the latitude that an entity is given to work things out within their internal controls. The main item that the standard should do is to make sure that entities have communication plans and their internal controls within the communication plans contain a process to monitor and self-deal with corrective action of instances where its communication plan was not properly followed. This language needs to be clearly stated in the standard and not somewhat stated in the RSAW. IMPA believes the prior version of this draft standard was close when it used language on internal controls that stated "implement, in a manner that identifies, assesses, and corrects deficiencies...".

IMPA believes there is a conflict between COM-003-1 and COM-002-3 when it comes to how an entity replies back to an "All Call". COM-003-1 does not require three part communication and it seems that COM-002-3 does require it. This creates confusion and needs to be corrected. IMPA supports the use of one communication standard to address proper communication protocols for Directives and Operating Instructions. This could be accomplished by retiring COM-002-3 upon the implementation of COM-003-1.

Anthony Jablonski

ReliabilityFirst

No

ReliabilityFirst abstains and offers the following comments for consideration: 1. Requirement R1 and

Requirement R3 - ReliabilityFirst questions the reasoning behind the term "where applicable" in the last sentence of Requirement R1 and Requirement R3. Can the SDT provide examples when there would be instances where an Entity would not need to address a sub-part within their documented communication protocols? ReliabilityFirst believes all sub-parts under Requirement R1 and Requirement R3 should be addressed within the respected protocols. 2. Requirement R1, Part 1.9 - ReliabilityFirst does not believe it is appropriate for Requirement R1, Part 1.9 to be addressed within the documented communication protocols. It is unclear how an entity would address "coordination" of its protocol within the protocol itself. ReliabilityFirst does agree with the concept of having the responsible entities be aware of each other's communication protocols and thus recommend elevating this to a stand-alone requirement. ReliabilityFirst recommends the following for consideration as a new R3, "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall make available its documented communication protocols that outline the communications expectations of its System Operators."

No

ReliabilityFirst abstains and offers the following comments for consideration: 1. Requirement R2 - ReliabilityFirst believes the concept of implementation of the method(s) to assess System Operators' communication should be added to the requirement. If the Entity is not required to implement the method(s), an Entity may never find any deficiencies and get to the point of implementing the corrective actions necessary to meet the expectations in its documented communication protocols. ReliabilityFirst recommends the following for consideration, "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1." 2. Requirement R4 - Similar to the comment on Requirement R2, ReliabilityFirst believes the concept of implementation of the method(s) to assess System Operators' communication should be added to the requirement. ReliabilityFirst recommends the following for consideration, "Each Distribution Provider and Generator Operator shall develop and implement method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R3."

No

1. VSL for Requirement R1 - In order to capture instances where more than three parts were not addressed, the second VSL under the "High" category needs to be modified to state, "...did not implement three (3) or more of the nine (9) parts of..." 2. VSL for Requirement R2 - ReliabilityFirst recommends including a lower bounds around the "Medium VSL". As written, an entity would fall into the Medium VSL range if they only implemented 1% or implemented 49% of the corrective actions. ReliabilityFirst recommends gradating the VSLs using 25% increments across all four VSLs. 3. VSL for Requirement R4 - ReliabilityFirst recommends including a lower bounds around the "Medium VSL". As written, an entity would fall into the Medium VSL range if they only implemented 1% or implemented 49% of the corrective actions. ReliabilityFirst recommends gradating the VSLs using 25% increments across all four VSLs.

No

No

We do not believe a Standard is needed, given other developments: A. The SDT materials have not demonstrated the reliability gap/need for this Standard. Without having a better sense of what the scope of the actual reliability risks are (frequency, impact, etc...), it's difficult to know if the proposed solution – as embodied in COM-003 Draft Version 5 – is “necessary to provide for reliable operation of the bulk-power system”. B. Moreover, the Requirements that the recipient repeat, restate, etc., if required/requested by the issuer (1.6 & 3.2) suggest that a RC, BA or TOP needs to ensure a repeat back or be non-compliant even though taking this extra time may, in fact, impact reliability. C. Lastly, the fact that the Ballot Body and Standard Drafting Team continue to have so many questions about how to interpret these requirements (see the recently issued FAQs) suggests: (a) that the Operating Committee would serve as a more effective forum for discussing what additional communication practices, if any, are needed, and (b) the requirements themselves may be unduly ambiguous. - Proposed Solution: We support strengthening communications protocols such as contained in the pending COM-002 revisions and in the OC White Paper. NERC Event Analysis Staff should work with the NERC OC to document the reported risks to the system, continue to monitor system operator performance, and periodically report on findings. If, however, it is determined that the Standard will move forward, then we would offer the following suggestions: A. We consider use of one-way burst messaging systems to be electronic and, as such, do not believe they should be included in the Standard. Further, in accordance with 1.5, a one-way burst messaging system is not a “oral two party, person-to-person Operating Instruction,” which would further justify its exclusion. B. Draft Version 5’s Requirements establish that each covered registered Entity shall develop its own communication protocol outlining the communications expectations of its operators. This has the potential for confusion as multiple Registered Entities within a single RC, BA or TOPs’ footprint may establish different communication expectations. - Proposed Solution: The Requirements should establish that if the RC, BA or TOP establish a communication protocol for their System Operators, the RC, BA or TOP should share that protocol with Registered Entities operating within their footprint, those Registered Entities must follow the RC, BA or TOP’s protocol, or adopt a consistent one for their company C. We agree with the SDT that the COM Standard need not employ a “zero tolerance/zero defect” approach, because NERC Enforcement need not monitor and assess every Operator-to-Operator communication. In Draft Version 5 (Measurements & RSAW), NERC, however, appears to adopt an approach of establishing “zero tolerance” around a Company’s Internal Controls program. The RSAW states that registered entities must provide “evidence that corrective actions necessary to meet the expectations in its documented communication protocols... are taken” and “deficient communication practice was indeed corrected.” - This type of approach to Standard drafting raises untested questions of how the Standard will be enforced, whether it is a “fill-in-the-blank”-type Standard, and whether a new “zero tolerance” enforcement approach to monitoring will, in fact, be maintained. - Proposed solution: Draft a Standard that sets performance based expectations and allow the ERO to use its enforcement discretion (e.g., through FFT and through review of internal control programs) to determine how stringently to audit and sanction.

No
FMPA prefers the prior version which had language on internal controls, e.g., "implement, in a manner that identifies, assesses and corrects deficiencies ...". As stated, and by using the word "implement" which means: "carry out, accomplish; especially : to give practical effect to and ensure of actual fulfillment by concrete measures", means that each entity must have evidence ("concrete measures") of implementing its communications protocol at all times for every instance. Three part communication is watered-down by giving the entity the choice as to whether to follow three-part communication for: 1) all Operating Instructions; 2) for Reliability Directives only; or 3) something in between. Many entities, to manage compliance risk, will only require three-part communications for Reliability Directives in their communication protocols as a result. For reliability reasons, FMPA believes that three-part communication ought to be required for all Operating Instructions, but, at the same time, there should be some tolerance for mistakes through use of the CIP v5 internal controls language "implement, in a manner that identifies, assesses and corrects deficiencies ...".
No
Use of the term "System Operators" is ambiguous; does the requirement cause internal evaluation, or evaluation of neighboring System Operators? We assume the former and suggest adding "its" in front of "System Operators".
As commented on several times previously, FMPA will not vote Affirmative (or recommend an Affirmative vote) until the inconsistencies of COM-003-1 and COM-002-3 concerning Reliability Directives are resolved. For a Reliability Directive delivered by an "All Call", COM-003-1 does not require three part communication whereas COM-002-3 does. This inconsistency will only be a source of confusion during the very time when rapid response to communication is needed, which causes us to be concerned for reliability. FMPA continues to recommend retiring COM-002-3 as part of the implementation plan of COM-003-1 and fails to see a good reason not to do so. All that would need to be done is to retain the definition of Reliability Directive and include R1 of COM-002-3 into COM-003-1, and a slight modification to 1.5 of COM-003-1 to require confirmation of a Reliability Directive.
Individual
Marie Knox
MISO
Yes
While MISO is not opposed to the current version of COM-003-1, it remains concerned regarding the overlap between COM-002-3 and COM-003-1. As written, the definition of "operating instruction" encompasses "reliability directives". This overlap and the application of multiple separate standards to operator communications in general is likely to result in ambiguity and confusion. Further, that only certain sub-requirements of COM-003-1 also mention reliability directives further confuses the applicability of these standards. While the identified overlap and application is manageable, it is recommended that this overlap be addressed at the earliest opportunity. One clear, succinct standard that addresses both operator communications, whether reliability directives or operating instructions, is respectfully recommended.
Yes
We believe the drafting team found a very reasonable solution to meet a FERC directive for a situation that deals with managing the quality of the millions of operator communications that occur annually.
Yes
To avoid confusion and misapplication of the standard, the RSAW should include a statement that electronic messaging systems are not subject to compliance with this standard.

Southern Company Operations Compliance
No
<p>Southern Company agrees with the new definition. Southern Company believes that Requirements R3 and R4 should be deleted. A. Southern Company believes that Requirements R3 and R4 (applicable to Distribution Providers (“DPs”) and Generator Operators (“GOPs”)) should be deleted from the proposed COM-003 standard because the burdens placed on Balancing Authorities (“BAs”), Reliability Coordinators (“RCs”) and Transmission Operators (“TOPs”) by Requirements R1 and R2: (a) sufficiently tighten communications protocols with DPs and GOPs, (b) render Requirements R3 and R4 administrative, unnecessary, and redundant, counter to FERC’s objectives as implemented by the NERC Paragraph 81 Task Force, and (c) potentially expose some Registered Entities to double jeopardy violations of COM-003-1. Specifically, Requirement R1 provides that BAs, RCs, and TOPs must develop and implement documented communication protocols that (a) address instances where the issuer of an oral two-party communication Operating Instruction is required to confirm that the DP or GOP recipient’s response was accurate or to reissue the Operating Instruction to resolve the misunderstanding (R1.5); and (b) to address coordination with affected DPs’ and GOPs’ communication protocols (R1.9). Requirement R2 further requires BAs, RCs, and TOPs to develop methods that assess communication practices and implement corrective actions necessary to meet the expectations outlined in these same protocols. Note that this assessment method would necessarily include assessment of the expectations included in the protocols regarding DPs and GOPs as required by R1.5 and R1.9. Meanwhile, proposed Requirement R3 would require the recipient DPs and GOPs to develop their own documented communications protocols that outline the communication expectations already addressed in the R1 protocols. [Note that the Rationale and Technical Justification for COM-003-1 specifies that Requirements R1 and R2 are addressed to entities that both issue and receive Operating instructions (BAs, RCs, and TOPs) whereas Requirements R3 and R4 are addressed to entities that only receive Operating Instructions.] Requiring DPs and GOPs in R3 to develop protocols outlining the communications expectations of its operators -- and requiring DPs and GOPs in R4 to assess those same operators’ communications practices and implement corrective actions -- is redundant and unnecessary when those same expectations are already being documented by BAs, RCs, and TOPs in the R1 protocols, are already being coordinated with DPs and GOPs under R1.9, and are already being assessed and corrected by the BAs, RCs, and TOPs as required by R2. Therefore, requiring DPs and GOPs to go through the same motions simply creates another layer of documentation that strains limited resources and does little to enhance the reliability of the Bulk Electric System. B. These duplicative exercises created by Requirements R3 and R4 run counter to the objectives directed by FERC in Paragraph 81 of FERC’s March 15, 2012 Order on NERC’s proposed “Find, Fix, and Track” (“FFT”) initiatives (“FFT Order”) as implemented by the P 81 Task Force. In Paragraph 81 of the FFT Order, FERC noted that “some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant.” In complying with FERC’s directives, the Paragraph 81 Task Force set out to identify standards that (a) do “little if anything, to benefit or protect the reliable operation of the BES” and (b) among other possible criteria, are either: “(a) Administrative in nature, do not support reliability, and are needlessly burdensome; or (b) Require responsible entities to develop documents that are not necessary to protect BES reliability; or (c) Impose documentation updating requirements that are out of sync with the actual BES operations, unnecessary, or duplicative; or (d) Redundant with another FERC-approved Reliability Standard requirement(s), the ERO compliance and monitoring program, or a governmental regulation.” (See Paragraph 81 Task Force Technical White Paper.) With respect to this last criterion of redundancy, the Task Force specifically stated that it is “designed to identify requirements that are redundant with other requirements and are therefore unnecessary. Unlike the other criteria listed ... in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity.” (emphasis added). By creating duplicative requirements on both ends of a coordinated</p>

communication scheme between issuing BAs/RCs/TOPs and recipient DPs/GOPs, the Standards Drafting Team is creating an unnecessary administrative burden that does "little, if anything, to benefit or protect the reliable operation of the BES." Even if it may be argued that requiring double coordination from both issuer and recipient somehow contributes to a reliable BES, "it is not necessary to have the two duplicative requirements on the same or similar task or activity." Proposed Requirements R3 and R4 would fit all of the criteria listed above that the Paragraph 81 Task Force is using to identify candidates for retirement and/or revision. C. Finally, the risk created by proposed Requirements R3 and R4 in conjunction with R1 and R2 is more than simple administrative duplication. For vertically integrated entities that are registered both as issuing BAs/RC/TOPs and recipient DPs/GOPs, the redundancy created by Requirement R3 and R4 could potentially expose them to double penalties for a single violation. Because of the duplicative documentation and coordination requirements in R1/R2 and R3/R4, an auditor could interpret a single instance where the communications protocol of an issuing BA/RC/TOP did not match up with the recipient DP/GOP as multiple violations. In such an instance, both the issuers and the recipients could conceivably be penalized because the issuer's communications protocols were not coordinated with the recipient's communications protocols and this lack of coordination was not assessed and remedied. If the Standards Drafting Team chooses not to delete Requirements R3 and R4, then Southern suggests that the following rewording of R3 and R4 would be beneficial. If the Standards Draft Team does not delete Requirement R3 and R4 in their entirety, then Southern suggests that R3 and R4 be reworded such that the entities work together to implement and coordinate one set of issuers' communications protocols (i.e., that of the BAs/RCs/TOPs) instead of two sets of both issuers' and recipients' protocols. This should help to "tighten" the communications protocols as directed in Order 693 and to mitigate some of the confusion and duplicative documentation that could arise from Requirements R3 and R4 as written: "R3. Each Distribution Provider and Generator Operator shall implement the documented communication protocols of its associated BA, RC, and TOP that define the communications expectations of R1. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] ...." and "R4. Each Distribution Provider and Generator Operator shall develop method(s) to assess its communications practices and implement corrective actions necessary to meet the expectations in the documented communications protocols developed for Requirement R1." Conforming revisions would also need to be made to the language in the Measures, VRFs, and VSLs as applicable.

No

See Southern's comments above regarding deletion and/or modification of R4. If R4 was not part of this question then Southern's answer would change to yes for this question. Additionally, GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations. However, the methods used are proper business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an internal compliance program.

No

We agree with the VRFs and VSLs for R1 and R2. As discussed above, R3 and R4 should not be part of the standard. To the extent R3 and R4 should be deleted or modified, the VRFs and VSLs should be modified accordingly.

See Southern's comments for R3 and R4 in the RSAW comments regarding use of the terms "Operator" and "operator". If Requirements R3 and R4 are neither deleted nor reworded as suggested above, then changes should be made in either the standard or the RSAW to make the two terms consistent and to clearly define the term "operator" if necessary.

We suggest adding 'as determined by the Functional Entity' to R1 to clarify that the protocols are those specifically determined by the applicable responsible entity: 'The documented communication protocols will address, where applicable as determined by the Functional Entity, the following:' Is the intent of R1.3 for applicable entities to maintain a list of common name identifiers which must be utilized in communications with all affected entities? If so, a similar requirement (R18) in TOP-002-2 is currently proposed to be eliminated in TOP-002-3. Therefore it shouldn't be added back by this requirement. Can the drafting team be more specific as to exactly what is required in R1.3 without going overboard as in the existing wording? We understand the need to be sure that affected entities do not have any misunderstandings regarding the specific facility that is at issue. However, our experience does not indicate that this is a problem. If we can't relax R1.3, we suggest eliminating it altogether. The use of the term 'coordination' in R1.9 causes concern in determining exactly what is required to coordinate. This could become a compliance nightmare for applicable entities. We suggest replacing R1.9 with "Provide each affected Reliability Coordinator, Balancing Authority, Transmission Operator, Distribution Provider, and Generator Operator with its communication protocols."
No
We have concerns with the continued inclusion of Distribution Provider in the list of Applicable Entities. Although this is in response to a FERC directive, the risk that Distribution Providers present to the BES is minimal at best. Actions taken by Distribution Providers which impact the reliability of the BES, load shedding for example, are adequately covered under COM-002-3 which applies to emergency situations. There are also jurisdictional questions associated with FERC directing the inclusion of Distribution Providers. If the Distribution Provider must remain as an Applicable Entity, then we would propose deleting Distribution Provider from R3 and R4 and then follow with the addition of a new R5 and R6. R5. Each Distribution Provider that is the recipient of an oral Operating Instruction, other than Reliability Directives, shall: 5.1 Use the English language, unless another language is mandated by law or regulation. 5.2 Repeat, restate, rephrase, or recapitulate the oral Operating Instruction. 5.3 For oral Operating Instructions issued as a one-way burst message to multiple parties in a short time period (e.g. an All Call system), request clarification from the issuer if the communication is not understood. R6. Each Distribution Provider shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in Requirement R5.
No
While we understand the process that gets us to the point where the VRFs for R1 and R3 are Low and those for R2 and R4 are Medium, in this situation we question the logic of the process. If developing a document only deserves a low VRF then how can we logically say that not implementing the items contained in the document is a medium? What happens if the document is flawed? This appears to be an inverted pyramid. We suggest using Low for all requirements.
Our comments are listed with the specific question they address.

Requirement 1.9 requires "Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols." This requirement seems unnecessary since the requirements of COM-3-1 apply to all these entities. If everyone is adhering to the requirements of COM-3-1 then the need for coordination is redundant as it becomes automatic. If individual entities adopt slight nuances to this requirement, or are more restrictive then the requirement then coordination between every entity becomes extremely difficult.

The latest version of COM-003 introduces a potential conflict with COM-002 related to use of one-way burst messaging systems to issue a Reliability Directive. COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3 way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst messaging RD as the requirements indicate in COM-003. In COM-003, the follow Requirements are included: R1.7 Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party. R1.8 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. R3.3 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. In other words, COM-003 allows one-way burst messaging to be used for Reliability Directives and prescribes: • issuer to confirm receipt from at least one receiving party • receiver to request clarification from the issuer if the communication is not understood

Regarding question #1, the SERC OC Review Group agrees with the definition of Operating Instruction. While we also can agree to the changes made to R1, we feel R3 in its entirety is unnecessary and duplicative. Removal of the word "develop" would eliminate double-jeopardy concerns. R3 could be acceptable if "develop and" are omitted and "as developed in R1" is inserted after "protocols" and before "that." It should be noted that this suggestion only applies to the sub-requirements in R1 that correspond to the proposed sub-requirements in R3. Regarding question #2,

R2 is acceptable and R4, as stated above for R3, is unnecessary and duplicative. Regarding question #3, we agree with the VRFs and VSLs for R1 and R2. Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed. 1. R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden. 2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations, however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity's internal compliance program. 3. R4 raises the question of sufficiency of an entities corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the "problem" is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program. 4. The SRT recommends that the language to M4 be changed as follows: M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following: Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session) Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session) Documented annual training Examples of sufficient corrective action programs include, but are not limited to, the following: Documented refresher training Documented meeting Documented "hot box" communication 5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is tagged with a Moderate violation, while the BA would receive a Lower. 6. In the RSAW, the following passage should be expunged; "Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected." Differentiating between slips of the tongue and "deficient communication practices" involves subjective judgments. The same is true for attempting to identify changes in an operator's degree of understanding, especially when doing so through the numbing process of making before-and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.

Draft 5 fails to address all of the communication gaps identified in the Standards Authorization Request (SAR), FERC Order 693 and the recommendations of the August 2003 Blackout Report. The draft as written does not require a consistent application of effective communications protocols but in turn requires each functional entity to develop their own protocols with insufficient guidance on how

to achieve better consistency.
Individual
Keith Morisette
Tacoma Power
No
Tacoma Power supports and strongly suggests reverting back to the Draft 2 definition, "Operating Communication — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System."
No
Tacoma Power supports Draft 2 - The requirement to establish communication protocols should be identical for BA, TO, RC, GO, and DP. To make different requirements for different functions is very confusing for those who perform multiple functions. Go back to basic "3-part communication" (and include an option for push-to talk). Remove fuzzy language such as "if requested". The Standard should leave it up to the Entity to establish their communication protocols and procedures based upon the type of communication systems they are using. This draft seems to trying to write the procedures for every type of possible communication equipment rather than set a standard for how to communicate.
No
Tacoma Power believes the Standard Drafting Team made Draft 5 overly complex and confusing for the System Operators and Operators to use. The Drafting Team needs to go back to the basics. The standard should apply to all, BA, TO, RC, GO and DPs alike. 1. Require all parties to develop Communication Protocols, train their operating personnel to use them, review their protocols annually and make improvements if necessary. 2. Require all parties to use "3-part communication" and forget the "oral two-party, person-to-person Operating Instruction" that has different requirements for GO and DP. All responsible entities should have the same requirements. The proposed Standard as written allows for the Instruction to be repeated back "if requested" by the issuer. This exception creates a "compliance" trap for the people communicating – remove it. BASIC 3-PART COMMUNICATION should include: * A System Operator or Operator shall issue an Operating Instruction * The person receiving the Operating Instruction shall repeat it back to the issuer, and/or request clarification if needed * The System Operator or Operator will acknowledge as correct and/or discuss clarifications as needed and agree on the final instruction. 3. We are not sure why "address nomenclature for Transmission interface Elements and Transmission interface Facilities" has replaced the term "common line identifiers." Entities should coordinate their communication protocols with the other Entities that they commonly communicate with and agree on: * Nomenclature for Lines and equipment * A common system for Alpha Numeric clarifiers * Use 24-hour clock and identify the time, time-zone and if day-light savings or standard time is in effect. System Operators and Operators are too busy to be put in the position of trying to maintain compliance with a standard that is so convoluted and confusing as to become a potential violation. Tacoma Power supports the original premise of the proposed COM-003 and the concept to separate the technical communication equipment requirements from communication protocol requirements but the drafting team has gone too far away from the intent of the standard by trying to make exceptions for too many different issues when they do not need to. Get back to the basics, i.e. Draft 2.
Individual
Gregory Campoli
NYISO
The text presented in the blue box for Requirement 1 should be incorporated into Requirement #1. If the requirement needs to be explained at this point, we recommend clarifying it in the text. In addition, by using this definition we have now introduced a list of controls that we will be audited

against. The requirement should simply be to have a procedure. The controls assessment can be addressed during the future RAI process. The current draft provides for a fill in the blank framework that allows for an entity to define what is applicable for its communication protocol. A better approach would be to state that an entity may include items from the list provided that the entity identifies them as critical. Then the entity would only be required to show what is critical to its operations, rather than having to prove what is not critical. The language in requirement 1.5 needs to be clarified. It is not clear on how an entity is required to 'confirm' the response was accurate. This could simply be a '2 part communication', where once the receiving entity repeats the instruction, the initiator may move on if he deems it correct. Or does the confirmation need to be 'confirmed' with the receiving party as in '3 part communications'? If the requirement is meant to initiate 2 part communication, the requirement should say that. If the requirement is meant for '3 part communication,' then we recommend utilizing the language from COM-002 R2 in place of Requirements 1.5 and 1.6.

Jason Snodgrass

Georgia Transmission Corporation

No

Georgia Transmission Corporation agrees with the new definition. Georgia Transmission Corporation believes that Requirements R3 and R4 should be deleted. A. Georgia Transmission Corporation does not agree with the use of the term "operators" with respect to the functional entity Distribution Providers for R3 and R4. This poses an incomprehensible requirement for non-vertically integrated entities that are registered as Transmission Owner's also serving as the DPs. NERC does not define or associate anywhere in the Functional Model or NERC registry the term Distribution Provider operator. Specifically, GTC would not understand how to comply with R3 or R4 because GTC does not have any operators yet we are registered as a DP for the functions we perform of our facilities which are directly connected to the BES. GTC believes that Requirements R3 and R4 (applicable to Distribution Providers ("DPs")) should be deleted from the proposed COM-003 standard, or else disassociate the term "operators" from the DP. B. Additionally, Georgia Transmission Corporation believes that Requirements R3 and R4 (applicable to Distribution Providers ("DPs") and Generator Operators ("GOPs")) should be deleted from the proposed COM-003 standard because the burdens placed on Balancing Authorities ("BAs"), Reliability Coordinators ("RCs") and Transmission Operators ("TOPs") by Requirements R1 and R2: (a) sufficiently tighten communications protocols with DPs and GOPs, (b) render Requirements R3 and R4 administrative, unnecessary, and redundant, counter to FERC's objectives as implemented by the NERC Paragraph 81 Task Force, and (c) potentially expose some Registered Entities to double jeopardy violations of COM-003-1. Specifically, Requirement R1 provides that BAs, RCs, and TOPs must develop and implement documented communication protocols that (a) address instances where the issuer of an oral two-party communication Operating Instruction is required to confirm that the response of any recipient entity such as a DP or GOP was accurate or to reissue the Operating Instruction to resolve the misunderstanding (R1.5); and (b) to address coordination with affected recipient entities' communication protocols (R1.9). Requirement R2 further requires BAs, RCs, and TOPs to develop methods that assess communication practices and implement corrective actions necessary to meet the expectations outlined in these same protocols. Note that this assessment method would necessarily include assessment of the expectations included in the protocols regarding any recipient entity as required by R1.5 and R1.9. Meanwhile, proposed Requirement R3 would require the recipient DPs and GOPs to develop their own documented communications protocols that outline the communication expectations already addressed in the R1 protocols. [Note that the Rationale and Technical Justification for COM-003-1 specifies that Requirements R1 and R2 are addressed to entities that both issue and receive Operating instructions (BAs, RCs, and TOPs) whereas Requirements R3 and R4 are addressed to entities that only receive Operating Instructions.] Requiring DPs and GOPs in R3 to develop protocols outlining the communications expectations of its operators -- and requiring DPs and GOPs in R4 to assess those same operators' communications practices and implement corrective actions -- is redundant and unnecessary when those same expectations are already being documented by BAs, RCs, and TOPs in the R1 protocols, are already being coordinated with recipient entities, such as DPs and GOPs under R1.9, and are already being assessed and corrected by the BAs, RCs, and TOPs as required by R2. Therefore, requiring DPs and GOPs to go through the same motions simply creates another layer of documentation that strains limited resources and does little to enhance the reliability of the Bulk

Electric System. C. These duplicative exercises created by Requirements R3 and R4 run counter to the objectives directed by FERC in Paragraph 81 of FERC's March 15, 2012 Order on NERC's proposed "Find, Fix, and Track" ("FFT") initiatives ("FFT Order") as implemented by the P 81 Task Force. In Paragraph 81 of the FFT Order, FERC noted that "some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant." In complying with FERC's directives, the Paragraph 81 Task Force set out to identify standards that (a) do "little if anything, to benefit or protect the reliable operation of the BES" and (b) among other possible criteria, are either: "(a) Administrative in nature, do not support reliability, and are needlessly burdensome; or (b) Require responsible entities to develop documents that are not necessary to protect BES reliability; or (c) Impose documentation updating requirements that are out of sync with the actual BES operations, unnecessary, or duplicative; or (d) Redundant with another FERC-approved Reliability Standard requirement(s), the ERO compliance and monitoring program, or a governmental regulation." (See Paragraph 81 Task Force Technical White Paper.) With respect to this last criterion of redundancy, the Task Force specifically stated that it is "designed to identify requirements that are redundant with other requirements and are therefore unnecessary. Unlike the other criteria listed ... in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity." (emphasis added). By creating duplicative requirements on both ends of a coordinated communication scheme between issuing BAs/RCs/TOPs and recipient DPs/GOPs, the Standards Drafting Team is creating an unnecessary administrative burden that does "little, if anything, to benefit or protect the reliable operation of the BES." Even if it may be argued that requiring double coordination from both issuer and recipient somehow contributes to a reliable BES, "it is not necessary to have the two duplicative requirements on the same or similar task or activity." Proposed Requirements R3 and R4 would fit all of the criteria listed above that the Paragraph 81 Task Force is using to identify candidates for retirement and/or revision. D. Finally, the risk created by proposed Requirements R3 and R4 in conjunction with R1 and R2 is more than simple administrative duplication. For vertically integrated entities that are registered both as issuing BAs/RC/TOPs and recipient DPs/GOPs, the redundancy created by Requirement R3 and R4 could potentially expose them to double penalties for a single violation. Because of the duplicative documentation and coordination requirements in R1/R2 and R3/R4, an auditor could interpret a single instance where the communications protocol of an issuing BA/RC/TOP did not match up with the recipient DP/GOP as multiple violations. In such an instance, both the issuers and the recipients could conceivably be penalized because the issuer's communications protocols were not coordinated with the recipient's communications protocols and this lack of coordination was not assessed and remedied. If the Standards Draft Team does not delete Requirement R3 and R4 in their entirety, then Georgia Transmission Corporation suggests that R3 be reworded such that the entities work together to implement and coordinate one set of issuers' communications protocols (i.e., that of the BAs/RCs/TOPs) instead of two sets of both issuers' and recipients' protocols. This should help to "tighten" the communications protocols as directed in Order 693 and to mitigate some of the confusion and duplicative documentation that could arise from Requirements R3 as written: "R3. Each Distribution Provider and Generator Operator shall implement the documented communication protocols of its associated BA, RC, and TOP that define the communications expectations of R1. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] ...." and "R4. In addition to the recommendation to eliminate for the reasons above, GTC still believes R4 prescribes elements of internal control language to which is not necessary due to the tightening of communications protocols for issuing entities within R1 and should still be eliminated under this alternate scenario.

No

See GTC's comments above regarding deletion of R4. GTC also believes the same logic can apply to R2 and recommends to be deleted. Additionally, see GTC's comments regarding the conflict with the drafting team's proposal to inadvertently define a new function for the DP "operators". Lastly, DPs do not issue Operating Instructions; DP field personnel only receive instructions from others.

No

We agree with the VRFs and VSLs for R1. As discussed above, R3 and R4 should not be part of the standard. To the extent R3 and R4 should be deleted or modified, the VRFs and VSLs should be modified accordingly.

If Requirements R3 and R4 are neither deleted nor reworded as suggested above, then changes should be made in the standard to clearly define the term "operator" or disassociate the term from

the DP function.

Oklahoma Gas & Electric
Oklahoma Gas & Electric supports that comments submitted by the Southwest Power Pool and submits its own comments as well.
No
Comment for R1.3: Is the intent of R1.3 for applicable entities to maintain a list of common name identifiers which must be utilized in communications with all affected entities? If so, a similar requirement (R18) in TOP-002-2 is currently proposed to be eliminated in TOP-002-3. Therefore, it shouldn't be added back by this requirement. Can the drafting team be more specific as to exactly what is required in R1.3 without going overboard as in the existing wording? We understand the need to be sure that affected entities do not have any misunderstandings regarding the specific facility that is at issue. However, our experience does not indicate that this is a problem. If we can't relax R1.3, we suggest eliminating it altogether since we believe this not does significantly impact the reliability of the BES. Comment for R1.9: The use of the term 'coordination' in R1.9 causes concern in determining exactly what is required to coordinate. This could become a compliance nightmare for applicable entities. We suggest replacing R1.9 with "Provide each affected Reliability Coordinator, Balancing Authority, Transmission Operator, Distribution Provider, and Generator Operator with its communication protocols."
No
We believe that R2 and R4 should already be covered in PER-005
No
While we understand the process that gets us to the point where the VRFs for R1 and R3 are Low and those for R2 and R4 are Medium; however, in this situation we question the logic of the process. If developing a document only deserves a Low VRF then how can we logically say that not implementing the items contained in the document is a Medium? What happens if the document is flawed? We suggest using Low for all requirements.
<ul style="list-style-type: none"> <li>• We believe that this proposed Standard (COM-003-1) meets the intent of Paragraph 81 of the FERC Order which notes that reliability standards that provide little protection to the reliable operations of the BES are redundant or unnecessary. Although blackout occurrences in the past points to communication issues, we believe it is not related to miscommunication. Instead, we believe it is due to lack of communication and communicating information that was incorrect to begin with.</li> <li>• In the Consideration of Comments from the Feb 14-15 conference, the SDT said "The OPCPSDT maintains its position that three-part communication be addressed in documented communication protocols, where applicable." OG&amp;E believes that while the opinions of the members of SDT are important, the SDT itself should not maintain a "position" as such. Rather, the SDT should attempt to merge direction from FERC with the comments from industry instead of rejecting industry comments out of hand. Per the Standards Process Manual (pg.9), the roles of drafting teams are: <ul style="list-style-type: none"> <li>o Drafts proposed language for the Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> <li>o Solicits, considers, and responds to comments related to the specific Reliability Standards development project.</li> <li>o Participates in industry forums to help build consensus on the draft Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> <li>o Assists in developing the documentation used to obtain governmental approval of the Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> </ul> </li> </ul>

Yes

No
All comments are shown in response to Question 4.
Luminant is generally supportive of the direction of this standard and agrees that requiring a documented communication protocol and monitoring processes is the correct approach for this standard. While we understand the need for the some Registered Entities (RE) to use a one-way burst messaging system to make mass communication quicker and easier the inclusion of Reliability Directive in R1.7, R1.8 and R3.3 creates a conflict COM-002-3 R2 and R3. By including Reliability Directives in R1.7, R1.8 and R3.3 which allows and electronic response or only one receipt to restate, the receiving REs will not be able to comply with COM-002-3 R2 that requires EACH recipient of a Reliability Directive to repeat, restate, rephrase or recapitulate the Reliability Directive. Removing Reliability Directive from those section would eliminate any confusion and conflict between COM-002-3 and COM-001-3 and allow COM-001-3 to be passed and implemented. Alternatively, COM-002-3 could be revised to CLEARLY STATE that it only applies to one-on-one verbal (or written?) communication.
Individual
Bradley Collard
Oncor Electric Delivery Company LLC
No
Oncor believes the specificity in the subparts of R1 is unnecessary. Three-part communication is the preferred method for ensuring that both parties understand an Operating Instruction and it provides a sufficient mechanism for clear, concise and accurate communication. In creating a protocol that requires System Operators to essentially relearn the way to speak (specifically using alpha-numeric identifiers) will only create confusion and inefficiency as operators try to follow protocol and catch/correct themselves.
No
Oncor supports the shift in compliance to the internal controls approach and we look forward to NERC providing a programmatic/principles framework in a collaborative approach with the industry. In the absence of this framework, it is unknown how the concept of "assess and correct" will evolve. As the framework is developed including the "assess and correct" concept, Oncor requests that continuous focus be placed on implementing principles including this concept and not requiring or specifying internal controls which would place additional compliance burden on entities. The internal controls principles/framework should enable entities to establish internal controls model utilizing deficiency correction approach but should not mandate the approach at the Standard/Requirement level. Internal Controls Program needs to be defined by an Entity, it is not a "One Size Fits All". The standards/RSAs should reflect this understanding. Oncor does not see how the Drafting Team adequately addressed this concern. NERC and the rest of the industry should work together and define the framework around Internal Controls.
Yes
R1.9 states that entities will address "Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols." Coordination with these entities in the ERCOT market will become cumbersome. Is it the SDT's intent to ensure all communication protocols are coordinated with multiple entities that a Transmission Operator communicates with, including the RC, BA, other TOs, GOPs, and DPs? Oncor is unclear how an entity with multiple registrations would communicate with itself in different functions. Would this require an entity with multiple registration functions to designate personnel by functional entity and in turn, personnel would have to identify which functional entity each person they interface with? It is impractical and inefficient to require Entities to re-organize all personnel which would foster an inefficient structure and could potentially lead teams to not communicate effectively. In addition, this could have a negative impact on communications between companies. For example, in the ERCOT region, there are approximately 15 local control centers and ERCOT who are all registered as TOPs. One might interpret communications between neighboring TOPs or ERCOT and one of the local control centers are not subject to the requirements

of COM-003-1 since these are TOP to TOP communications. We strongly recommend the SDT review this to greatly simplify COM-003-1. Potential alternative to the current language would be "require entities to implement, in a manner ..., protocols that include three-part communication for Operating Instructions" and eliminate the reference to Functional Entity.

SERC OC Standards Review Group

No

We agree with the definition of Operating Instruction. While we also can agree to the changes made to R1, we feel R3 in its entirety is unnecessary and duplicative. Removal of the word "develop" would eliminate double-jeopardy concerns. R3 could be acceptable if "develop and" is omitted and "as developed in R1" is inserted after "protocols" and before "that." It should be noted that this suggestion only applies to the sub-requirements in R1 that correspond to the proposed sub-requirements in R3.

No

R2 is acceptable and R4, as stated above for R3, is unnecessary and duplicative.

No

We agree with the VRFs and VSLs for R1 and R2. Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed.

TVA Nuclear Power's Human Performance program is driven by INPO and includes 1) requirements for operations to use 3-way communication and the phonetic alphabet; and 2) a documented assessment process via an established observation program with corrective actions. Any additional oversight process will contribute to distraction in the control room and promote overreliance on process and procedure with a "checklist mentality" rather than focus on potential impacts of the task being performed. If the RC, TOP, or BA specifically requests confirmation of a verbal communication (R1.6), our nuclear plant operators will respond accordingly as they are already expected to do. The use of "periodic assessment" in the measurements does not provide adequate guidance in the development of consistent, effective measures of compliance.

Jose H Escamilla

CPS Energy

Yes

No

Distribution Providers (DP) may be co-located in the same room with Transmission Operators (TOP) and would have oral communications and not use a telephone or other messaging system. Generator Operators (GOP) should have a separate standard.

No

I do not agree with the requirements, therefore I do not agree with the VRF's and VSL.

Separate the Distribution Provider (DP) and Generator Operator (GOP) COM requirements into a separate standard.

The primary reason for a no vote is that Draft 5 fails to address the communication gaps identified in the Standards Authorization Request (SAR), FERC Order 693 and the recommendations of the August 2003 Blackout Report. The draft as written does not require a consistent application of effective communications protocols but in turn requires each functional entity to develop their own protocols with insufficient guidance on how to achieve better consistency.

# Consideration of Comments

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

The Operating Personnel Communications Protocols Drafting Team thanks all commenters who submitted comments on the proposed draft COM-003-1 standard. The standard was posted for a 30-day public comment period from March 7, 2013 through April 8, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 78 sets of comments, including comments from approximately 215 different people from approximately 130 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary Consideration:

#### Requirements (Question 1, Comments on R1 and R3):

***“Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning]”***

A Major concern from draft 5, Question one regarding COM-003-1, R1 and R3 was the term “Reliability Directive” appearing in many parts of requirements R1 and R3 causing confusion as to which standard would apply to a situation and if potential conflict could exist between COM-003-1 and COM-002-3.

**The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of Requirement R1**

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/files/Appendix\\_3A\\_StandardsProcessesManual\\_20120131.pdf](http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf)

Another concern of commenters of draft 5 was the use of the term “all call” in COM-003-1, R1 and R3. Commenters are concerned these requirements create a conflict with COM-002-3 which is silent on the use of multi-party one way messages. Commenters cited confusion and double jeopardy as concerns.

**The OPCPSDT agrees and has removed the term “all call” from the Parts of R1**

An additional concern in COM-003-1, R1 was Part 1.9 requiring entities to coordinate communication protocols. Commenters believed this was ambiguous and difficult to accomplish.

**The OPCPSDT agrees and has removed COM-003-1, R1 Part 1.9 from R1 and now requires applicable entities to jointly develop the communication protocols.**

In response to Question 1 regarding use of the English language, 24 hour clock and time zone reference, common interface identifiers, and alpha-numeric clarifiers, a large majority of the commenters still believe that all of Parts are too prescriptive.

**The OPCPSDT believes the protocols must have common elements to ensure uniformity and consistent application for clear and concise communication.**

Another continuing theme that was repeated in draft 5 comments and previously from draft 2, 3 and 4 was the concern that the OPCPSDT was not addressing the tasking from the SAR, as well as related directives and orders.

**The OPCPSDT disagrees and cites the language from the SAR. The purpose of the SAR for this project is “Require that real time System Operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term normal operating conditions under Applicability: “*Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.*”**

There were many recommendations for multiple requirement language changes to improve clarity.

**The OPCPSDT agrees and has incorporated many of those recommendations into COM-003-1, draft 6.**

Others expressed a desire to combine COM-002-3 and COM-003-1 into a single standard.

**Based on other feedback, the OPCPSDT has chosen not to combine the two standards. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.**

**Requirements (Question 2 Comments on R2 and R4):**

***“Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators’ communication practices and implement corrective actions***

***necessary to meet the expectations in its documented communication protocols developed for Requirement R1. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Operations Assessment] (Same language for R4 for DP and GOP)”***

A majority of the commenters expressed concerns over how an entity’s internal controls to improve System Operators’ communication performance would be audited. The commenters state that auditing internal controls is contrary to ongoing initiatives that are seeking to improve the effectiveness of the audit process. Some commenters also claim the potential for double jeopardy exists. The lack of certainty over how compliance would be administered caused commenters to be concerned.

**The OPCPSDT understands the commenters’ concerns. The OPCPSDT decided to eliminate the COM-003-1, draft 5, R2 and R4 requirements in draft 6. Draft 6 features a results based approach that clearly specifies compliance and is linked to reliability results. The draft 6 requirements will also reduce the exposure of entities to voluminous compliance documentation.**

The OPCPSDT points out that many other commenters responded positively to the use of internal controls and preferred the assess and correct requirement.

**After consideration of all of the comments, the OPCPSDT voted for the approach featured in COM-003-1, draft 6.**

### **VRFs and VSLs (Question 3):**

The OPCPSDT acknowledges there were many good comments on draft 5 regarding VSLs and VRFs and appreciates the contributions.

**The OPCPSDT has changed draft 6, and all of the VRFs and VSLs have been adjusted to reflect those changes. The elimination of the “assess and correct” language and the revisions to R1, R2 and R3 have resulted in extensive changes to VRFs and VSLs for draft 6.**

### **Additional Issues Addressed by the OPCPSDT:**

Other commenters raised issues around:

The requirement for DPs and GOPs to have documented protocols

**Draft 6 resolves this issue by eliminating this requirement for GOPs and DPs.**

**Index to Questions, Comments, and Responses**

1. The SDT has proposed new language in COM-003-1, R1 and R3: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following:” (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a “A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions. ”) to be added as a term for the NERC Glossary? Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question. .... 17
2. The SDT has proposed new language in COM-003-1, R2 and R4: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols. (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). ” Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question: ..... 42
3. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4? ..... 55
4. Do you have any other comments or suggestions to improve the draft standard? ..... 63

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

**Summary Consideration:**

Organization	Supporting Comments of "Entity Name"
Brazos Electric Power Cooperative, Inc.	ACES Power Marketing.
Wisconsin Electric Power Company	Edison Electric Institute
Luminant	Edison Electric Institute (EEI)
Dominion	EEI
Illinois Municipal Electric Agency	Florida Municipal Power Agency
Lakeland Electric	Florida Municipal Power Agency (FMPA)
Liberty Electric Power	Generator Forum Standards Review Team
Lakeland Electric	LAK supports FMPA comments
Platte River Power Authority	Large Public Power Council
New York Power Authority	Large Public Power Council (LPPC)
Xcel Energy	MRO NERC Standards Review Forum (NSRF)
Oklahoma Gas & Electric	Oklahoma Gas & Electric supports that comments submitted by the Southwest Power Pool and submits its own comments as well.
Pepco Holdings Inc	Pepco Holdings Inc supports the comments submitted by EEI
Grant County PUD	Seattle City Light

Organization	Supporting Comments of “Entity Name”
LCRA Transmission Services Corporation	Seattle City Light
Tennessee Valley Authority	SERC OC Standards Review Group
Kansas City Power & Light	Southwest Power Pool
California ISO	The California ISO is supportive of those comments submitted by the SRC (ISO/RTO Council).
Vijayraghavan	The primary reason for a no vote is that Draft 5 fails to address the communication gaps identified in the Standards Authorization Request (SAR), FERC Order 693 and the recommendations of the August 2003 Blackout Report. The draft as written does not require a consistent application of effective communications protocols but in turn requires each functional entity to develop their own protocols with insufficient guidance on how to achieve better consistency.
Flathead Electric Cooperative, Inc.	Western Small Entity Comment Group submitted by Central Lincoln

1. The SDT has proposed new language in COM-003-1, R1 and R3: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following:” (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a “A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions. ”) to be added as a term for the NERC Glossary? Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question.

#### Summary Consideration:

##### **Requirements (Question 1 Comments on R1 and R3):**

A Major theme from draft 5, Question one regarding COM-003-1, R1 and R3 was the term “Reliability Directive” in many Parts of requirements R1 and R3 causing confusion as to which standard would apply and if there was potential conflict between COM-003-1 and COM-002-3.

##### **The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of R1**

A similar theme in draft 5 was the use of the term “all call” in COM-003-1, R1 and R3. Commenters are concerned these requirements create a conflict with COM-002-3 where the use of multi-party one way messages is silent. Commenters cited confusion and double jeopardy as concerns.

##### **The OPCPSDT agrees and has removed the term “all call” from the Parts of R1**

An additional major concern in COM-003-1, R1 was Part 1.9 requiring entities to coordinate communication protocols. Commenters believed this was ambiguous and difficult to accomplish.

##### **The OPCPSDT agrees and has removed COM-003-1, R1 Part 1.9 from R1 and now requires applicable entities to jointly develop the communication protocols subject to RC approval.**

In response to Question 1, regarding use of the English language, 24 hour clock and time zone reference, common interface identifiers, and alpha-numeric clarifiers, many commenters still believe that all of subparts are too prescriptive and unnecessary.

**The OPCPSDT believes the protocols must have common elements to ensure uniformity and consistent application for understanding communication.**

Another continuing theme that was repeated in draft 5 comments and previously from draft 2, 3 and 4 was the concern that the work of the OPCPSDT was not addressing the intentions of the SAR, related directives and orders.

**The OPCPSDT disagrees and cites the language from the SAR. The purpose of the SAR for this project is “Require that real time System Operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term normal operating conditions under Applicability: “Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.”**

There were many recommendations for multiple requirement language changes to improve clarity.

**The OPCPSDT agrees and has incorporated many of those recommendations into COM-003-1, draft 6.**

Others expressed a desire to combine COM-002-3 and COM-003-1 into a single standard.

**Based on other feedback, the OPCPSDT has chosen not to combine the two standards. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.**

Organization	Yes or No	Question 1 Comment
Luminant	No	All comments are shown in response to Question 4.
<b>Response: The OPCPSDT thanks you for your comments. Please see our response to Question 4.</b>		
Oklahoma Gas & Electric	No	Comment for R1.3: Is the intent of R1.3 for applicable entities to maintain a list of common name

Organization	Yes or No	Question 1 Comment
		<p>identifiers which must be utilized in communications with all affected entities? If so, a similar requirement (R18) in TOP-002-2 is currently proposed to be eliminated in TOP-002-3. Therefore, it shouldn't be added back by this requirement. Can the drafting team be more specific as to exactly what is required in R1.3 without going overboard as in the existing wording?</p> <p><b>Response: R1.3 is designed to increase familiarity with interface Transmission Elements and Facilities to prevent confusion and increase situational awareness. The requirement calls for entities to ensure operators are aware of the names or designators of interface equipment between those entities. It is up to the affected entities to determine how they would accomplish this through their communication protocols.</b></p> <p><b>One example may be to designate in the documented Communication Protocols to use the name of the Transmission interface Element/Facility assigned by the owner of such Element/Facility.</b></p> <p>We understand the need to be sure that affected entities do not have any misunderstandings regarding the specific facility that is at issue. However, our experience does not indicate that this is a problem. If we can't relax R1.3, we suggest eliminating it altogether since we believe this not does significantly impact the reliability of the BES.</p> <p><b>Response: The requirement focuses on Transmission interface Elements and Facilities only. The OPCPSDT believes that the draft standard requirements provide flexibility so that an entity may develop the protocols in a manner that supports their unique circumstances.</b></p> <p>Comment for R1.9:</p> <p>The use of the term 'coordination' in R1.9 causes concern in determining exactly what is required to coordinate. This could become a compliance nightmare for applicable entities. We suggest replacing R1.9 with "Provide each affected Reliability Coordinator, Balancing Authority, Transmission Operator, Distribution Provider, and Generator Operator with its communication protocols."</p>

Organization	Yes or No	Question 1 Comment
		<p><b>Response: The OPCPSDT agrees and has changed the wording of R1, to eliminate Part 1.9.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
<p>American Electric Power</p>	<p>No</p>	<p>Due to the manner in which the sub-requirements for R1 are written, there could be misinterpretation at which entities plan would require those sub-requirements. We assume that requirements R1.6 and R1.8 apply to an entity that in that instance is <i>*receiving*</i> an Operating Instruction where Requirement R1.2, R1.3, R1.4, R1.5, R1.7 are reserved for only those cases where an entity is <i>*issuing*</i> the Operating Instruction. As currently drafted, R1.6 and R1.8 could be interpreted as somehow requiring an entity that would normally be issuing an instruction (such as an RC) to implement documented communication protocols for an outside receiving entity (such as a Balancing Authority). A potential solution would be to restructure R1 and R3 in such a way that it is based on entities that would be issuing instructions in one requirement and entities that would be receiving instructions in a separate requirement.</p> <p><b>Response: The OPCPSDT agrees with your comments and have made changes similar to those suggested.</b></p> <p>AEP strongly disagrees with R 1.9, requiring coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols. For AEP, this requirement would require coordination among numerous entities, and keeping all those protocols in sync would be a significant logistical challenge that does not appear to proportionately improve reliability. In addition, exactly what kind of coordination is needed? R1.1 through are robust enough that adding R1.9 is totally redundant and unnecessary.</p> <p><b>Response: T The OPCPSDT agrees and has changed the wording of R1, to eliminate Part 1.9.</b></p> <p>If beyond R1.1 through 1.8 there are additional, specific needs that still need to be addressed, those should be identified so that specific requirements could be developed</p>

Organization	Yes or No	Question 1 Comment
		<p>if necessary. For this requirement alone, AEP must vote negative on this proposed draft.</p> <p><b>Response: If the intended meaning of your comment is that an entity may chose to develop protocols beyond R1.1 through 1.8, there is no restricting language to prevent them from doing so. The standard lists the basic requirements.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
<p>Florida Municipal Power Agency</p>	<p>No</p>	<p>FMPA prefers the prior version which had language on internal controls, e.g., “implement, in a manner that identifies, assesses and corrects deficiencies ...”. As stated, and by using the word “implement” which means: “carry out, accomplish; especially : to give practical effect to and ensure of actual fulfillment by concrete measures”, means that each entity must have evidence (“concrete measures”) of implementing its communications protocol at all times for every instance. Three part communication is watered-down by giving the entity the choice as to whether to follow three-part communication for: 1) all Operating Instructions; 2) for Reliability Directives only; or 3) something in between. Many entities, to manage compliance risk, will only require three-part communications for Reliability Directives in their communication protocols as a result. For reliability reasons, FMPA believes that three-part communication ought to be required for all Operating Instructions, but, at the same time, there should be some tolerance for mistakes through use of the CIP v5 internal controls language “implement, in a manner that identifies, assesses and corrects deficiencies ...”.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes draft 5 continues to permit entities to have protocols to address the standard as they believe the protocols will sustain reliability on the BES. The OPCPSDT agrees with FMPA that all Operating Instructions and Reliability Directives should employ three-part communications and believes FMPA is permitted to develop protocols that require it.</b></p>		
<p>Georgia Transmission Corporation</p>	<p>No</p>	<p>Georgia Transmission Corporation agrees with the new definition. Georgia Transmission Corporation believes that Requirements R3 and R4 should be deleted.</p> <p>A. Georgia Transmission Corporation does not agree with the use of the term</p>

Organization	Yes or No	Question 1 Comment
		<p>“operators” with respect to the functional entity Distribution Providers for R3 and R4. This poses an incomprehensible requirement for non-vertically integrated entities that are registered as Transmission Owner’s also serving as the DPs. NERC does not define or associate anywhere in the Functional Model or NERC registry the term Distribution Provider operator. Specifically, GTC would not understand how to comply with R3 or R4 because GTC does not have any operators yet we are registered as a DP for the functions we perform of our facilities which are directly connected to the BES. GTC believes that Requirements R3 and R4 (applicable to Distribution Providers (“DPs”)) should be deleted from the proposed COM-003 standard, or else disassociate the term “operators” from the DP.</p> <p><b>Response: The OPCSDT has eliminated R2 and R4 and has narrowed the role of GOPs and DP to those who would receive Operating Instructions</b></p> <p>B. Additionally, Georgia Transmission Corporation believes that Requirements R3 and R4 (applicable to Distribution Providers (“DPs”) and Generator Operators (“GOPs”)) should be deleted from the proposed COM-003 standard because the burdens placed on Balancing Authorities (“BAs”), Reliability Coordinators (“RCs”) and Transmission Operators (“TOPs”) by Requirements R1 and R2:</p> <ul style="list-style-type: none"> <li>(a) sufficiently tighten communications protocols with DPs and GOPs,</li> <li>(b) render Requirements R3 and R4 administrative, unnecessary, and redundant, counter to FERC’s objectives as implemented by the NERC Paragraph 81 Task Force, and</li> <li>(c) Potentially expose some Registered Entities to double jeopardy violations of COM-003-1.</li> </ul> <p><b>Response: The SDT has eliminated draft 5 R3 and R4 from draft 6.</b></p> <p>Specifically, Requirement R1 provides that BAs, RCs, and TOPs must develop and implement documented communication protocols that</p> <ul style="list-style-type: none"> <li>(a) address instances where the issuer of an oral two-party communication Operating Instruction is required to confirm that the response of any recipient entity such as a DP or GOP was accurate or to reissue the Operating Instruction to resolve the</li> </ul>

Organization	Yes or No	Question 1 Comment
		<p>misunderstanding (R1.5); and</p> <p>(b) to address coordination with affected recipient entities' communication protocols (R1.9).</p> <p>Requirement R2 further requires BAs, RCs, and TOPs to develop methods that assess communication practices and implement corrective actions necessary to meet the expectations outlined in these same protocols. Note that this assessment method would necessarily include assessment of the expectations included in the protocols regarding any recipient entity as required by R1.5 and R1.9.</p> <p>Meanwhile, proposed Requirement R3 would require the recipient DPs and GOPs to develop their own documented communications protocols that outline the communication expectations already addressed in the R1 protocols. [Note that the Rationale and Technical Justification for COM-003-1 specifies that Requirements R1 and R2 are addressed to entities that both issue and receive Operating instructions (BAs, RCs, and TOPs) whereas Requirements R3 and R4 are addressed to entities that only receive Operating Instructions.] Requiring DPs and GOPs in R3 to develop protocols outlining the communications expectations of its operators -- and requiring DPs and GOPs in R4 to assess those same operators' communications practices and implement corrective actions -- is redundant and unnecessary when those same expectations are already being documented by BAs, RCs, and TOPs in the R1 protocols, are already being coordinated with recipient entities, such as DPs and GOPs under R1.9, and are already being assessed and corrected by the BAs, RCs, and TOPs as required by R2. Therefore, requiring DPs and GOPs to go through the same motions simply creates another layer of documentation that strains limited resources and does little to enhance the reliability of the Bulk Electric System.</p> <p><b>Response: The OPCPSDT has also modified the standard requirements to make the DP and GOP subject to the protocols developed by its directing RC, TOP and BA rather than develop their own. This will hopefully help alleviate any confusion noted in the comments. The OPCPSDT believes assigning the appropriate responsibilities to those functions that will be "receiving" Operating Instructions so that clear and effective communications can occur does enhance reliability. The OPCPSDT supports</b></p>

Organization	Yes or No	Question 1 Comment
		<p>and encourages the effort of affected entities to develop and implement a common set of communication protocols. This adds additional clarity through enhanced uniformity.</p> <p>C. These duplicative exercises created by Requirements R3 and R4 run counter to the objectives directed by FERC in Paragraph 81 of FERC’s March 15, 2012 Order on NERC’s proposed “Find, Fix, and Track” (“FFT”) initiatives (“FFT Order”) as implemented by the P 81 Task Force. In Paragraph 81 of the FFT Order, FERC noted that “some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant.” In complying with FERC’s directives, the Paragraph 81 Task Force set out to identify standards that</p> <ul style="list-style-type: none"> <li>(a) do “little if anything, to benefit or protect the reliable operation of the BES” and</li> <li>(b) among other possible criteria, are either: <ul style="list-style-type: none"> <li>“(a) Administrative in nature, do not support reliability, and are needlessly burdensome; or</li> <li>(b) Require responsible entities to develop documents that are not necessary to protect BES reliability; or</li> <li>(c) Impose documentation updating requirements that are out of sync with the actual BES operations, unnecessary, or duplicative; or</li> <li>(d) Redundant with another FERC-approved Reliability Standard requirement(s), the ERO compliance and monitoring program, or a governmental regulation.” (See Paragraph 81 Task Force Technical White Paper.) With respect to this last criterion of redundancy, the Task Force specifically stated that it is “designed to identify requirements that are redundant with other requirements and are therefore unnecessary. Unlike the other criteria listed ... in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity.” (emphasis added). By creating duplicative requirements on both ends of a coordinated communication scheme between issuing BAs/RCs/TOPs and recipient DPs/GOPs, the Standards Drafting Team is creating an unnecessary administrative burden that does “little, if</li> </ul> </li> </ul>

Organization	Yes or No	Question 1 Comment
		<p>anything, to benefit or protect the reliable operation of the BES.” Even if it may be argued that requiring double coordination from both issuer and recipient somehow contributes to a reliable BES, “it is not necessary to have the two duplicative requirements on the same or similar task or activity.” Proposed Requirements R3 and R4 would fit all of the criteria listed above that the Paragraph 81 Task Force is using to identify candidates for retirement and/or revision. D. Finally, the risk created by proposed Requirements R3 and R4 in conjunction with R1 and R2 is more than simple administrative duplication. For vertically integrated entities that are registered both as issuing BAs/RC/TOPs and recipient DPs/GOPs, the redundancy created by Requirement R3 and R4 could potentially expose them to double penalties for a single violation. Because of the duplicative documentation and coordination requirements in R1/R2 and R3/R4, an auditor could interpret a single instance where the communications protocol of an issuing BA/RC/TOP did not match up with the recipient DP/GOP as multiple violations. In such an instance, both the issuers and the recipients could conceivably be penalized because the issuer’s communications protocols were not coordinated with the recipient’s communications protocols and this lack of coordination was not assessed and remedied.</p> <p><b>Response: The OPCPSDT has substantially modified the standard, making it “results” oriented and directly tying it to reliability. The draft 6 approach addresses some of the commenters concern, but sustains the applicability of the DP and GOP because they can and do have the potential for impacting reliability on the BES.</b></p> <p>If the Standards Draft Team does not delete Requirement R3 and R4 in their entirety, then Georgia Transmission Corporation suggests that R3 be reworded such that the entities work together to implement and coordinate one set of issuers’ communications protocols (i.e., that of the BAs/RCs/TOPs) instead of two sets of both issuers’ and recipients’ protocols. This should help to “tighten” the communications protocols as directed in Order 693 and to mitigate some of the confusion and duplicative documentation that could arise from Requirements R3 as written:            ”R3. Each Distribution Provider and Generator Operator shall implement the</p>

Organization	Yes or No	Question 1 Comment
		<p>documented communication protocols of its associated BA, RC, and TOP that define the communications expectations of R1. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] ....</p> <p>"and</p> <p>"R4. In addition to the recommendation to eliminate for the reasons above, GTC still believes R4 prescribes elements of internal control language to which is not necessary due to the tightening of communications protocols for issuing entities within R1 and should still be eliminated under this alternate scenario.</p> <p><b>Response: The OPCPSDT changed draft 6 and believes it addresses your concerns.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Western Small Entity Comment Group	No	In the comment area of the last section as asked.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Oncor Electric Delivery Company LLC	No	<p>Oncor believes the specificity in the subparts of R1 is unnecessary. Three-part communication is the preferred method for ensuring that both parties understand an Operating Instruction and it provides a sufficient mechanism for clear, concise and accurate communication. In creating a protocol that requires System Operators to essentially relearn the way to speak (specifically using alpha-numeric identifiers) will only create confusion and inefficiency as operators try to follow protocol and catch/correct themselves.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the level of specificity is necessary to attain a level of communication uniformity among affected entities. If protocols differ dramatically among entities they could be ineffective.</b></p>		
pacificorp	No	<p>PacifiCorp supports the proposed language referenced under R1 and the definition of "Operating Instruction" but does not support the following language proposed under R1.4:"Instances where alpha-numeric clarifiers are necessary when issuing an oral</p>

Organization	Yes or No	Question 1 Comment
		<p>Operating Instruction or Reliability Directive, and the format for those clarifiers.”Under the proposed draft, instances where alpha-numeric clarifiers are “necessary” are not clearly defined. In the absence of a clear definition, the identification of such instances is open to interpretation by both the entity and the auditor. Moreover, requiring the use of alpha-numeric clarifiers is not warranted when the requirements listed in R1.5 - R1.8 (requiring the strict use of three-way communication) alleviate any possibility of miscommunication, which PacifiCorp understands to be the drafting team’s intent in the development of separate Requirement R1.4. PacifiCorp believes implementing the use of alpha-numeric clarifiers poses additional risk due to the introduction of ambiguous language.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the current draft allows the flexibility for an entity to determine the instances where R1.4 would be necessary. The OPCPSDT reminds commenters they have significant flexibility on the “how” to develop their communication. The entity is to define the instances where they determine alphanumeric clarifiers shall apply.</b></p>		
Reliability First	No	<p>Reliability First abstains and offers the following comments for consideration:</p> <p>1. Requirement R1 and Requirement R3 - Reliability First questions the reasoning behind the term “where applicable” in the last sentence of Requirement R1 and Requirement R3. Can the SDT provide examples when there would be instances where an Entity would not need to address a sub-part within their documented communication protocols? Reliability First believes all sub-parts under Requirement R1 and Requirement R3 should be addressed within the respected protocols.</p> <p><b>Response: The OPCPSDT agrees that entities should address all protocols that apply to them. Some entities have pointed out their asset density; locations and their organizational structure negate the requirement for some protocols. An example is a BA that would never issue Operating Instructions for Transmission interface Elements/Facilities. The language referenced is how the OPCPSDT addressed these exceptions with those entities.</b></p>

Organization	Yes or No	Question 1 Comment
		<p>2.Requirement R1, Part 1.9 - ReliabilityFirst does not believe it is appropriate for Requirement R1, Part 1.9 to be addressed within the documented communication protocols. It is unclear how an entity would address “coordination” of its protocol within the protocol itself. ReliabilityFirst does agree with the concept of having the responsible entities be aware of each other’s communication protocols and thus recommend elevating this to a stand-alone requirement. ReliabilityFirst recommends the following for consideration as a new R3, “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall make available its documented communication protocols that outline the communications expectations of its System Operators.”</p> <p><b>Response: The OPCPSDT agrees and has changed the wording of R1, to eliminate Part 1.9.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
CenterPoint Energy Houston Electric L.L.C.	No	See comments below
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Occidental Energy Ventures Corp	No	See comments below.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation;	No	<p>Southern Company agrees with the new definition.Southern Company believes that Requirements R3 and R4 should be deleted.</p> <p>A. Southern Company believes that Requirements R3 and R4 (applicable to Distribution Providers (“DPs”) and Generator Operators (“GOPs”)) should be deleted from the proposed COM-003 standard because the burdens placed on Balancing Authorities (“BAs”), Reliability Coordinators (“RCs”) and Transmission Operators (“TOPs”) by Requirements R1 and R2:</p>

Organization	Yes or No	Question 1 Comment
<p>Southern Company Generation and Energy Marketing</p>		<p>(a) sufficiently tighten communications protocols with DPs and GOPs, (b) render Requirements R3 and R4 administrative, unnecessary, and redundant, counter to FERC’s objectives as implemented by the NERC Paragraph 81 Task Force, and (c) potentially expose some Registered Entities to double jeopardy violations of COM-003-1. Specifically, Requirement R1 provides that BAs, RCs, and TOPs must develop and implement documented communication protocols that</p> <p>(a) address instances where the issuer of an oral two-party communication Operating Instruction is required to confirm that the DP or GOP recipient’s response was accurate or to reissue the Operating Instruction to resolve the misunderstanding (R1.5); and (b) to address coordination with affected DPs’ and GOPs’ communication protocols (R1.9). Requirement R2 further requires BAs, RCs, and TOPs to develop methods that assess communication practices and implement corrective actions necessary to meet the expectations outlined in these same protocols. Note that this assessment method would necessarily include assessment of the expectations included in the protocols regarding DPs and GOPs as required by R1.5 and R1.9.</p> <p>Meanwhile, proposed Requirement R3 would require the recipient DPs and GOPs to develop their own documented communications protocols that outline the communication expectations already addressed in the R1 protocols. [Note that the Rationale and Technical Justification for COM-003-1 specifies that Requirements R1 and R2 are addressed to entities that both issue and receive Operating instructions (BAs, RCs, and TOPs) whereas Requirements R3 and R4 are addressed to entities that only receive Operating Instructions.] Requiring DPs and GOPs in R3 to develop protocols outlining the communications expectations of its operators -- and requiring DPs and GOPs in R4 to assess those same operators’ communications practices and implement corrective actions -- is redundant and unnecessary when those same expectations are already being documented by BAs, RCs, and TOPs in the R1 protocols, are already being coordinated with DPs and GOPs under R1.9, and are already being</p>

Organization	Yes or No	Question 1 Comment
		<p>assessed and corrected by the BAs, RCs, and TOPs as required by R2. Therefore, requiring DPs and GOPs to go through the same motions simply creates another layer of documentation that strains limited resources and does little to enhance the reliability of the Bulk Electric System.</p> <p>B. These duplicative exercises created by Requirements R3 and R4 run counter to the objectives directed by FERC in Paragraph 81 of FERC’s March 15, 2012 Order on NERC’s proposed “Find, Fix, and Track” (“FFT”) initiatives (“FFT Order”) as implemented by the P 81 Task Force. In Paragraph 81 of the FFT Order, FERC noted that “some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant.” In complying with FERC’s directives, the Paragraph 81 Task Force set out to identify standards that</p> <ul style="list-style-type: none"> <li>(a) do “little if anything, to benefit or protect the reliable operation of the BES” and</li> <li>(b) among other possible criteria, are either: <ul style="list-style-type: none"> <li>“(a) Administrative in nature, do not support reliability, and are needlessly burdensome; or</li> <li>(b) Require responsible entities to develop documents that are not necessary to protect BES reliability; or</li> <li>(c) Impose documentation updating requirements that are out of sync with the actual BES operations, unnecessary, or duplicative; or</li> <li>(d) Redundant with another FERC-approved Reliability Standard requirement(s), the ERO compliance and monitoring program, or a governmental regulation.” (See Paragraph 81 Task Force Technical White Paper.) With respect to this last criterion of redundancy, the Task Force specifically stated that it is “designed to identify requirements that are redundant with other requirements and are therefore unnecessary. Unlike the other criteria listed ... in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity.” (emphasis added). By creating duplicative requirements on both ends of a coordinated communication</li> </ul> </li> </ul>

Organization	Yes or No	Question 1 Comment
		<p>scheme between issuing BAs/RCs/TOPs and recipient DPs/GOPs, the Standards Drafting Team is creating an unnecessary administrative burden that does “little, if anything, to benefit or protect the reliable operation of the BES.” Even if it may be argued that requiring double coordination from both issuer and recipient somehow contributes to a reliable BES, “it is not necessary to have the two duplicative requirements on the same or similar task or activity.” Proposed Requirements R3 and R4 would fit all of the criteria listed above that the Paragraph 81 Task Force is using to identify candidates for retirement and/or revision. C. Finally, the risk created by proposed Requirements R3 and R4 in conjunction with R1 and R2 is more than simple administrative duplication. For vertically integrated entities that are registered both as issuing BAs/RC/TOPs and recipient DPs/GOPs, the redundancy created by Requirement R3 and R4 could potentially expose them to double penalties for a single violation. Because of the duplicative documentation and coordination requirements in R1/R2 and R3/R4, an auditor could interpret a single instance where the communications protocol of an issuing BA/RC/TOP did not match up with the recipient DP/GOP as multiple violations. In such an instance, both the issuers and the recipients could conceivably be penalized because the issuer’s communications protocols were not coordinated with the recipient’s communications protocols and this lack of coordination was not assessed and remedied.</p> <p>If the Standards Drafting Team chooses not to delete Requirements R3 and R4, then Southern suggests that the following rewording of R3 and R4 would be beneficial. If the Standards Draft Team does not delete Requirement R3 and R4 in their entirety, then Southern suggests that R3 and R4 be reworded such that the entities work together to implement and coordinate one set of issuers’ communications protocols (i.e., that of the BAs/RCs/TOPs) instead of two sets of both issuers’ and recipients’ protocols. This should help to “tighten” the communications protocols as directed in Order 693 and to mitigate some of the confusion and duplicative documentation that could arise from Requirements R3 and R4 as written:</p> <p><i>”R3. Each Distribution Provider and Generator Operator shall implement the</i></p>

Organization	Yes or No	Question 1 Comment
		<p><i>documented communication protocols of its associated BA, RC, and TOP that define the communications expectations of R1. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] ...."and"</i></p> <p><i>R4. Each Distribution Provider and Generator Operator shall develop method(s) to assess its communications practices and implement corrective actions necessary to meet the expectations in the documented communications protocols developed for Requirement R1."Conforming revisions would also need to be made to the language in the Measures, VRFs, and VSLs as applicable.</i></p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT changed draft 6 and believes it addresses your concerns.</b></p>		
Tacoma Power	No	<p>Tacoma Power supports and strongly suggests reverting back to the Draft 2 definition, "Operating Communication - Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System."</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The definition has been changed in response to past industry comments over several drafts.</b></p>		
City of Austin dba Austin Energy	No	<p>The latest version of COM-003 introduces a potential conflict with COM-002 related to the use of one-way burst messaging systems to issue a Reliability Directive. In COM-003, the follow Requirements apply:</p> <p>R1.7 Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.R1.8 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.R3.3 Require the receiver of an oral Operating</p>

Organization	Yes or No	Question 1 Comment
		<p>Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. In other words, COM-003 allows one-way burst messaging for Reliability Directives and prescribes:</p> <ul style="list-style-type: none"> <li>o the issuer confirm receipt from at least one receiving party</li> <li>o the receiver request clarification from the issuer if the communication is not understood</li> </ul> <p>However, COM-002 has the following requirements:</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase, or recapitulate the Reliability Directive.</p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> <li>o Reissue the Reliability Directive to resolve a misunderstanding.</li> </ul> <p>In other words, in the case of a one-way burst message used for Reliability Directives, COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3 way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst message Reliability Directive as the requirements indicate in COM-003. In order to fully comply with BOTH standards, the receiver would have to contact the issuer and repeat what was said on the original burst message; then, the issuer would confirm the response was accurate before acting on the message.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has eliminated R1, Parts 1.7, 1.8, and 3.3, which reference requirements for all calls.</b></p>		
NERC	No	<p>This will require each entity to develop its own unique protocol. This will not "tighten up" communications. Having each entity follow its own protocol will complicate and confuse communications. One entity will be attempting to communicate with another entity which is not familiar with the protocol being used by the first entity because the second entity uses a different protocol. Protocols if required should be standardized. Moreover, the proposed language requires a protocol that "meets the expectations of</p>

Organization	Yes or No	Question 1 Comment
		<p>its System Operators". The plain meaning of that sentence as writtem is that the protocol meet the expectations of the individual workers, not the entity itself. If this change is going to be approved, should not it read "Each (entity) shall develop protocols that PROVIDE ITS expectations of its System Operators"?</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has substantially altered the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to approval of the RC.</b></p>		
<p>Independent Electricity System Operator</p>	<p>No</p>	<p>We agree with most of the changes made. We offer a preferred wording for Part 1.4, and have a concern over the ambiguity of Part 1.6 and Part 1.8.</p> <p>Part 1.4 states that:1.4 Instances that alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction or Reliability Directive, and the format for those clarifiers. A preferable description would say that the protocol should address the risk of miscommunication arising from alpha-numeric identifiers. This could be addressed through the use of the phonetic alphabet or through different means if local conditions dictate a different approach.</p> <p><b>Response: The requirement permits the entity to determine the circumstances where they would employ alphanumeric clarifiers. The examples you cited: “The phonetic alphabet or through different means if local conditions dictate a different approach” would be acceptable.</b></p> <p>As noted above, we are concerned over the ambiguity of Part 1.6, which states that:            1.6 Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.</p> <p>When read together with the last sentence in R1, “The documented communication protocols will address, where applicable, the following:”, this part is unclear as to whether it is to identify the instances that the repeat is required, or that the documentation needs to include explicit statements that the issuer needs to request a repeat when issuing an operating instruction or reliability directive which the issuer</p>

Organization	Yes or No	Question 1 Comment
		<p>feels a repeat is necessary. This sub-requirement part, as written, is ambiguous and appears to be more applicable to the instruction recipient than the issuer. When read together with Part 3.2, Part 1.6 appears to be requiring the issuer to identify the instances that a repeat is required. We therefore suggest the SDT to revise Part 3.2 as follows:</p> <p>1.6 Instances where it requires the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.</p> <p><b>Response: The OPCPSDT agrees and has reworded R1, Part 1.6 (Now Part 1.5) to reflect its intent that a repeat back is required. The OPCPSDT has elected to eliminate R3 in its entirety.</b></p> <p>Similar concerns with Part 1.8 except the mirror part 3.3 does not contain the wording “if requested by the issuer”. Hence, we assume that the recipient is required to request clarification from the issuer if the communication is not understood without having to be asked. Therefore, we propose Part 1.8 be revised as follow:1.8 A stipulation that the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.</p> <p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has eliminated R1, Parts 1.7, 1.8, and 3.3, which reference requirements for all calls.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Tennessee Valley Authority	No	<p>We agree with the definition of Operating Instruction. While we also can agree to the changes made to R1, we feel R3 in its entirety is unnecessary and duplicative. Removal of the word “develop” would eliminate double-jeopardy concerns. R3 could be acceptable if “develop and” is omitted and “as developed in R1” is inserted after “protocols” and before “that.” It should be noted that this suggestion only applies to the sub-requirements in R1 that correspond to the proposed sub-requirements in R3.</p>

Organization	Yes or No	Question 1 Comment
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has eliminated R3 in draft 6.</b></p>		
<p>Western Electricity Coordinating Council</p>	<p>No</p>	<p>We do not agree with the revisions to the language of R1 and R3. The changes are a lowering of the bar for reliability. Earlier versions identified specific communication protocols for each BA, RC, and TOP. These specific requirements would have resulted in a consistent approach to communications between all system operators. The proposed revisions couple result in varying procedures that do not close the gap in communications. The watered-down versions of the requirements are essentially a fill-in-the-blank type of standard allowing each applicable entity to develop their own protocols.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes WECC is permitted to create communication protocols that are robust and as comprehensive as it desires. The OPCPSDT would recommend that all entities create strong protocols.</b></p>		
<p>Ameren</p>	<p>No</p>	<p>We do not believe that we need a definition for the term “Operating Instruction” and we would like to see this defined in the entities protocol. However if a definition is included, we ask the SDT to require an RC, TOP, or BA to identify when an Operating Instruction is used to communication to a GOP or DP.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has considered this request often and believes it has merit, but it may create undue burdens on some operators. If an entity wishes to announce an “Operating Instruction”, it may incorporate that in its communication protocols.</b></p>		
<p>Public Service Enterprise Group</p>	<p>No</p>	<p>We found what we believe to be a typo in the definition of "Operating Instruction." The defined term “Operating Instruction” has this phrase: “...where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” The comma after “act” should be removed because it is not grammatically correct. If removed, the phrase would become: “...where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.</p>

Organization	Yes or No	Question 1 Comment
<p>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has corrected the error.</p>		
<p>SPP Standards Review Group</p>	<p>No</p>	<p>We suggest adding 'as determined by the Functional Entity' to R1 to clarify that the protocols are those specifically determined by the applicable responsible entity:                      'The documented communication protocols will address, where applicable as determined by the Functional Entity, the following:'</p> <p><b>Response: The OPCPSDT believes that is redundant based on the previous addition of "where applicable".</b></p> <p>Is the intent of R1.3 for applicable entities to maintain a list of common name identifiers which must be utilized in communications with all affected entities? If so, a similar requirement (R18) in TOP-002-2 is currently proposed to be eliminated in TOP-002-3. Therefore it shouldn't be added back by this requirement. Can the drafting team be more specific as to exactly what is required in R1.3 without going overboard as in the existing wording? We understand the need to be sure that affected entities do not have any misunderstandings regarding the specific facility that is at issue. However, our experience does not indicate that this is a problem. If we can't relax R1.3, we suggest eliminating it altogether.</p> <p><b>Response: R1.3 is designed to increase familiarity with Transmission interface Elements and Facilities to prevent confusion and increase situational awareness. The requirement calls for entities to ensure that operators are aware of the names or designators of interface equipment between those entities. It is up to the affected entities to determine how they would accomplish this through their communication protocols. One example may be designate in the documented Communication Protocols to use the name of the Transmission interface Element/Facility assigned by the owner of such Element/Facility.</b></p> <p>We understand the need to be sure that affected entities do not have any misunderstandings regarding the specific facility that is at issue. However, our experience does not indicate that this is a problem. If we can't relax R1.3, we suggest eliminating it altogether since we believe this not does significantly impact the</p>

Organization	Yes or No	Question 1 Comment
		<p>reliability of the BES.</p> <p><b>Response: The requirement focuses on interface Elements and Facilities only. An entity may develop the protocols in a manner that supports their unique operating footprint.</b></p> <p>The use of the term ‘coordination’ in R1.9 causes concern in determining exactly what is required to coordinate. This could become a compliance nightmare for applicable entities. We suggest replacing R1.9 with “Provide each affected Reliability Coordinator, Balancing Authority, Transmission Operator, Distribution Provider, and Generator Operator with its communication protocols.”</p> <p><b>Response: The OPCPSDT agrees and has changed the wording of R1, to eliminate Part 1.9.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
Idaho Power Company	No	<p>Yes for R1 and R3. No for the definition of "Operating Instructions". It is not written very well and is difficult to understand. The language below is offered as a suggestion to simplify the definition.</p> <p>Operating Instruction -A command by a System Operator of a Reliability Coordinator, Transmission Operator, or Balancing Authority where the recipient is instructed to change or preserve the state, status, output, or input of any portion of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has considered your comments and elects to maintain the existing definition of an Operating Instruction because it reflects the response to many other comments from previous drafts.</b></p>		
SERC OC Standards Review Group	No	
ISO/RTO Standards Review	No	

Organization	Yes or No	Question 1 Comment
Committee		
South Carolina Electric and Gas	No	
ISO New England Inc.	No	
Cogentrix Energy Power Management	No	
Vijayraghavan	No	
Manitoba Hydro	Yes	(1) Definition “Operating Instruction” - reference is made to both ‘Bulk Electric System’ and ‘BES’. For consistency, either the words or acronym should be used.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has made the correction.</b>		
ACES Standards Collaborators	Yes	(1) We appreciate the efforts of the drafting team in developing this standard and the steps the team took to resolve industry’s concerns. (2) We continue to have concerns that the glossary term “Operating Instruction” overlaps with “Reliability Directive.” The standard as written allows flexibility on how to deal with these two terms/situations and gives the registered entity the responsibility to handle these types of communications in its protocol. Because of the flexibility and in the spirit of moving forward, we can support the approach by the drafting team that would allow NERC to address FERC concerns. This represents a good balance.
<b>Response: The OPCPSDT thanks you for your comments. The intention of the OPCPSDT is to balance uniformity with enough flexibility. Draft 6 includes more language to further separate Operating Instructions and Reliability Directives</b>		
Duke Energy	Yes	R1.7, R1.8, and R3.3 - All Call should not be capitalized since it is not a defined term. It should instead be placed in quotation (“All Call”).R1.6, R1.8, R3.2, and R3.3 - Change the word “Require” to “Requirement for” to better align grammar with R1.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has eliminated R1, Parts 1.7, 1.8, and R3, Part 3.3, which</b>		

Organization	Yes or No	Question 1 Comment
reference requirements for all calls. Also, The OPCPSDT has eliminated R1, Parts 1.6 and R3, Part 3.2.		
MISO	Yes	While MISO is not opposed to the current version of COM-003-1, it remains concerned regarding the overlap between COM-002-3 and COM-003-1. As written, the definition of “operating instruction” encompasses “reliability directives”. This overlap and the application of multiple separate standards to operator communications in general is likely to result in ambiguity and confusion. Further, that only certain sub-requirements of COM-003-1 also mention reliability directives further confuses the applicability of these standards. While the identified overlap and application is manageable, it is recommended that this overlap be addressed at the earliest opportunity. One clear, succinct standard that addresses both operator communications, whether reliability directives or operating instructions, is respectfully recommended.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has removed references to Reliability Directive.</b>

SMUD/Balancing Authority of Northern California		<p>SMUD would like to thank the Drafting Team for their efforts. While we agree with the intent of COM-003 SMUD believes the requirements R1.5 &amp; R1.5 are too vague. Requiring the receiving party to repeat back the Operating Instruction only (emphasis added) if requested does not provide insurance that the receiving party would have a clear understanding of the necessary actions intended by the issuing party.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the requirement for a repeat back of an Operating Instruction is important because it allows the issuer to determine whether a recipient understands a command. The issuer can then reissue the command until they are convinced the recipient understands it.</b></p>		

2. The SDT has proposed new language in COM-003-1, R2 and R4: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols. (the same language exists for R3, except DPs and GOPs listed as applicable entities and the use of “operators” instead of “System Operators”). ” Do you agree with these proposed requirement changes? If not, please explain in the comment area of the last question:

**Summary Consideration:**

**Requirements (Question 2 Comments on R2 and R4):**

A majority of the commenters expressed concerns over how an entity’s internal controls to improve System Operators’ communication performance would be audited. The commenters state that auditing internal controls is contrary to both, existing ERO doctrine and ongoing initiatives that are seeking to improve the effectiveness of the audit process. Some commenters also claim the potential for double jeopardy exists. The lack of certainty over how compliance would be administered caused commenters significant concern.

**The OPCPSDT understands the commenters’ concerns. The OPCPSDT decided to eliminate the COM-003-1, draft 5, R2 and R4 requirements in draft 6. Draft 6 features a results based approach that clearly specifies compliance and is linked to reliability results. The draft 6 requirements will also reduce the exposure of entities to voluminous compliance documentation.**

The OPCPSDT points out that many other commenters responded positively to the use of internal controls and preferred the assess and correct requirement.

**After consideration of all of the comments, the OPCPSDT voted for the approach featured in COM-003-1, draft 6.**

Organization	Yes or No	Question 2 Comment
NIPSCO	No	"Each Distribution Provider and Generator Operator shall develop and implement documented communication protocols that outline the communications expectations of its operators." This language is unclear as to the communication expectation to its operators. Does this address the communications between the DP and the TOP only? Or does this apply to the communication between the DP and field personnel?
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified COM-003-1, draft 6 to address your concern.</b></p>		

Organization	Yes or No	Question 2 Comment
Manitoba Hydro	No	(1) Compliance Data Retention, 1.2 - COM-001 and COM-002 standards both read 3 months or 90 days for the retention of evidence. It is unclear as to why the retention has been doubled in this standard to 180 days for R2, M2 and R4, M4. For consistency and simplicity, 90 days should be used.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified COM-003-1, draft 6 to address your concern.</b></p>		
CPS Energy	No	Distribution Providers (DP) may be co-located in the same room with Transmission Operators (TOP) and would have oral communications and not use a telephone or other messaging system. Generator Operators (GOP) should have a separate standard.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the risk of misunderstanding and miscommunication exists in face-to-face communication as you describe. The use of communication protocols reduce that risk and subsequent harm it could cause during BES operations. The current draft of the standard would allow an entity to develop its own communication protocols to identify the instances of when to use the protocols. There is no requirement to use a telephone or messaging system. The OPCPSDT has modified COM-003-1 to address your concern.</b></p>		
American Electric Power	No	If an entity has a control in place, but that control is somehow not viewed favorably during an audit, is that entity potentially in violation of an additional requirement? R2 and R4 appear to have potential double jeopardy implications.
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a “Reliability Directive.”</b></p>		
Western Small Entity Comment Group	No	In the comment area of the last section as asked.
<p><b>Response: The OPCPSDT thanks you for your comments. We will respond to those comments.</b></p>		
Georgia System Operations Corporation	No	Internal controls-like language was first introduced into draft 3, R3 and R4. We note that after the technical conference held in Atlanta - Feb 2013, draft 5, R2 and R4 appear to still have remnants of this control language. As discussed in length, it is not appropriate to have such control language in reliability requirements. As GSOC recalls,

Organization	Yes or No	Question 2 Comment
		<p>insertion of R2 and R4 was not discussed or agreed upon at the conference.</p> <p><b>Response: The Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive.</b></p> <p>GSOC recalls that statements were made by participants that it was pre-mature to include controls language in the standard/requirement at this time. So it appears that revisions to the contrary when were made when in fact NERC statements were made that the full RAI process would not be in place until 2016.GSOC still supports the RAI as it “proposes to transition away from a process-driven enforcement strategy to a proactive, risk-based strategy that clearly defines, communicates, and promotes desired entity behavior in an effort to improve the reliability of the BPS.” However, this transition has not been implemented yet. Until NERC transitions the Compliance Monitoring and Evaluation Program (CEMP) to the risk-based strategy, we are still under the past/current process-driven enforcement strategy. A primary concern of GSOC is that until the RAI is developed and provides audit guidance regarding treatment of entity control measures, then auditor subjectivity may creep into the audit process. GSOC believes that once a transition to a risk-based strategy is complete, only then will there be an established “set of parameters” to “guide the exercise of enforcement discretion.” “The parameters that would guide the exercise of discretion as well as the protections” “would be in place to ensure due process and to ensure that enforcement decisions are sound and reflect a consistent application of the ERO enterprise enforcement strategy.”More specifically, The “decline to pursue option” will have replaced Find, Fix, and Track “after necessary training of [NERC and Regional] personnel, industry and stakeholder outreach, and development of process improvements.” At that time, “for those violations that pose a serious or substantial risk, or are not proper candidates for the exercise of enforcement discretion, the ability to impose penalties up to the statutory maximum or adopt increased monitoring and broader audit scope must be retained.” At that time, internal controls will be the way to do business (operations/planning) and the process-driven zero-tolerance enforcement process will only apply to those serious or substantial risks. Regarding</p>

Organization	Yes or No	Question 2 Comment
		<p>zero tolerance, some in industry have the false perception that putting internal controls-like language in a reliability requirement NOW will subsequently allow auditors to apply non-zero tolerance. To the contrary, GSOC believes the current process-driven CMEP inclusive of requirements with controls-like language actually requires zero-tolerance treatment. If this standard is passed in its present form an auditor will not have the discretion to “decline to pursue” and must treat every possible violation the same. Of course, NERC/Regional compliance enforcement can now treat some possible violations as applicable to Find, Fix, Track. But that does not require controls language in a requirement. Accordingly, mitigating COMPLIANCE risk has been and still is a driver for the industry’s compliance programs. Once the CMEP is transitioned to the risk-based strategy, then such language will be in place with the CMEP and the industry can focus more on RELIABILITY risk and less on COMPLIANCE risk.</p> <p><b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive.</b></p> <p>In addition, GSOC notes that controls-like language is a requirement which is administrative and therefore meets the criteria under P81 for exclusion from reliability requirements. It is not a risk-based reliability requirement. A reliability requirement is one that is (as the statutory definition says) a requirement to provide for reliable operation of the bulk-power system. A reliability requirement includes requirements for the operation of existing bulk-power system facilities, including cyber-security protection, and the design of planned additions or modifications to such facilities to the extent necessary to provide for reliable operation of the bulk-power system. This administrative requirement does not meet the criteria for being a reliability requirement.</p> <p><b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive.</b></p>

Organization	Yes or No	Question 2 Comment
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>		
<p>Oncor Electric Delivery Company LLC</p>	<p>No</p>	<p>Oncor supports the shift in compliance to the internal controls approach and we look forward to NERC providing a programmatic/principles framework in a collaborative approach with the industry. In the absence of this framework, it is unknown how the concept of "assess and correct" will evolve. As the framework is developed including the "assess and correct" concept, Oncor requests that continuous focus be placed on implementing principles including this concept and not requiring or specifying internal controls which would place additional compliance burden on entities. The internal controls principles/framework should enable entities to establish internal controls model utilizing deficiency correction approach but should not mandate the approach at the Standard/Requirement level. Internal Controls Program needs to be defined by an Entity, it is not a "One Size Fits All". The standards/RSAs should reflect this understanding. Oncor does not see how the Drafting Team adequately addressed this concern. NERC and the rest of the industry should work together and define the framework around Internal Controls.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 "assess and correct" language and ties performance in avoiding communication related events that would generate a Reliability Directive. Draft 6 does not address or reference internal controls in its requirements.</b></p>		
<p>pacificorp</p>	<p>No</p>	<p>PacifiCorp does not support the following language referenced under R2 (with substantially similar language in R4) as it pertains to the Balancing Authority, Reliability Coordinator, Transmission Operator, Generator Operator, and Distribution Provider: "...shall develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1." In the absence of any proposed criteria for measuring how the aforementioned method(s) are developed, determining whether an entity has successfully met the expectations it has established in its communication protocols is subject to a multitude of interpretations. Moreover, Measures M2 and M4 are focused exclusively on the results of an entity's</p>

Organization	Yes or No	Question 2 Comment
		<p>periodic assessment and corrective actions. PacifiCorp believes that a results-based review of an entity’s assessment fails to provide any insight into the quality of the assessment itself.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive. Draft 6 does not address or reference internal controls in its requirements.</b></p>		
City of Garland	No	<p>R2 &amp; R4 Requirements are written assuming that corrective actions will be necessary. Should be written to state corrective actions “if necessary”</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive. Draft 6 does not address or reference internal controls in its requirements.</b></p>		
Tennessee Valley Authority	No	<p>R2 is acceptable and R4, as stated above for R3, is unnecessary and duplicative.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please refer to the response to your prior comment.</b></p>		
ReliabilityFirst	No	<p>ReliabilityFirst abstains and offers the following comments for consideration:</p> <ol style="list-style-type: none"> <li>1. Requirement R2 - ReliabilityFirst believes the concept of implementation of the method(s) to assess System Operators’ communication should be added to the requirement. If the Entity is not required to implement the method(s), an Entity may never find any deficiencies and get to the point of implementing the corrective actions necessary to meet the expectations in its documented communication protocols. ReliabilityFirst recommends the following for consideration, <i>“Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1.”</i></li> <li>2. Requirement R4 - Similar to the comment on Requirement R2, ReliabilityFirst believes the concept of implementation of the method(s) to assess System Operators’</li> </ol>

Organization	Yes or No	Question 2 Comment
		<p>communication should be added to the requirement. ReliabilityFirst recommends the following for consideration,</p> <p><i>“Each Distribution Provider and Generator Operator shall develop and implement method(s) to assess operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R3.”</i></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive.</b></p>		
<p>North American Generator Forum Standards Review Team</p>	<p>No</p>	<p>See answer to 4 below.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT will address your comments at that location</b></p>		
<p>Exelon</p>	<p>No</p>	<p>See comment #3 in the comment area of the last question</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT will address your comments at that location</b></p>		
<p>NIPSCO</p>	<p>No</p>	<p>See comments submitted on NIPSCO's behalf by Julaine Dyke</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT will address your comments at that location</b></p>		
<p>Georgia Transmission Corporation</p>	<p>No</p>	<p>See GTC’s comments above regarding deletion of R4. GTC also believes the same logic can apply to R2 and recommends to be deleted. Additionally, see GTC’s comments regarding the conflict with the drafting team’s proposal to inadvertently define a new function for the DP “operators”. Lastly, DPs do not issue Operating Instructions; DP field personnel only receive instructions from others.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive. Draft 6 does not address or reference internal controls in its requirements.</b></p>		

Organization	Yes or No	Question 2 Comment
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	See Southern’s comments above regarding deletion and/or modification of R4. If R4 was not part of this question then Southern’s answer would change to yes for this question. Additionally, GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations. However, the methods used are proper business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an internal compliance program.
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance in avoiding communication related events that would generate a Reliability Directive. Draft 6 does not address or reference internal controls in its requirements.</b></p>		
Tacoma Power	No	Tacoma Power supports Draft 2 - The requirement to establish communication protocols should be identical for BA, TO, RC, GO, and DP. To make different requirements for different functions is very confusing for those who perform multiple functions. Go back to basic “3-part communication” (and include an option for push-to-talk). Remove fuzzy language such as “if requested”. The Standard should leave it up to the Entity to establish their communication protocols and procedures based upon the type of communication systems they are using. This draft seems to be trying to write the procedures for every type of possible communication equipment rather than set a standard for how to communicate.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has substantially altered the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. This and other changes address many of your comments.</b></p>		
Indiana Municipal Power Agency	No	The COM-003-1 standard needs to be an independent document used to audit entities and the RSAW should not be used to address items not covered in the standard as to what is acceptable and what is not acceptable when it comes to instances when three-

Organization	Yes or No	Question 2 Comment
		<p>part communication is not properly followed by an entity during an audit. IMPA is concerned that an entity has one instance of a missed repeat back and per the entity's plan they address it and re-train for it; NERC could still call it a violation. The standard language needs to be clear about the latitude that an entity is given to work things out within their internal controls. The main item that the standard should do is to make sure that entities have communication plans and their internal controls within the communication plans contain a process to monitor and self-deal with corrective action of instances where its communication plan was not properly followed. This language needs to be clearly stated in the standard and not somewhat stated in the RSAW. IMPA believes the prior version of this draft standard was close when it used language on internal controls that stated "implement, in a manner that identifies, assesses, and corrects deficiencies...".</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 "assess and correct" language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p>		
<p>Florida Municipal Power Agency</p>	<p>No</p>	<p>Use of the term "System Operators" is ambiguous; does the requirement cause internal evaluation, or evaluation of neighboring System Operators? We assume the former and suggest adding "its" in front of "System Operators".</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The term "System Operator" has been eliminated from the requirements of draft 6 of COM-003-1.</b></p>		
<p>Ameren</p>	<p>No</p>	<p>We ask the SDT to delete requirements R3 and R4 because they are redundant and may cause double jeopardy for entities as these requirements are addressed in requirements R1 and R2 for the BA, RC, and TOP communication protocols with DPs/GOPs.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 "assess and correct" language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p>		
<p>Oklahoma Gas &amp; Electric</p>	<p>No</p>	<p>We believe that R2 and R4 should already be covered in PER-005</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT disagrees—training is only one of several means of</b></p>		

Organization	Yes or No	Question 2 Comment
<b>accomplishing the goals of COM-003-1.</b>		
SPP Standards Review Group	No	<p>We have concerns with the continued inclusion of Distribution Provider in the list of Applicable Entities. Although this is in response to a FERC directive, the risk that Distribution Providers present to the BES is minimal at best. Actions taken by Distribution Providers which impact the reliability of the BES, load shedding for example, are adequately covered under COM-002-3 which applies to emergency situations.</p> <p>There are also jurisdictional questions associated with FERC directing the inclusion of Distribution Providers. If the Distribution Provider must remain as an Applicable Entity, then we would propose deleting Distribution Provider from R3 and R4 and then follow with the addition of a new R5 and R6.R5.</p> <p>Each Distribution Provider that is the recipient of an oral Operating Instruction, other than Reliability Directives, shall:</p> <p>5.1 Use the English language, unless another language is mandated by law or regulation.</p> <p>5.2 Repeat, restate, rephrase, or recapitulate the oral Operating Instruction.</p> <p>5.3 For oral Operating Instructions issued as a one-way burst message to multiple parties in a short time period (e.g. an All Call system), request clarification from the issuer if the communication is not understood.</p> <p>R6. Each Distribution Provider shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in Requirement R5.</p>
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified COM-003-1 to address your concern.</b>

Vijayraghavan	No	
<b>Response:</b>		
ACES Standards Collaborators	Yes	(1) We appreciate the drafting team allowing the registered entity to have the flexibility in determining the assessment methods and corrective actions to implement. Further, we appreciate that the measures for these requirements state that the assessment should be “periodic” but do not impose any strict timeline. We recommend that the RSAW state the same or similar language, as the entity should be able to dictate how often the assessments occur in their protocols, policies, and procedures.
<b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b>		
Seattle City Light	Yes	Seattle City Light is supportive of the proposed "assess and implement" approach to compliance for COM-003 R2 and R4.
<b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b>		

Organization	Yes or No	Question 2 Comment
MISO	Yes	We believe the drafting team found a very reasonable solution to meet a FERC directive for a situation that deals with managing the quality of the millions of operator communications that occur annually.

3. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?

Summary Consideration:

VRFs and VSLs (Question 3):

The OPCPSDT acknowledges there were many comments on draft 5 regarding VSLs and VRFs and we appreciate the contributions.

The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes. The elimination of the “assess and correct” language and the revisions to R1, R2 and R3 have resulted in extensive changes to VRFs and VSLs for draft 6.

Organization	Yes or No	Question 3 Comment
ACES Standards Collaborators	No	(1) There are a few changes that need to be made in the severe VSLs for R1 and R3. The severe VSL states, “The Responsible Entity did not implement any documented communication protocols as required in Requirement R1.” This statement is in direct conflict with the lower, medium and high VSLs because if an entity violated at least one documented communication protocol (low VSL), or two protocols (medium VSL), or three protocols (high VSL), then the entity violated “any.” We recommend striking the statement in the severe VSL to avoid this conflict.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes. The draft 6 approach has required substantial changes to the VSLs and VRFs.</b></p>		
ReliabilityFirst	No	<p>1. VSL for Requirement R1 - In order to capture instances where more than three parts were not addressed, the second VSL under the “High” category needs to be modified to state, “...did not implement three (3) or more of the nine (9) parts of...”</p> <p>2. VSL for Requirement R2 - ReliabilityFirst recommends including a lower bounds</p>

Organization	Yes or No	Question 3 Comment
		<p>around the “Medium VSL”. As written, an entity would fall into the Medium VSL range if they only implemented 1% or implemented 49% of the corrective actions. ReliabilityFirst recommends gradating the VSLs using 25% increments across all four VSLs.3. VSL for Requirement R4 - ReliabilityFirst recommends including a lower bounds around the “Medium VSL”. As written, an entity would fall into the Medium VSL range if they only implemented 1% or implemented 49% of the corrective actions. ReliabilityFirst recommends gradating the VSLs using 25% increments across all four VSLs.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Luminant	No	All comments are shown in response to Question 4.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT will address your comments at that location.</b></p>		
Western Electricity Coordinating Council	No	Based on the changes we believe are necessary for Requirements R1 and R3, we beleive the VSLs should be changed accordingly.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Ameren	No	Concerning the VRF and VSLs we ask the SDT to review the severity levels because we do not believe that any violations of this standard should be at either a High or Severe level since these are documentation requirements.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the VSL levels, in addition to adhering to NERC and FERC guidelines, properly reflect the threshold of severity for violations.</b></p>		
CPS Energy	No	I do not agree with the requirements, therefore I do not agree with the VRF's and VSL.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		

Organization	Yes or No	Question 3 Comment
pacificorp	No	PacifiCorp does not support the VRFs and VSLs for Requirements R2 and R4. In keeping with PacifiCorp’s comment in Question 2, a method of assessment that is not explicitly defined and cannot be measured against a clear set of criteria makes it difficult for an entity or auditor to determine whether any of the corrective actions taken by an entity have fulfilled the expectations documented in their communication protocols. Assigning a severity level based on a percentage of completion is redundant when an entity cannot determine what a “complete” assessment is or the criteria by which it is measured.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Georgia System Operations Corporation	No	R2 & R4 - we believe without any definitive guidance from NERC's still-undeveloped RAI, auditors will apply subjective judgment as to the adequacy of controls used to perform periodic assessments and therefore VRF and VSL are not appropriate.
<p><b>Response: The OPCPSDT thanks you for your comments. Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
North American Generator Forum Standards Review Team	No	See answer to 4 below.
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our response at that location.</b></p>		
CenterPoint Energy Houston Electric L.L.C.	No	See comments below
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our response at that location.</b></p>		
Salt River Project	No	The VSLs give a higher violation to a GO than a BA for exactly the same error, even though the consequences with the BA are much greater. A GO who fails to require 3-part responses when requested is tagged with a Moderate violation, the BA with a

Organization	Yes or No	Question 3 Comment
		lower. We believe the VRF should be Low rather than Medium for R4.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Seattle City Light	No	The VSLs give a higher violation to a GO than a BA for exactly the same error, even though the consequences with the BA are much greater. A GO who fails to require 3-part responses when requested is tagged with a Moderate violation, the BA with a lower. Both should be lower.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Clark Public Utilities	No	The VSLs give a higher violation to a GO than a BA for exactly the same violation, even though the consequences with the BA are much greater. A GO who fails to require 3-part responses when requested is tagged with a Moderate violation, the BA with a Lower. Both should be Lower.
<p><b>Response: The OPCP SDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b></p>		
Southern Company - Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing	No	We agree with the VRFs and VSLs for R1 and R2. As discussed above, R3 and R4 should not be part of the standard. To the extent R3 and R4 should be deleted or modified, the VRFs and VSLs should be modified accordingly.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have</b></p>		

Organization	Yes or No	Question 3 Comment
<b>been modified to reflect those changes.</b>		
Tennessee Valley Authority	No	We agree with the VRFs and VSLs for R1 and R2. Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b>		
Georgia Transmission Corporation	No	We agree with the VRFs and VSLs for R1. As discussed above, R3 and R4 should not be part of the standard. To the extent R3 and R4 should be deleted or modified, the VRFs and VSLs should be modified accordingly.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b>		
SPP Standards Review Group	No	While we understand the process that gets us to the point where the VRFs for R1 and R3 are Low and those for R2 and R4 are Medium, in this situation we question the logic of the process. If developing a document only deserves a low VRF then how can we logically say that not implementing the items contained in the document is a medium? What happens if the document is flawed? This appears to be an inverted pyramid. We suggest using Low for all requirements.
<b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified draft 6, and all of the VRFs and VSLs have been modified to reflect those changes.</b>		
Oklahoma Gas & Electric	No	While we understand the process that gets us to the point where the VRFs for R1 and R3 are Low and those for R2 and R4 are Medium; however, in this situation we question the logic of the process. If developing a document only deserves a Low VRF then how can we logically say that not implementing the items contained in the document is a Medium? What happens if the document is flawed? We suggest using Low for all requirements.

4. Do you have any other comments or suggestions to improve the draft standard?

**Summary Consideration:**

The content of Question four comments has been addressed in the previous three summaries and the consolidated summary.

Organization	Question 4 Comment
Manitoba Hydro	<p>(1) ‘Reliability Directive’ is referred to in R1, 1.1 of the COM-003-1 standard but is not currently a FERC approved definition, defined in the Glossary of Terms.  <b>Response: The term “Reliability Directive” has been approved by the NERC Board of Trustees. It is appropriate to use the term.</b></p> <p>(2) R1, 1.3 and Rationale and Technical Justification documents - reference is made to ‘interface’, which is not a defined term. Accordingly, its meaning is questionable. Consider removing or clarifying.  <b>Response: Interface refers to Elements and Facilities that border those of other entities and interact more directly between or among those entities. Knowledge of the assigned nomenclature of those Elements and Facilities improves situational awareness.</b></p> <p>(3) R1, 1.6 and 1.8 - requirement language is not consistent. For example, ‘recipient’ and ‘receiver’ are used but have the same meaning. Suggest beginning the requirements with the following text “Instances where....”  <b>Response: The SDT has modified the standard to address your concern.</b></p> <p>(4) R2, R4 - the word ‘periodically’ should be inserted before ‘assess’ in each of these requirements for consistency with the Measures and VSLs, which refer to ‘periodic assessments’.  <b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p> <p>(5) R2, R4 - the phrase ‘necessary to meet the expectations in its documented communication protocols’ is ambiguous and will be difficult to interpret when assessing compliance. Is this statement to be the</p>

Organization	Question 4 Comment
	<p>interpretation of the drafter of the protocols as to what is, in their opinion ‘reasonably necessary’?  <b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p> <p>(6) R3, 3.2 and 3.3 - requirement language is not consistent. For example, ‘recipient’ and ‘receiver’ are used but have the same meaning. Suggest beginning the requirements with the following text “Instances where....”  <b>Response: R3, Parts 3.2 and 3.3 have been eliminated in draft 6.</b></p> <p>(7) General Measures - there is lack of guidance with respect to both who the documentation is to be provided, and when. For example, periodically, upon request, etc.  <b>Response: The OPCPSDT has made extensive changes to the draft 6 standard that required full changes to the Measurements.</b></p> <p>(8) M1 and M3 - ‘ / ’ should be placed between the words ‘and’ and ‘or’.  <b>Response: The OPCPSDT has made extensive changes to the draft 6 standard that required full changes to the Measurements.</b></p> <p>(9) Section D, Compliance, 1.1 - the paraphrased definition of ‘Compliance Enforcement Authority’ from the Rules of Procedure is not the standard language for this section. Is there a reason that the standard CEA language is not being used?  <b>Response: The OPCPSDT is using the ERO’s standard Compliance language provided by the NERC legal department.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>ACES Standards Collaborators</p>	<p>(1) The sub-parts of the protocols have grammatical errors, where the sub-parts do not correlate to the lead-in sentence. We recommend replacing the phrase “Require the recipient/receiver...” that is stated in sub-parts 1.6, 1.8, 3.2 and 3.3 with “Instances in which the recipient/receiver is required to...” in order to maintain consistency throughout the standard. Leaving these sections as mandates (verb phrases) could confuse auditors into thinking that these are zero defect requirements.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT has modified the standard to address your concern.</b></p>	

Organization	Question 4 Comment
Exelon	<p>1) In the COM-003 FAQ document the response to question 5 states that R3 and R4 apply to the “recipient of the command” where the recipient is “expected to act, to change or preserve the state, status, output, or Element of the [BES] of Facility of the [BES]. In many Registered Entity organizations, the commands from a TOP, BA or an RC typically go through an intermediary dispatch control center. Then, if necessary, the commands are passed through to the associated DP or GOP. How does COM-003 apply to such organizations with respect to R3 and R4?</p> <p><b>Response: The OPCPSDT has substantially altered the standard making it “results” oriented and directly tying it to reliability. The draft 6 approach addresses some of the commenters concern, but sustains the applicability of the DP and GOP that will receive “Operating Instructions” because they can and do have the potential for impacting reliability on the BES.</b></p> <p>2) In the COM-003 FAQ document the response to question 3 states that entities “develop their own programs that support the requirements of COM-003.” Suggest that the SDT clarify that recorded lines are not specifically required and that other tools such as documented direct supervisory observation could be used.</p> <p><b>Response: That discretion is contained in COM-003-1, D. Compliance: 1.2 Data Retention.</b></p> <p>3) In R3 and R4 the term ‘operators’ is used, in generation stations this term is widely used and relates to different job functions. Suggest clarifying the term by stating ‘operators who receive Operating Instructions or Reliability Directives from a Balancing Authority, Reliability Coordinator or Transmission Operator’.</p> <p><b>Response: The OPCPSDT has substantially altered the standard making it “results” oriented and directly tying it to reliability. The draft 6 approach addresses does not refer to “operators”.</b></p> <p>4) The COM-003 language that includes ‘reliability directives’ has the potential to create a compliance issue with COM-002 related to “all calls” since some Transmission Operations use ‘all calls’ or ‘one way burst messaging’ to communicate reliability directives. These communication methods typically do not allow for a response or repeat back or for an acknowledgement of the response accuracy. The problems with COM-002 cannot be solved by making edits to COM-003. Instead, changes to COM-002 should be made to clarify that "all calls" or burst messaging systems can be used to deliver Reliability Directives.</p> <p><b>Response: The OPCPSDT agrees with your comments and has elected to remove “all calls” from the standard.</b></p>

Organization	Question 4 Comment
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Western Small Entity Comment Group</p>	<p>1) R3 (formerly R2) apparently now applies to all of DP’s or GO’s operating communication expectations, and not just to Operating Instructions or Reliability Directives. We fail to see what Reliability objective is accomplished by entities presenting all their communication protocols for audit, when the only real reliability concern is if the entity responds appropriately to an Operating Instruction or Reliability Directive. Although 3.1, 3.2, and 3.3 deal only with Operating Instructions and Reliability Directives, R3 itself does not share this limitation.</p> <p><b>Response: The OPCPSDT has substantially altered the standard making it “results” oriented and directly tying it to reliability. The proposed draft 6 approach addresses the commenters concern, but sustains the applicability of the DP and GOP because they can and do have the potential for impacting reliability on the BES. COM-003-1, R3, draft 6 does limit the DPs and GOPs to “Operating Instructions.”</b></p> <p>2) We also note that by removing the “in a manner that identifies, assesses and corrects deficiencies” language, R3 becomes a zero defect requirement and an entity becomes subject to sanction for a single failure to implement the developed protocol. We don’t believe this was the SDT’s intent, but this was the effect of moving the language to R4. R4 is simply an additional separate requirement an entity must comply with. Taken together, we believe most auditors would look first to find failures to implement procedure under R3. If any failure was found, they would assign a violation and move on to R4 to look for evidence of corrective action following the occurrence. If none were found, a second violation would be assigned.</p> <p><b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding communication related events that would generate a Reliability Directive. The SDT has modified the standard to address your concern. Draft 6 does not address or reference internal controls in its requirements.</b></p> <p>3) We suggest: “R3. Each Distribution Provider and Generator Operator shall develop and implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols that outline the communications expectations for receipt of Operating Instructions and Reliability Directives by its operators,” and that R4 be removed.</p> <p><b>Response: Draft 6 eliminates R2 and R4 “assess and correct” language and ties performance to avoiding</b></p>

Organization	Question 4 Comment
	<p>communication related events that would generate a Reliability Directive. The SDT has modified the standard to address your concern. Draft 6 does not address or reference internal controls in its requirements.</p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>City of Garland</p>	<p>1)COM-003 now includes “Reliability Directives” which is why COM-002-3 was developed and approved - COM-002-3 does not need to exist if Reliability Directives are covered in COM-003</p> <p><b>Response: The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of Requirement R1.</b></p> <p>2) In the Background Section of the "Unofficial Comment Form", it is stated that the final goal of this standard was to implement 3 part communication. It would seem that it would be simple to state in a requirement that the entity has to develop a procedure to use 3 part communications for Operating Instructions using English except where prohibited by law or regulation and then a 2nd requirement to develop an assessment process with a corrective process if necessary. It is totally unnecessary to write a requirement with 9 sub parts that must be accounted for in a policy and procedure for an industry wide practice that already exists. As written, it only add burdensome and unnecessary paperwork to operations and compliance departments that has to be maintained and audited - again for a process that already exists industry wide.</p> <p><b>Response: The OPCPSDT has reduced the number to five parts, eliminating the all call parts. The OPCPSDT believes the remaining parts are proven protocols that will prevent misunderstandings that could result in a compromised BES.</b></p> <p>3) Why is the Time Horizon stated as "Long Term Planning" instead of "Real-Time"</p> <p><b>Response: Requirements R2 and R3 are now Real Time – Time Horizons.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Oklahoma Gas &amp; Electric</p>	<p>o We believe that this proposed Standard (COM-003-1) meets the intent of Paragraph 81 of the FERC Order which notes that reliability standards that provide little protection to the reliable operations of the BES are redundant or unnecessary. Although blackout occurrences in the past points to communication issues, we believe it is not related to miscommunication. Instead, we believe it is due to lack of</p>

Organization	Question 4 Comment
	<p>communication and communicating information that was incorrect to begin with.</p> <p><b>Response: The OPCPSDT believes COM-003-1 addresses the recommendations in the 2003 Blackout Report and FERC Order 693.</b></p> <p>o In the Consideration of Comments from the Feb 14-15 conference, the SDT said “The OPCPSDT maintains its position that three-part communication be addressed in documented communication protocols, where applicable.” OG&amp;E believes that while the opinions of the members of SDT are important, the SDT itself should not maintain a “position” as such. Rather, the SDT should attempt to merge direction from FERC with the comments from industry instead of rejecting industry comments out of hand. Per the Standards Process Manual (pg.9), the roles of drafting teams are:</p> <ul style="list-style-type: none"> <li>o Drafts proposed language for the Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> <li>o Solicits, considers, and responds to comments related to the specific Reliability Standards development project.</li> <li>o Participates in industry forums to help build consensus on the draft Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> <li>o Assists in developing the documentation used to obtain governmental approval of the Reliability Standards, definitions, Variances, and/or Interpretations and associated implementation plans.</li> </ul> <p><b>Response: The current draft reflects a culmination of responses to industry’s concerns, which the OPCPSDT, also made up of industry experts, has given careful consideration to in order to balance the direction from FERC with the concerns of the majority of the industry.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Florida Municipal Power Agency</p>	<p>As commented on several times previously, FMPA will not vote Affirmative (or recommend an Affirmative vote) until the inconsistencies of COM-003-1 and COM-002-3 concerning Reliability Directives are resolved. For a Reliability Directive delivered by an “All Call”, COM-003-1 does not require three part communication whereas COM-002-3 does. This inconsistency will only be a source of confusion during the very time when rapid response to communication is needed, which causes us to be concerned for reliability. FMPA continues to recommend retiring COM-002-3 as part of the implementation plan of COM-003-1 and fails to see a good reason not to do so. All that would need to be done is to retain the definition of Reliability</p>

Organization	Question 4 Comment
	Directive and include R1 of COM-002-3 into COM-003-1, and a slight modification to 1.5 of COM-003-1 to require confirmation of a Reliability Directive.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of Requirement R1.</b></p>	
NIPSCO	As per the effort of paragraph 81, we feel that COM-002 and COM-003 should be combined into one standard. It is evident there is redundancy between these two standards which should be eliminated.
<p><b>Response: The OPCPSDT thanks you for your comments. Based on other feedback, the OPCPSDT has chosen not to combine the two standards. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
CenterPoint Energy Houston Electric L.L.C.	<p>CenterPoint Energy appreciates the opportunity to comment. The Company recognizes the work of the SDT however CenterPoint Energy still has large concerns with Draft 5. Specifically:</p> <ol style="list-style-type: none"> <li>1) The addition of the term “Reliability Directive” to COM-003-1.</li> <li>2) R1.9 coordination with other entities.</li> <li>3) The addition of specifying the alpha-numeric format in R1.4.</li> <li>4) The VSL’s.</li> </ol> <p>1) The addition of the term “Reliability Directive” to COM-003-1 introduces a potential conflict with the already industry and NERC BOD approved COM-002-3. Requirements R1.7 of the current draft of COM-003-1 states: “Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.” (emphasis added) Requirements R1.8 and R3.3 of the current draft of COM-003-1 allow the recipient of a Reliability Directive from a one way burst messaging system communication to “...request clarification from the issuer if the communication is not understood.” (emphasis added) COM-002-3 makes no such distinctions regarding the issuing or receiving of Reliability Directives. COM-002-3 is clear; whether an entity is issuing or receiving a Reliability Directive 3-part communication must be employed. The Company firmly believes this conflict could easily cause entities to follow COM-003-1 yet be non-compliant with COM-002-3. In addition, since COM-002-3 already addresses emergency communications and has been reviewed and</p>

Organization	Question 4 Comment
	<p>approved by industry stakeholders as well as the NERC BOD CenterPoint Energy believes there is no additional reliability benefit to adding “Reliability Directive” to COM-003-1. CenterPoint Energy strongly recommends deleting “Reliability Directive” from COM-003-1.</p> <p><b>Response: The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of Requirement R1.</b></p> <p>2) CenterPoint Energy has strong concerns regarding the addition of R1.9 to Draft 5 of COM-003-1. R1.9 requires that an entity’s documented communication protocols address coordination with affected RC’s, BA’s, TOP’s, DP’s, and GOP’s communication protocols. For responsible entities that have interconnections with multiple entities, this will be the equivalent of “herding cats”. The Company does not believe it will be possible to coordinate with and come to a common agreement regarding the items in R1.1 - R1.8 with multiple parties. For example: R1.4 requires the documented communication protocols to address the format to be used when alpha-numeric clarifiers are necessary. Where a responsible entity is a TOP and is interconnected with multiple other TOP’s, DP’s, GOP’s as well as its RC, and BA, it will be extremely difficult for all parties to agree to a common alpha-numeric format. In addition, coordination will become an issue when any of the parties decide to revise or amend its communication protocols. This will be an on-going management issue for all entities. CenterPoint Energy strongly recommends R1.9 be deleted from COM-003-1.</p> <p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. There were many comments supporting this decision because it promoted uniformity and relieved the DPs and GOPs from developing their own distinct protocols. Requirement 1 Part 1.9 has been eliminated from draft 6.</b></p> <p>3) CenterPoint Energy believes the addition to R1.4 requiring a responsible entity to specify the format to be used where alpha-numeric clarifiers are necessary is an unnecessary and burdensome requirement. The Company agrees with the SDT’s decision to add to R1 and R3 language that allows an entity to address, where applicable, the items in the sub-requirements instead of requiring these items to be in the communication protocols as it was in Draft 4. However, the addition of specifying the format for those clarifiers is a step backwards. Draft 4 did not require documenting a specific format and therefore would have allowed an entity the flexibility to use, for example, “Baker” or “Bravo” for the letter “B”. The Draft 5 version now sets up an operator for a possible violation if the protocol specifies “Baker” and the operator inadvertently uses “Bravo”. The purpose of using alpha-numeric clarifiers is to ensure the recipient</p>

Organization	Question 4 Comment
	<p>understands that the alpha component, in this case, is the letter “B” and not “E” or “D”. The use of “Baker” or “Bravo” accomplishes that purpose. The Company believes having to specify a format to use does not result in any reliability benefit and therefore CenterPoint Energy strongly recommends the deletion of the format requirement from R1.4.</p> <p><b>Response: The OPCPSDT believes an entity can resolve the concerns you cite by including them in their documented communication protocols.</b></p> <p>4) CenterPoint Energy firmly believes there should be no High or Severe VSL for simply failing to document a process, policy, or procedure. High or Severe VSL’s should only apply to the most egregious violations that have a high impact on the reliability of the BES. As NERC has stated on many occasions, the purpose of the Reliability Standards is to enhance the reliable operation of the BES. Where an entity is performing the process, procedure, or task required in an applicable Standard and therefore is reliably operating its portion of the BES, yet has failed to document that process, procedure, or task, penalizing that entity with a High or Severe VSL will not result in improved reliable operation of the BES. CenterPoint Energy recommends no VSL’s higher than Moderate.</p> <p><b>Response: The OPCPSDT believes that if an entity completely fails to develop and implement communication protocols, it is an egregious violation and warrants a High or Severe VSL.</b></p> <p>CenterPoint Energy supported Draft 4 of COM-003-1 however, the changes made by the SDT in Draft 5 has caused the Company to rethink its position. If the SDT were to make the recommended changes CenterPoint Energy would be able to support the Standard.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
Clark Public Utilities	<p>Clark Public Utilities is concerned about the conflict between COM-002 and COM-003 regarding responses to Reliability Directives. In the case of a one-way burst messaging used to issue a Reliability Directive, COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3-way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst messaging Reliability Directive as the requirements indicate in COM-003. In order to be fully compliant with BOTH standards, the receiver would have to contact the issuer, repeat</p>

Organization	Question 4 Comment
	<p>what was said on the original burst message, then the issuer would confirm that the response was accurate before acting on the message. Clark appreciates the responsiveness of the OPCPSDT in quickly posting an FAQ once the COM-002/COM-003 issue was raised. The opinion of the OPCPSDT notwithstanding, Clark is not reassured by the secondary documentation cited in the FAQ when the plain language of the two Standards are in conflict. A simple solution would be to eliminate the words "Reliability Directive" from COM-003, which after all is designed to address "Operating Instructions."</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT agrees and has removed the term “Reliability Directive” from the Parts of Requirement R1.</b></p>	
<p>Pacific Gas and Electric Company</p>	<p>Draft 5 fails to address all of the communication gaps identified in the Standards Authorization Request (SAR), FERC Order 693 and the recommendations of the August 2003 Blackout Report. The draft as written does not require a consistent application of effective communications protocols but in turn requires each functional entity to develop their own protocols with insufficient guidance on how to achieve better consistency.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes it has addressed gaps identified in the Standards Authorization Request (SAR), FERC Order 693, and the recommendations of the August 2003 Blackout Report. Industry comment in the last five drafts has stated the opposite of your comment—requesting less prescriptive requirements. The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. There were many comments supporting this decision because it promoted uniformity and relieved the DPs and GOPs from developing their own distinct protocols.</b></p>	
<p>Edison Mission Marketing &amp; Trading</p>	<p>EMMT agrees with the concepts put forth in COM-003, but have some concerns, particularly with the proposed administrative burden associated with the Standard. EMMT offers the following comments:</p> <ol style="list-style-type: none"> <li>1. R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden.</li> </ol>

Organization	Question 4 Comment
	<p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. The reason for the change is based on other commenters’ recommendations to have the DP and GOP implement the protocols established by the directing RC, BA and TOP. There were many comments supporting this decision because it promoted uniformity and relieved the DPs and GOPs from developing their own distinct protocols.</b></p> <p>2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations, however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity’s internal compliance program.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>3. R4 raises the question of sufficiency of an entity’s corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the “problem” is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program.</p> <p><b>Response: The OPCPSDT eliminates R2 and R4 “assess and correct” language in Draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive. The OPCPSDT believes compliance will be uncomplicated and focused on stability on the BES.</b></p> <p>4. EMMT recommends that the language to M4 be changed as follows:</p> <p>M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following:</p> <ul style="list-style-type: none"> <li>• Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>• Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>• Documented annual training</li> </ul> <p>Examples of sufficient corrective action programs include, but are not</p>

Organization	Question 4 Comment
	<p>limited to, the following:</p> <ul style="list-style-type: none"> <li>• Documented refresher training</li> <li>• Documented meeting</li> <li>• Documented “hot box” communication</li> </ul> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is tagged with a Moderate violation, while the BA would receive a Lower.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>6. In the RSAW, the following passage should be expunged; “Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected.” Differentiating between slips of the tongue and “deficient communication practices” involves subjective judgments. The same is true for attempting to identify changes in an operator’s degree of understanding, especially when doing so through the numbing process of making before-and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Electric Reliability Council of Texas, Inc.</p>	<p>ERCOT recognizes and commends the drafting team’s efforts to respond to industry comments and is supportive of draft 5 of COM-003-1. It should be clear in the definition and the standard that electronic systematic interchanges are not Operating Instructions. Please consider modifying the last sentence of the definition for Operating Instructions as below: “Discussions of general information and of potential options</p>

Organization	Question 4 Comment
	<p>or alternatives to resolve BES operating concerns as well as electronic, system to system, interchanges are not commands and are not considered Operating Instructions.”</p> <p><b>Response: The OPCPSDT will keep the existing language in the definition of Operating Instructions. The language of the requirements and parts narrow the focus of COM-003-1 to voice communication.</b></p> <p>ERCOT ISO also maintains that the sub-requirements for R1 and R3 are not the “communication protocols” that FERC Order 693 and Blackout Recommendation #26 intended to be addressed as they are solely focused on “miscommunication”. However, ERCOT ISO believes that the structure of COM-003-1, in allowing an entity to address subrequirements through development of its own documented communication protocols and identification of the instances of needing to use such protocols, allows for future revisions to focus on the subrequirements, as needed, leaving the construct in place to easily add, modify, or delete such parts as necessary through such subsequent revisions. An example of such a revision is where IRO-014-1 R1 has a similar construct and was modified to include an additional subrequirement (R1.7) in version 2.</p> <p><b>Response: The OPCPSDT acknowledges your position but believes it has properly addressed the protocols as stated in FERC Order 693 and Blackout Recommendation #26.</b></p> <p>ERCOT believes that oral and written operator communication requirements should be in a single reliability standard and supports further refinement of the requirements and combining COM-002 and COM-003 into a single reliability standard.</p> <p><b>Response: Based on other feedback, the OPCPSDT has chosen not to combine the two standards. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>
	<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>
Georgia System Operations Corporation	GSOC recommends that only R1 and R3 survive; eliminate R2 and R4.
	<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
Georgia Transmission	If Requirements R3 and R4 are neither deleted nor reworded as suggested above, then changes should be

Organization	Question 4 Comment
Corporation	made in the standard to clearly define the term “operator” or disassociate the term from the DP function.
<p><b>Response: The OPCSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
Indiana Municipal Power Agency	<p>IMPA believes there is a conflict between COM-003-1 and COM-002-3 when it comes to how an entity replies back to an “All Call”. COM-003-1 does not require three part communication and it seems that COM-002-3 does require it. This creates confusion and needs to be corrected. IMPA supports the use of one communication standard to address proper communication protocols for Directives and Operating Instructions. This could be accomplished by retiring COM-002-3 upon the implementation of COM-003-1.</p>
<p><b>Response: The OPCSDT thanks you for your comments. The OPCSDT has removed all “all call” references from COM-003-1. Based on other feedback, the OPCSDT has chosen not to combine the two standards. The OPCSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
American Electric Power	<p>It needs to be acknowledged by the project team that there are overlapping requirements between COM-003-1 and COM-002-3. Although the project webpage states that “COM-003-1 establishes the practice of using communication protocols for all Operating Instructions”, COM-003-1 explicitly includes Reliability Directives along with the Operating Instructions. We understand Reliability Directives to be a subset of Operating Instructions, so with respect to Reliability Directives, there are unnecessary overlaps which will only cause confusion in adhering to the standard. In short, COM-003-1 should only be adopted with the understanding that the overlapping requirements in COM-002 would then be retired.</p> <p><b>Response: Based on other feedback, the OPCSDT has chosen not to combine the two standards. The OPCSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p> <p>AEP supports the forward-looking approach advocated by NERC’s Reliability Assurance Initiative. We believe this proposed standard puts “the cart before the horse” in that it mandates internal controls for a limited number of requirements rather than taking a wholistic approach where internal controls are generally required for all standards and where that language is housed outside of the standard itself.</p> <p><b>Response: The OPCSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>

Organization	Question 4 Comment
	<p>AEP believes this R 1.3 is redundant with TOP-002 R18. Other requirements in this proposed standard are already in place to drive clarity of communication.</p> <p><b>Response: The OPCPSDT believes that structured awareness of interfaced transmission assets by adjoined entities increases situational awareness, provides clear understanding and removes hesitation or doubt when issuing or receiving Operating Instructions.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
Luminant	<p>Luminant is generally supportive of the direction of this standard and agrees that requiring a documented communication protocol and monitoring processes is the correct approach for this standard. While we understand the need for the some Registered Entities (RE) to use a one-way burst messaging system to make mass communication quicker and easier the inclusion of Reliability Directive in R1.7, R1.8 and R3.3 creates a conflict COM-002-3 R2 and R3. By including Reliability Directives in R1.7, R1.8 and R3.3 which allows and electronic response or only one receipt to restate, the receiving REs will not be able to comply with COM-002-3 R2 that requires EACH recipient of a Reliability Directive to repeat, restate, rephrase or recapitulate the Reliability Directive. Removing Reliability Directive from those section would eliminate any confusion and conflict between COM-002-3 and COM-001-3 and allow COM-001-3 to be passed and implemented. Alternatively, COM-002-3 could be revised to CLEARLY STATE that it only applies to one-on-one verbal (or written?) communication.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
Occidental Energy Ventures Corp	<p>Occidental Energy Ventures Corp. (“OEV”) is firmly on board with the strategy taken by the drafting team to incorporate structure in the communication of Operating Instructions, while allowing each entity some flexibility in the process. As a GOP, we take very seriously our responsibility to accurately capture and execute all instructions from RCs, BAs, and TOPs that may affect the state of the Bulk Electric System. This approach will allow us to differentiate between instructions issued orally, via email/messaging, and one-to-many broadcasts - which change rapidly as new communications technologies are introduced. In addition, we agree that a risk-based compliance method is necessary - particularly in the case of oral communications. Even the most perfectly trained operators can stumble on occasion, and the result should not be a compliance violation unless the errors continue to manifest themselves. Furthermore, the amount</p>

Organization	Question 4 Comment
	<p>of overhead necessary to ensure that every oral instruction is repeated back with time stamps, equipment identifiers, and alpha-numeric clarifiers is extraordinary in the zero-defect model. However, we are not convinced that these excellent intentions are captured in a manner that will assure consistent assessments by Compliance Enforcement Authorities. It is clear from our reading of the FAQs recently posted by the drafting team that many industry respondents are unclear how auditors will interpret COM-003-1's requirements over a wide range of operating scenarios - a concern that we share. This means that a common understanding must be reached in an enforceable document that both operators and CEAs can rely on for consistency. In our view, the RSAW is the logical vehicle for this approach. It is a fundamental audit tool and has been traditionally used as a semi-binding reference in the evaluation of reliability compliance. In addition, the concurrent development of the RSAW with COM-003-1 was instituted precisely to ensure uniformity between the SDT's intent and the standard's enforcement. This implies that the RSAW must contain a greater level of detail to address multiple situations - and we have provided specific suggestions in our RSAW feedback form along these lines.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>Lastly, we do not have a clear understanding how Requirement R1.9 will be implemented. As it is presently written, it would seem that GOPs should expect some notification from their RCs, BAs, and TOPs that communication policies are to be "coordinated." Our experience has been that some entities simply post instructions on their web-sites hidden among many other documents - which does not count as coordination in our view. However, we are not sure that the issuers' policies are consistent with all of R1's other sub-requirements. As such, OEVC recommends that R1.9 be removed.</p> <p><b>Response: The OPCPSDT agrees and has changed the wording of R1, to eliminate Part 1.9.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>SPP Standards Review Group</p>	<p>Our comments are listed with the specific question they address.</p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>San Diego Gas &amp; Electric</p>	<p>Please see comments: NEW NERC RELIABILITY STANDARD - COM-003-1 - Version 5 Version 5 comments R1.1 and R3.1 Proposed</p>

Organization	Question 4 Comment
	<p>Updated Language:</p> <p>Use of English language when issuing or responding to an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation, or as otherwise agreed to by the parties.</p> <p>Comment: The Western Interconnection is interconnected with Mexico, south of the California, Arizona and New Mexico borders and with Canadian provinces north of the Washington, Idaho and Montana borders. SDG&amp;E, which is located at the California-Mexico border, communicates almost daily with the Mexico utility located in Baja California, CFE. When the standards became mandatory and enforceable, in compliance with COM-001, R4, SDG&amp;E maintained an agreement with CFE which documents that English will typically be used, but in instances where communicating in Spanish is more effective in ensuring system reliability, the personnel involved will use Spanish given that all parties involved are fluent in Spanish. CFE does not have a mandate to be in compliance with the U.S. NERC Reliability Standards. The native language in Mexico is Spanish, and SDG&amp;E staffs its Electric Grid Operations department with personnel who are fluent in Spanish, therefore its agreement with CFE is managed to insure that all communications with its neighbor to the south are clear, concise, and understood. In addition, there are at least two generation stations located south of the California border, interconnected with SDG&amp;E, and the employees at those stations are fluent in Spanish, therefore, because those generation station personnel will also communicate with the California ISO and the WECC RC on occasion, those entities need the flexibility provided in COM-001 R4 to be carried through to COM-003-1, R1.1. &amp; R3.1. All policies and procedures developed by power company entities south of the border are written in Spanish, and at times, written communication between U.S. and entities in Mexico are in Spanish. Since SDG&amp;E's neighbors to the south do not have to comply with U.S. NERC Reliability Standards, and U.S. entities are required to comply with U.S. NERC Reliability Standards, SDG&amp;E proposes the revisions to COM-003-1 R1.1 and R3.1 as identified above. This proposed revision provides for the flexibility that already exists in COM-001 R4 that has effectively worked over the last several years.</p> <p><b>Response: The OPCPSDT developed the standard in a manner to permit the RC to direct the development of the protocols within the RC control area. It is important for clarity that a singular language be used for BES operating commands. Risk of miscommunication increases when multiple languages are permitted.</b></p> <p>R1.2 Proposed Updated Language: Instances that require time identification when issuing an oral or written Operating Instruction or Reliability Directive, and the format for the time identification specified uses a 24-</p>

Organization	Question 4 Comment
	<p>hour clock format and the Entity’s time zone.</p> <p>Comment: SDG&amp;E prefers the language proposed above. The proposed language leaves NO doubt associated with how to reference a specific time for ALL entities. If one entity uses the 24 hour clock, and another is using a.m. and p.m., it simply leaves the opportunity for some confusion that can be eloquently avoided when stating that a 24 hour clock is to be used.</p> <p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Oncor Electric Delivery Company LLC</p>	<p>R1.9 states that entities will address “Coordination with affected Reliability Coordinators’, Balancing Authorities’, Transmission Operators’, Distribution Providers’, and Generator Operators’ communication protocols.” Coordination with these entities in the ERCOT market will become cumbersome. Is it the SDT’s intent to ensure all communication protocols are coordinated with multiple entities that a Transmission Operator communicates with, including the RC, BA, other TOs, GOPs, and DPs? Oncor is unclear how an entity with multiple registrations would communicate with itself in different functions. Would this require an entity with multiple registration functions to designate personnel by functional entity and in turn, personnel would have to identify which functional entity each person they interface with? It is impractical and inefficient to require Entities to re-organize all personnel which would foster an inefficient structure and could potentially lead teams to not communicate effectively. In addition, this could have a negative impact on communications between companies. For example, in the ERCOT region, there are approximately 15 local control centers and ERCOT who are all registered as TOPs. One might interpret communications between neighboring TOPs or ERCOT and one of the local control centers are not subject to the requirements of COM-003-1 since these are TOP to TOP communications. We strongly recommend the SDT review this to greatly simplify COM-003-1. Potential alternative to the current language would be “require entities to implement, in a manner ..., protocols that include three-part communication for Operating Instructions” and eliminate the reference to Functional Entity.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. The reason for the change is based on other commenters’ recommendations to have the DP and GOP implement the protocols established by the directing RC, BA and TOP. There</b></p>	

Organization	Question 4 Comment
<p>were many comments supporting this decision because it promoted uniformity and relieved the DPs and GOPs from developing their own distinct protocols. The goal is to establish a high degree of communication uniformity within the RC operating area.</p>	
<p>Salt River Project</p>	<p>R4 should be eliminated and R3 should end after the first sentence. GOs do not issue Operating Instructions. They only receive instructions from others. GOs should have a communications procedure as part of their operations. However, the methods used are properly business decisions made by the GO. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an internal compliance program.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT eliminates R2 and R4 “assess and correct” language in draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive. The OPCPSDT believes it has properly narrowed the GOPs and DPs roles to those who will only receive Operating Instructions.</b></p>	
<p>SERC OC Standards Review Group</p>	<p>Regarding question #1, the SERC OC Review Group agrees with the definition of Operating Instruction. While we also can agree to the changes made to R1, we feel R3 in its entirety is unnecessary and duplicative. Removal of the word “develop” would eliminate double-jeopardy concerns. R3 could be acceptable if “develop and” are omitted and “as developed in R1” is inserted after “protocols” and before “that.” It should be noted that this suggestion only applies to the sub-requirements in R1 that correspond to the proposed sub-requirements in R3. Regarding question #2, R2 is acceptable and R4, as stated above for R3, is unnecessary and duplicative. Regarding question #3, we agree with the VRFs and VSLs for R1 and R2. Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed. Additional SERC OC Standards Review Group supporting these comments are James Wood with Southern Company and Kelly Casteel with TVA. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT eliminates R2 and R4 “assess and correct” language in draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>

Based on our previous comments, we do not agree with the need for R3 and R4, and therefore VRFs and VSLs for these requirements are not needed.</p> <p><b>The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.1.</b> R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden.</p> <p><b>Response: The OPCPSDT has changed the coordination requirement in draft 6 by eliminating requirement 1, Part 1.9 and changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC. The reason for the change is based on other commenters’ recommendations to have the DP and GOP implement the protocols established by the directing RC, BA and TOP. There were many comments supporting this decision because it promoted uniformity and relieved the DPs and GOPs from developing their own distinct protocols.</b></p> <p>2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations,</p>

Organization	Question 4 Comment
	<p>however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity’s internal compliance program.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>3. R4 raises the question of sufficiency of an entities corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the “problem” is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program.</p> <p><b>Response: The OPCPSDT eliminates R2 and R4 “assess and correct” language in draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p> <p>4. The SRT recommends that the language to M4 be changed as follows:</p> <p>M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following:</p> <ul style="list-style-type: none"> <li>• Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>• Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>• Documented annual training             <ul style="list-style-type: none"> <li>○ Examples of sufficient corrective action programs include, but are not limited to, the following:                 <ul style="list-style-type: none"> <li>▪ Documented refresher training</li> <li>▪ Documented meeting</li> <li>▪ Documented “hot box” communication</li> </ul> </li> </ul> </li> </ul> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is</p>

Organization	Question 4 Comment
	<p>tagged with a Moderate violation, while the BA would receive a Lower.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>6. In the RSAW, the following passage should be expunged; “Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected.” Differentiating between slips of the tongue and “deficient communication practices” involves subjective judgments. The same is true for attempting to identify changes in an operator’s degree of understanding, especially when doing so through the numbing process of making before-and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
<p>NERC</p>	<p>Requirement (R1.5) provides inadequate protection against a misunderstanding when directives are issued. Granted, the Requirement does obligate the party receiving the directive to repeat back the directive. However, if the recipient repeats the directive back to the person issuing the directive, and the "repeat back" indicates the recipient has misunderstood the directive, this Requirement merely obligates the person issuing the directive to state the directive again. The Requirement places no obligation on the person issuing the directive, who knows he has been misunderstood, to explicitly and clearly bring to the attention of the recipient that the recipient has misunderstood. All the party issuing the directive has to do is repeat what he has already said. The party issuing the directive is under no obligation to make it clear that there has been a misunderstanding. With respect, I suggest having the person issuing the directive merely repeat it if he's been misunderstood, with no explicit statement that there has been a mistake, leaves open the potential for the recipient to be unaware he has misunderstood and to execute a misunderstood directive.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
<p>American Transmission</p>	<p>Requirement 1.9 requires “Coordination with affected Reliability Coordinators’, Balancing Authorities’,</p>

Organization	Question 4 Comment
Company	<p>Transmission Operators’, Distribution Providers’, and Generator Operators’ communication protocols.” This requirement seems unnecessary since the requirements of COM-3-1 apply to all these entities. If everyone is adhering to the requirements of COM-3-1 then the need for coordination is redundant as it becomes automatic. If individual entities adopt slight nuances to this requirement, or are more restrictive than the requirement then coordination between every entity becomes extremely difficult.</p>
<p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p>	
<p>Northeast Power Coordinating Council</p>	<p>Requirement 3 is an administrative requirement that does little to benefit the reliable operation of the BES.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>By specifically calling out “Directives” in the requirement it creates the potential for double jeopardy with other requirements such as COM-002, IRO-001 and TOP-001 which all speak to following Directives.</p> <p><b>Response: The OPCPSDT believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p> <p>Requiring a documented communications protocol when the only responsibility is repeat back the instruction as received and seek clarification if the directive is misunderstood is beyond the intended scope of the reliability program in general. This requirement should be removed.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>Requirement 4 should be removed because it is unnecessary and excessive. The smaller entities that this will affect do not record phone conversations and it would be difficult to assess performance based on the very low number of “Operating Instructions” or “Directives” that these entities actually receive. The performance of “Operating Instructions” should be the proof. A better approach would be to amend the above mentioned standards (IRO, TOP, COM) to include “Operating Instructions” along with Directives.</p> <p><b>Response: The OPCPSDT eliminates R2 and R4 “assess and correct” language in draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive. Operating Instructions.</b></p> <p>The term “All Call” is used in Requirement 1 Part 1.8. It should be defined in the NERC Glossary. If it isn’t to</p>

Organization	Question 4 Comment
	<p>be defined, then it should not be capitalized. Regarding Requirement 1 Part 1.8, and Requirement 3 Part 3.3, the receiver of an oral Operating Instruction or Reliability Directive from a one-way burst messaging system is “to request clarification from the issuer is the communication is not understood.” What if the receiver never gets the issued Operating Instruction or Reliability Directive? Regarding Requirement 1 Part 1.8, and Requirement 3 Part 3.3, suggest changing “using” to “from” to make them read “Require the receiver of an Oral Operating Instruction or Reliability Directive from a one-way burst...”</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Seattle City Light</p>	<p>Seattle City Light is concerned about the conflict between COM-002 and COM-003 regarding responses to Reliability Directives. In the case of a one-way burst messaging used to issue a Reliability Directives, COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3-way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst messaging Reliability Directive as the requirements indicate in COM-003. In order to be fully compliant with BOTH standards, the receiver would have to contact the issuer, repeat what was said on the original burst message, then the issuer would confirm that the response was accurate before acting on the message.</p> <p>Seattle City Light appreciates the responsiveness of the OPCPSDT in quickly posting an FAQ once the COM-002/COM-003 issue was raised. The opinion of the OPCPSDT notwithstanding, Seattle is not reassured by the secondary documentation cited in the FAQ when the plain language of the two Standards are in conflict. Past experience, such as illustrated in the 2008 PacifiCorp case, shows that where Standards are unclear or in conflict, auditors have been prone to take the language at face value and disregard secondary documents. In addition, entities charged with implementing the Standards are prone to change practices to avoid ambiguous areas and compliance risk, which in this case could result in the phase-out of effective all-call or burst messaging systems for announcing reliability Directives. As a result, Seattle is sufficiently concerned about the audit and reliability implications created by the present draft of COM-003 to change from a YES position to NO at this time.</p> <p>Seattle is prepared to support COM-003 once this conflict is addressed. A simple solution would be to eliminate the words "Reliability Directive" from COM-003, which after all is designed to address "Operating</p>

Organization	Question 4 Comment
	<p>Instructions."Inclusion of Reliability Directive language in COM-003 creates an additional complication, by making R1.8 incomplete. R1.8 require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. This language does not address the next step: if an entity receives a burst message from its RC that is unclear, and is unable to reach the RC for clarification (perhaps because the RC is busy handling the emergency situation), what is the entity to do? Implement to Reliability Directive to its best understanding? Wait until it can clarify the Directive? Do nothing? Serious reliability and compliance risks attend all of these possibilities, and the Standard should be clear as to which is preferred. Seattle again recommends removing "Reliability Directive" language from COM-003 as a simple solution. If the Reliability Directive language remains in COM-003, this potentiality should be addressed in the Standard as to which approach is preferred.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
NIPSCO	See comments submitted on NIPSCO's behalf by Julaine Dyke

Generation; Southern Company Generation and Energy Marketing	
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
CPS Energy	Separate the Distribution Provider (DP) and Generator Operator (GOP) COM requirements into a separate standard.
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes keeping the applicable entities in the same standard is more efficient.</b></p>	
SMUD/Balancing Authority of Northern California	<p>SMUD would like to thank the Drafting Team for their efforts. While we agree with the intent of COM-003 we would like the Drafting Team to provide input on a possible conflict between the Board approved COM-002-3 Requirement and Draft #5 of COM-003-1 Requirements R1, Part 1.7 &amp; R3, Part 3.3. It appears that a “One-way” burst messaging that includes either oral or electronic Operating Instructions or Reliability Directives as depicted in the current COM-003 does not require practice of 3-way communication prior to taking action. Since COM-002 Requirement R2 specifies that the recipient “shall repeat, restate, rephrase, or recapitulate the Reliability Directive” it is unclear whether or not the receiving parties of a blast message adhering to the COM-003 Standards would be in compliance with COM-002 requirement R2.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
Tacoma Power	<p>Tacoma Power believes the Standard Drafting Team made Draft 5 overly complex and confusing for the System Operators and Operators to use. The Drafting Team needs to go back to the basics. The standard should apply to all, BA, TO, RC, GO and DPs alike.</p> <ol style="list-style-type: none"> <li>1. Require all parties to develop Communication Protocols, train their operating personnel to use them, review their protocols annually and make improvements if necessary.</li> <li>2. Require all parties to use “3-part communication” and forget the “oral two-party, person-to-person Operating Instruction” that has different requirements for GO and DP. All responsible entities should have the same requirements. The proposed Standard as written allows for the Instruction to be repeated back “if requested” by the issuer. This exception creates a “compliance” trap for the people communicating -</li> </ol>

Organization	Question 4 Comment
	<p>remove it.</p> <p>BASIC 3-PART COMMUNICATION should include:</p> <ul style="list-style-type: none"> <li>* A System Operator or Operator shall issue an Operating Instruction</li> <li>* The person receiving the Operating Instruction shall repeat it back to the issuer, and/or request clarification if needed* The System Operator or Operator will acknowledge as correct and/or discuss clarifications as needed and agree on the final instruction.</li> </ul> <p>3. We are not sure why “address nomenclature for Transmission interface Elements and Transmission interface Facilities” has replaced the term “common line identifiers.” Entities should coordinate their communication protocols with the other Entities that they commonly communicate with and agree on:</p> <ul style="list-style-type: none"> <li>* Nomenclature for Lines and equipment</li> <li>* A common system for Alpha Numeric clarifiers</li> <li>* Use 24-hour clock and identify the time, time-zone and if day-light savings or standard time is in effect.</li> </ul> <p>System Operators and Operators are too busy to be put in the position of trying to maintain compliance with a standard that is so convoluted and confusing as to become a potential violation. Tacoma Power supports the original premise of the proposed COM-003 and the concept to separate the technical communication equipment requirements from communication protocol requirements but the drafting team has gone too far away from the intent of the standard by trying to make exceptions for too many different issues when they do not need to. Get back to the basics, i.e. Draft 2.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
Texas Reliability Entity	<p>Texas RE voted "no" on this draft for reasons expressed in our comments submitted on prior drafts. In particular, we are concerned about lack of coordination between COM-003 and COM-002.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
Western Electricity Coordinating Council	<p>The apparent conflict beteen COM-002-3 and COM-003-1 needs to be addressed. The information provided in the Frequently Asked Questions document was helpful but it is not clear that a drafting team response to</p>

Organization	Question 4 Comment
	<p>a frequently asked question can alter what is required in another standard. It s not clear that developping a communcations protocol that says three-part communcation is not necessary for a one-way burst message is going to relieve a BA, RC, or TOP from the requirement to use three-part communcations for all Reliability Directives. If the position is that thre-part communcaiton is not required for one-way burst messages, this exception should be included in COM-002-3.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
<p>Santee Cooper</p>	<p>The latest version of COM-003 introduces a potential conflict with COM-002 related to use of one-way burst messaging systems to issue a Reliability Directive. COM-002 does not allow for only those responses required in COM-003 but instead requires a full 3 way communication from all parties. This potentially sets up both the issuer and receiver for violating COM-002 if they respond to a one-way burst messaging RD as the requirements indicate in COM-003.</p> <p>In COM-003, the follow Requirements are included:</p> <p>R1.7 Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.</p> <p>R1.8 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.</p> <p>R3.3 Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood.</p> <p>In other words, COM-003 allows one-way burst messaging to be used for Reliability Directives and prescribes:</p> <ul style="list-style-type: none"> <li>o issuer to confirm receipt from at least one receiving party</li> </ul>

Organization	Question 4 Comment
	o receiver to request clarification from the issuer if the communication is not understood
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
MRO NSRF	<p>The NSRF recommends the following issues be addressed in order to provide a less ambiguous Requirement.</p> <p>Regarding R1 and the term; ‘implement’. The “Blue Box” explanation is not carried forward when the standard is filed with the Commission. The “Blue Box” explanation greatly expands the meaning “and implement”. Our understanding of ‘implement’ is that you will use the documented communication protocols in the manner outlined in your System Operator communications protocols. Training is not a demonstration of implementing. Only actual System Operator communications demonstrating the use of the communication protocols is demonstrating implementation. Recommend that “training” be removed from the blue text box since training is inherent to assuring that protocols are followed. The Training issue will also need to be removed from the RSAW.</p> <p><b>Response: The OPCPSDT has eliminated the blue box. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>Suggest R1.8 be removed. This requirement cannot be measured. How do you prove compliance? An entity will be asked to prove the negative and demonstrate that my System Operators were not confused? I can see where I might have to provide an attestation that states: “My System Operators were not confused on any one-way burst messages.” This proposed requirement is a common sense issue.</p> <p><b>Response: The OPCPSDT has removed R1.8.</b></p> <p>R1.9, R3.3: the word “coordination with affected” is vague and open to many interpretations. Suggest this requirement be deleted. Should the requirement be kept, suggest clarifying what is intended in the requirement. Such as “RC, TOP’s BA’s... shall share their communication protocols with applicable RC, BA, TOP, ... “ The NSRF does not understand if the intent is to share or coordinate protocols? Both have different outcomes, please clarify.</p> <p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p> <p>The NSRF believes that the infrequent communications to a Distribution Provider, that are not already in</p>

Organization	Question 4 Comment
	<p>scope of COM-002-3, do not carry any considerable risk to the BES. The administrative burden on the Distribution Provider should be greatly reduced, as there would not be a measurable gain in reliability by requiring them to formally document communication protocols and establish a monitoring program. To address these concerns, we recommend that Distribution Provider be removed from the applicability in R3 and R4. Secondly, we suggest that an R5 be created similarly to COM-002-3, R2. Recommend the following for how the new R5 might read:</p> <p>R5. Each Distribution Provider that is the recipient of an oral Operating Instruction, other than Reliability Directives, shall:</p> <p>5.1 Use the English language, unless another language is mandated by law or regulation.</p> <p>5.2 Repeat, restate, rephrase, or recapitulate the oral Operating Instruction, excluding oral Operating Instructions issued as a one-way burst message.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>Public Service Enterprise Group</p>	<p>The purpose statement needs to have “System Operators” limited to just those of RCs, TOPs, and BAs. The definition of “System Operators” in the NERC Glossary includes GOPs. The capitalizd language added to the Purpose statement below would clarify this:</p> <p>Purpose: To provide System Operators OF RELIABILITY COORDINATORS, TRANSMISSION OPERATORS, AND BALANCING AUTHORITIES predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT changed the language of the purpose statement to COM-003-1 to address the commenter’s concern.</b></p>	
<p>ISO/RTO Standards Review Committee</p>	<p>The SRC recognizes and commends the Drafting Team’s efforts to respond to Industry comments and to offer a revised pragmatic solution for this Project. The proposed changes do not create a common results-based standard that addresses let alone resolves any identified reliability problem. The SRC is concerned that the posting as proposed the standard creates a fill-in-the-blanks solution that could discourage a functional entity from employing anything more than a least common denominator solution.</p>

Organization	Question 4 Comment
	<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>Technically the definition and proposal are improvements and the SRC would agree with the proposed changes, if the definition and proposal were needed. The issue is with the need for this definition, and the continuing debate this definition is generating. The SRC is opposed to having this term defined and added to the NERC Glossary. The term operating instruction does not need to be defined. For years, system operators deal with operating instructions on a daily if not minute-to-minute basis. Having a defined term, and calling such communication as “Command” is unnecessary, and potentially could confuse operators from what they understand to be the meaning of operating instructions. While the SDT has found that their previous definitions were not appropriate for a NERC standard, and the subsequent incremental changes are useful, the debate itself does not seem to be a productive use of the SDT’s or the Industry’s time. The SRC would prefer that the objectives of the SAR (communications protocols) be handled through means other than a Standard (e.g. the Operating Committee’s Reliability Guidelines on Communications). The reason being, a standard requires zero-defect compliance, data retention, self-reporting, and requires these debates over the proposed terms such as “Operating instruction” which diverts the Industry, NERC and the Regional Entities from focusing on more productive reliability issues.</p> <p>The proposed RSAW wording must be more objective as the current test contains too many subjective requirements:</p> <p>Page 3</p> <ul style="list-style-type: none"> <li>o “... Identification of instances ...” - will this be viewed as identification of every instance or will one instance be sufficient?</li> <li>o “...when....necessary...” - who decides when there is a necessity? The auditor or the functional entity?</li> </ul> <p>Page 4</p> <ul style="list-style-type: none"> <li>o “...may include...” - this phraseology may be seen as meaning the listed following items are among the items that are required but are themselves insufficient to meet the requirement.</li> </ul> <p>Page 5</p> <ul style="list-style-type: none"> <li>o “...reviews of System Operator voice recordings...: - it should be made clear that the “review” is of the</li> </ul>

Organization	Question 4 Comment
	<p>sampled recordings used by the entity in its own self-assessments, and not a “review” of any voice recording.</p> <p>o “Where practicable” is subjective and inappropriate for a standard. To avoid confusion and misapplication of the standard, the RSAW should include a statement that messaging systems are not oral communication and not evaluated under the standard.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>North American Generator Forum Standards Review Team</p>	<p>The SRT agrees with the concepts put forth in COM-003, but have some concerns, particularly with the proposed administrative burden associated with the Standard. The SRT offers to following comments:</p> <ol style="list-style-type: none"> <li>1. R1.9 requires a TOP, BA, and RC to coordinate with affected RC, BA, TOP, DP and GOP communication protocols; this could result in a TOP having to coordinate with a hundred+ different entities' communications protocols. This coordination would not improve reliability, but only serve to create confusion and significant communication time delays in real-time operations. Both R1 and R4 create significant documentation and administrative burdens, without providing a comparable improvement to the reliability of the BES. As reliability based Standard, COM-003 should focus on those actions that would have a direct impact on reliability, while minimizing the administrative burden.</li> </ol> <p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p> <ol style="list-style-type: none"> <li>2. R3 should end after the first sentence. GOPs do not issue Operating Instructions. They only receive instructions from others. GOPs should have a communications procedure as part of their operations, however, the methods used are properly business decisions made by the GOP. The content, thoroughness and effectiveness of a communications plan are excellent items to consider when assessing an entity’s internal compliance program.</li> </ol> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <ol style="list-style-type: none"> <li>3. R4 raises the question of sufficiency of an entities corrective program. The RSAW requires the GO to turn over records of monitoring communications as well as records of corrective actions and then prove the</li> </ol>

Organization	Question 4 Comment
	<p>“problem” is not still in place. This standard could easily turn into a high-profile audit target due to the varying concepts of what does and does not constitute a sufficient corrective action program.</p> <p><b>Response: The OPCSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>4. The SRT recommends that the language to M4 be changed as follows:  M4. Each Distribution Provider and Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4. Examples of sufficient periodic assessment programs include, but are not limited to, the following:</p> <ul style="list-style-type: none"> <li>-Documented review of voice logs for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>-Documented personal monitoring of communications for a total of at least one hour per calendar year for each operator (does not need to be a single session)</li> <li>-Documented annual training Examples of sufficient corrective action programs include, but are not limited to, the following: <ul style="list-style-type: none"> <li>-Documented refresher training-Documented meeting-Documented “hot box” communication</li> </ul> </li> </ul> <p><b>Response: The OPCSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>5. The VSLs give a higher violation to a GOP than a BA for exactly the same error, even though the consequences with the BA are much greater. A GOP who fails to require 3-part responses when requested is tagged with a Moderate violation, while the BA would receive a Lower.</p> <p><b>Response: The OPCSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>6. In the RSAW, the following passage should be expunged; “Where practicable, verify that deficient communication practice was indeed corrected by reviewing evidence of Operator communications (such as voice recordings) occurring after the date of the corrective action to determine if deficient communication practice was corrected.” Differentiating between slips of the tongue and “deficient communication practices” involves subjective judgments. The same is true for attempting to identify changes in an operator’s degree of understanding, especially when doing so through the numbing process of making</p>

Organization	Question 4 Comment
	<p>before-and-after voice recording comparisons. This is an open-ended matter that could very quickly become an unreasonable compliance burden. RSAWs in general should not introduce new requirements, measures or forms of evidence, so the GOP materials reviewed should be limited to the protocols/procedures of R3, and the assessment forms and corrective action reports of R4.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>NYISO</p>	<p>The text presented in the blue box for Requirement 1 should be incorporated into Requirement #1. If the requirement needs to be explained at this point, we recommend clarifying it in the text. In addition, by using this definition we have now introduced a list of controls that we will be audited against.</p> <p><b>Response: The blue text box has been eliminated. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>The requirement should simply be to have a procedure. The controls assessment can be addressed during the future RAI process. The current draft provides for a fill in the blank framework that allows for an entity to define what is applicable for its communication protocol. A better approach would be to state that an entity may include items from the list provided that the entity identifies them as critical. Then the entity would only be required to show what is critical to its operations, rather than having to prove what is not critical.</p> <p><b>Response: The OPCPSDT eliminates R2 and R4 “assess and correct” language in draft 6 and ties performance to avoiding communication related events that would generate a Reliability Directive.</b></p> <p>The language in requirement 1.5 needs to be clarified. It is not clear on how an entity is required to ‘confirm’ the response was accurate. This could simply be a ‘2 part communication’, where once the receiving entity repeats the instruction, the initiator may move on if he deems it correct. Or does the confirmation need to be ‘confirmed’ with the receiving party as in ‘3 part communications’? If the requirement is meant to initiate 2 part communication, the requirement should say that. If the requirement is meant for ‘3 part communication,’ then we recommend utilizing the language from COM-002 R2 in place of Requirements 1.5 and 1.6.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your</b></p>

Organization	Question 4 Comment
	comments.
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
<p>PPL NERC Registered Affiliates</p>	<p>These comments are submitted on behalf of the following PPL Companies: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, on behalf of its NERC registered subsidiaries. The PPL Companies are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. The PPL Companies believe that the revised COM-003 standard represents an improvement over previous drafts. Nevertheless, we have one concern with the proposed standard and urge the Standard Drafting Team to add the following note to Requirements 1.7, 1.8, and 3.3 in the standard before it is submitted to NERC and FERC for their approval: Notwithstanding anything in COM-002, the requirements set forth in COM-003 Requirements R1.7, R1.8 and R3.3 shall govern the manner for responding to Reliability Directives that are issued through one-way burst messages (e.g., an All Call system).</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
<p>South Carolina Electric and Gas</p>	<p>This standard is becoming overly complicated. The reason this COM standard is being developed is to reduce the possibility of miscommunication of information when the BES is being altered. This proposed standard is an administrative burden. Operators will be fearful that they will cause a NERC Compliance Violation every time they communicate. Their focus will be on communicating compliantly and not on operating the BES. Consideration should be given to simplifying this standard.</p> <p>Below is an unrefined proposal for consideration:</p> <p>R1: Applicable REs shall have a procedure that requires its personnel (whether as a receiver or as an initiator) to use three-part communication when altering the state of the BES. Three-part communication is defined as when an initiator issues a command, the receiver repeats the command back, and the initiator confirms. Any misunderstandings are resolved during the repeat back. (3-part communication is the only proven way to mitigate miscommunication. If personnel use three way communication then all issues related to alpha-numeric clarifiers, time, etc should be resolved naturally during the repeat</p>

Organization	Question 4 Comment
	<p>back/confirmation. Additionally, this requires operators and field personnel to remember one thing: when changing the state of the BES they must use 3-part communication.)</p> <p>R2: Each calendar month REs required to comply with R1 shall assess a random sample of communications that occurred over the month to ensure that three-way communication was properly being utilized, when the BES was being altered. In instances where deficiencies are found, REs shall require remedial training to be completed by the individuals involved in the deficient communication. (Remedial training will act as a deterrent for those who get lazy about using three-part communication. Additionally, peers will be aware of who had to undergo remedial training, which will further act as deterrent. Requiring remedial training would be an incentive to using three-part communication properly)</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
MISO	<p>To avoid confusion and misapplication of the standard, the RSAW should include a statement that electronic messaging systems are not subject to compliance with this standard.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>	
Tennessee Valley Authority	<p>TVA Nuclear Power’s Human Performance program is driven by INPO and includes</p> <ol style="list-style-type: none"> <li>1) requirements for operations to use 3-way communication and the phonetic alphabet; and</li> <li>2) a documented assessment process via an established observation program with corrective actions. Any additional oversight process will contribute to distraction in the control room and promote overreliance on process and procedure with a “checklist mentality” rather than focus on potential impacts of the task being performed. If the RC, TOP, or BA specifically requests confirmation of a verbal communication (R1.6), our nuclear plant operators will respond accordingly as they are already expected to do. The use of “periodic assessment” in the measurements does not provide adequate guidance in the development of consistent, effective measures of compliance.</li> </ol>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p>	

Organization	Question 4 Comment
The United Illuminating Company	<p>UI as its functional role of DP is voting No because of the conflict between COM-003 R 1.7, R1.8 and R3.3 with COM-002 R2. COM-003 allows for the RC/TOP/BA communication protocol when issuing Reliability Directives to override the clearly stated requirement of COM-002 R2 that a DP SHALL REPEAT, RESTATE, REPHRASE, OR RECAPITULATE the Reliability Directive. There is no leeway in COM-002 R2 to allow for solely providing an affirmation of receipt of a verbal reliability directive or not repeating back the message when the RC/TOP requests no repeat. As a DP, UI is placed in a position of attempting to comply with two opposing requirement in the two standards. If the RC/TOP communication protocol clearly stated that there will be no repeat back when receiving a verbal Reliability Directive and COM-003 requires a DP to comply with the RC/TOP communication protocol, UI would have to choose between violating COM-002 or COM-003. Since the VRF for COM-002 R2 is HIGH indicating a greater risk to reliability than COM-003 VRF LOW, UI would comply with COM-002 R2. This issue can be resolved either by correcting COM-002 by assigning the flexibility of opting out of repeat back to the RC/TOP/BA function, or removing the words "Reliability Directive" from COM-003.</p>
<p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	
Hydro One Networks Inc.	<p>We are not convinced that a Standard is the best approach to routine communications, but we feel that the latest draft is a reasonable compromise.</p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
ISO New England Inc.	<p>We do not believe a Standard is needed, given other developments:</p> <p>A. The SDT materials have not demonstrated the reliability gap/need for this Standard. Without having a better sense of what the scope of the actual reliability risks are (frequency, impact, etc...), it's difficult to know if the proposed solution - as embodied in COM-003 Draft Version 5 - is "necessary to provide for reliable operation of the bulk-power system".</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>

Organization	Question 4 Comment
	<p>B. Moreover, the Requirements that the recipient repeat, restate, etc., if required/requested by the issuer (1.6 &amp; 3.2) suggest that a RC, BA or TOP needs to ensure a repeat back or be non-compliant even though taking this extra time may, in fact, impact reliability.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p> <p>C. Lastly, the fact that the Ballot Body and Standard Drafting Team continue to have so many questions about how to interpret these requirements (see the recently issued FAQs) suggests:</p> <p>(a) that the Operating Committee would serve as a more effective forum for discussing what additional communication practices, if any, are needed, and</p> <p>(b) the requirements themselves may be unduly ambiguous. - Proposed Solution: We support strengthening communications protocols such as contained in the pending COM-002 revisions and in the OC White Paper. NERC Event Analysis Staff should work with the NERC OC to document the reported risks to the system, continue to monitor system operator performance, and periodically report on findings. If, however, it is determined that the Standard will move forward, then we would offer the following suggestions:</p> <p>A. We consider use of one-way burst messaging systems to be electronic and, as such, do not believe they should be included in the Standard. Further, in accordance with 1.5, a one-way burst messaging system is not a “oral two party, person-to-person Operating Instruction,” which would further justify its exclusion.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p> <p>B. Draft Version 5’s Requirements establish that each covered registered Entity shall develop its own communication protocol outlining the communications expectations of its operators. This has the potential for confusion as multiple Registered Entities within a single RC, BA or TOPs’ footprint may establish different communication expectations.</p> <p>- Proposed Solution: The Requirements should establish that if the RC, BA or TOP establish a communication protocol for their System Operators, the RC, BA or TOP should share that protocol with</p>

Organization	Question 4 Comment
	<p>Registered Entities operating within their footprint, those Registered Entities must follow the RC, BA or TOP’s protocol, or adopt a consistent one for their company</p> <p><b>Response: The OPCPSDT has modified the standard by changing the R1 language to require the TOP, BA and RC to develop the protocols subject to the approval of the RC.</b></p> <p>C. We agree with the SDT that the COM Standard need not employ a “zero tolerance/zero defect” approach, because NERC Enforcement need not monitor and assess every Operator-to-Operator communication. In Draft Version 5 (Measurements &amp; RSAW), NERC, however, appears to adopt an approach of establishing “zero tolerance” around a Company’s Internal Controls program. The RSAW states that registered entities must provide “evidence that corrective actions necessary to meet the expectations in its documented communication protocols... are taken” and “deficient communication practice was indeed corrected.” - This type of approach to Standard drafting raises untested questions of how the Standard will be enforced, whether it is a “fill-in-the-blank”-type Standard, and whether a new “zero tolerance” enforcement approach to monitoring will, in fact, be maintained.</p> <p>- Proposed solution: Draft a Standard that sets performance based expectations and allow the ERO to use its enforcement discretion (e.g., through FFT and through review of internal control programs) to determine how stringently to audit and sanction.</p> <p><b>Response: The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments.</b></p>	
Ameren	<p>We would ask the SDT to consider for clarity to this standard that COM-002 only address Reliability Directives and COM-003 only address Operating Instructions.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The OPCPSDT believes the proposed draft 6 has incorporated changes that will address your comments. The OPCPSDT also believes draft 6 requirements create a logical delineation between COM-002-3 and COM-003-1.</b></p>	

END OF REPORT

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.

### Description of Current Draft:

This is the sixth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

### Future Development Plan:

Anticipated Actions	Anticipated Date
1. Fourth Successive Ballot of Standard	June 2013
2. Recirculation ballot of standard.	July 2013
3. Board adopts standard.	August 2013

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

**Operating Instruction** —A command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To strengthen communications for the issuance of Operating Instructions with predefined communications protocols that reduce the possibility of miscommunication that could adversely impact the reliability of the Bulk Electric System.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator
5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator's area.

The documented communication protocols will address, where applicable, the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]

- 1.1. The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation.
- 1.2. The instances, if any, that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
- 1.3. The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
- 1.4. The instances, if any, where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction and the format for those clarifiers.
- 1.5. The instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to:

- Confirm that the response from the recipient of the Operating Instruction was accurate; or
  - Reissue the Operating Instruction to resolve a misunderstanding.
- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [*Violation Risk Factor: Medium*][*Time Horizon: Real Time Operations* ]
- R3.** Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [*Violation Risk Factor: Medium*][*Time Horizon: Real Time Operations* ]

### C. Measures

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator in each Reliability Coordinator area, shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that it did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use documented communications protocols developed for Requirement R1. A Balancing Authority, Reliability Coordinator, and Transmission Operator may need to coordinate with another Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.
- M3.** Each Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator shall provide evidence that it did not experience a failure to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required, that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or by another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use the protocols. A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R1 Measure M1 for the most recent 90 days.

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R2 Measure M2 for the most recent 90 days.

Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator shall retain evidence for Requirement R3 Measure M3 for the most recent 90 days.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.3. Additional Compliance Information**

None

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.

### Description of Current Draft:

This is the ~~fifth~~sixth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

### Future Development Plan:

Anticipated Actions	Anticipated Date
1. <del>Third</del> <u>Fourth</u> Successive Ballot of <del>Standards</del> <u>Standard</u>	<del>March</del> <u>June</u> 2013
2. Recirculation ballot of <del>standards</del> <u>standard</u> .	<del>April</del> <u>July</u> 2013
3. Board adopts <del>standards</del> <u>standard</u> .	<del>May</del> <u>August</u> 2013

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

Operating Instruction —A command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act; to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

### Discussions

A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns are-is not a commands and are-is not considered Operating Instructionsan Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To ~~provide System Operators~~ strengthen communications for the issuance of Operating Instructions with predefined communications protocols that reduce the possibility of miscommunication that could ~~lead to action or inaction harmful to~~ adversely impact the reliability of ~~the BES~~ Bulk Electric System.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator
5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall ~~jointly~~ develop and implement, subject to the Reliability Coordinator's approval, documented, documented communication protocols for the issuance of Operating Instructions in that outline the communications expectations of its System Operators. Reliability Coordinator's area.

~~Implementation means (in R1, R2, R3 and R4) incorporating the communication protocols into processes, policies, procedures, training programs and assessment programs to support setting and attaining the communication expectations of operators (R3) and System Operators (R1).~~

The documented communication protocols will address, where applicable, the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]

- 1.1. ~~Use~~ The use of the English language when issuing or responding to an oral or written Operating Instruction ~~or Reliability Directive~~, unless another language is mandated by law or regulation.
- 1.2. ~~Instances~~ The instances, if any, that ~~require~~ require time identification when issuing an oral or written Operating Instruction ~~or Reliability Directive~~, and the format for that time identification.

- 1.3. ~~Nomenclature~~The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction ~~or Reliability Directive.~~
- 1.4. ~~Instances~~The instances, if any, where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction ~~or Reliability Directive,~~ and the format for those clarifiers.
- 1.5. ~~Instances~~The instances where the issuer of an oral two party, person-to-person Operating Instruction ~~is required~~requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to:
  - Confirm that the response from the recipient of the Operating Instruction was accurate;~~;~~ or
  - Reissue the Operating Instruction to resolve a misunderstanding.

- ~~1.6. Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.~~
- ~~1.7. Instances where the issuer of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party.~~
- ~~1.8. Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the initiator if the communication is not understood.~~
- ~~1.9. Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols.~~

**R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall ~~develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented-its~~ communication protocols developed forin Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.  
*[Violation Risk Factor: Medium+][Time Horizon: Real Time Operations Planning, Operations Assessment ]*

**R1.**

**R2.**—Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider ~~and Generator Operator~~ shall ~~develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where~~

applicable, the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning*]

- ~~3.1. Use of the English language repeat, restate, rephrase, or recapitulate an Operating Instruction when responding to required by the issuer of an oral or written Operating Instruction or Reliability Directive, unless another language is mandated by law or regulation.~~
  - ~~3.2. Require the recipient of an oral two party, person-to-person Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer.~~
  - ~~3.3. Require the receiver of an oral Operating Instruction or Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the initiator if the communication is does not understood, if required by the issuer.~~
- ~~R3. Each Distribution Provider and Generator Operator shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations result in its documented communication protocols developed for Requirement R3 an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [*Violation Risk Factor: Medium*] [*Time Horizon: Real Time Operations-Planning /Operations Assessment* ]~~

## C. Measures

- ~~M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator in each Reliability Coordinator area, shall provide its jointly developed documented communications protocols developed for Requirement R1.~~
- ~~M1-M2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that it implemented its documented communication protocols that it developed for Requirement R1 which may include, but is not limited to, its policies, procedures, and or operator training, did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use documented communications protocols developed for Requirement R1. A Balancing Authority, Reliability Coordinator, and Transmission Operator may need to coordinate with another Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.~~
- ~~M2. Each Balancing Authority, Reliability Coordinator, Generator Operator, Distribution Provider, and Transmission Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R2.~~

~~M3. Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R3. Each Distribution Provider, and Generator Operator shall provide evidence that it implemented its documented communication protocols that it developed for Requirement R3 which may include, but is did not limited experience a failure to, its policies, procedures, and repeat, restate, rephrase, or operator training.~~

~~M4.M3. Each Distribution Provider and recapitulate an Operating Instruction, when required, that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or by another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use the protocols. A Balancing Authority, Generator Operator shall provide the results of its periodic assessment and of any corrective actions (if any corrective actions were implemented) developed for Requirement R4., Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.~~

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### 1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R1 Measure M1 for the most recent 90 days.

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R2 Measure M2 for the most recent ~~180~~90 days.

Each Balancing Authority, Distribution Provider ~~and~~, Generator Operator, and Transmission Operator shall retain evidence for Requirement R3 Measure M3 for the most recent 90 days.

~~Each~~

~~If a Balancing Authority, Distribution Provider ~~and~~, Generator Operator ~~shall retain evidence for Requirement R4 Measure M4 for the most recent 180 days.~~~~

~~If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator or Transmission Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.~~

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

## Implementation Plan

Project 2007-02 - Operating Personnel Communications Protocols

### Implementation Plan for COM-003-1 – Operating Personnel Communications Protocols Standard

#### *Approvals Required*

COM-003-1 – Operating Personnel Communications Protocols Standard

#### *Prerequisite Approvals*

None

#### *Revisions to Glossary*

The following term is proposed for addition to the NERC Glossary of Terms:

#### **Operating Instruction —**

Operating Instruction — A command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

A discussion of general information and of potential options or alternatives to resolve BES operating concerns is not a command and is not considered an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.

#### *Applicable Entities*

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### *Revisions or Retirements to Approved Standards*

Approved Requirement to be Retired	Proposed Replacement Requirement(s)
COM-001-1.1 Requirement R4 R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use	COM-003-1 Requirement R1 Part 1.1 <b>R1.</b> Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall

<p>English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations</p>	<p>develop, subject to the Reliability Coordinator’s approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator’s area. The documented communication protocols will address, where applicable, the following:[<i>Violation Risk Factor: Low</i>] [<i>Time Horizon: Long-term Planning</i> ]</p> <p>1.1. The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation</p>
---	---

***Conforming Changes to Other Standards***

None

***Effective Dates***

COM-003-1 shall become effective the first day of first calendar quarter, twelve calendar months following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve calendar months from the date of Board of Trustee adoption.

Each Balancing Authority, Reliability Coordinator, and Transmission Operator must develop their communication protocols prior to the effective date of COM-003-1 to satisfy Requirement R1. COM-001-1.1 Requirement R4 shall expire midnight of the day immediately prior to the Effective Date of COM-003-1 in the particular Jurisdiction in which COM-003-1 is becoming effective.

COM-001-1.1 Requirement R4 shall expire midnight of the day immediately prior to the Effective Date of COM-003-1 in the particular Jurisdiction in which COM-003-1 is becoming effective.

## Project 2007-02 Operating Personnel Communications Protocols

### *Unofficial Comment Form for Standard COM-003-1 —Operating Personnel Communications Protocols*

Please **DO NOT** use this form. Please use the [electronic comment form](#) located at the link below to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by **July 19, 2013**. If you have questions please contact Joseph Krisiak at [Joseph.Krisiak@nerc.net](mailto:Joseph.Krisiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

#### *Background Information:*

Effective communication is critical for Bulk Electric System (BES) operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP SDT). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. FERC Order 693 paragraph 532 amplifies this need. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format.

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating Operating Instructions.

The Purpose statement of COM 003-1 states: "To strengthen communications for the issuance of Operating Instructions with predefined communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System."

- 1) **New NERC Glossary terms:** The SDT has added language to the previous definition of "Operating Instructions" proposed in the Standard version 5 to further clarify the distinction between an "Operating Instruction" and a "Reliability Directive."  
"Operating Instructions" differentiates the broad class of communications that deal with changing or altering the state of the BES from general discussions of options or alternatives; and from Reliability Directives that apply to Adverse Reliability Impacts and Emergencies on the BES. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

This term is proposed for addition to the NERC Glossary to establish meaning and usage within the electricity industry.

- 2) **COM-003-1, Draft 6 now features 3 requirements.** The requirement structure and language has been changed in draft 6 based on changes to the standard recommended by Industry representatives who commented on draft 5 and from Industry representatives who participated in the Informal Review of the proposed draft 6 standard. The language in COM-003-1, draft 6, R1 retained from the “Communications in Operations” Conference of February 14-15, 2013, in Atlanta still permits applicable entities flexibility to develop their communication protocols, but requires applicable entities to **develop the protocols, subject to the Reliability Coordinator’s approval**. This addresses commenters’ concerns over uniformity within Reliability Coordinator control areas.

The assess and correct language has been removed (COM-003-1, draft 5, R2 and R4) based on concerns over compliance with internal controls. Rather than focus on internal controls and System Operator performance improvement controls, the COM-003-1, draft 6, R2 and R3 requirements now focus on **misuse or lack of use of the communication protocols (developed in COM-003-1, draft 6, R1) resulting in the issuance of a Reliability Directive**. This approach requires the entity to manage the effective use of their governing communication protocols to avoid a situation that will initiate an Adverse Reliability Impact or an Emergency on the BES. This directly links communication to a reliability result, which is a recommendation offered by commenters in the last 5 drafts.

**Documented Communication Protocols:** The OPCPSDT has retained requirement COM-003-1, draft 5, Requirement R1 and eliminated COM-003-1, draft 5, Requirement R3, which addressed communication protocols for entities that are solely receivers of Operating Communications (DPs and GOPs). R1 in Draft 6 requires an applicable entity to jointly develop, subject to the Reliability Coordinator’s approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator’s area, that ,if applicable will **address** the following elements:

- a. **English language:** Requirement R1 Part 1.1 – The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation.
- b. **Time Identification:** Requirement R1 Part 1.2 – The instances, if any, which require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
- c. **Line and Equipment Identifiers:** Requirement R1 Part 1.3 – The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing oral or written Operating Instructions.
- d. **Alpha-numeric clarifiers:** Requirement R1 Part 1.4 – The instances, if any, where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction and the format for those clarifiers.

- e. **Three-part Communication:** Requirement R1 Part 1.5. The instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to:
- Confirm that the response from the recipient of the Operating Instruction was accurate, or
  - Reissue the Operating Instruction to resolve a misunderstanding.

**Eliminated in Draft 6 by OPCPSDT:**

- **One-way burst messaging system to multiple parties (all call)** based on industry comments. Requirement R1 Part 1.7, Requirement R1 Part 1.8
- **One-way burst messaging system to multiple parties (all call)** based on industry comments. Requirement R3 Part 3.3
- **Uniformity of communication protocols among entities** (Requirement R1 Part 1.9) Based on industry comments replaced 1.9 with change to R1 language to jointly develop and issue communication protocols within a Reliability Control area.

- 3) **VSL and VRF Changes from version five:** The OPCPSDT modified the VRFs and VSLs associated with R1, R2, and R3, to conform to NERC and FERC guidelines.

The SDT is proposing to retire Requirement R4 from COM-001-1 and incorporate it into Requirement R1 of COM-003-1. Since Requirement R4 from COM-001-1 carries over essentially unchanged there is no specific question related to it in this Comment Form.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Instructions. Requirements R1 is assigned a Low Violation Risk Factor due to its level of risk on BES operations. Requirements R2 and R3 are assigned a Medium Violation Risk Factor due to their more direct impact on BES reliability.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R1 must be implemented in long term planning operations and therefore is assigned a Time Horizon of Long Term Planning. R2 and R3 must be implemented in the Real Time Horizon. The drafting team is posting the standard for industry comment for a 30-day comment period.

The Operating Personnel Communications Protocols Drafting Team would like to receive industry comments on this draft standard. Accordingly, we request that you include your comments on this form by **July XX, 2013**.

**Comment Form**

**\*Please use the [electronic comment form](#) to submit your final comments to NERC.**

- 1. The OPCPSDT has proposed significant changes to the COM-003-1, draft 6. Do you agree that COM-003-1, draft 6 addresses the August 2003 Blackout Report Recommendation number 26, FERC Order 693 and the COM-003-1 SAR? If not, please explain in the comment area of the last question.**

# Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft 6

## Rationale and Technical Justification

### I. Introduction and Background

#### A. Order No. 693

On March 16, 2007, the Federal Energy Regulatory Commission (“FERC” or “Commission”) issued Order No. 693. Specifically, in paragraphs 512, 513 and 531-535 the Commission stated:<sup>1</sup>

512. The Commission finds that, *during both normal* and emergency operations, it is essential that the transmission operator, balancing authority and reliability coordinator have communications with distribution providers. In response to APPA, as discussed above, any distribution provider that is not a user, owner or operator of the Bulk-Power System would not be required to comply with COM-002-2, even though the Commission is requiring the ERO to modify the Reliability Standard to include distribution providers as applicable entities. APPA’s concern that 2,000 public power systems would have to be added to the compliance registry is misplaced, since, as we explain in our Applicability discussion above, we are approving NERC’s registry process, including the registry criteria. Therefore, we adopt our proposal to require the ERO to modify COM-002-2 to apply to distribution providers through its Reliability Standards development process.

513. The Commission believes that this Reliability Standard does not alter who would operate a distribution provider’s system. It only concerns communications, not the operation of the distribution system.

---

<sup>1</sup> In Order No. 693-A at paragraph 41, the Commission also noted that “. . . as to COM-001-1 and COM-002-2, the Commission was concerned [in Order 693] about having a reliability gap during normal and emergency operations.”

531. We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies, either as part of COM-002-2 or as a new Reliability Standard. We note that the ERO's response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.

532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. *We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk- Power System is so tightly interconnected that system impacts often cross several operating entities' areas. (Emphasis added)*

533. Regarding APPA's suggestion that it may be beneficial to include communication protocols in the relevant Reliability Standard that governs those types of emergencies, we direct that it be addressed in the Reliability Standards development process.

534. In response to MISO's contention that Blackout Report Recommendation No. 26 has been fully implemented, we note that Recommendation No. 26 addressed two matters. We believe MISO is referring to the second part of the recommendation requiring NERC to "[u]pgrade communication system hardware where appropriate" instead of tightening communications protocols. While we commend the ERO for taking appropriate action in upgrading its NERCNet, *we remind the industry to continue their efforts in addressing the first part of Blackout Recommendation No. 26.*

535. Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.

540. ... In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include

distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) *requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above.* Finally, we direct the ERO to include APPA's suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process. (Emphasis added)(footnotes omitted).

### **B. 2003 Blackout Report**

The 2003 Blackout Report Recommendation No. 26 reads:

NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date.

### **C. COM-002-3**

In response to the Commission's determinations in Order No. 693, the NERC Board of Trustees has approved COM-002-3 that addresses effective communications during emergency circumstances. COM-002-3 states that:

**R1.** When a Reliability Coordinator, Transmission Operator, or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator, or Balancing Authority shall identify the action as a Reliability Directive to the recipient.

**R2.** Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase, or recapitulate the Reliability Directive.

**R3.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either:

- Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or
- Reissue the Reliability Directive to resolve a misunderstanding.

COM-002-3 also adds the following new definition:

**Reliability Directive:** A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.

In COM-002-3, the identification of a communication as a Reliability Directive is required to address communications related to an Emergency or Adverse Reliability Impact, which are defined in the NERC *Glossary of Terms Used in Reliability Standards* or are approved by the NERC Board of Trustees and pending FERC approval as follows:

**Emergency:** Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

**Adverse Reliability Impact:** The impact of an event that results in Bulk Electric System instability or Cascading.

#### D. NERC's Operating Committee guideline

On September 19, 2012, the NERC Operating Committee issued a Reliability Guideline entitled: "System Operator Verbal Communications – Current Industry Practices." As stated on page one, the purpose of the Reliability Guideline ". . . is to document and share current verbal BES communications practices and procedures from across the industry that have been found to enhance the effectiveness of system operator communications programs." Specifically, in the context of routine or normal operation communications, the Guideline on pages 4-5 states that:

There are two schools of thought regarding utilization of three-part communication for routine operating instructions. Every routine communication opportunity has a different impact on the reliability of the BES, and many routine communication opportunities have no impact on reliability. While the industry has disparate viewpoints on the necessity of the use of three-part communication for all real-time communications, *most agree that the point is to be effective when it counts for reliability — not that every communication opportunity has a reliability impact. . . .* If an entity determines it would utilize the three-part communication protocol for routine operating instructions, that entity should define when its System Operators are expected to utilize the protocol, including coordinating with entities regarding when the use of three-part communication is expected. (Emphasis added).

The Guideline goes on to address barriers to effective communications and other related subjects.

## II. COM-003-1

Because COM-002-3 addresses effective communications during emergency circumstances, COM-003-1 needs to focus on those communications during normal operations that impact reliability. The latest draft of COM-003-1 implements a results-based approach to strengthening normal operating communications, which focuses entities on communicating Operating Instructions in a way that does not result in an operating condition that requires the issuance of a Reliability Directive. Accordingly, COM-003-1 is reliability-driven, results-based approach that appropriately focuses on those communications during normal operations that impact reliability. To elaborate on this approach, the definition of Operating Instruction and the COM-003-1 requirements are set forth below followed by a discussion of the impacts of the requirements.

### A. Operating Instruction

The definition of Operating Instruction reads:

A command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.

This version of the definition of Operating Instruction clearly sets forth the types of communications that are and are not Operating Instructions. It also clearly states that there is no overlap between COM-003-1 with the requirements of COM-002-3 and its definition of Reliability Directive. This emphasis on the exclusive and distinct difference between an Operating Instruction and a Reliability Directive creates separation between the two standards, ensuring that there is no confusion between the implementation of COM-002-3 and COM-003-1 and eliminating any risk for double jeopardy with the two standards. The separate definitions also convey the importance of issuing a Reliability Directive versus an Operating Instruction.

### B. Requirement R1

Requirement R1 requires the development of documented communication protocols for the issuance of Operating Instructions in a Reliability Coordinator's area. The development of documented communication protocols is designed to strengthen the issuance of Operating Instructions to guard against a miscommunication (*i.e.*, failure to

follow the protocols) of an Operating Instruction that results in an operating condition that requires the issuance of a Reliability Directive (see Requirements 2 and 3).

Requirement R1 and its Parts read:

**R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator's area.

The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning]

1.1. The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation.

1.2. The instances, if any, that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.

1.3. The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.

1.4. The instances, if any, where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction and the format for those clarifiers.

1.5. The instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to:

- Confirm that the response from the recipient of the Operating Instruction was accurate; or
- Reissue the Operating Instruction to resolve a misunderstanding.

It is appropriate for the entities with system responsibilities and a wide-area view of the Bulk Electric System (*i.e.*, Reliability Coordinators, Transmission Operators and Balancing Authorities) to develop the documented communication protocols. Development does not require that the protocols of a Reliability Coordinator, Transmission Operator and Balancing Authority be identical, but rather requires these entities to coordinate to develop protocols for their Reliability Coordinator area. Also, given the reliability-driven, results-based construct set forth in Requirements R2 and R3, there is no need, and, therefore, no requirement that the Distribution Provider or Generator Operator develop documented protocols. The Distribution Provider and Generator Operator are simply required to repeat, restate, rephrase, or recapitulate the Operating Instruction when required by the issuer, following the protocol of the issuance of the Operating Instruction.

In addition, consistent with Order No. 693 and the Reliability Guideline, the Requirement R1 documented communication protocols are appropriately tied to the execution of Operating Instructions (Requirements R2 and R3), so that an Emergency or Adverse Reliability Impact does not result due to miscommunication (*i.e.*, need to issue a Reliability Directive). Working in concert with Requirement R1, Requirements R2 and R3 implement a results-based approach that promotes reliability, while eliminating any operational and compliance environment that requires a mining of hundreds, thousands or millions of routine/normal communications to prove compliance or make a finding of reasonable assurance of compliance, and, instead, properly focuses on those Operating Instructions that impact reliability.

### C. Requirement R2

Requirement R2 is a reliability-driven, results-based requirement that is designed to prevent miscommunications during normal operating conditions that would result in an operating condition that requires the issuance of a Reliability Directive. To that end, the requirement focuses entities' behavior on implementing its documented communication protocols, but focuses the compliance risk on instances where failure to use the protocols by the issuer of an Operating Instruction results in an operating condition that requires the issuance of a Reliability Directive. The requirement reads:

R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.

*[Violation Risk Factor: Medium][Time Horizon: Real Time Operations]*

The intent of Requirement R2 is to focus entities on use of the documented communications protocols when a Balancing Authority, Reliability Coordinator, or Transmission Operator issues an Operating Instruction. Rather than focus on all miscommunications, the standard focuses compliance risk on instances where an entity fails to follow its documented communication protocols **and** that failure to follow its documented communication protocols results in an operating condition that requires the issuance of a Reliability Directive. This captures those Operating Instructions that impact reliability. This construct creates an operational defense-in-depth approach with the use of Operating Instructions and Reliability Directives. COM-003-1 requires implementation of documented communications protocols to prevent operating conditions that would require the issuance of a Reliability Directive and even if that does occur, a Reliability Directive would be issued to maintain the reliable operation of the bulk electric system.

This approach also appropriately focuses compliance on the instances in which both an entity fails to follow its documented communication protocols **and** that failure to follow its documented communication protocols results in an operating condition that requires the issuance of a Reliability Directive, rather than all communications during normal operating conditions. Accordingly, Requirement R2 is a reliability-driven, results-based requirement that appropriately focuses operations and compliance on Operating Instructions that impact reliability.

#### D. Requirement R3

Requirement R3 is designed to prevent miscommunications during normal operating conditions where the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction, when required, would result in an operating condition that requires the issuance of a Reliability Directive. The requirement reads:

R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.  
[Violation Risk Factor: Medium][Time Horizon: Real Time Operations]

Similar to Requirement R2, the intent of Requirement R3 is to focus on those instances in which the recipient fails to follow the issuer's three-way instructions (which are instructions consistent with its protocols) and there is an impact to reliability, *i.e.*, an operating condition that requires the issuance of a Reliability Directive. Rather than focus on all instances where three-way instructions are used, the standard focuses compliance on instances where: (1) a Balancing Authority, Transmission Operator, Generator Operator or Distribution Provider fails to repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer; **and** (2) the use of this repeat back protocol is required in the issuers communication protocols developed in Requirement 1; **and** (3) the failure to use the repeat back protocol results in an operating condition that requires the issuance of a Reliability Directive.<sup>2</sup>

<sup>2</sup> To assist in those instances where a Generator Operator or Distribution Provider, etc. may need an attestation or other evidence such as log or voice recording from a Reliability Coordinator, Transmission Operator or Balancing Authority, the Measures for Requirement 3 indicates the potential need for coordination between the entities.

#### **E. VRF/VSLs**

The VRF/VSLs and measures compliment the results-based approach by focusing on the impact to reliability resulting from miscommunications and not the volume of Operating Instructions or solely the development of communication protocols. By focusing on communications that create operating conditions that result in the issuance of a Reliability Directive, only those communications tied directly to the eventual issuance of a Reliability Directive would be necessary from a compliance standpoint. As written, there will likely be a smaller subset of Operating Instructions that are relevant to a finding of a violation of Requirement R2 and R3, particularly given the instructional value of the Requirement R1 communication protocols. However, a violation of Requirements R2 and R3 are considered significant and thus the VRFs and VLSs reflect that impact on reliability.

### **III. Conclusion**

COM-003-1 is scoped and designed to complement COM-002-3. COM-003-1 represents a results-based standard that protects the reliability of the bulk electric system and that appropriately balances compliance risk by focusing entities on the development and implementation of documented communication protocols during normal operating conditions that only impact reliability. The Operating Committee's Reliability Guideline on System Operator communications acts as a complimentary guidance document that will be useful to entities during their joint development of documented communication protocols under COM-003-1.

## Project 2007-2 – Operating Personnel Communications Protocol

### VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### NERC Criteria - Violation Risk Factors

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are three requirements in COM-003-1, draft 6 with the deletion of R4 (draft 5). Requirement R1 is assigned a “Low” VRF. R1 now reads: *“Each ..... in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator’s approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator’s area. The documented communication protocols will address, where applicable, the following: ”*. Requirements R2 and R3 are assigned a “Medium” VRF. The language change to R2 , which now reads: *“Each ..... shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.”* R2 warrants a VRF of “Medium” because it links failed use of communication protocols to events that impact the reliability of the BES. The language change to R3, which now reads: *“Each ..... shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator”* warrants a VRF of “Medium” because it links failed use of three-part communication to events that impact the reliability of the BES.

## NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or	Missing at least one	Missing more than one	Missing most or all of the significant

Project YYYY-##.# - Project Name

<p>a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.</p>	<p>elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>
---	--	---	---

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
<b>Proposed VRF</b>	Low
NERC VRF Discussion	R1 is a requirement in a long term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “Low” which is consistent with NERC guidelines
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 establishes communication protocols, which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-parts that are of equal importance and similarly address communication

VRF and VSL Justifications – COM 003-1, R1			
	protocols; only one VRF was assigned so there is no conflict.		
FERC VRF G3 Discussion	<p><b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the development of documented communication protocols by entities that issue “Operating Instructions” that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.</p>		
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Low” which is consistent with NERC guidelines for similar requirements.</p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.</p>

## Project 2007-2 – Operating Personnel Communications Protocol

### VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### NERC Criteria - Violation Risk Factors

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are ~~four~~ three requirements in COM-003-1, draft 5-6 with the addition-deletion of ~~R3 and R4~~ (draft 5). Requirements ~~R1 and R3~~ is are assigned a "Low" VRF. ~~R1 and R3~~ now reads: "*Each ..... in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator's area. shall develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where applicable, the following: ". Requirements R2 and ~~R4~~ R3 are assigned a "Medium" VRF. ~~and t~~ The language change to R2 and R4, which now reads: "Each ..... shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. shall perform a quarterly assessment of its System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement RX" - R2 warrants raising the VRF to of "Medium" because it features evaluation and correction of operating links failed use of communication protocols to events that impact the reliability of the BES. The language change to R3, which now reads: "Each ..... shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator" warrants raising the VRF to of "Medium" because it links failed use of three-part communication to events that impact the reliability of the BES.*

### NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Project YYYY-##.# - Project Name

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	Low
NERC VRF Discussion	R1 is a requirement in a long term planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “Low” which is consistent with NERC guidelines

VRF and VSL Justifications – COM 003-1, R1			
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 establishes communication protocols, which is consistent with FERC guideline G1.		
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub- <del>requirements parts</del> that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.		
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the development <del>and implementation</del> of documented communication protocols by entities that <del>will both</del> issue <del>and receive</del> “Operating Instructions” that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.		
FERC VRF G4 Discussion	<b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “-Low” which is consistent with NERC guidelines for similar requirements.		
FERC VRF G5 Discussion	<b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.

<p><b>FERC VSL G1</b> Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>Based on the VSL Guidance, the SDT developed <del>four VSLs based on quarterly assessments of an entity's System Operators' communication practices and the administration of corrective actions. If no quarterly assessments of an entity's System Operators' communication practices are conducted a single binary, then the</del>VSL, <u>therefore it</u> is Severe.</p>
<p><b>FERC VSL G2</b> Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: The VSL assignment for R2 is <del>not</del> binary.</p> <p>Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p><b>FERC VSL G3</b> Violation Severity Level Assignment Should Be Consistent with the</p>	<p>The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement</p>

**VRF and VSL Justifications – COM 003-1, R2**

VRF and VSL Justifications – COM 003-1, R2	
Corresponding Requirement	
<p><b>FERC VSL G4</b> Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	The VSL is based on a single violation and not cumulative violations
<p><b>FERC VSL G5</b> Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs</p>	Non CIP
<p><b>FERC VSL G6</b> VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence</p>	Non CIP

VRF and VSL Justifications – COM 003-1, R3	
<b>Proposed VRF</b>	Low
NERC VRF Discussion	R3 is a requirement in a <del>long term planning</del> <u>Real Time</u> , time frame that, if violated, <u>could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.</u> However, violation of a medium risk requirement is unlikely to lead to <u>bulk electric system instability, separation, or cascading failures</u> <del>would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system.</del> The VRF for this requirement is “ <u>LowMedium</u> ” which is consistent with NERC guidelines.
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R3 establishes communication protocols, which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has <u>no</u> sub-requirements <del>that are of equal importance and similarly address communication protocols</del> ; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for <u>an entity to repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator</u> <del>the development and implementation of documented communication protocols by entities that will only receive “Operating Instructions” that to</del> reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.
FERC VRF G4 Discussion	<b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize communication protocols properly could directly affect the electrical state or the

VRF and VSL Justifications – COM 003-1, R3			
	<p>capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “<del>Low</del><u>Medium</u>” which is consistent with NERC guidelines <del>for requirements that are administrative.</del></p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R3 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.</p>

# Standards Announcement

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

**Successive Ballot and Non-binding Poll now open through July 19, 2013**

### [Now Available](#)

A successive ballot of **COM-003-1- Operating Personnel Communications Protocols** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now open through **8 p.m. Eastern on Friday, July 19, 2013.**

Background information for this project can be found on the [project page](#).

### **Instructions for Balloting**

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking [here](#).

### **Next Steps**

The ballot results for **COM-003-1** will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

### **Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Wendy Muller,  
Standards Development Administrator, at [wendy.muller@nerc.net](mailto:wendy.muller@nerc.net) or at 404-446-2560.*

## Project 2007-02 Operating Personnel Communications Protocols COM-003-1

**Formal Comment Period:** June 20, 2013 – July 19, 2013

Upcoming

Successive Ballot and Non-binding Poll: July 10, 2013 - July 19, 2013

### [Now Available](#)

A 30-day formal comment period for **COM-003-1- Operating Personnel Communications Protocols** is open through **8 p.m. Eastern on Friday, July 19, 2013**.

Background information for this project can be found on the [project page](#).

### Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact [Wendy Muller](#). An off-line, unofficial copy of the comment form is posted on the [project page](#).

### Next Steps

A successive ballot of **COM-003-1** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted from July 10, 2013 through July 19, 2013.

### Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Oncor Electric Delivery
No
Draft 6 of COM-003-1 appears to go beyond the recommendations and FERC 693 directives which were the basis for the SAR. The main objective to develop an operating protocol in alignment with other communications standards to improve reliability. Oncor's concerns with Draft 6 are: (1) R1 - subject to the Reliability Coordinator's approval: adding this to R1 potentially adds an administrative burden to an Entity/Industry without clear reliability benefits. Operating protocol should support an Entity's operations and functions which are not a "one size fits all". By requiring a RC's approval, the requirement empowers the RC to interpret the requirement (as well as defining "Operating Instructions") which may not be consistent with an Entity as well as the Regional Entity who will be enforcing the requirement. (2) R2/R3 - there is the potential for multiple levels of interpretation of these requirements; these requirement potentially creates a situation in which Operators will need to be able to assess the transition from normal to emergency operations and could quite impact efficiency and productivity of operations which is the opposite of the objective. In addition based on M2 & M3, Oncor has concerns with the administrative burden versus the reliability benefits gained in proving a negative condition.
No
R2 – it is unclear how a "failure" of using an operating protocol results in a reliability directive therefore the VSL indicates a zero tolerance level of performance which does not align to reliability based performance. R3 – not all failures of using three-part communication will automatically led to a Reliability Directive so the VSL should be designed to support more than a failure to use the protocols by the issuer of an Operating Instruction does not result
Individual
Scott McGough

Georgia System Operations
Yes
No
No, regarding R2 and R3, GSOC recommends to revise the wording as follows. In particular, we believe it advantageous to use NERC's definition of Emergency (BES Emergency) to provide entities escalating levels of severity as opposed to the single VSL - severe that appears in the current Draft 6. R2 - Each Balancing Authority, Reliability Coordinator, and Transmission Operator (R3 - Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider) shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in any of the following: <ul style="list-style-type: none"> <li>• Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.</li> <li>• The failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System and automatic or immediate manual action to limit the failure was required.</li> <li>• An Adverse Reliability Impact</li> </ul>
Group
Northeast Power Coordinating Council
Guy Zito
No
The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues with the standard. <p>a. The issuance of a Reliability Directive may be caused by a number of reasons, for example, the operating instruction (repeated or otherwise) may not be sufficient to address a potential condition that has an Adverse Reliability Impact; b. The operating instruction that is communicated, with or without adhering to the protocols developed in R1, is in fact moving other system conditions from a reliable state to one that has a potential of having Adverse Reliability Impact, for which a Reliability Directive needs to be issued after implementing the communicated operating instruction. c. The operating personnel may second guess whether or not a Reliability Directive will be issued if the established communication protocols are not implemented (such as by requiring 3-part communication) before it takes the required action. This puts the need to comply with a requirement into a condition assessment mode, which defeats the purpose of having a reliability standard to manage risk and meet performance expectation whose reliability outcome are predetermined, not on the fly. d. The added condition is a compliance assessment element with which to gauge violation severity or sanction; itself not a requirement. By introducing this to the requirement, it convolutes the</p>

requirement, adds nothing to meeting the reliability objectives, and may in fact jeopardize reliability. And what if a Reliability Directive was not issued despite the failure of Responsible Entity to implement its communication protocol? Is the Responsible Entity deemed compliant with the requirement? If so, do Requirements R2 and R3 drive the right behaviors? If not, then what's the value and influence of the added condition in the assessment outcome?

Requirement R1 clearly requires the responsible entity to develop documented communication protocols for the issuance of Operating Instructions. By Part 1.5, the instances where the issuer of an oral two party, person-to-person Operating Instruction requiring the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and subsequent actions by the issuer are already clearly stipulated in the documented communication protocols. Responsible entities simply need to implement the protocols as documented, regardless of whether failure to do so would result in having to issue a Reliability Directive, or any other possible outcomes, for that matter. Similar comments apply to Requirement R3 when the responsible entities are required to close out the last part of the 3-part communication. The suggested rephrasing of the Purpose statement "To strengthen communications..." could be misleading. Communications could be strengthened with better equipment as well, but the intent of COM-003 is to deal only with communications protocols. Suggest changing the language to that which is found in the technical guidance document, "Enhance the effectiveness of communications..."

No

We agree with the VRFs, but not the VSLs because of the concerns with Requirements R2 and R3. We do not agree with the Long-term Planning Time Horizon for R1. Developing and documenting communication protocols for use during real-time operations is an operational planning process (or mid-term planning, at most), not a long-term planning process. We suggest to change the Time Horizon to Operations Planning. Regarding the Implementation Plan, it conflicts with Ontario regulatory practice with regards to the effective date of the standard. It is suggested that this conflict be removed by appending to the effective date wording, after "applicable regulatory approval" in the Effective Dates Section of the Implementation Plan: ", or, in those jurisdictions as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities."

Individual

Bill Fowler

City of Tallahassee

No

TAL has voted NO because the standard is still not "clear and unambiguous". TAL is concerned at the degree to which the proposed standard complicates compliance for Operating Instructions without benefit to reliability. The FERC Directive was to tighten communications during Emergencies and Alerts. Operating Instructions deserve separate consideration under the standards. Requiring an entity's procedure to be subject to the Reliability Coordinator's approval creates an undue burden on the RC with no measurable improvement in reliability. While this addressed a commenter's concerns over uniformity within RC control areas, it would

be simpler and more efficient to have the RC create a procedure and provide it to all the entities in the footprint. Measure 3 should be changed to “when required by the issuer” in order to provide clarity and consistency with R3.

Individual

Nazra Gladu

Manitoba Hydro

Yes

Although Manitoba Hydro is in general support of the proposed draft, we suggest the following: (1) For clarity, consider rewriting the second paragraph of the definition of Operating Instruction as follows, An Operating Instruction is not: (1) A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns (2) Exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive. (2) R1 and M1 - for consistency, add an “s” to the second instance of “Reliability Coordinator” as follows: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator’s area, shall...” (3) R1 – the requirement instructs each BA, RC and TO develop separate communication protocols. Are these duplicative efforts practical? (4) R1, 1.4 – alpha-numeric clarifiers are limited to oral Operating Instructions only. For consistency with R1.1, 1.2 and 1.3, consider adding applicability to written Operating Instructions as well. (5) R1, 1.5 – is limited to oral Operating Instructions while R3 (which deals with the same situation) does not specify whether it is oral or written or both. (6) M2 – the measure does not seem to match the requirement. The requirement R2 states that the responsible entity implement its communication protocols so that there is no failure to use the protocols which results in a certain operating condition. The measure however requires that the responsible entity provide evidence that they did not create the certain operating condition. Manitoba Hydro suggests that the measure should more accurately require that the responsible entity provide evidence that it implemented its communication protocol so that...

David Thorne

Agree

Group

NERC Compliance Group

Bill Thompson

Yes
As far as the August 2003 Blackout Report Recommendation, the COM-003-1 revisions address this concern. However, the criteria for communication protocols that need to be used should be established. The criteria needs to be applied to both COM-002 and COM-003. There is too much room for interpretation when it comes to measuring compliance.
Yes
Individual
Si Truc PHAN
Hydro-Quebec TransEnergie
Yes
Yes
Hydro Québec TransÉnergie proposes to change the wording of R2 to reflect the language used in M2. The current text has too many negative connotations and is difficult to understand. The requirement should be written : Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.
Group
PacifiCorp
Ryan Millard
Yes
No
PacifiCorp does not agree with the VRFs and VSLs associated with R2 because it is not clear how R2 is measured. M2 would require an entity to provide evidence that it did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use documented communications protocols developed for Requirement R1. In essence, an entity is required to prove that it did not do something that resulted in a condition which caused another entity to be issued a directive (that it may or may not be privy to, depending upon whether or not it was the original issuer of said directive). A requirement that is measured by the absence of evidence creates a challenging auditing environment for the industry. PacifiCorp strongly recommends that the drafting team reconsider the measures required for proving compliance with R2.

Individual
Joe O'Brien
NIPSCO
Agree
Julie Dyke , NIPSCO comments submitted Also, We would like to see COM-002 & 003 combined into a single standard. In R1 1.5 it appears that three way communication need only to be addressed in the communication protocol and not necessarily required. An operator may be reluctant to issue an RD which would possibly expose entities to R2 & R3 non-compliance.
Individual
Thomas Foltz
American Electric Power
No
AEP cannot vote in the affirmative for COM-003-1 as long as COM-002-2 R2 would be in effect at the same time. The standard establishes a higher bar for more routine communications than would be required for emergency situations. This would only confuse operators in determining which rules are to be followed under which specific circumstances. AEP still contends that it is unnecessary to obtain Reliability Coordinator's approval on the resulting documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator's area. Why would it be necessary to develop and document internal procedures regarding communication protocols when the proposed standard itself already provides specific instruction on the required communication? Is R 1.3 in any way redundant with TOP-002-2 R18? AEP proposes the elimination of COM-002-2 R2 and changing COM-003-1 as proposed below so that it covers all commands rather than a subset of commands. Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall adhere to the following communication protocols for the issuance of Operating Instructions in that entity's area. 1.1. The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation. 1.2. The instances, if any, that require time identification when issuing an oral or written Operating Instruction, specify the time zone unless the RC has previously established an operational timezone. 1.3. The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. 1.4. The instances, when referencing letters, utilize the phonetic alphabet when issuing an oral Operating Instruction (Reference prior draft(s)) 1.5. In instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to: * Confirm that the response from the recipient of the

Operating Instruction was accurate; or \* Reissue the Operating Instruction to resolve a misunderstanding. R2. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction

Individual

Angela P Gaines

Portland General Electric Company

No

Portland General Electric Company (PGE) thanks you for the opportunity to provide comments. PGE is supportive of the intent of COM-003-1 and appreciates the work that the drafting team has put into the development of the proposed standard. However, the language in R2 and R3 is convoluted and confusing. The following is a suggestion for both R2 and R3: R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1. Delete: so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations] R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1. Delete: so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations] Then add the following to each Measure, (and RSAW) respectively: R2.1. Did the issuer of the Operating Instruction fail to use its approved Operating Instruction protocols it developed in R1? (yes/no) R2.2. Did the failure to use the approved Operating Instructions produce an operating condition requiring the issuance of an Reliability Directive? R3.1. Did the BA, TOP, GOP and DP fail to repeat, restate, rephrase, or recapitulate an Operating Instruction in its communications protocols developed in R1? R3.2 Did the failure to repeat, restate, rephrase, or recapitulate an Operating Instruction produce a condition requiring the issuance of an Reliability Directive? Also in R3, the phrase, "...in its communications protocols" do you mean in the issuer's protocol or the receiver's protocol?

Group

Arizona Public Service Company

Janet Smith, Regulatory Affairs Supervisor

Yes
Negative ballot cast on the Standard: For communication purposes, R1 should not include Reliability Coordinator (RC) approval. If a regional requirement (RC approval) is deemed necessary, then a regional standard should be developed that includes the procedure(s) and requirements to obtain RC approval of communication protocols.
Yes
Individual
Chris de Graffenried
Consolidated Edison Co. of NY, Inc.
No
Add the word "verbal" before the word "Operating Instructions" so that Requirement R1 reads: "R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of verbal Operating Instructions in that Reliability Coordinator's area." Also make similar changes where required elsewhere.
No
FERC requires that VSL's be graded. The Requirement R3 VSL should be modified to reflect the following graded proposal: "The first failure following the effective date of this standard is a "Low VSL." However, should failures be more frequent, then the severity level for such failures should be increased. "For the second and subsequent failures following the effective date of the standard a single failure within a given 12-month rolling period is a Moderate VSL. "For the second and subsequent failures following the effective date of the standard and when there is more than one failure within a given 12-month rolling period the failure is a Severe VSL."
Individual
Russ Schneider
Flathead Electric Cooperative, Inc.
No
No, the 2003 Blackout recommendations were specific to control center and reliability coordinator entities. This standard appears to push down below to small DP entities that don't have control centers. Also, the Blackout recommendations were clearly concerned with "reliability" directives and did not contemplate a new category of Operating Instructions. The existing authority in other standards for registered entities to respond to reliability directives should be sufficient to address the recommendations without this standard.
No
Individual
Michelle R D'Antuono

Occidental Energy Ventures Corp.
Yes
<p>Occidental Energy Ventures Corp. (“OEVC”) would like to compliment the drafting team for finding a compliance solution that focuses only on the results of an improperly executed Operating Instruction. The approaches in previous drafts could be construed that entities retain proof that every applicable communication was monitored and verified – an impossible administrative task. We believe that Draft 6 of COM-003-1 removes the onerous compliance burden without freeing Operating entities from the obligation to perform responsibly. They are free to choose the level of sample communications to monitor, the amount of training they perform, and the internal disciplinary actions they take for non-compliance to the required protocols. However, there are consequences if their oversight is inadequate. We do have two concerns which we would like to air. First, that recipients of Operating Instructions must be informed that formal communication is being done. Although front-line Operators will be trained to comply with the appropriate protocol documents, they will be naturally inclined to follow the lead of the issuing entity – particularly if the communication is a borderline instruction. For example, a request for equipment status may be part of discussion concerning available alternatives, or information needed to confirm real-time stability. The recipient should not be left in a position to guess what the needs of the immediate situation are. Secondly, we would hope that the protocols developed by the various RCs, BAs, and TOPs are generally consistent. Even though we agree that each individual organization may have specific communications needs, it is in no one’s interest to have minor preferential differences between entities. Perhaps this is an issue that NERC’s performance management team can monitor – particularly as they have a highly vested interest in the resolution of Operating Instruction errors. These comprise a high percentage of outage root causes, and we are sure that uniformity will be a key improvement indicator.</p>

ReliabilityFirst
No
<p>ReliabilityFirst believes the newly included language in Requirement R1 “...subject to the Reliability Coordinator’s approval...” introduces three issues which need to be addressed prior to the draft standard being enforceable. The three issues include: 1) With the Reliability Coordinator being an Applicable Entity within this requirement, it is unclear which entity will be approving the Reliability Coordinator’s documented communication protocols? Based on the current language, the Reliability Coordinator would need to seek approval from themselves as the Reliability Coordinator. 2) There is no companion requirement requiring the Reliability Coordinator to approve the Balancing Authority’s and Transmission Operator’s documented</p>

communication protocols. It is inferred, but there is no requirement which explicitly requires the Reliability Coordinator to take action. Based on the current language in Requirement R1, if a Reliability Coordinator never takes action (approval or disapproval), where does this leave an entity for compliance purposes? 3) In the scenario where the Applicable Entity (Balancing Authority, Transmission Operator) develops documented communication protocols (which address the elements in sub parts 1.1 through 1.5) but the Reliability Coordinator disapproves, will the Applicable Entity be non-compliant with Requirement R1? The Applicable Entity has no control over action taken (approval or disapproval) by the Reliability Coordinator. Furthermore, since Requirement R2 and Requirement R3 depend on the documented communication protocols developed in Requirement R1, would the Applicable Entity be automatically found non-compliant with those two requirements as well? ReliabilityFirst offers the following two recommendations for the SDT to consider to address the ReliabilityFirst concerns with the newly included language "...subject to the Reliability Coordinator's approval...": 1) Remove the "...subject to the Reliability Coordinator's approval..." language from Requirement R1. Add a new requirement requiring the Applicable Entities to make their documented communication protocols available to all the other Applicable Entities within in each Reliability Coordinator area. 2) Make Requirement R1 applicable to only the Reliability Coordinator and remove the "...subject to the Reliability Coordinator's approval..." language. This will require the Reliability Coordinator to develop one consistent set of documented communication protocols for all entities within their Reliability Coordinator area. This will also allow the Reliability Coordinator to tailor the documented communication protocols to address uniqueness among Balancing Authorities and Transmission Operators (e.g., asset density, locations and organizational structure) within their area. If the SDT agrees with either of these recommendations, the sub-parts for Requirement R1 and both Requirement R2 and Requirement R3 would remain relatively unchanged.

No

ReliabilityFirst has a concern with the VSLs for Requirement R1. In the previous draft, the VSLs for Requirement R1 were gradated based on missing "x" out of nine sub-parts. For example, missing 44% (four out of nine) of the sub-parts was a Severe VSL). With the current draft only including five sub-parts under Requirement R1, the gradation should be adjusted accordingly. ReliabilityFirst believes that an entity not addressing more than half of the sub-parts within the documented communication protocols is missing the intent of the requirement and should be a Severe VSL. Furthermore, if the "...subject to the Reliability Coordinator's approval..." language continues to remain in Requirement R1 (against our recommendations in previous comments), this "Reliability Coordinator approval" needs to be included in the VSLs as well. ReliabilityFirst offers the following as an example for consideration: i. Lower VSL – none ii. Moderate VSL – "...did not develop one (1) of the five (5) parts..." iii. High VSL – "...did not develop one (2) of the five (5) parts..." iv. Severe VSL - "...did not develop one (3) of the five (5) parts..." v. Severe VSL - "The Responsible Entity did not receive Reliability Coordinator approval of its documented communication protocols as required in Requirement R1."

Texas Reliability Entity

No

(1) Definition of Operating Instruction: We remain concerned about potential interference between COM-002 and COM-003. While it has been made abundantly clear in this draft that a Reliability Directive is not an Operating Instruction, it remains unclear exactly where the boundary between them is. We are concerned that an operator faced with an imminent emergency situation will have to stop to consider whether he needs to issue a Reliability Directive or an Operating Instruction, and entities will be subject to second-guessing as to whether they picked the right one. COM-002 and COM-003 should be melded into one coherent standard that will not interfere with system operations. (2) The present draft does not address one-to-many communications (hot-line calls, all-calls), which are commonly used to convey Operating Instructions in critical situations. A repeat-back procedure for those calls should be included in an entity's documented communications protocols. (3) While we respect the desire to avoid writing a "zero-defect" standard, we strongly object to the approach taken in requirements R2 and R3. Compliance with these requirements should not be based on whether a subsequent Reliability Directive was issued. Instead, compliance should be based on whether the communication protocols are routinely and effectively implemented (perhaps using an "identify/assess/correct" approach). The present draft allows system conditions over which the entity may have little control (i.e. luck) to determine whether a deviation from its protocols results in a violation. Importantly, the current draft may create an undesirable incentive for an operator to avoid issuing a Reliability Directive in order to avoid scrutiny of prior Operating Instructions. (4) We also object to basing compliance with R2 and R3 on whether the entity's conduct "resulted in" an adverse operating condition. The existence of a violation should be based solely on the entity's conduct, not on the results of that conduct on system conditions. The proposed approach creates an unmanageable compliance assessment burden, as parties will dispute whether events were causally related, which can be very difficult to conclusively assess. Furthermore, what does "result in" mean? Does it require proximate cause, direct cause, contributing cause, or some other measure of causal relationship? (5) The proposed revisions in COM-003 interact with the revisions in TOP-001-2 to create a reliability gap that will reduce the performance level required by the standards. The existing requirements 3 and 4 of TOP-001-1a require TOP, BA, GOP, DP and LSE entities to comply with reliability directives (not capitalized) issued by a TOP. We interpret "reliability directives" in that standard to include all operating instructions related to reliable system operation, including those that are proposed to be defined as both Reliability Directives and as Operating Instructions. The new version TOP-001-2 (pending at FERC) limits the compliance requirement to only Reliability Directives (defined term), and will no longer require compliance with Operating Instructions issued by TOPs. This problem is enhanced by the proposed definition of Operating Instructions, which now emphasizes that Operating Instructions and Reliability Directives are mutually exclusive. There needs to be a reliability standard that requires compliance with Operating Instructions issued by TOPs, and the absence of such a standard creates a reliability gap.

Three part communications is a standard business practice in transmission and distribution operations across the country. If by chance there is / was a company that was not using three part communications, that company would have had to develop a procedure / policy for three part communications to be compliant with COM-002-2 R2 (COM-002-3 R2 future). Therefore, the proposed COM-003 R1 requiring companies to develop “documented communication protocols” that have to be approved by the Reliability Coordinator is nothing more than a compliance burden to maintain documentation for an audit. Furthermore, COM-003 R3 requires use of three part communications and should be the only requirement in COM-003. Because of COM-002-2 R2 and COM-003 R3, COM-003 R1 is merely a paperwork compliance burden and should be deleted. COM-003 R2 relies on R1 and therefore it should be deleted also. As previously stated, COM-003 should only contain the requirement listed in the current R3.
No
R2 & R3 only have a “Severe VSL” listing - As I understand it, NERC has recognized that “perfect” historical compliance is not practical and is one of the reasons NERC is moving to implement the RAI program. R2 & R3 Severe VSL only listings require 100% perfection - Real life operations is not perfect (as recongnized by the RAI) – VSLs should be a gradient from “lower” to “severe”

Yes
The proposed Standard language appears to address the requirements of FERC Order 693. However, R3 is still confusing and appears to assume that the distribution provider or generator operator would have some way of knowing if an Operating Instruction would “result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” Also, more clarification is needed with respect to the terms "restate", "rephrase" and "recapitulate". We suggest the the following language for R3: “Balancing Authorities, Transmission Operators, Generator Operators and Distribution Providers shall repeat or restate an Operating Instruction given to them when required by the issuer of that Operating Instruction.”

Dominion

Connie Lowe
Yes
Dominion appreciates the SDT efforts on this project as we know it has not been an easy task to satisfy industry concerns while at the same time, addressing FERC directives relative to this issue. We believe that having a requirement that the communication protocol be approved by the RC, while possibly considered an administrative burden by them, greatly enhances consistency of such protocols. And, we greatly appreciate the fact that recipients are required to repeat, restate, rephrase, or recapitulate only when required by those approved protocol.

PPL NERC Registered Affiliates
Brent Ingebrigtson
No
These comments are submitted on behalf of the following PPL NERC Registered Affiliates (PPL): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, on behalf of its NERC registered affiliates. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. PPL has generally supported draft 4 and draft 5 of the COM-003 standard. However, the significant changes proposed in draft 6 introduce ambiguity, as well as several other issues that need to be addressed. First, the proposed definition of an “Operating Instruction” continues to require clarification. PPL NERC Registered Affiliates suggest the following definition to address the above issue: “Operating Instruction - A Real-time Operations command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the Real-time Operations command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information, potential options and/or alternatives to resolve Bulk Electric System operating concerns is not a command and is not an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.” The focus of COM-003 is on operations, and therefore the communications subject to the COM-003 requirement should be those requiring action in the Real-time Operations time horizon — i.e., actions required within one hour or less. (See definition provided in a NERC document at: <a href="http://www.nerc.com/files/Time_Horizons.pdf">http://www.nerc.com/files/Time_Horizons.pdf</a> ). During the Q/A portion of the November 27, 2012 conference call hosted by the SDT, the SDT stated that they intended to narrow the focus of the timeframe of an Operating Instruction to the Real-time Operations time horizon. . Second, there is inconsistency in the wording of some parts of R1. Specifically, PPL

recommends revising part 1.5 as follows: “The instances, if any, where the issuer...” or removing the ‘if any’ from R1.2 and R1.4, since it is redundant to the R1 ‘where applicable’ and the use of ‘when, that, etc.’ in the sub requirements. Third, both R2 and R3 as currently written may not aid in enhancing reliability. PPL suggests R2 be revised to require the BA, RC, and/or TOP provide their communication protocols to the GOPs, DPs with whom they communicate. PPL suggests language for R3 be revised to read as follows: “Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall assess its adherence to the applicable documented communication protocols developed for R1 and R2.” As currently drafted, R2 and R3 appear to require that entities issuing or receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of use of the R1 protocol or of three-part communication. The R2 draft language says that the BA/RC/TOP communication protocols must be developed such that even when the communication protocols are not used, there is still no need for a Reliability Directive. This could imply that if no Reliability Directive is required, the failure to use the protocols created no risk and the communication protocol was not needed. This appears to make inconsequential any reliability benefit of R1 of the Standard. Also, R3 has requirements for entities that may not have received the communication protocols developed by the BA/RC/TOP. Fourth, there is ambiguity introduced in R2 and R3 through the use of the phrase “that requires the issuance.” It is unclear who would determine whether the Reliability Directive was “required.” Likewise, if there are multiple incidents which contribute to the issuance of a Reliability Directive, it is not clear what weight would be given to the lack of use of communication protocols, nor is it clear how that determination is made. Finally, M2 and M3 introduce an expectation that applicable entities will need to coordinate to produce evidence. PPL recommends that M2 and M3 be revised to align with the changes made to R2 and R3 as noted above.

Version 6 of the standard does not explicitly limit the timeframe prior to the issuance of a Directive subject to review for compliance with communication protocol requirements. Additionally, the draft Standard and definition of Operating Instruction do not adequately define instances where Operating Instructions would require 3-way communications. The process by which a Reliability Coordinator approves instances where communication protocols are required will define the substantial requirements in the standard. Establishing the Reliability Coordinator as an approval authority for BA or TOP internal procedures implies the RC will have responsibility for operational activities and/or procedures owned by the BA or TOP and essentially outsources the standard development to the Reliability Coordinator.

No
<p>R3 can present an excessive or even impossible compliance burden, in that all parties receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of three-part communication. This is not a matter of simply obtaining annually a “No known errors” letter from the BA, RC and TOP with which a receiving-end entity is directly involved, since all the neighboring BAs, RCs and TOPs are drawn-in by R3 as well. There is meanwhile no requirement that BAs, RCs or TOPs issue such letters when requested to do so, or that they must share any information at all regarding Reliability Directives issued. This leaves GOPs and other entities that receive Operating Instructions in danger of self-certifying compliance to R3, then being later confronted with evidence of non-compliance from a source from whom they had previously heard nothing. The issue of interpretation also creates undue ambiguity. Who will make the determination of cause when a Reliability Directive is issued, and is that opinion subject to review if objections are raised? If all GOPs in a region were instructed to bring all available generators online at their Emergency Rating due to tripping of a 2000 MW nuclear plant, for example, and the operator of a 10 MW blackstart unit did not respond in the prescribed fashion, and a Reliability Directive ultimately had to be issued to shed some load, did that 10 MW unit “cause” the load shedding? R3 should be revised to match the draft that</p>

was issued for comments several weeks ago, and which the NAGF found acceptable. That is, R3 should state that “Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess, as applicable, System Operators’ and operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1 and R2.”

No

The VRF and VSL language for R3 should be changed to that of the draft version of Draft 6 that was commented-on by the NAGF several weeks ago.

Despite we have always held a position that this standard was not needed given the approved COM-002-3 and the NERC OC’s operating guide on operating personnel communication, we supported the previous version of COM-003-1 (Draft 5) as it was a clearly written standard which would be an acceptable compromise for meeting the FERC directive and BoT’s direction without overburdening industry participants having to repeat every operating instruction. This latest version, Draft 6, however, turns an acceptable standard into one that is ambiguous and provides an escape clause for operating personnel to not comply with the basic requirement (R1). The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues with the standard, as follows: a. The issuance of a Reliability Directive may be caused by a number of reasons, for example: the operating instruction (repeated or otherwise) may not be sufficient to address a potential condition that has an Adverse Reliability Impact; b. The operating instruction that is communicated, with or without adhering to the protocols developed in R1, is in fact moving other system conditions from a reliable state to one that has a potential of having Adverse Reliability Impact, for which a Reliability Directive needs to be issued after implementing the communicated operating instruction. c. The operating personnel may second guess whether or not a Reliability Directive will be issued if the established communication protocols are not implemented (such as by requiring 3-part communication) before it takes the required action. This puts the need to comply with a requirement into a “condition assessment” mode, which defeats the purpose of having a reliability standard to manage risk and meet performance expectation whose reliability outcome are predetermined, not on the fly. d. The added condition is a compliance assessment element with which to gauge violation severity or sanction; itself is not a requirement. By introducing this to the requirement, it convolutes the requirement, adds nothing to meeting the reliability objectives, and may in fact jeopardize reliability. And what if a Reliability Directive was not issued despite the failure of Responsible Entity to implement its communication protocol. Is the Responsible

Entity deemed compliant with the requirement? If so, do Requirements R2 and R3 drive the right behaviors? If not, then what's the value and influence of the added condition in the assessment outcome? Requirement R1 clearly requires the responsible entity to develop documented communication protocols for the issuance of Operating Instructions. By Part 1.5, the instances where the issuer of an oral two party, person-to-person Operating Instruction requiring the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and subsequent actions by the issuer are already clearly stipulated in the documented communication protocols. Responsible entities simply need to implement the protocols as documented, regardless of whether failure to do so would result in having to issue a Reliability Directive, or any other possible outcomes, for that matter. Similar comments apply to Requirement R3 when the responsible entities are required to close out the last part of the 3-part communication.

Yes

We agree with the VRFs, but not the VSL since we do not agree with Requirements R2 and R3. We offer the following two additional comments: 1. We do not agree with the Long-term Planning Time Horizon for R1. Developing and documenting communication protocols for use during real-time operations is an operational planning process (or mid-term planning, at most), not a long-term planning process. We suggest to change the Time Horizon to Operations Planning. 2. The proposed Implementation Plan conflicts with Ontario regulatory practice with respect to the effective date of the standard. It is suggested that this conflict be removed by appending to the effective date wording, after "applicable regulatory approval" in the Effective Dates Section of the Implementation Plan, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." Prior to the wording "; or, In those jurisdiction....". Alternatively, the same language in the Effective Dates Section of the Implementation Plan could be used.

The blackout recommendation 26 had little or nothing to do with operator communications. The recommendation was to implement some type of communication system to keep Regions, NERC and regulators informed during emergencies. Here is the recommendation: "NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date." These are our comments on what is presented in this revision of COM-003-1. • We're generally OK with a requirement to develop a set of communication protocols and whereby the applicable entity does a periodic assessment of its operators' adherence to the protocols. •

While we believe that it is acceptable for a BA and TOP to develop their own protocols, it would be preferable that they be allowed to use a set of protocols developed by the RC. • We disagree that the RC should approve others' protocols. What are the criteria for approval? NERC should not put RCs in the role of de-facto compliance monitors. • There is a likely unintended consequence of the latest draft. This will plant a seed of doubt in an operator's mind whether or not to issue a reliability directive due to the scrutiny and second guessing that will be the outcome of each investigation associated with a directive. This standard will result in investigations associated with each directive. • We were OK with the previous version. We'd be OK with a revision to the current draft if there was an ex post assessment of operating instructions following the issuance of a directive. There should not be a rabbit-trail investigation following the issuance of each directive.

We are electing to not respond directly to this question, as we have expressed concern with the advancement of this project many times in the past. While this draft seems far superior to the others, the proposed change to R1 raises concern over the portion that dictates that the Reliability Coordinator has approval authority over the communications protocols for Operating Instructions. The majority of the Operating Instructions, as defined by the standard, will be between the System Operator at a Balancing Authority or Transmission Operator and their respective field personnel. Communications between System Operators of BAs and TOPs and field personnel have well-established protocols and should not necessarily be held to the same protocol as communications between BAs or TOPs and the Reliability Coordinator. In essence, the proposed change to R1 places the Reliability Coordinator in a position to dictate communication protocols that may breakdown the well-established protocols of the BAs and TOPs and create more burdensome communication with their field personnel.

<p>Requirement 1 does adequately address the concerns. Requirements 2 and 3 are confusing and difficult interpret. It was not until I rea the FAQ on COM-003 that I understood R2 and R3. I believe R2 and R3 should be revsed as described below. R2. R2 needs to indicate that it is only applicable to issuers of Operating Instructions. R2 should be revised to read as follows: Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an Operating Instruction shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. With the change it is clearer that the standard is saying that an issuer of an Operating Instruction is supposed to have a communication protocol(R1). R2 is stating the issuer of an Operating Instruction needs to use the communication protocol and if the issuer's failure to use the communication protocol results in the issuance of a Reliabilty Directive, a violation has occured. R3. R3 needs to indicate that it is only applicable to recipients of Operating Instructions. R3 should be revised to read as follows: Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider that receives an Operating Instruction shall repeat, restate, rephrase, or recapitulate the Operating Instruction when required by the issuer of the Operating Instruction (in accordance with the issuer's communication protocols developed in Requirement R1) so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. With the change it is clearer that the standard is saying that a recipient of an Operating Instruction is supposed to to repeat, restate, rephrase, or recapitulate the Operating Instruction when required by the issuer and if the recipient's failure to repeat, restate, rephrase, or recapitulate the Operating Instruction (as long as it is required in the issuer's communication protocol) results in the issuance of a Reliabilty Directive, a violation has occured.</p>

<p>R1 • The phrase “subject to the Reliability Coordinator’s approval” is included in the requirement, but there is no reference to RC approval in the measure. It is unclear exactly what the expectations are for TOPs and BAs in this requirement. Are they to develop protocols and submit to the RC for approval, and have a record of this approval for compliance evidence? If so, the SDT needs to modify this requirement to make the required actions very clear. EOP-005-2 is an example of the TOP getting approval from the RC on its restoration plan. This may be a better model to use as it is more clear. • In addition, the RC is required to approve its TOPs / BAs protocols; however there is no guidance on what criteria to base this approval on. There needs to be very clear guidance that RCs are to ensure that the protocols are compatible with its protocol and that RCs are not “auditing” the TOPs / BAs protocols to confirm they include all the subparts of requirement R1. R3 • R3 can present an excessive or even impossible compliance burden, in that all parties receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of three-part communication. This is not a matter of simply obtaining annually a “No known errors” letter from the BA, RC and TOP with which a receiving-end entity is directly involved, since all the neighboring BAs, RCs and TOPs are drawn-in by R3 as well. There is meanwhile no requirement that BAs, RCs or TOPs issue such letters when requested to do so, or that they must share any information at all regarding Reliability Directives issued. This leaves GOPs and other entities that receive Operating Instructions in danger of self-certifying compliance to R3, then being later confronted with evidence of non-compliance from a source from whom they had previously heard nothing.</p>

The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues. • The issuance of a Reliability Directive may be caused by a number of reasons, for example: the operating instruction may not be sufficient to address a potential condition that has an Adverse Reliability Impact; • R2 has the unintended consequence of making Reliability Directives a subject of a Root Cause analysis. Whenever a Reliability Directive is issued it would be necessary for the issuer to prove that that Reliability Directive was not linked to an Operating Instruction protocol failure.

While the draft may meet the Blackout Recommendation and Order 693, the draft is problematic and is resulting in Seminole changing its votes from prior affirmation to negative with this ballot. The reasons are: 1. The requirement for RC approval of entity developed communications protocols (R1), which impose an unreasonable administrative and associated cost burden upon all of the applicable entities. 2. The new connection to Reliability Directives issued by an RC, TOP, or BA, which are due to the failure of an applicable entity to properly implement its communication protocols for Operating Instructions, seemingly implies compliance investigation following the issuance of any RC Reliability Directive, for all entities affecting the RC area’s footprint (R2&3). 3. The term Operating Instruction is so broad, that every System Operator communication might require logging, recording and compliance review.

No

The VSL’s are far too high given the ambiguity inherent to the R2 and R3 requirements as written.

Individual

Greg LeGrave

Wisconsin Public Service Corp

Also, since enforcement and compliance under Version 6 hinges on a Reliability Directive being issued, am I correct to assume that if emergency conditions requiring actions on the BES were to occur, but an issuing entity failed to announce their request for action as a Reliability Directive – then NO Directive was issued, and therefore there could be no COM-003 violation for that event and no need to analyze if preceding Operating Instructions were given which may have lead up to the Emergency condition? Note: COM-003 Rev. 6, R3 “... an operating condition that requires the issuance of a Reliability Directive...” so put another way, what if a Reliability Directive was required – but not clearly identified as in COM-002 V3, R1? The future COM-002 V3, R1 requires an issuing RC, TOP, or BA (or LBA) in part, to clearly call a Reliability Directive a Reliability Directive. I couldn’t find similar language for Operating Instructions in Rev. 6 of COM-003. Is it intended that this will need to be included in each entities communications protocol, along with the need for the issuing entity to clearly communicate “...and I will need you to repeat this back.”? My concern here is that while I like the SDT’s approach with R3 in Rev. 6, if only R3 applies to DP’s and GOP’s (and therefore they are not required to have or to implement communications protocols), if the issuer of an Operating Instruction doesn’t clearly identify it as such AND tell the recipient in advance that he requires a repeat-back, it will be difficult for the recipient who is a DP or GOP to meet the R3 requirement. Conversely, based on the high number of Operating Instructions occurring each day, perhaps it was the intent of the SDT that DP’s and GOP’s which are limited to simply how to respond to Directives and/or Instructions with repeat-backs. Please clarify. Lastly, I mentioned the concern under M3. Rather than just stating it is confusing, I’m listing a proposed change for consideration if the Standard doesn’t get approved as is. We hope it is more clear in its wording and its expectation that the issuer of any Directive should lead efforts to complete an analysis of what lead up to a Directive. Draft 6 proposal for M3: Each Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator shall provide evidence that it did not experience a failure to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required, that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or by another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use the protocols. A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence. WPS proposal for M3: The issuer of a Reliability Directive shall provide evidence that a failure to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required, resulted in an operating condition that required the issuance of a Reliability Directive. A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.

It addresses parts of each. While a reliability standard may not be the most appropriate control to address the reliability concern, this standard, in conjunction with COM-003-2 does address the Standards Authorization Request to require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. There is concern with making protocols (and any revisions) available to those who are expected to comply. R1 states that the RC must approve; M1 states that each...shall provide. It is not clear that those who must comply will have the latest version. Suggest that the Measure be tightened up to state that the RC must provide the approved communication protocols to the .... in thier footprint.

Similar to Restoration Plans, Registered Entities are capable of coordinating communication protocols with their neighbors without Reliability Coordinator approval. Minnesota Power recommends removing Reliability Coordinator approval from the Requirements.

We agree on a very limited view that Recommendation 26 is addressed. However, when looking at reliability we are concerned that the administrative burden, and uncertainty of which Operating Instruction will become a Reliability Directive may negatively impact BES reliability in the reluctance of issuing a Reliability Directive. Therefore, we strongly recommend that the SDT review this draft and redraft to clarify these points. Measure 3 should be changed to "when required by the issuer" in order to provide clarity and consistency with R3. In addition, we believe that a statement needs to be added in R1 that includes providing or distributing those communication protocols developed by a BA or TOP to their associated DPs and GOPs. This would address a potential gap of DPs and GOPs not aware of the communication expectations when communicating with BAs and TOPs when given an

Operating Instruction.
The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.

(1) While we understand that there are numerous approaches to satisfy the FERC order and the 2003 Blackout Report, we disagree that the drafting team addresses these concerns in a measurable and uniform process. The FERC Order and the Blackout Report both call for a “tightening of communications.” We are not convinced that giving the RC the authority to approve communication protocols will result in less confusion and a tightening of communications. There are currently 15 Reliability Coordinators in the NERC Compliance Registry, which leaves 15 opportunities for inconsistent application of what constitutes an “Operating Instruction.” (2) Further, we are concerned that by granting the Reliability Coordinator the authority to approve a registered entity’s communication protocol, there may be differing protocols among the various RC areas, which would negatively impact registered entities that are located in more than one RC area. For entities that operate in multiple RC areas, there could be different criteria for what constitutes an Operating Instruction, differing line and equipment identifiers, and other nuances that result in confusion and lead to an increase in miscommunication. The standard does not require uniform communication protocols among the various Reliability Coordinators. (3) In addition, how would an entity communicate to a neighboring BA and TOP who are in a different RC area with different protocols? This draft poses significant issues for registered entities located on the seams of RC areas that communicate to other entities in other RC areas. (4) We have an issue with the language in the Measure M2. Measure M2 requires a registered entity to prove the negative that no reliability directives occurred. This presents an issue because some regions are reluctant to accept attestations as evidence. This approach is an increased compliance burden on registered entities. This draft did not include an RSAW for review and we recommend the drafting team provide further clarification that an attestation is acceptable for compliance and continue to work with NERC compliance on this issue. (5) Finally, we disagree with the revised definition of Operating Instruction and the approach of Requirement R2 and R3. Under the revised definition, an Operating Instruction is separate from a Reliability Directive, but an entity will only be in violation for failing to communicate effectively that would result in the issuance of a Reliability Directive. This is double jeopardy. An entity could be in violation of both COM-002 and COM-003 for failing to communicate effectively that results in an event on the Bulk Electric System. This issue has been stated in our earlier comments that the definitions and the two COM standards would be better as a combined standard instead of the separate projects to avoid this potential compliance issue.
No

(1) We disagree with the VSL for R1. The compliance violation should fall on the RC for failing to approve the communication protocol and it should be up to the RC to ensure the sub-parts 1.1 through 1.5 are included in the protocol. Under the current draft, the RC has approval authority without any accountability. The VSL would find the entity in violation of R1, even though it would be at the mercy of the RC to approve its protocol. (2) The VSLs for R2 and R3 imply that a violation of COM-002 also occurred. We cannot support a standard that has the potential for multiple violations.

AECI strongly supports the SERC OC Q1 comments posted for this draft. In addition, AECI believes that COM-003 fails to properly address related topics found within the August 2003 Blackout Report Recommendation number 26 and FERC Order 693, primarily because of the SDT's having included DPs within the COM-003 scope, and thereby overreaching these two citation's intended scope. In the case of the August 2003 Blackout Recommendation 26, while its terse two-sentences appear to be met by COM-003, the same report's pp 161-162 clarifies its intended scope being "during alerts, emergencies or critical situations." That same section's "particularly during alerts and emergencies", might be stretched to include COM-003 Operating Instructions for DPs, yet FERC's determination, expressed within Order 693 paragraphs 493, 509-512, suggests that NERC COM-003 is attempting to tread where FERC itself dared not go. Within that paragraph 493, FERC's rationale cites no more than "when generators with blackstart capability must be placed in service and nearby loads restored as an initial step in system restoration", in support of exercising governance over DP telecommunications. These two limited conditions for communication appear confined to COM-002, and not COM-003's drafted governance over external communications with DPs. Paragraph 509's real-time staffing requirement omits DPs. Paragraph 510.3 cites DPs as applicable under COM-002, and 510.4 "requires tightened communications protocols, especially for communications during alerts and emergencies" and then par 510 goes on to propose a new standard (COM-003?) for addressing the Blackout Report Recommendation 26. Paragraph 512's assertion "that, during both normal and emergency operations, it is essential that the transmission operator,

balancing authority and reliability coordinator have communications with distribution providers" appears to conflict with earlier par 509 with regard to levels of "essential", and then asserts that many DPs are "not a user, owner or operator of the Bulk-Power System" so not required to comply with COM-002 (nor therefore COM-003). However COM-003 fails to provide for such differentiation within its Applicability section 4.1.2, for its scope of governance over DP communications during "normal operations". AECI recommends that DP applicability be dropped from COM-003 and reserved for COM-002 where these citations rationale for inclusion is clear. Finally, because industry balloting appears highly conflicted over the terms under which COM-003's rules would be developed, AECI strongly suggests that the SDT limit scope to only communications between RCs and their external communicating parties. This stance would have stronger backing from the above citations, and would make more sense, because only RCs communicate changes to the BES. New governance over the exact manner in which communicated changes become executed, is where industry appears to have heartburn. This may be occurring because much of industry has already tweaked and tuned those operational methodologies long before RCs came into existence, and therefore see much greater Compliance risk being ventured, for relatively little BES-reliability gains.

No

See AECI comment to Q1 above, with respect to DPs. While the SDT did follow Guideline 5, the resulting VSLs with respect to communication with these functional entities under normal operating conditions, hardly merits a medium risk assessment, whereas COM-002 might. Further, the SDT's VRF and VSL justification for COM 003-1, R2 "FERC VRF G1 Discussion" assertion that R2 is consistent with Recommendation of 26...", ignores the same report's "particularly during..." qualifier. See AECI response to Q1 above.

Seattle remains confused as to the intent of the draft Standard. R1 appears to require a protocol for communications that need not be followed in R2 or R3, because only communications problems leading to a Reliability Directive are to be audited. Seattle does not know if this position satisfies the FERC Order or the SAR. As proposed, the present Standard draft could be simplified to a single requirement to "communicate in such a way as to avoid Reliability Directives." On the other hand, if the intent is to REQUIRE three-way communications, then present draft R2 and R3 do not do so.

The NSRF does not believe that this Standard is necessary to address recommendation 26 of the Blackout Report, thus this project should be terminated. The NSRF suggests that COM-002-3 be filed with FERC as approved by the NERC BOT, as we believe it adequately addresses the Blackout recommendation 26 and FERC Order 693. However, if the NERC SC wants to continue with this development, we provide the following recommendations. For Measure 2 and Measure 3, the SDT is requiring each registered entity to 'prove the negative' by requiring each entity to demonstrate that each Operating Instruction issued by its System Operators did not result in an operating condition that required the issuance of a Reliability Directive. From the webinar on July 2, the SDT stated that all an entity needs to do is request an attestation letter from its, RC and neighboring TOPs and BAs. Some entities are reluctant to issue such blanket attestation letters and some Regional Entities do not accept attestation letters as proof of compliance. The SDT went on to say the Reliability Directives are rare. The NSRF suggests changing M2 & M3 to state: M2. When a Reliability Directive is issued, demonstrate that it was not the result of a Reliability Coordinator, Transmission Operator or Balancing Authority's failure to use documented protocols when issuing an Operating Instruction developed for Requirement 1. M3. When a Reliability Directive is issued, demonstrate that it was not the result of a failure of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator or Distribution Provider to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required by another Reliability Coordinator, Transmission Operator or Balancing Authority.

<p>We appreciate the drafting team’s efforts and persistence in the drafting of this new standard. We believe that this proposal goes beyond what was contemplated in the Blackout Recommendation as well as FERC Order 693 directives 1 and 3 of paragraph 540. We urge the drafting team to reconsider the need for a new COM-003 standard, we already have a standard</p>

for communication (COM-002), the requirements of the FERC Order can be added to COM-002 with minimal effort reducing the need for yet another standard. Additionally, we feel that a new term to define "Operating Instruction" is not warranted or required to fulfill either the FERC directive or Blackout Recommendations.

No

No, we believe that the minimal changes to address the FERC directives and Blackout Recommendations should be included as a revision to COM-002, not in a new Standard. Additionally, the requirements to develop and document protocols were not contemplated or warranted in either the FERC Directives or the Blackout Recommendations. We recommend that the drafting team reconsider their decision to develop a new COM-003 and investigate incorporating the requirements into the existing COM-002.

Although FMPA voted affirmative, there are still significant improvements that can be made, and enough significant weaknesses remain to make this a difficult voting decision for FMPA. It still artificially separates COM-002-3 and Reliability Directives and COM-003-1 and Operating Instructions when in reality Reliability Directives (RD) are a subset of Operating Instructions. Contrary to the white paper, there will likely be confusion as to whether an instruction should or should not be a Reliability Directive, i.e., the only real difference is whether an Emergency condition exists or not. The only certain distinguishing factor in practice is that the issuer of an RD needs to identify it as an RD per COM-002-3. There will still be significant Monday morning quarterbacking after an event as to whether an Operating Instruction should have been issued as an RD or not, i.e., whether or not the issuer should have recognized an Emergency or not. The better solution is to treat RD and Operating Instructions the same and only differentiate with VRFs (as an analogy, look at difference between R1 and R2 of FAC-003-2) and whether there should be a difference in treatment regarding "zero tolerance" for RDs and some tolerance for Operating Instructions. Reliability Directives on "all-calls" are still a problem It still makes 3-part communication optional for Operating Instructions. Does "optional" meet FERC's directive, i.e." requires tightened communications protocols, especially for communications during alerts and emergencies" (Order 693, P 540) and "(w)e also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis ... This is important because the Bulk- Power System is so tightly interconnected that system impacts often cross several operating entities' areas."

(Order 693, P 532)? At minimum, the standard should require 3-part communication for alerts in addition to Emergencies. R2 and R3 try to limit potential violations for failure to follow the subject of the requirement (i.e., R2: “Each (responsible entity) shall implement its communication protocols developed in Requirement R1”) would not actually result in a violation unless an Emergency occurred as described in the predicate, (e.g., R2: “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive ....”). Remember, Reliability Directives are only given in a state of Emergency (Reliability Directive: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact”). Does this serve reliability well, must we get to a state of Emergency to have a violation to the standard – and doesn’t that just highlight potential double jeopardy and overlap between COM-002-3 and COM-003-1, e.g., if an Operating Instruction is issued in COM-003-1 that is not followed that results in the same instruction being given as a Reliability Directive? This of course begs the question of whether or not the System Operator should have issued an RD in the first place. Does this address FERC’s requirement to tighten communication protocols, including emergencies and alerts? In addition, we don’t think the actual language limits the potential violations to those that meet the predicate as intended (i.e., we do not think the predicate – “so that ...” – modifies the subject so much as it describes and repeats the purpose of the standard. In other words, to us the requirements can be interpreted that the subject must always be met “so that” the purpose/predicate is accomplished. Hence, we do not think that it solves the zero tolerance issue without stating the requirement in a similar manner as the Measure is stated). Note that the Measure confirms that an Emergency is intended for potential violation: “Each (responsible entity) shall provide evidence that it did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive ...”. We still strongly believe that the better solution is to cause COM-003-1 to address Reliability Directives and retire COM-002-3. After all, when issuing a Reliability Directive, don’t we want the issuer to speak English, use a consistent clock time with their neighbors, etc., for which COM-002-3 is silent but COM-003-1 specifies? We still have not heard a good reason why this is not being done. We also think that it is necessary to require 3-part communication for “alerts” to meet FERC’s directives. Don’t we want 3-part communication to be followed during alerts?

John Brockhan

CenterPoint Energy Houston Electric LLC.

No

No

As stated in its Draft 5 comments, CenterPoint Energy firmly believes there should be no High or Severe VSL for simply failing to document a process, protocol, or procedure. It is

counterintuitive to allow for a scenario where an entity's System Operators are communicating effectively and correctly and yet that has the entity penalized with the highest severity level for not having the appropriate documentation. Additionally, CenterPoint Energy disagrees with the assignment of Severe VSL for R3, when a comparable violation in COM-002-3 R2 is also a Severe VSL. The VSL for failing to repeat an O.I. and for failing to repeat an R.D. should not be the same. CenterPoint Energy also has concerns with the following two aspects of Draft 6: 1. CenterPoint Energy disagrees with R1's stipulation that the RC must approve the BA's and the TOP's communication protocols, especially given the SDT's assertion that a possible outcome is for the RC to unilaterally develop the protocols and impose them on the BA and the TOP. Instead, CenterPoint Energy recommends that R1 be modified to state "Each Reliability Coordinator shall develop, and each Balancing Authority and Transmission Operator shall develop collaboratively with the Reliability Coordinator, documented communication protocols..." 2. CenterPoint Energy appreciates the efforts of the SDT to revamp COM-003-1 so that its Operating Instruction is compartmentalized from COM-002-3's Reliability Directive, effectively reducing the industry's compliance burden. However, the revision does not ease a System Operator's practical operational burden of having to distinguish in real-time whether a command that is about to be issued is an O.I. or an R.D. Rather than focusing solely on maintaining the integrity of the BES, an Operator may now be distracted by what to label that command and the consequences of assigning the incorrect label. The industry and NERC have been working on the proposed COM-003 standard for nearly four years, ever since the posting of draft 1 in 2009. The proposed standard is now at draft 6, and it is becoming apparent that the industry is struggling to achieve consensus on the specifications for COM-003. Furthermore, it's been more than nine years since the release of the Blackout Report and six years since Order 693. In that interim, the industry has improved and evolved in numerous areas, including operator communication effectiveness. Most of all, the industry and NERC have already approved COM-002-3 and its associated definition of Reliability Directive, which, once enforceable, will undoubtedly further tighten communication. Perhaps it is time then for NERC and the industry to start a dialogue with FERC to reevaluate the purpose and the need for COM-003 and to request from FERC refreshed, clear guidance on this subject.

Indiana Municipal Power Agency

There is no place to submit "other" comments, so Indiana Municipal Power Agency (IMPA) is submitting comments under this question. For requirement R3, how will entities (BA, TOP,

GOP, and DP) who are responsible for the repeat back of the Operating Instruction know the “when required by the issuer” part of the requirement is in place or being required by the issuer? Will the issuer be stating their request is an Operating Instruction or be asking for the receiver to please repeat the Operating Instruction back to them? Maybe the issuer of the Operating Instruction can make their communication protocol available to the receiving entities in Requirement R3 to allow them to be familiar with their protocols which may help with know when a repeat back is required by the issuer.

Individual

HHWP

No

The draft standard does not clearly articulate the purpose nor an appropriate results based approach to addressing FERC objective to ensure clear communications between operators and users of the BES.

Group

Bureau of Reclamation

Erika Doot

No

The Bureau of Reclamation believes that the proposed changes to COM-003-1 do not adequately address Order 693 directives or 2003 Blackout Report Recommendation No. 26. First, Order 693 Paragraph 512 directed the ERO to modify COM-002-2 to address “both normal and emergency operations,” and because each Transmission Operator (TOP), Balancing Authority (BA), and Reliability Coordinator (RC) is able to design their own Operating Instructions under R1 of the proposed revision, Reclamation is unable to ascertain whether Operating Instructions will apply to normal operations. Second, Paragraph 532 of Order 693 specified that “an integral component in tightening [communication] protocols is to establish communication uniformity as much as practical on a continent-wide basis.” As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. Third, the 2003 Blackout Report Recommendation No. 26 specified that NERC should improve internal and external communications during “alerts, emergencies, or other critical situations.” Under the proposed definition of Operating Instruction and R1, it seems that BAs and TOPs have discretion to determine under what conditions Operating Instructions are issued in their operating area, so it is not possible for Reclamation to determine whether Recommendation No. 26 is adequately addressed by the standard. In addition, Reclamation would like to emphasize that the revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination (“discussion of general information and potential options?”), Operating Instructions (applicable in circumstances as defined by various TOPs and

BAAs), and Reliability Directives (real-time emergency conditions addressed by COM-002). COM-003 does not clearly define the timeframe for Operating Instructions, and should make clear what the line of demarcation is between “real-time emergency” communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which “Operating Instructions” apply, Reclamation believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. Also, Reclamation does not believe that violations of R3 should be tied to a failure to repeat an Operating Instruction only if it “result[s] in an operating condition that required the issuance of a Reliability Directive.” To reinforce the importance of repeat-back communications, repeat-back communications should be required under all circumstances like in the aviation industry. Further, Reclamation believes that Generator Operators (GOPs) and Distribution Providers should provide concurrence or have a role in Operating Instructions development required under R1 to avoid potential miscommunications (e.g., in nomenclature for Transmission interface elements). Lastly, Reclamation believes that COM-002 should include provisions parallel to IRO-001 and TOP-001 that allow Generator Operators to inform the TOP, BA, or RC that they are unable to comply with an Operating Instruction because the actions requested “would violate safety, equipment, regulatory or statutory requirements” so that the TOP, BA, or RC “can implement alternate remedial actions,” If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their “inability to perform” the Operating Instruction like they are able to inform the TOP, BA, or RC of the inability to perform a Reliability Directive. The Bureau is proactive about assisting with transmission system events, but at certain times of year dramatic changes in reservoir levels could endanger the public in reservoirs or on rivers, could cause unlawful total dissolved gas (TDG) levels, or violate Endangered Species Act requirements. Other safety and equipment circumstances could also lead to an inability to follow an Operating Instruction. Reclamation suggests that the previous draft of the standard was clearer and that perhaps the drafting team could revisit it.

No

Reclamation does not believe that R3 should only be accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP “Operating Instruction” protocols could vary significantly among BAs and TOPS. Reclamation reiterates that if the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their “inability to perform” an Operating Instruction because it “would violate safety, equipment, regulatory, or statutory requirements” so that the Operating Instruction does not become a Reliability Directive. Reclamation suggests that the drafting team develop thresholds for failure to repeat that would amount to low, medium, high or severe violations.

<p>We support this proposed draft (version 6) of the standard on the basis of it being a compromise between what the industry would like to see and what the US regulator is mandating. That said, we still have concerns with the proposed standard (comment below). As proposed, the standard may be ambiguous and difficult to measure. For example, Requirement 2, states that the entity shall implement its communication protocols in such a way that failure to use them would not result in an operating condition that requires the issuance of a Reliability Directive. How does the SDT envision enforcing such requirement? It is difficult to determine if the failure to follow the protocols when addressing Operating Instructions is truly the reason for a new operating condition that requires issuance of a Reliability Directive or is the result of the original instruction being insufficient or in error. Also, the corresponding measure M2 puts the burden on the entities to provide evidence that it did not have any such cases. We see this as an ever encompassing and burdensome approach for collecting and presenting evidence. The issue of three-part communications has always been very central to the development of this standard. So far the SDT has not been able to produce a draft standard to achieve industry consensus on this issue. While at least partially addressing FERC orders, we believe that the approach the SDT chose, makes the day-to-day duties inside the control room more complicated, cumbersome and hard to implement. If the current version 6 does not achieve the required industry approval rate, we still stand by our prior comments and consideration should be given to modify the COM-002 standard to incorporate into it the matters that COM-003 has been trying to address, all in one communications standard.</p>

TAL has voted NO because the standard is still not “clear and unambiguous”. TAL is concerned at the degree to which the proposed standard complicates compliance for Operating Instructions without benefit to reliability. The FERC Directive was to tighten communications during Emergencies and Alerts. Operating Instructions deserve separate consideration under the standards. Requiring an entity’s procedure to be subject to the Reliability Coordinator’s approval creates an undue burden on the RC with no measurable improvement in reliability. While this addressed a commenter’s concerns over uniformity within RC control areas, it would be simpler and more efficient to have the RC create a procedure and provide it to all the entities in the footprint. Measure 3 should be changed to “when required by the issuer” in order to provide clarity and consistency with R3.

As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. The revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination ("discussion of general information and potential options"?), Operating Instructions (applicable in circumstances as defined by various TOPs and BAs), and Reliability Directives (real-time emergency conditions addressed by COM-002). COM-003 does not clearly define the time frame for Operating Instructions, and should make clear what the line of demarcation is between "real-time emergency" communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which "Operating Instructions" apply, Reclamation believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. COM-003 should include provisions parallel to IRO-001 and TOP-001 that allow Generator Operators to inform the TOP, BA, or RC that they are unable to comply with an Operating Instruction because the actions requested "would violate safety, equipment, regulatory or statutory requirements" so that the TOP, BA, or RC "can implement alternate remedial actions," If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" the Operating Instruction like they are able to inform the TOP, BA, or RC of the inability to perform a Reliability Directive.

No

R3 should only be accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP "Operating Instruction" protocols could vary significantly among BAs and TOPS. If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" an Operating Instruction because it "would violate safety, equipment, regulatory, or statutory requirements" so that the Operating Instruction does not become a Reliability Directive. The drafting team should develop thresholds for failure to repeat that would amount to low, medium, high or severe violations.

Duke Energy
Yes
<p>Duke Energy agrees in part that draft 6 of the proposed COM-003-1 does address the recommendations of the 2003 Blackout Report, FERC Order 693, and the COM-003-1 SAR. However, Duke Energy believes that this draft has gone beyond the expectations outlined in the documents mentioned above. Measure 3 should be changed to “when required by the issuer” in order to provide clarity and consistency with R3. Requirement 2 language leads to uncertainty (risk) as to when an Operating Instruction will become a Reliability Directive. This could negatively impact BES reliability in creating reluctance, by the entity, to issue a Reliability Directive and furthermore places Operators in the position of acting in compliance with the Requirement at the time only to be deemed non-compliant later when circumstances change. This is an untenable position and leads to less reliability. Such a finding of non-compliance cannot be mitigated leaving the Responsible Entity without means to “control” performance. We are also concerned with the language in Requirement 2 “so that”. This vague language can be interpreted as to intent which is unmeasurable and therefore adds to the uncertainty (risk). In addition, Duke Energy believes that a statement needs to be added in R1 that includes providing or distributing those communication protocols developed by a BA or TOP to their associated DPs and GOPs. This would address a potential gap of DPs and GOPs not aware of the communication expectations when communicating with BAs and TOPs when given an Operating Instruction. Lastly, while Duke Energy applauds the efforts made by the SDT, we are not convinced that a standard can be developed that will garner the requisite support from industry stakeholders. Duke Energy recommends the SDT to delineate other options, such as a Guideline document or White Paper, before addressing the recommendations in the 2003 Blackout Report.</p>
No
<p>Duke Energy believes that the VSL(s) need to use the same language as in the standard requirements. In order to stay consistent with the VSL(s), we believe that “Functional Entities” should be replaced with “Responsible Entities” in the Applicability Section of this standard.</p>

Pacific Gas and Electric Company

No

Pacific Gas and Electric believes that the proposed changes to COM-003-1 do not adequately address Order 693 directives or 2003 Blackout Report Recommendation No. 26. First, Order 693 Paragraph 512 directed the ERO to modify COM-002-2 to address "both normal and emergency operations," and because each Transmission Operator (TOP), Balancing Authority (BA), and Reliability Coordinator (RC) is able to design their own Operating Instructions under R1 of the proposed revision, PG&E is unable to ascertain whether Operating Instructions will apply to normal operations. Second, Paragraph 532 of Order 693 specified that "an integral component in tightening [communication] protocols is to establish communication uniformity as much as practical on a continent-wide basis." As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. Third, the 2003 Blackout Report Recommendation No. 26 specified that NERC should improve internal and external communications during "alerts, emergencies, or other critical situations." Under the proposed definition of Operating Instruction and R1, it seems that BAs and TOPs have discretion to determine under what conditions Operating Instructions are issued in their operating area, so it is not possible to determine whether Recommendation No. 26 is adequately addressed by the standard. In addition, PG&E would like to emphasize that the revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination ("discussion of general information and potential options?"), Operating Instructions (applicable in circumstances as defined by various TOPs and BAs), and Reliability Directives (real-time emergency conditions addressed by COM-002). COM-003 does not clearly define the timeframe for Operating Instructions, and should make clear what the line of demarcation is between "real-time emergency" communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which "Operating Instructions" apply, PG&E believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. Also, PG&E does not believe that violations of R3 should be tied to a failure to repeat an Operating Instruction only if it "result[s] in an operating condition that required the issuance of a Reliability Directive." To reinforce the importance of repeat-back communications, repeat-back communications should be required under all circumstances like in the aviation industry. The use of three-way communication has been proven as an effective error prevention tool in the military, aviation, and in the nuclear power industry. It is time that the same discipline and rigor be implemented in the electric industry. The current version of this Standard is moving away from reliability and will be difficult for compliance and enforcement. Further, Generator Operators (GOPs) and Distribution Providers should provide concurrence or have a role in Operating Instructions development required under R1 to avoid potential miscommunications (e.g., in nomenclature for Transmission interface elements). PG&E suggests that the previous draft of the standard was clearer and that perhaps the drafting team could revisit it.

No
PG&E does not believe that R3 should only be accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP "Operating Instruction" protocols could vary significantly among BAs and TOPS. Reclamation reiterates that if the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" an Operating Instruction because it "would violate safety, equipment, regulatory, or statutory requirements" so that the Operating Instruction does not become a Reliability Directive.

Puget Sound Energy
Denise Lietz
No
Puget Sound Energy appreciates the drafting team's work to simplify the requirements of this standard and believes that the standard's language is moving in the right direction. However, Puget Sound Energy cannot vote to approve this standard for the following reasons. Requirement R1, by requiring the Reliability Coordinator (RC) to approve each communication protocol, is unnecessarily burdensome on the RC and all the entities that must receive that approval. This type of approval makes sense for restoration plans (EOP-005-2) because of the required coordination in an emergency situation, but not for the communications protocols that apply in non-emergency situations. There is certainly a benefit to uniformity of communication protocols within an interconnection; however, uniformity should be achieved by requiring the RC to specify its requirements for communication protocols and then requiring Balancing Authorities and Transmission Operators to comply with that specification (similar to the approach of IRO-010). There should be an additional requirement for Reliability Coordinators, Balancing Authorities and Transmission Operators to provide information about the communication protocol requirements that apply to other entities within their area to those entities. It is only appropriate to hold an entity responsible for complying with communication protocol requirements when it has advance notice of what those requirements will be. The language connecting miscommunications to Reliability Directives in requirements R2 and R3, along with the associated VSLs, should address degrees of compliance. While the approach does narrow the scope of possible violations, it seems that the language could easily lead to a debate on whether a miscommunication "results in" an impact. Typically, events have many elements that contribute to their occurrence and in some cases a miscommunication might only indirectly or tangentially relate to the event. Given the assigned VSL of severe for all violations of these requirements, a miscommunication with an indirect relationship to a subsequent Reliability Directive will likely have the same compliance impact as one that has a more direct and substantial relationship. Thank you for your consideration of these comments.

<p>FERC Order 693 states "We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis." R1 allows each BA, RC, and TOP to develop their own, separate communication protocols. Criteria 1.1 thru 1.5 are open-ended. As a result, each BA and TOP will have different protocols that they submit to the RC for approval. The standard does not give RCs guidance on how to evaluate submitted protocols for consistency/uniformity before approval. Without such guidance, it is unclear how consistency and uniformity will be promoted among the various BA/TOP documented protocols. Furthermore, if such criteria were added, the standard would still only promote uniformity within an RC footprint. It would not promote uniformity across the continent, as directed within Order 693, or even the regions. It seems the only way for the SDT to fully address the FERC directive, is for the SDT to specify the specific protocols they want BAs TOPs and RCs to use. Many entities are opposed to this approach because they are concerned about monitoring and maintaining compliance with such a standard. These concerns could be alleviated if the SDT writes the standard in a way such that a violation only occurs if a BES Emergency results from failure to use the specified protocols.</p>

No
<p>PJM does not support Draft 6 of this standard. There is a concern specific to the potential, unintended compliance responsibility in R2 because of the way the requirement is written, as well as the associated M2. Applicable entities will be required to prove a negative which may result in unnecessary Root Cause Analysis (RCA) efforts that are not required and are solely performed to satisfy an administrative, compliance item, yet adds no discernible reliability value.</p>

While we agree that the proposed Standard addresses the FERC Order 693, we do not feel that R3 is well drafted and assumes that the distribution provider or generator operator would be able to determine if the Operating Instruction would “result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” In addition, the dictionary term for restate, rephrase, or recapitulate all have the same meaning and it seems odd that an auditor would be able to distinguish any difference. We suggest the drafting team simplify R3 as follows: “Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat or restate an Operating Instruction when required by the issuer of an Operating Instruction.”

Yes
While draft 6 of COM-003-1 is largely acceptable, the wording of R3 may create confusion about what is required. R3 reads, in part: R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so ... This language suggests that the receiving entity must know what is in the issuer's communication protocol and repeat, restate, rephrase or recapitulate the Operating Instruction without any prompts from the issuer. If that is the case, then there needs to be a requirement that the developer of a communication protocol must provide that communication protocol to all relevant parties prior to implementation. However, after reading the Technical Justification, that doesn't appear to be the intent. Rather the intent is that the issuer will request the receiver to repeat the Operating Instruction back during the phone call. To make that clear, Luminant suggests the following language change to R3: R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when requested by the issuer of an Operating Instruction in accordance with the communication protocols developed in Requirement R1 so ... With this change, we would be in support of this draft standard.

<p>The SRC has reviewed the current COM-003 posting and offer the following comments that augments previously provided comments on the standard. • Requirement R1 now requires each BA and TOP’s to have protocols approved by the RC. One question certain SRC Members have is whether the RC is being asked to “assess” whether the BA/TOP’s protocols are “compliant” with the Standard. Another question is whether the RC is being asked to “approve” the TOP communication protocols with other Registered Entities (e.g., TOs). Depending on the answers to these questions, the SRC proposes that the “approval” requirement could be revised to a “coordination” obligation. • Requirement R2 now has add a trigger for non compliance for not implementing the communications protocol if following an operating instruction, a reliability directive is issued to correct the problem caused by a failure to implement its communication protocol. We ask NERC to comment on whether this will produce an obligation for compliance authorities to begin a compliance investigation on every Reliability Directive to assess whether communication protocols were followed. Reliability Directives are an important means of communications to address all emergencies. Poor communications have yet to be clearly identified as a root cause. The SRC would also like NERC and the SDT to consider comments provided by NERC at the recent FERC Technical Conference stating, ‘complementary approaches should also be examined where the risks to reliability can effectively be mitigated through other means, such as through guidelines, data collection or other technical approaches.’ NERC should continue to consider the effectiveness of the NERC Operating Committee communications protocol. Note, ERCOT and PJM, members of the IRC Standards Review Committee did not join these joint comments and have submitted individual comments.</p>

Colorado Springs Utilities
No
<p>Colorado Springs Utilities appreciates the commitment and long, hard work of the Drafting Team as well as the opportunity to comment on this draft. R.1: The clause, “subject to the Reliability Coordinator’s approval” is unclear in its intent. If the intent is that the RC must review and approve all Communication Protocols, there should be discrete requirements (a la EOP-005-2 &amp; EOP-006-2) in the Standard. If that is not the explicit intent, what is? If the intent is to make it optional or suggested for the RC to review and approve Protocols, then that is not a Standard – it is a suggestion. Please state whatever is the intent clearly in the requirement. CSU proposes the clause be removed entirely. R1.3: Should be removed. This requirement is redundant to TOP-002-2.1b, R18; “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” R2 &amp; R3: CSU prefers the language along the lines of the previous draft (R2 &amp; R4). The clause, “failure to use the protocols by the issuer of an (or R3- failure to repeat, restate, rephrase, or recapitulate the) Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive” is unworkable, probably unauditible, and definitely an evidentiary nightmare. If one entity issues a Reliability Directive, what chain of evidence from how many other entities is required to prove that no other entity failed to use its communications protocols in such a way that failure resulted in the operating condition requiring the first entity to issue a Reliability Directive? Or, to view it from the other direction: if CSU is being audited on compliance with COM-003-1, how shall it prove that it did not have a failure to properly implement any communication protocol which then contributed to operating conditions which may have required any other reliability entity in the western interconnect to have to issue a Reliability Directive? How does one establish the causal relationship, or lack thereof? In lieu of a return to the previous draft’s language, CSU recommends adding another sub-part to R1, “R1.6 A method to assess System Operator’s communication practices and implement improvements as necessary to meet the expectations in its documented communications protocols developed for this Requirement.” Then R2 could be written, “Each ... shall implement its communication protocols developed in R1.” R3 could state, “Each ... shall repeat, restate, rephrase, or recapitulate an Operating Instruction, when required by the issuer in its communication protocols developed in requirement R1, to the</p>

satisfaction of the issuing System Operator.” M2 & M3: Reliability Standards need to get away from asking for negative evidence. The Standard is probably written incorrectly if negative evidence is required for compliance. Even sticking with the negative theme; “Each ... shall provide evidence that it did not fail to use its documented communications protocols developed for Requirement R1 in a way that resulted in an operating condition that required <anyone> to issue a Reliability Directive,” comes closer to supporting the Requirement as drafted. Thank you! Sincerely, Colorado Springs Utilities

**Comments - Eizans:**

In response to request for comment number 1 and a literal reading of the question and associated documents:

The August 2003 Blackout Report Recommendation number 26 speaks to “tightening communication protocols, especially for communications during alerts and emergencies.” In the context of the entire document, it highlights the lack of sharing of critical information during the blackout event. It does not really address “Operating Instructions” or mention a failure to correctly understand, follow or execute a direction/instruction. The focus is on what information would have assisted the operators in dealing with the event, not mistakes in execution of Operating Instructions. Page 109 of the report summarizes “Effectiveness of Communications” and states “Under normal conditions, parties with reliability responsibility need to communicate important and prioritized information to each other in a timely way, to help preserve the integrity of the grid. This is especially important in emergencies. During emergencies, operators should be relieved of duties unrelated to preserving the grid. A common factor in several of the events described above was that information about outages occurring in one system was not provided to neighboring systems.” Information exchange seems to be the focus, not communication of Operating Instruction.

FERC Order 693 (which refers back to the Blackout Report) also requires tightening communication protocols “especially for communications during alerts and emergencies” to “establish communication uniformity” and “eliminate ambiguities.” The proposed standard is focused on Operating Instructions and lacks requirements regarding consistency in information sharing.

Regarding COM-003-1 SAR, the SAR states its’s scope is “to establish essential elements of communications protocols and communications paths such that operators and users of the North American bulk electric system will efficiently convey information and ensure mutual understanding. “ It also states that the purpose of the standard is “to ensure that effective

communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities.” Version 6 of COM-003-1 does not address Applicability number 1 “relay critical reliability-related information in a timely and effective manner.” It also does not address Applicability number 3: “requirements for entities that experience abnormal conditions to use pre-defined terms such as proposed in the “Alert Level Guideline” (attached) to communicate the operating condition to other entities that are in a position to either assist in resolving the operating situation condition or to entities that are impacted by the operating condition.” It only focuses on Operating Instructions, not communication of the status/condition of the electrical system. The SAR Scope mentions “consistency across regions,” yet the standard does not address RC to RC communications within/across regions.

The purpose of COM-003-1 revision 1 was closer to addressing the above than the purpose in revision 6. It seems the standard has strayed from the intent and although there may be value in having a standard that addresses protocols for issuance of Operating Instructions, this version does not address the concerns laid out in the documents listed above. Items such as sharing of tie line trips, major generation loss trips, high risk situations/evolutions (possibly tripping critical items), loss of EMS capabilities/control center functionality, declared alerts/emergencies and other pertinent information would be the types of information would be standardized and addressed in a standard in order to meet the objectives of the SAR and FERC rather than Operating Instructions.

General comments regarding revision 6 of the standard “as written,” the purpose of which is different from the question asked in the comment form:

As this standard seems to focus on verbal communication, written communications should not be included this standard. It is not clear what is intended to be in scope for “written” Operating Instruction. The standard should not introduce vague terminology subject to different interpretations. If there is a need (or reliability reason) to address written Operating Instructions, they should be included in a separate standard. Focus on 3-way communication and use of alpha-numeric clarifiers in COM-003-1 do not readily fit written communications. Not sure how R2 and R3 would be applied to written Operating Instruction.

Since COM-003-1 has emphasized the difference between Operating Instruction and Reliability Directive as exclusive and distinct, it appears that COM-003-1 communication protocols are more strict for Operating Instruction (regarding use of time zone, alpha-numeric clarifiers, etc.) than COM-002-3 requiring only 3-way communication (no time zone, etc.). If COM-003-1 protocols (other than 3-way communication) are not followed for Reliability Directives, there is no standard violation of either COM-002-3 or COM-003-1. This seems to leave a reliability gap.

Should NOT require RC approval of an entity’s communication protocol. By requiring RC approval of each responsible entity’s communication protocol document, it sets up the possibility of disagreements. Entities should be responsible to develop protocols that are compatible with RC protocols, but that may differ on the “downstream” side (i.e. with entity’s

field personnel). This may be required if RC demands use of Standard Time and BA must communicate with field personnel in Daylight Time. RC should not be able to dictate these types of issues. No defined resolution process in cases of disagreement. If RC is final word, then standard should require RC to develop protocol with input from other entities and all entities should use RC protocol (no requirement for individual protocols). Who would “approve” RC to RC communication protocols?

R2 and R3 documentation is onerous. It really requires a coordinated investigation into every Reliability Directive that is issued to verify it was NOT caused by a communication protocol violation somewhere in the chain (as it may not be between just two responsible entities/protocol documents).

How wide a net needs to be cast in gathering attestations of “No Reliability Directives issued?” How deep in connected systems or entities? An entity may issue a Reliability Directive to a different entity than violated the communication protocol if that problem surfaces in their system.

**Comments - Stefaniak:**

R1.1, R 1.2, R1.3: It is not clear what is intended to be in scope for “written” Operating Instruction. The standard should not introduce vague terminology subject to different interpretations.

R2, R3: Failing to use communication protocols would not directly lead to an operating condition that requires the issuance of a Reliability Directive. It is more likely that failing to use communication protocols could cause an Operating Instruction to be incorrectly executed. Such an error could lead to an operating condition that requires the issuance of a Reliability Directive. Consider changing R2 and R3 as follows:

R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an Operating Instruction to be incorrectly executed thus leading to an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations ]

R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an Operating Instruction to be incorrectly executed thus leading to an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations ]

## Consideration of Comments

### Project 2007-02 Operating Personnel Communications

The Project 2007-02 Drafting Team thanks all commenters who submitted comments on COM-003-1 standard for System Protection Coordination. The standard was posted for a 30-day formal comment period from June 20, 2013 through July 19, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 80 responses from approximately 50 different organizations or individuals.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.

#### Summary Consideration of all Comments Received

1. The OPCPSDT has proposed significant changes to the COM-003-1, draft 6. Do you agree that COM-003-1, draft 6 addresses the August 2003 Blackout Report Recommendation number 26, FERC Order 693 and the COM-003-1 SAR? If not, please explain in the comment area of the last question.

Since the last posting, the Board of Trustees - Standards Oversight and Technology Committee (SOTC) issued a recommendation to the NERC Board of Trustees for consideration at its November 2013 meeting. The recommendation suggests that the Board direct the Standards Committee and the relevant standard drafting team to develop a combined COM-002 and COM-003 standard that addresses, at a minimum, certain essential elements. In light of the recommendation to combine the COM-002 and COM-003 standard and because the OPCPSDT has not had the opportunity to ballot a combined standard, the OPCPSDT has created draft 7 as COM-002-4, which creates a single combined standard. The OPCPSDT also considered the essential elements and evaluated whether they should be included within the combined standard.

Commenters provided various comments in response to Question 1 on whether COM-003-1 draft 6 addresses the August 2003 Blackout Report Recommendation number 26, FERC Order 693 and the COM-003-1 SAR. The OPCPSDT appreciates the feedback on draft 6 regarding these issues. The comments were considered by the drafting team in deciding to move away from the approach in draft 6. Numerous commenters provided comments on the Reliability Coordinator (RC) approval of the protocols in

Requirement R1 and on aspects of Requirements R2 and R3 and the associated Measures. Because the OPCPSDT has taken a different approach in draft 7 that moves away from the construct reflected in Requirements R2 and R3, the standard drafting team will not address each comment individually. The comments were considered by the drafting team to understand the industry’s perspective on the approach in draft 6 and will be useful in crafting solutions in draft 7 and to NERC staff in creating a compliance approach to draft 7. In response to comments, the OCPCSDT has removed the approval of the RC from Requirement R1.

The OPCPSDT responds to other comments not addressed above in the responses below.

Organization	Yes/No	Comment
Oncor Electric Delivery	No	<p>Draft 6 of COM-003-1 appears to go beyond the recommendations and FERC 693 directives which were the basis for the SAR. The main objective to develop an operating protocol in alignment with other communications standards to improve reliability. Oncor’s concerns with Draft 6 are: (1) R1 - subject to the Reliability Coordinator’s approval: adding this to R1 potentially adds an administrative burden to an Entity/Industry without clear reliability benefits. Operating protocol should support an Entity’s operations and functions which are not a “one size fits all”. By requiring a RC’s approval, the requirement empowers the RC to interpret the requirement (as well as defining “Operating Instructions”) which may not be consistent with an Entity as well as the Regional Entity who will be enforcing the requirement.</p> <p>(2) R2/R3 - there is the potential for multiple levels of interpretation of these requirements; these requirement potentially creates a situation in which Operators will need to be able to assess the transition from normal to emergency operations and could quite impact efficiency and productivity of operations which is the opposite of the objective. In addition based on M2 &amp; M3, Oncor has concerns with the administrative burden versus the reliability benefits gained in proving a negative condition.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7. Also, the language of R2 and R3 has been</p>

		changed to reflect the new approach.
Georgia System Operations	Yes	No response
Guy Zito/NPCC	No	The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues with the standard. a. The issuance of a Reliability Directive may be caused by a number of reasons, for example, the operating instruction (repeated or otherwise) may not be sufficient to address a potential condition that has an Adverse Reliability Impact; b. The operating instruction that is communicated, with or without adhering to the protocols developed in R1, is in fact moving other system conditions from a reliable state to one that has a potential of having Adverse Reliability Impact, for which a Reliability Directive needs to be issued after implementing the communicated operating instruction. c. The operating personnel may second guess whether or not a Reliability Directive will be issued if the established communication protocols are not implemented (such as by requiring 3-part communication) before it takes the required action. This puts the need to comply with a requirement into a condition assessment mode, which defeats the purpose of having a reliability standard to manage risk and meet performance expectation whose reliability outcome are predetermined, not on the fly. d. The added condition is a compliance assessment element with which to gauge violation severity or sanction; itself not a requirement. By introducing this to the requirement, it convolutes the requirement, adds nothing to meeting the reliability objectives, and may in fact jeopardize reliability. And what if a Reliability Directive was not issued despite the failure of Responsible Entity to implement its communication protocol? Is the Responsible Entity

		<p>deemed compliant with the requirement? If so, do Requirements R2 and R3 drive the right behaviors? If not, then what’s the value and influence of the added condition in the assessment outcome? Requirement R1 clearly requires the responsible entity to develop documented communication protocols for the issuance of Operating Instructions. By Part 1.5, the instances where the issuer of an oral two party, person-to-person Operating Instruction requiring the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and subsequent actions by the issuer are already clearly stipulated in the documented communication protocols. Responsible entities simply need to implement the protocols as documented, regardless of whether failure to do so would result in having to issue a Reliability Directive, or any other possible outcomes, for that matter. Similar comments apply to Requirement R3 when the responsible entities are required to close out the last part of the 3-part communication.</p> <p><b>Response: The language of R2 and R3 has been changed to reflect the new approach.</b></p> <p>The suggested rephrasing of the Purpose statement “To strengthen communications...” could be misleading. Communications could be strengthened with better equipment as well, but the intent of COM-003 is to deal only with communications protocols. Suggest changing the language to that which is found in the technical guidance document, “Enhance the effectiveness of communications...”</p>
City of Tallahassee	No	<p>TAL has voted NO because the standard is still not “clear and unambiguous”. TAL is concerned at the degree to which the proposed standard complicates compliance for Operating Instructions without benefit to reliability. The FERC Directive was to tighten communications during Emergencies and Alerts. Operating Instructions deserve separate consideration under the standards. Requiring an entity’s procedure to be subject to the</p>

		<p>Reliability Coordinator’s approval creates an undue burden on the RC with no measurable improvement in reliability. While this addressed a commenter’s concerns over uniformity within RC control areas, it would be simpler and more efficient to have the RC create a procedure and provide it to all the entities in the footprint. Measure 3 should be changed to “when required by the issuer” in order to provide clarity and consistency with R3.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
Manitoba Hydro	Yes	<p>Although Manitoba Hydro is in general support of the proposed draft, we suggest the following: (1) For clarity, consider rewriting the second paragraph of the definition of Operating Instruction as follows, An Operating Instruction is not: (1) A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns (2) Exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive. (2) R1 and M1 - for consistency, add an “s” to the second instance of “Reliability Coordinator” as follows: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator’s area, shall...” (3) R1 – the requirement instructs each BA, RC and TO develop separate communication protocols. Are these duplicative efforts practical? (4) R1, 1.4 – alpha-numeric clarifiers are limited to oral Operating Instructions only. For consistency with R1.1, 1.2 and 1.3, consider adding applicability to written Operating Instructions as well.</p> <p><b>Response:</b> The SDT is unclear what added benefit alpha-numeric clarifiers would provide for written Operating Instructions.</p> <p>(5) R1, 1.5 – is limited to oral Operating Instructions while R3 (which deals with the same situation) does not</p>

		specify whether it is oral or written or both. (6) M2 – the measure does not seem to match the requirement. The requirement R2 states that the responsible entity implement its communication protocols so that there is no failure to use the protocols which results in a certain operating condition. The measure however requires that the responsible entity provide evidence that they did not create the certain operating condition. Manitoba Hydro suggests that the measure should more accurately require that the responsible entity provide evidence that it implemented its communication protocol so that...
Pepco Holdings Inc & Affiliates	Yes	No response
NERC Compliance Group	Yes	As far as the August 2003 Blackout Report Recommendation, the COM-003-1 revisions address this concern. However, the criteria for communication protocols that need to be used should be established. The criteria needs to be applied to both COM-002 and COM-003. There is too much room for interpretation when it comes to measuring compliance.  <b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.
Hydro-Quebec TransEnergie	Yes	
PacifiCorp	Yes	
NIPSCO	Yes	Julie Dyke , NIPSCO comments submitted Also, We would like to see COM-002 & 003 combined into a single standard. In R1 1.5 it appears that three way communication need only to be addressed in the communication protocol and not necessarily required. An operator may be reluctant to issue an RD which would possibly expose entities to R2 & R3 non-compliance.  <b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.
American Electric Power	No	AEP cannot vote in the affirmative for COM-003-1 as long as COM-002-2 R2 would be in effect at the same

	<p>time. The standard establishes a higher bar for more routine communications than would be required for emergency situations. This would only confuse operators in determining which rules are to be followed under which specific circumstances.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.</p> <p>AEP still contends that it is unnecessary to obtain Reliability Coordinator’s approval on the resulting documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator’s area. Why would it be necessary to develop and document internal procedures regarding communication protocols when the proposed standard itself already provides specific instruction on the required communication?</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>Is R 1.3 in any way redundant with TOP-002-2 R18?</p> <p><b>Response:</b> Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 when it developed TOP-002-3. This Requirement states “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” This standard, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are readily familiar with each other’s interface Elements and Facilities, eliminating hesitation and confusion when referring to equipment for the Operating Instruction. This shortens response time and improves situational awareness.</p>
--	--

	<p>AEP proposes the elimination of COM-002-2 R2 and changing COM-003-1 as proposed below so that it covers all commands rather than a subset of commands.</p> <p>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall adhere to the following communication protocols for the issuance of Operating Instructions in that entity’s area. 1.1. The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation. 1.2. The instances, if any, that require time identification when issuing an oral or written Operating Instruction, specify the time zone unless the RC has previously established an operational timezone. 1.3. The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. 1.4. The instances, when referencing letters, utilize the phonetic alphabet when issuing an oral Operating Instruction (Reference prior draft(s)) 1.5. In instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to: * Confirm that the response from the recipient of the Operating Instruction was accurate; or * Reissue the Operating Instruction to resolve a misunderstanding. R2. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when</p>
--	---

		<p>required by the issuer of an Operating Instruction</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.</p>
<p>Portland General Electric Company</p>	<p>No</p>	<p>Portland General Electric Company (PGE) thanks you for the opportunity to provide comments. PGE is supportive of the intent of COM-003-1 and appreciates the work that the drafting team has put into the development of the proposed standard. However, the language in R2 and R3 is convoluted and confusing. The following is a suggestion for both R2 and R3: R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1. Delete: so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations] R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1. Delete: so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations] Then add the following to each Measure, (and RSAW) respectively: R2.1. Did the issuer of the Operating Instruction fail to use its approved Operating Instruction protocols it developed in R1? (yes/no) R2.2. Did the failure to use the approved Operating Instructions produce an operating condition requiring</p>

		<p>the issuance of an Reliability Directive? R3.1. Did the BA, TOP, GOP and DP fail to repeat, restate, rephrase, or recapitulate an Operating Instruction in its communications protocols developed in R1? R3.2 Did the failure to repeat, restate, rephrase, or recapitulate an Operating Instruction produce a condition requiring the issuance of an Reliability Directive? Also in R3, the phrase, "...in its communications protocols" do you mean in the issuer's protocol or the receiver's protocol?</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Arizona Public Service Company	Yes	<p>Negative ballot cast on the Standard: For communication purposes, R1 should not include Reliability Coordinator (RC) approval. If a regional requirement (RC approval) is deemed necessary, then a regional standard should be developed that includes the procedure(s) and requirements to obtain RC approval of communication protocols.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
Consolidated Edison Co. of NY, Inc.	No	<p>Add the word "verbal" before the word "Operating Instructions" so that Requirement R1 reads: "R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of verbal Operating Instructions in that Reliability Coordinator's area." Also make similar changes where required elsewhere.</p> <p><b>Response:</b> The standard is intended to cover both oral and written communication.</p>
Flathead Electric Cooperative, Inc.	No	<p>No, the 2003 Blackout recommendations were specific to control center and reliability coordinator entities. This standard appears to push down below to small DP</p>

		<p>entities that don't have control centers. Also, the Blackout recommendations were clearly concerned with "reliability" directives and did not contemplate a new category of Operating Instructions. The existing authority in other standards for registered entities to respond to reliability directives should be sufficient to address the recommendations without this standard.</p> <p><b>Response:</b> The DP was added in response to directive in FERC Order 693.</p>
Occidental Energy Ventures Corp.	Yes	<p>Occidental Energy Ventures Corp. ("OEVC") would like to compliment the drafting team for finding a compliance solution that focuses only on the results of an improperly executed Operating Instruction. The approaches in previous drafts could be construed that entities retain proof that every applicable communication was monitored and verified – an impossible administrative task. We believe that Draft 6 of COM-003-1 removes the onerous compliance burden without freeing Operating entities from the obligation to perform responsibly. They are free to choose the level of sample communications to monitor, the amount of training they perform, and the internal disciplinary actions they take for non-compliance to the required protocols. However, there are consequences if their oversight is inadequate. We do have two concerns which we would like to air. First, that recipients of Operating Instructions must be informed that formal communication is being done. Although front-line Operators will be trained to comply with the appropriate protocol documents, they will be naturally inclined to follow the lead of the issuing entity – particularly if the communication is a borderline instruction. For example, a request for equipment status may be part of discussion concerning available alternatives, or information needed to confirm real-time stability. The recipient should not be left in a position to guess what the needs of the immediate situation are. Secondly, we would hope that the protocols developed by the various RCs, BAs, and TOPs are generally consistent. Even</p>

		<p>though we agree that each individual organization may have specific communications needs, it is in no one’s interest to have minor preferential differences between entities. Perhaps this is an issue that NERC’s performance management team can monitor – particularly as they have a highly vested interest in the resolution of Operating Instruction errors. These comprise a high percentage of outage root causes, and we are sure that uniformity will be a key improvement indicator.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p>
ReliabilityFirst	No	<p>ReliabilityFirst believes the newly included language in Requirement R1 “...subject to the Reliability Coordinator’s approval...” introduces three issues which need to be addressed prior to the draft standard being enforceable. The three issues include: 1) With the Reliability Coordinator being an Applicable Entity within this requirement, it is unclear which entity will be approving the Reliability Coordinator’s documented communication protocols? Based on the current language, the Reliability Coordinator would need to seek approval from themselves as the Reliability Coordinator. 2) There is no companion requirement requiring the Reliability Coordinator to approve the Balancing Authority’s and Transmission Operator’s documented communication protocols. It is inferred, but there is no requirement which explicitly requires the Reliability Coordinator to take action. Based on the current language in Requirement R1, if a Reliability Coordinator never takes action (approval or disapproval), where does this leave an entity for compliance purposes? 3) In the scenario where the Applicable Entity (Balancing Authority, Transmission Operator) develops documented communication protocols (which address the elements in sub parts 1.1 through 1.5) but the Reliability Coordinator disapproves, will the Applicable</p>

		<p>Entity be non-compliant with Requirement R1? The Applicable Entity has no control over action taken (approval or disapproval) by the Reliability Coordinator. Furthermore, since Requirement R2 and Requirement R3 depend on the documented communication protocols developed in Requirement R1, would the Applicable Entity be automatically found non-compliant with those two requirements as well? ReliabilityFirst offers the following two recommendations for the SDT to consider to address the ReliabilityFirst concerns with the newly included language "...subject to the Reliability Coordinator's approval...": 1) Remove the "...subject to the Reliability Coordinator's approval..." language from Requirement R1. Add a new requirement requiring the Applicable Entities to make their documented communication protocols available to all the other Applicable Entities within in each Reliability Coordinator area. 2) Make Requirement R1 applicable to only the Reliability Coordinator and remove the "...subject to the Reliability Coordinator's approval..." language. This will require the Reliability Coordinator to develop one consistent set of documented communication protocols for all entities within their Reliability Coordinator area. This will also allow the Reliability Coordinator to tailor the documented communication protocols to address uniqueness among Balancing Authorities and Transmission Operators (e.g., asset density, locations and organizational structure) within their area. If the SDT agrees with either of these recommendations, the sub-parts for Requirement R1 and both Requirement R2 and Requirement R3 would remain relatively unchanged.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
Texas Reliability Entity	No	(1) Definition of Operating Instruction: We remain concerned about potential interference between COM-002 and COM-003. While it has been made abundantly clear in this draft that an Reliability Directive is not an

	<p>Operating Instruction, it remains unclear exactly where the boundary between them is. We are concerned that an operator faced with an imminent emergency situation will have to stop to consider whether he needs to issue a Reliability Directive or an Operating Instruction, and entities will be subject to second-guessing as to whether they picked the right one. COM-002 and COM-003 should be melded into one coherent standard that will not interfere with system operations.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>(2) The present draft does not address one-to-many communications (hot-line calls, all-calls), which are commonly used to convey Operating Instructions in critical situations. A repeat-back procedure for those calls should be included in an entity's documented communications protocols.</p> <p><b>Response:</b> The concept of all-calls is addressed in draft 7.</p> <p>(3) While we respect the desire to avoid writing a "zero-defect" standard, we strongly object to the approach taken in requirements R2 and R3. Compliance with these requirements should not be based on whether a subsequent Reliability Directive was issued. Instead, compliance should be based on whether the communication protocols are routinely and effectively implemented (perhaps using an "identify/assess/correct" approach). The present draft allows system conditions over which the entity may have little control (i.e. luck) to determine whether a deviation from its protocols results in a violation. Importantly, the current draft may create an undesirable incentive for an operator to avoid issuing a Reliability Directive in order to avoid scrutiny of prior Operating Instructions. (4) We also object to basing compliance with R2 and R3 on whether the entity's conduct</p>
--	---

	<p>“resulted in” an adverse operating condition. The existence of a violation should be based solely on the entity’s conduct, not on the results of that conduct on system conditions. The proposed approach creates an unmanageable compliance assessment burden, as parties will dispute whether events were causally related, which can be very difficult to conclusively assess. Furthermore, what does “result in” mean? Does it require proximate cause, direct cause, contributing cause, or some other measure of causal relationship?</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>(5) The proposed revisions in COM-003 interact with the revisions in TOP-001-2 to create a reliability gap that will reduce the performance level required by the standards. The existing requirements 3 and 4 of TOP-001-1a require TOP, BA, GOP, DP and LSE entities to comply with reliability directives (not capitalized) issued by a TOP. We interpret “reliability directives” in that standard to include all operating instructions related to reliable system operation, including those that are proposed to be defined as both Reliability Directives and as Operating Instructions. The new version TOP-001-2 (pending at FERC) limits the compliance requirement to only Reliability Directives (defined term), and will no longer require compliance with Operating Instructions issued by TOPs. This problem is enhanced by the proposed definition of Operating Instructions, which now emphasizes that Operating Instructions and Reliability Directives are mutually exclusive. There needs to be a reliability standard that requires compliance with Operating Instructions issued by TOPs, and the absence of such a standard creates a reliability gap.</p> <p><b>Response:</b> This scope of this standard, as defined by the SAR, only considers communication protocols. The obligation to follow “directives” is defined elsewhere in the body of standards. The gap you have identified</p>
--	---

		would be present whether or not this project existed.
City of Garland	No	<p>Three part communications is a standard business practice in transmission and distribution operations across the country. If by chance there is / was a company that was not using three part communications, that company would have had to develop a procedure / policy for three part communications to be compliant with COM-002-2 R2 (COM-002-3 R2 future). Therefore, the proposed COM-003 R1 requiring companies to develop “documented communication protocols” that have to be approved by the Reliability Coordinator is nothing more than a compliance burden to maintain documentation for an audit. Furthermore, COM-003 R3 requires use of three part communications and should be the only requirement in COM-003. Because of COM-002-2 R2 and COM-003 R3, COM-003 R1 is merely a paperwork compliance burden and should be deleted. COM-003 R2 relies on R1 and therefore it should be deleted also. As previously stated, COM-003 should only contain the requirement listed in the current R3.</p> <p><b>Response:</b> This scope of this standard, as defined by the SAR, considers communication protocols, not just three-part communications.</p>
City of Anaheim	Yes	<p>The proposed Standard language appears to address the requirements of FERC Order 693. However, R3 is still confusing and appears to assume that the distribution provider or generator operator would have some way of knowing if an Operating Instruction would “result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” Also, more clarification is needed with respect to the terms "restate", "rephrase" and "recapitulate". We suggest the the following language for R3: “Balancing Authorities, Transmission Operators, Generator Operators and Distribution Providers shall repeat or restate an Operating Instruction given to them when required by</p>

		<p>the issuer of that Operating Instruction.”</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Dominion	Yes	<p>Dominion appreciates the SDT efforts on this project as we know it has not been an easy task to satisfy industry concerns while at the same time, addressing FERC directives relative to this issue. We believe that having a requirement that the communication protocol be approved by the RC, while possibly considered an administrative burden by them, greatly enhances consistency of such protocols. And, we greatly appreciate the fact that recipients are required to repeat, restate, rephrase, or recapitulate only when required by those approved protocol.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
PPL NERC Registered Affiliates	No	<p>These comments are submitted on behalf of the following PPL NERC Registered Affiliates (PPL): Louisville Gas and Electric Company and Kentucky Utilities Company; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; and PPL Generation, LLC, on behalf of its NERC registered affiliates. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. PPL has generally supported draft 4 and draft 5 of the COM-003 standard. However, the significant changes proposed in draft 6 introduce ambiguity, as well as several other issues that need to be addressed. First, the proposed definition of an “Operating Instruction” continues to require clarification. PPL NERC Registered Affiliates suggest the following definition to address the above issue: “Operating Instruction - A Real-time Operations command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a</p>

	<p>Transmission Operator, or of a Balancing Authority, where the recipient of the Real-time Operations command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information, potential options and/or alternatives to resolve Bulk Electric System operating concerns is not a command and is not an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive.” The focus of COM-003 is on operations, and therefore the communications subject to the COM-003 requirement should be those requiring action in the Real-time Operations time horizon — i.e., actions required within one hour or less. (See definition provided in a NERC document at: <a href="http://www.nerc.com/files/Time_Horizons.pdf">http://www.nerc.com/files/Time_Horizons.pdf</a>). During the Q/A portion of the November 27, 2012 conference call hosted by the SDT, the SDT stated that they intended to narrow the focus of the timeframe of an Operating Instruction to the Real-time Operations time horizon. . Second, there is inconsistency in the wording of some parts of R1. Specifically, PPL recommends revising part 1.5 as follows: “The instances, if any, where the issuer...” or removing the ‘if any’ from R1.2 and R1.4, since it is redundant to the R1 ‘where applicable’ and the use of ‘when, that, etc.’ in the sub requirements.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p> <p>Third, both R2 and R3 as currently written may not aid in enhancing reliability. PPL suggests R2 be revised to require the BA, RC, and/or TOP provide their communication protocols to the GOPs, DPs with whom they communicate. PPL suggests language for R3 be revised to read as follows: “Each Balancing Authority, Distribution Provider, Generator Operator, Reliability</p>
--	--

		<p>Coordinator, and Transmission Operator shall assess its adherence to the applicable documented communication protocols developed for R1 and R2.” As currently drafted, R2 and R3 appear to require that entities issuing or receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of use of the R1 protocol or of three-part communication. The R2 draft language says that the BA/RC/TOP communication protocols must be developed such that even when the communication protocols are not used, there is still no need for a Reliability Directive. This could imply that if no Reliability Directive is required, the failure to use the protocols created no risk and the communication protocol was not needed. This appears to make inconsequential any reliability benefit of R1 of the Standard. Also, R3 has requirements for entities that may not have received the communication protocols developed by the BA/RC/TOP. Fourth, there is ambiguity introduced in R2 and R3 through the use of the phrase “that requires the issuance.” It is unclear who would determine whether the Reliability Directive was “required.” Likewise, if there are multiple incidents which contribute to the issuance of a Reliability Directive, it is not clear what weight would be given to the lack of use of communication protocols, nor is it clear how that determination is made. Finally, M2 and M3 introduce an expectation that applicable entities will need to coordinate to produce evidence. PPL recommends that M2 and M3 be revised to align with the changes made to R2 and R3 as noted above.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Wisconsin Electric Power Company	No	Version 6 of the standard does not explicitly limit the timeframe prior to the issuance of a Directive subject to review for compliance with communication protocol requirements. Additionally, the draft Standard and definition of Operating Instruction do not adequately

		<p>define instances where Operating Instructions would require 3-way communications. The process by which a Reliability Coordinator approves instances where communication protocols are required will define the substantial requirements in the standard. Establishing the Reliability Coordinator as an approval authority for BA or TOP internal procedures implies the RC will have responsibility for operational activities and/or procedures owned by the BA or TOP and essentially outsources the standard development to the Reliability Coordinator.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p>
ISO New England Inc.	Yes	
Sacramento Municipal Utility District	Yes	<p>Although SMUD agrees with the draft 6 of COM-003-1. Also, we are in support of the finding from the Independent Standards Review Panel’s final report for mitigating BPS risks as noted: Resolve COM-002 and COM-003 by requiring three-part communication for operational directives and for registered entity defined operational instructions that involve taking specific actions or steps that would cause a change in status or output of the BPS or a generator. This does not include three-part communication for myriad of conversations where information is being exchanged or options are being discussed.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p>
North American Generator Forum Standards Review Team	No	<p>R3 can present an excessive or even impossible compliance burden, in that all parties receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of three-part communication. This is not a matter of simply</p>

		<p>obtaining annually a “No known errors” letter from the BA, RC and TOP with which a receiving-end entity is directly involved, since all the neighboring BAs, RCs and TOPs are drawn-in by R3 as well. There is meanwhile no requirement that BAs, RCs or TOPs issue such letters when requested to do so, or that they must share any information at all regarding Reliability Directives issued. This leaves GOPs and other entities that receive Operating Instructions in danger of self-certifying compliance to R3, then being later confronted with evidence of non-compliance from a source from whom they had previously heard nothing. The issue of interpretation also creates undue ambiguity. Who will make the determination of cause when a Reliability Directive is issued, and is that opinion subject to review if objections are raised? If all GOPs in a region were instructed to bring all available generators online at their Emergency Rating due to tripping of a 2000 MW nuclear plant, for example, and the operator of a 10 MW blackstart unit did not respond in the prescribed fashion, and a Reliability Directive ultimately had to be issued to shed some load, did that 10 MW unit “cause” the load shedding? R3 should be revised to match the draft that was issued for comments several weeks ago, and which the NAGF found acceptable. That is, R3 should state that “Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess, as applicable, System Operators’ and operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R1 and R2.”</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Independent Electricity System Operator	No	Despite we have always held a position that this standard was not needed given the approved COM-002-3 and the NERC OC’s operating guide on operating

	<p>personnel communication, we supported the previous version of COM-003-1 (Draft 5) as it was a clearly written standard which would be an acceptable compromise for meeting the FERC directive and BoT’s direction without overburdening industry participants having to repeat every operating instruction. This latest version, Draft 6, however, turns an acceptable standard into one that is ambiguous and provides an escape clause for operating personnel to not comply with the basic requirement (R1). The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues with the standard, as follows: a. The issuance of a Reliability Directive may be caused by a number of reasons, for example: the operating instruction (repeated or otherwise) may not be sufficient to address a potential condition that has an Adverse Reliability Impact; b. The operating instruction that is communicated, with or without adhering to the protocols developed in R1, is in fact moving other system conditions from a reliable state to one that has a potential of having Adverse Reliability Impact, for which a Reliability Directive needs to be issued after implementing the communicated operating instruction. c. The operating personnel may second guess whether or not a Reliability Directive will be issued if the established communication protocols are not implemented (such as by requiring 3-part communication) before it takes the required action. This puts the need to comply with a requirement into a “condition assessment” mode, which defeats the purpose of having a reliability standard to manage risk and meet performance expectation whose reliability outcome are predetermined, not on the fly. d. The added condition is a compliance assessment element with which to gauge violation severity or sanction; itself is not a requirement. By introducing this to the</p>
--	--

		<p>requirement, it convolutes the requirement, adds nothing to meeting the reliability objectives, and may in fact jeopardize reliability. And what if a Reliability Directive was not issued despite the failure of Responsible Entity to implement its communication protocol. Is the Responsible Entity deemed compliant with the requirement? If so, do Requirements R2 and R3 drive the right behaviors? If not, then what’s the value and influence of the added condition in the assessment outcome? Requirement R1 clearly requires the responsible entity to develop documented communication protocols for the issuance of Operating Instructions. By Part 1.5, the instances where the issuer of an oral two party, person-to-person Operating Instruction requiring the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and subsequent actions by the issuer are already clearly stipulated in the documented communication protocols. Responsible entities simply need to implement the protocols as documented, regardless of whether failure to do so would result in having to issue a Reliability Directive, or any other possible outcomes, for that matter. Similar comments apply to Requirement R3 when the responsible entities are required to close out the last part of the 3-part communication.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
MISO	No	<p>The blackout recommendation 26 had little or nothing to do with operator communications. The recommendation was to implement some type of communication system to keep Regions, NERC and regulators informed during emergencies. Here is the recommendation: “NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC</p>

		<p>should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date.” These are our comments on what is presented in this revision of COM-003-1. • We’re generally OK with a requirement to develop a set of communication protocols and whereby the applicable entity does a periodic assessment of its operators’ adherence to the protocols. • While we believe that it is acceptable for a BA and TOP to develop their own protocols, it would be preferable that they be allowed to use a set of protocols developed by the RC. • We disagree that the RC should approve others’ protocols. What are the criteria for approval? NERC should not put RCs in the role of de-facto compliance monitors. • There is a likely unintended consequence of the latest draft. This will plant a seed of doubt in an operator’s mind whether or not to issue a reliability directive due to the scrutiny and second guessing that will be the outcome of each investigation associated with a directive. This standard will result in investigations associated with each directive. • We were OK with the previous version. We’d be OK with a revision to the current draft if there was an ex post assessment of operating instructions following the issuance of a directive. There should not be a rabbit-trail investigation following the issuance of each directive.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p>
Bonneville Power Administration	Yes	
Xcel Energy	No	We are electing to not respond directly to this question, as we have expressed concern with the advancement of this project many times in the past. While this draft seems far superior to the others, the proposed change

		<p>to R1 raises concern over the portion that dictates that the Reliability Coordinator has approval authority over the communications protocols for Operating Instructions. The majority of the Operating Instructions, as defined by the standard, will be between the System Operator at a Balancing Authority or Transmission Operator and their respective field personnel. Communications between System Operators of BAs and TOPs and field personnel have well-established protocols and should not necessarily be held to the same protocol as communications between BAs or TOPs and the Reliability Coordinator. In essence, the proposed change to R1 places the Reliability Coordinator in a position to dictate communication protocols that may breakdown the well-established protocols of the BAs and TOPs and create more burdensome communication with their field personnel.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
City of Redding	Yes	
Clark Public Utilities	No	<p>Requirement 1 does adequately address the concerns. Requirements 2 and 3 are confusing and difficult interpret. It was not until I read the FAQ on COM-003 that I understood R2 and R3. I believe R2 and R3 should be revised as described below. R2. R2 needs to indicate that it is only applicable to issuers of Operating Instructions. R2 should be revised to read as follows: Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an Operating Instruction shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. With the change it is clearer that the standard is saying that an issuer of an Operating Instruction is supposed to have</p>

		<p>a communication protocol(R1). R2 is stating the issuer of an Operating Instruction needs to use the communication protocol and if the issuer's failure to use the communication protocol results in the issuance of a Reliability Directive, a violation has occurred. R3. R3 needs to indicate that it is only applicable to recipients of Operating Instructions. R3 should be revised to read as follows: Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider that receives an Operating Instruction shall repeat, restate, rephrase, or recapitulate the Operating Instruction when required by the issuer of the Operating Instruction (in accordance with the issuer's communication protocols developed in Requirement R1) so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. With the change it is clearer that the standard is saying that a recipient of an Operating Instruction is supposed to repeat, restate, rephrase, or recapitulate the Operating Instruction when required by the issuer and if the recipient's failure to repeat, restate, rephrase, or recapitulate the Operating Instruction (as long as it is required in the issuer's communication protocol) results in the issuance of a Reliability Directive, a violation has occurred.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
<p>Southern Company: Southern Company Services, Inc; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power</p>	<p>Yes</p>	

Company; Southern Company Generation and Energy Marketing		
Illinois Municipal Electric Agency	Yes	
Florida Municipal Power Agency, and SERC OC Standards Working Group	Yes	
Oklahoma Gas & Electric	Yes	There is still concern that the intent of Recommendation 26 was strictly for emergency situations which are covered by COM-002-3. While well intentioned, based upon the spirit of the Paragraph 81 initiative, OG&E believes the current draft of the COM-003-1 standard to be more of an administrative burden than an improvement to reliability.
New Brunswick System Operator	No	<p>The introduction of the condition in R2 “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” creates a number of issues. • The issuance of a Reliability Directive may be caused by a number of reasons, for example: the operating instruction may not be sufficient to address a potential condition that has an Adverse Reliability Impact; • R2 has the unintended consequence of making Reliability Directives a subject of a Root Cause analysis. Whenever a Reliability Directive is issued it would be necessary for the issuer to prove that that Reliability Directive was not linked to an Operating Instruction protocol failure.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Seminole Electric Cooperative, Inc.	No	While the draft may meet the Blackout Recommendation and Order 693, the draft is problematic and is resulting in Seminole changing its votes from prior affirmation to negative with this ballot.

	<p>The reasons are: 1. The requirement for RC approval of entity developed communications protocols (R1), which impose an unreasonable administrative and associated cost burden upon all of the applicable entities.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>2. The new connection to Reliability Directives issued by an RC, TOP, or BA, which are due to the failure of an applicable entity to properly implement its communication protocols for Operating Instructions, seemingly implies compliance investigation following the issuance of any RC Reliability Directive, for all entities affecting the RC area’s footprint (R2&amp;3).</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>3. The term Operating Instruction is so broad, that every System Operator communication might require logging, recording and compliance review.</p>
<p>Wisconsin Public Service Corp</p>	<p>Also, since enforcement and compliance under Version 6 hinges on a Reliability Directive being issued, am I correct to assume that if emergency conditions requiring actions on the BES were to occur, but an issuing entity failed to announce their request for action as a Reliability Directive – then NO Directive was issued, and therefore there could be no COM-003 violation for that event and no need to analyze if preceding Operating Instructions were given which may have lead up to the Emergency condition? Note: COM-003 Rev. 6, R3 “... an operating condition that requires the issuance of a Reliability Directive...” so put another way, what if a Reliability Directive was required – but not clearly identified as in COM-002 V3, R1? The future COM-002 V3, R1 requires an issuing RC, TOP, or BA (or LBA) in part, to clearly call a Reliability Directive a Reliability Directive. I couldn’t find similar language for Operating Instructions in Rev. 6 of COM-003. Is it intended that this</p>

	<p>will need to be included in each entities communications protocol, along with the need for the issuing entity to clearly communicate "...and I will need you to repeat this back."? My concern here is that while I like the SDT's approach with R3 in Rev. 6, if only R3 applies to DP's and GOP's (and therefore they are not required to have or to implement communications protocols), if the issuer of an Operating Instruction doesn't clearly identify it as such AND tell the recipient in advance that he requires a repeat-back, it will be difficult for the recipient who is a DP or GOP to meet the R3 requirement. Conversely, based on the high number of Operating Instructions occurring each day, perhaps it was the intent of the SDT that DP's and GOP's which are limited to simply how to respond to Directives and/or Instructions with repeat-backs. Please clarify. Lastly, I mentioned the concern under M3. Rather than just stating it is confusing, I'm listing a proposed change for consideration if the Standard doesn't get approved as is. We hope it is more clear in its wording and its expectation that the issuer of any Directive should lead efforts to complete an analysis of what lead up to a Directive. Draft 6 proposal for M3: Each Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator shall provide evidence that it did not experience a failure to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required, that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or by another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use the protocols. A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence. WPS proposal for M3: The issuer of a Reliability Directive shall provide evidence that a failure to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required, resulted in an operating condition that required the issuance of a</p>
--	--

		<p>Reliability Directive. A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator may need to coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
SERC Reliability Corporation	Yes	<p>It addresses parts of each. While a reliability standard may not be the most appropriate control to address the reliability concern, this standard, in conjunction with COM-003-2 does address the Standards Authorization Request to require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. There is concern with making protocols (and any revisions) available to those who are expected to comply. R1 states that the RC must approve; M1 states that each...shall provide. It is not clear that those who must comply will have the latest version. Suggest that the Measure be tightened up to state that the RC must provide the approved communication protocols to the .... in thier footprint.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard. Hopefully this will address your concern.</p>
Minnesota Power	No	<p>Minnesota Power supports comments submitted by the MRO NERC Standards Review Forum (NSRF).</p>
SERC OC Review Group	Yes	<p>We agree on a very limited view that Recommendation 26 is addressed. However, when looking at reliability we are concerned that the administrative burden, and uncertainty of which Operating Instruction will become a Reliability Directive may negatively impact BES reliability in the reluctance of issuing a Reliability Directive. Therefore, we strongly recommend that the</p>

		<p>SDT review this draft and redraft to clarify these points. Measure 3 should be changed to “when required by the issuer” in order to provide clarity and consistency with R3. In addition, we believe that a statement needs to be added in R1 that includes providing or distributing those communication protocols developed by a BA or TOP to their associated DPs and GOPs. This would address a potential gap of DPs and GOPs not aware of the communication expectations when communicating with BAs and TOPs when given an Operating Instruction.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
<p>ACES Standards Collaborators</p>	<p>No</p>	<p>(1) While we understand that there are numerous approaches to satisfy the FERC order and the 2003 Blackout Report, we disagree that the drafting team addresses these concerns in a measurable and uniform process. The FERC Order and the Blackout Report both call for a “tightening of communications.” We are not convinced that giving the RC the authority to approve communication protocols will result in less confusion and a tightening of communications. There are currently 15 Reliability Coordinators in the NERC Compliance Registry, which leaves 15 opportunities for inconsistent application of what constitutes an “Operating Instruction.” (2) Further, we are concerned that by granting the Reliability Coordinator the authority to approve a registered entity’s communication protocol, there may be differing protocols among the various RC areas, which would negatively impact registered entities that are located in more than one RC area. For entities that operate in multiple RC areas, there could be different criteria for what constitutes an Operating Instruction, differing line and equipment identifiers, and other nuances that result in confusion and lead to an increase in miscommunication. The standard does not require uniform communication protocols among the various Reliability Coordinators. (3) In addition, how would an entity communicate to a neighboring BA and</p>

		<p>TOP who are in a different RC area with different protocols? This draft poses significant issues for registered entities located on the seams of RC areas that communicate to other entities in other RC areas.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>(4) We have an issue with the language in the Measure M2. Measure M2 requires a registered entity to prove the negative that no reliability directives occurred. This presents an issue because some regions are reluctant to accept attestations as evidence. This approach is an increased compliance burden on registered entities. This draft did not include an RSAW for review and we recommend the drafting team provide further clarification that an attestation is acceptable for compliance and continue to work with NERC compliance on this issue. (5) Finally, we disagree with the revised definition of Operating Instruction and the approach of Requirement R2 and R3. Under the revised definition, an Operating Instruction is separate from a Reliability Directive, but an entity will only be in violation for failing to communicate effectively that would result in the issuance of a Reliability Directive. This is double jeopardy. An entity could be in violation of both COM-002 and COM-003 for failing to communicate effectively that results in an event on the Bulk Electric System. This issue has been stated in our earlier comments that the definitions and the two COM standards would be better as a combined standard instead of the separate projects to avoid this potential compliance issue.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
<p>Southwest Power Pool Regional Entity</p>	<p>Yes</p>	<p>What is the expected time frame for the RC’s initial approval of the protocols? NERC needs to clarify the protocol approval dates in relation to the</p>

		<p>effective/enforceable date.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
<p>Associated Electric Cooperative, Inc. - JRO00088</p>	<p>No</p>	<p>AECI strongly supports the SERC OC Q1 comments posted for this draft. In addition, AECI believes that COM-003 fails to properly address related topics found within the August 2003 Blackout Report Recommendation number 26 and FERC Order 693, primarily because of the SDT's having included DPs within the COM-003 scope, and thereby overreaching these two citation's intended scope. In the case of the August 2003 Blackout Recommendation 26, while its terse two-sentences appear to be met by COM-003, the same report's pp 161-162 clarifies its intended scope being "during alerts, emergencies or critical situations." That same section's "particularly during alerts and emergencies", might be stretched to include COM-003 Operating Instructions for DPs, yet FERC's determination, expressed within Order 693 paragraphs 493, 509-512, suggests that NERC COM-003 is attempting to tread where FERC itself dared not go. Within that paragraph 493, FERC's rationale cites no more than "when generators with blackstart capability must be placed in service and nearby loads restored as an initial step in system restoration", in support of exercising governance over DP telecommunications. These two limited conditions for communication appear confined to COM-002, and not COM-003's drafted governance over external communications with DPs. Paragraph 509's real-time staffing requirement omits DPs. Paragraph 510.3 cites DPs as applicable under COM-002, and 510.4 "requires tightened communications protocols, especially for communications during alerts and emergencies" and then par 510 goes on to propose a new standard (COM-003?) for addressing the Blackout Report Recommendation 26. Paragraph 512's assertion "that, during both normal and emergency operations, it is</p>

		<p>essential that the transmission operator, balancing authority and reliability coordinator have communications with distribution providers" appears to conflict with earlier par 509 with regard to levels of "essential", and then asserts that many DPs are "not a user, owner or operator of the Bulk-Power System" so not required to comply with COM-002 (nor therefore COM-003). However COM-003 fails to provide for such differentiation within its Applicability section 4.1.2, for its scope of governance over DP communications during "normal operations". AECI recommends that DP applicability be dropped from COM-003 and reserved for COM-002 where these citations rationale for inclusion is clear. Finally, because industry balloting appears highly conflicted over the terms under which COM-003's rules would be developed, AECI strongly suggests that the SDT limit scope to only communications between RCs and their external communicating parties. This stance would have stronger backing from the above citations, and would make more sense, because only RCs communicate changes to the BES. New governance over the exact manner in which communicated changes become executed, is where industry appears to have heartburn. This may be occurring because much of industry has already tweaked and tuned those operational methodologies long before RCs came into existence, and therefore see much greater Compliance risk being ventured, for relatively little BES-reliability gains.</p>
seattle city light	No	<p>Seattle remains confused as to the intent of the draft Standard. R1 appears to require a protocol for communications that need not be followed in R2 or R3, because only communications problems leading to a Reliability Directive are to be audited. Seattle does not know if this position satisfies the FERC Order or the SAR. As proposed, the present Standard draft could be simplified to a single requirement to "communicate in such a way as to avoid Reliability Directives." On the other hand, if the intent is to REQUIRE three-way communications, then present draft R2 and R3 do not</p>

		do so.  <b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.
Lincoln Electric System	Yes	
Tennessee Valley Authority	Yes	
MRO NERC Standards Review Forum (NSRF)	No	The NSRF does not believe that this Standard is necessary to address recommendation 26 of the Blackout Report, thus this project should be terminated. The NSRF suggests that COM-002-3 be filed with FERC as approved by the NERC BOT, as we believe it adequately addresses the Blackout recommendation 26 and FERC Order 693. However, if the NERC SC wants to continue with this development, we provide the following recommendations. For Measure 2 and Measure 3, the SDT is requiring each registered entity to 'prove the negative' by requiring each entity to demonstrate that each Operating Instruction issued by its System Operators did not result in an operating condition that required the issuance of a Reliability Directive. From the webinar on July 2, the SDT stated that all an entity needs to do is request an attestation letter from its, RC and neighboring TOPs and BAs. Some entities are reluctant to issue such blanket attestation letters and some Regional Entities do not accept attestation letters as proof of compliance. The SDT went on to say the Reliability Directives are rare. The NSRF suggests changing M2 & M3 to state: M2. When a Reliability Directive is issued, demonstrate that it was not the result of a Reliability Coordinator, Transmission Operator or Balancing Authority's failure to use documented protocols when issuing an Operating Instruction developed for Requirement 1. M3. When a Reliability Directive is issued, demonstrate that it was not the result of a failure of the Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator or Distribution Provider to repeat, restate, rephrase, or recapitulate an Operating Instruction, when required by

		<p>another Reliability Coordinator, Transmission Operator or Balancing Authority.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Alliant Energy	Yes	
American Transmission Company, LLC	Yes	<p>And ATC supports the communication protocols identified in R1. However, ATC proposes changing R2 and R3 to make the protocols for issuing and receiving Operational Instructions consistent with the protocols for issuing and receiving Reliability Directives as defined in R2 and R3 of proposed Reliability Standard COM-002-3 as follows: R2. When instructed by a Balancing Authority, Reliability Coordinator, or Transmission Operator to repeat, restate, rephrase, or recapitulate an Operational Instruction, each Balancing Authority, Transmission Operator, Generator Operator, or Distribution Provider, that is the recipient of a Operational Instruction, shall repeat, restate, rephrase, or recapitulate the Operational Instruction. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Operational Instruction shall either: • Confirm that the response from the recipient of the Operational Instruction (in accordance with Requirement R2) was accurate, or • Reissue the Operational Instruction to resolve a misunderstanding. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 in a manner which identifies and corrects deficiencies in said communication protocols.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Exelon and its affiliates	Yes	<p>Exelon supports COM-003 Draft 6 but would like to submit the following comments for consideration by the SDT: Suggest rewording the last sentence of M2 to read: A Balancing Authority, Reliability Coordinator, and</p>

		Transmission Operator shall coordinate with another Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence. Suggest rewording the last sentence of M3 to read: A Balancing Authority, Generator Operator, Distribution Provider, and Transmission Operator shall coordinate with a Reliability Coordinator, Balancing Authority and Transmission Operator to provide this evidence.
Tri-State Generation and Transmission Association, Inc.	No	We appreciate the drafting team’s efforts and persistence in the drafting of this new standard. We believe that this proposal goes beyond what was contemplated in the Blackout Recommendation as well as FERC Order 693 directives 1 and 3 of paragraph 540. We urge the drafting team to reconsider the need for a new COM-003 standard, we already have a standard for communication (COM-002), the requirements of the FERC Order can be added to COM-002 with minimal effort reducing the need for yet another standard. Additionally, we feel that a new term to define “Operating Instruction” is not warranted or required to fulfill either the FERC directive or Blackout Recommendations.
DTE Electric	Yes	
Florida Municipal Power Agency	No	Although FMPA voted affirmative, there are still significant improvements that can be made, and enough significant weaknesses remain to make this a difficult voting decision for FMPA. It still artificially separates COM-002-3 and Reliability Directives and COM-003-1 and Operating Instructions when in reality Reliability Directives (RD) are a subset of Operating Instructions. Contrary to the white paper, there will likely be confusion as to whether an instruction should or should not be a Reliability Directive, i.e., the only real difference is whether an Emergency condition exists or not. The only certain distinguishing factor in practice is that the issuer of an RD needs to identify it as an RD per COM-002-3. There will still be significant Monday morning quarterbacking after an event as to whether an Operating Instruction should have been issued as an RD or not, i.e., whether or not the issuer should have

	<p>recognized an Emergency or not. The better solution is to treat RD and Operating Instructions the same and only differentiate with VRFs (as an analogy, look at difference between R1 and R2 of FAC-003-2) and whether there should be a difference in treatment regarding “zero tolerance” for RDs and some tolerance for Operating Instructions.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.</p> <p>Reliability Directives on “all-calls” are still a problem It still makes 3-part communication optional for Operating Instructions. Does “optional” meet FERC’s directive, i.e.” requires tightened communications protocols, especially for communications during alerts and emergencies” (Order 693, P 540) and “(w)e also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis ... This is important because the Bulk- Power System is so tightly interconnected that system impacts often cross several operating entities’ areas.” (Order 693, P 532)? At minimum, the standard should require 3-part communication for alerts in addition to Emergencies. R2 and R3 try to limit potential violations for failure to follow the subject of the requirement (i.e., R2: “Each (responsible entity) shall implement its communication protocols developed in Requirement R1”) would not actually result in a violation unless an Emergency occurred as described in the predicate, (e.g., R2: “so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive ....”). Remember, Reliability Directives are only given in a state of Emergency (Reliability Directive: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact”). Does this serve reliability</p>
--	---

	<p>well, must we get to a state of Emergency to have a violation to the standard – and doesn't that just highlight potential double jeopardy and overlap between COM-002-3 and COM-003-1, e.g., if an Operating Instruction is issued in COM-003-1 that is not followed that results in the same instruction being given as a Reliability Directive? This of course begs the question of whether or not the System Operator should have issued an RD in the first place. Does this address FERC's requirement to tighten communication protocols, including emergencies and alerts? In addition, we don't think the actual language limits the potential violations to those that meet the predicate as intended (i.e., we do not think the predicate – "so that ..." – modifies the subject so much as it describes and repeats the purpose of the standard. In other words, to us the requirements can be interpreted that the subject must always be met "so that" the purpose/predicate is accomplished. Hence, we do not think that it solves the zero tolerance issue without stating the requirement in a similar manner as the Measure is stated). Note that the Measure confirms that an Emergency is intended for potential violation: "Each (responsible entity) shall provide evidence that it did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive ...". We still strongly believe that the better solution is to cause COM-003-1 to address Reliability Directives and retire COM-002-3. After all, when issuing a Reliability Directive, don't we want the issuer to speak English, use a consistent clock time with their neighbors, etc., for which COM-002-3 is silent but COM-003-1 specifies? We still have not heard a good reason why this is not being done. We also think that it is necessary to require 3-part communication for "alerts" to meet FERC's directives. Don't we want 3-part communication to be followed during alerts?</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
--	---

CenterPoint Energy Houston Electric LLC.	No	No explanation
Keys Energy Services	Yes	
Indiana Municipal Power Agency		<p>There is no place to submit “other” comments, so Indiana Municipal Power Agency (IMPA) is submitting comments under this question. For requirement R3, how will entities (BA, TOP, GOP, and DP) who are responsible for the repeat back of the Operating Instruction know the “when required by the issuer” part of the requirement is in place or being required by the issuer? Will the issuer be stating their request is an Operating Instruction or be asking for the receiver to please repeat the Operating Instruction back to them? Maybe the issuer of the Operating Instruction can make their communication protocol available to the receiving entities in Requirement R3 to allow them to be familiar with their protocols which may help with know when a repeat back is required by the issuer.</p> <p><b>Response: The language of R2 and R3 has been changed to reflect the new approach.</b></p>
HHWP	No	The draft standard does not clearly articulate the purpose nor an appropriate results based approach to addressing FERC objective to ensure clear communications between operators and users of the BES.
Bureau of Reclamation	No	The Bureau of Reclamation believes that the proposed changes to COM-003-1 do not adequately address Order 693 directives or 2003 Blackout Report Recommendation No. 26. First, Order 693 Paragraph 512 directed the ERO to modify COM-002-2 to address “both normal and emergency operations,” and because each Transmission Operator (TOP), Balancing Authority (BA), and Reliability Coordinator (RC) is able to design their own Operating Instructions under R1 of the proposed revision, Reclamation is unable to ascertain whether Operating Instructions will apply to normal operations. Second, Paragraph 532 of Order 693

	<p>specified that “an integral component in tightening [communication] protocols is to establish communication uniformity as much as practical on a continent-wide basis.” As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. Third, the 2003 Blackout Report Recommendation No. 26 specified that NERC should improve internal and external communications during “alerts, emergencies, or other critical situations.” Under the proposed definition of Operating Instruction and R1, it seems that BAs and TOPs have discretion to determine under what conditions Operating Instructions are issued in their operating area, so it is not possible for Reclamation to determine whether Recommendation No. 26 is adequately addressed by the standard. In addition, Reclamation would like to emphasize that the revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination (“discussion of general information and potential options”?), Operating Instructions (applicable in circumstances as defined by various TOPs and BAs), and Reliability Directives (real-time emergency conditions addressed by COM-002). COM-003 does not clearly define the timeframe for Operating Instructions, and should make clear what the line of demarcation is between “real-time emergency” communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which “Operating Instructions” apply, Reclamation believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. Also, Reclamation does not believe that violations of R3 should be tied to a failure to repeat an Operating Instruction only if it “result[s] in an operating condition that required the issuance of a Reliability Directive.” To reinforce the importance of repeat-back communications, repeat-back communications should be required under all circumstances like in the aviation</p>
--	---

		<p>industry. Further, Reclamation believes that Generator Operators (GOPs) and Distribution Providers should provide concurrence or have a role in Operating Instructions development required under R1 to avoid potential miscommunications (e.g., in nomenclature for Transmission interface elements).</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>Lastly, Reclamation believes that COM-002 should include provisions parallel to IRO-001 and TOP-001 that allow Generator Operators to inform the TOP, BA, or RC that they are unable to comply with an Operating Instruction because the actions requested “would violate safety, equipment, regulatory or statutory requirements” so that the TOP, BA, or RC “can implement alternate remedial actions,” If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their “inability to perform” the Operating Instruction like they are able to inform the TOP, BA, or RC of the inability to perform a Reliability Directive. The Bureau is proactive about assisting with transmission system events, but at certain times of year dramatic changes in reservoir levels could endanger the public in reservoirs or on rivers, could cause unlawful total dissolved gas (TDG) levels, or violate Endangered Species Act requirements. Other safety and equipment circumstances could also lead to an inability to follow an Operating Instruction. Reclamation suggests that the previous draft of the standard was clearer and that perhaps the drafting team could revisit it.</p> <p><b>Response:</b> This scope of this standard, as defined by the SAR, only considers communication protocols. The obligation to follow “directives” is defined elsewhere in the body of standards.</p>
Liberty Electric Power	Yes	

<p>Hydro One Networks Inc.</p>	<p>No</p>	<p>We support this proposed draft (version 6) of the standard on the basis of it being a compromise between what the industry would like to see and what the US regulator is mandating. That said, we still have concerns with the proposed standard (comment below). As proposed, the standard may be ambiguous and difficult to measure. For example, Requirement 2, states that the entity shall implement its communication protocols in such a way that failure to use them would not result in an operating condition that requires the issuance of a Reliability Directive. How does the SDT envision enforcing such requirement? It is difficult to determine if the failure to follow the protocols when addressing Operating Instructions is truly the reason for a new operating condition that requires issuance of a Reliability Directive or is the result of the original instruction being insufficient or in error. Also, the corresponding measure M2 puts the burden on the entities to provide evidence that it did not have any such cases. We see this as an ever encompassing and burdensome approach for collecting and presenting evidence.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>The issue of three-part communications has always been very central to the development of this standard. So far the SDT has not been able to produce a draft standard to achieve industry consensus on this issue. While at least partially addressing FERC orders, we believe that the approach the SDT chose, makes the day-to-day duties inside the control room more complicated, cumbersome and hard to implement. If the current version 6 does not achieve the required industry approval rate, we still stand by our prior comments and consideration should be given to modify the COM-002 standard to incorporate into it the matters that COM-003 has been trying to address, all in one communications standard.</p>
--------------------------------	-----------	--

		<p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.</p>
FirstEnergy	yes	<p>(1) FirstEnergy (FE) believes that Requirement 2 is confusing as worded, and as such, we propose the following for clarity: [R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an Operating Instruction shall follow its documented communication protocols developed in Requirement R1 such that it does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.] (2) FE believes that clarity will also be attained with clear and precise RSAWs. The latest RSAW that has been posted is applicable to Draft 4 and provides no guidance to stakeholders the intent of the requirements from Draft 6. FE appreciates the FAQs from July 2, 2013 Industry Webinar the SDT has provided and would recommend the SDT incorporate into the RSAW for Requirement 2 the intent of the response to Question 2 regarding when an evaluation to an Operating Instruction shall be used as evidence.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Public Service Enterprise Group	Yes	
Deseret Power Electric Cooperative	No	<p>As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. The revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination ("discussion of general information and potential options?"), Operating Instructions (applicable in circumstances as defined by various TOPs and BAs), and Reliability Directives (real-</p>

		<p>time emergency conditions addressed by COM-002). COM-003 does not clearly define the time frame for Operating Instructions, and should make clear what the line of demarcation is between "real-time emergency" communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which "Operating Instructions" apply, Reclamation believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. COM-003 should include provisions parallel to IRO-001 and TOP-001 that allow Generator Operators to inform the TOP, BA, or RC that they are unable to comply with an Operating Instruction because the actions requested "would violate safety, equipment, regulatory or statutory requirements" so that the TOP, BA, or RC "can implement alternate remedial actions," If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" the Operating Instruction like they are able to inform the TOP, BA, or RC of the inability to perform a Reliability Directive.</p> <p><b>Response:</b> This scope of this standard, as defined by the SAR, only considers communication protocols. The obligation to follow "directives" is defined elsewhere in the body of standards.</p>
Duke Energy	Yes	<p>Duke Energy agrees in part that draft 6 of the proposed COM-003-1 does address the recommendations of the 2003 Blackout Report, FERC Order 693, and the COM-003-1 SAR. However, Duke Energy believes that this draft has gone beyond the expectations outlined in the documents mentioned above. Measure 3 should be changed to "when required by the issuer" in order to provide clarity and consistency with R3. Requirement 2 language leads to uncertainty (risk) as to when an Operating Instruction will become a Reliability Directive. This could negatively impact BES reliability in creating reluctance, by the entity, to issue a Reliability Directive</p>

		<p>and furthermore places Operators in the position of acting in compliance with the Requirement at the time only to be deemed non-compliant later when circumstances change. This is an untenable position and leads to less reliability. Such a finding of non-compliance cannot be mitigated leaving the Responsible Entity without means to “control” performance. We are also concerned with the language in Requirement 2 “so that”. This vague language can be interpreted as to intent which is unmeasurable and therefore adds to the uncertainty (risk).</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>In addition, Duke Energy believes that a statement needs to be added in R1 that includes providing or distributing those communication protocols developed by a BA or TOP to their associated DPs and GOPs. This would address a potential gap of DPs and GOPs not aware of the communication expectations when communicating with BAs and TOPs when given an Operating Instruction. Lastly, while Duke Energy applauds the efforts made by the SDT, we are not convinced that a standard can be developed that will garner the requisite support from industry stakeholders. Duke Energy recommends the SDT to delineate other options, such as a Guideline document or White Paper, before addressing the recommendations in the 2003 Blackout Report.</p>
Northeast Utilities	Yes	
Pacific Gas and Electric Company	No	<p>Pacific Gas and Electric believes that the proposed changes to COM-003-1 do not adequately address Order 693 directives or 2003 Blackout Report Recommendation No. 26. First, Order 693 Paragraph 512 directed the ERO to modify COM-002-2 to address "both normal and emergency operations," and because each Transmission Operator (TOP), Balancing Authority (BA), and Reliability Coordinator (RC) is able to design their own Operating Instructions under R1 of the</p>

	<p>proposed revision, PG&amp;E is unable to ascertain whether Operating Instructions will apply to normal operations. Second, Paragraph 532 of Order 693 specified that "an integral component in tightening [communication] protocols is to establish communication uniformity as much as practical on a continent-wide basis." As written, R1 would allow each BA and TOP to develop their own Operating Instructions, which does not promote the continent-wide uniformity called for by FERC in Order 693. Third, the 2003 Blackout Report Recommendation No. 26 specified that NERC should improve internal and external communications during "alerts, emergencies, or other critical situations." Under the proposed definition of Operating Instruction and R1, it seems that BAs and TOPs have discretion to determine under what conditions Operating Instructions are issued in their operating area, so it is not possible to determine whether Recommendation No. 26 is adequately addressed by the standard. In addition, PG&amp;E would like to emphasize that the revised definition of Operating Instruction is not clear enough to distinguish between real-time operations coordination ("discussion of general information and potential options?"), Operating Instructions (applicable in circumstances as defined by various TOPs and BAs), and Reliability Directives (real-time emergency conditions addressed by COM-002). COM-003 does not clearly define the timeframe for Operating Instructions, and should make clear what the line of demarcation is between "real-time emergency" communications governed by COM-002 and other alert conditions governed by COM-003. If each BA and TOP is allowed to define separate circumstances under which "Operating Instructions" apply, PG&amp;E believes that COM-003 will not achieve continent-wide standardization of communications protocol that FERC recommended in Order 693. Also, PG&amp;E does not believe that violations of R3 should be tied to a failure to repeat an Operating Instruction only if it "result[s] in an operating condition that required the issuance of a Reliability Directive." To reinforce the importance of</p>
--	---

		<p>repeat-back communications, repeat-back communications should be required under all circumstances like in the aviation industry. The use of three-way communication has been proven as an effective error prevention tool in the military, aviation, and in the nuclear power industry. It is time that the same discipline and rigor be implemented in the electric industry. The current version of this Standard is moving away from reliability and will be difficult for compliance and enforcement. Further, Generator Operators (GOPs) and Distribution Providers should provide concurrence or have a role in Operating Instructions development required under R1 to avoid potential miscommunications (e.g., in nomenclature for Transmission interface elements).</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>PG&amp;E suggests that the previous draft of the standard was clearer and that perhaps the drafting team could revisit it.</p>
Puget Sound Energy	No	<p>Puget Sound Energy appreciates the drafting team's work to simplify the requirements of this standard and believes that the standard's language is moving in the right direction. However, Puget Sound Energy cannot vote to approve this standard for the following reasons. Requirement R1, by requiring the Reliability Coordinator (RC) to approve each communication protocol, is unnecessarily burdensome on the RC and all the entities that must receive that approval. This type of approval makes sense for restoration plans (EOP-005-2) because of the required coordination in an emergency situation, but not for the communications protocols that apply in non-emergency situations. There is certainly a benefit to uniformity of communication protocols within an interconnection; however, uniformity should be achieved by requiring the RC to specify its requirements for communication protocols and then requiring Balancing Authorities and Transmission Operators to</p>

		<p>comply with that specification (similar to the approach of IRO-010). There should be an additional requirement for Reliability Coordinators, Balancing Authorities and Transmission Operators to provide information about the communication protocol requirements that apply to other entities within their area to those entities. It is only appropriate to hold an entity responsible for complying with communication protocol requirements when it has advance notice of what those requirements will be.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>The language connecting miscommunications to Reliability Directives in requirements R2 and R3, along with the associated VSLs, should address degrees of compliance. While the approach does narrow the scope of possible violations, it seems that the language could easily lead to a debate on whether a miscommunication "results in" an impact. Typically, events have many elements that contribute to their occurrence and in some cases a miscommunication might only indirectly or tangentially relate to the event. Given the assigned VSL of severe for all violations of these requirements, a miscommunication with an indirect relationship to a subsequent Reliability Directive will likely have the same compliance impact as one that has a more direct and substantial relationship. Thank you for your consideration of these comments.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
SCE&G	No	<p>FERC Order 693 states "We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis." R1 allows each BA, RC, and TOP to develop their own, separate communication protocols. Criteria 1.1 thru 1.5 are open-ended. As a</p>

		<p>result, each BA and TOP will have different protocols that they submit to the RC for approval. The standard does not give RCs guidance on how to evaluate submitted protocols for consistency/uniformity before approval. Without such guidance, it is unclear how consistency and uniformity will be promoted among the various BA/TOP documented protocols. Furthermore, if such criteria were added, the standard would still only promote uniformity within an RC footprint. It would not promote uniformity across the continent, as directed within Order 693, or even the regions. It seems the only way for the SDT to fully address the FERC directive, is for the SDT to specify the specific protocols they want BAs TOPs and RCs to use. Many entities are opposed to this approach because they are concerned about monitoring and maintaining compliance with such a standard. These concerns could be alleviated if the SDT writes the standard in a way such that a violation only occurs if a BES Emergency results from failure to use the specified protocols.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p>
<p>PJM Interconnection, L.L.C.</p>	<p>No</p>	<p>PJM does not support Draft 6 of this standard. There is a concern specific to the potential, unintended compliance responsibility in R2 because of the way the requirement is written, as well as the associated M2. Applicable entities will be required to prove a negative which may result in unnecessary Root Cause Analysis (RCA) efforts that are not required and are solely performed to satisfy an administrative, compliance item, yet adds no discernible reliability value.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
<p>Santee Cooper</p>	<p>No</p>	<p>Santee Cooper believes the issuing authority should specifically identify a communication as an Operating Instruction, thereby triggering the need for three-part</p>

		communications, and the receiver to use three part.
Cooper Compliance Corp	No	<p>While we agree that the proposed Standard addresses the FERC Order 693, we do not feel that R3 is well drafted and assumes that the distribution provider or generator operator would be able to determine if the Operating Instruction would “result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.” In addition, the dictionary term for restate, rephrase, or recapitulate all have the same meaning and it seems odd that an auditor would be able to distinguish any difference. We suggest the drafting team simplify R3 as follows: “Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat or restate an Operating Instruction when required by the issuer of an Operating Instruction.”</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Luminant Energy Company LLC	Yes	<p>While draft 6 of COM-003-1 is largely acceptable, the wording of R3 may create confusion about what is required. R3 reads, in part: R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so ... This language suggests that the receiving entity must know what is in the issuer's communication protocol and repeat, restate, rephrase or recapitulate the Operating Instruction without any prompts from the issuer. If that is the case, then there needs to be a requirement that the developer of a communication protocol must provide that communication protocol to all relevant parties prior to implementation. However, after reading the Technical Justification, that doesn't appear to be the intent. Rather the intent is that the</p>

		<p>issuer will request the receiver to repeat the Operating Instruction back during the phone call. To make that clear, Luminant suggests the following language change to R3: R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when requested by the issuer of an Operating Instruction in accordance with the communication protocols developed in Requirement R1 so ... With this change, we would be in support of this draft standard.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
<p>IRC Standards Review Committee</p>	<p>No</p>	<p>The SRC has reviewed the current COM-003 posting and offer the following comments that augments previously provided comments on the standard. • Requirement R1 now requires each BA and TOP’s to have protocols approved by the RC. One question certain SRC Members have is whether the RC is being asked to “assess” whether the BA/TOP’s protocols are “compliant” with the Standard. Another question is whether the RC is being asked to “approve” the TOP communication protocols with other Registered Entities (e.g., TOs). Depending on the answers to these questions, the SRC proposes that the “approval” requirement could be revised to a “coordination” obligation.</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <ul style="list-style-type: none"> <li>• Requirement R2 now has add a trigger for non compliance for not implementing the communications protocol if following an operating instruction, a reliability directive is issued to correct the problem caused by a failure to implement its communication protocol. We ask NERC to comment on whether this will produce an obligation for compliance authorities to begin a compliance investigation on every Reliability</li> </ul>

		<p>Directive to assess whether communication protocols were followed. Reliability Directives are an important means of communications to address all emergencies. Poor communications have yet to be clearly identified as a root cause. The SRC would also like NERC and the SDT to consider comments provided by NERC at the recent FERC Technical Conference stating, ‘complementary approaches should also be examined where the risks to reliability can effectively be mitigated through other means, such as through guidelines, data collection or other technical approaches.’ NERC should continue to consider the effectiveness of the NERC Operating Committee communications protocol. Note, ERCOT and PJM, members of the IRC Standards Review Committee did not join these joint comments and have submitted individual comments.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
Kansas City Power & Light	No	We feel that this standard is not necessary if the COM-002 standard is properly followed. Also, R3 could cause an over burdensome amount of effort to prove compliance with COM-003.
SPP Standards Review Group	Yes	Although there still remain some concerns that the intent of Recommendation 26 was strictly for emergency situations which are covered by COM-002-3.
Colorado Springs Utilities	No	Colorado Springs Utilities appreciates the commitment and long, hard work of the Drafting Team as well as the opportunity to comment on this draft. R.1: The clause, “subject to the Reliability Coordinator’s approval” is unclear in its intent. If the intent is that the RC must review and approve all Communication Protocols, there should be discrete requirements (a la EOP-005-2 & EOP-006-2) in the Standard. If that is not the explicit intent, what is? If the intent is to make it optional or suggested for the RC to review and approve Protocols, then that is not a Standard – it is a suggestion. Please state whatever is the intent clearly in the requirement. CSU proposes the clause be removed entirely.

	<p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>R1.3: Should be removed. This requirement is redundant to TOP-002-2.1b, R18; “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.”</p> <p><b>Response:</b> Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 when it developed TOP-002-3. This standard, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are readily familiar with each other’s interface Elements and Facilities, eliminating hesitation and confusion when referring to equipment for the Operating Instruction. This shortens response time and improves situational awareness.</p> <p>R2 &amp; R3: CSU prefers the language along the lines of the previous draft (R2 &amp; R4). The clause, “failure to use the protocols by the issuer of an (or R3- failure to repeat, restate, rephrase, or recapitulate the) Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive” is unworkable, probably unauditible, and definitely an evidentiary nightmare. If one entity issues a Reliability Directive, what chain of evidence from how many other entities is required to prove that no other entity failed to use its communications protocols in such a way that failure resulted in the operating condition requiring the first entity to issue a Reliability Directive? Or, to view it from the other direction: if CSU is being audited on compliance with COM-003-1, how shall it prove that it did not have a failure to properly implement any</p>
--	--

		<p>communication protocol which then contributed to operating conditions which may have required any other reliability entity in the western interconnect to have to issue a Reliability Directive? How does one establish the causal relationship, or lack thereof? In lieu of a return to the previous draft’s language, CSU recommends adding another sub-part to R1, “R1.6 A method to assess System Operator’s communication practices and implement improvements as necessary to meet the expectations in its documented communications protocols developed for this Requirement.” Then R2 could be written, “Each ... shall implement its communication protocols developed in R1.” R3 could state, “Each ... shall repeat, restate, rephrase, or recapitulate an Operating Instruction, when required by the issuer in its communication protocols developed in requirement R1, to the satisfaction of the issuing System Operator.” M2 &amp; M3: Reliability Standards need to get away from asking for negative evidence. The Standard is probably written incorrectly if negative evidence is required for compliance. Even sticking with the negative theme; “Each ... shall provide evidence that it did not fail to use its documented communications protocols developed for Requirement R1 in a way that resulted in an operating condition that required &lt;anyone&gt; to issue a Reliability Directive,” comes closer to supporting the Requirement as drafted. Thank you! Sincerely, Colorado Springs Utilities</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p>
DTE Electric Co	No	<p>In response to request for comment number 1 and a literal reading of the question and associated documents:</p> <p>The August 2003 Blackout Report Recommendation number 26 speaks to “tightening communication protocols, especially for communications during alerts and emergencies.” In the context of the entire document, it highlights the lack of sharing of critical</p>

	<p>information during the blackout event. It does not really address “Operating Instructions” or mention a failure to correctly understand, follow or execute a direction/instruction. The focus is on what information would have assisted the operators in dealing with the event, not mistakes in execution of Operating Instructions. Page 109 of the report summarizes “Effectiveness of Communications” and states “Under normal conditions, parties with reliability responsibility need to communicate important and prioritized information to each other in a timely way, to help preserve the integrity of the grid. This is especially important in emergencies. During emergencies, operators should be relieved of duties unrelated to preserving the grid. A common factor in several of the events described above was that information about outages occurring in one system was not provided to neighboring systems.” Information exchange seems to be the focus, not communication of Operating Instruction.</p> <p>FERC Order 693 (which refers back to the Blackout Report) also requires tightening communication protocols “especially for communications during alerts and emergencies” to “establish communication uniformity” and “eliminate ambiguities.” The proposed standard is focused on Operating Instructions and lacks requirements regarding consistency in information sharing.</p> <p>Regarding COM-003-1 SAR, the SAR states its scope is “to establish essential elements of communications protocols and communications paths such that operators and users of the North American bulk electric system will efficiently convey information and ensure mutual understanding. “ It also states that the purpose of the standard is “to ensure that effective communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities.” Version 6 of</p>
--	--

	<p>COM-003-1 does not address Applicability number 1 “relay critical reliability-related information in a timely and effective manner.” It also does not address Applicability number 3: “requirements for entities that experience abnormal conditions to use pre-defined terms such as proposed in the “Alert Level Guideline” (attached) to communicate the operating condition to other entities that are in a position to either assist in resolving the operating situation condition or to entities that are impacted by the operating condition.” It only focuses on Operating Instructions, not communication of the status/condition of the electrical system. The SAR Scope mentions “consistency across regions,” yet the standard does not address RC to RC communications within/across regions.</p> <p>The purpose of COM-003-1 revision 1 was closer to addressing the above than the purpose in revision 6. It seems the standard has strayed from the intent and although there may be value in having a standard that addresses protocols for issuance of Operating Instructions, this version does not address the concerns laid out in the documents listed above. Items such as sharing of tie line trips, major generation loss trips, high risk situations/evolutions (possibly tripping critical items), loss of EMS capabilities/control center functionality, declared alerts/emergencies and other pertinent information would be the types of information would be standardized and addressed in a standard in order to meet the objectives of the SAR and FERC rather than Operating Instructions.</p> <p>General comments regarding revision 6 of the standard “as written,” the purpose of which is different from the question asked in the comment form: As this standard seems to focus on verbal communication, written communications should not be included this standard. It is not clear what is intended to be in scope for “written” Operating Instruction. The standard should not introduce vague terminology</p>
--	---

	<p>subject to different interpretations. If there is a need (or reliability reason) to address written Operating Instructions, they should be included in a separate standard. Focus on 3-way communication and use of alpha-numeric clarifiers in COM-003-1 do not readily fit written communications. Not sure how R2 and R3 would be applied to written Operating Instruction.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p>Since COM-003-1 has emphasized the difference between Operating Instruction and Reliability Directive as exclusive and distinct, it appears that COM-003-1 communication protocols are more strict for Operating Instruction (regarding use of time zone, alpha-numeric clarifiers, etc.) than COM-002-3 requiring only 3-way communication (no time zone, etc.). If COM-003-1 protocols (other than 3-way communication) are not followed for Reliability Directives, there is no standard violation of either COM-002-3 or COM-003-1. This seems to leave a reliability gap.</p> <p><b>Response:</b> The posted version of COM-002-4 combines COM-002-3 and COM-003-1 into a single standard.</p> <p>Should NOT require RC approval of an entity's communication protocol. By requiring RC approval of each responsible entity's communication protocol document, it sets up the possibility of disagreements. Entities should be responsible to develop protocols that are compatible with RC protocols, but that may differ on the "downstream" side (i.e. with entity's field personnel). This may be required if RC demands use of Standard Time and BA must communicate with field personnel in Daylight Time. RC should not be able to dictate these types of issues. No defined resolution process in cases of disagreement. If RC is final word, then standard should require RC to develop protocol with input from other entities and all entities should use</p>
--	--

	<p>RC protocol (no requirement for individual protocols). Who would “approve” RC to RC communication protocols?</p> <p><b>Response:</b> The RC approval has been removed from the draft 7.</p> <p>R2 and R3 documentation is onerous. It really requires a coordinated investigation into every Reliability Directive that is issued to verify it was NOT caused by a communication protocol violation somewhere in the chain (as it may not be between just two responsible entities/protocol documents). How wide a net needs to be cast in gathering attestations of “No Reliability Directives issued?” How deep in connected systems or entities? An entity may issue a Reliability Directive to a different entity than violated the communication protocol if that problem surfaces in their system.</p> <p><b>Response:</b> The language of R2 and R3 has been changed to reflect the new approach.</p> <p><b>Comments - Stefaniak:</b> R1.1, R 1.2, R1.3: It is not clear what is intended to be in scope for “written” Operating Instruction. The standard should not introduce vague terminology subject to different interpretations.  R2, R3: Failing to use communication protocols would not directly lead to an operating condition that requires the issuance of a Reliability Directive. It is more likely that failing to use communication protocols could cause an Operating Instruction to be incorrectly executed. Such an error could lead to an operating condition that requires the issuance of a Reliability Directive. Consider changing R2 and R3 as follows:  R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an Operating Instruction to be incorrectly executed thus leading to an</p>
--	--

		<p>operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations ]</p> <p>R3. Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an Operating Instruction to be incorrectly executed thus leading to an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator. [Violation Risk Factor: Medium][Time Horizon: Real Time Operations ]</p>
--	--	--

**2. Do you agree with the VRFs and VSLs for Requirements R1, R2, and R3?**

In light of the recommendation to combine the COM-002 and COM-003 standard and because the OPCPSDT has not had the opportunity to ballot a combined standard, the OPCP SDT has created draft 7 as COM-002-4, which creates a single combined standard. The OPCP SDT also considered the essential elements and evaluated whether they should be included within the combined standard. This change in the proposed standard led to changes in VRFs and VSLs. Given that, the comments below are not responded to individually because they are no longer relevant to the current version of the standard.

Organization	Yes/No	Comment
Oncor Electric Delivery	No	R2 – it is unclear how a “failure” of using an operating

		<p>protocol results in a reliability directive therefore the VSL indicates a zero tolerance level of performance which does not align to reliability based performance. R3 – not all failures of using three-part communication will automatically led to a Reliability Directive so the VSL should be designed to support more than a failure to use the protocols by the issuer of an Operating Instruction does not result</p>
GSOC	NO	<p>No, regarding R2 and R3, GSOC recommends to revise the wording as follows. In particular, we believe it advantageous to use NERC's definition of Emergency (BES Emergency) to provide entities escalating levels of severity as opposed to the single VSL - severe that appears in the current Draft 6. R2 - Each Balancing Authority, Reliability Coordinator, and Transmission Operator (R3 - Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider) shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in any of the following: • Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System. • The failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System and automatic or immediate manual action to limit the failure was required. • An Adverse Reliability Impact</p>
NPCC	No	<p>We agree with the VRFs, but not the VSLs because of the concerns with Requirements R2 and R3. We do not agree with the Long-term Planning Time Horizon for R1. Developing and documenting communication protocols for use during real-time operations is an operational planning process (or mid-term planning, at most), not a long-term planning process. We suggest to change the Time Horizon to Operations Planning. Regarding the Implementation Plan, it conflicts with Ontario regulatory practice with regards to the effective date of the standard. It is suggested that this conflict be removed by</p>

		<p>appending to the effective date wording, after “applicable regulatory approval” in the Effective Dates Section of the Implementation Plan: “, or, in those jurisdictions as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.”</p>
Manitoba Hydro	Yes	
NERC Compliance Group	Yes	
PacifiCorp	No	<p>PacifiCorp does not agree with the VRFs and VSLs associated with R2 because it is not clear how R2 is measured. M2 would require an entity to provide evidence that it did not issue an Operating Instruction that resulted in an operating condition that required the issuance of a Reliability Directive by the issuer or another Balancing Authority, Reliability Coordinator, or Transmission Operator due to the failure to use documented communications protocols developed for Requirement R1. In essence, an entity is required to prove that it did not do something that resulted in a condition which caused another entity to be issued a directive (that it may or may not be privy to, depending upon whether or not it was the original issuer of said directive). A requirement that is measured by the absence of evidence creates a challenging auditing environment for the industry. PacifiCorp strongly recommends that the drafting team reconsider the measures required for proving compliance with R2.</p>
Arizona Public Service Company	Yes	
Consolidated Edison Co. of NY, Inc.	No	<p>FERC requires that VSL’s be graded. The Requirement R3 VSL should be modified to reflect the following graded proposal: “The first failure following the effective date of this standard is a “Low VSL.” However, should failures be more frequent, then the severity level for such failures should be increased. “For the second and subsequent failures following the effective date of the standard a single failure within a given 12-month rolling period is a Moderate VSL. “For the second and subsequent failures following the effective date of the standard and when there is more than one failure within</p>

		a given 12-month rolling period the failure is a Severe VSL.”
Flathead Electric Cooperative, Inc.	No	
Occidental Energy Ventures Corp.	Yes	
ReliabilityFirst	No	ReliabilityFirst has a concern with the VSLs for Requirement R1. In the previous draft, the VSLs for Requirement R1 were gradated based on missing “x” out of nine sub-parts. For example, missing 44% (four out of nine) of the sub-parts was a Severe VSL). With the current draft only including five sub-parts under Requirement R1, the gradation should be adjusted accordingly. ReliabilityFirst believes that an entity not addressing more than half of the sub-parts within the documented communication protocols is missing the intent of the requirement and should be a Severe VSL. Furthermore, if the “...subject to the Reliability Coordinator’s approval...” language continues to remain in Requirement R1 (against our recommendations in previous comments), this “Reliability Coordinator approval” needs to be included in the VSLs as well. ReliabilityFirst offers the following as an example for consideration: i. Lower VSL – none ii. Moderate VSL – “...did not develop one (1) of the five (5) parts...” iii. High VSL – “...did not develop one (2) of the five (5) parts...” iv. Severe VSL - “...did not develop one (3) of the five (5) parts...” v. Severe VSL - “The Responsible Entity did not receive Reliability Coordinator approval of its documented communication protocols as required in Requirement R1.”
City of Garland	No	R2 & R3 only have a “Severe VSL” listing - As I understand it, NERC has recognized that “perfect” historical compliance is not practical and is one of the reasons NERC is moving to implement the RAI program. R2 & R3 Severe VSL only listings require 100% perfection - Real life operations is not perfect (as recongnized by the RAI) – VSLs should be a gradient from “lower” to “severe”
Dominion	Yes	

North American Generator Forum Standards Review Team	No	The VRF and VSL language for R3 should be changed to that of the draft version of Draft 6 that was commented-on by the NAGF several weeks ago.
Independent Electricity System Operator	Yes	We agree with the VRFs, but not the VSL since we do not agree with Requirements R2 and R3. We offer the following two additional comments: 1. We do not agree with the Long-term Planning Time Horizon for R1. Developing and documenting communication protocols for use during real-time operations is an operational planning process (or mid-term planning, at most), not a long-term planning process. We suggest to change the Time Horizon to Operations Planning. 2. The proposed Implementation Plan conflicts with Ontario regulatory practice with respect to the effective date of the standard. It is suggested that this conflict be removed by appending to the effective date wording, after “applicable regulatory approval” in the Effective Dates Section of the Implementation Plan, to the following effect: “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.” Prior to the wording “; or, In those jurisdiction....”. Alternatively, the same language in the Effective Dates Section of the Implementation Plan could be used.
Bonneville Power Administration	Yes	
Clark Public Utilities	Yes	
Southern Company: Southern Company Services, Inc; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation and Energy Marketing		R1 • The phrase “subject to the Reliability Coordinator’s approval” is included in the requirement, but there is no reference to RC approval in the measure. It is unclear exactly what the expectations are for TOPs and BAs in this requirement. Are they to develop protocols and submit to the RC for approval, and have a record of this approval for compliance evidence? If so, the SDT needs to modify this requirement to make the required actions very clear. EOP-005-2 is an example of the TOP getting approval from the RC on its restoration plan. This may be a better model to use as it is more clear. • In addition, the RC is required to approve its TOPs / BAs protocols; however there is no guidance on what criteria to base this approval on. There needs to be very clear

		<p>guidance that RCs are to ensure that the protocols are compatible with its protocol and that RCs are not “auditing” the TOPs / BAs protocols to confirm they include all the subparts of requirement R1. R3 • R3 can present an excessive or even impossible compliance burden, in that all parties receiving Operating Instructions must prove that no BA, RC or TOP issued a Reliability Directive as a result of their lack of three-part communication. This is not a matter of simply obtaining annually a “No known errors” letter from the BA, RC and TOP with which a receiving-end entity is directly involved, since all the neighboring BAs, RCs and TOPs are drawn-in by R3 as well. There is meanwhile no requirement that BAs, RCs or TOPs issue such letters when requested to do so, or that they must share any information at all regarding Reliability Directives issued. This leaves GOPs and other entities that receive Operating Instructions in danger of self-certifying compliance to R3, then being later confronted with evidence of non-compliance from a source from whom they had previously heard nothing.</p>
Oklahoma Gas & Electric	Yes	<p>There were a couple of typos in the VSLs: R1 – Insert a space between ‘R1’ and ‘in’ in the Lower VSL. R3 – Insert ‘to’ between ‘failed’ and ‘repeat’ in the Severe VSL.</p>
Seminole Electric Cooperative, Inc.	No	<p>The VSL’s are far too high given the ambiguity inherent to the R2 and R3 requirements as written.</p>
Wisconsin Public Service Corp	Yes	
Minnesota Power	No	<p>Minnesota Power supports comments submitted by the MRO NERC Standards Review Forum (NSRF).</p>
ACES Standards Collaborators	No	<p>(1) We disagree with the VSL for R1. The compliance violation should fall on the RC for failing to approve the communication protocol and it should be up to the RC to ensure the sub-parts 1.1 through 1.5 are included in the protocol. Under the current draft, the RC has approval authority without any accountability. The VSL would find the entity in violation of R1, even though it would be at the mercy of the RC to approve its protocol.                  (2) The VSLs for R2 and R3 imply that a violation of COM-002 also occurred. We cannot support a standard that</p>

		has the potential for multiple violations.
Southwest Power Pool Regional Entity	Yes	
Associated Electric Cooperative, Inc. - JRO00088	No	See AECl comment to Q1 above, with respect to DPs. While the SDT did follow Guideline 5, the resulting VSLs with respect to communication with these functional entities under normal operating conditions, hardly merits a medium risk assessment, whereas COM-002 might. Further, the SDT's VRF and VSL justification for COM 003-1, R2 "FERC VRF G1 Discussion" assertion that R2 is consistent with Recommendation of 26...", ignores the same report's "particularly during..." qualifier. See AECl response to Q1 above.
seattle city light	Yes	
MRO NERC Standards Review Forum (NSRF)	No	
Tri-State Generation and Transmission Association, Inc.	No	No, we believe that the minimal changes to address the FERC directives and Blackout Recommendations should be included as a revision to COM-002, not in a new Standard. Additionally, the requirements to develop and document protocols were not contemplated or warranted in either the FERC Directives or the Blackout Recommendations. We recommend that the drafting team reconsider their decision to develop a new COM-003 and investigate incorporating the requirements into the existing COM-002.
CenterPoint Energy Houston Electric LLC.		As stated in its Draft 5 comments, CenterPoint Energy firmly believes there should be no High or Severe VSL for simply failing to document a process, protocol, or procedure. It is counterintuitive to allow for a scenario where an entity's System Operators are communicating effectively and correctly and yet that has the entity penalized with the highest severity level for not having the appropriate documentation. Additionally, CenterPoint Energy disagrees with the assignment of Severe VSL for R3, when a comparable violation in COM-002-3 R2 is also a Severe VSL. The VSL for failing to repeat an O.I. and for failing to repeat an R.D. should not be the same. CenterPoint Energy also has concerns with the following two aspects of Draft 6: 1. CenterPoint

		<p>Energy disagrees with R1’s stipulation that the RC must approve the BA’s and the TOP’s communication protocols, especially given the SDT’s assertion that a possible outcome is for the RC to unilaterally develop the protocols and impose them on the BA and the TOP. Instead, CenterPoint Energy recommends that R1 be modified to state “Each Reliability Coordinator shall develop, and each Balancing Authority and Transmission Operator shall develop collaboratively with the Reliability Coordinator, documented communication protocols...” 2. CenterPoint Energy appreciates the efforts of the SDT to revamp COM-003-1 so that its Operating Instruction is compartmentalized from COM-002-3’s Reliability Directive, effectively reducing the industry’s compliance burden. However, the revision does not ease a System Operator’s practical operational burden of having to distinguish in real-time whether a command that is about to be issued is an O.I. or an R.D. Rather than focusing solely on maintaining the integrity of the BES, an Operator may now be distracted by what to label that command and the consequences of assigning the incorrect label. The industry and NERC have been working on the proposed COM-003 standard for nearly four years, ever since the posting of draft 1 in 2009. The proposed standard is now at draft 6, and it is becoming apparent that the industry is struggling to achieve consensus on the specifications for COM-003. Furthermore, it’s been more than nine years since the release of the Blackout Report and six years since Order 693. In that interim, the industry has improved and evolved in numerous areas, including operator communication effectiveness. Most of all, the industry and NERC have already approved COM-002-3 and its associated definition of Reliability Directive, which, once enforceable, will undoubtedly further tighten communication. Perhaps it is time then for NERC and the industry to start a dialogue with FERC to reevaluate the purpose and the need for COM-003 and to request from FERC refreshed, clear guidance on this subject.</p>
Bureau of Reclamation	No	Reclamation does not believe that R3 should only be

		<p>accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP "Operating Instruction" protocols could vary significantly among BAs and TOPS. Reclamation reiterates that if the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" an Operating Instruction because it "would violate safety, equipment, regulatory, or statutory requirements" so that the Operating Instruction does not become a Reliability Directive. Reclamation suggests that the drafting team develop thresholds for failure to repeat that would amount to low, medium, high or severe violations.</p>
Hydro One Networks Inc	Yes	
FirstEnergy	Yes	
Deseret Power Electric Cooperative	No	<p>R3 should only be accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP "Operating Instruction" protocols could vary significantly among BAs and TOPS. If the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" an Operating Instruction because it "would violate safety, equipment, regulatory, or statutory requirements" so that the Operating Instruction does not become a Reliability Directive. The drafting team should develop thresholds for failure to repeat that would amount to low, medium, high or severe violations.</p>
Duke Energy	no	<p>Duke Energy believes that the VSL(s) need to use the same language as in the standard requirements. In order to stay consistent with the VSL(s), we believe that "Functional Entities" should be replaced with "Responsible Entities" in the Applicability Section of this standard.</p>
Northeast Utilities	No	<p>Requirements R2 and R3 need to be written to clarify requirements. The current draft could result in differing interpretations</p>

Pacific Gas and Electric Company	No	PG&E does not believe that R3 should only be accompanied by a Severe Violation Severity Level (VSL), especially because BA and TOP "Operating Instruction" protocols could vary significantly among BAs and TOPS. Reclamation reiterates that if the intent of the standard is to avoid Operating Instructions escalating to Reliability Directives, GOPs should be able to inform the TOP, BA or RC of their "inability to perform" an Operating Instruction because it "would violate safety, equipment, regulatory, or statutory requirements" so that the Operating Instruction does not become a Reliability Directive.
Santee Cooper	Yes	
Cooper Compliance Corp	Yes	
Luminant Energy Company LLC	Yes	
Kansas City Power & Light	No	
SPP Standards Review Group	Yes	There were a couple of typos in the VSLs. R1 – Insert a space between ‘R1’ and ‘in’ in the Lower VSL. R3 – Insert ‘to’ between ‘failed’ and ‘repeat’ in the Severe VSL.
Colorado Springs Utilities	Yes	

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting of the SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of COM-003-1 Standard posted November 2009 for Informal Comments closed January 15, 2010.
7. Version 2 draft of COM-003-1 Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20, 2012.
8. Version 3 draft of COM-003-1 Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of COM-003-1 Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of COM-003-1 Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.
11. Version 6 draft of COM-003-1 Standard posted June 2013 for Formal Comments, Ballot closed July 19, 2013.

**Description of Current Draft:**

This is the first draft of a revised standard (seventh posting of a communications standard) requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team is posting this standard for a 15-day concurrent Formal Comment period and Ballot.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Additional ballot of Standard	October 2013
2. Final ballot of Standard.	November 2013
3. Board adopts standard.	November 2013

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

Operating Instruction — A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one type of an Operating Instruction.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-002-4
3. **Purpose:** To tighten communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Reliability Coordinator
    - 4.1.4 Transmission Operator
    - 4.1.5 Generator Operator
5. **(Proposed) Effective Date:** The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum:  
*[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
  - 1.1. Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.
  - 1.2. Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.3. Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer to take one of the following actions:
    - Confirm the receiver's response if the repeated information is correct.

- Reissue the Operating Instruction if the repeated information is incorrect, if the receiver does not issue a response, or if requested by the receiver.
- 1.4. Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 1.5. Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).
  - 1.6. Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).
  - 1.7. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
  - 1.8. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
  - 1.9. Specify the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers.
- R2.** Each Distribution Provider and Generator Operator shall have documented communications protocols. The protocols shall, at a minimum: [*Violation Risk Factor: Low*][*Time Horizon: Long-term Planning*]
- 2.1. Require the receiver of an oral or written Operating Instruction to respond using the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 2.2. Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 2.3. Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).

- R3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement the documented communications protocols developed in Requirement R1. [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- R4.** Each Distribution Provider and Generator Operator shall implement the documented communications protocols developed in Requirement R2. [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a method to evaluate the communications protocols developed in Requirement R1 that: [*Violation Risk Factor: Low*][*Time Horizon: Operations Planning*]
  - 5.1.** Assesses adherence to the communications protocols to provide feedback to issuers and receivers of Operating Instructions.
  - 5.2.** Assesses the effectiveness of the communications protocols and modifies those protocols, as necessary.

**C. Measures**

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R2.
- M3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R1 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols established in Requirement R1 and the remediation of noted exceptions in fulfillment of Requirement R5.
- M4.** Each Distribution Provider and Generator Operator shall provide evidence that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols established in Requirement R2.
- M5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide descriptions and associated evidence of the management practices in place that demonstrate a review of communications with operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System

and evidence that the entity evaluates the effectiveness of its documented communications protocols in fulfillment of Requirement R5.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall each keep data or evidence for each applicable Requirement for the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

#### **1.3. Additional Compliance Information**

None

DRAFT

None.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	February 7, 2006	Adopted by Board of Trustees	Added measures and compliance elements
2	November 1, 2006	Adopted by Board of Trustees	Revised in accordance with SAR for Project 2006-06, Reliability Coordination (RC SDT). Retired R1, R1.1, M1, M2 and updated the compliance monitoring information. Replaced R2 with new R1, R2 and R3.
2a	February 9, 2012	Interpretation of R2 adopted by Board of Trustees	Project 2009-22
3	November 7, 2012	Adopted by Board of Trustees	

## Implementation Plan

### Operating Personnel Communications Protocols

#### COM-002-4

##### Standards Involved

Approval:

- COM-002-4 – Operating Personnel Communications Protocols

Retirements:

- COM-001-1.1 Requirement R4 – Telecommunications
- COM-002-2 – Communication and Coordination
- COM-002-3 – Communication and Coordination

##### Prerequisite Approvals

Approval of the definition of “Reliability Directive”

##### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

##### **Operating Instruction** —

A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one type of an Operating Instruction.

##### Applicable Entities

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

##### Conforming Changes to Other Standards

None

**Effective Date**

COM-002-4 and the definition of “Operating Instruction” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Retirement of Existing Standards:**

COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

## Unofficial Comment Form

### Project 2007-02 Operating Personnel Communications Protocols COM-002-4 Operating Personnel Communications Protocols

Please **DO NOT** use this form. Please use the [electronic comment form](#) to submit comments on the proposed draft COM-002-4 Operating Personnel Communications Protocols standard. Comments must be submitted by **November 4, 2013**. If you have questions please contact [Stephen Eldridge](#) or by telephone at 404-446-9686.

[http://www.nerc.com/pa/Stand/Pages/Op\\_Comm\\_Protocol\\_Project\\_2007-02.aspx](http://www.nerc.com/pa/Stand/Pages/Op_Comm_Protocol_Project_2007-02.aspx)

#### Background Information:

Effective communication is critical for Bulk Electric System (BES) operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES. The seventh posting of Project 2007-02 combines COM-002-3 and COM-003-1 into one standard titled COM-002-4 that addresses communications protocols for operating personnel in Emergency, alert, and non-emergency situations.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work for Project 2007-02 Operating Personnel Communications Protocols (OPCP). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American BES will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. Federal Energy Regulatory Commission (FERC) Order 693 paragraph 532 reiterates this need. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear and consistent language.

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating Operating Instructions.

The Purpose statement of COM-002-4 states: "To tighten communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System."

- 1) **New NERC Glossary term:** The OPCP Standards Drafting Team (SDT) revised the definition of Operating Instructions from its previous drafts. The definition states that a Reliability Directive

is a type of Operating Instruction. The proposed term differentiates the class of communications that deal with changing or altering the state of the BES from general discussions of options or alternatives. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the BES at an unacceptable risk of instability, separation, or cascading failures. This term is proposed for addition to the North American Electric Reliability Corporation (NERC) Glossary to establish meaning and usage within the electricity industry.

- 2) **Project 2007-02, Posting 7 combines COM-002-3 and COM-003-1 into COM-002-4.** The OPCP SDT combined COM-002-3 and COM-003-1 into one standard in order to simplify communications protocols for operating personnel. The OPCP SDT determined that one communications protocols standard that addresses Emergency, alert, and non-emergency situations will improve communications because system operators will not need to refer to a different set of protocols during an emergency situation. The OPCP SDT believed this will improve consistency of communications and mitigate confusion during stressful emergency situations. Similarly, the Independent Experts Review Panel and NERC management recommended a single standard that addresses emergency and non-emergency communications protocols. The OPCP SDT decided to combine the standards under the title COM-002-4 to further reduce confusion. The COM-002-4 title keeps the numbering of COM standards consecutive (*e.g.*, COM-001, COM-002).
- 3) **Project 2007-02, Posting 7 features 5 requirements.** The The OPCP SDT developed the requirement structure and language in posting 7 to incorporate Emergency, alert, and non-emergency communications protocols. The language in COM-002-4, Requirement R1 permits applicable entities flexibility to develop their communication protocols but requires a set of minimum elements in the communications protocols. Requirement R1 requires communications protocols to include the following elements:
  - a. **Reliability Directive Identification:** Requirement R1, Part 1.1 – Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.
  - b. **English Language:** Requirement R1, Part 1.2 – Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - c. **Three-part Communication for Oral Operating Instructions:** Requirement R1, Parts 1.3 and 1.4 – Require three-part communication for issuers and receivers of oral two-party, person-to-person Operating Instructions.
  - d. **One-way Burst Message Receipt Confirmation and Clarification:** Requirement R1, Parts 1.5 and 1.6 – Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common

- message to multiple parties in a short time period (*e.g.*, an all call system). Require receiver to request clarification if not understood.
- e. **Time Identification:** Requirement R1, Part 1.7 – Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
  - f. **Transmission Interface Elements and Facilities Nomenclature:** Requirement R1, Part 1.8 – Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
  - g. **Alpha-numeric Clarifiers:** Requirement R1, Part 1.9 – Specify the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers.

Requirement R2 establishes minimum requirements in communications protocols for entities that typically only receive Operating Instructions. Requirement R2 requires Generator Operators and Distribution Providers to include the following elements in their communications protocols:

- a. **English Language:** Requirement R2, Part 2.1 – Require the receiver of an oral or written Operating Instruction to respond using the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
- b. **Three-part Communication for Oral Operating Instructions:** Requirement R2, Part 2.2 – Require the receiver of an oral two-party, person-to-person Operating Instruction to either repeat the Operating Instruction and receive confirmation from the issuer or request the issuer to reissue the Operating Instruction.
- c. **One-way Burst Message Receipt Clarification:** Requirement R2, Part 2.3 – Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).

Requirements R3 and R4 require entities to implement the communications protocols in Requirements R1 and R2. The OPCP SDT included these requirements to ensure that entities would include COM-002-4 in their training programs under PER-005-1. Finally, Requirement R5 requires each Balancing Authority, Reliability Coordinator, and Transmission Operator to assess personnel's adherence to communications protocols to provide feedback to issuers and receivers of Operating Instructions and to assess the effectiveness of the communications protocols.

The OPCP SDT is posting the standard for industry comment for a **15-day** comment period. The OPCP SDT received a waiver of the 45-day comment period required in the NERC Standards Processes Manual from the NERC Standards Committee. Accordingly, we request that you include your comments on the electronic form by **November 4, 2013**.

## Questions

1. The OPCP SDT combined COM-002-3 and COM-003-1 into the COM-002-4 standard. Do you agree that COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26, FERC Order 693, and the COM-003-1 SAR? If not, please explain in the comment area of the last question.

- Yes  
 No

Comments:

2. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3, R4, and R5? If not, please explain.

- Yes  
 No

Comments:

3. Do you have any additional comments? Please provide them here.

- Yes  
 No

Comments:

# Project 2007-02, COM-002-4 Operating Personnel Communications Protocols Rationale and Technical Justification

Justification for Requirements in Posting 7

## Background

Posting 7 of Project 2007-02 – Operating Personnel Communications Protocols combines COM-002-3 and former draft COM-003-1 into one standard that addresses communications protocols for operating personnel in Emergency, alert and non-emergency conditions. The Operating Personnel Communications Protocols Standard Drafting Draft (OPCP SDT) determined that one communications protocols standard that addresses emergency and non-emergency situations will improve communications because system operators will not need to refer to a different set of protocols during the issuance of a Reliability Directive. The OPCP SDT believe this will improve consistency of communications and mitigate confusion during stressful emergency situations. As a result of the combination, the standard has been renumbered as COM-002-4 to maintain the consecutive numbering of the standards (e.g., COM-001, COM-002) since the combined standard will replace COM-002-2 and COM-002-3, where necessary.

In preparing COM-002-4, the Operating Personnel Communications Protocols Standard Drafting Team (OPCP SDT) considered the comments provided on draft 6 of COM-003-1 and also reviewed the recommendation of the NERC Board of Trustees (Board) Standards Oversight and Technology Committee (SOTC). In this posting, the OPCP SDT seeks industry comment on a combined communications standard. This provides an opportunity for industry to comment and ballot a combined standard prior to the Board's consideration of a communications standard at the November 2013 meeting of the Board.

The latest draft reflects a results-based approach to strengthening communications during non-emergency, alert, and emergency operating conditions. The following sections outline the OPCP SDT's revisions to the communications standards and rationale.

## Definition of Operating Instruction

The proposed definition of "Operating Instruction" has been revised to read as follows:

A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric

System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one type of an Operating Instruction.

As opposed to the definition used in draft 6 of COM-003-1, this revised definition characterizes a Reliability Directive as a type of Operating Instruction. Retaining the definition of Reliability Directive and including it within the scope of the definition of Operating Instruction is necessary since it is currently used in other Reliability Standards (e.g., TOP-001-2 and IRO-001-3).

A “command” as used in the definition refers to both oral and written commands by operating personnel. In the requirements of COM-002-4, the OPCP SDT has specified “oral” or “written” as needed to define which Operating Instructions are covered by the requirement. The definition continues to clarify that general discussions are not considered Operating Instructions.

## Applicability

In addition to Balancing Authorities, Reliability Coordinators, and Transmission Operators, the proposed standard applies to Distribution Providers and Generator Operators. The OPCP SDT added these Functional Entities in the Applicability section because they are often on the receiving end of Operating Instructions. The OPCP SDT determined that it would leave a gap to not cover them in a communications standard that addresses operating personnel. Recognizing that Generator Operators and Distribution Providers typically only receive Operating Instructions, the OPCP SDT proposed that only Requirements R2 and R4 apply to these Functional Entities. As a result, Generator Operators and Distribution Providers need only develop communications protocols governing receipt of Operating Instructions.

## Requirements in COM-002-4

### Requirement R1

Requirement R1 requires entities that can both issue and receive Operating Instructions to have documented communications protocols that include a minimum set of elements, outlined in Parts 1.1 through 1.9 of the requirement. Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between Functional Entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication

failures.<sup>1</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems.<sup>2</sup> The necessary protocols include the use of the English language unless agreed to otherwise (except for internal operations), time formatting, specified nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three-part communications.

The OPCP SDT drafted Requirement R1 to ensure consistency among communications protocols while also allowing flexibility for entities to develop additional communications protocols. The OPCP SDT determined that the inclusion of the elements in Parts 1.1 through 1.9 are necessary to tighten communications protocols but are not overly prescriptive. The OPCP SDT determined that this approach is the best way to promote effective communications while maintaining flexibility for entities to include additional communications protocols based on its own operating environment.

On September 19, 2012, the NERC Operating Committee issued a Reliability Guideline entitled: "System Operator Verbal Communications – Current Industry Practices." As stated on page one, the purpose of the Reliability Guideline ". . . is to document and share current verbal BES communications practices and procedures from across the industry that have been found to enhance the effectiveness of system operator communications programs." This guideline serves as an additional source of information on best practices that entities can draw on in creating the documented communications protocols.

The term *documented communication protocols* in R1 refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. An entity should include as much detail as it believes necessary in their documented protocols, but they must address all of the applicable parts of Requirement R1. Where an entity does not already have a set of documented protocols that meet the parts of Requirement R1, the entity must develop the necessary communications protocols. Entities may also adopt the documented protocols of another entity as its own communications protocols, but the entity must maintain its own set of documented communications protocols to meet Requirement R1.

Each part of Requirement R1 is discussed below:

*1.1. Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.*

---

<sup>1</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

<sup>2</sup> Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

The OPCP SDT has included this part to ensure consistency with TOP-001-2, which requires compliance with the identified Reliability Directive by the Transmission Operator. This identification must be required in order to meet the performance expected in TOP-001-2. TOP-001-2 requires each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity to comply with each Reliability Directive *issued and identified* as such by its Transmission Operator(s), unless such action would violate safety, equipment, regulatory, or statutory requirements.

*1.2. Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.*

The OPCP SDT has included this part to carry forward the same use of English language included in COM-001-1, Requirement R4. Retirement of this Requirement in COM-001-1 was specifically referred to Project 2007-02. The requirement continues to permit the issuer and receiver to use an agreed to alternate language. This has been retained since use of an alternate language on a case-by-case basis may serve to better facilitate effective communications where the use of English language may create additional opportunities for miscommunications. Part 1.2 requires the use of English language when issuing oral or written (e.g. switching orders) Operating Instructions. This creates a standard language (unless agreed to otherwise) for use when issuing commands that could change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. It also clarifies that an alternate language can be used internally within the organization.

*1.3. Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer to take one of the following actions:*

- *Confirm the receiver's response if the repeated information is correct.*
- *Reissue the Operating Instruction if the repeated information is incorrect, if the receiver does not issue a response, or if requested by the receiver.*

The OPCP SDT has included this part to require communications protocols for the use of three-part communications for oral two-party, person-to-person Operating Instructions by the issuer. This carries forward the requirement to use three-part communications in COM-002-2 and COM-002-3.

The reliability benefits of using three-part communication (R1, parts 1.3 and 1.4) are threefold:

1. The removal of any doubt that communication protocols will be used and when they will be used. This will reduce the opportunity for confusion and misunderstanding among entities that may have different doctrine. An example is: One entity uses three-part for emergencies, and the other uses it for all operating conditions.

2. There will be no mental “transition” when operating conditions shift from normal to Emergency. The communication protocols for the operators will remain standard during transitions through all conditions.
  3. The formal requirement for three-part communication will create a heightened sense of awareness in operators that the task they are about to execute is critical, and recognize the risk to the reliable operation of the BES is increased if the communication is misunderstood.
- 1.4. *Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:*
- *Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.*
  - *Request that the issuer reissue the Operating Instruction.*

The OPCP SDT has included this part to require communications protocols for the use of three-part communications for oral two-party, person-to-person Operating Instructions by the receiver. This is consistent with the approach to using three-part communications in COM-002-2 and COM-002-3.

- 1.5. *Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).*

The OPCP SDT has included this part to require communications protocols for an issuer for the use of a one-way burst messaging system. The drafting team has included this because the use of three-part communications is not practically possible when utilizing this type of communication. Therefore, it is necessary to include a different set of protocols for these situations.

- 1.6. *Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).*

The OPCP SDT has included this part to require communications protocols for a receiver for the use of a one-way burst messaging system. The drafting team has included this because the use of three-part communications is not practically possible when utilizing this type of communication. Therefore, it is necessary to include a different set of protocols for these situations.

- 1.7. *Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.*

The OPCP SDT has included this part to add necessary clarity to Operating Instructions to reduce the risk of mistakes. Clarifying time and time zone (where necessary) contributes to reducing misunderstandings and reduce the risk of a grave error during BES operations.

*1.8. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.*

Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 when it developed TOP-002-3. This Requirement states “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” COM-002-4, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are readily familiar with each other’s interface Elements and Facilities, eliminating hesitation and confusion when referring to equipment for the Operating Instruction. This shortens response time and improves situational awareness.

*1.9. Specify the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers.*

The OPCP SDT has included this part to avoid miscommunications due to the fact that several letters in the English language sound alike and can be confused in stressful or noisy situations. For example, some letters sound alike when spoken, and can easily be confused; such as “D” and “B.” The phonetic alphabet specifies a common word for each letter of the English alphabet. By using a word for each letter, there is less chance that the person listening will confuse the letters. Using the phonetic alphabet, “Delta” and “Bravo” are more easily differentiated. The effects of noise, weak telephone or radio signals, and an individual's accent are reduced through the use of the phonetic alphabet.

## **Requirement R2**

Requirement R2 requires the development of documented communications protocols for Generator Operators and Distribution Providers receiving Operating Instructions. As Generator Operators and Distribution Providers typically only receive Operating Instructions, the OPCP SDT determined that a separate requirement for these Functional Entities covers their communications protocols but does not subject them to the additional requirements imposed upon entities who issue Operating Instructions. The requirement includes similar parts requiring the inclusion in communications protocols of the use of English language, three-part communications, and protocols for the use of a one-way burst messaging system.

## **Requirements R3 and R4**

Requirement R3 requires entities that issue and receive Operating Instructions to implement the documented communications protocols in Requirement R1. Requirement R4 requires Generator Operators and Distribution Providers who receive Operating Instructions to implement the documented communications protocols in Requirement R2.

The associated Measures for R3 and R4 explain that evidence demonstrating compliance may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R1 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols established in Requirement R1 and the remediation of noted exceptions in fulfillment of Requirement R5. The VSLs for Requirement R3 and R4 have also been designed to reflect the identification of a pattern of not using the documented communications protocols developed in Requirement R1 and R2 as the VSL for Operating Instructions that are not Reliability Directives, also in addition to the severe VSL for not using the documented communications protocols developed in Requirement R1 and R2 when issuing or receiving a Reliability Directive.

### **Requirement R5**

Requirement R5 requires entities that are subject to Requirement R1 to continually assess the communications protocols and determine whether personnel adhere to them. The OPCP SDT determined that communications protocols need to be evaluated but allowed flexibility for entities to determine when to evaluate and how to assess or modify those communications protocols. The OPCP SDT believed this creates a learning environment through the use of feedback and most effectively promotes reliable communications.

## Project 2007-02: Operating Personnel Communication Protocols

Mapping Document

### COM-001-1.1 to COM-002-4

Board Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p>R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.</p>	<p><b>COM-002-4</b></p> <p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>1.2. Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations</p> <p>R2. Each Distribution Provider and Generator Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>2.1. Require the receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for</p>

Board Approved Standard	Proposed Replacement Requirement(s)
	internal operations
<b>Notes:</b> Moved COM-001-1 R4 into COM 002-4 Requirement R1 Part 1.2 and Requirement R2 Part 2.1	

## COM-002-2 to COM-002-3

Board Approved Standard	Proposed Replacement Requirement(s)
<p>COM-002-2</p> <p>R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall have communications (voice and data links) with appropriate Reliability Coordinators, Balancing Authorities, and Transmission Operators. Such communications shall be staffed and available for addressing a real-time emergency condition. <i>[Violation Risk Factor: High]</i></p> <p>R1.1 Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator, and all other potentially affected Balancing Authorities and Transmission Operators through predetermined communication paths of any condition that could threaten the reliability of its area or when firm load shedding is anticipated. <i>[Violation Risk Factor: High]</i></p>	<p>The RC SDT retired COM-002-2, R1 and R1.1. The following rational was provided by that drafting team:</p> <p>The communications requirements of R1 are addressed in existing COM-001-1.1 as well as the proposed COM-001-2 requirements. Additionally, IRO-010-1a addresses data provisions.</p> <p>The RC SDT contends that COM-002-2, R1.1 is a low level facilitating requirement that is more appropriately and inherently monitored under various higher level performance-based reliability requirements for each entity throughout the body of standards. Examples include:</p> <ul style="list-style-type: none"> <li>• EOP-002-1, R3 – outlines BA to RC communications. IRO-001-1, R3 requires adequate telecommunication for the Reliability Coordinator to direct actions of multiple entities, including TOPs and BAs.</li> <li>• TOP-001-1, R3 requires adequate telecommunications facilities for the TOP, BA, and GOP to be able to receive directives from the RC.</li> </ul>

Board Approved Standard	Proposed Replacement Requirement(s)
	<ul style="list-style-type: none"> <li>• TOP-001-1, R5 requires communications between TOPs and RCs for emergency situations.</li> <li>• TOP-005-1, R1 and R3 require adequate telecommunications for BAs and TOPs to provide each other with operating data as well as providing data to the RC.</li> <li>• TOP-006-1, R1 requires adequate telecommunications for the GOP to inform the BA and TOP of resources. The BA and TOP will then inform the RC, other TOP and BAs of all transmission and generation available for use.</li> <li>• PER-001-1, R1 and PER-004-1, R1 set forth the staffing requirements.</li> </ul>
<p><b>Notes:</b> The RC SDT contends that COM-002-2, R1 and its sub-requirements are low level facilitating requirements that are more appropriately and inherently monitored under various higher-level performance-based reliability requirements for each entity throughout the body of standards. These include standards within the COM, IRO, and TOP body of standards and are specifically identified in the mapping table below.</p>	
<p><b>COM-002-2</b></p> <p>R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall issue directives in a clear, concise, and definitive manner; shall ensure the recipient of the directive repeats the information back correctly; and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings. <i>[Violation Risk Factor: Medium]</i></p>	<p><b>COM-002-3</b></p> <p>The RC SDT expanded COM-002-2 R2 into three requirements in COM-002-3:</p> <p><b>R1.</b> When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p><b>R2.</b> Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive, shall repeat, restate, rephrase or recapitulate the Reliability Directive. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p><b>R3.</b> Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either: <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <ul style="list-style-type: none"> <li>• Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> <li>• Reissue the Reliability Directive to resolve any misunderstandings.</li> </ul>
<p><b>Notes:</b> The RC SDT expanded the list of responsible entities to include the DP and GOP and subdivided the requirement to improve clarity.</p>	

## COM-002-3 to COM-002-4

Board Approved Standard	Proposed Replacement Requirement(s)
<p>COM-002-3</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. <i>[Violation Risk Factor: High][Time</i></p>	<p>COM-002-4</p> <p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p>

Board Approved Standard	Proposed Replacement Requirement(s)
<i>Horizon: Real-Time]</i>	1.1. Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.
<b>Notes:</b> Moved COM-002-3 R1 into COM 002-4 Requirement 1 Part 1.1	
<p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive, shall repeat, restate, rephrase or recapitulate the Reliability Directive. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p>	<p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>1.4. Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:</p> <ul style="list-style-type: none"> <li>• Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.</li> <li>• Request that the issuer reissue the Operating Instruction.</li> </ul> <p>R2. Each Distribution Provider and Generator Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>2.2. Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:</p> <ul style="list-style-type: none"> <li>• Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was</li> </ul>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p>correct.</p> <ul style="list-style-type: none"> <li>Request that the issuer reissue the Operating Instruction.</li> </ul>
<p><b>Notes:</b> Moved COM-002-3 R2 into COM 002-4 Requirement R1 Part 1.4 and Requirement R2 Part 2.2. Additional language was added to provide clarity for the responsibility of the receiver of three-part communication.</p>	
<p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either: <i>[Violation Risk Factor: High] [Time Horizon: Real-Time]</i></p> <ul style="list-style-type: none"> <li>Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> <li>Reissue the Reliability Directive to resolve any misunderstandings.</li> </ul>	<p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>1.3. Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer to take one of the following actions:</p> <ul style="list-style-type: none"> <li>Confirm the receiver’s response if the repeated information is correct.</li> <li>Reissue the Operating Instruction if the repeated information is incorrect, if the receiver does not issue a response, or if requested by the receiver.</li> </ul>
<p><b>Notes:</b> Moved COM-002-3 R3 into COM 002-4 Requirement R1 Part 1.3. Additional language was added to provide clarity for the responsibility of the issuer of three-part communication.</p>	

## **Project 2007-02 – Operating Personnel Communications Protocol**

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM-002-4 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-002-4:

There are five requirements in COM-002-4, draft 1. Requirements R1 and R2 are assigned a "Low" VRF. R1 now reads: *"Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum:."* R2 now reads: *"Each Distribution Provider and Generator Operator shall have documented communications protocols. The protocols shall, at a minimum:."* Requirements R3 and R4 are assigned a "High" VRF. R3 now reads: *" Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement the documented communications protocols developed in Requirement R1."* R4 now reads: *" Each Distribution Provider and Generator Operator shall implement the documented communications protocols developed in Requirement R2."* These Requirements warrant VRFs of "High" because failure to use the communications protocols during an emergency could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures. Requirement R5 is assigned a "Low" VRF. R5 now reads: *" R5. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a method to evaluate the communications protocols developed in Requirement R1 that:."*

## **NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product	Missing at least one significant element (or a moderate percentage) of the required performance.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet

Project YYYY-##.# - Project Name

measured has significant value as it almost meets the full intent of the requirement.	The performance or product measured still has significant value in meeting the intent of the requirement.	component. The performance or product has limited value in meeting the intent of the requirement.	the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.
---	---	--	---

## **FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

### **Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM-002-4, R1	
Proposed VRF	Low
NERC VRF Discussion	R1 is a requirement in a Long-term Planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “Low,” which is consistent with NERC guidelines.
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 establishes communications protocols, which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the development of documented communications protocols by entities that will both issue and receive “Operating Instructions” that reduce the possibility of miscommunication which

VRF and VSL Justifications – COM-002-4, R1			
	could eventually lead to action or inaction harmful to the reliability of the bulk electric system.		
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                      Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “ Low,” which is consistent with NERC guidelines for similar requirements.</p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                      COM-002-4 Requirement R1 contains only one objective which is to document clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of the bulk electric system. Since the requirement has only one objective, only one VRF was assigned.</p>

## Table of Issues and Directives

Project 2007-02

Operating Personnel Communications Protocols

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
FERC Order No. 693, P 512, 513, 540 (Part1)	512. The Commission finds that, during both normal and emergency operations, it is essential that the transmission operator, balancing authority and reliability coordinator have communications with distribution providers. In response to APPA, as discussed above, any distribution provider that is not a user, owner or operator of the Bulk-Power System would not be required to comply with COM-002-2, even though the Commission is requiring the ERO to modify the Reliability Standard to include distribution providers as applicable entities. APPA's concern that 2,000 public power systems would have to be added to the compliance registry is misplaced, since, as we explain in our Applicability discussion above, we are approving NERC's registry process, including the registry criteria. Therefore, we adopt our proposal to require	Distribution Providers have been included as applicable entities in COM-002-4	Applicability 4.1.2 Requirements R2, R4, R5.

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>the ERO to modify COM-002-2 to apply to distribution providers through its Reliability Standards development process.</p> <p>513. The Commission believes that this Reliability Standard does not alter who would operate a distribution provider’s system. It only concerns communications, not the operation of the distribution system.</p> <p>540. ... In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may</p>		

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. Finally, we direct the ERO to include APPA's suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process.</p>		
<p>FERC Order No. 693, P 531, 534, 535, 540 (Part 3)</p>	<p>531. We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies, either as part of COM-002-2 or as a new Reliability Standard. We note that the ERO's response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.</p> <p>534. In response to MISO's contention that Blackout Report Recommendation No. 26 has been fully implemented, we note that</p>	<p>COM-002-4 tightens protocols for Operating Instructions, which cover necessary non-emergency communications and communications that are Reliability Directives. Reliability Directives include both alert and emergency communications.</p>	<p>Definition of Operating Instruction Requirements R1, R2, R3, R4, R5</p>

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>Recommendation No. 26 addressed two matters. We believe MISO is referring to the second part of the recommendation requiring NERC to “[u]pgrade communication system hardware where appropriate” instead of tightening communications protocols. While we commend the ERO for taking appropriate action in upgrading its NERCNet, we remind the industry to continue their efforts in addressing the first part of Blackout Recommendation No. 26. (Emphasis added)</p> <p>535. Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.</p>		
<p>FERC Order No. 693, P 532</p>	<p>532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be</p>	<p>Reliability Standard EOP-001-2.1b — Emergency Operations Planning (successor standard to EOP-001-0) requires that the emergency plans for each Transmission Operator and Balancing Authority include:</p>	<p>Requirements R1, R3, R5</p>

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk- Power System is so tightly interconnected that system impacts often cross several operating entities' areas.</p> <p>533. Regarding APPA's suggestion that it may be beneficial to include communication protocols in the relevant Reliability Standard that governs those types of emergencies, we direct that it be addressed in the Reliability Standards development process.</p>	<p>communications protocols to be used during emergencies (Requirement R3.1). This requirement is compatible with COM-002-4, which establishes the communications protocols and requires their use.</p> <p>COM-002-4 requires a set of protocols be used by all applicable entities, establishing communication uniformity as much as practical on a continent-wide basis</p>	

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
<p>FERC Order No. 693, P 514, 515</p>	<p>514. APPA notes that the Levels of Non-Compliance for COM-002-2 are inadequate in two respects: (1) reliability coordinators are not included in any Level of Non-Compliance and (2) the Levels of Non-Compliance for transmission operators and balancing authorities in Compliance D.2 do not reference Requirements R1 and R2. Therefore, APPA would support approval of COM-002-2 as a mandatory Reliability Standard, but would not support levying penalties for violating incomplete portions of the Reliability Standard.</p> <p>515. As stated in the Common Issues section, a Reliability Standard is enforceable even if it does not contain Levels of Non-Compliance. However, the Commission agrees with APPA that this Reliability Standard could be improved by incorporating the changes proposed by APPA. Therefore, when reviewing the Reliability Standard through the Reliability Standards development process, the ERO should consider</p>	<p>COM-002-4 includes Measures, VRFs and VSLs for each requirement.</p>	<p>Section C, Measures Section D, Compliance</p>

**Table of Issues and Directives Associated with COM-002-4**

Source	Directive Language	Disposition	Section and/or Requirement(s)
	APPA’s concerns.		
2003 Blackout Report Recommendation No. 26	NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date.	The requirements in COM-002-4 will improve the effectiveness of internal and external communications during alerts, emergencies, and other critical situations.	Requirements R1, R2, R3, R4, R5

# Reliability Standard Audit Worksheet<sup>1</sup>

## COM-002-4 – Operating Personnel Communications Protocols

*This section to be completed by the Compliance Enforcement Authority.*

**Audit ID:** Audit ID if available; or REG-NCRnnnnn-YYYYMMDD  
**Registered Entity:** Registered name of entity being audited  
**NCR Number:** NCRnnnnn  
**Compliance Enforcement Authority:** Region or NERC performing audit  
**Compliance Assessment Date(s)<sup>2</sup>:** Month DD, YYYY, to Month DD, YYYY  
**Compliance Monitoring Method:** Audit  
**Names of Auditors:** Supplied by CEA

### Applicability of Requirements *[RSAW developer to insert correct applicability]*

	BA	DP	GO	GOP	IA	LSE	PA	PSE	RC	RP	RSG	TO	TOP	TP	TSP
R1	X								X				X		
R2		X		X											
R3	X								X				X		
R4		X		X											
R5	X								X				X		

<sup>1</sup> NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC’s and the Regional Entities’ assessment of a registered entity’s compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC’s Reliability Standards can be found on NERC’s website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity’s adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

<sup>2</sup> Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

DRAFT

**R1 Supporting Evidence and Documentation**

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum:
- 1.1.** Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the recipient.
  - 1.2.** Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.3.** Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer to take one of the following actions:
    - Confirm the receiver’s response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect, if the receiver does not issue a response, or if requested by the receiver..
  - 1.4.** Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 1.5.** Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).
  - 1.6.** Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (*e.g.*, an all call system).
  - 1.7.** Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
  - 1.8.** Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
  - 1.9.** Specify the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers.

**Definition of Operating Instruction**

A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential

## DRAFT NERC Reliability Standard Audit Worksheet

options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one type of an Operating Instruction.

**M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.

### Registered Entity Response to General Compliance with this Requirement (Required):

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

### Evidence Requested<sup>3</sup>:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

A copy of the documented communication protocols that cover the Requirements outlined in Requirement R1 Parts 1.1 to 1.9.

### Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

### Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

### Compliance Assessment Approach Specific to COM-002-4, R1

#### *This section to be completed by the Compliance Enforcement Authority*

	Review the documented communications protocols provided by entity and ensure they address the sub-requirements of R1 as follows:
	(1.1) Requires the issuer of a Reliability Directive to identify the action as a Reliability Directive to the

<sup>3</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

	recipient
(1.2)	Requires the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
(1.3)	Requires the issuer of an oral two party, person-to-person Operating Instruction to wait for a repetition from the receiver and if the repetition is correct confirm the repetition. If the repetition is incorrect, or if no repetition is received, or if the receiver requests, requires the issuer to reissue the Operating Instruction.
(1.4)	Requires the receiver of an oral two party, person-to-person Operating Instruction to take one of the following actions: <ul style="list-style-type: none"><li>• Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct</li><li>• Request that the issuer reissue the Operating Instruction.</li></ul>
(1.5)	Requires the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiving party when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system)
(1.6)	Requires the receiver of an oral Operating Instruction to request clarification from the initiator if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system).
(1.7)	Specifies the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
(1.8)	Specifies the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
(1.9)	Specifies the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers

**Note to Auditor:**

**Auditor Notes:**

**R2 Supporting Evidence and Documentation**

- R2.** Each Distribution Operator and Distribution Operator shall have documented communications protocols. The protocols shall, at a minimum:
- 2.1.** Require the receiver of an oral or written Operating Instruction to respond using the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 2.2.** Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 2.3.** Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).
- M2.** Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R2.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>4</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

A copy of the documented communication protocols that cover the Requirements outlined in Requirement R2 Parts 2.1 to 2.3.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

<sup>4</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**R3 Supporting Evidence and Documentation**

- R3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement the documented communications protocols developed in Requirement R1.
  
- M3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R1 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel’s adherence to the protocols established in Requirement R1 and the remediation of noted exceptions in fulfillment of Requirement R5.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>5</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R1 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System.

Spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel’s adherence to the protocols established in Requirement R1 and the remediation of noted exceptions.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

<sup>5</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity’s discretion.

## DRAFT NERC Reliability Standard Audit Worksheet

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-002-4, R3**

*This section to be completed by the Compliance Enforcement Authority*

	Review the design of the entity’s management practices related to communication protocols to gain reasonable assurance that they are effective. Design considerations include frequency, volume of communications reviewed, and independence of the reviewing party. Identify if management practices proactively identify and correct issues with communications protocols.
	Review the evidence provided to gain reasonable assurance that the management practices asserted above are actually occurring, and are reasonably effective.
	If above management practices are deemed insufficient to provide reasonable assurance that communication protocols are being followed, apply other audit procedures as necessary to gain confidence regarding the implementation of the communication protocols. See ‘Note to Auditor’ section for additional details.

**Note to Auditor:**

The nature and extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System and the auditor’s assessment of management practices specific to this requirement. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are higher and management practices are determined to be less effective.

Based on the assessment of risk and internal controls, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing a sample of voice recordings to ensure the protocols related to Operating Instructions were followed. Auditors may also interview entity operating personnel to understand how they comply with the protocols and observe them performing their duties. In circumstances where voice recordings are reviewed, auditors should consider requesting recordings commensurate with known events in the entity’s footprint during the audit period, as Operating Instructions may be more likely to occur during, and related to, such events, although other sampling methods for selecting voice recordings may also be employed.

An auditor should first examine the internal controls for this Requirement, not the actual communications. The focus is on understanding the entity’s internal control processes, verifying they are actually performing the control, and that the control is reasonably designed. Sampling is not a part of the audit process unless the auditor determines that the internal control is not properly designed or is ineffective. If the auditor cannot

**DRAFT NERC Reliability Standard Audit Worksheet**

---

rely on the entity's controls to gain reasonable assurance of compliance, then the auditor can pull a sample of the entity's communications from their available voice recordings (limited to the prior 90 calendar days) and if instances of noncompliance with the protocols are found, they will be turned over to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols and, if applicable, the severity of the violation.

**Auditor Notes:**

---

DRAFT

**R4 Supporting Evidence and Documentation**

- R4.** Each Distribution Provider and Generator Operator shall implement the documented communications protocols developed in Requirement R2.
  
- M4.** Each Distribution Provider and Generator Operator shall provide evidence that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel’s adherence to the protocols established in Requirement R2.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>6</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System.

Spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel’s adherence to the protocols established in Requirement R2 and the remediation of noted exceptions.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

<sup>6</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity’s discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-002-4, R4**

***This section to be completed by the Compliance Enforcement Authority***

	Review the design of the entity’s management practices related to communication protocols to gain reasonable assurance that they are effective. Design considerations include frequency, volume of communications reviewed, and independence of the reviewing party. Identify if management practices proactively identify and correct issues that could lead to failure of communications protocols.
	Review the evidence provided to gain reasonable assurance that the management practices asserted above are actually occurring, and are reasonably effective.
	If above management practices are deemed insufficient to provide reasonable assurance that communication protocols are being followed, apply other audit procedures as necessary to gain confidence regarding the implementation of the communication protocols. See ‘Note to Auditor’ section for additional details.

**Note to Auditor:** The nature and extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System and the auditor’s assessment of management practices specific to this requirement. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are higher and management practices are determined to be less effective.

Based on the assessment of risk and internal controls, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing a sample of voice recordings to ensure the protocols related to Operating Instructions were followed. Auditors may also interview entity operating personnel to understand how they comply with the protocols and observe them performing their duties. In circumstances where voice recordings are reviewed, auditors should consider requesting recordings commensurate with known events in the entity’s footprint during the audit period, as Operating Instructions may be more likely to occur during, and related to, such events, although other sampling methods for selecting voice recordings may also be employed.

An auditor should first examine the internal controls for this Requirement, not the actual communications. The focus is on understanding the entity’s internal control processes, verifying they are actually performing the control, and that the control is reasonably designed. Sampling is not a part of the audit process unless the auditor determines that the internal control is not properly designed or is ineffective. If the auditor cannot rely on the entity’s controls to gain reasonable assurance of compliance, then the auditor can pull a sample of the entity’s communications from their available voice recordings (limited to the prior 90 calendar days) and if instances of noncompliance with the protocols are found, they will be turned over to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols and, if applicable, the severity of the violation.

DRAFT

**R5 Supporting Evidence and Documentation**

- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a method to evaluate the communications protocols developed in Requirement R1 that:
  - 5.1.** Assesses adherence to the communication protocols to provide feedback to issuers and receivers of Operating Instructions.
  - 5.2.** Assesses the effectiveness of the communication protocols and modifies those protocols, as necessary.
  
- M5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide descriptions and associated evidence of the management practices in place that demonstrate a review of communications with operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System and evidence that the entity evaluates the effectiveness of its documented communications protocols in fulfillment of Requirement R5.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>7</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Provide evidence that entity evaluates the effectiveness of the documented protocols.

Provide evidence that entity provides feedback to improve the effectiveness of operator communication.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

<sup>7</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-003-1, R5**

***This section to be completed by the Compliance Enforcement Authority***

	Understand the method and review the evidence provided by the entity to gain confidence that the entity is evaluating its documented communications protocols developed in Requirement R1. Gain confidence that evaluation addresses sub-requirements R5.1-R5.2.
--	--

**Note to Auditor:** Auditor should assess whether evidence related to the management practices providing reasonable assurance of implementation of communication protocols provided by entity for Requirement R3 also satisfies Requirement R5, in part or in whole.

**Auditor Notes:**

**Additional Information:**

**Reliability Standard**

*The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.*

The full text of STD-OXX-N may be found on the NERC Web Site ([www.nerc.com](http://www.nerc.com)) under “Program Areas & Departments”, “Reliability Standards.”

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

**Sampling Methodology [If developer deems reference applicable]**

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The [Sampling Methodology Guidelines and Criteria](#), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

**Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]**

E.g. FERC Order No. 742 paragraph 34: “Based on NERC’s.....”

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: “We affirm NERC’s.....”

**Selected Glossary Terms [If developer deems applicable]**

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

DRAFT

## **Proposed Waiver on COM-002 and COM-003 Reliability Standards**

### **Action**

Approve a waiver to shorten ballot and comment periods during development of a combined COM-002 and COM-003 standard.

### **Background**

To prepare for potential direction from the Board of Trustees (“Board”) regarding COM-003-1, the SC took two actions at its meeting on September 19, 2013 enabling the development of a revised COM-003-1 standard on an expedited timeline. On September 30, 2013, the Board’s Standards Oversight and Technology Committee (“SOTC”) held a closed conference call to deliberate on the inputs to the Board’s questions received on the draft COM-003-1 Reliability Standard from the Independent Expert Review Panel, Reliability Issues Steering Committee, NERC Management and the Operating Committee. The SOTC approved a recommendation to the Board directing the SC to work with the relevant standard drafting team (SDT) (i.e. the Operating Personnel Communications Protocols (OPCP) SDT) to develop a combined COM-002 and COM-003 standard (the “combined standard”) that includes essential elements included in the SOTC’s resolution.

Prior to Board action, the SOTC further agreed to direct the SC and NERC management to provide an update to the SOTC at the November 6, 2013 SOTC meeting on the status of the development of the draft combined standard and the RSAW. The November 2013 Policy Input to NERC Board of Trustees is attached. Based on the action of the SOTC, the SC is requested to approve a new waiver that will supersede the SC’s September 19, 2013 waiver on COM-003 that will allow the OPCS SDT to approve development of a revised standard on a shortened timeline and will enable the SDT to develop a draft combined standard with the input and direction from the SOTC. The SC is also requested to approve a shorter time period for the initial posting to develop, post, and ballot the draft combined standard before the November 7, 2013 Board meeting. The proposed waiver on a combined COM-002/COM-003 standard is included below:

If, prior to or at its November 7, 2013 meeting, the Board or the Standards Oversight and Technology Committee requests or directs the COM-003-1 standard drafting team to post for comment and ballot a proposed COM-002 and COM-003 standard (the “combined standard”), the Standards Committee approves the following waiver:

- a. Direct the COM-003-1 standard drafting team to develop a combined standard and post the revised combined standard for a 15-calendar day comment and concurrent 10-calendar day ballot period.
- b. If the revised combined standard passes, the COM-003-1 standard drafting team is directed to post the revised combined standard for a 5-calendar day final ballot period.

- c. If the revised combined standard does not pass, the standard drafting team is directed not to post the revised combined standard for final ballot.

As required in Section 16.0 of the Standard Processes Manual, NERC provided stakeholders with notice of this waiver request on October 1, 2013. If the waiver is authorized, NERC staff will post notice of the waiver on the project page and notify the NERC Board of Trustees Standards Oversight and Technology Committee.

## Standards Announcement **Reminder**

Project 2007-02 Operating Personnel Communications Protocols  
COM-002-4

**An Additional Ballot and Non-binding Poll is now open through November 4, 2013**

[Now Available](#)

An additional ballot for **COM-002-4** Operating Personnel Communications Protocols and a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels is now open through **8 p.m. Eastern on Monday, November 4, 2013**.

Background information for this project can be found on the [project page](#).

### **Instructions for Balloting**

Members of the ballot pools associated with this project may log in and submit their vote for the definition by clicking [here](#).

**As a reminder, this ballot is being conducted under the revised Standard Processes Manual, which requires all negative votes to have an associated comment submitted (or an indication of support of another entity's comments). Please see NERC's [announcement](#) regarding the balloting software updates and the [guidance document](#), which explains how to cast your ballot and note if you've made a comment in the online comment form or support another entity's comment**

### **Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the definition. If the comments do not show the need for significant revisions, the definition will proceed to a final ballot.

### **Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

# Standards Announcement

## Project 2007-02 Operating Personnel Communications Protocols COM-002-4

**Comment Period: October 21 – November 4, 2013**

Upcoming

Additional Ballot and Non-binding Poll: October 25 – November 4, 2013

### [Now Available](#)

A **15-day** comment period for **COM-002-4** Operating Personnel Communications Protocols is open through **8 p.m. Eastern on Monday, November 4, 2013.**

**On October 17, 2013, the NERC Standards Committee authorized a waiver of the standard process, in accordance with Section 16 of the Standard Processes Manual, to shorten this comment period of the combined communication standard from 45 days to 15 days with a ballot during the last 10 days of the comment period.**

**Effective communication is critical for Bulk Electric System (BES) operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES. The seventh posting of Project 2007-02 combines COM-002-3 and COM-003-1 into one standard titled COM-002-4 that addresses communications protocols for operating personnel in emergency, alert, and non-emergency situations.**

**The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating Operating Instructions.**

Background information for this project can be found on the [project page](#).

### Instructions for Commenting

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact [Wendy Muller](#). An off-line, unofficial copy of the comment form is posted on the [project page](#).

### Next Steps

An additional ballot of **COM-002-4** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted from October 25, 2013 through November 4, 2013.

**Standards Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Project 2007-02 Operating Personnel Communications Protocols COM-002-4

#### Additional Ballot and Non-Binding Poll Results

##### [Now Available](#)

An additional ballot of **COM-002-4** Operating Personnel Communications Protocols and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Thursday, November 7, 2013.**

This standard achieved a quorum but did not receive sufficient affirmative votes for approval. Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the additional ballot.

Approval	Non-Binding Poll Results
Quorum: 76.67%	Quorum: 75.52%
Approval: 58.24%	Supportive Opinions: 55.46%

Background information for this project can be found on the [project page](#).

#### Next Steps

On November 7, 2013 the NERC Board of Trustees (Board) approved a resolution on Operating Personnel Communications Protocols, which may be found [here](#). In response to this resolution, the drafting team will meet in Atlanta, GA on November 19, 2013 to consider comments and prepare a new draft of COM-002-4. Meeting details may be found [here](#), as well as [registration information](#). The drafting team expects to post this new draft the week of December 2, 2013 so that the standard can be delivered to the Board at the February 2014 meeting, as directed in the resolution.

#### Standards Development Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Yes
Requirement R.1.5 obligates issuers of burst messages using "a one-way burst messaging system" to confirm receipt of that message "by at least one receiver." However, nothing in the requirements that I can find explains how such confirmation is to occur. Requirement R.1.6 obligates a receiver of a burst message to respond only "to request clarification from this issuer if the communication is not understood." There is no Requirement on any receiver to confirm receipt of an understood communication.

Guy Zito
No
Neither Recommendation 26 in the Final Report on the August 14, 2003 Blackout In The United States and Canada or FERC Order 693 require 3-part communications protocol, or any established communication protocol for day to day operations. Both the Blackout Report Recommendation 26 and the Order 693 sections related to inter-Area communications identified one of the key factors in the Blackout being related to communications between and to RC entities as not being effective. It is not apparent if 3-part communications or the content of the other requirements in the proposed standard were in effect August 13, 2003 the problems would not have occurred. From the North American Electric Reliability Council Status of August 2003 Blackout Recommendations July 14, 2005: Recommendation 26. Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate. Status: Ongoing initiative. In response to this recommendation, NERC installed a new conference bridge and approved a new set of hotline procedures and protocols for reliability coordinator hotline calls. NERC is

working on an upgrade of the Reliability Coordinator Information System (RCIS) — an on-line, real-time, messaging system that connects all Reliability Coordinators and many control areas, which permits Reliability Coordinators to share emergency alerts. RCIS also displays information related to Area Control Error (ACE), frequency, and selected outages. Work in this area will be an ongoing activity as technologies and techniques improve. Note that NERC's own report does not mention any operator-to-operator communications. Also, from the Report to the U.S.-Canada Power System Outage Task Force The August 14, 2003 Blackout One Year Later: Actions Taken in the United States and Canada To Reduce Blackout Risk from the Natural Resources Canada, and the U.S. Department of Energy, the section Key Accomplishments—and Major Challenges Still Ahead section, there is no mention of communications issues. In light of the above, some of NPCC's participating members do not believe that the Standard is necessary and any perceived gap in communications has already been addressed through other means. We are not aware of any evidence that exists of a reliability issue existing for normal communications that needs to be addressed.

No

Not following a communications protocol when the Operating Instruction is identified as a Reliability Directive is an instance of zero tolerance. So even if a Reliability Directive is addressed and action is taken but the protocol was "missed" and a BES situation is mitigated, it is still a Severe Violation. This is extreme, and the VSLs for R4 should be reduced to address this. Regarding Requirement R4, more clarity needs to be provided on how a "consistent pattern" will be established and a set of uniform criteria needs to exist, without it there will be disparity in assessing compliance. Some of the applicable entities do not record phone conversations. The RSAW states that any instances of non-compliance will be turned over to Enforcement to determine a "consistent pattern." Again this is zero-tolerance language as each instance will be considered a potential violation. The standard implies that a zero defect assessment for Reliability Directives will be assessed in reviewing the VSL's. This does not meet the tenets of a results based standards development or any intention of the RAI process. The requirement needs to stand on its own. Only requirements that are approved by FERC are therefore enforceable. Requirement language should be provided that clearly states the intent to have a zero defect requirement for completing three part communication when Reliability Directives are issued. This is not an endorsement of this approach, simply a correct application of the SDT intent. The VSL wording is incorrect. For example, in R1, the Low VSL states the following: "The responsible entity did not specify the instances that require time identification..." when it should read "The responsible entity's protocol did not specify the instances that require time identification..." The Requirement is about specification in the protocol document explicitly. There are other places in the VSLs that similar errors occur. Suggest adding for R4 VSL Lower - The Reliability Directive was performed correctly by the receiver, but the responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive. Suggest revising R4 VSL Severe - The Reliability Directive was performed incorrectly by the receiver, because the responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive. The VSL should not add an additional layer of compliance to the proposed requirement. The requirements are structured to include:

1) document, 2) implement and 3) evaluate. The VSL should be developed from these three components of the standard and not introduce a 'zero defect' enforcement approach. NERC's recent direction was to move away from 'zero defect' standards and approach compliance from an 'identify, assess and correct' approach for controls type standards that have high frequency activity that do not immediately pose a reliability risk. The proposed requirements follow that approach. The proposed VRFs incorrectly introduce a 'zero defect' approach through a 'back door'. An entity may 'implement' a protocol, but one occurrence of not following that protocol does not warrant an entity to be non-compliant, as proposed in the standard. If the drafting team is looking for a 'zero defect' standard then the appropriate wording needs to be in the requirement. It is unnecessary as the 'zero defect' requirements for poor communication already exist in current IRO/TOP Standards.

Yes

The Requirements of COM-002-4 as written make it a zero tolerance standard. Non-emergency communications should not be zero tolerance. It can be argued that Reliability Directives be subject to zero tolerance, but even then there are realistic operational situations where having to identify a communication as a Reliability Directive, and having to repeat it back can further exacerbate a tenuous operating condition. Burst messaging should not be considered in the standard. Part 1.5 requires confirmation by at least one receiver for burst messaging. A burst message can include the issuance of multiple Reliability Directives. Getting one receipt does not guarantee that all Reliability Directives were received. There is no value in getting one back. In an emergency situation waiting for all recipients of a burst message to respond can have catastrophic reliability consequences. When a burst message is sent, the initiator can see from the system response if the message was received. FERC approved Standard TOP-001-1a Requirement R3 states that "Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements..." (This TOP-001 is deficient in itself as it doesn't address Transmission Operator to Transmission Operator directives). The Requirement goes on to further state that a response is only required if there is an inability to perform the directive. This introduces a double jeopardy situation with COM-002-4. If an entity does not comply with a directive and has not repeated it back to the issuer there is a violation of TOP-001-1a, and COM-002-4. TOP-001-1a Requirement R4, IRO-001-1.1 Requirement R8, and IRO-004-2 Requirement R1 also address communications. There is questionable value in having a documented communications protocol if the entity does not intend to implement it, make sure it is followed, maintained and personnel are trained in it. Suggest that requirements R3 and R4 either be added into the body of R1 and R2 respectively, or as Parts of R1 and R2 respectively. The VSLs should be modified accordingly. There was concern in the expressed in the Northeast that if no proper documented protocol is available, it also can't be implemented thus resulting in double jeopardy concerns. Combining these and requiring the protocol and also implementing it in the same requirement is preferable. In addition a problem was expressed with the term "implement". NPCC's participating members believe that implement, in the context written, could result in an auditor taking a "zero" defect approach. In this context, implement means to

have a current in effect document that is part of the mandatory policy of the entity that employees must follow if applicable to their job function. Part 1.4 reads: "Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system)." This removes the efficiency gains obtained through such communication. It is unrealistic and an impediment to reliability if, during an emergency situation for example, the issuer of an oral Operating Instruction has to take the time to confirm receipt, and have the receiver of the Operating Instruction interrupt the implementation of actions to mitigate the emergency to confirm receipt. In all cases the issuer of the instruction would observe changes to the system thus providing "confirmation" of receipt. Furthermore, there is no requirement for the receiver to confirm receipt. Suggest adding a bullet stating that the receiver has to acknowledge receipt of the initial message. NPCC's participating members maintain that a Reliability Directive is a communication requiring immediate or emergency action, it should not be included in the definition of Operating Instruction, and the definition of Operating Instruction revised accordingly. R5 reads: "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a method to evaluate the communications protocols developed in Requirement R1 that:..." This does not require any evaluation by the DP or GOP. We would like the Standard Drafting Team to explain why a similar requirement was not considered for the DP or GOP? There is a disparity between the RSAW and VSLs as to what is considered noncompliant. The VSL states you are non-compliant for not using 3-way communications for Operating Instructions only if you show a "consistent pattern" of not following your protocols. The RSAW states that events should be sampled, and if instances of noncompliance with the protocols are found, the issue should be turned over to the Compliance Enforcement Authority who will then make a determination whether there was a pattern. First, the focus should not be on just sampling events. The entity should provide the samples that they tested internally to do their periodic reviews of the effectiveness and adherence to the protocols in place. Is Requirement R1.1 necessary? As per NERC Management's response in the document "NERC Management Response to the Questions of the NERC BOT on Reliability Standard COM-003-1" (page 4/5), it was suggested that distinguishing between "operating instructions" and "reliability directives" would not be practical during real-time situations and that it was as important, if not more important that common protocols be used for emergency communications. Any instruction given should be treated as a reliability directive and therefore there is no need for R1.1. Furthermore, the proposed definition of Operating Instruction on page 2 of the draft standard states that a reliability directive is one type of operating instruction. This further demonstrates the redundancy of having R1.1 in the standard. The applicability of the standard should be written to exclude DPs that do not own or operate BES equipment. As per the definition of Operating Instruction "A command ... to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System..." Entities that do not have real-time control of Elements or Facilities of the BES should be removed from the applicability of the standard. Suggest adding the following to Section 4: 4.1.2 Distribution Provider with control of Elements or Facilities of the Bulk Electric System. M3 and M4 are

difficult to understand and suggest edits to clarify: Each Distribution Provider and Generator Operator shall provide evidence that it implemented the documented communication protocols such that the entity has reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Evidence should show periodic, independent review of the operating personnel's adherence to protocols established in R2. Evidence may include, but is not limited to • Descriptions of the management practices in place, • spreadsheets, • memos, or • logs, R5.1 is redundant with R3 as both require assessment of adherence to protocols established in R1. If part of "Implementation" (covered in R3) includes an assessment of the communication protocols, R5 should be limited to only correcting deficiencies with the protocols and the implementation of those protocols. If not removed as redundant, Requirement 5.1 should specify that the assessment will be limited to the operating personnel of the individual entity for both issuing and receiving Operating Instructions. As it is written now it would be the responsibility of the BA, RC and TOP to assess compliance with communication protocols to all entities involved in every communication, including the receiving GOPs and DPs, and other BAs, RCs and TOPs based on the Operating Instruction as "issuer and receiver" are not defined. Suggested Rewording of R5.1: "Assesses adherence to the communications protocols to provide feedback to entity personnel". In several places, including the Implementation Plan, there is mention of retiring COM-002-3. This standard was never FERC approved, therefore suggest changing this from retiring COM-002-3 to withdrawing COM-002-3. Implementation plan period – it is in the best interest of reliability for operating and other control room personnel to be thoroughly trained on the new communications protocols proposed in COM-002-4 before the standard goes into effect for compliance. To thoroughly train the more than 6000 certified operators in North America will likely take more than a year and an implementation plan period of one year is therefore inadequate. It is recommended that the SDT consider a two year period to assure successful implementation. If the SDT decides to retain the proposed one year implementation plan, we recommend that the SDT consider adding an option for the Registered Entity to elect an additional one year implementation period, to be vetted and pre-approved on a case by case basis upon mutual agreement between the Regional Entity and the Registered Entity. Addressing preferred communication methods and procedures could be addressed in training programs that would be reviewed for universal consistency. The requirements contained within COM-002-4 and its previous versions have concepts that more appropriately belong in a procedure or guideline. One example is COM-002-4, R1.3: "Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver ...". If the NERC Board of Trustees decides that a standard is needed: 1) Industry must accept that there needs to be a NERC Standard that addresses both Normal and Emergency communications. 2) The standard needs to be simplified. 3) Regulators acknowledge and understand that the "zero-defect" regulatory approach is already (appropriately) applied to the result (e.g. was a Reliability Directive implemented properly), and therefore does not need to be applied to the supporting means (communications). 4) Related to 3), there are already "zero-defect" requirements associated with Reliability Directive compliance as contained in IRO-001, R8, IRO-004-2, R1, TOP-001-1a, R3 and R4. 5) Acknowledge that each entity is going to

have to ensure their communication protocols are appropriately coordinated w/ neighboring entities. 6. Burst messaging should not be included in this standard. The preceding will require compromise between the Industry and Regulatory bodies. RSAW Comments: The “Note to Auditor” related to R3 and R4 is outside of the scope of the standard. Placing the examination of Internal Control within the RSAW effectively requires entities to have Internal Controls, which expands the scope of the standard significantly.

Individual

Thomas Foltz

American Electric Power

Yes

No

R3 & R4: While there \*is\* the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations were performed as a result. The severe category should be reserved only for those instances in which documented communications protocols were not followed \*and\* which resulted in an emergency operation or reliability issue. As a result, we suggest “demoting” each existing VSL to a lower level, and editing the Severe VSL and limit it to only those instances that resulted in an emergency operation or reliability issue (suggestions provided below). Low - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R1 for Operating Instructions that are not Reliability Directives. Moderate – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive. High – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving an Operating Instruction \*and\* resulting in an emergency operation or reliability issue. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive \*and\* resulting in an emergency operation or reliability issue.

Yes

R5.1: Read on its own, one might think an issuer of an operating instruction may be required to provide feedback to the receiver. We don’t believe this is the intent. We suggest removing R5.1 in its entirety, or at a minimum, change the wording to the following: “Assesses adherence to communications protocols.”

Individual

Gerald G Farringer

Consumers Energy

Yes

The addition of “Operating Instruction” is less clear than in previous versions. In the distinction of “Operating Instruction “is needed at all it needs to be distinct and separate from a “Reliability Directive”. There needs to be a distinction of requests and instruction. Typical generation dispatch could be a request and does not have the weight of a direct reliability risk

for example. Keeping a clear distinction of "Reliability Directive" lends an air of urgency to the direction. There needs to be this clear distinction to communicate the difference between routine economic dispatches and true reliability needs. Creating "Operating Instruction" will only cause this category to be used when a "Reliability Directive" would be appropriate.

R3, R4, and R5 as addressed in the draft RSAW focuses on compliance related to internal controls. Disagree that compliance assessment is primarily based on internal controls and limiting audit scope and review of evidence as reflected in the Notes to Auditor section. Also limiting review of voice recordings to last 90 days negates the value of sampling for 3 way communication during events during the entire audit period. I don't think notes to auditor section should include audit scoping and dedicated to internal controls review for which compliance assessment findings of violations cannot be determined. R1 and R2 are focused on documentation of communication protocols, R3 and R4 the implementation of said protocols. R5 a method to evaluate protocols for R1. Unclear as to why R3 implementation cannot include the components of R5 as for same entities and both involve implementation of protocols. R5 is review.

We believe that requirement 1.9 should be removed or rewritten. If each utility is allowed to define this differently it would make communication more difficult, especially in emergency conditions.

No
Neither the August 2003 Blackout Report Recommendation number 26 nor Order 693 requires three-part communications or any established communication protocol for normal operations. Additionally, EOP-001-2, R3.1 and COM-002-2, R2 already address the requirements of the Blackout Report and FERC Order 693.
No
Regarding R3 and R4: These VSLs create a “zero tolerance” situation. If an entity fails to follow the communication protocol when issuing or receiving a Reliability Directive one time, even if there is no adverse impact to the BES, it is a violation. While there is the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations occurred as a result. The severe category should be reserved for only those instances in which documented communications protocols were not followed and the failure resulted in an emergency operation or reliability issue. As a result, we suggest “demoting” each existing VSL to a lower level and limiting the Severe VSL to only those instances that resulted in an adverse impact on the BES (suggestions provided below). Low - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R1 for Operating Instructions that are not Reliability Directives. Moderate – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive. High – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving an Operating Instruction and that failure resulted in an emergency operation or reliability issue. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive and that failure resulted in an emergency operation or reliability issue. Regarding the VSL for R3 and R4: Use of the term “consistent pattern” is vague and will be difficult to determine and analyze.
Yes
R2.1 currently requires, “the receiver of an oral or written Operating Instruction to respond using the English language.” We recommend re-writing the requirement to require, “the receiver of an oral or written Operating Instruction to use the English language.” (similar to R1.2) “Written Operating Instructions” must be defined (e.g. in the ERCOT Region, would an electronic, computer-generated dispatch instruction constitute a “written Operating Instruction?”) Measure 3 requires “reasonable assurance” without defining that term. Additionally, M3 also requires an “independent review.” Does that require hiring a third-party? Can a company’s compliance office serve as the “independent” reviewer? Can an operator “independently review” another operator? In several places, including the implementation plan, there is mention of retiring COM-002-3. FERC never approved that standard. The standard should not apply to DPs who do not own or operate BES equipment. As per the definition of Operating Instruction “A command ... to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric

System...” The Standard should not apply to entities that do not have real-time control of BES Elements or Facilities. We suggest adding the following to Section 4: 4.1.2 Distribution Providers who control BES Elements or Facilities. In the definition of “Operating Instruction,” the word “and” in the second line and the fourth line should be “or.”

Yes

Yes

The RSAW for COM-002-4 seems dependent on the implementation of the Reliability Assurance Initiative (RAI) which is not expected to be implemented until 2016. It is not reasonable to utilize an internal controls approach to auditing until the criteria for such evaluation has been clearly explained to the stakeholders. Therefore, the Implementation Plan and the EFFECTIVE DATE for this standard needs to be delayed accordingly.

Modify Requirement 1 Part 1.1 to say: “Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver where time permitting.” Time permitting would be defined as when taking proactive actions to mitigate or prevent an Adverse Reliability impact pre-contingency. Stating “This is a Reliability Directive” would not be required post-contingency, and at the discretion of the sender would only be used if time were permitting. Add a new sub-requirement requiring that senders (RC, BA, TOP) and receivers (GOP, DP) of Operating Instructions, including Reliability Directives, have direct communication facilities. This requirement would remove the inherent time delay and introduction of garbled messages caused by the use of communications intermediaries. The following wording is suggested: New Requirement 1.2 - Require the issuer and receiver of an oral or written Operating Instruction have direct communications facilities. The use of communications intermediaries is not acceptable. Append the following words to the end of Requirement 5.1: “to ensure there that there is a consistent pattern in the use of communications protocols.” The sub-requirement would then read as follows: 5.1. Assesses adherence to the communications protocols to provide feedback to issuers and receivers of Operating Instructions to ensure there that there is a consistent pattern in the use of communications protocols.

No

Background - The ultimate purpose of any communications standard should be to see that the correct actions affecting the BES are taken. Greater emphasis should be placed on Reliability Directives, than on non-RD Operating Instructions. Therefore, the ultimate measure of whether such communications were successful should be whether the required action was taken (and

the real-time risk to the BES reduced) or not. It should not be based on whether some documentation requirement was met or some communications protocol was followed to the letter. Recommendations - We recommend different VSL ratings for a failure to repeat-back, depending upon whether the Operating Instruction was a Reliability Directive or a non-RD Operating Instruction, and whether the action taken reduced or potentially increased the real-time risk to the BES. If the action taken by the receiver (who failed to repeat back) was still correct and in accordance with the Sender's instructions, then only an administrative requirement was violated. There was no actual risk to the BES. This fact should be recognized and the documentation failure rated lower. However, if following a failure to repeat-back a receiver takes an incorrect or inappropriate action, which potentially introduces increased risk to the reliable operation of the BES, then this failure and should receive a higher rating. As such, we recommend the following replacements for the Requirement R4 VSL's: Add R4 VSL Lower - The Reliability Directive was performed correctly by the receiver, but the responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive. Revise R4 VSL Severe - The Reliability Directive was performed incorrectly by the receiver, because the responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive.

Manitoba Hydro

Yes

No comment.

Yes

Although Manitoba Hydro is in general agreement with the standard, we have the following clarifying comments: (a) VSLs, R1 and R2, Moderate – the statement ‘an alternate language may be used for internal operations’ is not necessary. (b) VSLs, R1 and R2, High and Severe – these are not written in the same form as the lower and moderate VSLs. The latter paraphrase the requirement part that is being violated while the former only refer to the requirement part

number. (c) VSLs R3, R4 – the term ‘consistent pattern’ is subjective; unclear how this would be interpreted. (d) VSLs R5 – doesn’t address requirements in 5.1 and 5.2

Yes

Although Manitoba Hydro is in general agreement with the standard, we have the following clarifying comments: (a) M3, M4, M5 – replace Bulk Electric System with BES. (b) Purpose – consider using the word ‘improve’ or ‘strengthen’ instead of ‘tighten’ in this statement. (c) R1 – Reliability Directive is not yet a FERC approved definition. What is the protocol if the definition of Reliability Direction is not approved? (d) R1 – the bulleted statements in R1, 1.3 make more sense if they came after the statements in 1.4. 1.4 discusses the requirement on the receiver to repeat information, a reference in 1.3 to ‘repeated information’ is premature. (e) R5 – 5.2 buries an additional requirement with the last few words ‘to modify the protocols as necessary’. If such a requirement is to be in place, it should be a separate requirement not tagged on to the R5 requirement to evaluate and assess. (f) There seems to be missing a further requirement that would require the Distribution Provider and Generator Operator to evaluate their communication protocols similar to that in R5. (g) M3 and M4 – the language ‘that provide the entity reasonable assurance that protocols.....Bulk Electric System’ seems unnecessary here. This language does not appear anywhere else in the requirement or the standard. Wouldn’t it be sufficient to require evidence of management practices in place without going into further description? (h) M4 – the language ‘and the remediation of noted exceptions in fulfillment of Requirement R5’ doesn’t seem to belong here. R3 simply requires implementation, not remediation. (i) M5 – the language in M5 does not match the language in R5, and doesn’t address 5.1 or 5.2.

a. As indicated in all of our comments on the previous COM-003 postings, we believe that the COM-002-3 standard that is supported by the industry and approved by NERC Board of Trustees adequately addressed the Blackout Report recommendation. Furthermore, communication protocols are in place to require functional entities that receive Reliability Directives to perform the directive issues by the RC, BA and TOP. While we generally supports exercising tightened communication protocols for routine operating instructions, we continue to disagree with the need to develop a standard that mandate three-part communication for issuance of Operating Instructions for normal operating system conditions. Any and all instructions will either change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Unlike its COM-003-1 Draft 5 predecessor, this draft no longer allows the Responsible Entity to specify the instances where the issuer of an oral two party, person-to-person Operating Instruction is required to exercise 3-part communication. Without this provision, the standard now requires 3-part communication whenever a Responsible Entity issues an Operating Instruction. This is overly burdensome, and may in fact hurt reliability as System Operators will now place focus on implementing and completing the 3-part communication process rather than concentrating on

the actions needed to achieve a reliability outcome. Notwithstanding the above, we have the following comments on the proposed standard. b. Part 1.3 is unclear in two aspects: • To “wait” is not a 2-part action, and is not measurable. How is an entity assessed whether or not it waited or not waited? We suggest to make it more proactive by replacing it with “obtain” or “collect” a response. • In the second sentence, the phrase “or if no response is received” is open-ended. When should the issuing entity take one of the actions listed in the bullets below? We suggest the SDT to add a time frame in this sentence such as: “or if no response is received in X minutes”. Without the time frame, it will not be possible for the issuing entity to know when it is supposed to follow up, and for the Compliance Enforcement Authority to assess if Part 1.3 was complied with. • The above comment also applies to Part 2.2. c. Part 1.4 places the obligation on the receivers of the Operating Instruction; it is not appropriate for inclusion in the issuer’s communication protocol unless the protocol document is distributed to all potential recipients of the Operating Instructions. However, there does not exist a requirement for the BA, RC or TOP to distribute their communication protocol document hence the inclusion of Part 1.4 in their communication protocol document is inappropriate and serves no purpose. d. Part 1.5: The intent of this part is unclear or the requirement is incomplete, leading to an unnecessary or missing action mandated by the requirement, or the potential for non-compliance despite best effort. Part 1.5 requires the issuer (say, a BA) of an Operating Instruction that uses a one-way burst messaging system for communicating common messages to multiple parties to obtain confirmation from at least one recipient (say, a GOP). The intent of using the burst messaging system is to achieve efficiency by eliminating the need for one-on-one communication of the same message and the need for confirming receipt of the message. The requirement for the issuer to confirm receipt by at least one receiver of the message is not consistent with the intent of using the burst messaging system. Further, we believe that the combined standard should focus on oral two-party, person-to-person communication. The one-way burst messaging system requirement is thus not necessary (e.g., confirmation of receipt) and should be removed because this is more of an electronic verification that is a function of the operability of the one-way burst messaging system. If the SDT should insist that requirement be retained, then to confirm at least one recipient receives the message, there needs to be an obligation on the receiving entities to acknowledge receipt of the Operating Instruction. However, there is no requirement in the standard to require the receiving entities (say, a GOP or a DP) to provide that confirmation. The only requirement for responding to Operating Instruction transmitted through the burst messaging system is when the communication is not understood by the recipient as stipulated in Part 1.6 and Part 2.3. If all recipients understand (or think they understand) the Operating Instruction so transmitted, the issuing party (e.g. a BA) will not receive any confirmation at all. In this case, the issuing party (e.g. the BA) will not be able to comply with Part 1.5. We suggest the SDT to review the intent of Part 1.5, and to remove this part or strengthen the other parts in this and other requirements to close the loop for confirming receipt of Operating Instructions transmitted through the burst messaging system. e. Requirement R5 requires the BA, RC and TOP to implement a method to evaluate the communications protocols developed in Requirement R1, assess adherence to the protocol, provide feedback and make adjustments as necessary. There is no such requirement for the GOP and DP who are also required to develop their communication protocol per

Requirement R2. The reason for not having such a requirement is not presented in the posted Rationale and Technical Justification document. We suggest the SDT to provide the reason for not having this requirement, or to add this requirement to close the gap.

No

Requirements R3 and R4 were mapped from Requirements R1 and R2 of in Draft 5 of the COM-003-1 standard. In that draft, both of these requirements were assigned a LOW VRF, which we concurred. In the proposed COM-002-4, the SDT proposes that these two requirements (now R3 and R4) be assigned a HIGH VRF "... because failure to use the communications protocols during an emergency could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures." We do not agree with the HIGH VRF since miscommunication alone does not and cannot cause instability. It needs to have another action or inaction combined by an event on the BES to result in any disturbance that results in instability. Even if we agree to some extent that failure to use the communication protocol during an emergency could contribute to bulk electric system instability, these two requirements also cover non-emergency situations. Under the latter conditions, we are unable to support the argument that failure to use the communications protocols could cause or contribute to bulk electric system instability. At most, we can accept a MEDIUM VRF assigned to these two requirements, but not a HIGH. We suggest the SDT to revise these VRF accordingly.

Individual

Pepco Holdings Inc

Yes

Take the case of a TO communicating with a TOP regarding the TOs prescheduled request to perform a BES switching activity. When field personnel are ready to begin work, the TO would contact the TOP requesting that the switching activity begin. The TOP would then authorize the TO perform the prescheduled BES switching. Technically the TOP did not "command" that the TO change the state of the BES system as described in the definition of Operating Instruction. Is "three part" communication required in this instance? If so please explain/describe how the draft standard is applied in this instance, since TOs are not included as Applicable and that no Operating Instructions were issued. In R3 and R4 in the RSAW it states under Evidence Required: "Spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols..." What is meant by "independent review"? Is that meant to only exclude the personnel involved directly in the communication from "self-certifying" their adherence or does that exclude the Operations supervisor in charge of the Operating personnel and other operations personnel from review? That would imply then that review would require someone from outside operations like internal audit or a consultant.

Yes
Yes
Yes
TVA supports the SERC OC Review Group comments. We would respectfully add the comment below: As currently written, Measurements M3 and M4 establish the additional requirement of “periodic, independent review . . . of adherence to the [documented communication] protocols.” This is essentially duplication of activity without additional reliability benefit over assessments performed by issuers required in R5. As such, this will create unnecessary administrative burden on applicable entities. The SDT is respectfully requested to remove this language from M3 and M4 and to add as an alternative, a requirement for documented response to feedback from the issuers’ assessments that would include evidence of corrective actions taken. Suggested wording would be, “. . . reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, and documented responses to feedback received from assessments performed as required in R5, consisting of dated reports, or copies of electronic messages, or other evidence of appropriate corrective actions taken or technically justified explanations as to why no action is required.

1. Make a common NERC-wide communications protocol a separate standard attachment. We believe a single protocol that would apply across all of NERC is desirable. That protocol could be incorporated in a separate attachment with these items defining the “protocol:” a. The issuer of a Reliability Directive shall identify the action as a Reliability Directive to the receiver. b. When an oral person-to-person Operating Instruction command is issued, the command shall be repeated by the recipient and either confirmed by the issuer or reissued to resolve misunderstandings. c. For an oral Operating Instruction that uses a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g., an all call system): i. The issuer shall electronically or verbally confirm the receipt by at least recipient. ii. The receiver shall request clarification from the issuer when the Operating Instruction is not understood. We have not included certain provisions in R1 in the COM-002-4 draft in the protocol items: • We would not require each RC, BA, and TOP to develop its own protocol to address such items as time identifiers and the use of alpha-numeric clarifiers. We believe that three-part communications will correct any misunderstandings. • We would not address written communications, which are included in subparts 1.2 and 1.8. Although addressed in COM-002-4 draft, written communications requirements are only placed the issuer and therefore should not be included. • While not impacted by 1.2 for oral Operating Instructions, we did not require the receiver of an oral Operating Instruction to reply in English, unless agreed to otherwise. We believe the language used for communicating does not need to

be addressed in a standard because it is automatically handled by the use of three-part communications. 2. Include a requirement that requires the protocol be implemented. With a protocol defined in an attachment, a requirement should simply require Operating Instruction issuers (RC, BA, and TOP) and receivers (BA, TOP, DP, and GOP) to implement the communications protocol as defined in the attachment. This requirement would replace R1 through R4 in the current COM-002-4 draft.

Hydro-québec Production

Yes

No

VRF, VSL The violation severity level and the VRF level seems not to be at the proper level compare to the requirement.

Yes

R1 - The issuer of a reliability directive should not have to identify the action as a reliability directive to a receiver. There should be only one level of communication protocol. The operating instruction should be included in the Reliability Directive to create only one level of communication protocol. This communication protocol would then be considered the highest level in all communication situation. A single communication protocol would minimise the risk of unwanted communication delay in emergency situation. Requiring the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver and having the receiver to repeat the Operating instruction would induce unwanted communication delay in emergency situation.

FERC Order 693 P 512 may have intended Distribution Provider (DP) be made applicable, but also stipulates not all DP entities will be required to comply with the communication and coordination standard. For an entity registered as a DP to provide BES support as intended by the Standard, there must be means and trained personnel available 24/7 to control facilities in a timely fashion which will have a significant operational impact on the BES and staff available to receive Operational Instructions. Many small entities do not maintain a 24/7 distribution dispath operation, precisely because their TOP is the one with control of the BES and lower level communications are generally related to impacts of the TOP's operational decisions. If DPs are included in the applicability section, there needs to be some qualifier on DPs with BES control of assets deemed essential by the the RC or PA/PC or something similar.

No

Not with the current unqualified applicability for DPs.

No

Previous comments by other small entities on the impacts of this standard appear to remain unaddressed in the current draft. This may be an oversight by the drafting team, but it does remain a defect in the current draft. The standard as drafted will require small entities to have and implement protocols to deal with Operating Instructions that they currently don't get or may never get from their TOP or BA, because of their lower voltage and impact position on the outskirts of the BES. Additional staffing will be required to deal with one-way bursts that might occur after hours, even though none of the possible issuers of these have indicated any plans to implement such a system, or have suggested that these entities must be available around the clock for reliability. DPs not designated by the RC or PA/PC be excluded.

Individual

Keith Morisette

Tacoma Power

No

Tacoma Power does not agree with the result, COM-002-4 standard. Reason One: -R1 and R2 of the proposed standard both address the issuance and receipt of an "oral, two-party, person-to-person Operating Instruction." -R1 applies to BA, TC, and TO -R2 applies to DP and GO -The requirements in R1 are different from R2, in that R1 contains several sub-requirements that R2 does not. One of these additional requirements is confirming the accuracy of the repeat-back of the Operating Instruction. This is a cornerstone of three-part communication, and its omission from R2 is a move in the wrong direction. -This sets a "compliance trap" for the System Operator and could delay critical communications. Alternately, it would require utilities that perform TO, BA, GO, and DP functions out of the same control room, often from the same Operator, to over-apply R1 to ensure compliance. Reason Two: -R5 (R5.1) will require implementation of a method to evaluate the communication protocols developed in R1 that assesses the adherence to the communication protocols and provide feedback to the issuers and receivers of Operating Instructions. -R5.1 does not specify a periodicity for this evaluation: annually, semi-annually, monthly? The data retention period is 90 days, so arguably we would need to perform these evaluations every 90 days on all operators. -This has the potential to create a large burden to administer this program.

No

Tacoma Power does not agree to the standard as proposed, for the reasons stated above. Therefore applications of VRFs and VSLs cannot be determined and supported for the proposed standard.

No

Group

Western Small Entity Comment Group

Steve Alexanderson

No

FERC Order 693 P 512 mandates Distribution Providers (DP) be made applicable, but also stipulates that DP entities that do not use, own, or operate BES facilities need not be required to comply with the communication and coordination standard. This implies there is room for

exclusion language in the Standard to remove compliance obligations for DP entities that are unable to provide any BES reliability support the Standard is designed to cover. However, the current draft has no such language. This standard assumes each applicable entity has the means to control BES facilities in a timely fashion, and has staff continuously available to receive Operational Instructions (OIs). Many DP entities do not have continuously staffed dispatch, nor own supervisory control and data acquisition (SCADA) equipment enabling remote control from a central location and may own limited BES facilities, if any at all. Therefore, the applicability section should allow exclusion for such entities. We suggest the applicability for Distribution Providers be further focused: Distribution Providers having a continuously staffed (24-7) dispatch desk with the ability to remotely control BES facilities with an aggregate impact of 75 MW or greater; or as identified in written agreement by the RC, BA, or TOP as required for specific prearranged operational actions. We also urge consideration be given to small non-24/7 GOPs. Small generation projects often are only manned for a single 8-hour shift each day.

No

In light of the comments submitted for questions one and three, the VRFs and VSLs cannot be aligned until the Standard is modified to remove applicability on entities that cannot provide the Reliability support it is designed to cover. Further, the high VRF for Requirement R4 is obviously inappropriate for small DPs and GOPs.

Yes

The comment group emphasizes its past comments submitted during COM-003-1 development and believes that smaller entities and non-24/7 staffed-entities, including small GOPs, were not considered during the drafting of this standard. The standard as drafted will require these entities to have and implement protocols to deal with OIs that have never occurred in the memories of numerous 30 year employees. Additional staffing will be required to deal with one-way burst OIs that might occur after hours, even though none of the possible issuers of these OIs have indicated any plans to implement such a system, or have suggested that these entities must be available around the clock for reliability. We suggest that non-24/7 DPs/GOPs and/or those not designated by the RC or PA/PC be excluded from the Applicability section of COM-002-4. The comment group also believes that the abbreviated 15-day comment period is an unreasonably short period for stakeholders to analyze and reach consensus on modifications to the standard that would address our concerns.

Group

Associated Electric Cooperative, Inc. - JRO00088

David Dockery

No

AECI firmly believes COM-002-3 adequately addressed SWBO recommendation 26 and FERC Order 693, with a reasonable balance of BES benefit, risk, and scope of governance, and should have been submitted to FERC upon NERC BOT approval per standard development procedure.

No

The scope of Operating Instructions is too broad for the assessed Severity, due to capturing

within its scope communications that would not significantly affect BES reliability, based solely upon mild possibilities.

Yes

AECI does not approve of this draft for the following reasons: 1) Expectations that once a Directive or even Instruction is issued then the issuer is legally obligated to wait upon a response, although adverse conditions could make such response impossible. 2) Including Distribution Providers, where redundant communication lines are not and in most all cases should not be required, by failing to reduce their Applicability scope to only communications affecting load reduction or shedding to protect the BES. 3) This draft introduces a hidden compliance-risk to responsible entities who improperly categorize Directives. 4) COM-002-3 addressed the risks to the industry.

1. However, ATC does not believe that the following text taken from the SAR was adequately addressed: "Requirements will ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to operating directives." NERC Glossary of Terms Definition of a "Reliability Directive": (Approved by FERC) A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. The draft COM-002-4 Standard in R1.1 requires the "issuer" to identify a "Reliability Directive", however, does not specifically call out the requirement that the "receiver" repeat back that it is considered a "Reliability Directive". ATC recommends this be added to R1.1. The Standard should close the loop on this subject as it is considered an Emergency or Adverse Reliability Impact. 2. Draft COM-002-4 Standard R1.4 requires the receiver to wait for "confirmation" from the issuer that the repeat back was correct. ATC recommends that the SDT include language which states confirmation consists of stating "that is correct" or "that is incorrect" followed by a re-issuing of the instruction.

No

ATC believes there should be more than just a "Severe VSL" for R5. Implementing a method of evaluating communication protocols could be accomplished at various levels of adequacy. With that said, additional levels should be considered.

Yes

The following are recommendations to improve the quality of the draft Standard: 1. After

reviewing the Measures in this draft Standard , ATC has the following comments: • M3, as written, is awkward and not grammatically correct and should be revised to clearly state the intent of the Measure. • Also, M3 and M5 may be duplicative when referring to R5. Furthermore, ATC recommends that in the last sentence in M3 be shortened by deleting the phrase “..... and the remediation of noted exceptions in fulfillment of Requirement 5.” Finally, this phrase uses the term “remediation” that does not make sense after researching the definition of the term to meet the intent of R5. 2. After reviewing Section D 1.2 Data Retention of the draft Standard, ATC is concerned that the guidance provided to the CEA is confusing and contradictory. In the first paragraph, the Standard states “ where the evidence retention period (for the Standard) is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.” (What does this mean?) In the second paragraph, the Standard requires the entity to “keep data or evidence for each applicable Requirement for the current year and one previous calendar year, with the exception of voice recordings which shall be retained for 90 calendar days.....” Bottom line is the required retention period in the second paragraph is much shorter than the 3-year audit period that would apply to Transmission Operators and it is not reasonable to meet the expectations of both time periods and comply. 3. ATC suggests R5.2 be re-worded as follows: R5.2 Provides for a periodic review of the communication protocols and modifies them based on lessons-learned during the adherence of the communication protocols. Evidence would be documenting this periodic review, whether changes were warranted, and subsequently implemented.

Individual

Scott Berry

Indiana Municipal Power Agency

No

For requirement R3 (and other requirements) VSL, how many non-conforming communications or types of non-conforming communications demonstrate a consistent pattern of not using the documented communications protocols? Would it be two or three or does it just depend on the volume of communications the entity performs? This VSL is very open to interpretation and may lead to much inconsistency in the Enforcement area.

Yes

The definition of an Operating Instruction has changed since the last posting of COM-003-1. In COM-003-1, an Operating Instruction was “a command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where...” and now it has changed to “a command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change...”. The current definition in COM-002-4 of Operating Instruction seems to now include communications between an entity’s Market Operations Center (not a control center) and its generation facility. Previously, this did not seem to be the intent of the SDT and IMPA would recommend that the SDT uses the words “a command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where...” so as not to include communications between the entity’s Market Operations and its generation facilities. IMPA has

concerns with the RSAW. First, the GOP requirements do not say or require the GOP to have management practices in place. The RSAW should be written to audit an entity to what is in the requirements and nothing more. Second, the RSAW is written in a way that makes an entity's management practices fall under the audit, and it allows the auditor great latitude in determining if an entity's management practice designs are effective. IMPA does not believe that management practices should be reviewed by an auditor during an audit. Even the RAI is looking at reviewing management practices outside of an audit in an assessment style only before an audit is performed. If a management practice must be included in the audit, there must be consistency among the auditors and not so much discretion of the auditor allowed which may lead to inconsistent audits. Maybe benchmarking or a model of internal controls can be used by both the entities and auditors (one that also allows for different sizes of entities - scalability and tailor-able). Third, an entity may believe that its internal controls are effective but if the auditor deems they are not effective then the auditor can pull samples of communications which may be ones that were not reviewed by the entity during its review check. So, does this mean the entity will have to review every communication just in case the auditor pulls a sample of communications? Under this scenario, if the auditor finds instances of noncompliance they are to turn them over to Enforcement. This is very problematic and does not remove the "zero defects" issue.

No

General a. The SRC disagrees with the need for standards to repeat and confirm Operating Instructions for normal operating system conditions. Any and all instructions will either change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Unlike its COM-003-1 Draft 5 predecessor, this draft no longer allows the Responsible Entity to specify the instances where the issuer of an oral two party, person-to-person Operating Instruction is required to exercise 3-part communication. Without this provision, the standard now requires 3-part communication whenever a Responsible Entity issues an Operating Instruction. To track every Operating instruction is overly burdensome, and may in fact hurt reliability as System Operators will now place focus on implementing and completing the 3-part communication process rather than concentrating

on the actions needed to achieve a reliability outcome. The SRC supports relying on the OC's Reliability Guidance that supports 3-part communication for all oral two party, person-to-person communications. The SRC proposes that this approach be used for a two year trial period. During that trial period NERC should collect information on the number of reliability events caused by communications errors. The ERO could then use the data to justify added requirements if the data justified the need. b. R3 in conjunction with R1 is a zero tolerance standard. All parties (Industry as well as the SDT) have stated that a zero tolerance standard for Operating Instructions during normal conditions is inappropriate. The SRC recommends that R3 be deleted. c. There is no rationale given for the omission of Load-Serving Entity (LSE) as an Applicable entity. The TOP-001-2 standard, as referenced in the Rationale and Technical Justification document, holds the LSE responsible for complying with Reliability Directives from its TOP. If, as the standard implies, tightened communication is required for any and all Reliability Directives and Operating Instructions, then there is no reason that LSE is not included in this standard. We would like to understand the rationale/technical basis for excluding the LSE and determine whether that same rationale should be applied to other parts or to the entire standard. Absent a rationale/technical reason for omission of LSE, we ask that this entity also be subject to the requirement. The SRC recommends that LSE be added to the standard Requirements d. R1.3 is unclear in two aspects: • To "wait" is not a 2-part action, and is not measurable. The SRC questions how an entity would be assessed regarding whether or not it waited or not waited? The SRC recommends that the word "wait" be replaced with "obtain" or "collect" a response. • In the second sentence, the phrase "or if no response is received" is open-ended. The SRC asks "When should the issuing entity take one of the bulleted actions listed? The SC proposes that the SDT to add a time frame in this sentence such as: "or if no response is received in X minutes". Without the time frame, it will not be possible for the issuing entity to know when it is supposed to follow up, and for the Compliance Enforcement Authority to assess if Part 1.3 was complied with. The above comment also applies to Part 2.2. e. Requirement 1 is a mandate to document the applicable (issuing) entity's protocols for communications. And lists the requirements that must be in those protocols. Part 1.4 however, is an obligation on the receivers of the Operating Instruction. Such an obligation on the receiver is not appropriate for inclusion in the issuer's communication protocol unless of course the issuer's protocol document is distributed to all potential recipients of the Operating Instructions. However, there is no requirement for the BA, RC or TOP to distribute their communication protocol document hence the inclusion of Part 1.4 in their communication protocol document is inappropriate and serves no purpose. f. Part 1.5: The intent of this part is unclear or the requirement is incomplete, leading to an unnecessary or missing action mandated by the requirement, or the potential for non-compliance despite best effort. Part 1.5 requires the issuer (e.g. a BA) of an Operating Instruction that uses a one-way burst messaging system for communicating common messages to multiple parties to obtain confirmation from at least one recipient (e.g. a GOP). The intent of using the burst messaging system is to achieve efficiency by eliminating the need for one-on-one communication of the same message and the need for confirming receipt of the message. The requirement for the issuer to confirm receipt by at least one receiver of the message thus mitigating the reason for using the burst messaging system. On the other hand, to be effective, a requirement to confirm at least one

recipient receives the message requires a complementary obligation on the receiving entities to acknowledge receipt of the Operating Instruction. However, there is no requirement in the standard to require the receiving entities (say, a GOP or a DP) to provide that confirmation. The only requirement for responding to Operating Instruction transmitted through the burst messaging system is when the communication is not understood by the recipient as stipulated in Part 1.6 and Part 2.3. If all recipients understand (or think they understand) the Operating Instruction so transmitted, the issuing party (e.g. a BA) will not receive any confirmation at all. In this case, the issuing party (e.g. the BA) will not be able to comply with Part 1.5. We suggest the SDT to delete requirement 1.5. g. Requirement R5 requires the BA, RC and TOP to implement a method to: evaluate the communications protocols developed in Requirement R1; assess adherence to the protocol; provide feedback; and make adjustments as necessary. There is no such requirement for the GOP and DP who are also required to develop their communication protocol per Requirement R2. The reason for not having such a requirement is not presented in the posted Rationale and Technical Justification document. The SRC recommends the SDT add this requirement to close the gap. h. The Industry-approved COM-002 states “When a Reliability Coordinator, Transmission Operator, or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator, or Balancing Authority shall identify the action as a Reliability Directive to the recipient.” However, the current draft reads “Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.” The previous version allowed the RC, TOP or BA to pre-define what system conditions constitute a Reliability Directive in an operating procedure instead of during pressing oral communications, in effect, developing a standing definition, the new draft appears to eliminate that needed flexibility The SRC recommends the SDT to retain the previously approved text.

No

Requirements R3 and R4 were mapped from Requirements R1 and R2 of in Draft 5 of the COM-003-1 standard. In that draft, both of these requirements were assigned a LOW VRF, with which we concurred. In the proposed COM-002-4, the SDT proposes that these two requirements (now R3 and R4) be assigned a HIGH VRF “... because failure to use the communications protocols during an emergency could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.” We do not agree with the HIGH VRF since miscommunication alone does not and cannot cause instability. There needs to be another action or inaction combined with an event on the BES to result in any disturbance that results in instability. Even if we agree to some extent that failure to use the communication protocol during an emergency could contribute to bulk electric system instability, these two requirements also cover non-emergency situations. Under the latter conditions, we are unable to support the argument that failure to use the communications protocols could cause or contribute to bulk electric system instability. At most, we can accept a MEDIUM VRF assigned to these two requirements, but not a HIGH. The SRC recommends the SDT to revise these VRFs accordingly.

Yes

The SDT tries to avoid making this standard a zero tolerance by using explanations in the

Measures, VSLs and RSAWs. However it is our understanding that the words of the requirement form the basis for compliance (the other venues are not part of the standard they are part of the compliance program that is not subject to Industry or regulatory approval). The SRC recommends all text that is meant to mitigate the impact of the words in the requirement be placed in that requirement. Please note that CAISO and PJM abstained from these comments and will submit their own comments independently.

R1.4 / R2: It should be clear that it is the issuer’s responsibility to ensure three-way conversation occurs. Situations where an issuer fails to prompt the receiver to partake in a 3-way conversation during issuance of an Operating Instruction should not be a violation on the part of the receiver. R1.7: The protocol should include a format for time identification, identifying specific instances for using the protocol becomes more problematic. An instance could mean a number of things, including: (1) when issuing Operating Instructions to a receiver in a different time zone; (2) when issuing specific types of Operating Instructions, or when a time component would materially impact an Operating Instruction. Alternate language for R1.7, “Specify the time format to use when issuing an oral or written Operating Instruction.” The R5 requirement to implement a method to evaluate the communications protocols provides a more flexible method for evaluating “instances.” R1.9: Comments similar to R1.7, alternate language for R1.9, “Specify the alpha-numeric clarifiers to use when issuing an oral Operating Instruction.” The R5 requirement to implement a method to evaluate the communications protocols provides a more flexible method for evaluating “instances.” R2 / R4: These requirements should also be made applicable to Load Serving Entities, Balancing Authorities, and Transmission Operators. All are potential “receivers” of Operating Instructions. The following Standards (mandatory or in process) establish RC and TOP authority for issuing Operating Instructions. • Mandatory Standards Subject to Enforcement: o IRO-001-1.1 R3. The Reliability Coordinator shall have clear decision-making authority to act and to direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes. o TOP-001-1a R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or

Transmission Operator can implement alternate remedial actions. • Filed and Pending Regulatory Approval o IRO-001-3 R2: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator’s direction unless compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. o TOP-001-2 R1. Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Reliability Directive issued and identified as such by its Transmission Operator(s), unless such action would violate safety, equipment, regulatory, or statutory requirements. R2 / R4 / R5: The standard as drafted requires the DP and GOP to document and implement their protocols in the role as a receiver. However, R5 or similar language establishing an evaluation program is identified only for the Balancing Authority, Reliability Coordinator, and Transmission Operator. As a result, compliance for the DP and GOP will be in a zero defect environment with no opportunity to internally set-up a program to evaluate and assess effectiveness. We highly recommend making R5 applicable to all receivers of Operating Instructions. Alternate language for R5, “Each Balancing Authority, Reliability Coordinator, Transmission Operator, Generation Operator, and Distribution Provider shall implement a method to evaluate the communication protocols developed in Requirements R1 or R2”

Michelle D’Antuono

Ingleside Cogeneration LP (Occidental Chemical Corporation)

No

Ingleside Cogeneration agrees in general with the Operating Instruction concept proposed by the project team. It correctly distinguishes between entities who issue and receive Operating Instructions and those who only receive them. In addition, protocols can be developed which vary by the criticality of the communication – allowing much more flexibility in the delivery of a routine Operating Instruction as compared to a Reliability Directive. However, we do not believe that Requirements R3 and R4, which state that entities “shall implement the documented communications protocols”, can be consistently enforced. Although we understand the intent to leverage the Measures, VSLs, and auditor guidance in the RSAW to determine when a violation takes place, is not clear that they would prevail in a finding of violation. In addition, the intent which seems to be reasonable now, could change over time to be more restrictive if an RE, NERC, or FERC should so choose. FERC has consistently ruled that reliability violation outcomes must be consistent, deterministic, and repeatable. Ingleside believes that mandatory bright-line criteria can be developed to assure such an outcome – but COM-002-4 as written relies too heavily on CEA opinion. There is a place for subjectivity in any risk-based evaluation, but that balance has not been struck in our view.

No

The enforcement of COM-002-4 relies heavily on the “High” VSL for requirements R3 and R4 which call for a violation to be assessed on a responsible entity who “demonstrates a consistent pattern of not using the documented communications protocols” for routine Operating Instructions. There is no definition of “pattern” given in the standard or NERC

glossary. It is possible that some CEAs would consider a pattern to be 10% or more of all Operating Instructions – others could assess a violation when two or more errors occur. Also, there is no differentiation between situations where documentation is inadequate as compared to those where Operating Instructions are inadequately performed. If “undocumented” equates to a “miss”, Ingleside Cogeneration believes the chances of a “pattern” being detected go up significantly. In our view, the criteria that Enforcement will use to determine a violation must be vetted as part of this project. In addition; we would like to see language added to the VSL allowing to consideration of the outcomes of miss-executed Operating Instructions. Those that led to a BES threat or even an outage must weigh heavily in an assessment – those that do not should be less of a factor. This was the primary criteria in COM-003-1 Draft 6, but has disappeared completely in COM-002-4. Even though there were concerns that a causal tie cannot be made under every circumstance, we believe that a reasonable solution can be found through the development of specific Compliance criteria. The VSLs for R3 and R4 seem to determine what constitutes a violation, which is not the purview of the VSLs. The language “demonstrates a consistent pattern of not using the documented communications protocols” is determinative of a violation. Perhaps some modified form of this wording could be included in the Requirements themselves. The VSLs for R3 and R4 are also “stacked” on the High and Severe level. Obviously, the communications are important, but without the emphasis on outcomes, there can’t be High and Severe VSLs. See AEP’s comments.

Yes

1. The SDT should consider having the issuer of an oral, two-party, person-to-person Operating Instruction identify the communication as such much like a Reliability Directive. Since the issuer will have to use three part communications in both cases, this will avoid any confusion on the receiver’s part concerning whether the communication is a Reliability Directive, Operating Instruction, or other type of communication. 2. In M3 and M4, there needs to be clarity on what constitutes an “independent review.” The same comment is applicable to “degree of independence” in the proposed RSAW. 3. Clarification is also needed for R5.1 “feedback to issuers and receivers.” We understand this to mean internal feedback from the internal review to the issuers and receivers. However, it could be construed as BA to GOP, etc. 4. In R1.2, the words “or written” should be deleted. This standard doesn’t seem to pertain to written or electronic communications. The term “written” could be construed as an electronic dispatch instruction.

Yes

No
The severe VSLs for requirements R3 and R4 effectively add a requirement to the standard by requiring a responsible entity to use its communications protocols when issuing or receiving a Reliability Directive. This is inconsistent with the measurements for those requirements, which address only management controls for the implementation of the protocols. It is also inconsistent with the draft RSAW language for these requirements, which do not address this issue either. For clarity, this additional requirement should be included in the standard's requirement and measurement language, not just in the VSL language. It is preferable to include it as a separate requirement, since the related measure will be much different than those addressing the implementation of the communications protocols.

Duke Energy
Michael Lowman
Yes
Duke Energy would like to commend the SDT's efforts on developing a Communications Standard that is on the right path. We agree, in general, that this standard is intended to be a risk/process based standard and not a zero defect standard. Duke Energy's balloting position is predicated on the assurances from the ERO and RRO that the standard's enforcement will be from a process/risk based approach as opposed to a zero defect approach.
No
Duke Energy would like for the SDT to clarify the meaning of "consistent pattern" in the VSLs for R3 and R4. We are concerned with how an auditor determines what constitutes a "consistent pattern" of non-compliance. Once the SDT has clarified the meaning of "consistent pattern", Duke Energy recommends adding similar language to the Severe VSLs for

Requirements 3 and 4 for a Reliability Directive. If the industry is going to be measured on the effectiveness of their internal controls process, as outlined in the Measures and in the RSAW, a zero-defect VSL should not be the answer.

Yes

Duke Energy suggests rewording, for clarity, the definition of Operating Instruction as follows: “Operating Instruction — A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element or Facility of the Bulk Electric System. A Reliability Directive is one type of an Operating Instruction. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.” Duke Energy seeks clarification on the absence of a provision requiring the GOP and DP from implementing a method to evaluate the communications protocols developed in R2. Also, FERC has not approved Reliability Directive as an official definition in the NERC Glossary of Terms. Duke Energy recommends adding this definition to the new COM-002-4 standard for consistency and to provide clarification to this standard.

Midwest Reliability Organization NERC Standards Review Forum (MRO NSRF)

Russ Mountjoy

No

The MRO NSRF agrees with the Independent Expert Review Panel and NERC Management on the recommendation of combining COM-002-3 and COM-003-1 into one Operating Personnel Communications Reliability Standard. The NSRF disagrees with the decision to waive the standards development procedures. For such a substantial change, a 15 day review and comment period does not allow sufficient time for consideration of the proposed changes and comment coordination Recommendation 26 states, “...ensure that all key parties, including state and local officials, receive timely and accurate information.” This draft does not address communicating to entities outside of the identified functional entities. Each of the cited scenarios for Recommendation 26 (p. 56, 65 & 67) were categorized under “Cause 2 – Inadequate Situational Awareness” this draft standard does not address System Operator situational awareness, only how to communicate instructions.

No

The MRO NSRF recommends that the drafting team should clarify what is a “consistent pattern of not using the documented communication protocols.” The NSRF also believes that R3 and R4 should include lower and moderate VSLs for errors in the use of communication protocols that do not rise to the level of a “consistent pattern of not using the documented communication protocols.” The Violation Severity Levels imply you are only non-compliant for operating instructions if you show a pattern of not following your protocols. The problem is the RSAW states that system events should be sampled, and if instances of nonconformance with the protocols are found, the issue should be turned over to the Compliance Enforcement Authority, who will then make a determination whether there was a pattern. Are two data points a pattern? Is this considered a trend, too? The NSRF recommends the development of

clear numerical thresholds for the VSLs. "In circumstances where voice recordings are reviewed, auditors should consider requesting recordings commensurate with known events in the entity's footprint during the audit period, as Operating Instructions may be more likely to occur during, and related to, such events...". This goes against the NERC process of random sampling. Auditors are trained and should be industry experts. They do not need auditor notes that explicitly guide them on how to audit a requirement. Auditors need to read each Requirement and understand what the intent is, just like every applicable entity is required to do. Recommend that if "Note to Auditors" needs to be present within the RSAW that R3 and R4 wording be deleted and replaced with R5's Note to Auditor wording; "Auditor should assess whether evidence related to the management practices providing reasonable assurance of implementation of communication protocols provided by entity for Requirement...". If the RSAW SDT will not provide this change then a foot note with a disclaimer needs to be added.

Yes

1. The Purpose seems to be wordy and loosely written. Recommend the Purpose to read, "To reduce the possibility of miscommunications that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES) by establishing Operating Instructions with predefined communication protocols". 2. R1.2 and R2.1, remove "An alternate language may be used for internal operations" as this will not be used between two different operating personal and the first sentence already allows for other languages to be used, if agreed upon. 3. The proposed definition of Operating Instruction defines a Reliability Directive as a subset or one type of Operating Instruction. However, the current definition of Reliability Directive refers to a broader set of "communications" than "commands" referred to in the proposed definition of Operating Instruction. The drafting team should reconcile the use of the broader term "communication" with the narrower term "command," 4. R1.7, R1.8 and R1.9, all speak of "specifying" time identification, nomenclature and instances of alpha-numeric clarifiers, respectfully. Recommend that a statement similar to CIP-002-5.1, R3.1 be added that reads "a discrete list of all Operating Instructions is not required". This statement has been vetted within the CIP version 5 Standard, CIP-002 and would allow entities to determine (specify) what R1.7, R1.8 and R1.9 need to refer too. 5. R3. Add at the end of Requirement 3 (after the words Requirement 1) "and remediate noted exceptions identified as provided in R5". (This aligns with Measurement 3 (M3).) M4 (Measurement 4) calls for an "...independent review of operating personnel's adherence to the protocols established in Requirement 2". M4 in effect is expanding R4. This independent review should be removed from M4 and we suggests the following for M4: after the words "Bulk Electric System, spreadsheets, memos or logs[.]" place a period. 6. R5.2, please change "modifies" to "modify". 7. The NSRF recommends that the drafting team update R1 and R2 to allow entities to inform the RC, BA, or TOP of the inability to comply with an Operating Instruction or Reliability Directive if doing so would violate safety, equipment, regulatory, or statutory requirements. 8. The NSRF suggests that the Implementation Plan be updated to reflect necessary conforming changes to other standards. The NSRF notes that proposed revisions to IRO-001-3 and TOP-001-2 would refer to "Reliability Directives." The NSRF believes that other standards that incorporate terms with a meaning similar to Operating Instruction or Reliability Directive should be updated to include defined terms. BAL-STD-002-0 refers to "any instruction, directive, order or suggested action." CIP-002-

5 refers to “operational directives.” INT-010-1 refers to Interchange schedules “directed” by the Reliability Coordinator. IRO-004-2 R1 refers to “directives.” VAR-001-2 R6 refers to “direct[ing] the Generator Operator to maintain or change its voltage schedule or its Reactive Power schedule.” VAR-001-3 M3 refers to evidence of “issued directives.” VAR-002-1.1.B R2.1 refers to actions “directed by the Transmission Operator,” and M3 refers to responses to “Transmission Operator’s directives.” The NSRF recommends that these standards be updated to incorporate the term Operating Instruction or Reliability Directive to avoid industry confusion about which types of communications these standards are intended to describe. COM-002-4 Proposed RSAW, comments: The MRO NSRF does not agree with the contents of the COM-002-4 RSAW. Per the SPM, footnote 19 of the SPM says “While RSAWs are not part of the Reliability Standard; they are developed through collaboration of the SDT and NERC Compliance Staff. A non-binding poll, similar to what is done for VRFs and VSLs may be conducted for the RSAW developed through this process to gauge industry support for the companion RSAW to be provided for informational purposes to the NERC Board of Trustees.” (Emphasis added). Please note the following items expand the scope of the applicable Requirement(s). Under Note to Auditor; The RSAW drafting team starts to add additional compliance actions and there are no foot notes associated, either. Note that footnote 1 states, “While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard.” And foot notes 3, 4 and 5 all state that “These items are not mandatory and other forms and types of evidence may be submitted at the entity’s discretion”. R1, well written and no additional wording was interjected that expands the Requirement. R2, well written and no additional wording was interjected that expands the Requirement. Per the RSAW; R3 and R4, do not relate to the actionable words of the Requirement. As stated in R3, protocols are to be “implemented” per R1. But under Compliance assessment Approach for R3 the first sentence states for the auditor to review management practices to assure that R3 is “effective”. This statement needs to be deleted as it does not support Requirement 3. For both R3 and R4 these types of statements should be deleted.

SERC OC Review Group

Stuart Goza

Yes

Yes

Yes

The SDT is respectfully requested to rearrange the sentences in the Operating Instruction definition to differentiate between what the command is and what it is not. The recommendation follows: A command by operating personnel responsible for the Real-time generation control and operation of the interconnected Bulk Electric System to change or

preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A Reliability Directive is one type of an Operating Instruction. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. The SDT is requested to clarify the applicability of COM-002-4 for the Distribution Provider (DP) with language that limits DP applicability to load reduction or load shedding. The Violation Severity Levels imply you are only non-compliant for operating instructions if you show a pattern of not following your protocols. The problem is the RSAW says that system events should be reviewed, and if instances of nonconformance with the protocols are found, the issue will be turned over to the Compliance Enforcement Authority, who will then make a determination whether there was a pattern. Are two data points a pattern? The standard should not focus on sampling events. The standard should let the entity provide the samples used as part of the periodic reviews of their operators' communications. The RSAW should be changed and the standard should be clear that if the entity has a protocol document that lays out its expectations of its operators, periodically checks for conformance with the protocols, and implements corrective actions when deficiencies are found, the entity is compliant. In several places, including the implementation plan, there is mention of retiring COM-002-3. This standard was approved by the NERC BoT but not submitted to FERC. Therefore, we suggest that the SDT review the language and modify as necessary to capture the anticipated NERC BoT future action regarding COM-002-3. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.

Florida Municipal Power Agency

Frank Gaffney

No

In regards to Order 693, P 532: "... We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions ..." FMPA believes that only the RC needs to have protocols that everyone else follows. Everyone within an RC talks with each other; therefore, everyone's protocols ought to be similar if not the same within an RC area, e.g., entities within an RC ought to use similar time stamps, similar nomenclature, etc. There are a couple of ways that this could be done: i) the RC could be the only one to develop protocols that everyone else follows within their area; or ii) the RC develops "pro forma" protocols that everyone else uses to develop their protocols (similar to FERC developing the Pro Forma OATT and each TSP using that Pro Forma to develop their OATTs, with the associated need to justify deviations).

Yes

Yes

FMPA appreciates the efforts of the SDT. We believe it is the best effort to date in developing the standard. However, FMPA is voting "Negative" primarily due to regulatory uncertainty concerning monitoring and enforcement, and we also have concerns regarding the standard

itself. OTHER ISSUES WITH THE STANDARD The SDT incorporated two approaches to the standard: 1. Performance Measurement: Zero defect requirements with RAI type enforcement in R3 and R4 2. Internal Controls Measurement where we measure the internal controls themselves in R1, R2 and R5 The standard should not include both of these types of measurements, and it would be better if only one of these two methods were contained in the standard. R3 and R4 as written are “zero defect” requirements for all Operating Instructions. The SDT tries to mitigate the “zero defect” problem through the VSLs and the RSAW, which depend on internal controls. This creates a double jeopardy with R5. There are two ways to resolve this: a) Measure performance for only Reliability Directives by replacing “Operating Instruction” within R3 and R4 with “Reliability Directives” (FMPA’s preferred alternative as further described below). b) Remove R5. If R3 and R4 are retained as is, R5 is not necessary and should be deleted. With the audit methodology proposed for R3 and R4 of evaluating management practices / internal controls, which would include the protocols themselves, the assessment described in R5 would happen naturally to avoid a “pattern” of failure to follow the protocols. DPs are a special case within the standard. FMPA believes that DPs will not receive any Operating Instructions with the exception of Reliability Directives to shed load, or Operating Instructions associated with a cranking path, since they do not own or operate “an Element of the Bulk Electric System or Facility of the Bulk Electric System. As such, DPs should only be measured against performance and not internal controls, e.g., R3 and R4, not R5, due to the very rare occurrence of an Operating Instruction being given to a DP. As such, the expectation for audit is that DPs will not have the same level of internal controls as other registered functions since there will be no statistical significance to rely on in sampling. As such, if R5 is retained, DPs should not be included as an applicable entity to that requirement.

ISSUES WITH THE RSAW The RSAW gives the auditor complete subjective discretion and decision making as to what constitutes an effective management practice / internal control. Such unfettered discretion is a recipe for: i) inconsistent treatment, not only between regions, but between different auditors within a region; and ii) conflict between entities and auditors as to what is and is not an effective internal control. FMPA supports moving towards RAI; but in order to do so, expectations must be set to avoid unnecessary conflict and inconsistency. As such, the SDT ought to develop benchmarks or criteria for what would constitute effective management practices/internal controls in the next version of the RSAW if R3 and R4 are retained as written. In addition, FMPA is especially concerned about the auditor having the experience and wisdom necessary to properly scale their subjective judgments to the entity. For instance, as discussed above concerning a DP that will receive very, very few Operating Instructions, internal controls that require statistical sampling of voice recordings makes no sense. As such, we suggest that the next draft of the RSAW include “benchmark” internal controls or other criteria for at least three different size entities (large, medium and small) so that the auditor has guidance as to how to scale their expectations. Another source of ambiguity that will give rise to unnecessary inconsistency and conflict is the ambiguous phrase “consistent pattern”. The SDT is also encouraged to set expectations regarding what “consistent pattern” is intended to mean. The standard, as written, depends on the successful implementation of RAI; yet, we are not confident in that successful implementation. So far, we have heard a great short story; but, the story does not have nearly enough depth to make for a

good novel. And, we have a lot of concern over the details around RAI. If not implemented correctly, RAI could make our lives much worse than they already are, not better. As such, if we are going to depend on RAI to audit R3 and R4, we need more meat on the bone of what that RAI process would look like for this standard. WHEN SHOULD AN ENTITY SELF REPORT? R3 and R4 are written as zero-defect requirements. However, the expectation is that there would not be a violation as long as the entity has effective internal controls. Such internal controls may reveal instances where the communication protocols were not followed. Is an entity expected to self-report those instances, or only self-report if the entity identifies a pattern of failing to follow those protocols? CONCLUSION FMPA recommends that either: 1) The SDT made R3 and R4 only applicable to Reliability Directives and retain R5 for other Operating Instructions (FMPA's preferred method since it does not depend on successful implementation of RAI while allowing RAI to mature, and addresses the "self-report" issue). 2) The SDT put much more meat on the bone of how RAI would be used for COM-002-4 by setting expectations of both the auditors and the entities concerning mutual agreement about what constitutes effective internal controls for various size entities and various registrations.

Silvia Parada Mitchell

NextEra Energy

Yes

NextEra Energy (NextEra) appreciates the work of the SDT. NextEra has a number of recommended changes based on its experience as RC agent, large DP, TOP and BA and GOP, as well as TOP and GOP in multiple regions. Definition of Operating Instruction. NextEra is concerned that the definition of Operating Instruction is overly board, subject to multiple interpretations and goes well beyond communications that could impact the reliability of the Bulk Electric System. To clarify Operating Instruction and have it pertain to communications that can impact reliability, NextEra recommends that Operating Instruction be amended to read as follows: "A Reliability Directive; or, a non-emergency command by operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System to: (i) switch in or out a Bulk Electric System Element or Facility or (ii) mitigate a SOL or IROL. Any discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is a type of an Operating Instruction." Applicability of DPs and GOPs. NextEra is concerned that without qualification on the applicability of DPs and GOPs the Standard is vague and will have unintended consequences. Thus, NextEra recommends that GOPs be qualified in the same manner that the PER-005 SDT is qualifying GOPs. To NextEra, such a qualification and syncing up of PER-005's section "4.1.5 Generator Operators" is needed because PER-005 is related to the training associated with communications, and, thus, is targeting the personnel who need to be trained to effectively communicate and receive Operating Instructions and Reliability Directives. Hence, the population of applicable GOPs should be the same in both Standards. With respect to DPs, NextEra only sees DPs being applicable when they are required to curtail load via a Reliability Directive or conduct switching of BES facility – both of which rarely occur. To fail to limit the

applicability to DPs to personnel who receive Reliability Directives to curtail load or Operating Instructions/Reliability Directives to switch a BES facility will lead to confusion and over application of the Standard to DPs for no reliability reason. Thus, NextEra recommends that both GOPs and DPs applicability sections be revised pursuant to these comments. R1. NextEra is concerned with the lack of coordination between an RC, TOP and BA in one RC region as well as across the Interconnections. Reliability will not likely be served by having multiple protocols in one RC region and across RC regions. One approach that NextEra supports is to recommend in the implementation plan that RCs, TOPs and BAs coordinate their protocols, and that NERC facilitate the coordination of these protocols. R1.1 NextEra favors retaining R1.1 so that the RC, TOP or BA must state it is issuing a Reliability Directive. Without this requirement, receiving parties will not understand the importance of a Reliability Directive during an Emergency or leading up to a possible Emergency versus an Operating Instruction issued during a non-Emergency state. At the same time that NextEra favors retaining, R1.1, it is concerned that application of a strict zero tolerance approach will not consider the facts and circumstances of the situation. For example, during an emergency, an operating person may forget to state “Reliability Directive” but otherwise indicate that the situation is an Emergency, and he or she requires action from the receiver. Thus, for purposes of self-reporting, during an audit or spot check, there should be discretion not to find a violation simply because the word Reliability Directive was not used. NextEra will address this issue below in the context of the draft RSAW. R2 and subrequirements. NextEra does not see the value of documented protocols for receivers only – i.e., DPs and GOPs. DPs and GOPs need to use three-way communication when provided a Reliability Directive or Operating Instruction; this is performance of a task, a documented protocol for this task is unnecessary, administrative in nature and problematic. For example, what if a GOP or DP implemented a different written protocol than a RC, TOP or BA – the issuer; such a situation will not help reliability, but only add to confusion and possible mistakes. As NERC Standards are to be drafted to be results-based, this is a perfect situation in which the DPs and GOPs are more appropriately required to perform, than to have a documented protocol. Therefore, NextEra, recommends that R2 and its subrequirements read as follows: “R2. Each Distribution Provider and Generator Operator that receives an Operating Instruction shall: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] 2.1. Respond using the English language, unless agreed to otherwise. An alternate language may be used for internal operations. 2.2. Take one of the following actions for an oral two-party, person-to-person Operating Instruction: • Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct. • Request that the issuer reissue the Operating Instruction. 2.3. Request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).” This performance-based approach also nullifies the need for R4, thus, that requirement should be deleted. R5. NextEra supports R5; however, it is not clear how R5 is or is not connected to moving away from a zero tolerance environment. To clarify this connection, NextEra will recommend, below, specific changes to the RSAW. Implementation Plan. Moving the implementation plan to 18 months would facilitate the industry considering that operators work on multiple shifts and multiple training will be required as well as provide time to conduct

the recommendation coordination of protocols among RCs, TOPs and BAs. Also, the 18 month implementation would provide time for a robust pilot program, as offered by some regions, along with an assessment and the follow-up to ensure success of the implementation of non-zero defect compliance and enforcement program. Measures and RSAW overall. NextEra thanks NERC for providing a draft RSAW. The RSAW, however, needs to be significantly re-written in order to sync up with COM-004-2 and set forth a reasonably understood and predictable compliance and enforcement approach. For example, the measures and RSAW both introduce management practices, which are not required by the Standard's requirements. The term "management practices" should be deleted from both the Measures and RSAW, and replaced with more directly applicable language, such as "implemented the communication protocols." To facilitate the re-writing of the RSAW, NextEra recommends that the following language be used in R3. RSAW R3. Evidence Requested. That the communication protocols set forth in R1 and its subrequirements have been implemented and are followed by the applicable operating personnel, with the understanding that zero tolerance implementation is not required, given that under certain circumstances an operating personnel may not have followed the communication protocols, yet sufficiently communicated the need for the receiver to follow the Operating Instruction, and, thus the reliability of the Bulk Electric System was served. For example, the operating personnel may not have identified a Reliability Directive, as required by R1.1, but did communicate that there was an Emergency and that the receiver needed to follow the instructions. In these instances, the auditor shall work with the entity to understand the circumstances and determine whether a violation is warranted. Evidence may include spreadsheets, memos, or logs and any noted exceptions to following the communication protocols set forth in R1 and its subrequirements. RSAW Compliance Assessment Approach Specific to COM-002-4, R3. Review the evidence provided to gain reasonable assurance that R1 and its subrequirements have been implemented, with the understanding that zero tolerance implementation is not required, given that under certain circumstances an operating personnel may not have followed the communication protocols yet sufficiently communicated the need for the receiver to follow the Operating Instruction, and, thus the reliability of the Bulk Electric System was served. Only if above implementation of R1 and its subrequirements are deemed insufficient to provide reasonable assurance, apply other audit procedures as necessary to gain confidence regarding the implementation of the communication protocols. See 'Note to Auditor' section for additional details. RSAW Auditors Note R3. The auditor may interview SMEs and pull a statistically random sample of the entity's communications from their available voice recordings (limited to the prior 90 calendar days) and if instances of noncompliance with the protocols are found (without a reasonable exception due to the facts and circumstances), the possible non-compliance will be submitted to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols and, if applicable, the severity of the violation. For purposes of a statistically random sample, auditors may not request more than 15 days of recordings. Also, findings of possible non-compliance during the review of the statistically random sample, may not lead to additional review of voice recordings, unless necessary by Enforcement to determine the severity of the violation, and even in those cases the review of voice recordings shall be limited to sampling of additional

days (no more than 15 days) to determine a pattern. RSAW existing R4 (if not deleted as recommended above). Evidence Requested. That the communication protocols set for in R2 and its subrequirements have been implemented and are followed by the applicable operating personnel receiving an Operating Instruction, with the understanding that zero tolerance implementation is not required, given that under certain circumstances an operating personnel may not have followed the communication protocols, yet sufficiently received and communicated back the Operating Instruction, and, thus, the reliability of the Bulk Electric System was served. For example, the operating personnel receiving a Reliability Directive may not repeat that it heard the term Reliability Directive used, but sufficiently communicated that it would implement the instruction given. In these instances, the auditor shall work with the entity to understand the circumstances and determine whether a violation is warranted. Evidence may include spreadsheets, memos, or logs and any noted exceptions to following the communication protocols set forth in R2 and its subrequirements. RSAW Compliance Assessment Approach Specific to COM-002-4, R4. Review the evidence provided to gain reasonable assurance that R2 and its subrequirements have been implemented, with the understanding that zero tolerance implementation is not required, given that under certain circumstances an operating personnel may not have followed the communication protocols, yet sufficiently communicated that it would follow the Operating Instruction, and, thus, the reliability of the Bulk Electric System was served. Only if above implementation of R2 and its subrequirements are deemed insufficient to provide reasonable assurance, apply other audit procedures as necessary to gain confidence regarding the implementation of the communication protocols. See 'Note to Auditor' section for additional details. RSAW Auditors Note R4. The auditor may interview SMEs and pull a statistically randomly valid sample of the entity's communications from their available voice recordings (limited to the prior 90 calendar days) – provided the DP or GOP have voice recordings. If instances of noncompliance with the protocols are found (without a reasonable exception due to the facts and circumstances), the possible non-compliance will be submitted to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols, and, if applicable, the severity of the violation. For purposes of a statistically random sample, auditors may not request more than 15 days of recordings, provided the DP or GOP have voice recordings. Also, findings of possible non-compliance during the review of the statistically random sample may not lead to additional review of voice recordings, unless deemed necessary by Enforcement to determine the severity of the violation, and even in those cases the review of voice recordings shall be limited to sampling of additional days (no more than 15 days) to determine a pattern. NextEra also recommends that the following language be used in the RSAW if the newly NextEra drafted R2 and its subrequirements, above is adopted: RSAW new NextEra R2 set forth above. Evidence Requested. That R2 and its subrequirements have been executed by the applicable operating personnel receiving an Operating Instruction, with the understanding that zero tolerance execution is not required, given that under certain circumstances an operating personnel may not have strictly executed R2, yet sufficiently received and communicated back the Operating Instruction, and, thus, the reliability of the Bulk Electric System was served. For example, the operating personnel receiving a Reliability Directive may not repeat that it heard the term

Reliability Directive used, but sufficiently communicated that it would execute the instruction given. In these instances, the auditor shall work with the entity to understand the circumstances and determine whether a violation is warranted. Evidence may include spreadsheets, memos, or logs and any noted exceptions to following the communication protocols set forth in R2 and its subrequirements. RSAW Compliance Assessment Approach Specific to COM-002-4, new NextEra R2. Review the evidence provided to gain reasonable assurance that R2 and its subrequirements have been executed, with the understanding that zero tolerance execution is not required, given that under certain circumstances an operating personnel may not have followed the communication protocols, yet sufficiently communicated that it would follow the Operating Instruction, and, thus, the reliability of the Bulk Electric System was served. Only if above execution of R2 and its subrequirements are deemed insufficient to provide reasonable assurance, apply other audit procedures as necessary to gain confidence regarding the execution R2. See 'Note to Auditor' section for additional details. RSAW Auditors Note new NextEra R2. The auditor may interview SMEs and pull a statistically randomly valid sample of the entity's communications from their available voice recordings (limited to the prior 90 calendar days) – provided the DP or GOP has voice recordings. If instances of noncompliance with R2 are found (without a reasonable exception due to the facts and circumstances), the possible non-compliance will be submitted to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols and, if applicable, the severity of the violation. For purposes of a statistically random sample, auditors may not request more than 15 days of recordings, provided the DP or GOP has voice recordings. Also, findings of possible non-compliance during the review of the statistically random sample, may not lead to additional review of voice recordings, unless deemed necessary by Enforcement to determine the severity of the violation, and even in those cases the review of voice recordings shall be limited to sampling of additional days (no more than 15 days) to determine a pattern.

Segment 1 BGE, Segment 3 ComEd, Segment 4 CECD, Segment 5 Exelon Nuclear, Segment 6 CEG; all submit the following comments in support of their negative vote.

No

2003 Blackout Report Recommendation No. 26 reads: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate. (footnote omitted) NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date." • While Exelon believes that COM-002-4 goes beyond the Recommendation and includes the requirement to implement communication protocols for operating BES elements in non-emergency and other non-critical situations, Exelon also recognizes that the NERC Board believes that the words "especially for" in the recommendation are the reason to include a standard for normal communications. We also understand that in paragraph 540 of Order No. 693, FERC directed the ERO to expand the applicability of the communication standard to distribution providers (DP's) but that directive tied back to communications protocols "especially for communications during alerts and emergencies." However, although Recommendation 26 addresses "key parties" and FERC directive addresses DP's in the context of Blackout Recommendation No. 26, we don't believe that either was intended to include DP's and GOP's for non-emergency /Operating Instructions communications. There is no evidence that failure by DP's and GOP's to follow Operating Instructions has caused a reliability gap in the BES.

No

• VSL for R4 introduces the concept of "consistent pattern" of behavior. This is undefined and subjective. Entities operating in multiple regions may be subject to varying interpretations of this language.

No

The Exelon companies have voted affirmatively for previous versions of the COM standards including COM-002-3 (pending filing) and COM-003-1 (predecessor to COM-002-4 recently defeated at ballot). We do however have concerns with the process used to arrive at COM-002-4 and some of the content of the standard and have therefore cast a negative ballot for this rev. • COM-002-4 represents more than a revision in response to comments of the previously balloted standard. Several other approved standards are proposed to be modified as part of this Project. Additionally, the change from COM-003-1 to COM-002-4 regarding Operating Instructions is significant. In the time allotted, Exelon has not been able to conduct a sufficient review of the impacts to all of its business units. • M4 says that "independent review" of the entity's evidence should be done to demonstrate adherence to the protocols. What is an "independent review"? Is it a second operator, an operations supervisor, a management person from a separate business area, a contractor? More clarity on this issue is required. • M4 and the RSAW "Notes to Auditor" for R4 and Data Retention make it clear that an entity (DP

and GOP) will need to be able to produce two years of evidence and 90 days of voice recordings. As noted above, this is a significant change from COM-003-1 and Exelon has not had sufficient time to assess the potential impact of the increased compliance burden to the DP and GOP because of the changes requiring these entities to have evidence of compliance for all Operating Instructions, not just Operating Instructions that were not followed and led to a Directive. (COM-003-1 R3) In the technical document, the SDT points to a potential “reliability gap” if DPs and GOPs are not included. More information is needed on the nature of this potential gap in order to determine whether this extension is technically supported. • Several Regions are currently conducting pilots to develop the RAI/Internal Control initiative. Repeated references to and instructions to the auditors in the RSAW to review internal controls are premature. • Exelon agrees with the recommendation made by EEI and others that COM-002-3 be filed with FERC. Exelon feels that other COM Projects have been responsive to the Order No. 693 directives. Related Projects already approved by FERC and/or the NERC BOT include: COM-001-1.1 (FERC effective date 5/13/2009), COM-001-2, (NERC BOT approved, 11/7/2012), COM-002-2 (FERC effective date 6/18/2007), COM-002-3 (NERC BOT approved 11/7/2012). • The definition of Operating Instruction may be misinterpreted to mean that an OI is a command applicable to personnel responsible for “Real-time generation control and operation of the interconnected Bulk Electric System” as opposed to “Real-time generation control and/or operation of the interconnected Bulk Electric System”. Please consider this clarification.

Recommendation 26 says “Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate.” It is difficult to see how including or forcing a communications protocol for non-emergency operations fulfills this recommendation. Furthermore, the 2003 Blackout report suggested a lack of situational awareness was a key causal component and yet no link between three part communication and identified lack of situational awareness has been made. We therefore believe that the significant and unreasonably burdensome compliance obligations associated with this broad expanse is unjustified.

No

Given our belief that establishing a communications protocol for non-emergency communications is overly burdensome, we fail to see the need for VRFs any greater than low.

Yes

• The use of terms such as “reasonable assurance” in the measures and “reasonably designed” in the RSAW leaves us little guidance on how an auditor might interpret those terms. • OG&E finds significant parallels in the proposed revision to the COM-002-3 standard and those standards called out for retirement in the Paragraph 81 project. OG&E believes that requiring a standard for three-part communication for non-emergency communication fits several of the criteria in Paragraph 81 such as: o Criterion A: Little, if any benefit or protection to the reliable operation of the BES ♣ Because there are no instances of any significance in which the lack of

three-part communication contributed to a reduction in reliable operation of the BES, requiring three-part communication for non-emergency conditions, complete with implementation/documentation/assessment/remediation requirements seems unwarranted, especially given the significant effort required to demonstrate compliance. ♣ In the “NERC Management Response to the Questions of the NERC Board of Trustees on Reliability Standard COM-003-1” dated September 6, 2013, an attempt is made to tie the lack of three-part communication during non-emergency conditions to a lack of situational awareness, thus implicating it in FERC’s Recommendation 26 of the 2003 Blackout Report. There is little, if any evidence to suggest that the lack of the use of three-part communication had any impact on the 2003 blackout, or any other significant reliability failure in North America. In its response, NERC Management uses the term “could” several times. For example, on page 1, they state, “... miscommunication by operating personnel could result in switching errors during routine switching of Bulk Electric System Elements, which could jeopardize the reliable operation of the Bulk Electric System” (emphasis added). We believe that the amount of additional compliance and operational burdens that will be imposed by this standard should be due to a situation that would jeopardize the reliable operation of the BES, rather than anything that could do so. o

Criteria B: ♣ B1: Administrative –B2: Data Collection/Data Retention – The activities required in the proposed standard would involve a significant amount of data collection and data retention to prove compliance. In its response to the NERC BOT, NERC Management states (on page 7), “Second, concerns over creating an operational and compliance environment that requires mining of hundreds, thousands or millions of routine/normal communications to prove compliance or make a finding of reasonable assurance of compliance was consistently cited in comments to all drafts of COM-003-1. NERC plans to address this issue in the compliance section of the standard and in development of the RSAW concurrently with development of the standard.” Nowhere in the proposed standard can we find any meaningful attempt to address this issue. That leaves entities to the interpretations of various auditors to find “reasonable assurance of compliance”, which would increase their compliance risk, and therefore their compliance effort, beyond what we believe to be reasonable, especially given the minimal benefit to the reliable operation of the BES. ♣ B3. Documentation – As stated our comments above, the amount of documentation that will be required to prove compliance with COM-002-4 will be significant. In order to demonstrate compliance with the proposed standard, entities will be required to create additional documentation, audit period to audit period, in order to demonstrate compliance. Protocols will have to be developed, maintained, and distributed, on a regular basis. They will have to be reviewed, and that review documented. For a single standard, this may not seem like much, but when combined with the significant efforts already required of us today for standards that we do believe have a positive impact on reliability, we find the continual additions to our workload unsustainable, especially given the lack of empirical data to support such an increase. • Finally, every Transmission Operator that OG&E is aware of uses three-part communication, in some form, when performing routine switching and as well as some other operations. We train our operators in three-part communication and we assess their performance. In fact, the use of three-part communication is a part of their performance assessments throughout the year and their annual performance appraisals reflect their performance in that regard. In short, OG&E finds

little value in an additional NERC Reliability Standard that addresses a “best practice” that has never been implicated in any significant reliability failure; at least as far as has been published in North America and we believe that our collective effort should be spent focusing on those issues that have been a problem and that continue to be a challenge for the industry. Three-part communication for non-emergency conditions is not one of those.

Individual

Liberty Electric Power, LLC

No

The blackout report, in Recommendation 26, states "NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information." Operating instructions in non-emergency situations are, by definition, not "communications during alerts, emergencies, or other critical situations". Order 693 similarly states "(4) requires tightened communications protocols, especially for communications during alerts and emergencies. With respect to this final issue, the Commission proposed alternatively to direct NERC to develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26, which deals with the need for tightened communications protocols." Again, the focus of the order is on "alerts and emergencies". The error of stating 693 requires non-emergency communications protocols is repeated in the SAR, which was developed prior to the enforcement date of the standards. Not surprisingly, there was little attention paid to the error by industry, as most were scrambling to confirm their programs were in compliance prior to June 8th 2007. As there is not a specific directive from FERC or the Blackout Report mandating the development of communications protocols for routine interactions between RE's, the SAR should be remanded.

No

VRF/VSL for R4 penalizes a "consistent pattern of not using the protocols". This would trigger a violation even if the pattern was discovered by implementing a review of evidence under M4. The VRF/VSL should be for not implementing the review, instead of for discovery of the issue.

Yes

M4 requires an "independent review of operating personnel’s adherence to the protocols established in Requirement R2.". The word "independent" should be removed, as small entities may only have staff in the supervisory chain trained and capable of performing an accurate review of the implementation of the communications program.

Individual

Jen Fiegel

Oncor Electric Delivery Company LLC

No

COM-002-4 goes beyond the August 2003 Blackout Report Recommendation number 26, FERC Order 693 for neither identify requirements for normal operations. Oncor concurs with Austin Energy’s comment that EOP-001-2, R3.1 and COM-002-2, R2 already address the requirements

of the Blackout Report and FERC Order 693. In addition, the COM Standards were evaluated by the NERC Operating Committee (OC) who recommended guidelines on normal operations protocols not mandatory standards.

No

The VSLs proposed for all Requirements are designed as prescriptive zero-tolerance and appear to step backward from the global objective of transitioning to results, risk based standards which support the reliability of the BES. Oncor recommends the requirements be defined and the VRF/VSL be developed based on the risk to the reliability of the BES. For example, in normal or emergency operations, not following the letter of the law is not indicative of a severe reliability risk to the BES. Additionally, Oncor concurs with Austin Energy's comments: Regarding R3 and R4: These VSLs create a "zero tolerance" situation. If an entity fails to follow the communication protocol when issuing or receiving a Reliability Directive one time, even if there is no adverse impact to the BES, it is a violation. While there is the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations occurred as a result. The severe category should be reserved for only those instances in which documented communications protocols were not followed and the failure resulted in an emergency operation or reliability issue. As a result, we suggest "demoting" each existing VSL to a lower level and limiting the Severe VSL to only those instances that resulted in an adverse impact on the BES (suggestions provided below). Low - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R1 for Operating Instructions that are not Reliability Directives. Moderate – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive. High – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving an Operating Instruction and that failure resulted in an emergency operation or reliability issue. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive and that failure resulted in an emergency operation or reliability issue. Regarding the VSL for R3 and R4: Use of the term "consistent pattern" is vague and will be difficult to determine and analyze.

Yes

Oncor recommends Requirement 5 be removed and the Measurements be re-evaluated to remove the internal controls additives. Reliability Standards must be revised to focus on strategic and critical reliability objectives incorporating requirements for meeting and sustaining reliability of the BES. The current state of Standards must transition from a prescriptive zero tolerance approach to results-based requirements which assure the reliability and security of the critical infrastructure. A reliability results-based approach should not be an additive to the Reliability Standards; hence, controls requirements should not be incorporated within the Standards, rather controls should be considered at the Program level. Reliability Standards should define the results ("what") Entities are mandated to meet and maintain and the "how" should be handled by each Entity for there is not a "one size fits all". Incorporating internal controls as requirements and prescriptive measurements can lead to unintended consequences and again, an additive versus a process that helps provide a registered entity

with reasonable assurance they comply with the Standard(s) or the operating function(s) and processes that the Standard(s) require.

Agree

We generally support the SERC OC comments. We believe that combining the two standards is the right approach.

Group

US Bureau of Reclamation

Erika Doot

Yes

The Bureau of Reclamation (Reclamation) agrees with NERC’s decision to combine COM-002 and COM-003 into one standard. However, Reclamation disagrees with the decision to waive the standards development procedures. For such a substantial change, a 15 day review and comment period does not allow sufficient time for consideration of the proposed changes and comment coordination.

No

Reclamation recommends that the drafting team clarify what is a “consistent pattern of not using the documented communication protocols.” Reclamation also believes that R3 and R4 should include lower and moderate VSLs for errors in the use of communication protocols that do not rise to the level of a “consistent pattern of not using the documented communication protocols.” Reclamation recommends the development of clear numerical thresholds for the VSLs.

1. Reclamation recommends that the drafting team revise the definitions of Operating Instruction and Reliability Directives to make sure they are clear and consistent. First, Reclamation suggests that the drafting clarify the term “command” because most day-to-day communications between Transmission Operators or Balancing Authorities are phrased as requests rather than commands. The definition of Operating Instruction exempts “discussions of general information and of potential options or alternatives,” without recognizing that these discussions generally result in mutually agreed upon decisions of how to operate the Bulk Electric System (rather than resulting in commands). Reclamation suggests that the drafting team choose another term or define the term command to reflect this operational reality. Second, the proposed definition of Operating Instruction defines a Reliability Directive as a subset or one type of Operating Instruction. However, the current definition of Reliability Directive refers to a broader set of “communications” than “commands” referred to in the proposed definition of Operating Instruction. The drafting team should reconcile the use of the broader term “communication” with the narrower term “command,” and preferably revise the term command as explained above. Third, under the proposed definition, Operating Instructions that can be issued by a seemingly broader array of “operating personnel” than Reliability Directives, which can only be issued by Reliability Coordinators, Balancing

Authorities, and Transmission Operators. Reclamation suggests that the definition of Operating Instruction should be updated to refer to instructions “from a Reliability Coordinator, Transmission Operator, or Balancing Authority” to clarify that Generator Operators and Distribution Providers do not issue internal Operating Instructions. 2. Reclamation recommends that the drafting team update R1 and R2 to allow entities to inform the RC, BA, or TOP of the inability to comply with an Operating Instruction or Reliability Directive if doing so would violate safety, equipment, regulatory, or statutory requirements. Reclamation recommends that the drafting team incorporate language similar to IRO-001.1a and TOP-001-1a, for example the drafting team could add an R2.4 which states “Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with Operating Instructions issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with Operating Instructions issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the Operating Instruction so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.” 3. Finally, Reclamation suggests that the Implementation Plan be updated to reflect necessary conforming changes to other standards. Reclamation notes that proposed revisions to IRO-001-3 and TOP-001-2 would refer to “Reliability Directives.” Reclamation believes that other standards that incorporate terms with a meaning similar to Operating Instruction or Reliability Directive should be updated to include defined terms. BAL-STD-002-0 refers to “any instruction, directive, order or suggested action.” CIP-002-5 refers to “operational directives.” INT-010-1 refers to Interchange schedules “directed” by the Reliability Coordinator. IRO-004-2 R1 refers to “directives.” VAR-001-2 R6 refers to “direct[ing] the Generator Operator to maintain or change its voltage schedule or its Reactive Power schedule.” VAR-001-3 M3 refers to evidence of “issued directives.” VAR-002-1.1.B R2.1 refers to actions “directed by the Transmission Operator,” and M3 refers to responses to “Transmission Operator’s directives.” Reclamation recommends that these standards be updated to incorporate the term Operating Instruction or Reliability Directive to avoid industry confusion about which types of communications these standards are intended to describe.

Individual

Texas Reliability Entity

Texas Reliability Entity

Yes

Texas RE generally supports the approach taken in this draft: combining COM-002 and COM-003 into one comprehensive communications standard. However, we feel that the current draft is seriously defective because the REQUIREMENTS do not clearly and completely set forth criteria by which compliance can be assessed (R3 and R4).

No

See comments below under Question 3.

Yes

1. Texas RE generally supports the approach taken in this draft: combining COM-002 and COM-003 into one comprehensive communications standard. However, we feel that the current draft is seriously defective because the REQUIREMENTS do not clearly and completely set forth criteria by which compliance can be assessed (R3 and R4). 2. The existence of a violation should be determinable by applying the REQUIREMENTS to the evidence, without reference to the VSLs. However, in this draft, the VSLs for R3 and R4 appear to be intended to define what constitutes a violation, rather than the Requirements. Texas RE urges the drafting team to clearly state what is required for compliance in the REQUIREMENTS only. VSLs are intended to indicate the severity of a violation, not the existence of a violation. 3. The apparent intent of this draft is that an entity is to be deemed compliant in a non-emergency situation unless there is a “consistent pattern of not using the documented communications protocols.” That is an extremely vague threshold that will be very difficult to enforce. How are we supposed to consistently determine whether a “consistent pattern” exists? What if an entity fails to follow its protocols 25% of the time, but there is no “consistent pattern” to the failures? 4. Texas RE opposes the zero-defect application of this standard in connection with Reliability Directives. The circumstances of a violation, including system impact, are taken into account in the enforcement process when determining a penalty. The standard requirements should focus on an entity’s conduct and performance, which are under its control, not on system occurrences, which may be out of the entity’s control. Furthermore, having different requirements for different situations will be disruptive in the control room and can adversely affect reliability. 5. Consider whether this standard should apply to Load Serving Entities (LSE) as recipients of Operating Instructions. Note that TOP-001-01a Requirement R4 contemplates that LSEs will receive “reliability directives” from TOPs. TOP-001-2 (pending regulatory approval) also includes LSEs as recipients of “Reliability Directives.” 6. RSAW: On page 9 and page 12, the draft RSAW states “Sampling is not a part of the audit process unless the auditor determines that the internal control is not properly designed or is ineffective. If the auditor cannot rely on the entity’s controls to gain reasonable assurance of compliance, then the auditor can pull a sample of the entity’s communications from their available voice recordings (limited to the prior 90 calendar days) . . .” (6A) This is written in a manner that leads a reader (e.g. Auditor or Registered Entity) to believe the CEA cannot review actual performance (e.g. voice recordings) unless the CEA first finds that the entity’s controls are deficient or defective. In order to assess the internal controls by listening to a voice recording the Regional Entity will have to put the Registered Entity in a defensive posture. Is that the expectation of the RSAW drafters? We hope not, as Texas RE would expect to be able to review voice recordings as part of any assessment engagement, even if the controls appear to be in order. [The NERC Sampling Methodology specifically lists voice recordings in the discussion of statistical sampling: “Statistical sampling helps ensure a high confidence level of compliance for the larger population of documents when a smaller population is statistically sampled. The confidence level for the Sampling Methodology is set at 95%. Statistical sampling should be employed when auditing all processes, procedures and any documentation-related evidence (documents, logs, voice recordings, etc.) when a sample is required because the entire population cannot be audited. The use of RAT-STATS in tandem with the Sampling Methodology lends itself nicely to support this approach.”] (6B) The 90-day retention period is too short. The CEA could easily

need to review recordings for a longer period, particularly if it becomes concerned about the entity’s performance or needs to determine whether a “consistent pattern” exists. Advancing technology has mitigated many earlier limitations with respect to retention of data, including voice recordings. (6C) Recordings associated with Reliability Directives should be retained until the next audit, or else the CEA will need to conduct spot checks after each “Emergency or Adverse Reliability Impact” occurs. 7. RSAW: On page 10 and page 12, the draft RSAW states: “. . . if instances of noncompliance with the protocols are found, they will be turned over to Enforcement, which will make the determination whether the entity demonstrates a consistent pattern of not using their documented communications protocols and, if applicable, the severity of the violation.” (7A) This provision reflects the inappropriate failure to clearly state what constitutes compliance in the REQUIREMENTS. If a “consistent pattern” of errors is required to constitute a violation, that needs to be stated in the REQUIREMENT, not in the VSL, and it should be addressed by Compliance, not by Enforcement, in the first instance. (7B) This language should not even be in the RSAW – it appears to forbid the auditor from making a compliance determination and it turns the auditor into a mere collector of evidence for Enforcement. We are not aware of any justification or precedent for this allocation of responsibility.

Group

EPSA

Jack Cashin

Yes

Companies have strongly responded to the 2003 Blackout Report with strengthened communications protocols. Since 2003 companies have responded by reinforcing their reliability regimes with a host of management, training, communications, and technology tools. Therefore, much of what addresses the substance of the standard has taken place in the intervening 10 years since the event. EPSA believes that NERC management and staff have not clearly described the reliability gap that takes place between what the Board has already approved, and the Order No. 693 directive. Reliability would be better served if questions around the perceptions of a reliability gap were responded to in detail. The seven year old directive is both dated and vague in light of the steps taken by registered entities since the Blackout.

No

Comments: It is not clear from the draft standard what language would prevail in a finding of violation – the Requirement, Measure, VSL, or RSAW. Without better definition in the Standard over which language prevails makes consensus agreement with the measures difficult. While some requirements would seem eligible for Find, Fix and Track (FFT) treatment due to a high measurement designation would not qualify for FFT . In addition, while the intent seems reasonable at this time, this could change over time should an RE, NERC or FERC choose to make it more restrictive.

Yes

EPSA supports the development and approval of a single, combined communication protocols Reliability Standard that covers emergency, alert and normal operating conditions for the BES,

while recognizing that performance expectations for applicable registered entities and NERC’s approach to compliance and enforcement should differentiate between emergency and nonemergency conditions. The proposed draft standard COM-002-4 strikes an appropriate balance between these considerations, and responds to the NERC Board’s and Standards Oversight and Technology Committee’s Resolutions. Competitive suppliers however are concerned that the severely shortened, 15-day comment and ballot period directed by the Standards Committee for COM-002-4 will foreclose resolution of major technical objections to the proposed standard. The proposed draft relies heavily on the as-yet untested application of the NERC Reliability Assurance Initiative (RAI). Small changes to the Compliance Elements of the proposed standard – the Measures, Violation Risk Factors, Violation Severity Levels and Reliability Standard Audit Worksheets – would undermine the balance of what EPSA supports. Consequently, delays in the development and implementation of RAI will certainly jeopardize successful implementation of COM-002-4. Control Room operators will find it difficult to capture every oral Operating Instruction that must be transacted using the proper protocol. COM-002-4 offers a solution where the Compliance Enforcement Authorities (CEAs) look for a situation where a “pattern” of lapses occurs in the transaction of routine Operating Instructions. However, there is no definition of “pattern” given in the standard or NERC glossary. It is possible that some CEAs would consider a pattern to be 10 percent or more of all Operating Instructions – others could assess a violation when two or more errors occur. Also, there is no differentiation between situations where documentation is inadequate as compared to those where Operating Instructions are inadequately performed. If “undocumented” equates to a “miss,” your chances of a “pattern” being detected go up significantly.

Individual

Don Schmit

Nebraska Public Power District

No

NPPD agrees with combining COM-002-3 and COM-003-1 into one Standard. We do not agree that COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26. The recommendation addressed effectiveness of alerts, emergencies, or other critical situations and not normal operating communications.

No

Suggest the following changes: For R1; Severe- No documented communication protocols, High- documented protocols missing from 5 to 8 sub-requirements in R1. Medium-missing 3 or 4 sub-requirements, Low-missing one or two sub-requirements. R2; Severe- no communication protocols, High- missing 2 of 3 sub-requirements of R2, Moderate: missing 1 of 3 sub-requirements of R2. R3 and R4; See changes in Question 3 below. R5: as is, but re-classify to Moderate or High.

Yes

Revise the Purpose Statement to read: “Minimum communication protocols for the issuance of Operating Instructions with the intended affect to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the BES”. The former purpose

statement says to “tighten communications” which makes it sound as though communications need to be prescriptive. Within the definition of “Operating Instruction” provided it states “...A discussion of general information and of potential options or alternatives to resolve BES operating concerns...”. NPPD believes that it is imperative to BES reliability for operators to be able to discuss possible options or actions to help system reliability. A Reliability Directive or Operating Instruction may result from that discussion or may change the Reliability Directive or Operating Instruction based upon the discussion. The purpose should not be to “tighten” communications, but to broaden and provide for “effective” communications. The purpose of the Standard appears to be to provide “minimum communication” protocols for the industry.

R3. Add at the end (after the words Requirement 1) “and remediate noted exceptions identified in R5”. This aligns with the Measurement 3 (M3). The VSL for R3 needs to change to correlate to R3: for the High VSL after “Requirement R1” add “or remediating noted exceptions identified in R5” for Operating Instructions that are not Reliability Directives. The Severe VSL should read the same way as the High VSL, except for the issuing or receiving of a Reliability Directive.

R4. Add at the end (after the words Requirement 2) “and remediate noted exceptions identified in R5”. This aligns with the Measurement 4 (M4); however M4 does need to change to reference back to Requirement R5 in a similar way that M3 does. The VSL for R4 needs to change to correlate to R4: for the High VSL after “Requirement R2” add “or remediating noted exceptions identified in R5” for Operating Instructions that are not Reliability Directives. The Severe VSL should read the same way as the High VSL, except for the receiving of a Reliability Directive.

R5. NPPD suggests that that sub-requirement 5.1 and 5.2 be removed. R5 adequately covers the requirement to evaluate communications protocols. Sub-requirements 5.1 and 5.2 are ambiguous and lead to auditors to interject their own “standards” for adherence and effectiveness. NPPD appreciates the considerations and changes made by the drafting team and with the additional changes identified above we will change our vote in support of this proposed Standard.

Group

PPL NERC Registered Affiliates

Brent Ingebrigtsen

Yes

These comments are submitted on behalf of the following PPL NERC Registered Affiliates: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL EnergyPlus, LLC; and PPL Generation, LLC, on behalf of its NERC registered entities. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. PPL NERC Registered Affiliates recognize the need for industry standards applicable to certain communications. However, the current draft version of COM-002-4 requires change. We have the following questions that we would like the SDT to consider and respond to as part of the next draft: 1) There is no lesser VSL for R3 and R4 other than for a “consistent pattern of not using the communication protocols” developed in accordance with R1 or R2 for Operating Instructions that are not Reliability Directives. Does this mean that the SDT intends that there would be no violation unless there is a “consistent pattern” of not using such documented

protocols? 2) What would constitute a “consistent pattern” of not following the communication protocols? 3) If, for example, a BA, RC or TOP develops and implements a communications protocol which addresses the requirements and performs periodic sampling of communications among the issuers and recipients of the Operating Instructions to determine adherence to the protocols (e.g., 95% confidence), would identification of any issues with appropriate corrective action by the affected parties meet the compliance requirement? Along with a significant majority of the industry, we supported COM-002-3 (Version 3) developed under NERC project 2006-06 and approved by the NERC Board of Trustees. We support NERC filing COM-002-3 with the Applicable Governmental Authorities for approval and ending Project 2007-02. In the event that NERC moves the current draft of COM-002-4 forward the draft should be revised as follows. This current draft does not include the “Reliability Directive” definition that industry and the NERC BOT approved in COM-002-3. Likewise, the implementation plan that is posted with this first draft of COM-002-4 indicates that there are “Prerequisite Approvals” needed “of the definition of ‘Reliability Directive’”. The current definition of Reliability Directive is now unclear as the term had been defined in the Board approved COM-002-3 but is not included in this draft. Therefore, we suggest adding the definition of Reliability Directive into Definitions of Terms Used in Standard as follows:

Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. Similarly, we had previously proposed in comments to COM-003-1 drafts a clear definition of Operating Instruction and suggests the following:

Operating Instruction: A Real-time Operations command, other than a Reliability Directive, by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the Real-time Operations command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information, potential options and/or alternatives to resolve Bulk Electric System operating concerns is not a command and is not an Operating Instruction. An Operating Instruction is exclusive and distinct from a Reliability Directive. There is no overlap between an Operating Instruction and Reliability Directive. Only in concert with these two definitions, we propose only the following Requirements as part of COM-002-4: [R1 through R3 are for Reliability Directives and are identical to those in approved COM-002-3 with clarification for burst messages in R2.1 through R2.2] R1. When a Reliability Coordinator, Transmission Operator, or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator, or Balancing Authority shall identify the action as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time] R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase, or recapitulate the Reliability Directive. [Violation Risk Factor: High][Time Horizon: Real-Time] R2.1 The issuer of an oral Reliability Directive using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party. R2.2 The receiver of an oral Reliability Directive receiving a one-way burst messaging system to communicate a

common message to multiple parties in a short time period (e.g. an All Call system) shall request clarification from the issuer if the communication is not understood. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either: [Violation Risk Factor: High][Time Horizon: Real-Time] Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or Reissue the Reliability Directive to resolve a misunderstanding. [R4 through R7 are for those instances where an entity determines Operating Instructions are necessary in their protocol and are based upon the comments provided by PPL NERC Registered Affiliates in COM-003-1 draft 5] R4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop and implement documented communication protocols that outline the communications expectations of its System Operators. The documented communication protocols will address, where applicable, the following:[Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] 4.1. Use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation. 4.2. Instances that require time identification when issuing an oral or written Operating Instruction, and the format for that time identification. 4.3. Nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. 4.4. Instances where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction, and the format for those clarifiers. 4.5. Instances where the issuer of an oral two party, person-to-person Operating Instruction is required to: Confirm that the response from the recipient of the Operating Instruction was accurate, or Reissue the Operating Instruction to resolve a misunderstanding. 4.6. Require the recipient of an oral two party, person-to-person Operating Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer. 4.7. Instances where the issuer of an oral Operating Instruction using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) is required to verbally or electronically confirm receipt from at least one receiving party. 4.8. Require the receiver of an oral Operating Instruction using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. 4.9. Coordination with affected Reliability Coordinators', Balancing Authorities', Transmission Operators', Distribution Providers', and Generator Operators' communication protocols. R5. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop method(s) to assess System Operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R4. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Operations Assessment ] R6. Each Distribution Provider and Generator Operator shall develop and implement documented communication protocols that outline the communications expectations of its operators. The documented communication protocols will address, where applicable, the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ] 6.1. Use of the English language when responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation. 6.2. Require the recipient of an oral two party, person-to-person Operating

Instruction to repeat, restate, rephrase, or recapitulate the Operating Instruction, if requested by the issuer. 6.3. Require the receiver of an oral Operating Instruction using a one-way burst messaging system to communicate a common message to multiple parties in a short time period (e.g. an All Call system) to request clarification from the issuer if the communication is not understood. R7. Each Distribution Provider and Generator Operator shall develop method(s) to assess operators' communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols developed for Requirement R6. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning /Operations Assessment ] In summary, we do not agree with imposing three-part communications on the industry for all normal / routine operating instructions.

Group

Hydro One Networks inc.

Sasa Maljukan

Yes

Hydro One fully supports combining two standards into one. From the early drafts we believed that in order to make it easier for entities to comply single communication standard is the right way to go. However, on one occasion, drafting team rejected requests for combining two standards on the ground that COM-002 SAR doesn't give enough room for this to be done and that brand new standard must be developed. How is the SDT planning to address possible challenges from the industry? Would margining two standards into COM-003 which has broader scope relieve this notion?

Yes

Yes

Hydro One agrees with the comments submitted by the NPCC RSC and would like to offer following additional comments: Hydro One believes that the issue of three part communication is major stumbling block in passing this standard. Hydro One understands the reasons behind it and generally is not opposed to tightened communication for both Operating and Reliability directives. However, our issue and consequently the negative vote on this draft is primarily due to lack of coordination between the entities. Additionally, we don't agree with the general direction this standard is taking when it comes to compliance with this standard. We feel that violation of three part communication should constitute non-compliance with the standard ONLY if it played a part in the event. Otherwise it should be treated as non-violation and be handled through identify, asses and correct approach. We see these two issues as important enough to cast a negative vote. If corrected, we'd be open to supporting this standard in the future. In addition to above we'd like to offer following comments: 1. General Comment: We feel that the current draft is lacking coordination of communication protocols. We recommend that the SDT reassesses the need and assigns clear accountabilities to RC or others as appropriate. We believe that this component is essential in ensuring clear and reliable communication between entities. 2. In R1.2 the alternate language can be used for internal operation and if agree otherwise. For clarity purposes we'd like to see the standard address following questions: - Who can agree otherwise? - What is the meaning of internal operation? Is this operation internal to one entity? What if this is a vertically integrated utility? We believe

that these two instances are vague and must be further defined to avoid future interpretations. 3. R2.2 – see the comment above Section 1.2 Data Retention states “...the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.” This statement is vague and unenforceable. Hydro One recommends the SDT removes this sentence and provide clear, measurable direction regarding the retention period. 4. We understand that due to the rush for this standard to be developed SDT and NERC staff didn’t have time to develop the RSAW and post it together with the standard (RSAW was posted sometimes at a later date). We hope that this is exception rather than the rule and that in the future RSAWs are going to be developed in time to be posted together with the standard.

Yes

Yes

While we think this draft standard is superior to the previous drafts, we have some issues that should be addressed first. Suggest changing language in the purpose section from “to tighten communications” to “to strengthen communications” The “Real-time generation control and operation” language in the definition for Operating Instruction is confusing. As written the definition seems to limit Operating Instructions being issued only by personnel that control and operate generation. Suggest changing the language to “A command by operating personnel responsible for the Real-time generation control or operation of the interconnected Bulk Electric System...” In R1.8, what is the definition for “Transmission interface”? This seems to be alluding to interconnection facilities, but is not definitive. If the intent was for Transmission interconnections, suggest the language be “Specify the nomenclature for Transmission interconnecting Elements and Transmission interconnecting Facilities between two parties when issuing an oral or written Operating Instruction.”

Gregory Campoli

New York Independent System Operator

No

It remains unclear that additional work is needed to address recommendations from the August 2003 Black out Report or to address concerns raised in FERC Order 693. Much work has been completed to date that should address issues raised in those comments. We agree with the SRC in relying on the OC’s Reliability Guidance that supports 3-part communication for all oral two party, person-to-person communications. The SRC proposes that this approach be used for a two year trial period. During that trial period NERC should collect information on the number of reliability events caused by communications errors. The ERO could then use the data to justify added requirements if the data justified the need. To date it does not appear that data exists to support that need for and additional communication standards.

No

The NERC Compliance Monitoring and Enforcement Program is based on FERC approved requirements and registered entities are obligated to demonstrate compliance with Reliability Standard requirements. The proposed VSL introduce an additional layer of compliance without being clearly defined in the proposed requirement. The proposed requirements are structured to include: 1) document, 2) implement and 3) evaluate communication protocols. The VSL should be developed from these three components of the standard and not introduce a 'zero defect' enforcement approach as is proposed in VSL R3 and others. NERC's recent direction was to move away from 'zero defect' standards and approach compliance from an 'identify, assess and correct' approach for controls type standards that have high frequency activity that do not immediately pose a reliability risk. The proposed requirements follow that approach. The proposed VRF's incorrectly introduce a 'zero defect' approach through a 'back door'. An entity may 'implement' a protocol, but one occurrence of not following that protocol does not warrant an entity to be non compliant, as proposed in the standard. If the drafting team is looking for a 'zero defect' standard, then the words need to be in the requirement. However we continue to believe that this is unnecessary, since a 'zero defect' requirement for poor communication already exist in current IRO/TOP Standards for not following directives.

Yes

We have specific questions to individual requirements below: R1.1 Require the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver. The NYISO request confirmation from the SDT that identification of Reliability Directives can be made in policies or procedures agreed to by all parties. This will allow an entity to ensure consistent communications for all conditions without having to add additional information into the dialogue for emergency conditions that could complicate the interaction. 1.5. Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt by at least one receiver when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system). This requirement appears to require a confirmation that the all call was completed. The NYISO is requesting confirmation from the SDT that an electronic confirmation that the one-way communication was completed to the intended parties. For the following: 1.7. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification. 1.8. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. 1.9. Specify the instances where alpha-numeric clarifiers are required when issuing an oral Operating Instruction and the format for those clarifiers. The NYISO is requesting confirmation from the SDT that in some cases an entity may have no instances where time identification, nomenclature or alpha-numeric's will be required and that the SDT did not intend this to be a case of non-compliance. The NYISO would also like to ask the drafting team what jurisdiction or authority the initiator of the communication has over the receiver of the communication. Some requirements require the entities communication protocol to have an obligation on the receiver to take action with no apparent authority to enforce that requirement. The NYISO would also like the SDT to consider the relationship between R1, 'have a protocol' and R3 'implement a protocol'. We believe that to

have a protocol is simply an administrative requirement that could be incorporated into a single requirement. One requirement could exist to 'implement a protocol that shall at a minimum...'. To have a protocol has no impact on reliability. We believe this would be a recommendation based on the paragraph 81 work.

Individual

Lee Layton

Blue Ridge Electric

Yes

The draft expands the scope of COM-002 to include DP's, however, I don't see any rational offered for including DP's who have no impact to the BES.

Individual

Brian Evans-Mongeon

Utility Services, Inc

No

Not following a communications protocol when the Operating Instruction is a Reliability Directive is a zero tolerance instance. So even if directive is followed and any BES situation is mitigated, it is still a Severe Violation. This is extreme, and the VSLs for R4 should be reduced. If a Reliability Directive is not followed there are violations of other standards, which are severe, so a lowering of this VSL will not affect the reliability of the BES. VSLs for all Operating Instructions should be graduated within the VSL table as opposed to being passed onto Enforcement to make a determination of a "Consistent Pattern." This will provide clearer guidance to industry on Violation Severities. For example, they could range from Low to High, with failures in less than 1/3 as Low VSL, less than 2/3 as Medium, and failure in more than 2/3 as High. R4: More clarity needs to be provided on how a "consistent pattern" will be established. Most of the applicable entities do not record phone conversations. The RSAW states that any instances of non-compliance will be turned over to Enforcement to determine a "consistent pattern." This is zero-defect language as each instance will be considered a PV.

No

The applicability of the standard should be written to exclude DPs that do not own or operate BES equipment. As per the definition of Operating Instruction "A command ... to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System..." Entities that do not have real-time control of Elements or Facilities of the BES should be removed from the applicability of the standard. It is excessive to mandate that DPs in this situation, that never receive Operating Instructions, have a Communications Protocol, and implement that protocol. Suggest adding the following to Section 4: 4.1.2 Distribution Provider with control of Elements or Facilities of the Bulk Electric System. M3 and M4 are difficult to understand and suggest edits to clarify: Each Distribution Provider and Generator Operator shall provide evidence that it implemented the documented communication protocols such that the entity has reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Evidence should

show periodic, independent review of the operating personnel’s adherence to protocols established in R2. Evidence may include, but is not limited to • Descriptions of the management practices in place, • spreadsheets, • memos, or • logs, R5.1 is redundant with R3 as both require assessment of adherence to protocols established in R1. If part of “Implementation” (covered in R3) includes an assessment of the communication protocols, R5 should be limited to only correcting discovered and correcting deficiencies with the protocols and the implementation of those protocols. If not removed as redundant, Requirement 5.1 should specify that the assessment will be limited to the operating personnel of the individual entity for both issuing and receiving Operating Instructions. As it is written now it would be the responsibility of the BA, RC and TOP to assess compliance with communication protocols to all entities involved in every communication, including the receiving GOPs and DPs, and other BAs, RCs and TOPs based on the Operating Instruction as “issuer and receiver” are not defined. Suggested Rewording of R5.1: “Assesses adherence to the communications protocols to provide feedback to entity personnel” R2 requires DPs and GOPs to call the issuer in an all call situation if the Operating Instruction is not understood. If the Operating Instruction is misunderstood, and the entity believes it has taken the appropriate action, but was incorrect creates a potential violation scenario. This needs to be clearly addressed as a Potential Violation in this instance could be severe (if the OI is a Reliability Directive) and could be a Potential Violation of several other standards as well (not following a Reliability Directive). RSAW Comments: The “Note to Auditor” related to R3 and R4 is outside of the scope of the standard. Placing the examination of Internal Control within the RSAW effectively requires entities to have Internal Controls, which expands the scope of the standard significantly.

Group

Dominion

Connie Lowe

Yes

Yes

Yes

It does not appear that there are any requirements to coordinate communication protocols established in R1 with those established in R2. For instance, R1 contains 9 sub-requirements whereas R2 only contains 3 sub-requirements. Does the SDT maintain that coordination is not necessary expecting that the recipient will be instructed by the issuer to either repeat or confirm any information that is included in parts 1.5, 1.6, 1.7, 1.8, or 1.9 that is vital to understanding the Reliability Directive or Operating Instruction? There is no value in having a documented communications protocol if the entity does not intend to implement it. We therefore suggest that requirements 3 & 4 either be added into the body of R1 and R2 respectively, or as sub-requirements of R1 and R2 respectively. The VSLs and RSAW should be modified accordingly. The Violation Severity Levels imply an entity is non-compliant for operating instructions only if a pattern of not following its protocols is demonstrated. However, the RSAW says that system events should be reviewed, and if instances of nonconformance with the protocols are found, the issue will be turned over to the Compliance Enforcement Authority, who will then make a determination whether there was a pattern. We suggest that

the RSAW be changed to explicitly indicate that if the entity has a documented protocol that defines the expectations of its operators, requires periodic checks to validate conformance with the protocols, and implements corrective actions when deficiencies are found, the entity will be determined to be compliant In several places, including the implementation plan, there is mention of retiring COM-002-3. This standard was never FERC approved, therefore Dominion suggests changing this from retiring COM-002-3 to withdrawing COM-002-3.

Marcus Pelt

Yes

No

R3 & R4 - While there is the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations were performed as a result. The severe category should be reserved only for those instances in which documented communications protocols were not followed \*and\* which resulted in an emergency operation or reliability issue. As a result, we suggest “demoting” each existing VSL to a lower level, and editing the Severe VSL and limit it to only those instances that resulted in an emergency operation or reliability issue (suggestions provided below). Low - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R1 for Operating Instructions that are not Reliability Directives. Moderate – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive. High – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving an Operating Instruction \*and\* resulting in an emergency operation or reliability issue. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive \*and\* resulting in an emergency operation or reliability issue. Southern also suggests (per comments below in section 3 on R5) that the VRF’s and VSL’s should be deleted for R5.

Yes

Standard Comments: R2 - We disagree with the DP and GOP being required to have a documented communications protocol. The requirement should simply require these two entities to use 3-part communication (i.e. repeat back) for Operating Instructions. Requiring a document is a purely administrative requirement and certainly meets the Paragraph 81 criteria. R5 - In NERC’s own Q&A document for RAI prepared by the Risk-Based Reliability Compliance Working Group (RBRCWG), the following statements are made: “An entity can voluntarily establish internal controls designed to reduce its control risk, which could have a positive influence on the scoping of compliance monitoring by the Regional Entity. Conversely, the entity can voluntarily elect to not establish internal controls or share them with the Regional Entity.” This is inconsistent with the direction of the proposed Standard COM-002-4, R5. This

not only requires an internal control, but also requires that the control be shared with the Regional Entity (during audits). Also, consider that an entity can develop and implement a robust communication protocol consistent with COM-002-4 requirements and flawlessly follow its communication protocol, yet be found in violation of COM-002-4 by failing to demonstrate that it has adequate (subjective) management (internal) controls in place. This is inconsistent with the RAI guidance provided by NERC regarding the voluntary nature of internal controls. So, in principle, internal controls should not be dictated in a reliability standard. This goes against the principle of “Results-Based” standards. The intended result is effective communications. This can be attained with Requirements 1 through 4. No one will argue that internal controls won’t help ensure that the desired results are achieved. However, Requirement 5 is not absolutely necessary for the results to be achieved, and therefore, should not be included in the standard and should be removed. R5.1 – We understand the thought that the BA, RC, and TOP will be assessing both the issuer’s and receiver’s adherence to the communications protocols; however, there needs to be some obligation on the receiver’s end to incorporate the feedback in their management practices. M3 and M4 – It is not clear what is meant by “independent review of operating personnel’s adherence to the protocols”. We recommend clarifying that this independent review only implies that the operator cannot assess their own communications. This assessment can be conducted by the operator’s management that is responsible for developing and training on the protocols or other groups within the entity’s organization that the operator’s management deems appropriate to provide an independent assessment. This same comment applies to the RSAW for R3 and R4. RSAW Comments: It appears that the intent of the revised COM-002-4 standard and the RSAW is to eliminate the “zero defect” concern expressed by the industry. Southern appreciates the SDT and NERC’s move in this direction; however we recommend modifying the RSAW to make it clear that as long as registered entities have a protocol document that lays out its expectations of its operators, periodically checks for conformance with the protocols, and implements corrective actions when deficiencies are found, the entities are compliant. Specifically, the Compliance Assessment Approach specific to COM-002-4, R3 as drafted provides the CEAs too much subjectivity. There needs to be more defined rule set and objective criteria that are used to determine if an entity’s internal controls around operating personnel adherence to the documented communications are insufficient. For example, CEAs should not have the flexibility to determine if the design frequency, volume of communications reviewed, and independence of the review party are sufficient. These parameters should be left up to the entity. The compliance approach should simply provide for the auditors to review the entity’s management practices related to assessing operators’ communications and actual evidence of such review to ensure these management practices are occurring. The RSAW should be modified to state that entity’s management practices should only be allowed to be deemed insufficient if: a) there is no evidence that management practices exist to assess operating personnel’s adherence to communications protocols or b) evidence demonstrates a pattern of not following the documented communications protocols.

CenterPoint Energy Houston Electric

Yes

CenterPoint Energy agrees that the proposed COM-002-4 Standard addresses the August 2003 Blackout Report Recommendation number 26, FERC Order 693, and the COM-003-1 SAR however, the Company believes it goes beyond what is necessary to address the recommendations and ensure reliable communications. In addition CenterPoint Energy is concerned the proposed Standard may actually have the unintended opposite impact and impair reliable communication. See response to Q3 below.

No

CenterPoint Energy strongly disagrees with any Moderate or higher VSL for failure to document part of a procedure. See proposed VSL's for R1 and R2. The focus should remain on reliable operation of the system. If an entity is consistently using the required elements in its normal and emergency communications, failure to document a portion of that procedure should result in no more than a Lower VSL.

Yes

CenterPoint Energy strongly believes the stakeholder and NERC BOT approved COM-002-3 adequately addresses the FERC directive and no other Standard is necessary. CenterPoint Energy is very concerned regarding certain aspects of the proposed COM-002-4. The Company firmly believes R1.1 has great potential to detract from reliable operation of the Bulk Electric System (BES). By definition, a Reliability Directive is issued when an entity is in an Emergency situation or an unplanned system event has occurred that is causing an Adverse Reliability Impact on the BES. In these situations System Operators are analyzing multiple screens of data, reviewing various options of possible actions to take, and determining the other entities and personnel that need to be notified of the event. To inject a requirement to identify a command as a Reliability Directive into this environment has a high probability of negatively impacting the System Operator's response by causing the System Operator to hesitate in issuing the appropriate command thereby delaying the needed action. In addition this introduces the possibility of confusion on the part of the issuer and the receiver. At what point during an unplanned system event does it become an Emergency and therefore an Operating Instruction becomes a Reliability Directive requiring a special identification? In this highly stressful situation the System Operator does not need to be considering anything else other than what actions need to be taken in order to stabilize the BES and to protect life and property. CenterPoint Energy does not believe this requirement enhances reliable operation of the BES and in fact could impair that reliability at a crucial time. In addition CenterPoint Energy believes R1.8 is unnecessary since it is redundant with current TOP-002-2.1b requirement R18 which requires the use of common line identifiers when referring to transmission facilities of an interconnected network. CenterPoint Energy strongly recommends deletion of R1.1. While the Company believes R1.8 is unnecessary, redundant, and offers no enhancement to reliable communication CenterPoint Energy would be able to support COM-002-4 if R1.1 was deleted.

BC Hydro

Yes
1. Purpose: The word "tighten" implies what the revisions to the standard are expected to do and doesn't reflect what the standard purpose is. BC Hydro recommends revising. 2. R1.5: Why is the requirement to confirm receipt for only one receiver and not all receivers for the multiple party message?
Group
SPP Standards Review Group
Robert Rhodes
Yes
We can support the combination of the two standards although we still have reservations regarding the need to introduce Operating Instructions in order to address Recommendation 26 which we see as strictly for emergency situations. We provide Recommendation 26 to support our position. "NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date."
No
The VSLs need to be modified to reflect the changes we propose in response to Question 3.
Yes
In order to more closely link the internal control process in R5 to the implementation of the protocols as required in R3 and R4, we propose revised language for R3 and R4. Additionally, we believe it was the intent of the SDT to provide the flexibility contained in R5 to the DP and GOP in addition to the BA, RC and TOP. Therefore, the DP and GOP should be included in R5. With that linkage established to R3 and R4, we propose that Parts 5.1 and 5.2 be deleted. Associated Measures and VSLs will need to be modified to reflect these changes. For example, the High VSL for R3 should now incorporate the remediation concept since without it the VSL implies zero-tolerance even though consistent pattern language is provided. To be non-compliant the responsible entity would have to demonstrate a consistent pattern of non-adherence to its protocols and a lack of remediation for the given situation. R3 - Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement the documented communications protocols developed in Requirement R1 and remediate noted exceptions for Operating Instructions which are not Reliability Directives in fulfillment of Requirement R5. Exceptions are not allowed for Reliability Directives. R4 - Each Distribution Provider and Generator Operator shall implement the documented communications protocols developed in Requirement R2 and remediate noted exceptions for Operating Instructions which are not Reliability Directives in fulfillment of Requirement R5. Exceptions are not allowed for Reliability Directives. Furthermore, this process should not be an audit of our internal controls. It should be an audit of the implementation of our communications protocols and our efforts to correct exceptions to the non-use of those protocols. This being the case, language such as 'reasonable

assurance' and 'reasonably designed' which is in both the standard (M3 and M4) and the RSAW (pages 9 and 15) needs to be eliminated. R1.5 and R1.6 cover one-way burst messaging systems which create unique operating situations when it comes to issuing Operating Instructions. In previous versions of COM-003-1 the SDT deleted this requirement. We suggest deleting it in this draft. It is a difficult situation to handle and does not present itself to cleanly handling 3-part communication. Having only one party confirm receipt of a Reliability Directive which has been sent to potentially tens of entities, does not provide a secure mode of operation nor does it address Recommendation 26. To eliminate the possibility of confusion over the use of 'internal operations' we suggest pulling the language in its entirety from COM-001-1.1, R4 into COM-002-4, R1.2. Replace 'real-time' with 'Real-time' in M3, M4 and M5.

Individual

Jason Snodgrass

Georgia Transmission Corporation

No

Both Reliability Directives and Operating Instructions have a HIGH VRF which appears inconsistent with previous drafts of the definitions and use of the two terms. R3 & R4 - While there is the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations were performed as a result. The severe category should be reserved only for those instances in which documented communications protocols were not followed \*and\* which resulted in an emergency operation or reliability issue. As a result, we suggest "demoting" each existing VSL to a lower level, and editing the Severe VSL and limit it to only those instances that resulted in an emergency operation or reliability issue (suggestions for R4 provided below). Lower - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R2 for Operating Instructions that are not Reliability Directives. Moderate - The responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive. High - The responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving an Operating Instruction \*and\* resulting in an emergency operation or reliability issue. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R2 when receiving a Reliability Directive \*and\* resulting in an emergency operation or reliability issue. These aforementioned suggestions could also be duplicated for R3 with respect to issuers.

Yes

R2 - GTC disagrees with the DP and GOP being required to have a documented communications protocol. The requirement should simply require these two entities to use 3-part communication (i.e. repeat back) for Operating Instructions. Requiring a document is a purely administrative requirement and certainly meets the Paragraph 81 criteria. The following is suggested: R2 Each Distribution Provider and Generator Operator that receives an Operating Instruction shall: 2.1 Respond using the English language unless agreed to otherwise. An alternate language may be used for internal operations. 2.1.1 Oral Operating Instructions shall be responded to orally. 2.1.2 Written Operating Instructions shall be responded to in writing.

2.2 Take one of the following actions: • Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct. • Request that the issuer reissue the Operating Instruction. 2.3 Request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system). R5 - GTC believes internal controls type language is not appropriate within Reliability Standards Requirements and recommends deletion of R5. Specifically, since R3 and R4 are requirements to implement the communication protocols of R1 and R2 and must be adhered to (zero tolerance), it seems R5 is unnecessary to meet the objective of this Standard identified in the purpose statement and would seem to be more closely aligned with Paragraph 81 principles as administrative. Additionally, in NERC's own Q&A document for RAI prepared by the Risk-Based Reliability Compliance Working Group (RBRCWG), the following statements are made: "An entity can voluntarily establish internal controls designed to reduce its control risk, which could have a positive influence on the scoping of compliance monitoring by the Regional Entity. Conversely, the entity can voluntarily elect to not establish internal controls or share them with the Regional Entity." This is inconsistent with the direction of the proposed Standard COM-002-4, R5. This not only requires an internal control, but also requires that the control be shared with the Regional Entity (during audits). In summary, internal controls should not be listed as a requirement in a Reliability Standard. This goes against the principle of "Results-Based". The intended result is effective communications. This can be attained with Requirements 1 through 4. However, Requirement 5 is not absolutely necessary for the results to be achieved, and therefore, should not be included in the standard and should be removed. While GTC firmly supports moving away from zero-tolerance standard requirements, the RAI-related compliance elements of the proposed COM-002-4 appear to be premature as the RAI remains under development. Until the RAI program is more fully developed it's unclear how COM-002-4 would be audited. RAI and related changes to the Compliance Monitoring and Enforcement Program (CMEP) must be fully developed to ensure all parties (NERC, Regional Entities and Registered Entities) understand the rules of the road before being asked to approve a standard that relies on information and processes not yet finalized. Additionally, the RSAW for COM-002-4 depends on the implementation of the Reliability Assurance Initiative (RAI) which is not expected to be implemented until 2016. It seems unreasonable to utilize an internal controls approach to auditing until the criteria for such evaluation has been clearly explained to the stakeholders. -Both the terms Operating Instruction and Reliability Directive are used in this standard with little guidance on when to use a Reliability Directive which is described as a type of Operating Instruction.

Individual

Allen Mosher - APPA Staff

American Public Power Association

Yes

APPA staff supports the development and approval of a single, combined communication protocols Reliability Standard that covers emergency, alert and normal operating conditions for the BES, while recognizing that performance expectations for applicable registered entities and

NERC's approach to compliance and enforcement should differentiate between emergency and non-emergency conditions. Our initial review indicates the recently proposed draft standard COM-002-4 strikes an appropriate balance between these considerations, while fully responding to the NERC Board's and Standards Oversight and Technology Committee's Resolutions. We commend the SDT for its efforts. However, additional work is necessary to address technical concerns with the draft standard. See below.

No

No. APPA has concerns with several Compliance Elements, including the VRFs and VSLs in proposed COM-002-4. (1) The VRFs for DPs under R3 and R4 should be lowered, since non-compliance by these functions (within vertically integrated entities) or by these functional entities (if structurally separate) will pose minimal risk to the BES because they do not own or operate BES facilities. BES protective devices such as UFLS and UVLS relays operate automatically. (2) The Severe VSL for R3 and R4 requires specific zero defect performance when a Reliability Directive is issued or received. This is conceptually sound reliability performance objective, but it should be stated in the Requirements, as is the case in COM-002-3, with appropriate limitations to Reliability Directives, rather than burying the Requirement in the VSLs or in other Compliance Elements. (3) More fundamentally, the proposed draft relies heavily on the as-yet untested application of the NERC Reliability Assurance Initiative. Even modest changes to the Compliance Elements of the proposed standard – the Measures, Violation Risk Factors, Violation Severity Levels and Reliability Standard Audit Worksheets – would undermine the balance outlined above. Further delays in the development and implementation of RAI will certainly jeopardize successful implementation of COM-002-4.

Yes

(1) Project Plan: APPA staff supports the development and approval of a single, combined communication protocols Reliability Standard that covers emergency, alert and normal operating conditions for the BES, while recognizing that performance expectations for applicable registered entities and NERC's approach to compliance and enforcement should differentiate between emergency and non-emergency conditions. Our initial review indicates the recently proposed draft standard COM-002-4 strikes an appropriate balance between these considerations, while fully responding to the NERC Board's and Standards Oversight and Technology Committee's Resolutions. We are nonetheless concerned that the severely shortened, 15-day comment and ballot period directed by the Standards Committee for COM-002-4 will foreclose resolution of major technical objections to the proposed standard. (2) Reliability Objectives and Approach to Compliance Assurance: APPA Staff believes a strict, zero defect performance expectation for use of three-part communications by operating personnel is appropriate for the issuance of and response to Reliability Directives during emergencies and other adverse operating conditions on the BES. In marked contrast, the emphasis for Operating Instructions issued during normal conditions should be on behavioral, management and compliance assurance. First, each BES system operator should be trained in three-part communications (and other communication protocols) such that his or her use of such practices during normal operations is equally routine during emergency conditions. Second, each registered entity's management team should be confident that its operating personnel will follow the protocols on a consistent basis and that management practices and controls will

detect both departures from these communication protocols, as well as opportunities for improved performance. Third, NERC and regional compliance and enforcement staff should have reasonable assurance that the evidence proffered by each registered entity demonstrates it meets these performance expectations. (3) Applicability of the Standard: For a number of very practical considerations, APPA Staff urges the SDT, NERC staff and the NERC Board of Trustees to be cautious and measured in their efforts to bring this project to conclusion. The combined communication standard is unusual if not unique among NERC standards in that it touches on the day-to-day activities of thousands of industry employees engaged in real time operations and that its application as drafted will apply to many thousands of routine communications every day. APPA Staff urges the SDT to clarify which operation personnel are subject to the proposed standard, including whether Operating Instructions include oral communications issued and received within a single functional entity. The standard does not clarify such applicability beyond referring to “issuers” and “receivers” of Operating Instructions. Is the standard’s applicability limited to NERC certified operators? Control center operating personnel for all functions, even for individuals that do not operate or supervise operation of BES elements? Does the standard include training for field personnel? APPA Staff believes that operators and field personnel should use three-part communications to ensure safety, equipment protection and quality of retail service. However, the proposed open-ended Applicability to potentially ALL operating and field personnel of all BAs, DPs, RCs, TOPs and GOPs is overly broad for a NERC reliability standard. The training burdens and the documentation that each entity has implemented a systematic approach to such training is clearly burdensome. APPA Staff also recommends that the SDT clarify the Applicability of the draft standard, to eliminate applicability to small DPs under either a size threshold such as a peak load of less than 100 MW or that do not operate and staff a 24/7 distribution control center. (4) Compliance Assurance, Implementation Plan and Regulatory Certainty: APPA Staff believes the immature, untested nature of RAI takes the proposed standard beyond “in flight maintenance” into the world of simultaneous program design and operation. A poorly designed or implemented standard could actually increase the risk of BES performance errors, by diverting the focus of operators and management from what is being communicated to how the communication takes place. For these reasons, it is imperative that NERC and the industry have a clear, common understanding of the communication protocols and management controls that will be required at least one year prior to the effective date of the proposed standard. We support a balanced approach that focuses on education and training during a 12-month trial period to allow the industry to implement training programs and test its processes. Any failures identified in an audit or an events analysis during the trial period would not trigger any penalties, but would be noted for further evaluation. After the trial period, any failures would trigger an automatic re-training or coaching of the individual(s) in question, as well as improvements to the registered entity’s management controls. Finally, APPA Staff seeks assurance that NERC will not seek to modify the Compliance Elements of proposed COM-002-4 after it has been approved by the registered ballot body, without due process that protects the balance now present in the standard. Even modest changes to the Measures, VSLs, or RSAWs, such as changing “Reliability Directive” to “Operating Instruction” in the Severe VSL for Requirement R3, would transform COM-002-4 into a zero defect standard and drown the

industry and NERC in compliance administrivia.

The issue of zero defect in operating Instructions requiring three way communications is unacceptable. The Notes to the Auditor giving the auditor unlimited power to determine that the internal controls are not properly designed or is ineffective is not acceptable
Group
National Grid
Michael Jones
Yes
<p>National Grid appreciates the opportunity to provide the following comments. National Grid believes that clear communication is important for the reliable operation of the system in both normal and emergency conditions. To ensure that communication protocols are followed in both normal and emergency conditions, National Grid includes proper communication protocols in continuing operating training. In addition, National Grid has internal controls to assess adherence to communication protocols in both normal and emergency conditions. National Grid's concern regarding COM-002-4 is the additional, open-ended, compliance burden that will be added if communication protocols under normal conditions are added to the scope of the COM standard. National Grid appreciates the information provided in the draft Reliability Standard Audit Worksheet (RSAW) regarding the audit and enforcement approach. It should be clearly described, within the reliability standard, that the reliability standard is not a "zero-defect" standard for every communication. As written, the draft COM-002-4 standard requirements could be interpreted to be "zero-defect" requirements. National Grid provides the following recommended solution for the COM-002-4 standard:</p> <p>Requirements: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall document communications protocols that specify the use of repeat-back and acknowledgements (three-way communication) of Operating Instructions and Reliability Directives for Normal and Emergency communications. 1.1. The communication protocol shall require the issuer and receiver of an oral Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations. Violation Risk Factor: Low - Time Horizon: Long-term Planning R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a method to evaluate the communications protocols developed in requirement R1 that: 2.1. Assesses adherence to the communications protocols to provide feedback to issuers and receivers of Operating Instructions and Reliability Directives. 2.2. Assesses the effectiveness of the communications protocols and modifies those protocols, as necessary. Violation Risk Factor: Low - Time Horizon: Operations Planning</p>

The Independent Industry Experts Panel provided a "point-on" review of the COM-003 draft standard. That review included recommended some simple and clear language to define the reliability objectives of a combined COM-002/COM-003 Standard. Instead, the drafting team has opted to draft more complex and unintuitive language without any obvious need for the for the additional requirements, despite the availability a simpler, more intuitive solution.
Individual
Ryan Walter
Tri-State Generation and Transmission Association, Inc.
No
Tri-State believes that this proposal goes beyond what was contemplated in the Blackout Recommendation as well as FERC Order 693 directives 1 and 3 of paragraph 540. Additionally, Tri-State feels that a new term to define "Operating Instruction" is not warranted or required to fulfill either the FERC directive or Blackout Recommendations and is creating confusion where it is not needed. While the Final Blackout Report Recommendation 26 recommended tightening communications protocols, it emphasized communications during alerts and emergencies. This draft has pulled Reliability Directives and Operating Instructions into one definition and the draft does little to differentiate between the two. They appear to both be held to the same expectations and standards with minimal differentiation. Further work needs to be done on the definition and differentiation between the expectations and risk for communicating during alerts and emergencies and during normal operating instructions. The additional administrative burden added here for normal Operating Instructions does not add value to BES reliability and substantially increases the compliance burden. Tri-State requests further clarity of the Operations Instructions definition with clear expectations between emergencies, alerts and normal communication. Also, Tri-State requests feedback as to how standards for normal communication will address actual events that occurred during the Blackout and how this standard is providing a foundation for BES risk assessments and prioritization, which the RAI is working towards. R3 and R4 are written in a zero tolerance fashion: "implement the documented communications protocols". This opens up industry to have to document, review and monitor all communications for emergencies, alerts and normal communications to effectively complete audits with no findings. Having the normal Operating Instructions included with the emergency and alert communications does not allow the industry to maximize their limited resources for the issues that are of higher risk. The added burden of assessing and evaluation the programs for identifying, assessing and correcting (R3-R4 RSAW) are also premature. The industry has not developed and vetted these practices to have a strong and regionally consistent foundation to be audited from. Tri-State requests feedback for what exactly R5 is seeking. R5.1 appears to be a reiteration of R3 and R4 ("implement" versus "assess adherence"). Who or what determines "effectiveness of the

communication protocols” in 5.2? What are the expectations for documentation of this? It is the communication programs and the final results of that program that impact the BES reliability. The internal control programs will support the industry to achieve these goals with more consistency, but should not be included within the standards. Tri-State recommends eliminating R5. Language more specific to the communication as opposed to the control programs should be considered, if needed.

No

In order to develop appropriate VRFs and VSLs, it will be imperative to differentiate between Reliability Directives and Operating Instructions. It must be clear which Operating Instructions will be monitored and audited and the expectations for each type of communication. There is a difference between the risk and impact to the BES under these various conditions and the VSLs should reflect that. Tri-State does not find that evaluating, auditing and administratively following normal Operating Instructions to this degree of specificity provides the BES reliability value that the Blackout recommendations were seeking.

Yes

For the reasons listed in response to Questions 1 and 2, Tri-State cannot support expanding COM-002 as it is shown in this draft. It adds a tremendous amount of administrative burden and does not enhance the BES reliability.

Requirement 1.8 should not be included, it is proposed to be removed under Paragraph 81.

Group

Luminant

Brenda Hampton

Yes

While neither the August 2003 Blackout Report Recommendation number 26 nor Order 693 requires three-part communications or any established communication protocol for normal operations, EOP-001-2, R3.1 and COM-002-2, R2 already address the requirements of the Blackout Report and FERC Order 693. Therefore, in keeping the requirements from COM-002-2 as part of the COM-002-4 standard, we can reasonably argue that the Standard addresses the recommendation.

No

We do not agree with VSLs for R3 & R4. While there is the potential of risk if documented communications protocols are not followed, this should not somehow imply that incorrect operations were performed as a result. The severe category should be reserved only for those instances in which documented communications protocols were not followed \*and\* the Operating Instructions were not implemented correctly which resulted in an Emergency or

Adverse Reliability Impact. As a result, we suggest the following Violation Severity Levels which results in limiting the High and Severe levels to only those instances that resulted in an Emergency or Adverse Reliability Impact: Low - The responsible entity demonstrates a consistent pattern of not using the documented communications protocols developed in Requirement R1 for Operating Instructions that are not Reliability Directives. Moderate – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive. High – The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving an Operating Instruction \*and\* the Operating Instruction was not implemented correctly resulting in an Emergency or Adverse Reliability Impact. Severe - The responsible entity did not use the documented communications protocols developed in Requirement R1 when issuing or receiving a Reliability Directive \*and\* the Reliability Directive was not implemented correctly which make the Emergency or Adverse Reliability Impact worse.

Yes

While, under the circumstances, we fully support combining COM-002-3 and COM-003-1 into one communication protocol and appreciate the efforts of the Standards Drafting Team to draft this combined standard in such a short time frame, we do not believe this standard contains clear requirements at this point. Requirements R3 and R4 simply requires the communication protocols to be implemented. The Measure for those requirements requires evidence which may include descriptions of management practices that provide the entity reasonable assurance that protocols are being followed. The RSAW requires the auditor to consider the frequency and volume of communications reviewed as part of the audit process even though communication review is not required by R3 & R4 nor M3 & M4. Additionally we do not believe that this "communication review" should be a requirement to reasonably assure compliance with the communication protocol. Not only is it not necessary to reasonably assure compliance as ongoing periodic training can suffice but due to the fact that we have hundreds of communications with the RC, BA and TOP on a monthly basis and very few if any of those communications result in an Operating Instructions it will be very burdensome to find calls to review. So to reasonably assure compliance with the communication protocol and to not create an undue compliance burden we suggest that R3 & R4 implementation requirement be changed to require periodic communication protocol reviews and ongoing operator training on the communication protocol. In addition, Requirements 1.2 and 2.1 introduce the idea of written Operating Instructions while the other requirements covering the issuance of clear concise instructions and the requirements covering the receipt and understanding of the instruction do not cover written Operating Instructions at all. To ensure that communications are tightened as required by Recommendation #26 and the SAR then the reference to a written instruction should be removed from the requirements and the definition of the Operating Instruction should be refined as follows: "An oral command by operating personnel responsible...."

PacifiCorp
Ryan Millard
Yes
Yes
Yes
PacifiCorp appreciates the diligence and dedication of the Standard Drafting Team and recognizes the improvements that were made in response to industry comments from the previous draft. There are a few additions, however, that PacifiCorp would like the drafting team to clarify: Firstly, in light of the fact that NERC has not finalized or implemented the RAI project, PacifiCorp would like to know why the drafting team included internal control language in the COM-002-4 RSAW? This language seems to anticipate what the end-state of the RAI Initiative is going to be (see "Note to Auditor" on pages 9-15 of the RSAW). In the absence of a final auditor handbook (which is supposed to be consistent across regions), PacifiCorp would like to know how an auditor can determine whether an internal control is "properly designed" or "effective"? Secondly, in M3 and M4 of the proposed COM-002-4 standard the drafting team has added language that includes, "Evidencing periodic, independent review of operating personnel's adherence to the protocols established in R2 and R5." It does not seem clear to PacifiCorp what the periodicity is expected to be or what constitutes an "independent" review? Although these points do not influence our support of the COM-002-4 standard, PacifiCorp strongly recommends that the drafting team reconsider including internal control review language in the RSAW until the RAI initiative has been fully implemented and auditor guidance has been formally developed and distributed across all regions.

(1) This standard does not address the directive to "tighten communications." This draft is a reproduction of prior COM-003-1 drafts, with unnecessary protocols that do not improve reliability of the BES. For example, it is unnecessary to include a requirement to use the English language in all but a small handful of areas of the Eastern, Western and ERCOT interconnections. This will result in unnecessary compliance burdens that do not support reliability contrary to the RAI. (2) We appreciate the SDT combining COM-002-3 and COM-003-1. (3) Broad applicability to DPs is inappropriate. DPs do not operate or own Elements of the BES. Thus, they cannot "change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System" as defined in the definition of Operating Instruction. Thus, they will never receive an operating instruction and should not be put in the position of having to demonstrate compliance with a requirement that can never impact them. This approach is contrary to the RAI initiative to refocus compliance efforts on higher risk requirements that actually impact reliability. While a DP may be required to reduce load, this is essentially a reliability directive and not an operating instruction. What other actions would a BA, TOP or RC require of a DP besides to reduce load? We can think of none and cannot fathom applicability for operating instructions to DPs.
No
We disagree with the content of COM-003-1, as there should not be detailed protocols. Since we disagree with the content of the standard, we also disagree with the VSLs. Further, both Reliability Directives and Operating Instructions have a HIGH VRF which appears inconsistent with previous drafts of the definitions and use of the two terms.
Yes
We do not understand the urgency to request a waiver to the SPM for this project. The NERC BOT resolution did not require a new standard to be developed by the November BOT meeting. Due to the shortened time frame, industry does not have enough time to fully vet the issues with SMEs. This standard lacks technical justification to justify the reduced comment and ballot period. There are serious compliance impacts from the proposed requirements and not enough

guidance on when to self-report instances of miscommunication. This will only further serve to perpetuate the current compliance approaches that place too much emphasis on minor details that do not support reliability.

Yes

While I agree with the combining of COM standards, I have a disagreement with the definition of operating instruction. I would whole-heartedly agree that this protocol be adhered to during emergency or abnormal conditions, but not during normal conditions. The mere fact that a System Operator calls a remote generation plant to raise 25-30-50 MW should not necessitate a three-point communication. There are times when those instructions are given to another System Operator who then calls the plant, therefore doubling up on three-point communications.

## Introduction

---

The Project 2007-02 Drafting Team (OPCP SDT) thanks all commenters who submitted comments on the COM-002-4 Operating Personnel Communications Protocols standard. The standard was posted for a 14-day public comment period from October 21, 2013 through November 4, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 77 sets of comments, including comments from approximately 178 different people from approximately 115 companies representing all 10 Industry Segments.

All comments submitted may be reviewed in their original format on the standard's [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/files/Appendix\\_3A\\_StandardsProcessesManual\\_20120131.pdf](http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf)

# Consideration of Comments

---

## Purpose of Consideration of Comments Summary

The OPCP SDT appreciates the comments from industry regarding the COM-002-4 standard. All comments were reviewed carefully by the OPCP SDT and changes were made to the standard accordingly. While all comments were reviewed, the new Standards Process Manual (SPM) does not require responses to each individual comment when an additional ballot is needed. However, this document provides a summary of responses to comments. The following pages will provide a summary of the comments received and how the comments were addressed by the OPCP SDT.

## COM-002-4 Comments

### *Operating Instruction Definition*

Several commenters provided alternative language to provide clarity for the Operating Instruction definition. After reviewing the comments, and considering the NERC Board of Trustees' November 7<sup>th</sup> 2013 Resolution<sup>2</sup>, the OPCP SDT has revised the definition of Operating Instruction to remove the reference to Reliability Directive. This was primarily in response to a NOPR issued by FERC<sup>3</sup> which proposed to remand the filing that contained the definition of Reliability Directive. This action would result in Reliability Directive not being a defined term. Furthermore, the OPCP SDT inserted parentheses to offset the type of communication that is not included in the Operating Instruction definition to provide additional clarity.

### *Applicability*

Several commenters expressed concern with the standard's applicability to Generator Operators (GOP) and Distribution Providers (DP). The concerned entities commented that some DPs and GOPs do not have 24/7 staff or do not use, own, or operate Bulk Electric System (BES) facilities. Further, some entities expressed concern that the current wording of the standard might require them to begin 24-hour operations, and require them to install recording equipment, even if they never receive an Operating Instruction.

In response to the comments and the NERC Board Resolution, the OPCP SDT revised the standard to clarify that DPs and GOPs are required to a) train their operators prior to receiving an Operating Instruction, and b) use three-part communication when receiving an Operating Instruction during an Emergency. In addition, the measures have been revised to show that a DP or GOP can demonstrate compliance for use of three-part communication when receiving an Operating Instruction during an Emergency by providing an attestation from the issuer of the Operating Instruction. If a DP or GOP never receives an Operating Instruction, no requirement in this standard would apply to them. To clarify, it was never the intent of the OPCP SDT to require entities to change their staffing, or to install any additional equipment to demonstrate compliance.

### *Non-Emergency Operations*

Some entities stated that the communications protocols specified in COM-002-4 should not apply to non-Emergency or day-to-day operations. Similarly, some entities expressed concern that three-part communications are not necessary for non-Emergency and day-to-day operations.

---

<sup>2</sup> See [http://www.nerc.com/gov/bot/Board of Trustees Quarterly Meetings/Board COM Resolution 11.7.13 v1 AS APPROVED BY BOARD.pdf](http://www.nerc.com/gov/bot/Board%20of%20Trustees%20Quarterly%20Meetings/Board%20COM%20Resolution%2011.7.13%20v1%20AS%20APPROVED%20BY%20BOARD.pdf)

<sup>3</sup> See [http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/NOPR TOP IRO RM13-12 RM13-14 RM13-15 20131121.pdf](http://www.nerc.com/FilingsOrders/us/FERCOrdersRules/NOPR%20TOP%20IRO%20RM13-12%20RM13-14%20RM13-15%2020131121.pdf)

The OPCP SDT respectfully disagrees with these comments. From a practical standpoint, one set of communications protocols for both emergency and non-emergency situations will reduce confusion for operating personnel. In particular, operating personnel would not have to switch to a different set of (potentially unfamiliar) communications protocols in stressful emergency situations. This is especially true for three-part communications. Operating personnel should be using three-part communications in day-to-day operations so that the use of three-part communications during emergency conditions is natural and supports effective communications. Also, FERC Order No. 693 directed the OPCP SDT to address both emergency and non-emergency communications protocols. The NERC Board of Trustees also directed the Standards Committee and the OPCP SDT to draft a single Reliability Standard that includes communications protocols for emergency and non-emergency operations. A new draft of COM-002-4 was developed in response to this input.

### *Requirement R1 Clarification*

Several commenters requested more clarity in Requirement R1. Some entities expressed confusion over whether a receiver of an Operating Instruction was required to respond when operating personnel that issued an Operating Instruction were required to confirm a response. Other entities wanted more clarity as to what actions may be taken by operating personnel issuing an Operating Instruction when no response was received. Additionally, several entities stated that some of the protocols were unnecessary, specifically the use of English and the use of alpha-numeric clarifiers.

The OPCP SDT revised Requirement R1 to provide more clarity as well as provide more latitude to operating personnel issuing an Operating Instruction. The revised requirement states that operating personnel that issue an Operating Instruction may take an alternate action to issue an Operating Instruction when the receiver does not respond or if the receiver does not understand the Operating Instruction. This revision more accurately reflects the scope of actions that an issuer of an Operating Instruction can take. In response to the comments above, the OPCP SDT removed Part 1.8 which required entities to specify which instances required alpha-numeric clarifiers in their communications protocols. The requirement for the use of the English language was retained, since it was incorporated from COM-001-1.1 Requirement R4.

### *GOP and DP Documented Communications Protocols and Three-Part Communications*

Some entities commented that GOPs and DPs should not be required to develop documented communications protocols because they only receive Operating Instructions and/or Reliability Directives.

The OPCP SDT agrees that the requirement to develop documented communications protocols for DPs and GOPs is not necessary. The OPCP SDT removed the seventh posting's Requirement R2, which required documented communications protocols for GOPs and DPs that receive Operating Instructions. In the eighth posting, the only requirements that apply to DPs and GOPs are Requirements R3 and R6. Requirement R3 requires initial training for operating personnel who can receive an Operating Instruction. Requirement R6 requires receivers of Operating Instructions issued during an Emergency to use three-part communications. Requirement R5 supports Requirement R6 by requiring each BA, RC, and TOP that issues an Operating Instruction during an Emergency to use three-part communications. Therefore, the OPCP SDT reduced the administrative burden on GOP and DP while covering any reliability gap by requiring GOPs and DPs receiving Operating Instructions during an Emergency to engage in three-part communications.

### *"Implement" and Training*

Several entities requested clarification for the word "implement" in Requirements R3 and R4 from the seventh posting. They expressed concern that the term was difficult to demonstrate compliance with.

In response, the OPCP SDT removed those requirements and added Requirements R2 and R3 in the eighth posting. Requirement R2 now requires each BA, RC, and TOP to conduct initial training for each operator responsible for the Real-time operation of the interconnected BES on the documented communications protocols developed in Requirement R1. Requirement R3 requires each DP and GOP to conduct initial training for each operator who can receive an Operating Instruction. The OPCP SDT originally intended “implement” to include this initial training but determined an initial training requirement more clearly captures this intent. In addition, Requirement R4 was added to require BAs, RCs, and TOPs to at least once every 12 months assess adherence by its operating personnel to the documented communication protocols in Requirement R1 and to provide feedback to its operators on their performance, including any appropriate corrective actions. It also requires these entities to assess the effectiveness of their communications protocols and make changes as necessary to improve the effectiveness of the protocols. The requirement of entities to self assess, self identify and provide feedback to its operators was also included in the Board of Trustees’ resolution. Further, the OPCP SDT believes that it is good operating practice for an entity to periodically evaluate the effectiveness of their protocols and improve them when possible. Additionally, the OPCP SDT also believes it is good operating practice to provide operators with performance feedback on their adherence to the entity’s documented protocols. This provides entities an opportunity to evaluate their operators’ performance and take corrective actions where necessary, which could prevent a miscommunication from occurring and thus quite possibly prevent an event which could harmful to the reliability of the Bulk Electric System.

The OPCP SDT believes the combination of R1-R4 and a non-zero tolerance approach to compliance, for Operating Instructions issued/received during a non-Emergency, represents an improvement over the previous “implement” terminology as it better captures an approach that improves reliability by providing a shorter assessment and correction cycle for an entity than a traditional audit schedule and reduces the associated compliance burden concurrently.

### *Consistent Pattern*

Several commenters expressed concern with the phrase “consistent pattern” in the VSLs for Requirements R3 and R4.

The OPCP SDT agrees that the term is vague and has removed it from the revised VRFs and VSLs.

### *VRFs and VSLs*

Several commenters requested revised VRFs and VSLs.

The OPCP SDT modified the VRFs and VSLs to better reflect the differences in severity of violating a documents requirement (*i.e.* Requirement R1), violating a training or assessment requirement (*i.e.* Requirements R2, R3 and R4) and violating a requirement when issuing or receiving an Operating Instruction during an Emergency (*i.e.* Requirements R5, R6 and R7). In addition, the OPCP SDT focused on using clear language in the VSLs.

### *Zero Defect Standard*

Some entities expressed concern that posting seven of the standard had elements that had no tolerance for compliance deviations. Given that the Board directed the OPCP SDT to include no exceptions for using three-part communications for emergency communications, the OPCP SDT determined that the standard must maintain this aspect in a few requirements. However, the OPCP SDT took this approach only for

Operating Instructions issued during an Emergency in Requirements R5, R6, and R7. Therefore, the OPCP SDT limited the zero tolerance approach to only Emergency communications in the standard.

*Compliance/Enforcement*

Several commenters expressed concern over compliance with the requirements and their enforceability.

In response, the OPCP SDT focused on eliminating vague terms from the standard that would create ambiguity in compliance with the standard. In addition, the comments have been provided to NERC Compliance to use in revising the RSAW that is posted with the eighth posting of the standard.

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting of the SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of COM-003-1 Standard posted November 2009 for Informal Comments closed January 15, 2010.
7. Version 2 draft of COM-003-1 Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20, 2012.
8. Version 3 draft of COM-003-1 Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of COM-003-1 Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of COM-003-1 Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.
11. Version 6 draft of COM-003-1 Standard posted June 2013 for Formal Comments, Ballot closed July 19, 2013.
12. COM-003-1 renumbered as COM-002-4. Version 1 draft of COM-002-4 Standard posted October 2013 for Formal Comments, Ballot closed November 7, 2013.
13. On December 12, 2013, the Standards Committee approved a waiver of the Standard Processes Manual to shorten the formal comment and ballot period, from 45 days to 30 days.

**Description of Current Draft:**

This is the second draft of a revised standard (eighth posting of a communications standard) requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The standard drafting team is posting this standard for a shortened 30 day formal Comment and 10 day Ballot period per the Standards Committee wavier.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
----------------------------	-------------------------

## COM-002-4 Operating Personnel Communications Protocols

---

1. Additional ballot of Standard	January 2014
2. Final ballot of Standard	February 2014
3. Board adopts standard	TBD

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

Operating Instruction — A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

**A. Introduction**

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-002-4
3. **Purpose:** To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Reliability Coordinator
    - 4.1.4 Transmission Operator
    - 4.1.5 Generator Operator
5. **(Proposed) Effective Date:** The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements**

- R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
  - 1.1. Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.2. Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Confirm the receiver’s response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.

- Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- 1.3. Require its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 1.4. Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
  - 1.5. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
  - 1.6. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction. *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- R3.** Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every twelve (12) calendar months: *[Violation Risk Factor: Medium][Time Horizon: Operations Planning]*
- 4.1. Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action, as appropriate to address deviations from the documented protocols.
  - 4.2. Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.

- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- Confirm the receiver's response if the repeated information is correct (in accordance with Requirement R6).
  - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or
  - Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- R6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R7.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]

**C. Measures**

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.
- M3.** Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.
- M4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of

Requirement R4. The entity shall provide evidence that it took appropriate corrective actions as part of its assessment for all instances where an operating personnel's non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency and for all other instances where the entity determined that it was appropriate to take a corrective action to address deviations from the documented protocols developed in Requirement R1.

- M5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issued an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence that the issuer either: 1) confirmed that the response from the recipient of the Operating Instruction was correct; 2) reissued the Operating Instruction if the repeated information was incorrect or if requested by the receiver; or 3) took an alternative action if a response was not received or if the Operating Instruction was not understood by the receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings, or dated and time-stamped transcripts of voice recordings, or dated operator logs in fulfillment of Requirement R5.
- M6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that was the recipient of an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence to show that the recipient either repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction in fulfillment of Requirement R6. Such evidence may include, but is not limited to, dated and time-stamped voice recordings dated operator logs, an attestation from the issuer of the Operating Instruction, voice recordings (if the entity has such recordings), memos or transcripts.
- M7.** Each Balancing Authority, Reliability Coordinator and Transmission Operator that issued a written or oral single or multiple-party burst Operating Instruction during an Emergency shall provide evidence that the Operating Instruction was received by at least one receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings, dated operator logs, electronic records, voice recordings (if the entity has such recordings), memos or transcripts.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall each keep data or evidence for each applicable Requirement for the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

### **1.3. Additional Compliance Information**

None

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting of the SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of COM-003-1 Standard posted November 2009 for Informal Comments closed January 15, 2010.
7. Version 2 draft of COM-003-1 Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20, 2012.
8. Version 3 draft of COM-003-1 Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of COM-003-1 Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of COM-003-1 Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.
11. Version 6 draft of COM-003-1 Standard posted June 2013 for Formal Comments, Ballot closed July 19, 2013.
12. COM-003-1 renumbered as COM-002-4. Version 1 draft of COM-002-4 Standard posted October 2013 for Formal Comments, Ballot closed November 7, 2013.
13. On December 12, 2013, the Standards Committee approved a waiver of the Standard Processes Manual to shorten the formal comment and ballot period, from 45 days to 30 days.

### Description of Current Draft:

This is the ~~first~~second draft of a revised standard (~~seventh~~eighth posting of a communications standard) requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The standard drafting team is posting this standard for a ~~15-shortened 30 day concurrent Formal~~formal Comment ~~period~~ and 10 day Ballot period per the Standards Committee wavier.

### Future Development Plan:

**COM-002-4 Operating Personnel Communications Protocols**

---

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Additional ballot of Standard	<del>October 2013</del> <u>January 2014</u>
2. Final ballot of Standard-	<del>November 2013</del> <u>February 2014</u>
3. Board adopts standard-	<del>November 2013</del> <u>TBD</u>

DRAFT

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

Operating Instruction — A command by operating personnel responsible for the Real-time ~~generation control and~~ operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. ~~(A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one type of an Operating Instruction.)~~

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-002-4
3. **Purpose:** To ~~tighten~~improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Reliability Coordinator
    - 4.1.4 Transmission Operator
    - 4.1.5 Generator Operator
5. **(Proposed) Effective Date:** The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall ~~have~~develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum:  
*[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- ~~1.1.~~ Require ~~the issuer of a Reliability Directive to identify the action as a Reliability Directive to the receiver.~~
- ~~1.2.1.1.~~ Require the issuer and receiver of its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
- ~~1.3.1.2.~~ Require the issuer of its operating personnel that issue an oral two-party, person-to-person Operating Instruction ~~to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer~~ to take one of the following actions:

- Confirm the receiver's response if the repeated information is correct.
- Reissue the Operating Instruction if the repeated information is incorrect; ~~if the receiver does not issue a response~~; or if requested by the receiver.
  - ~~Require the receiver of~~ Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.

~~1.4.1.3.~~ Require its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions:

- Repeat, not necessarily verbatim, the Operating Instruction and ~~wait for~~ receive confirmation from the issuer that the ~~repetition~~ response was correct.
- ~~Request that the issuer reissue the Operating Instruction.~~
  - Request that the issuer reissue the Operating Instruction.

~~1.5.~~ Require the issuer of an its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to ~~verbally or electronically confirm receipt by at least one receiver when issuing or verify that the Operating Instruction through was received by at least one way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).~~

~~1.6.1.4.~~ Require the receiver of an oral the Operating Instruction ~~to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all call system).~~

~~1.7.1.5.~~ Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.

~~1.8.1.6.~~ Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.

~~2.0.~~ Specify Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the instances where alpha-numeric clarifiers are required when Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an ~~oral~~ Operating Instruction ~~and the format for those clarifiers.~~

~~R3.R2.~~ Each Distribution Provider and Generator Operator shall have documented communications protocols. The protocols shall, at a minimum: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*

~~2.1.~~ Require the receiver of an oral or written Operating Instruction to respond using the English language, unless agreed to otherwise. An alternate language may be

~~used~~ Each Distribution Provider and Generator Operator shall conduct initial training for ~~internal operations~~.

~~2.2.R3.~~ Require the receiver of each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to take one of the following actions: either: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*

- Repeat, ~~not necessarily verbatim~~, the Operating Instruction and ~~wait for~~ receive confirmation from the issuer that the ~~repetition~~ response was correct, ~~or~~
- Request that the issuer reissue the Operating Instruction.

~~2.0.~~ Require the receiver of an oral Operating Instruction to request clarification from the issuer if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g., an all-call system).

~~R5.R4.~~ Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall ~~implement the documented communications protocols developed in Requirement R1~~ at least once every twelve (12) calendar months: *[Violation Risk Factor: High/Medium][Time Horizon: Real-time Operations] Planning]*

~~Each Distribution Provider and Generator Operator~~ 4.1. Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action, as appropriate to address deviations from the documented protocols.

4.2. Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.

~~R6.R5.~~ Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall ~~implement the documented communications protocols developed in Requirement R2~~ either: *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*

- Confirm the receiver's response if the repeated information is correct (in accordance with Requirement R6).
- Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or
- Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.

R6. Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*

- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
- Request that the issuer reissue the Operating Instruction.

—Each Balancing Authority, Reliability Coordinator, and Transmission Operator ~~shall implement a method to evaluate the communications protocols developed in Requirement R1 that:~~ *[Violation Risk Factor: Low][Time Horizon: Operations Planning]*

R7. 5.1. —~~Assesses adherence to the communications protocols~~that issues a written or oral single-party to ~~provide feedback to issuers and receivers~~multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of Operating Instructions. ~~the Operating Instruction.~~ *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*

5.2. ~~Assesses the effectiveness of the communications protocols and modifies those protocols, as necessary.~~

### C. Measures

M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.

M2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.

M2-M3. Each Distribution Provider and Generator Operator shall provide its ~~documented communications protocols developed for Requirement R2.~~initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.

M3-M4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence ~~that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R1 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols established in Requirement R1 and the remediation of noted exceptions in fulfillment of Requirement R5~~of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness

and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4. The entity shall provide evidence that it took appropriate corrective actions as part of its assessment for all instances where an operating personnel's non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency and for all other instances where the entity determined that it was appropriate to take a corrective action to address deviations from the documented protocols developed in Requirement R1.

~~M4.~~ Each Distribution Provider and Generator Operator shall provide evidence that it implemented the documented communication protocols which may include, but is not limited to, descriptions of the management practices in place that provide the entity reasonable assurance that protocols established in Requirement R2 are being followed by personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, spreadsheets, memos, or logs, evidencing periodic, independent review of operating personnel's adherence to the protocols established in Requirement R2.

~~M5.~~ Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide descriptions and associated evidence of the management practices in place that demonstrate a review of communications with operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System and evidence that the entity evaluates the effectiveness of its documented communications protocols in fulfillment of Requirement R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issued an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence that the issuer either: 1) confirmed that the response from the recipient of the Operating Instruction was correct; 2) reissued the Operating Instruction if the repeated information was incorrect or if requested by the receiver; or 3) took an alternative action if a response was not received or if the Operating Instruction was not understood by the receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings, or dated and time-stamped transcripts of voice recordings, or dated operator logs in fulfillment of Requirement R5.

~~M6.~~ Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that was the recipient of an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence to show that the recipient either repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction in fulfillment of Requirement R6. Such evidence may include, but is not limited to, dated and time-stamped voice recordings dated operator logs, an attestation from the issuer of the Operating Instruction, voice recordings (if the entity has such recordings), memos or transcripts.

~~M5-M7.~~ Each Balancing Authority, Reliability Coordinator and Transmission Operator that issued a written or oral single or multiple-party burst Operating Instruction during an Emergency shall provide evidence that the Operating Instruction was received by at least one receiver. Such evidence may include, but is not limited to, dated and time-

stamped voice recordings, dated operator logs, electronic records, voice recordings (if the entity has such recordings), memos or transcripts.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### 1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall each keep data or evidence for each applicable Requirement for the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.3. Additional Compliance Information**

None

## Implementation Plan

### Operating Personnel Communications Protocols

#### COM-002-4

#### Standards Involved

Approval:

- COM-002-4 – Operating Personnel Communications Protocols

Retirements:

- COM-001-1.1 Requirement R4 – Telecommunications
- COM-002-2 – Communication and Coordination
- COM-002-3 – Communication and Coordination

#### Prerequisite Approvals

None

#### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

#### Operating Instruction —

A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

#### Applicable Entities

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### Conforming Changes to Other Standards

None

**Effective Date**

COM-002-4 and the definition of “Operating Instruction” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Retirement of Existing Standards:**

COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

# Implementation Plan

## Operating Personnel Communications Protocols

### COM-002-4

#### Standards Involved

Approval:

- COM-002-4 – Operating Personnel Communications Protocols

Retirements:

- COM-001-1.1 Requirement R4 – Telecommunications
- COM-002-2 – Communication and Coordination
- COM-002-3 – Communication and Coordination

#### Prerequisite Approvals

None

~~Approval of the definition of “Reliability Directive”~~

#### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

##### Operating Instruction —

A command by operating personnel responsible for the Real-time ~~generation control and~~ operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.) ~~—A Reliability Directive is one type of an Operating Instruction.~~

#### Applicable Entities

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### Conforming Changes to Other Standards

None

**Effective Date**

COM-002-4 and the definition of “Operating Instruction” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Retirement of Existing Standards:**

COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

# DRAFT Reliability Standard Audit Worksheet<sup>1</sup>

## COM-002-4 – Operating Personnel Communications Protocols

*This section to be completed by the Compliance Enforcement Authority.*

**Audit ID:** Audit ID if available; or REG-NCRnnnnn-YYYYMMDD  
**Registered Entity:** Registered name of entity being audited  
**NCR Number:** NCRnnnnn  
**Compliance Enforcement Authority:** Region or NERC performing audit  
**Compliance Assessment Date(s)<sup>2</sup>:** Month DD, YYYY, to Month DD, YYYY  
**Compliance Monitoring Method:** Audit  
**Names of Auditors:** Supplied by CEA

### Applicability of Requirements

	BA	DP	GO	GOP	IA	LSE	PA	PSE	RC	RP	RSG	TO	TOP	TP	TSP

R6	X	X	X												
R7	X								X				X		

<sup>1</sup> NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC’s and the Regional Entities’ assessment of a registered entity’s compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC’s Reliability Standards can be found on NERC’s website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The NERC RSAW language contained within this document provides a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity’s adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserves the right to request additional evidence from the registered entity that is not included in this RSAW. Additionally, this RSAW includes excerpts from FERC Orders and other regulatory references. The FERC Order cites are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

<sup>2</sup> Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

**DRAFT** NERC Reliability Standard Audit Worksheet

DRAFT

**R1 Supporting Evidence and Documentation**

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum:
- 1.1.** Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.2.** Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Confirm the receiver’s response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.
    - Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
  - 1.3.** Require its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 1.4.** Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
  - 1.5.** Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
  - 1.6.** Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.

**Definition of Operating Instruction**

A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.

**Registered Entity Response to General Compliance with this Requirement (Required):**

## DRAFT NERC Reliability Standard Audit Worksheet

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

### Evidence Requested<sup>3</sup>:

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

A copy of the documented communication protocols that cover the Requirements outlined in Requirement R1 Parts 1.1 to 1.6.

### Registered Entity Evidence (Required):

The following information is recommended for all evidence submitted:

File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.

Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

### Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

### Compliance Assessment Approach Specific to COM-002-4, R1

*This section to be completed by the Compliance Enforcement Authority*

	Review the documented communications protocols provided by entity and ensure they address the Parts of R1 as follows:
(1.1)	Requires its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
(1.2)	Requires its operating personnel that issue an oral two-part, person-to-person Operating Instruction to take one of the following actions: confirm the receiver's response if the repeated information is correct, reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or take an alternative action to issue a new or the same Operating Instruction if the receiver does not respond.
(1.3)	Requires its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions: repeat, not necessarily verbatim, the Operating

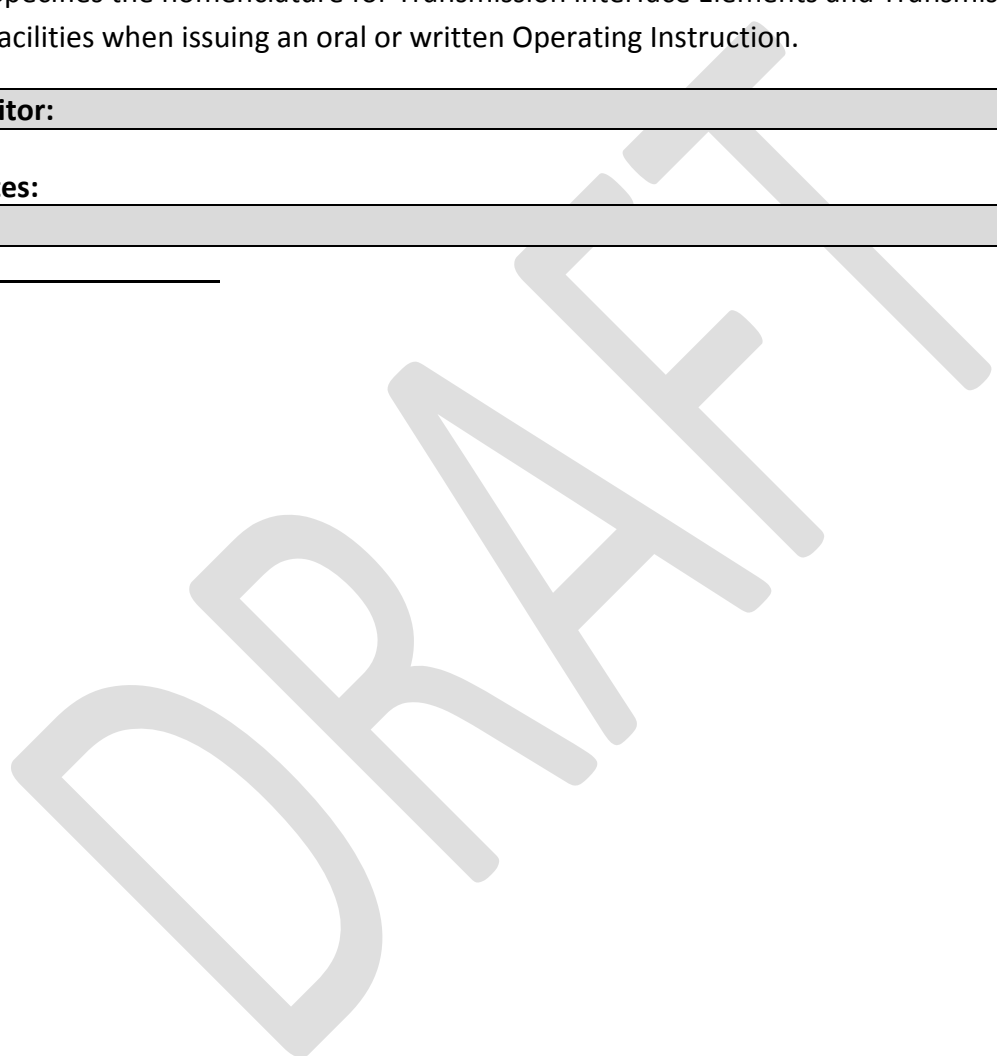

<sup>3</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

	Instruction and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction.
(1.4)	Requires its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
(1.5)	Specifies the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
(1.6)	Specifies the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.

**Note to Auditor:**

**Auditor Notes:**

**R2 Supporting Evidence and Documentation**

- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>4</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Copies of dated attendance logs, agendas, learning objectives, or course materials as outlined in M2.

Organization chart or similar artifact identifying the operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System and the date such personnel began operating the Real-time Bulk Electric System.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

<sup>4</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

**Compliance Assessment Approach Specific to COM-002-4, R2**

***This section to be completed by the Compliance Enforcement Authority***

Verify applicable operating personnel, or a sample thereof, received the required training prior to the date they began operating the Real-time Bulk Electric System by agreeing selected personnel names to training records.
--

<b>Note to Auditor:</b> Requirement R2 requires only initial training; continuing training is not required.
---

**Auditor Notes:**

--

DRAFT

**R3 Supporting Evidence and Documentation**

- R3.** Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either:
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- M3.** Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>5</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Copies of dated attendance logs, agendas, learning objectives, or course materials as outlined in M3.

Organization chart or similar artifact identifying the operating personnel who can receive an oral two-party, person-to-person Operating Instruction and the date such personnel began receiving such instructions.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

<sup>5</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

**Compliance Assessment Approach Specific to COM-002-4, R3**

*This section to be completed by the Compliance Enforcement Authority*

Verify applicable operating personnel, or a sample thereof, received the required training prior to the date they began receiving oral two-party, person-to-person Operating Instructions by agreeing selected personnel names to training records.
---

**Note to Auditor:** Requirement R3 requires only initial training; continuing training is not required.

**Auditor Notes:**

--

DRAFT

**R4 Supporting Evidence and Documentation**

- R4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall, at least once every twelve (12) calendar months:
  - 4.1.** Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action as appropriate to address deviations from the documented protocols.
  - 4.2.** Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.
  
- M4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4. The entity shall provide evidence that it took appropriate corrective actions as part of its assessment or all instances where an operating personnel’s non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency, and for all other instances where the entity determined that it was appropriate to take a corrective action to address deviations from the documented protocols developed in Requirement R1.

**Definition of Emergency**

Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>6</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

- (4.1) Dated spreadsheets, logs, or other evidence of assessment and feedback of operating personnel as outlined in M4.

<sup>6</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity’s discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

(4.2) Revisions made to documented communications protocols based on assessments, or minutes of meetings or others summaries evidencing the effectiveness of documented protocols were assessed.

A list or log of corrective actions taken in response to Emergencies occurring on the entity’s system due to non-adherence to documented communications protocols during the audit period.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-002-4, R4**

*This section to be completed by the Compliance Enforcement Authority*

	<p>(4.1) Review evidence to gain reasonable assurance that an assessment of operating personnel issuing and receiving Operating Instructions adherence to the documented protocols established in Requirement R1 occurred every twelve months during the audit period. Verify assessment or another artifact includes evidence such as annotations or summaries of providing feedback and taking corrective action, as necessary, in accordance with the requirement.</p>
	<p>(4.2) Review evidence such as document revisions, meetings minutes, or other summaries to gain reasonable assurance that the effectiveness of documented communications protocols in Requirement R1 was assessed every twelve months during the audit period.</p>
	<p>For Emergencies, occurring on the entity’s system, or a sample thereof, assess whether or not an operating personnel’s non-adherence to the documented protocols was the partial or sole cause of the Emergency and if so, verify entity took appropriate corrective actions by reviewing summaries, meeting minutes, or the like, outlining corrective actions taken.</p>

**Note to Auditor:** Auditors can use their general knowledge of the entity’s system, discussions with other Regional Entity/NERC personnel, and discussions with entity personnel to gain an awareness of Emergencies resulting potentially from non-adherence to communications protocols. Such Emergency events can then be reviewed during an audit to determine, if the Emergency was indeed attributable to an instance of non-adherence to communications protocols ,that corrective action was taken.

The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with this requirement.

**DRAFT** NERC Reliability Standard Audit Worksheet

Based on the auditor's assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity's responses to numerous Emergencies.

**Auditor Notes:**

DRAFT

**R5 Supporting Evidence and Documentation**

- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either:
- Confirm the receiver’s response if the repeated information is correct (in accordance with Requirement R6).
  - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.
  - Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- M5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issued an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence that the issuer either: 1) confirmed that the response from the recipient of the Operating Instruction was correct; 2) reissued the Operating Instruction if the repeated information was incorrect or if requested by the receiver; or 3) took an alternative action if a response was not received or if the Operating Instruction was not understood by the receiver. Such evidence could include, but is not limited to, dated and time-stamped voice recordings, or dated and time-stamped transcripts of voice recordings, or dated operator logs in fulfillment of Requirement R5.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>7</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Dated and time-stamped voice recordings or transcripts of such voice recordings or operator logs, as described in M5.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.

<sup>7</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity’s discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-002-4, R5**

*This section to be completed by the Compliance Enforcement Authority*

Review evidence and determine for Operating Instructions issued during an Emergency the entity confirmed the receiver's response if the repeated information was correct (in accordance with Requirement R6), reissued the Operating Instruction if the repeated information was not correct or if requested by the receiver, and took alternative action to issue a new or the same Operating Instruction if the receiver did not respond.

**Note to Auditor:** Auditors can use their general knowledge of the entity's system, discussions with other Regional Entity/NERC personnel, and discussions with entity personnel to gain an awareness of Emergencies resulting potentially from non-adherence to Requirement R5. Such Emergency events can then be reviewed during an audit to determine if the evidence indicates the entity complied with Requirement R5 in issuing Operating Instructions during the Emergency.

The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with this requirement.

Based on the auditor's assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity's responses to numerous Operating Instructions issued during Emergencies.

**Auditor Notes:**

--

**R6 Supporting Evidence and Documentation**

- R6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either:
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- M6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that was the recipient of an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence to show that the recipient either repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction in fulfillment of Requirement R6. Such evidence may include, but is not limited to, dated and time-stamped voice recordings, dated operator logs, an attestation from the issuer of the Operating Instruction, voice recordings (if the entity has such recordings), memos or transcripts.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>8</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Dated operator logs, voice recordings, memos, or transcripts, or other evidence (per M6) describing the entity's response to Operating Instructions received during an Emergency selected by the auditor.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

<sup>8</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**DRAFT NERC Reliability Standard Audit Worksheet**

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

**Compliance Assessment Approach Specific to COM-002-4, R6**

*This section to be completed by the Compliance Enforcement Authority*

	Review evidence and determine for Operating Instructions received during an Emergency entity repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction.
<b>Note to Auditor:</b> Auditors can use their general knowledge of the entity’s system, discussions with other Regional Entity/NERC personnel, and discussions with entity personnel to gain an awareness of Emergencies resulting potentially from non-adherence to Requirement R6. Such Emergency events can then be reviewed during an audit to determine if the evidence indicates the entity complied with Requirement R6 for Operating Instructions received during the Emergency.	
The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with this requirement.	
Based on the auditor’s assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity’s responses to numerous Operating Instructions received during Emergencies.	

**Auditor Notes:**

--

**R7 Supporting Evidence and Documentation**

- R7.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
- M7.** Each Balancing Authority, Reliability Coordinator and Transmission Operator that issued a written or oral single or multiple-party burst Operating Instruction during an Emergency shall provide evidence that the Operating Instruction was received by at least one receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings, dated operator logs, electronic records, voice recordings (if the entity has such recordings), memos or transcripts.

**Registered Entity Response to General Compliance with this Requirement (Required):**

Describe, in narrative form, how you meet compliance with this Requirement. Provide a brief explanation, in your own words, of how you meet compliance with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

**Evidence Requested<sup>9</sup>:**

Provide the following evidence, or other evidence to demonstrate compliance. If the provisioning of this evidence is burdensome or otherwise unreasonable, contact your CEA to arrange for sampling or other means of reduction of the quantity of evidence submitted.

Dated operator logs, voice recordings, memos, or transcripts, as described in M5 and for Emergencies requested by the auditor.

**Registered Entity Evidence (Required):**

The following information is recommended for all evidence submitted:  
File Name, Document Title, Revision, Date, Page(s), Section(s), Section Title(s), and Description.  
Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

**Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):**

<sup>9</sup> Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

**Compliance Assessment Approach Specific to COM-002-4, R7**

***This section to be completed by the Compliance Enforcement Authority***

Review evidence and determine entity confirmed or verified that the multiple-party burst Operating Instruction was received by at least one receiver of the Operating Instruction.
--

**Note to Auditor:** Auditors can use their general knowledge of the entity’s system, discussions with other Regional Entity/NERC personnel, and discussions with entity personnel to gain an awareness of Emergencies resulting potentially from non-adherence to Requirement R7. Such Emergency events can then be reviewed during an audit to determine if the evidence indicates the entity complied with Requirement R7 when issuing written or oral burst Operating Instructions during the Emergency.

The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with this requirement.

Based on the auditor’s assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing evidence, in accordance with the above Compliance Assessment Approach, associated with the entity’s responses to numerous burst Operating Instructions issued during Emergencies.

## Project 2007-02 Operating Personnel Communications Protocols COM-002-4

Please **DO NOT** use this form. Please use the [electronic comment form](#) to submit comments on the proposed draft COM-002-4 (Operating Personnel Communications Protocols) standard. Comments must be submitted by **January 31, 2014**. If you have questions please contact [Stephen Eldridge](#) by email or by telephone at 404-446-9686.

[http://www.nerc.com/pa/Stand/Pages/Op\\_Comm\\_Protocol\\_Project\\_2007-02.aspx](http://www.nerc.com/pa/Stand/Pages/Op_Comm_Protocol_Project_2007-02.aspx)

### Background Information:

Effective communication is critical for Bulk Electric System (BES) operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES. The eighth posting of Project 2007-02 is a continuation of the previous draft which combined COM-002-3 and COM-003-1 into one standard titled COM-002-4 that addresses communications protocols for operating personnel in Emergency, alert, and non-emergency situations.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work for Project 2007-02 Operating Personnel Communications Protocols (OPCP). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American BES will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. Federal Energy Regulatory Commission (FERC) Order 693 paragraph 532 reiterates this need. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear and consistent language.

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating Operating Instructions.

The Purpose statement of COM-002-4 states: "To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES)."

- 1) **New NERC Glossary term:** The OPCP Standards Drafting Team (SDT) revised the definition of Operating Instruction from its previous drafts. The current definition reads “A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)” The Project 2007-02 SDT removed the term “Reliability Directive” in order to avoid complications that may result from the Notice of Proposed Rulemaking issued by the Federal Energy Regulatory Commission on November 21, 2013 proposing to remand the definition of “Reliability Directive.” COM-002-4 uses the defined term “Operating Instruction” to define the circumstances when documented communications protocols must be used. This term is proposed for addition to the North American Electric Reliability Corporation (NERC) Glossary to establish meaning and usage within the electricity industry.
- 2) **Project 2007-02, Posting 8 continues to combine COM-002-3 and COM-003-1 into COM-002-4.** The OPCP SDT combined COM-002-3 and COM-003-1 in posting 7 into one standard in order to simplify communications protocols for operating personnel. This construct has been maintained in the posting 8 draft. The OPCP SDT determined that one communications protocols standard that addresses Emergency, alert, and non-emergency situations will improve communications because system operators will not need to refer to a different set of protocols during an emergency situation. The OPCP SDT believes this will improve consistency of communications and mitigate confusion during stressful emergency situations. The OPCP SDT decided to combine the standards under the title COM-002-4 to further reduce confusion. The COM-002-4 title keeps the numbering of COM standards consecutive (*e.g.*, COM-001, COM-002).
- 3) **Project 2007-02, Posting 8 features 7 requirements.** The The OPCP SDT developed the requirement structure and language in posting 8 to incorporate Emergency, alert, and non-emergency communications protocols. The language in COM-002-4, Requirement R1 permits applicable entities flexibility to develop their communication protocols but requires a set of minimum elements in the communications protocols. Requirement R1 requires communications protocols to include the following elements:
  - a. **English Language:** Requirement R1, Part 1.1 – Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - b. **Three-part Communication for Oral Operating Instructions:** Requirement R1, Parts 1.2 and 1.3 – Require three-part communication for issuers and receivers of oral two-party, person-to-person Operating Instructions.

- c. **One-way Burst Message Receipt Confirmation and Clarification:** Requirement R1, Part 1.4– Requires the issuer of a written or oral single-party to multiple-party burst Operating Instruction to verbally or electronically confirm receipt by at least one receiver of the Operating Instruction. **Time Identification:** Requirement R1, Part 1.5 – Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
- d. Transmission Interface Elements and Facilities Nomenclature: Requirement R1, Part 1.6 – Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating *Instruction*.

Requirements R2 and R3 require each Balancing Authority, Reliability Coordinator, Transmission Operator, Distribution Provider and Generator Operator to conduct initial training for operating personnel who can issue and/or receive Operating Instructions . These requirements mandate that before operating personnel can issue or receive an Operating Instruction, the operating personnel in question must receive the training listed in the respective requirement.

Requirement R4 mandates a feedback loop for each Balancing Authority, Reliability Coordinator, and Transmission Operator, where the entity must assess the adherence of its operating personnel to the communication protocols the entity developed (with appropriate corrective actions) as well as assess the effectiveness of its documented communication protocols for its operating personnel that issue Operating Instructions.

Requirements R5 and R6 require the use of three part communication during Emergency conditions without exception, per the November 13, 2013 NERC Board of Trustees resolution.

Requirement R7 requires each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction to confirm the receipt of that Operating Instruction by at least one receiver.

The OPCP SDT is posting the standard for industry comment for a **30-day** comment period. The OPCP SDT received a waiver of the 45-day comment period required in the NERC Standards Process Manual from the NERC Standards Committee on December 11, 2013. Accordingly, we request that you include your comments on the electronic form by **January 31, 2014**.

## Questions

1. **Do you agree that that the COM-002-4 standard addresses addresses the NERC Board of Trustees November 19<sup>th</sup>, 2013 Resolution? If not, please explain in the comment area?**

Yes

No

Comments:

2. **Do you agree that COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26, and FERC Order 693? If not, please explain in the comment area.**

Yes

No

Comments:

3. **Do you agree with the VRFs and VSLs for the Requirements? If not, please explain.**

Yes

No

Comments:

4. **Do you have any additional comments? Please provide them here.**

Yes

No

# Project 2007-02, COM-002-4 Operating Personnel Communications Protocols Rationale and Technical Justification

## Background and Justification for COM-002-4 Requirements

The purpose of the proposed COM-002-4 Reliability Standard is to improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES). The proposed Reliability Standard combines COM-002-3 and former draft COM-003-1 into one standard that addresses communications protocols for operating personnel in Emergency, alert and non-emergency conditions. The Operating Personnel Communications Protocols Standard Drafting Draft (OPCP SDT) believes that one communications protocols standard that addresses emergency and non-emergency situations will improve communications because operating personnel will not need to refer to a different set of protocols during the different operating conditions. A single standard will improve consistency of communications and mitigate confusion during stressful emergency situations. As a result of the combination, the standard has been numbered as COM-002-4 to maintain the consecutive numbering of the standards (e.g., COM-001, COM-002) since the combined standard will replace COM-002-2 and COM-002-3, where necessary.

In preparing COM-002-4, the OPCS SDT considered industry comments and also drew from a variety of other resources including:

- the NERC Board of Trustees' November 7<sup>th</sup>, 2013 Resolution for Operating Personnel Communication Protocols, discussed below;<sup>1</sup>
- a survey distributed to a sample of industry experts by the Director of Standards Development and the Standards Committee Chair requesting feedback on the draft standard in posting 8;
- consultation on the use of the term "Reliability Directive" in the COM-002-4 standard with the Project 2007-03 Real-time Transmission Operations Standard Drafting Team and the Project 2006-06 Reliability Coordination Standard Drafting Team; and
- a full-day "Communications in Operations" technical conference held February 14-15, 2013 to gather industry input on a consensus communications standard approach.

<sup>1</sup> *Resolution for Agenda Item 8.i: Operating Personnel Communication Protocols*, NERC Board of Trustees Meeting, Nov. 7, 2013, available at:

<http://www.nerc.com/gov/bot/Board%20of%20Trustees%20Quarterly%20Meetings/Board%20COM%20Resolution%2011.7.13%20v1%20AS%20APPROVED%20BY%20BOARD.pdf>.

### *Structure of the COM-002-4 Draft*

In response to the Board of Trustees direction to draft a combined COM-002 and COM-003 standard that addresses, at a minimum certain protocols, NERC staff prepared a “strawman” draft standard and provided it as a starting point for the standard drafting team to edit and adjust as it deemed appropriate. The structure of posting 8 of COM-002-4 reflects the minimum elements listed by the Board in its resolution (see below for detail on the Board resolution). The structure also allows for the implementation of a compliance/enforcement approach also described by the Board’s resolution that maintains the current requirement that entities should be accountable for incorrect use of communication protocols in connection with emergency communications, without exception.

In COM-002-4, the same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions – i.e. non-emergency, alert, and Emergency communications. However, the standard uses the phrase “Operating Instruction during an Emergency” in certain Requirements (R5, R6, R7) to provide a demarcation for what is subject to a zero-tolerance compliance/enforcement approach and what it not. This is necessary to allow the creation of Violation Severity Levels for each compliance/enforcement approach. Where “Operating Instruction during an Emergency” is not used, an entity will be assessed under a non-zero tolerance compliance/enforcement approach that focuses on whether an entity met the initial training Requirement (either R2 or R3) and/or whether an entity performed the assessment and took corrective actions according to Requirement R4.

Separately listing out Requirements R5, R6, and R7 and using “Operating Instruction during an Emergency” in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an “Operating Instruction during an Emergency.” The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies.

For example, an entity should expect its operating personnel that issue and receive Operating Instructions to use the documented communication protocols for all Operating Instructions. The way that they reinforce that with its operating personnel is through training, assessing adherence by its operating personnel to the documented communication protocols and providing feedback those operating personnel on their use of the protocols. During Emergencies, operating personnel must use the communication protocol without exception, since clear communication is essential to providing swift and coordinated response to events that are directly impacting the reliability of the BES.

### *Definition of “Operating Instruction”*

The current draft of COM-002-4 does not include the term “Reliability Directive,” which was included in previous postings as a subset within the definition of “Operating Instruction.”

The proposed definition of “Operating Instruction” in COM-002-4 reads as follows:

A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

The OPCP SDT debated whether to remove the term “Reliability Directive” in response to comments suggesting it should be removed from the definition of “Operating Instruction” and in light of FERC’s issuance of the TOP/IRO NOPR, which proposes to remand the definition of “Reliability Directive.” A detailed description of the FERC action is included in the section below titled “Developments Following Posting 7.”

In order to avoid unnecessary complications, the OPCP SDT consulted on the use of the term “Reliability Directive” in the COM-002-4 standard with the Project 2007-03 Real-time Transmission Operations and the Project 2006-06 Reliability Coordination Standard Drafting Teams to ask whether they believed removal of the term would cause concerns. Both teams agreed that the COM-002-4 standard did not need to require a protocol to identify Reliability Directives as such and that the definition of Operating Instruction could be used absent the term Reliability Directive in COM-002-4 to set the protocols. The OPCP SDT ultimately voted to remove the term and incorporate the phrase “Operating Instruction during an Emergency” in the Requirements where it was needed to preserve the structure created to ensure that only an Operating Instruction issued during an Emergency is subject to a zero-tolerance compliance/enforcement approach.

A “command” as used in the definition refers to both oral and written commands by operating personnel. In the requirements of COM-002-4, the OPCP SDT has specified “oral” or “written” as needed to define which Operating Instructions are covered by the requirement. The definition continues to clarify that general discussions are not considered Operating Instructions.

### *Applicability*

In addition to Balancing Authorities, Reliability Coordinators, and Transmission Operators, the proposed standard applies to Distribution Providers and Generator Operators. The OPCP SDT added these Functional Entities in the Applicability section because they can be and are on the receiving end of some Operating Instructions. The OPCP SDT determined that it would leave a gap to not cover them in a communications standard that addresses operating personnel. The addition of Distribution Providers as an applicable entity also responds to FERC’s directive in Order No. 693 to add them as applicable entities to the communications standard.

Recognizing that Generator Operators and Distribution Providers typically only receive Operating Instructions, the OPCP SDT proposed that only Requirements R3 and R6 apply to these Functional Entities. In response to the comments and the NERC Board Resolution, the OPCP SDT revised the standard to clarify that DPs and GOPs are required to a) train their operators prior to receiving an Operating Instruction, and b) use three part communication when receiving an Operating Instruction during an Emergency. In addition, the measures have been revised to show that a DP or GOP can demonstrate compliance for use of three-part communication when receiving an Operating Instruction during an Emergency by providing an attestation from the issuer of the Operating Instruction (i.e., a voice recording is not required). If a DP or GOP never receives an Operating Instruction, no requirement in COM-002-4 would apply to them. In both Requirements R3 and R6, qualifying language that discusses the “receipt” of an Operating Instruction is included to make this point clear. This construct ensures that appropriate entities are trained and able to use three-part communication for reliability purposes, while seeking to minimize the compliance burden on DPs and GOPs.

### *Requirements in COM-002-4*

#### **Requirement R1**

Requirement R1 requires entities that can both issue and receive Operating Instructions to have documented communications protocols that include a minimum set of elements, outlined in Parts 1.1 through 1.6 of the requirement. Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between Functional Entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.<sup>2</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators’ errors were due to communication problems.<sup>3</sup> The necessary protocols include the use of the English language unless agreed to otherwise (except for internal operations), protocols for use of a written or oral single-party to multiple-party burst Operating Instruction, specification of instances that require time identification, nomenclature for Transmission interface Elements, and three-part communications (including a protocol for taking an alternate action if a response is not received or if the Operating Instruction was not understood by the receiver).

The OPCP SDT drafted Requirement R1 to ensure consistency among communications protocols while also allowing flexibility for entities to develop additional communications protocols. The OPCP SDT determined that the inclusion of the elements in Parts 1.1 through 1.6 are necessary to improve communications protocols but are not overly prescriptive. The OPCP SDT determined that this

---

<sup>2</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

<sup>3</sup> Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

approach is the best way to promote effective communications while maintaining flexibility for entities to include additional communications protocols based on its own operating environment.

It should be noted that requiring the use of alphanumeric clarifiers has been removed in this posting. Several entities have provided the comment that it is unnecessary to include them in a requirement, and pointed to the fact that the lack of use has not been shown to contribute to any investigated event. The drafting team agreed to remove the term, and NERC will continue to monitor events to determine if these clarifiers should be added in a future modification to the standard.

The term *documented communication protocols* in R1 refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. An entity should include as much detail as it believes necessary in their documented protocols, but they must address all of the applicable parts of Requirement R1. Where an entity does not already have a set of documented protocols that meet the parts of Requirement R1, the entity must develop the necessary communications protocols. Entities may also adopt the documented protocols of another entity as its own communications protocols, but the entity must maintain its own set of documented communications protocols to meet Requirement R1.

On September 19, 2012, the NERC Operating Committee issued a Reliability Guideline entitled: “System Operator Verbal Communications – Current Industry Practices.” As stated on page one, the purpose of the Reliability Guideline “. . . is to document and share current verbal BES communications practices and procedures from across the industry that have been found to enhance the effectiveness of system operator communications programs.” This guideline serves as an additional source of information on best practices that entities can draw on in creating the documented communications protocols.

Each part of Requirement R1 is discussed below:

*1.1. Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.*

The OPCP SDT has included this part to carry forward the same use of English language included in COM-001-1.1, Requirement R4. Retirement of this Requirement in COM-001-1.1 was specifically referred to this Project 2007-02. The requirement continues to permit the issuer and receiver to use an agreed to alternate language. This has been retained since use of an alternate language on a case-by-case basis may serve to better facilitate effective communications where the use of English language may create additional opportunities for miscommunications. Part 1.1 requires the use of English language when issuing oral or written (e.g. switching orders) Operating Instructions. This creates a standard language (unless agreed to otherwise) for use when issuing commands that could change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. It also clarifies that an alternate language can be used internally

within the organization. The phrase has been modified slightly from the language in COM-001-1.1, Requirement R4 to incorporate the term “Operating Instruction,” which defines the communications that require the use of the documented communications protocols.

*1.2. Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:*

- *Confirm the receiver’s response if the repeated information is correct.*
- *Reissue the Operating Instruction if the repeated information is incorrect, if the receiver does not issue a response, or if requested by the receiver.*
- *Take an alternative if a response is not received or if the Operating Instruction was not understood by the receiver.*

*1.3. Require the receiver of an oral two-party, person-to-person Operating Instruction to take one of the following actions:*

- *Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.*
- *Request that the issuer reissue the Operating Instruction.*

The OPCP SDT has included part 1.2 to require communications protocols for the use of three-part communications for oral two-party, person-to-person Operating Instructions *by the issuer*. The OPCP SDT has included part 1.3 to require communications protocols for the use of three-part communications for oral two-party, person-to-person Operating Instructions *by the receiver*. This carries forward the requirement to use three-part communications in COM-002-2 and COM-002-3 and also adds an option in part 1.2 for the issuer to take an alternative action to resolve the issue if the receiver does not respond or understand the Operating Instruction. The addition of this third bullet serves to clarify in the requirement language itself that the issuing entity can take alternate action in lieu of reissuance if necessary.

The reliability benefits of using three-part communication (Requirement R1, parts 1.2 and 1.3) are threefold:

1. The removal of any doubt that use of the documented communication protocols is required when issuing or receiving Operation Instructions. This will reduce the opportunity for confusion and misunderstanding during all operating conditions.
2. There will be no mental “transition” between protocols when operating conditions shift from non-emergency to Emergency. The documented communication protocols for the operating personnel will remain the same during transitions through all conditions.
3. The formal requirement for three-part communication will create a heightened sense of awareness in operating personnel that the task they are about to execute is critical, and

recognize the risk to the reliable operation of the BES is increased if the communication is misunderstood.

*1.4. Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.*

The OPCP SDT has included this part to require communications protocols for an issuer for the use of a one-way burst messaging system. The drafting team has included this because the use of three-part communications is not practical when utilizing this type of communication. Therefore, it is necessary to include a different set of protocols for these situations. In addition, many entities expressed concern that if one-way burst messaging systems were not addressed, it would imply that three part communication would be required for all participants. For this reason, the drafting team chose to address one-way burst messaging systems.

*1.5. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.*

The OPCP SDT has included this part to add necessary clarity to Operating Instructions to reduce the risk of mistakes. Clarifying time and time zone (where necessary) contributes to reducing misunderstandings and reduces the risk of a grave error during BES operations, especially when communicating across time zones or specifying an action that will take place at a future time. Note that an action that is to occur immediately would not be required to have time identification, unless the entity specified that requirement in its communication protocols.

*1.6. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.*

Project 2007-03 chose to eliminate TOP-002-2a, Requirement R18 when it developed TOP-002-3. This Requirement stated “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” COM-002-4, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are readily familiar with each other’s interface Elements and Facilities, eliminating hesitation and confusion when referring to equipment for the Operating Instruction. This shortens response time and improves situational awareness. It also permits entities to jointly develop the nomenclature for their interface.

### **Requirements R2 and R3**

Requirement R2 requires the entities listed in Requirement R1 (i.e. each Balancing Authority, Reliability Coordinator, and Transmission Operator) to conduct initial training for each of their operating personnel responsible for the Real-time operation of the Bulk Electric System on the entity's documented communication protocols.

Requirement R3 requires Distribution Providers and Generator Operators to conduct initial training on three part communication for each of their operating personnel who can who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction. Distribution Providers and Generator Operators would have to train their operating personnel prior to placing them in a position to receive an oral two-party, person-to-person Operating Instruction. Operating Personnel that would never be in a position to receive an oral two-party, person-to-person Operating Instruction, therefore, would not need initial training unless their circumstance changes. The purpose of the language in Requirement R3, is to minimize the training burden, and demonstration of compliance, to only those operating personnel that can receive an oral two-party, person-to-person Operating Instruction.

The OPCP SDT has included an initial training requirement in the standard in response to the NERC Board of Trustees resolution, which directs that a training requirement be included in the COM-002-4 standard. Additionally, requiring entities who issue and or receive Operating Instructions to conduct initial training with their operating personnel will ensure that all applicable operators will be trained in three-part communication. The OPCP SDT believes this training will reduce the possibility of a miscommunication, which could eventually lead to action or inaction harmful to the reliability of the Bulk Electric System. Ongoing training would fall under an entities training program in PER-005 or could be listed as a type of corrective action under Requirement R4.

#### **Requirement R4**

Requirement R4 requires Balancing Authorities, Reliability Coordinators, and Transmission Operators to, at least once every 12 months, assess adherence by its operating personnel to the documented communication protocols in Requirement R1 and to provide feedback to its operating personnel on their performance. This also includes any corrective action taken, as appropriate, to address deviations from the documented protocols. It also requires the aforementioned entities to assess the effectiveness of their documented communications protocols and make changes, as necessary, to improve the effectiveness of the protocols. An entity may determine that corrective action beyond identification of the misuse of the documented communications protocols to the operating personnel is not necessary, therefore, the phrase "as appropriate" is included in the Requirement R4 language to indicate that whether to take additional corrective action is determined by the entity and not dictated by the Requirement for all instances of a misuse of a documented communication protocol.

Requiring entities to assess, identify and provide feedback to its operating personnel, was also included in the November 7, 2013 NERC Board of Trustees resolution as an element to include in the standard. Further, the OPCP SDT believes that it is good operating practice for an entity to periodically

evaluate the effectiveness of their protocols and improve them when possible. Most entities currently engage in some type of assessment activity for their operating personnel. Additionally, the OPCP SDT also believes it is good operating practice to provide operators with performance feedback on their adherence to the entity's documented protocols. Doing so, provides entities an opportunity to evaluate the performance of their operating personnel and take corrective actions where necessary, which could prevent a miscommunication from occurring and thus possibly prevent an event which could be harmful to the reliability of the Bulk Electric System.

The associated Measure M4 for Requirement R4 lists the types of evidence that an entity can provide to demonstrate compliance and also explains when an entity should show the corrective actions taken. Of particular interest is any corrective action taken where the miscommunication is the sole or partial cause of an Emergency and the entity has opted to take a corrective action. While the Measure lists out this particular set of circumstances to highlight the importance, the Measure does not modify the Requirement to require corrective action. Again, to reiterate, whether a corrective action is necessary is best determined by the entity based on the facts and circumstances of the particular communication.

### **Requirements R5 and R6**

Requirement R5 requires entities that issue oral two-party, person-to-person Operating Instructions during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, to use three-part communication or take an alternate action if the receiver does not respond or if the Operating Instruction was not understood by the receiver. The language of Requirement R5 specifically excludes written or oral single-party to multiple-party burst Operating Instructions to make clear that three-part communication is not required when issuing Operating Instructions in this manner. Requirement R5 applies to each Balancing Authority, Reliability Coordinator, and Transmission Operator since these are the entities that would be in a position to *issue* oral two-party, person-to-person Operating Instructions during an Emergency.

Requirement R6 requires entities that receive an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, to repeat (not necessarily verbatim) the Operating Instruction and receive confirmation from the issuer that the response was correct or request that the issuer reissue the Operating Instruction. Requirement R6 includes the same clarifying language as Requirement R5 for the exclusion of single-party to multiple-party burst Operating Instructions. Requirement R6 applies to each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator since these are the entities that would be in a position to *receive* oral two-party, person-to-person Operating Instructions during an Emergency

The use of three-part communication when issuing and receiving Operating Instructions is always important because a miscommunication could create an Emergency. An entity should expect its operating personnel that issue and receive Operating Instructions to use the documented communication

protocols for all Operating Instructions. The way that they reinforce that with its operating personnel is through training, assessing adherence by its operating personnel to the documented communication protocols and providing feedback those operating personnel on their use of the protocols. However, the use of three-part communication is critically important if an Emergency condition already exists, as further action or inaction could cause exponentially increase the harmful effects to the BES. Clear communication is essential to providing swift and coordinated response to events that are directly impacting the reliability of the BES.

### **Requirement R7**

Requirement R7 requires that when a Balancing Authority, Reliability Coordinator, or Transmission Operator issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency, it must confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. Because written or oral single-party to multiple-party burst Operating Instruction during an Emergency are excluded from Requirements R5 and R6, this separate Requirement is necessary to specify the standard an entity must meet to demonstrate clear communication for the use of written or oral single-party to multiple-party burst Operating Instructions during an Emergency. This prevents leaving a gap in the types of communications used during an Emergency.

The OPCP SDT believes this requirement is necessary because without confirmation from at least one receiver, the issuer has no way of confirming if the Operating Instruction was transmitted and received by any of the recipients. Therefore, the issuer cannot know whether to resend the Operating Instruction, wait for the recipient to take an action, or take an alternate action because the recipient cannot perform the action. As a best practice, an entity can opt to confirm receipt from more than one recipient, which is why the requirement states “at least one.”

## **NERC Board’s Resolution**

At its November meeting, the Board passed a resolution that directs the Standards Committee and the standard drafting team “to continue development of a combined COM-002 and COM-003 standard that addresses, at a minimum, the following:

- Draws on the Operating Committee Guideline for good communication practice;
- Includes an essential set of communications protocols to be used by all entities that would be included in an entity’s overall communications protocol approach;
  - The protocol should at a minimum require the use of three-part communications for

- (i) emergency and alert communications (“Emergency Communications”) and (ii) non-emergency communications that change or preserve the state, status, output, or input of the Bulk Electric System (“Non-Emergency Communications”);
- Requires training and periodic review of communications subject to the communications protocols; and
- Requires each entity to (i) periodically self assess its effectiveness in implementing the communications protocols, (ii) self identify any necessary changes to the entity’s protocols based upon experience and the results of periodic review, and (iii) provide feedback to its operators regarding their adherence to the protocols.”

The resolution further directs the standard drafting team to “consider the following compliance/enforcement approach:

- Maintain the current requirement that entities should be accountable for incorrect use of communication protocols in connection with Emergency Communications, without exception.
- For all other use of communication protocols in connection with Non-Emergency Communications, the standard should provide that compliance with the standard should only entail assessing whether an entity has: (i) adopted a communications protocol consistent with the foregoing; (ii) implemented training and periodic review of communications subject to the protocols; and (iii) implemented a process to (x) periodically self assess its effectiveness in implementing the communications protocols, (y) self identify any necessary changes to the entity’s protocols based upon experience and the results of periodic review, and (z) provide feedback to its operators regarding their adherence to the protocols.”

# Project 2007-02: Operating Personnel Communication Protocols

Mapping Document

## COM-001-1.1 to COM-002-4

Board Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p>R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.</p>	<p><b>COM-002-4</b></p> <p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communications protocols. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>1.1. Require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations</p>
<p><b>Notes:</b> Moved COM-001-1 R4 into COM-002-4 Requirement R1 Part 1.1 and modified language to include the defined term “Operating Instruction.”</p>	

## COM-002-2 to COM-002-3

Board Approved Standard	Proposed Replacement Requirement(s)
<p>COM-002-2</p> <p>R1. Each Transmission Operator, Balancing Authority, and Generator Operator shall have communications (voice and data links) with appropriate Reliability Coordinators, Balancing Authorities, and Transmission Operators. Such communications shall be staffed and available for addressing a real-time emergency condition. <i>[Violation Risk Factor: High]</i></p> <p>R1.1 Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator, and all other potentially affected Balancing Authorities and Transmission Operators through predetermined communication paths of any condition that could threaten the reliability of its area or when firm load shedding is anticipated. <i>[Violation Risk Factor: High]</i></p>	<p>The Project 2006-06 SDT proposed retiring COM-002-2, R1 and R1.1 during the development of proposed standard COM-002-3. The following rationale was provided by that drafting team in the Implementation Plan for Draft 6 of Project 2006-06. The same rationale continues to apply for the current version of COM-002-4:</p> <p>“The communications requirements of R1 are addressed in existing COM-001-1.1 as well as the proposed COM-001-2 requirements. Additionally, IRO-010-1a addresses data provisions.</p> <p>The Project 2006-06 SDT contends that COM-002-2, R1.1 is a low level facilitating requirement that is more appropriately and inherently monitored under various higher level performance-based reliability requirements for each entity throughout the body of standards. Examples include:</p> <ul style="list-style-type: none"> <li>• EOP-002-1, R3 – outlines BA to RC communications. IRO-001-1, R3 requires adequate telecommunication for the Reliability Coordinator to direct actions of multiple entities, including TOPs and BAs.</li> <li>• TOP-001-1, R3 requires adequate telecommunications facilities for the TOP, BA, and GOP to be able to receive directives from the RC.</li> <li>• TOP-001-1, R5 requires communications between TOPs and RCs for emergency situations.</li> </ul>

Board Approved Standard	Proposed Replacement Requirement(s)
	<ul style="list-style-type: none"> <li>• TOP-005-1, R1 and R3 require adequate telecommunications for BAs and TOPs to provide each other with operating data as well as providing data to the RC.</li> <li>• TOP-006-1, R1 requires adequate telecommunications for the GOP to inform the BA and TOP of resources. The BA and TOP will then inform the RC, other TOP and BAs of all transmission and generation available for use.</li> <li>• PER-001-1, R1 and PER-004-1, R1 set forth the staffing requirements.”</li> </ul>
<p><b>Notes:</b> None. The rationale provided above is available at the following hyperlink: <a href="#">Project 2006-06 Draft 6 Implementation Plan</a></p>	
<p>COM-002-2</p> <p>R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall issue directives in a clear, concise, and definitive manner; shall ensure the recipient of the directive repeats the information back correctly; and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings. <i>[Violation Risk Factor: Medium]</i></p>	<p>COM-002-3</p> <p>The Project 2006-06 expanded COM-002-2 R2 into three requirements in COM-002-3:</p> <p><b>R1.</b> When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p><b>R2.</b> Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive, shall repeat, restate, rephrase or recapitulate the Reliability Directive. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p><b>R3.</b> Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either:  <i>[Violation Risk Factor: High] [Time Horizon: Real-Time]</i></p> <ul style="list-style-type: none"> <li>• Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> <li>• Reissue the Reliability Directive to resolve any misunderstandings.</li> </ul>
<p><b>Notes:</b> The Project 2006-06 expanded the list of responsible entities to include the DP and GOP and subdivided the requirement to improve clarity.</p>	

## COM-002-3 to COM-002-4

Board Approved Standard	Proposed Replacement Requirement(s)
<p>COM-002-3</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p>	<p>COM-002-4</p> <p>None</p>
<p><b>Notes:</b> The Project 2007-02 SDT removed the term “Reliability Directive” in order to avoid complications that may result from the Notice of Proposed Rulemaking issued by the Federal Energy Regulatory Commission on November 21, 2014 proposing to remand the</p>	

Board Approved Standard	Proposed Replacement Requirement(s)
<p>definition of “Reliability Directive”. COM-002-4 uses the defined term Operating Instruction to define the circumstances when documented communications protocols must be used, and uses the phrase “Operating Instruction during an Emergency” to designate Operating Instructions that would have qualified as Reliability Directives. The Project 2007-02 SDT coordinated with the Project 2009-02 Real time Operations team and Project 2006-06 SDT and all parties agreed that requirement for an issuer to identify a command as a Reliability Directive is not a communication protocol, and will be considered by each team for future modifications.</p>	
<p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive, shall repeat, restate, rephrase or recapitulate the Reliability Directive. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall either: <i>[Violation Risk Factor: High] [Time Horizon: Real-Time]</i></p> <ul style="list-style-type: none"> <li>• Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> </ul> <p>Reissue the Reliability Directive to resolve any misunderstandings.</p>	<p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>1.1 Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.</p> <p>1.2. Require the issuer of an oral two-party, person-to-person Operating Instruction to wait for a response from the receiver. Once a response is received, or if no response is received, require the issuer to take one of the following actions:</p> <ul style="list-style-type: none"> <li>• Confirm the receiver’s response if the repeated information is correct.</li> <li>• Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.</li> </ul>

Board Approved Standard	Proposed Replacement Requirement(s)
	<ul style="list-style-type: none"> <li>• Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.</li> </ul> <p>1.3 Require its operating personnel that receive an oral two party, person-to-person Operating Instruction to take one of the following actions:</p> <ul style="list-style-type: none"> <li>• Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct.</li> <li>• Request that the issuer reissue the Operating Instruction.</li> </ul> <p>1.4 Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.</p> <p>1.5 Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.</p> <p>1.6 Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.</p> <p>R2. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the</p>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p>documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction. <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <p>R3. Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: <i>[Violation Risk Factor: Low][Time Horizon: Long-term Planning]</i></p> <ul style="list-style-type: none"> <li>• Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or</li> <li>• Request that the issuer reissue the Operating Instruction.</li> </ul> <p>R4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every twelve (12) calendar months: <i>[Violation Risk Factor: Medium][Time Horizon: Operations Planning]</i></p> <p style="padding-left: 40px;">4.1. Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action, as deemed appropriate by the entity, to address deviations from the documented protocols.</p>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p>4.2. Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.</p> <p>R5. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> <li>• Confirm the receiver’s response if the repeated information is correct (in accordance with Requirement R6).</li> <li>• Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or</li> <li>• Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.</li> </ul> <p>R6. Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an</p>

Board Approved Standard	Proposed Replacement Requirement(s)
	<p>Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> <li>• Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or</li> <li>• Request that the issuer reissue the Operating Instruction.</li> </ul> <p>R7. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p>
<p><b>Notes:</b> COM-002-3 Requirements R2 and R3 were moved into COM-002-4. The Project 2007-02 SDT has developed COM-002-4 to provide more stringent communication requirements during Emergencies and Alerts as well as establish communication protocols for non-Emergency/non-alert communications that occur between entities.</p>	

## Project 2007-02 – Operating Personnel Communications Protocol

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM-002-4 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) – Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management

- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

#### **Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

### **Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

### **VRFs for COM-002-4**

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs and the SDT, therefore, concentrated its approach on the reliability impact of the requirements.

There are seven requirements in COM-002-4. Requirements R1, R2, and R3 are assigned a "Low" VRF. Requirement R4 is assigned a "Medium" VRF. Requirement R5, R6 and R7 are each assigned a "High" VRF.

- R1 reads: *" Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum:"*
- R2 reads: *" Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction."*
- R3 reads: *" Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either:"*

R4 reads: *" Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every twelve (12) calendar months:"* This Requirement warrants a VRF of "Medium" because R4 is a requirement in an operations planning time frame that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, a violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. "

R5 now reads: *" Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either:"*

R6 is a new requirement which reads “Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either:”

R7 is a new requirement which reads *“Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.”* Requirements R5, R6, and R7 warrant VRFs of “High” because failure to use the communications protocols during an emergency could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

VRF and VSL Justifications – COM-002-4, R1	
<b>Proposed VRF</b>	Low
NERC VRF Discussion	R1 is a requirement in a Long-term Planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system. The VRF for this requirement is “Low,” which is consistent with NERC guidelines.
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 establishes communications protocols, which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard:</b> The requirement has sub-parts that similarly address communication protocols; only one VRF was assigned so there is no conflict. There are no other requirements in COM-002-4 that address specific protocols.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> There are no other standards which address documented communications protocols.

VRF and VSL Justifications – COM-002-4, R1			
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                      Failure to utilize communication protocols properly could result in actions that directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures since R1 strictly deals with documenting clear, formal and universally applied communication protocols. The VRF for this requirement is “Low,” which is consistent with NERC guidelines for similar requirements.</p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                      COM-002-4 Requirement R1 contains only one objective which is to document clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of the bulk electric system. Since the requirement has only one objective, only one VRF was assigned.</p>		
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity did not specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification, as required in Requirement R1, Part 1.5	The responsible entity did not require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise, as required in Requirement R1, Part 1.1. An alternate language may be used for internal operations.	The responsible entity did not include Requirement R1, Part 1.4 in its documented communication protocols. **VRF and VSL Justifications – COM-002-4, R1**

<b>VRF and VSL Justifications – COM-002-4, R1</b>	
<p><b>FERC VSL G1</b> Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>Based on the VSL Guidance, the SDT developed four VSLs based on misapplication or absence of common communication protocols, with varied VSLs. The SDT determined how the protocols should be divided in the VSLs by judging the severity of the potential risk to the bulk electric system if the protocols ultimately are not used. If the severity is greater, then not having the protocol documented should carry a higher severity level and similarly for protocols where the severity is lesser. If no communication protocols were addressed at all then the VSL is Severe.</p>
<p><b>FERC VSL G2</b> Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: The SDT has intentionally not structured the VSL assignment for R1 as binary in order to reflect the relative severity of each protocol should the protocol not ultimately be employed.</p> <p>Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

**VRF and VSL Justifications – COM-002-4, R1**

<p><b>FERC VSL G3</b> Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement. In addition, the VSLs are consistent with Requirement R1.</p>
<p><b>FERC VSL G4</b> Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>
<p><b>FERC VSL G5</b> Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs</p>	<p>The requirement does not address cyber security protection.</p>

VRF and VSL Justifications – COM-002-4, R1

<p><b>FERC VSL G6</b> VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence</p>	<p>The requirement does not address cyber security protection.</p>
---	--

VRF and VSL Justifications – COM-002-4, R2

Proposed VRF	Low
<p>NERC VRF Discussion</p>	<p>R2 is a requirement in a Long-term Planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system. The VRF for this requirement is “Low,” which is consistent with NERC guidelines.</p>
<p>FERC VRF G1 Discussion</p>	<p><b>Guideline 1- Consistency w/ Blackout Report:</b> R2 establishes that entities who issue and receive Operating Instructions shall conduct initial training with their operating personnel to ensure that all applicable operators will be trained on their documented communication protocols established in Requirement R1. This training reduces the possibility of a miscommunication, which could eventually lead to action or inaction harmful to the reliability of the Bulk Electric System, which is consistent with FERC guideline G1.</p>
<p>FERC VRF G2 Discussion</p>	<p><b>Guideline 2- Consistency within a Reliability Standard :</b> Only one VRF is assigned for this requirement.</p>

VRF and VSL Justifications – COM-002-4, R2			
FERC VRF G3 Discussion	<p><b>Guideline 3- Consistency among Reliability Standards:</b>                      This requirement establishes that each Balancing Authority, Reliability Coordinator and Transmission Operator conduct initial training with each of its operating personnel responsible for the Real-time operation of the BES on documented communication protocols to reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of the bulk electric system. This VRF is consistent with other training requirements within the body of NERC Reliability Standards, including CIP-004-5.1 Requirements R1 and R2.</p>		
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                      Violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Low,” which is consistent with NERC guidelines for similar requirements.</p>		
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                      COM-002-4 Requirement R2 contains only one objective which is to conduct initial training for each of its operating personnel responsible for the Real-time operation of the BES. Since the requirement has only one objective, only one VRF was assigned.</p>		
Proposed VSL			
Lower	Moderate	High	Severe

		<p>documented communications protocols developed in Requirement R1.</p>	<p>being trained on the documented communications protocols developed in Requirement R1.</p>
--	--	---	--

## VRF and VSL Justifications – COM-002-4, R2

**FERC VSL G1**

Violation Severity Level  
Assignments Should Not Have  
the Unintended Consequence  
of Lowering the Current Level  
of Compliance

Based on the VSL Guidance, the SDT developed two VSLs for R2. These VSLs were determined based on the potential consequences of an operator issuing an Operating Instruction without having first received training on the communication protocols. An operator who is not trained on the communication protocols could miscommunicate an Operating Instruction, which could put the BES in an undesirable state. This warrants a High VSL. An operator who is not trained on the communication protocols could miscommunicate an Operating Instruction *during an Emergency*, which could directly put the BES in an undesirable state. This warrants a Severe VSL.

Since training requirements were not in prior versions of COM-002, the introduction of this training requirement will not have the unintended consequence of lowering the current level of compliance.

**VRF and VSL Justifications – COM-002-4, R2**

<p><b>FERC VSL G2</b>          Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties          Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent          Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:          The VSL assignment is not binary. VRF and VSL Justifications – COM 002-4, R3	
<b>Proposed VRF</b>	Low
NERC VRF Discussion	R3 is a requirement in a Long-term Planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system. The VRF for this requirement is “Low,” which is consistent with NERC guidelines.

VRF and VSL Justifications – COM 002-4, R3	
FERC VRF G1 Discussion	<p><b>Guideline 1- Consistency w/ Blackout Report:</b>                      R3 establishes that entities who only receive Operating Instructions shall conduct initial training with their operating personnel to ensure that all applicable operators will be trained in three part communication. This training reduces the possibility of a miscommunication, which could eventually lead to action or inaction harmful to the reliability of the Bulk Electric System, which is consistent with FERC guideline G1.</p>
FERC VRF G2 Discussion	<p><b>Guideline 2- Consistency within a Reliability Standard :</b>                      The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.</p>
FERC VRF G3 Discussion	<p><b>Guideline 3- Consistency among Reliability Standards:</b>                      This requirement establishes that Distribution Providers and Generator Operators conduct initial training with each of its operating personnel responsible for the Real-time operation of the BES on three part communication to reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of the bulk electric system. This VRF is consistent the VSL assignment for COM-002-4 R2 and other training requirements within the body of NERC Reliability Standards, including CIP-004-5.1 Requirements R1 and R2.</p>
FERC VRF G4 Discussion	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b>                      Failure to conduct initial training for individual operators on three part communication could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Low,” which is consistent with NERC guidelines for similar requirements.</p>
FERC VRF G5 Discussion	<p><b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b>                      COM-002-4 Requirement R3 contains only one objective which to conduct initial training with individual system operators on three part communication. Since the requirement has only one objective, only one VRF was assigned.</p>

VRF and VSL Justifications – COM 002-4, R3

<p><b>FERC VSL G1</b> Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>Based on the VSL Guidance, the SDT developed two VSLs. These VSLs were determined based on the potential consequences of an operator receiving an Operating Instruction without having first received training on the communication protocols. An operator who is not trained on three part communication could miscommunicate an Operating Instruction, which could put the BES in an undesirable state. This warrants a High VSL. An operator who is not trained on three part communication could miscommunicate an Operating Instruction <i>during an Emergency</i>, which could directly put the BES in an undesirable state. This warrants a Severe VSL.</p> <p>Since training requirements were not in prior versions of COM-002, the introduction of this training requirement will not have the unintended consequence of lowering the current level of compliance.</p>
<p><b>FERC VSL G2</b> Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: The VSL assignment for R3 is not binary. The VSL accounts for two different operating conditions to differentiate two levels of severity based on which condition, Emergency or other condition, is present when the miscommunication occurs.</p> <p>Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – COM 002-4, R4

**FERC VSL G1**

Violation Severity Level  
 Assignments Should Not Have  
 the Unintended Consequence  
 of Lowering the Current Level  
 of Compliance

Based on the VSL Guidance, the SDT developed four VSLs to establish the severity of an entity not assessing their operator’s adherence to the entity’s communications protocols and/or not assessing the effectiveness of those protocols at least once every 12 calendar months. If an entity implemented a method to evaluate the documented communications protocols developed in Requirement R1, but exceeded twelve (12) calendar months between evaluations then it is a “Low” VSL, since the performance or product measured has significant value as it almost meets the full intent of the requirement.

If an entity implemented a method for evaluating its communications protocols as specified in Requirement R4 and assessed adherence to the documented communications protocols in Requirements R1 by its operating personnel that issue and receive Operating Instructions but did not provide feedback to those operating personnel it is a “Medium” VSL. If an entity implemented a method for evaluating its communications protocols and assessed adherence to the communications protocols by its operating personnel and provided feedback to those personnel but did not take corrective action, as appropriate It is also a “Medium” VSL. If an entity implemented a method for evaluating its communications protocols and assessed the effectiveness of its protocols for its operating personnel but did not modify its documented communication protocols, as necessary, it is also a “Medium” VSL. The value of “Medium” is justified based one significant element (or a moderate percentage) of the required performance is missing but the performance or product measured still has significant value in meeting the intent of the requirement.

If an entity implemented a method for evaluating its communications protocols but did not assess adherence to them by its operating personnel then it is a “High” VSL. If an entity implemented a method for evaluating its communications protocols as specified in Requirement R4 but did not assess the effectiveness of its protocols in for its operating personnel it is a “High” VSL. The value of “High” is justified because the entity is missing more than one significant element (or is missing a high percentage) of the required performance.

## VRF and VSL Justifications – COM 002-4, R4

	If an entity did not assess adherence to the documented communications protocols by its operating personnel and it did not assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel, then it is a “Severe” VSL. The value of “Severe” is justified because the performance measured does not meet the intent of the requirement.

VRF and VSL Justifications – COM 002-4, R5

**FERC VSL G1**

Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Based on the VSL Guidance, the SDT developed two VSLs based on the failure to use three part communication when issuing an Operating Instruction during an Emergency.

If an entity, when issuing an Operating Instruction during an Emergency, did not use three part communication or take an alternative action if the receiver does not respond, yet instability, uncontrolled separation, or cascading failures did not occur as a result, the entity violated the Requirement with a “Medium” VSL. The value of “Medium” is justified based one significant element (or a moderate percentage) of the required performance is missing but the performance or product measured still has significant value in meeting the intent of the requirement, which is to avoid action or inaction that is harmful to the reliability of the Bulk Electric System.

If an entity, when issuing an Operating Instruction during an Emergency, did not use three part communication or take an alternative action if the receiver does not respond, and instability, uncontrolled separation, or cascading failures occurred as a result, the entity violated the Requirement with a “Severe” VSL. The value of “Severe” is justified because the performance outcome does not meet the intent of the requirement.

**VRF and VSL Justifications – COM 002-4, R5**

<p><b>FERC VSL G2</b>          Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties          Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent          Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:          The VSL assignment for R5 is not binary. Proposed VSL			
Lower	Moderate	High	Severe
N/A	The responsible entity did not repeat, not necessarily verbatim, the Operating Instruction during an Emergency and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction when receiving an Operating Instruction.	N/A	The responsible entity did not repeat, not necessarily verbatim, the Operating Instruction during an Emergency and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction when receiving an Operating Instruction  AND Instability, uncontrolled separation, or cascading failures occurred as a result.

**VRF and VSL Justifications – COM 002-4, R6**

**FERC VSL G1**

Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Based on the VSL Guidance, the SDT developed two VSLs based on the failure of the recipient of an Operating Instruction to use three part communication after receiving an Operating Instruction during an Emergency.

If an entity, when receiving an Operating Instruction during an Emergency, did not repeat, not necessarily verbatim, the Operating Instruction during an Emergency and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction when receiving an Operating Instruction, yet instability, uncontrolled separation, or cascading failures did not occur as a result, the entity violated the Requirement with a “Medium” VSL. The value of “Medium” is justified based one significant element (or a moderate percentage) of the required performance is missing but the performance or product measured still has significant value in meeting the intent of the requirement, which is to avoid action or inaction that is harmful to the reliability of the Bulk Electric System.

If an entity, when receiving an Operating Instruction during an Emergency, did not repeat, not necessarily verbatim, the Operating Instruction during an Emergency and receive confirmation from the issuer that the response was correct, or request that the issuer reissue the Operating Instruction when receiving an Operating Instruction, and instability, uncontrolled separation, or cascading failures occurred as a result, the entity violated the Requirement with a “Severe” VSL. The value of “Severe” is justified because the performance outcome does not meet the intent of the requirement.

**VRF and VSL Justifications – COM 002-4, R6**

<p><b>FERC VSL G2</b> Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: The VSL assignment for R6 is not binary. **FERC VSL G1**

Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Based on the VSL Guidance, the SDT developed two VSLs based on the failure of the issuer of a written or oral single-party to multiple-party burst Operating Instruction during an Emergency to confirm or verify that the Operating Instruction was received by at least one receiver.

If an entity, when issuing a written or oral single-party to multiple-party burst Operating Instruction during an Emergency, did not confirm or verify that the Operating Instruction was received by at least one receiver, yet instability, uncontrolled separation, or cascading failures did not occur as a result, the entity violated the Requirement with a “Medium” VSL. The value of “Medium” is justified based one significant element (or a moderate percentage) of the required performance is missing but the performance or product measured still has significant value in meeting the intent of the requirement, which is to avoid action or inaction that is harmful to the reliability of the Bulk Electric System.

If an entity, when issuing a written or oral single-party to multiple-party burst Operating Instruction during an Emergency, did not confirm or verify that the Operating Instruction was received by at least one receiver, and instability, uncontrolled separation, or cascading failures occurred as a result, the entity violated the Requirement with a “Severe” VSL. The value of “Severe” is justified because the performance outcome does not meet the intent of the requirement.

**VRF and VSL Justifications – COM 002-4, R7**

<p><b>FERC VSL G2</b>          Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties          Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent          Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:          The VSL assignment for R7 is not binary. The VSL accounts for two different operating conditions to differentiate two levels of severity based on which condition, Emergency or other condition, is present when the miscommunication occurs.</p> <p>Guideline 2b:          The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p><b>FERC VSL G3</b>          Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement</p>
<p><b>FERC VSL G4</b>          Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations</p>

## Table of Issues and Directives

Project 2007-02

Operating Personnel Communications Protocols

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
FERC Order No. 693, P 512 and 540 (Part 1)	512. The Commission finds that, during both normal and emergency operations, it is essential that the transmission operator, balancing authority and reliability coordinator have communications with distribution providers. In response to APPA, as discussed above, any distribution provider that is not a user, owner or operator of the Bulk-Power System would not be required to comply with COM-002-2, even though the Commission is requiring the ERO to modify the Reliability Standard to include distribution providers as applicable entities. APPA's concern that 2,000 public power systems would have to be added to the compliance registry is misplaced, since, as we explain in our Applicability discussion above, we are approving NERC's registry process, including the registry criteria. Therefore, we adopt our proposal to require	Distribution Providers have been included as applicable entities in COM-002-4	Applicability 4.1.2 Requirements R3 and R6

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>the ERO to modify COM-002-2 to apply to distribution providers through its Reliability Standards development process.</p> <p>540. ... In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. Finally, we direct the ERO to include APPA's</p>		

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process.</p>		
<p>FERC Order No. 693, P 531, 534, 535, 540 (Part 3)</p>	<p>531. We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies, either as part of COM-002-2 or as a new Reliability Standard. We note that the ERO’s response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.</p> <p>534. In response to MISO’s contention that Blackout Report Recommendation No. 26 has been fully implemented, we note that Recommendation No. 26 addressed two matters. We believe MISO is referring to the second part of the recommendation requiring NERC to “[u]pgrade communication system</p>	<p>COM-002-4 improves communications protocols for the issuance of Operating Instructions, in order to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System.</p>	<p>Definition of Operating Instruction Requirements R1, R2, R3, R4, R5, R6 and R7</p>

Table of Issues and Directives Associated with COM-002-4

Source	Directive Language	Disposition	Section and/or Requirement(s)
	<p>hardware where appropriate” instead of tightening communications protocols. While we commend the ERO for taking appropriate action in upgrading its NERCNet, we remind the industry to continue their efforts in addressing the first part of Blackout Recommendation No. 26. (Emphasis added)</p> <p>535. Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.</p>		
<p>FERC Order No. 693, P 532</p>	<p>532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as</p>	<p>Reliability Standard EOP-001-2.1b — Emergency Operations Planning (successor standard to EOP-001-0) requires that the emergency plans for each Transmission Operator and Balancing Authority include: communications protocols to be used during emergencies (Requirement R3.1). This requirement is compatible with COM-002-4, which establishes the documented</p>	<p>Requirements R1, R5, R6, R7</p>

Table of Issues and Directives Associated with COM-002-4

	together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date.		

## **Waiver for Project 2007-02 Operating Personnel Communications Protocols**

### **Action**

Authorize a waiver of the Standard Processes Manual to shorten the comment period for Project 2007-02 from 45 days to 30 days, with a ballot conducted during the last 10 days of the comment period; and, also require NERC Staff to post a notice of the waiver on the project page and work with the Chair of the Standards Committee to notify the NERC Board of Trustees Standards Oversight and Technology Committee of the waiver.

### **Background**

On November 7, 2013 the NERC Board of Trustees (Board) passed a resolution that, among other things, directed the Standards Committee and relevant Standards Drafting Team (SDT) to develop a combined COM-002 and COM-003 Standard and requested "that the Standards Committee direct the standard drafting team to work toward providing an industry approved combined standard, as contemplated by the foregoing resolutions, for Board approval as quickly as possible, but in no event later than the Board's February 2014 meeting." The Project 2007-02 SDT has been working to draft a COM Standard that is responsive to the Board's resolution.

The defined term "Reliability Directive" is currently being considered by the Project 2007-02 SDT in proposed Reliability Standard COM-002-4. The same term is used in revised TOP and IRO Standards pending with the Federal Energy Regulatory Commission (FERC). On November 21, 2013, FERC issued a Notice of Proposed Rulemaking (NOPR) proposing to remand the TOP and IRO Standards including the definition of "Reliability Directive." As a result of the NOPR, the Project 2007-02 SDT is also considering alternatives to using the term Reliability Directive. The SDT needs additional time to conduct outreach to the IRO and TOP SDTs to obtain feedback on the options currently under consideration for COM-002-4 with respect to the definition of "Reliability Directive."

Currently, to meet the Board deadline, the SDT would likely need to post on or about December 4, 2013 for a full 45-day comment and ballot period. In order to provide the Project 2007-02 SDT time to coordinate with the IRO and TOP SDTs and meet the February Board deadline, a reduction in the comment and ballot period is needed from 45 days to 30 days.

As required by Section 16 of the NERC Standard Processes Manual, NERC provided stakeholders with notice of this request on December 3, 2013 (see attached).

# Notice of Request to Waive the Standard Process

## Project 2007-02 Operating Personnel Communications Protocols COM-002 and COM-003

### Notice of Request to Waive the Standard Process

As required by Section 16 of the Standards Processes Manual, this is official notice to stakeholders that the Chair of the Standards Committee is requesting that the Standards Committee consider a waiver of the Standard Processes Manual to shorten the formal comment and ballot period, from 45 days to 30 days to meet a NERC Board of Trustees (“Board”) requested deadline to “work toward providing an industry approved combined standard, as contemplated by the foregoing resolutions, for Board approval as quickly as possible, but in no event later than the Board’s February 2014 meeting.”

To comply with the five day business day notice requirement, the Standards Committee will meet to consider this waiver request on December 11, 2013. Notice of the Standards Committee’s meeting has been announced and posted on the NERC website. Additional details about the waiver request are included below, and should a waiver be granted by the Standards Committee, it will be posted on the [project page](#).

### Authority

Pursuant to Section 16 of the NERC Standard Processes Manual, the Standards Committee may reduce the days for formal comment and ballot for good cause shown and to meet a Board’s deadline.

### Justification for Waiver Request

On November 7, 2013 the Board passed a resolution that, among other things, directed the Standards Committee and relevant Standards Drafting Team (SDT) to develop a combined COM-002 and COM-003 Standard and requested “that the Standards Committee direct the standard drafting team to work toward providing an industry approved combined standard, as contemplated by the foregoing resolutions, for Board approval as quickly as possible, but in no event later than the Board’s February 2014 meeting.” The Project 2007-02 SDT has been working to draft a COM Standard that is responsive to the Board’s resolution.

The defined term “Reliability Directive” is currently being considered by the Project 2007-02 SDT in proposed Reliability Standard COM-002-4. The same term is used in revised TOP and IRO Standards pending with the Federal Energy Regulatory Commission (FERC). On November 21, 2013, FERC issued a Notice of Proposed Rulemaking (NPR) proposing to remand the TOP and IRO Standards including the definition of “Reliability Directive.” As a result of the NPR, the Project 2007-02 SDT is also considering alternatives to using the term “Reliability Directive.” The SDT needs additional time to conduct outreach to the IRO and TOP SDTs to obtain feedback on the options currently under consideration for COM-002-4 with respect to the definition of “Reliability Directive.”

Currently, to meet the Board deadline, the SDT would likely need to post on or about December 4, 2013 for a full 45-day comment and ballot period. In order to provide the Project 2007-02 SDT time to coordinate with the IRO and TOP SDTs and meet the February Board deadline, a reduction in the comment and ballot period is needed from 45 days to 30 days.

# Project 2007-02 Posting 8

## Frequently Asked Questions Guide

### General Questions

#### 1. What were the inputs that drove the development of posting 8 of Project 2007-02?

- The NERC Board of Trustees' November 7<sup>th</sup>, 2013 Resolution for Operating Personnel Communication Protocols, discussed below;
- Two separate surveys distributed to a sample of industry experts by the Director of Standards Development and the Standards Committee Chair requesting feedback on the draft standard; and
- Consultation on the use of the term "Reliability Directive" in the COM-002-4 standard with the Project 2007-03 Real-time Transmission Operations Standard Drafting Team and the Project 2006-06 Reliability Coordination Standard Drafting Team.
- Industry stakeholder comments from previous drafts of Project 2007-02.

#### 2. Why was the term "Reliability Directive" removed from the definition of Operating Instruction?

The OPCP SDT debated whether to remove the term "Reliability Directive" in response to comments suggesting it should be removed from the definition of "Operating Instruction" and in light of FERC's issuance of the TOP/IRO Notice of Proposed Rulemaking (NOPR), which proposes to remand the definition of "Reliability Directive" along with the proposed TOP and IRO standards. To avoid unnecessary complications with the timing of the NOPR and posting 8, the OPCP SDT consulted with the Project 2007-03 Real-time Transmission Operations and the Project 2006-06 Reliability Coordination Standard Drafting Teams to ask whether they believed removal of the term "Reliability Directive" in the COM-002-4 standard would cause concerns. Both teams agreed that the COM-002-4 standard did not need to require a protocol to identify Reliability Directives as such and that the definition of Operating Instruction could be used absent the term Reliability Directive in COM-002-4 to set the protocols. The OPCP SDT ultimately voted to remove the term. The OPCP SDT also decided to incorporate the phrase "Operating Instruction during an Emergency" in certain Requirements, where needed, to identify Requirements that are subject to a zero-tolerance compliance/enforcement approach.

#### 3. Why does this standard apply to Generator Operators and Distribution Providers?

The OPCP SDT included these Functional Entities in the Applicability section because they can be and are on the receiving end of some Operating Instructions. The OPCP SDT determined that it would leave a gap

to not cover them in a standard that addresses communications protocols for operating personnel. The inclusion of Distribution Providers as an applicable entity also responds to FERC's directive in Order No. 693 to add them as applicable entities to the communications standard. The inclusion of Distribution Providers and Generator Operators is also consistent with the currently approved COM-002-3 standard, which the Board directed be combined with COM-003-1.

Recognizing that Generator Operators and Distribution Providers typically only receive Operating Instructions, the OPCP SDT proposed that only Requirements R3 and R6 apply to these Functional Entities.

#### 4. What does the term *documented communications protocols* refer to?

The term *documented communication protocols* in R1 refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. An entity should include as much detail as it believes necessary in their documented protocols, but they must address all of the applicable parts of Requirement R1. Where an entity does not already have a set of documented protocols that meet the parts of Requirement R1, the entity must develop the necessary communications protocols. Entities may also adopt the documented protocols of another entity as its own communications protocols, but the entity must maintain its own set of documented communications protocols to meet Requirement R1.

#### 5. Is this a “zero tolerance” standard

The standard uses the phrase “Operating Instruction during an Emergency” in certain Requirements (R5, R6, R7) to provide a demarcation for what is subject to a “zero tolerance” compliance/enforcement approach and what is not. This is necessary to allow the creation of Violation Severity Levels for each compliance/enforcement approach. **Where “Operating Instruction during an Emergency” is not used, an entity will be assessed under a compliance/enforcement approach that focuses on whether or not an entity met the initial training Requirement (either R2 or R3) and whether or not an entity performed the assessment and took corrective action according to Requirement R4.** The proposed COM-002-4 does not contain a Requirement to adhere to all documented communications protocols during non-Emergency conditions. Under COM-002-4, the assessment and training documentation will provide auditors assurance that responsible entities are using their documented communications protocols and taking corrective actions, as necessary.

Separately listing out Requirements R5, R6, and R7 and using “Operating Instruction during an Emergency” in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an “Operating Instruction during an Emergency.” The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Compliance/enforcement is measured differently using the operating condition as an indicator of which compliance/enforcement approach applies.

**6. Do any of the proposed requirements require the use of three-part communication when issuing or receiving an Operating Instruction outside of an Emergency?**

Compliance with the standard during non-Emergencies is based on whether or not an entity met the initial training Requirement (either R2 or R3) and whether or not an entity performed the assessment and took corrective action according to Requirement R4. An instance of an Operating Instruction outside of an Emergency not using three-part communication, or any of the other protocols in Requirement R1, is not in and of itself a violation of any requirement of COM-002-4. However, an entity will need be using three-part communication when issuing or receiving an Operating Instruction outside of an Emergency in order to complete the assessment of adherence to the entities' documented communications protocols.

**7. Why are entities required to assess the adherence of its operating personnel to the documented communication protocols the entity developed and provide feedback?**

Requiring entities to assess and provide feedback to its operating personnel, was also included in the November 7, 2013 NERC Board of Trustees' resolution as an element to include in the standard. Further, the OPCP SDT believes that it is good operating practice for an entity to periodically evaluate the effectiveness of their protocols and improve them when possible. Most entities currently engage in this type of assessment activity for their operating personnel. This assessment and feedback activity by the entity improves reliability as it provides a shorter evaluation and correction cycle than a traditional audit cycle, while reducing the associated compliance burden as well.

Additionally, the OPCP SDT believes it is good operating practice to provide operators with performance feedback on their adherence to the entity's documented protocols. Doing so, provides entities an opportunity to evaluate the performance of their operating personnel and take corrective actions where necessary, which could prevent a miscommunication from occurring and thus possibly prevent an event which could be harmful to the reliability of the Bulk Electric System.

**8. Should the BA, RC, and TOP provide their protocols to the GOPs and DPs and each other?**

While an entity may choose to provide their protocols to entities to which they communicate, there is not a mandatory and enforceable requirement that they do so.

**9. Why is the standard not applicable to Transmission Owners?**

Please refer to the Functional Model, found at <http://www.nerc.com/pa/Stand/Pages/FunctionalModel.aspx>. In the document, the following is provided for the Transmission Operator:

*The Transmission Operator operates or directs the operation of transmission facilities, and maintains local-area reliability, that is, the reliability of the system and area for which the Transmission Operator has responsibility. The Transmission Operator achieves this by operating the transmission system within its purview in a manner that maintains proper voltage profiles and System Operating Limits, and honors transmission equipment limits established by the Transmission Owner. The Transmission Operator is under the Reliability Coordinator's direction respecting wide-area reliability considerations, that is, considerations beyond those of the system and area for which the Transmission Operator has responsibility and that include the systems and areas of neighboring Reliability Coordinators. The Transmission Operator, in coordination with the Reliability Coordinator, can take action, such as implementing voltage reductions, to help mitigate an Energy Emergency, and can take action in system restoration.*

The following is provided for the Transmission Owner:

*The Transmission Owner owns its transmission facilities and provides for the maintenance of those facilities. It also specifies equipment operating limits, and supplies this information to the Transmission Operator, Reliability Coordinator, and Transmission Planner and Planning Coordinator. In many cases, the Transmission Owner has contracts or interconnection agreements with generators or other transmission customers that would detail the terms of the interconnection between the owner and customer.*

While the Transmission Owner owns the facilities, the Transmission Operator operates the facilities, and as such is subject to this standard. In the case where a Transmission Owner operates facilities, that Transmission Owner is bundled with a Reliability Coordinator or Transmission Operator, and as such would be covered by the standard.

**10. If an entity cannot complete a task included in an Operating Instruction, are they non-compliant?**

COM-002-4 deals with communication protocols, not actions taken by any entity. If an entity does not take action on an Operating Instruction, it may be a violation of another standard, but is not a violation of COM-002-4.

**11. A GOP contacts its TOP and notifies the TOP that a generator is about to trip due to a tube leak. Is this considered an Operating Instruction?**

No. This is not a command; it is simply relaying information about the generator to the Transmission Operator.

**12. If a Distribution Provider cannot operate a BES Element, would this standard apply to them?**

Distribution Providers are applicable entities for this standard. However, if they never receive an Operating Instruction due to their particular circumstance, they would not need to prove compliance with Requirements R3 and R6.

**Requirement R1 and Measure M1**

**13. Pursuant to R1, is it correct that an oral two-party, person-to-person Operating Instruction requires three part communication, but a single-party to multiple-party burst Operating Instruction message only requires two part communication?**

Yes. Since the use of three-part communications is not practical when issuing a single-party to multiple-party burst Operating Instruction, it is necessary to include a different set of protocols for these situations.

**14. Can you provide some examples of what is meant by written Operating Instructions as contemplated in Requirement R1 Parts 1.1 and 1.4 - 1.6?**

One example of a written Operating Instruction is a written switching order. Another example is an Operating Instruction issued by using a text message.

**15. Please explain how the current draft does not conflict with TOP-002 R18 (uniform line identifiers)?**

Project 2007-03 chose to eliminate TOP-002-2a, Requirement R18 when it developed TOP-002-3. This Requirement stated "Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network." COM-002-4, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations) for Operating Instructions. This supports both parties being familiar with each other's interface Elements and Facilities, minimizing hesitation and confusion when referring to equipment for the Operating Instruction.

**16. Can you explain what "specify when time identification required"? Is this just for entities in multiple time zones?**

The OPCP SDT has included this part to add necessary clarity to Operating Instructions to reduce the risk of miscommunications. The inclusion of "specify when time identification required" allows for an entity to evaluate its particular circumstances and communications to determine when it may be appropriate to use time identification in its Operating Instructions. The drafting recognized from comments the need to provide this flexibility while still requiring an entity to address this part in its documented communication protocols. Clarifying time and time zone (where necessary) contributes to reducing misunderstandings and reduces the risk of a grave error during BES operations. This is not exclusively for entities in multiple

time zones, but Operating Instructions between entities in multiple time zones is one example of instances that may need time identification when issuing and receiving Operating Instructions.

**17. Why did the drafting team remove the protocol requiring alphanumeric clarifiers?**

Based on feedback from industry and consideration of the NERC Board resolution, the drafting team chose to remove alphanumeric clarifiers as a required protocol. Entities are free to include it in their documented communication protocols.

**18. Why is there a requirement for the use of the English language?**

The drafting team included this part to carry forward the same use of English language included in COM-001-1, Requirement R4 and to retire this requirement from COM-001. The requirement continues to permit the issuer and receiver to use an agreed to alternate language. This has been retained since use of an alternate language on a case-by-case basis may serve to better facilitate effective communications where the use of English language may create additional opportunities for miscommunications. Part 1.1 requires the use of English language when issuing oral or written (e.g. switching orders) Operating Instructions. This creates a standard language (unless agreed to otherwise) for use when issuing commands that could change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. It also clarifies that an alternate language can be used internally within the organization. The phrase has been modified slightly from the language in COM-001-1, Requirement R4 to incorporate the term "Operating Instruction," which defines the communications that require the use of the documented communications protocols.

**Requirements R2 and R3 and Measures M2 and M3**

**19. Is there an obligation on the part of the entity issuing an Operating Instruction to ensure the receiving operator is trained to receive it?**

No. It is the responsibility of the receiving entity to ensure that their operator has received training prior to receiving an Operating Instruction.

**20. Why is there a requirement to conduct initial training?**

The OPCP SDT has included an initial training requirement in the standard in response to the NERC Board of Trustees' resolution, which directs that a training requirement be included in the COM-002-4 standard. Additionally, requiring entities that issue and/or receive Operating Instructions to conduct initial training with their operating personnel will ensure that all applicable operators will be trained in three-part communication. The OPCP SDT believes this training will reduce the possibility of a miscommunication, which could eventually lead to action or inaction harmful to the reliability of the Bulk Electric System. Ongoing training would fall under an entity's training program in PER-005 or could be listed as a type of corrective action under Requirement R4. As such, this requirement is not in conflict with PER-005, but complements it.

**21. Current operating personnel issue and receive Operating Instructions now and thus it is not possible to train them on documented protocols \*prior\* to their issuing or receiving their first Operating Instruction. If training takes place before the enforcement date for COM-002-4, would an entity meet the expectations of Requirement R2 and/or R3?**

Yes.

#### **Requirement R4 and Measure M4**

**22. Would you please provide more specificity as to how the R.4.1 and 4.2 assessments may be performed?**

An entity could perform an assessment by listening to random samplings of each of their operating personnel issuing and/or receiving Operating Instructions. If there were instances where an Operator deviated from the entity's protocols, the entity would provide feedback to the operator in question in any method it sees as appropriate. An example would be counseling or retraining the operator on the protocols.

An entity could assess the effectiveness of its protocols by reviewing instances where operators deviated from those protocols and determining if whether the deviations were caused by operator error or by flaws in the protocols that need to be changed.

**23. Doesn't Measure M4 extend beyond the scope of the requirement when it addresses communications which deviated from the protocol and contributed to an emergency?**

The purpose of COM-002-4 is "To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES)." If the deviation from the protocol contributed to an emergency, the purpose of this standard was not met. The entity must determine what caused that deviation and address any necessary corrective actions.

#### **Requirements R5 and R6 and Measures M5 and M6**

**24. What is defined as an Emergency and who is responsible for declaring when an Emergency begins and ends?**

The NERC Glossary of Terms defines Emergency as "Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System." It is expected that these are abnormal and rare circumstances. There is not an expectation that an Emergency be declared. For further information, please refer to Question 15.

**25. Is it a violation of R5 if three-part communication is not used, but an alternative action is taken?**

If an operator issues an Operating Instruction during an Emergency and, based on the response from the receiver, or lack thereof, chooses to take an alternative action, that operator has satisfied Requirement R5 and is not in violation.

**26. How does the SDT envision operators differentiating, during Real-time, between Emergency Operating Instructions and non-emergency Operating Instructions? Are the operators to explicitly say "this is an Emergency Operating Instruction"?**

Separately listing out Requirements R5, R6, and R7 and using "Operating Instruction during an Emergency" in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an "Operating Instruction during an Emergency." The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies. In other words, it is not the drafting team's expectation that the operator must differentiate between Emergency and non-Emergency Operating Instructions.

**27. Does this standard require TOPs to provide evidence of another parties' compliance in Measure M6?**

No. The Measures provide various options that the drafting team considered as ways to demonstrate compliance for Requirement R6. It is not an exhaustive list, and in no way places an expectation on any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.

**28. Can you provide an example of an alternative action being taken?**

The following scenario is provided as an example of an alternative action:

A Transmission Operator (TOP) calls a Generator Operator (GOP) to reduce generation due to an Emergency. The GOP does not respond verbally. At that point the TOP could:

- Ask if the GOP understood the Operating Instruction (alternative action).
- Hang up and redial the GOP, assuming that the communication line was dead (alternative action),
- Request a different generator that is effective to reduce (alternative action);
- or
- Call a different contact at the GOP (alternative action)

**29. Must the receiver repeat the Operating Instruction back verbatim?**

No. The Operating Instruction does not have to be repeated verbatim. The issuer must confirm that the receiver's response of the Operating Instruction was correct.

# Standards Announcement **Reminder**

## Project 2007-02 Operating Personnel Communication Protocols

**Additional Ballot and Non-binding Poll Now Open through January 31, 2014**

### [Now Available](#)

An additional ballot for **COM-002-4 – Operating Personnel Communication Protocols** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) are open through **8 p.m. Eastern on Friday, January 31, 2014.**

Background information for this project can be found on the [project page](#).

### **Instructions for Balloting**

Members of the ballot pools associated with this project may log in and submit their vote for the definition by clicking [here](#).

### **Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

### **Standards Development Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact [Wendy Muller](#),  
Standards Development Administrator at 404-446-2560.

## Standards Announcement- Update

Project 2007-02 – Operating Personnel Communications Protocols  
Formal Comment Period and RSAW Posted for Industry Comments: January 2 –  
31, 2014  
Additional Ballot and Non-binding Poll: January 22 – 31, 2014

### Now Available

A **30-day** formal comment period for **COM-002-4 – Operating Personnel Communication Protocols** is open through **8 p.m. Eastern on Friday, January 31, 2014**. An additional ballot of COM-002-4 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Wednesday, January 22, 2014 through 8 p.m. Eastern on Friday, January 31, 2014**.

**On December 11, 2013, the NERC Standards Committee authorized a waiver of the standard process, in accordance with Section 16 of the Standard Processes Manual, to shorten this comment period from 45 days to 30 days with a ballot during the last 10 days of the comment period to meet the NERC Board of Trustees requested deadline. A link to the waiver request is available on the project page.**

In response to comments received during the last comment period for COM-002-4 and other input, the drafting team has created a new communications standard, which requires the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.

Background information for this project can be found on the [project page](#).

### **Instructions for Commenting**

A formal comment period on the draft standard is open through **8 p.m. Eastern on Friday, January 31, 2014**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact [Arielle Cunningham](#). An off-line, unofficial copy of the comment form is posted on the [project page](#).

**A comment period on the draft RSAW is open through 8 p.m. Eastern on Friday, January 31, 2014. The draft RSAW is posted on the [project page](#). Please submit comments on the draft RSAW using the RSAW comment form to [RSAWfeedback@nerc.net](mailto:RSAWfeedback@nerc.net).**

For more information or assistance, please contact [Arielle Cunningham](#),

## Standards Announcement

### Project 2007-02 Operating Personnel Communications Protocols COM-002-4

#### Additional Ballot and Non-Binding Poll Results

#### [Now Available](#)

An additional ballot of **COM-002-4 – Operating Personnel Communications Protocols** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels concluded at **8 p.m. Eastern on Tuesday, February 4, 2014.**

The standard achieved a quorum and received sufficient affirmative votes for approval. Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the ballots.

Approval	Non-Binding Poll Results
Quorum: 76.03%	Quorum: 77.19%
Approval: 71.86%	Supportive Opinions: 66.81%

Background information for this project can be found on the [project page](#).

#### Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

#### Standards Development Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

No
The SERC OC Review Group appreciates the efforts that the SDT has made on this draft standard and the flexibility demonstrated to address the constantly evolving feedback received. We do not believe the proposed requirements and measures clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon

whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.

Applicability Section: 4.1.2 Distribution Provider: We understand that it would be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives. Therefore, we are respectfully recommending an alternative that parallels the recently FERC approved CIP-003-5 that we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended: 4.1.2 Distribution Provider that:

4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation.

4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

General Requirement Comment: The SDT is respectfully requested to review the Requirements to ensure that it is clear that "during an Emergency" is only applicable to the entities involved.

Requirement 1: The proposed standard still contains requirements that mandate the use of, and training to include, 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. While we agree that the SDT has stated in its Rationale and Technical Justification document that the proposed measures don't specifically require that auditors verify compliance of this for the requirements (and associated measures), a strict read leads to a different conclusion. We are concerned that, absent a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. We respectfully recommend modifying requirement 1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm their understanding through use of 3 part communication. To accomplish this we propose a new R1.1. The current R1.1 through R1.6 would be renumbered R1.2 through R1.7

Current R1 language: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [Violation Risk Factor: Low][Time Horizon: Long-term Planning]

1.1. Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.

Proposed R1 language: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [Violation Risk Factor: Low][Time Horizon: Long-term Planning]

Proposed R1.1: ADD: Require that its operating personnel identify, at the time of issuance, when the Operating Instruction is being issued to alleviate or avoid an Emergency

R1.2: Based on the SDT comments and zero tolerance for Emergency communications we propose a new bullet be added to R1.2.

Current R1.2 language: Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:

- Confirm the receiver's response if the repeated information is

correct. • Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver. • Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver. Proposed R1.2: Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions: • Confirm the receiver's response if the repeated information is correct. • Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver. • Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver. • ADD: Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency R1.3: We respectfully recommend a word change (correct to understood) in 1.3, bullet 1. Current 1.3 sub-bullet 1 follows: Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct. Proposed 1.3, sub-bullet 1: Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was understood. Requirement R2: This group feels that R2 should be eliminated as redundant with the systematic approach to training requirements of PER-005 (Operations Personnel Training) which are applicable to all BAs, RCs & TOPs. Communications protocols must be included in each company's specific reliability-related task list. Inherent in systematic approach is initial training on all reliability-related tasks, since each task must be analyzed as to its Difficulty, Importance & Frequency (DIF analysis). As a result of the DIF analysis, systematic approach would require that communications protocols have both initial and continuing training. Requirement R3: We agree with the SDT concern that Operating Personnel should not be placed in a position to receive an oral two-party, person-to-person Operating Instruction prior to being trained. This Group understands that OPCP SDT included an initial training requirement in the standard in response to the NERC Board of Trustees' resolution, which directs that a training requirement be included in the COM-002-4 standard. We would like to recommend that the term "initial" be removed so not to give the impression that training is a one-time effort. Current R3 language: Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] Proposed R3 language: Each Distribution Provider and Generator Operator shall conduct training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] Requirements R5, R6, and R7: This Group feels that the relationship between R1, R5, R6, and R7 requires further clarification to remove possible opportunities for different interpretations which could result in uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. The concern centers on the absence of a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. This is the reason for the

R1 modifications. If the recommended R1 modifications are accepted then R5, R6, and R7 should be considered for deletion (incorporating specific items deemed necessary by the SDT as bullets or sub-requirements of R1). Measures: Measure 1: Base on the Group's recommendations above we propose for consideration the following modification to Measure 1: Current M1 language: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. Proposed M1 language: Revised M1: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2). Measure 2,5,6,and 7: If our recommendations are accepted then Measures 2, 5, 6, and 7 should be deleted incorporating specific items deemed necessary by the SDT as bullets or sub-requirements of R1 Measure 3: To align M3 with our R3 recommendation we propose deleting the word "initial". Current M3 language: Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3. Proposed M3 language: Each Distribution Provider and Generator Operator shall provide its training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.

We are concerned that this draft goes further than mentioned in the blackout recommendation that NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations. This group feels that the modifications recommended will add further clarity in communications and work towards the goal identified in the Black Report recommendation number 26.

We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19th, 2013 Resolution, which is to enforce 'zero tolerance' only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency. VSL for R1: Modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency Current VSL for R1 language: The responsible entity did not include Requirement R1, Part 1.2 in its documented communications protocols OR The responsible entity did not include Requirement R1, Part 1.3 in its documented communications protocols OR The responsible entity did not develop any documented communications protocols as required in Requirement R1. Proposed VSL for R1 language: Moderate - The responsible entity did not require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise, as required in Requirement R1, Part 1.2. An alternate language may be used for internal operations. Severe - The responsible entity did not include Requirement R1, Part 1.1, in its

documented communications protocols OR Requirement R1, Part 1.3 in its documented communications protocols OR The responsible entity did not include Requirement R1, Part 1.4 in its documented communications protocols OR The responsible entity did not develop any documented communications protocols as required in Requirement R1 OR the responsible entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency. VSL for R3: This Group recommends that the “High VSL for R3” be deleted. The reason for the High VSL deletion is to align with the concept that the standard should provide that compliance with the standard should only entail assessing whether an entity has utilized their documented communications for Operating Instructions that are not issued during an Emergency. VSL for R2, R5, R6, and R7: If the SDT modifies the requirements based on this Group’s recommendation VSL for R2, R5, R6, and R7 can be deleted except for any sections that are applicable in revised requirements.

Yes

The SERC OC Review Group understands the position that the SDT is working in and greatly appreciates the patience and dedication shown in developing this draft standard. Thank you. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.

Group

North American Generator Forum - Standards Review Team (NAGF-SRT)

Allen Schriver

Yes

Yes

1) R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction. 2) Specific to R.6, consideration should be given to revise the verbiage from, “during an Emergency” to “identified by the sender as constituting an Emergency directive.” The rationale for the recommendation is offered to provide clarity to the Requirement, as it is anticipated that there will be cases when it is not clear the Operating Instruction is associated with an Emergency. Additionally, the definition of “Emergency” in the NERC Glossary is broad and consequently it may be difficult, at times, to determine which inputs are subject to COM-002-4 requirements, especially if the TO or TOP calls a plant operator

directly rather than going through the respective dispatchers. Note: On the 1/17/14 COM-002-4 SDT webinar the question was asked, how a DP or GOP would know that an Operating Instruction occurred during an Emergency. The drafting team stated that after every Operating Instruction the DP should call its TOP to determine if the Operating Instruction occurred during an Emergency. The NAGF-SRT once again reiterates that it would be more efficient and the industry would benefit as a whole, if the sender of the Operational Instruction, states the instruction is associated with an Emergency. 3) Specific to Measures M5 and M6, which contain language associated with the issuer and the recipient both maintaining evidence of two-party communication respectively. It is recommended that M5 be revised such that the all associated evidence is maintained by the issuer and M6 be deleted in its entirety. Consolidating the evidence requirements would benefit the industry by reducing duplication of efforts, associated with maintaining evidence by different entities, in support of the same requirement.

Yes
While the Public Utility District No.1 of Snohomish County supports this draft of COM-002-4, we see an issue with R2 and R3 of this standard. These requirements both deal with entities conducting training for its personnel, and feel it would be more appropriate if they were addressed in the PER family of standards. The Public Utility District No.1 of Snohomish County also supports the comments submitted by the SERC OC Review Group. Thank you very much.

No
The "Moderate" VSL for R6 should be modified in the same manner as the "Severe" VSL. In addition to repeating the Directive, the RE needs to fail to take action as directed. Suggest the following language: "AND the RE failed to take action as requested by the issuer of the Operating Instruction".
Yes
COM-002 remains a zero defect standard, and there is no FERC directive to provide a zero defect standard in response to either blackout recommendation 26 or Paragraph 535 of Order 693. Further, there is no requirement for the issuer of an Operating Instruction in an Emergency to indicate the Emergency status. The webinar response to queries over the lack of Emergency Status Indication was to suggest the RE "call and inquire" if the OI was in fact a Directive. This adds to the regulatory burden while offering zero benefit. Identification of an Emergency has positive effects far beyond three part communications. The realization of risk to the BES should create a heightened sense of urgency among all parties. The standard must require announcement of Emergency status in order to penalize RE's for actions which are not violations in a non-Emergency situation.
Group
Northeast Power Coordinating Council
Guy Zito
No
The proposed Requirements and Measures do not clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.
No
We do not agree that the blackout recommendation calls for the use of 3 part communication for every Operating Instruction and note that neither the NERC Board nor the SDT has provided any evidence that indicates a direct correlation between errors due to communication problems and events that adversely impact the BES. The justification for reliability standard Requirements that require 3 part communication for every Operating Instruction, and having to enforce compliance with the same, is not supported.
No
Regarding Requirement R4, the LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no maximum or "cap" to the delayed assessment, and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this "cap", or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even if the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs. Regarding Requirement R5, the MEDIUM VSL and SEVERE VSL

are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. Suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL be: “AND instability, uncontrolled separation, or cascading failures occurred as a result.” The same comments apply for Requirements R6 and R7. We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19, 2013 Resolution, which is to enforce ‘zero tolerance’ only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency.

Yes

Regarding Part 1.4, it must be considered that some ISOs issue multiple-party burst Operating Instruction to Generator Operators through electronic means. Regarding Part 1.6, the requirement is vague and needs to be clarified for Registered Entities to know how to comply. How would one “specify the nomenclature” system wide? Regarding Requirements R2 and R3, those “training” requirements aren’t necessary. Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a standard’s requirement. Under RAI principles, NERC and Regions can determine what type of monitoring is appropriate for Responsible Entities’ compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment. The proposed standard still contains requirements that mandate the use of, and training to include 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. As stated in the Rationale and Technical Justification document the proposed Measures and RSAW don’t specifically require that auditors verify compliance of this for the Requirements (and associated Measures), however a strict read leads us to a different conclusion. Under the RSAW for R1 it states that the entity shall provide its documented communications protocols developed for this requirement and the auditor shall review the documented communications protocols provided by the entity and ensure they address the Parts of R1 (including the use of 3 part communications). The RSAW contains similar actions relative to Requirements R2 and R3 in that the entity is to provide evidence consisting of agendas, learning objectives, or course materials that it provides pursuant to these requirements. Given this, an auditor can enforce to a ‘zero defect tolerance’ if the auditor chooses to do so, and in fact would argue that an audit would be deficient if it failed to validate whether the learning objective included ensuring that 3 part communication was used during issuance or receipt of each Operating Instruction. Suggest that the training requirements contained with R2 and R3 be removed and placed within the PER-005 Operations Personnel Training standard. PER-005 should be the home of all system operator related training requirements. There are no clear and concise differences between Requirements R1, R5 and R6. This creates uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. Absent a Requirement that the issuer make a definitive statement as to

whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. Suggest revising Requirement R1 so that it applies to all Operating Instructions, but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request that the recipient confirm their understanding through use of 3 part communication. Remove Requirements R5, R6 and R7 (incorporating items deemed necessary by the SDT as bullets or Parts of R1). Suggested rewording for Part 1.1: 1.1. Require that its operating personnel identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency. • Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency. Revise M1, VRF/VSLs and RSAW so that strict compliance with use of 3 part communication is only applied when an Operating Instruction is issued to alleviate or avoid an Emergency as identified by the issuer at the time of issuance. Suggested revisions to M1: M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2). VSL for R1 – modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency Measure M4 requires compliance demonstration beyond Requirement R4. Specifically, entities must provide evidence that appropriate corrective action was taken for all instances where an operating personnel’s non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency. The format of the standard should be changed to conform with the current NERC direction—the measures get listed with the associated requirement, and the rationale get included in the standard, not a separate document.

The proscribed training requirements embedded in R2 and R3 should be removed. The existence and usage of protocols should be the primary focus of the standard and regulatory

review, creating a training requirement within the standard shifts focus to training content and administration. Additionally, PER-005-1 requires the Balancing Authority, Reliability Coordinator, and Transmission Operator to have a systematic approach to training (SAT). The adoption and management of a SAT would presumably include communications protocols as a task for potential training. The current draft version of PER-005-2 includes a similar requirement for a SAT applicable to the Generator Operator. The annual assessment and corrective action process defined in R4 should be made applicable to Operating Instructions during an Emergency. Although the NERC Glossary of terms provides a definition of Emergency, two reasonable people looking at a situation can disagree as to when an Operating Instruction is issued during an Emergency. Creating a zero defect standard applicable to inherently ambiguous situations shifts focus from the adoption of communication protocols to discussion of when an Operating Instruction is issued during an Emergency. During an entities annual assessment process, the focus would be on classification of an Emergency instead of process improvement for communications. An alternate approach would be to draft the standard so as to require the explicit identification of an Operating Instruction and/or Emergencies so as to remove the ambiguity. Finally, the definition of Operating Instruction references a command issued by operating personnel, without sufficiently defining operating personnel.

NRECA

No

NRECA appreciates the efforts of the drafting team in working to address the FERC directives and NERC BOT Resolution November 2013, but does not believe that COM-002-4 accurately reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. NRECA understands that the inclusion of Distribution Providers to this standard stems from various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions, continues to recommend that Distribution Providers be removed from the applicability of COM-002-4. Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, NRECA is recommending an alternative that parallels the recently FERC approved CIP-003-5 that we

believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended: 4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started. NRECA proposes to recommend an “affirmative” ballot to its members if the applicability is modified in the next posting as provided.

No

See response to Question 1

No

Will need to be modified dependent on applicability modifications.

Yes

NRECA suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements.

Ingleside Cogeneration LP

Yes

Ingleside Cogeneration LP ("ICLP") believes that the requirements that govern directives issued during the course of an Emergency remain consistent with those in-place today. In addition, the latest draft of COM-002-4 allows oversight of all other Operating Instructions – although to a lesser degree. This is a good combination of compliance strategies that retains focus on the important communications while adding attention on daily discussions which may have impact on the BES if improperly transacted.

Yes

COM-002-4 adds requirements that call for protocols that add precision to operations communications as called for in both documents. However, in the latest draft, ICLP believes

the compliance approach has been modified in a manner that ensures that routine Operating Communications are conducted using a common protocol – but do not involve significant tracking resources. In addition, the use of operator training and regular review of its effectiveness is consistent with other NERC standards related to operator capabilities. As it is written now, CIP-002-4 introduces new expectations related to routine communications, but only puts incremental pressures on existing processes and equipment necessary to address them.

Yes

Yes

ICLP would like to see the innovative approach that the drafting team used to develop COM-002-4 applied to other standards as well. The issue that continues to arise is not so much whether mandatory requirements are based upon sound reliability principles, but how they can be reasonably enforced. In this case, it is clear that many entities do not have the tools or resources to examine every Operating Instruction in detail in order to assure 100% compliance with a rigorous communication protocol. Conversely, training and retention programs are common – and have proven to be an effective means to drive consistent Operator performance.

Clark Public Utilities

Yes

Yes

Yes

Yes

For the purposes of Requirements 5 and 6, Clark believes it should be an obligation of the issuer of Operating Instruction given during an emergency to identify it as an Emergency Operating Instruction. It should not an obligation of the reciever to determine after-the-fact whether an Operating Instruction is an Emergency or not. All Operating Instructions issued by a BA, RC, or TOP should be regarded with importance but a specification by the issuer that the instruction is in response to an Emergency will alert the receiver that a particular Operating Instruction action requirement has a role in the overall reliability of the BES resulting in a higher level of BES reliability.

As it has been stated in previous comments, Recommendation 26 from the 2003 Blackout report is about situational awareness and who and what entities need to be contacted during emergencies. It is not about what System Operators should say in their conversations.
No

R1, The NSRF does not understand why there is a Severe VSL for normal everyday Operating Instructions. This Severe VSL is imposing the “zero defect” language that the industry is trying to move away from. We understand if there were no protocols as in “The responsible entity did not develop any documented communications protocols as required in Requirement R1”, but not the sub requirements of R1.2 and R1.3. The highest VSL should be High. Save the Severe VSL for R5, R6, and R7.

Yes

1. Per section one of this document, the SDT states: The Project 2007-02 SDT removed the term “Reliability Directive” in order to avoid complications that may result from the Notice of Proposed Rulemaking issued by the Federal Energy Regulatory Commission on November 21, 2013 proposing to remand the definition of “Reliability Directive.” But within the latest Implementation Plan, there still is the prerequisite of approving the term “Reliability Directive”. Please update whichever documentation that should be corrected in order to provide the industry with accurate information so that we can determine if this Standard supports the reliability of the BES.

We do not agree with the following VSLs: 1) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or “cap” to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed

HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs. 2) R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.” 3) R6: Same comments as in R5. 4) R7: Same comments as in R5.

Yes

Comments: 1. R1.4. – [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. • Some ISO’s issues multiple-party burst Operating Instruction to Generator Operators through electronic means Associated real-time requirement: R7. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. Comment: The SRC does not believe this requirement is necessary for reliability. Moreover, the Standard Drafting Team has not provided any , nor have we been made aware of the substantiated rationale for keeping this Requirement except that the SDT believes is it necessary. 2. R1.6. – [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. Comment: This requirement is vague and needs to be clarified for Registered Entities to know how to comply with it; how would one “specify nomenclature” system-wide? Comment: This requirement was dropped from TOP-002-2a, requirement 18. Communication on transmission equipment must be equipment specific. Nomenclature should not be used, rather entities should always be correctly communicating using the unique and specific equipment identifiers. Adding nomenclature will reduce not improve reliability. 3. R2. and R3. – ...”shall conduct initial training for each of its operating personnel ...” Comment: The SRC does not believe a training Requirement is necessary; Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a Standard Requirement. Under RAI principles, NERC and Regions can determine what type of monitoring is appropriate of Responsible Entities’ compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment.

Shirley Mayadewi
Manitoba Hydro
Yes
Yes
Yes
Although Manitoba Hydro agrees with the VRFs and VSLs for the Requirements, we have the following comments: 1) VSLs, R2 – the term ‘individual operator’ is used in this VSL where throughout the standard operating personnel is used. 2) VSLs, R5 – text of VSLs refer to Requirement R6 instead of R5. 3) VSLs, R6 – inconsistent drafting as the words ‘that received an oral, .....’ is not included here, but does appear in the VSL for R7. 4) VSLs, R5, R6, R7 – the final criteria for a Severe VSL is for a specific outcome of non-compliance which does not seem appropriate when measuring compliance. Depending on the outcome of the circumstances, the VSL may be High or Severe. The outcome itself is not something that is related to the entity’s compliance with the standard. The entity may take the same action and comply to the same degree and by virtue of the outcome alone they are moved from a High to a Severe VSL.
Yes
1) The protocols at minimum should require full name identification. 2) R2 – the description of the applicable operating personnel (i.e. that are responsible for Real-Time operation of the interconnected BES) is different in this part than others (that state it’s for operating personnel that issue and receive certain Operating Instructions). Is that purposeful? 3) R5, R6, R7 and R8 - the numbering seems to be mixed up. 4) M2 and M3 – are not drafted consistently given the consistency in drafting of requirements R2 and R3. M3 refers to ‘its initial’ training records while M2 does not and M3 refers to training records ‘for its operating personnel’ while M2 does not. 5) M4 – contains a section of text that is not reflective of the requirement itself and has no basis for appearing in the measure. The requirement states only that the entity need only take corrective action to address deviations. The extra text that discusses instances where non adherence is the sole or partial cause of an Emergency should be deleted. 6) M6, M7 – the words ‘if the entity has such recordings’ seem unnecessary. This qualifying language isn’t attached to any other type of evidence that is listed as a possibility; presumably all of those are subject to the same qualifier and would only be presented as evidence if the entity had them.

Comments: GTC recognizes FERC Order 693 directs the revision of COM-002 to include the DP and specifically states how essential it is that the TOP, BA and RC have communications with DPs. Additionally, GTC observes Order 693 also identifies the need for tightened communications protocols, especially for communications during alerts and emergencies and that such protocols shall be established with uniformity as much as practical on a continent wide basis to eliminate possible ambiguities in communications during emergency conditions. If the Standard requires the use of 3 part communications by the issuers of Operating Instructions, then it would seem sensible that receivers of Operating Instructions be trained for awareness and proper participation of such protocols. GTC sees parallels of this approach in other Standards such as restoration training of DPs identified in the TOPs restoration plan as required in EOP-005-2. GTC believes the current proposal of COM-002-4 still contains ambiguities that should be addressed before GTC can provide an affirmative ballot. GTC is offering 3 alternatives such that if any of them is adopted by the SDT, GTC would modify our position to cast an affirmative vote in the next recirculation. Alternative 1 (Modify the DP applicability): Applicability Section: 4.1.2 Distribution Provider: GTC is recommending an alternative that parallels the recently FERC approved CIP-003-5 that we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES when in an Emergency. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended: 4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started. Alternative 2 (Modify the DP applicability per above, modify R3; Eliminate R6): Alternative 2 is an extension of alternative 1 for additional clarities. Requirement 3: Revise R3 to insert the words [during an Emergency] within the sentence "...who can receive an oral two-party, person-to-person Operating Instruction [during an Emergency] prior to that individual operator...". Additionally, replace the word "receive" with the word "request" in the first bullet of R3. The word "receive" is ambiguous and the word "request" is consistent with the receiver using his words to request a confirmation. GTC maintains that R3 is sufficient to satisfy FERC Order 693 for the DP applicability during emergencies, and would ensure uniformity on a continent wide basis to eliminate possible ambiguities in communications during emergency conditions. GTC prefers the elimination of R6. GTC does not believe that a receiver of an Operating Instruction in the field performing field switching activities should be required to document evidence of following the oral communication practices. Issuers of Operating Instructions are already recording the Operating Instruction communications and have the capability to do so. Issuers are also required to ensure the receiver responds accordingly per R5. Issuers are required to confirm the receiver's response is correct or else reissue if incorrect; issuers can also take an alternative action. Having the receiver document the implementation of these practices for compliance is redundant and duplicative to the issuer's requirements. This is an unnecessary, administrative requirement that introduces a double jeopardy situation that does not

enhance the reliability of the BES. The SDT should recognize that all reliability bases are covered with the training requirements of the issuers in R1, the training requirement of the receivers in R3, and the performance of these are monitored via the issuers recording capabilities in R5 and R7. With this approach, issuers can be satisfied that receivers are prepared to receive instructions in accordance with their training, and the options the issuers have per R5 in a live scenario. The receivers could not expose or cause a non-compliance situation to the issuers. However, the issuers could expose the receivers to a non-compliance situation if a recording is lost or damaged and the receiver was on his cell phone in the field taking orders and performing switching, hence the double jeopardy and GTC's plea to remove this requirement 6. Alternative 3 (Modify the DP applicability above, Modify R3 above, Modify R6, create separate DP requirement): Requirement 6: If the SDT decides that R6 must remain, then GTC requires the following changes to modify our negative vote to affirmative. GTC appreciates the drafting team making concessions to eliminate the need for DPs and GOPs being required to have documented communication protocols. Additionally, GTC appreciates the drafting team's willingness to limit the scope of performing the 3 part communications to those Operating Instructions received during an Emergency. These drafting team concessions are a testament to the team, along with industry, of understanding that the DP will typically have a very limited role in receiving Operating Instructions from the BA or TOP to protect the BES during an Emergency. This role is typically limited to operating non-BES equipment (load serving stations) to shed load or reduce voltage to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the BES. GTC would submit that the TOP would further limit the DPs role to "manual" load shed type situations when the "automatic" load shed schemes misoperate or malfunction as designed. This is highlighted in the NERC functional model which identifies this real time function of the DP "Implements voltage reduction and sheds load as directed by the Transmission Operator or Balancing Authority". During an Emergency, which NERC defines as any abnormal condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the BES, the aforementioned function is what the DP will be called upon to implement. The ambiguity that arises is captured within the various types of utility registrations with NERC, and GTC believes the SDT can accommodate two distinct types of DPs which GTC believes to be critical to pass this Standard. GTC observed there are 298 entities in the NERC registry that are true DP function only. Most of these are DP/LSE and would not own BES assets, but they would be directly connected to the BES, hence registration. These entities own load serving substations and implementing voltage reduction or shedding load in an Emergency would not be ambiguous. However, GTC observed there are 242 entities in the NERC registry that are registered DPs, and also registered TOs that own BES assets. To these integrated entities, the scope of communications during an Emergency would be more ambiguous, as these entities may perform actions at transmission stations on a routine basis that the other DP only type entities would not have to consider. With the addition of R6 as written, these entities have an amplified burden of compliance risk associated with their TO registration even though R6 applies to them as a DP. This burden is the separation of those Operating Instructions performed at transmission stations

which occurs more often than the Emergency event which requires a manual operation for reduction of voltage or load shed at load serving stations. GTC believes this ambiguity is significant enough to justify the separation of the DP from R6 to provide a standalone requirement commensurate to the DPs function as documented in the NERC functional model. Proposed R6 language: Remove Distribution Provider from R6. Create a separate standalone requirement for the DP. R#. Each Distribution Provider that receives an oral two-party, person-to-person Operating Instruction to implement voltage reduction or shed load during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: \* Repeat, not necessarily verbatim, the Operating Instruction and request confirmation from the issuer that the response was correct, or \* Request that the issuer reissue the Operating Instruction.

No

modify in accordance with selected alternative drafted above.

Yes

Comments: GTC suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards which FERC directed the removal of. The removal or modification of this language was included in the Final Rule of NERC CIP V5 (Order No. 791). FERC stated that IAC language was “overly-vague, lacking definition and guidance is needed” and that these control concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements. Lastly, GTC recommends a revision to the NERC Glossary term Emergency. GTC recommends the removal of the terms “or limit” within this definition. One could argue that every single Operating Instruction is utilized to limit failures of transmission facilities. Emergency should be more appropriately defined without this ambiguity:  
Proposed: Emergency or BES Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

R3 VSL is listed as high and severe; The concern is that if an operator receives instruction and performs accurately using 3-part, but can't show initial training for Operating Instruction and Operating instruction during an Emergency, would this warrant a high or severe VSL. While there is the potential of risk if Operating Instructions are received prior to being trained, this should not somehow imply that incorrect operations were performed as a result of no training. The severe category should be reserved only for those instances in which Operating Instructions were received prior to being trained \*and\* which resulted in an emergency operation or reliability issue. As a result, we suggest "demoting" each existing VSL to a lower level, and editing the High and Severe VSL and limit it to only those instances that resulted in an emergency operation or reliability issue (suggestions provided below). Low – An individual operator at the responsible entity receiving an Operating Instruction prior to being trained. Moderate – An individual operator at the responsible entity received an Operating Instruction during an Emergency prior to being trained. High – An individual operator at the responsible entity received an Operating Instruction prior to being trained \*and\* resulting in an emergency operation or reliability issue. Severe - An individual operator at the responsible entity received an Operating Instruction during an Emergency prior to being trained \*and\* resulting in an emergency operation or reliability issue.

No

R1.2: Correct the formatting of the third bullet to match the first two so that it is clear that there are three options permitted not just two with a sub bullet to number two. R3: Is worded a little confusing. Suggestion would be to add the text below. Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction that requires them to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] • Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or • Request that the issuer

reissue the Operating Instruction. R4 - In NERC's own Q&A document for RAI prepared by the Risk-Based Reliability Compliance Working Group (RBRCWG), the following statements are made: "An entity can voluntarily establish internal controls designed to reduce its control risk, which could have a positive influence on the scoping of compliance monitoring by the Regional Entity. Conversely, the entity can voluntarily elect to not establish internal controls or share them with the Regional Entity." This is inconsistent with the direction of the proposed Standard COM-002-4, R4. This not only requires an internal control, but also requires that the control be shared with the Regional Entity (during audits). Also, consider that an entity can develop and implement a robust communication protocol consistent with COM-002-4 requirements and flawlessly follow its communication protocol, yet be found in violation of COM-002-4 by failing to demonstrate that it has adequate (subjective) management (internal) controls in place. This is inconsistent with the RAI guidance provided by NERC regarding the voluntary nature of internal controls. So, in principle, internal controls should not be dictated in a reliability standard. This goes against the principle of "Results-Based" standards. The intended result is effective communications. This can be attained with Requirements 1 through 3. No one will argue that internal controls won't help ensure that the desired results are achieved. However, Requirement 4 is not absolutely necessary for the results to be achieved, and therefore, should not be included in the standard and should be removed.

**Definition of Operating Instruction:** The term "command" in the definition of Operating Instruction implies authority, and Southern believes it should be made clear that Operating Instructions (for purposes of this standard) are commands issued by those functional entities that are expressly granted the responsibility and authority by the NERC Reliability Standards to take actions or direct the actions of others to ensure the reliability of the BES. These are the Balancing Authority, Reliability Coordinator and Transmission Operator only. No other functions are expressly authorized in the NERC Reliability Standards to issue a command. Our proposed definition Operating Instruction should be: Operating Instruction — A command originated by a Balancing Authority, Transmission Operator or Reliability Coordinator responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

**Measures: M4:** The inclusion of Emergency here is inappropriate due to the non-inclusion of Emergency in R4. Also change the RSAW to reflect this change as well. Suggested rewording: "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4. The entity shall provide evidence that it took appropriate corrective actions as part of its assessment for all identified instances where operating personnel did not adhere to the protocols developed in Requirement R1"

**Definition of Emergency** Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric

System. If read literally, EVERY breaker operation on the system IS an EMERGENCY. This causes a great deal of concern. From a DP and GOP standpoint, the RSAW and technical justification wording states that an attestation that no emergency had been called requiring a three part response would suffice for evidence. The rationale and technical justification document has some very good explanations of the INTENT of the drafting team and how they want the industry to view the standard requirements. If the standard and the subsequent audits adhered ONLY to what was in the justification document, then there should be little or no concerns. Unfortunately, the justification document carries no statutory weight and the standard as written does.

We do not agree with the following VSLs: i) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or “cap” to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs. ii) R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation that should have been reflected by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.” iii) R6: Same comments as in R5. iv) R7: Same comments as in R5.

Yes

Recently, FERC directed NERC to eliminate the ambiguity with language “identify, assess, and correct” deficiencies for the CIP standards. Although it supported NERC’s move away from a “zero tolerance” approach to compliance, FERC wanted NERC provide more guidance regarding enforceability with the self-identify/assess/correct approach to compliance. NERC may want to consider that FERC may raise the same concerns with this proposed standard. According to the draft standard, if DPs and GOPs receive an Operating Instruction, they can provide an attestation from the issuer of the Operating Instruction to demonstrate

compliance – they do not need to develop documented communications protocols. The lighter compliance burden on DPs and GOPs may result in a higher administrative burden for the RC/BA/TOP to provide attestations.

The AND qualifier provided for R5 which qualifies that Instability, uncontrolled separation, or cascading failures occurred, should also be used for R3.

Yes

AEP believes the most recent changes represent a major step back in regards to clarity (as compared to the draft proposed in October 2013), and has driven us to change our voting position from affirmative to negative. We are concerned by the removal of Reliability Directive, and instead, now basing requirements on whether or not the communications are made during an Emergency. Who determines whether or not an Emergency state exists, and in addition, how would that be communicated? AEP recommends returning to the fundamentals and approach taken in the previous draft. If the phrase “Reliability Directive” is to be remanded, we encourage the drafting team to pursue alternative language which would not require the need to know whether or not the communications are being made during an “Emergency”. For example, perhaps the drafting team could change R1 (as taken from the October 2013 draft) to state something like the following: “Require the issuer to identify the action as a directive or instruction...”. R4.2: Though M4 specifies the kinds of evidence needed to meet R4, we believe it would be too subjective in determining whether or not the entity’s efforts properly assessed the effectiveness of the documented communications protocols.

Brian Evans-Mongeon

Utility Services, Inc

Yes
Smaller DPs and GOPs will have a significant problems demonstrating compliance with Requirement 6 as written. 1. As there is no requirement to notify these entities that an Operating Instruction is being issued during an Emergency, they will not be aware of which communications will be subject to compliance review. 2. Since these entities typically do not record phone conversations they would have to rely on other forms of evidence. Log book enties will not document if three part communication was used and since the entities are not made aware of Emergency conditions, they will not know to maintain a higher level of documentation to demonstrate compliance. 3. Approaching the issuer for confirmation of OIs during Emergency conditions and seeking Attestations from these entities will create a significant administrative burden not only for the small entities, but for the Issuer of the OI as well. 4. Any additional tasks that must be performed during Emergency situations runs contrary to the intent of the standard, which is to normalize communication protocols during all situations, and not have separate procedures during normal and Emergency conditions.

Recommendation 26 calls for work to be done to improve the effectiveness of communications in emergency situations. The purpose of the standard is to improve communications. However, the focus of the standard is primarily 3-part communications.

There is no supporting documentation or data that 3-part communications improves the effectiveness of communications. Focusing on 3-part communications provides an easy target from a compliance perspective but all it teaches us is to mechanically repeat back what we have been instructed to do. We're focusing on the 'how' and 'what' rather than the 'why'. Keeping the 'why' in mind improves communications and the reliability of the BES. Keeping the 'why' in mind also leads to improved situational awareness. Improving effective communications is difficult to quantify in a standard and even more difficult to measure. We may be better off focusing on the principles contained in the OC's Reliability Guideline System Operator Verbal Communications – Current Industry Practices.

Yes

1) Applicability for Distribution Providers (DP's) should be qualified similar to qualification used for DP applicability in version 5 of CIP-003. Applicability needs to be focused on DP employees that may receive instructions relative to the BES. 2) R1: Since Requirements R5, R6 and R7 are zero tolerance, R1 protocols should state that when there is an emergency condition on the system that those issuing Operating Instructions during an emergency shall state that "this is an emergency". Reason Number 1, there needs to be a triggering mechanism that tells both the issuer and receiver that 3 part communication is zero tolerance and in effect during an emergency; Reason Number 2, there is question in the industry as to when the "emergency" begins and ends; and Reason Number 3 the RSAW for R5, R6 and R7 are telling the auditor (in the auditors note) to predetermine before an audit what are emergencies on an entities system, which could potentially create an issue of what is a determined emergency between the auditor and the entity. By inserting a triggering mechanism as suggested will create a demarcation for operating instructions during emergencies. 3) R2 and R3 are already provided for in PER-005 and therefore are redundant in this standard. If there is a need to include a training requirement in this standard, that requirement could consist of a statement to include protocol training in the entity's reliability task list. 4) R4 as written puts a huge administrative burden on entities to administer assessments of 'each' of its operating personnel that issue and/or receive Operating Instructions. As in previous drafts of this Standard, entities should determine and document their own assessments to the Standard and so that adherence and effectiveness fits their program. In addition, the 12-month requirement in the Standard now provides for an administrative burden and compliance trap in order to remain compliant to the 12-month requirement. We're a TOP and do many switching orders a day with operating personnel throughout the state. R4 requires us to assess adherence to communications protocols by our operating personnel (see FAQ #22 says "each" issuer/reciever) that receive these operating instructions and provide feedback to the operating personnel, and take corrective actions when appropriate. Currently, we have over 800 switch personnel, and some of these are not NPPD employees. We utilize personnel from some of our public power partners, such as rural power districts and municipalities. The 12 calendar month clock will be different for each person. So, day-to-day will be a challenge to ensure we capture compliance documentation on each person that changes the state of a BES element. The drafting team

should revert back language similar to R5 of posting #7 (with exception to the “implement” language) so that entities can manage their own compliance controls and can develop assessments that fit their program. NPPD would suggest the following for Requirement 4: R4. Each BA, RC and TOP shall have a documented method to evaluate the communication protocols developed in R1 that: 4.1 Assess adherence to the communications protocols developed in R1; 4.2 Assess the effectiveness of the communications protocols in R1; 4.3 Provide feedback to issuers and receivers of Operating Instructions; and 4.4 Modify communication protocols as necessary as a result evaluated communication protocols in this R4.

FMPA is voting “affirmative” on this standard, yet we have concerns with the RSAW language and lack of criteria on how an entity will be assessed and audited. There is language in the RSAW “Notes to Auditor” for multiple requirements (R4-R7) that is of concern. (See example below) The RSAW language is not clear regarding the nature and extent of audit procedures that will be applied because there is reference to scoping the audit based on “certain risk factors to the Bulk Electric System”. It is not clear what “risk factors” will be used. As an example in R5 auditing “can range from exclusion of a requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity’s responses to numerous Operating Instructions issued during Emergencies.” This is essentially a zero tolerance approach, yet, also appears to be an attempt to apply Reliability Assurance Initiative (RAI) concepts, that have not been finalized and communicated to the industry. It is uncertain whether these concepts have been fully developed yet; and therefore, this leaves too much auditor discretion, without providing the industry information or criteria on how “risk” will be assessed. Stakeholders continue to await the details of these RAI concepts that are being utilized in RSAWS. Clarity is needed around how an entity’s risk to the BES will be assessed due to compliance or non-compliance with this standard. This would also be beneficial for an entity to know, so that they can lessen that risk, as appropriate. Example language from RSAW: “The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with

this requirement. Based on the auditor’s assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity’s responses to numerous Operating Instructions issued during Emergencies. “

PPL NERC Registered Affiliates

Brent Ingebrigtsen

Yes

These comments are submitted on behalf of the following PPL NERC Registered Affiliates: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL EnergyPlus, LLC; PPL Electric Utilities Corporation; and PPL Generation, LLC, on behalf of its NERC registered entities. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. Each of the PPL NERC Registered Affiliates recognize the need for and support the use of three part communications for Operating Instructions. However, we are abstaining from voting on this standard because we believe that the current version of COM-002-4 requires change to ensure consistency with the SDT’s intent. If these clarifications are made, the PPL NERC Registered Affiliates would support the proposed standard. First, the PPL NERC Registered Affiliates request that the SDT revise Measure M.4 to specifically state that sampling is allowed in performing the assessments required by Requirements R.4.1 and R.4.2. This is consistent with the SDT’s oral statements during the January 17, 2014 webinar and the FAQ (“An entity could perform an assessment by listening to random samplings of each of their operating personnel issuing and/or receiving Operating

Instructions....”). Additionally, for consistency and to avoid ambiguity, the SDT should also conform the wording in Measure M.4 to Measures M.5-M.7 (i.e., “Such evidence may include, but is not limited to,...”). Therefore, we recommend that the SDT revise Measure M.4 as follows: M4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments. Such evidence may include, but is not limited to, sampling results, spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4.... Second, the PPL NERC Registered Affiliates request that the SDT clarify in the proposed standard that only a failure to use three-part communications during an Emergency is a violation of COM-002-4. Therefore, we recommend that the standard’s requirements be further revised to indicate that if an entity does not adhere to its documented communications protocols developed in accordance with Requirement R.1 during a non-Emergency, such action shall not be considered a noncompliance event under Requirement R.1.

CenterPoint Energy Houston Electric LLC

Yes

CenterPoint Energy agrees that the COM-002-4 standard addresses the NERC Board of Trustees 2013 Resolution.

Yes

CenterPoint Energy agrees that the COM-002-4 standard addresses both the August 2003 Blackout Report Recommendation 26 and FERC Order 693.

No

CenterPoint Energy does not agree with the Severe VSL for Requirement R1. The Company strongly believes that the focus of any Reliability Standard should be on enhancing the reliable operation of the BES and not on documents. Simply failing to document a procedure should never warrant a Severe VSL as long as the entity is operating according to the Standard.

Yes

CenterPoint Energy would like to thank the COM-002-4 Standard Drafting Team and appreciates the SDT’s time and effort dedicated in the development of this standard, in engaging the industry, and incorporating industry feedback into the standard. The removal of the requirement to identify an Operating Instruction in an emergency or a Reliability Directive to the receiver is viewed as a positive change. CenterPoint Energy believes that operating personnel’s focus should always be on monitoring and controlling the reliability of the BES rather than a compliance burden of correctly identifying and aligning company specific communication protocols to normal versus emergency operations. Overall, CenterPoint Energy agrees with the standard, but still has general concerns. The Company believes the prescriptiveness of the requirements: particularly R1.1 thru R1.6 exceeds the

necessary components needed in establishing communication protocols for tightened reliable communications.

Duke Energy

Michael Lowman

No

(1)Duke Energy believes that Operating Instruction during an Emergency is unclear, vague, and subject to interpretation. By using the NERC defined term of Emergency, certain tasks that Duke Energy believes is a non-emergency action would now be considered an Emergency and subject to zero tolerance. Duke submits, for consideration by the SDT, a revised definition of Emergency in an attempt to remove this ambiguity. Emergency – Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that would adversely affect the reliability of the Bulk Electric System.

No

(1)Based on our comments to Question 1, Duke Energy does not believe that the SDT has addressed Recommendation 26 of the August 2003 Blackout report. The intent of the 2003 Blackout recommendation was to provide tighter communication during normal and emergency situations. Due to the ambiguity that exists between Operating Instruction and Operating Instruction during an Emergency, we believe that this recommendation was not addressed.

Yes

(1)Duke Energy suggests rewording R1.6 as follows: “Specify the nomenclature to be used for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction to neighboring entities.” While the Technical Justification document suggests that R1.6 applies to communication with neighboring entities, it is unclear that this requirement, as worded in the current draft of COM-002-4, is specifically discussing communication with neighboring entities. (2)M2 should include “initial training” and be reworded as follows in order to maintain consistency with the requirement: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.”

We recommend the drafting team: (1) Remove the attestation for another provision (2) Restrict the zero-defect component of the standard to those operating instructions directly related to the emergency (e.g. redistpach instructions for IROLs, committment instructions during EEAs, synchronizing during restoration, etc.) (3) Maintain Reliability Directives in the toolkit as the clear indicator of an Operating Instruction that is directly applicable to the emergency. We believe that DPs and LSEs don't need stringent requirements. They just need to follow Directives or explain why they cannot. We understand that the drafting team is trying to meet a deadline, however we'd support the drafting team addressing all of the industry comments even if it requires more time to get this standard right.

The evidence needed to avoid violation is not clear. The VSL for R2 is not reasonable and an auditing nightmare. It should state an operator did not receive training on the documented communication protocol. Adding "prior to issuing an operating instruction" cannot be determined without excessive investigation. A check that all operators received training is appropriate. Same issue with R3 as listed for R2.

Yes
Yes
PJM supports the draft standard as it strikes a good balance between the industry and the NERC BOT November, 2013 resolutions. The standard provides the industry some flexibility regarding how communication protocols are developed. It also makes it cleaner and easier for operators to use the same protocol for all Operating Instructions, whether in an emergency or not, while not burdening System Operators with issues around how compliance will be measured. PJM does not support the addition of a new training requirement under R1. PJM recommends that all training requirements be included in one standard and not spread throughout families of standards. Consolidation of all training requirements under a single training standard will help in development of a clear, more organized training process.
Group
SPP Standards Review Group
Robert Rhodes
No
Our understanding of Recommendation 26 is that it deals strictly with communications during emergencies which COM-002-3 had already addressed. The addition of non-emergency communications, which are not mentioned in Recommendation 26 at all, has expanded the scope of the standard beyond that called for by the recommendation. The addition of non-emergency communications has added additional compliance burden for the responsible entities without clearly improving the reliability of the BES.
No
We suggest changing the Moderate VSLs for R5, R6 and R7 to Lower. If the failure to completely follow through with the protocols contained in R1 had no adverse impact on the situation, then this VSL is purely administrative and is not deserving of being Moderate. The Lower and Moderate VSLs for R1 contain specific details regarding each of the Parts referenced in each of the VSLs. In the High and Severe VSLs for R1 only reference is made to the Parts while the details contained in the Parts is not included in the VSLs. Either the details should be removed from the Lower and Moderate VSLs or the details need to be included in the High and Severe VSLs.
Yes

The removal of Reliability Directive from the definition of Operating Instruction has removed clarity from a compliance viewpoint. Without this clarity, which could also be provided by requiring a statement which identifies the Emergency situation as an Emergency, the operator does not know that he is in an Emergency situation. Although the operator's response may be the same as it is in a non-emergency, the compliance hook of zero tolerance is there. We need a mechanism in place that we can use to identify when we are in an Emergency situation which prevents Monday-morning quarterbacking during an audit regarding whether an Emergency actually occurred or not. Reliability Directive gave us that indication. We recommend requiring an Operating Instruction that is issued during an Emergency situation be identified as 'This is an Emergency.' Recommendation 26 calls for work to be done to improve the effectiveness of communications in emergency situations. The purpose of the standard is to improve communications. However, the focus of the standard is primarily 3-part communications. There is no supporting documentation or data to support the position that 3-part communications improves the effectiveness of communications. Focusing on 3-part communications provides an easy target from a compliance perspective but all it teaches us is to mechanically repeat back what we have been instructed to do. We're focusing on the 'how' and 'what' rather than the 'why'. Keeping the 'why' in mind improves communications and the reliability of the BES. Keeping the 'why' in mind also leads to improved situational awareness. Improving effective communications is difficult to quantify in a standard and even more difficult to measure. We may be better off focusing on the principles contained in the OC's Reliability Guideline System Operator Verbal Communications – Current Industry Practices. We suggest that R2 and R3 are already provided for in PER-005 and therefore are redundant in this standard. If there is a need to include a training requirement in this standard, that requirement could consist of a statement to include protocol training in the entity's reliability task list. Measure 4 adds an additional requirement regarding the failure to follow protocols which in turn leads to an Emergency. The Measure basically requires the responsible entity to assess those particular situations even though they are not specifically called out in the requirement. We recommend adding the following sentence at the end of R4.1: 'Such assessment shall include, at a minimum, any instance that is an Emergency.' We recommend that the drafting team consider moving R4 back to language similar to that contained in R5 of Posting 7. This language is much clearer and eliminates Paragraph 81 concerns of administrative burden associated with the required 12-month assessments and removes the ambiguity of 'corrective actions' and 'as appropriate'. In the last line of the Evidence Requested table in the R2 section of the RSAW, the following evidence is requested: 'Organization chart or similar artifact identifying the operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System and the date such personnel began operating the Real-time Bulk Electric System.' This implies that an entity will be found non-compliant if operating personnel operate the Real-time BES prior to receiving training on issuing Operating Instructions. This is not what is stated in the requirement. This entry should be reworded to the following: 'Organization chart or similar artifact identifying the operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System and the date such personnel began issuing Operating Instructions.' Similarly, this change

needs to be made in the Compliance Assessment Approach Specific to COM-002-4, R2 table. That entry should read: 'Verify applicable operating personnel, or a sample thereof, received the required training prior to the date they began issuing Operating Instructions by agreeing selected personnel names to training records.'

Group

Bureau of Reclamation

Erika Doot

Yes

Reclamation requests that R5 include a bullet requiring the issuer of an Operating Instruction during an Emergency to identify the situation as an Emergency. This is important because R6 requires recipients of Operating Instructions to repeat the instructions during Emergencies, but it may not be clear to the recipient that an Emergency is occurring. Reclamation reiterates that R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction. The drafting team could choose to address this point with a footnote explaining that the requirement to repeat the instruction does not obligate the recipient to perform the action if he repeats the instruction, but then explains that he cannot perform the action because doing so would violate safety, equipment, regulatory, or statutory requirements.

No

We do not believe the proposed requirements and measures clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.

No

We do not agree that the blackout recommendation calls for the use of 3 part communication for every Operating Instruction and note that neither the NERC Board nor the SDT has provided any evidence that indicates a direct correlation between errors due to communication problems and events that adversely impacted the BES. Therefore we find it difficult to support reliability standard requirements that require 3 part communication for every Operating Instruction and enforce compliance with same.

No

We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19th, 2013 Resolution, which is to enforce 'zero tolerance' only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency.

Yes

The proposed standard still contains requirements that mandate the use of, and training to include, 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. While Dominion agrees that the SDT has stated in its Rationale and Technical Justification document that the proposed measures and RSAW don't specifically require that auditors verify compliance of this for the requirements (and associated measures), a strict read leads us to a different conclusion. Under the RSAW for R1 it states that the entity shall provide its documented communications protocols developed for this requirement and the auditor shall review the documented communications protocols provided by entity and ensure they address the Parts of R1 (including the use of 3 part communications). The RSAW contains similar actions relative to R2 and R3 in that the entity is to provide evidence consisting of agendas, learning objectives, or course materials that it provides pursuant to these requirements. Given this, Dominion believes an auditor can enforce to a 'zero defect tolerance' if it chooses to do so and in fact would argue that an audit would be deficient if it failed to validate whether the learning objective included insuring that 3 part communication was used during issuance or receipt of each Operating Instruction. Dominion also finds there are not clear and concise differences between requirements 1, 5 and 6 resulting in uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. Dominion is concerned that, absent a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. Having said this, we could support the standard if it were revised in a fashion similar to that described below. 1. Modify requirement 1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm their understanding through use of 3 part

communication. 2. Remove requirements 5, 6 & 7 (incorporating specific items deemed necessary by the SDT as bullets or sub-requirements of R1). 3. Revise measures, VRFs/VSLs and RSAW so that strict compliance with use of 3 part communication is only applied when an Operating Instruction is issued to alleviate or avoid an Emergency as identified by the issuer at the time of issuance. 4. Measure M4 requires compliance demonstration beyond Requirement R4. Specifically, entities must provide evidence that appropriate corrective action was taken for all instances where an operating personnel's non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency..., Examples of suggested changes R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] 1.1. Require that its operating personnel identify, at the time of issuance, when the Operating Instruction is being issued to alleviate or avoid an Emergency 1.2. Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions: • Confirm the receiver's response if the repeated information is correct. • Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver. • Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver. • Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency 1.3 Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations. 1.4. Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. 1.5. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification. 1.6. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2). • VSL for R1 – modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency

ACES Standards Collaborators

Ben Engelby

No

(1) We disagree that the current draft addresses the NERC Board resolution because the Board charged the drafting team with developing an “essential set of communications protocols” for reliable operation of the BES. The proposed standard conflicts with other existing reliability standards, which would subject entities to double jeopardy. Therefore, the standard includes more than an “essential set” of requirements as stated in the NERC Board Resolution. (2) For example, the “nomenclature” protocol in Requirement R1 is duplicative with TOP-002 R18. Since FERC issued a NOPR proposing to remand the TOP standards, the requirement of using “uniform line identifiers” will remain as an enforceable standard. Having a nomenclature requirement in COM-002-4 will subject entities to double jeopardy and is not an “essential set of communication protocols.” (3) Another example of a redundant requirement is training. Communications that impact the BES will be covered in a reliability related task as part of the systematic approach to training. This will also subject entities to double jeopardy with PER-005 R1 and is not an “essential set of communication protocols.” (4) We appreciate the efforts of the drafting team in working to address the FERC directives and NERC November 2013 BOT Resolution, but we do not believe that COM-002-4 accurately reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. We understand that the inclusion of Distribution Providers to this standard stems from various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions. Thus, we continue to recommend that Distribution Providers be removed from the applicability of COM-002-4. (5) Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, we recommend an alternative that parallels the recently FERC approved CIP-003-5 applicability section 4.1.2, which we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative can be used as technical justification to clarify those Distribution Providers that have an impact on the BES is recommended: “4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.”

No

(1) We believe recommendation number 26 of the 2003 Blackout Report continues to be misinterpreted. The recommendation is focused on how the ERO should communicate with governmental agencies. It states, “Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties, [including state and local officials] are able to give and

receive timely and accurate information.” The recommendation does not state anywhere to utilize three-part communication. COM-002-4 does not address the development of hotline networks or “upgrading communication system hardware where appropriate” for contacting governmental agencies, including state and local officials.

No

(1) We disagree with some of the requirements of including training and several aspects of the communication protocols. Since we disagree with the underlying requirements, we also disagree with the corresponding VSLs and VRFs.

Yes

(1) We disagree with training requirements as they are redundant with PER-005. Similar to a FERC directive, the drafting team should be able to provide the BOT with technical justification that other alternatives exist to developing a new requirement such as pointing to an existing requirement. Training is already included in the PER requirements. The drafting team should provide the feedback from industry and show that there is an already existing enforceable standard that covers this issue of training and there are no gaps in reliability. (2) We do not think the Distribution Provider should be an applicable function. Most Distribution Providers simply do not have a materially impact on BES reliability. We suggest an alternative to have the standard apply to those DP that may impact the BES. According to the FERC-approved CIP version 5 standards, a Distribution Provider is subject to the standards if the DP has UFLS/UVLS systems that have the capability of shedding 300 MW or more of load. We ask the drafting team to consider revising the applicability section to mirror the CIP standards. There was technical justification provided during the development of those standards, NERC and FERC both approved those standards, and therefore, a precedent exists for this reasonable approach to focusing on entities that pose an impact, however minimal, to the BES. (3) Many DPs have no practical way to demonstrate compliance with “repeat backs.” Many DPs do not have recording systems for the telephonic communications. This puts the DP in a position to request the voice recordings or attestations from the issuer. The issuer is not obligated to provide the data and, in fact, history has shown that many registered entities will not provide this type of data to a third party for fear of compliance issues being identified with the issuer. Thus, from a practical perspective the standard puts the DP in the position of having to use weak evidence to demonstrate compliance. This is an unreasonable burden on the DP. (4) We recommend that the drafting team remove references to “taking alternative actions.” This is ambiguous and could potentially tie in actions that should be taken in accordance to directives in IRO-001 and TOP-001. COM-002 is related only to communications, so taking alternative actions must be limited to alternative communications. (5) We suggest that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance

Initiative (RAI), rather than standards requirements. (6) Thank you for the opportunity to comment.

GSOC recommends modifying R1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm understanding through use of 3 part communication. This would require a revised R1.1 Proposed R1: ADD: Require that its operating personnel identify, at the time of issuance, when the Operating Instruction is being issued to alleviate or avoid an Emergency. Proposed R1.2: ADD: Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency. Proposed R1.3: change the word "correct" to "understood" Requirement 2: GSOC believes R2 should be eliminated as redundant with the systematic approach to training requirements of PER-005-2(Operating Personnel Training) which are applicable to all Bas, RCs and TOPs. Communication protocols must be included in each company's specific reliability-related task list. GSOC believes the current proposal of COM-002-4 still contains ambiguities that can be resolved with the following alternative. GSOC recognizes the following alternative in that it parallels the recently FERC approved CIP-003-5. GSOC believes this alternative more accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. 4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.

No

R1 – GSOC requests that there not be applied a Severe VSL for normal everyday Operating Instructions.

Yes

With consideration that an Emergency may not be initially recognized by system operators for several minutes, GSOC requests Requirements R5 thru R7 include the word “recognized” precede the work “Emergency”. GSOC cites the newly effective EOP-004-2, R2 currently affords this consideration. It requires reporting “within 24 hours of recognition of meeting an event type threshold”. In addition, GSOC recommends R5 thru R7 replace the words “during an Emergency” with “addressing a recognized Emergency” so as to avoid confusion should there be Operating Instructions issued during an Emergency that may have nothing to do with an Emergency. GSOC suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements

This standard is not responsive to the Blackout Recommendation #26. The prevention of miscommunication is the current focus of this standard, while nothing in the Blackout Report commented on an instruction not being followed due to miscommunication. Rather, the Blackout Report focused on a lack of situational awareness based on one entity not understanding what the other entity was describing because different entities used different terminology. Flow of communications or “who” should be notified was also lacking in addition to “what” needed to be communicated. The report highlighted that effective communication was based on communication of important and prioritized information to each other in a timely way. In essence, this focuses on communication protocols to prevent miscommunications while Recommendation #26 focused on effective communication protocols that improve situational awareness, where the former is process and the latter is substantive. That being said, and regardless of whether COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26 or not, ERCOT ISO can support the COM-002-4 standard. However, ERCOT ISO believes the draft standard could be improved and offers suggestions in Question 4 below, for the SDT’s consideration.

No

R2 and R3 VSLs should not have the “during an Emergency” distinction between a high and severe VSL. VSL’s grade the severity or “how bad” did an entity violate a requirement. The risk and situation of non-compliance is included in the VRF and not the VSL. ERCOT ISO would recommend percentage indicator across the severity levels as detailed in the VSL guideline document. R5-R7 VSLs should remove “Instability, uncontrolled separation, or cascading failures occurred as a result.” as that stipulation is not appropriate in the VSLs. The resulting

impact of non-compliance is addressed in the enforcement process and not in how severe an entity did not comply with a requirement. ERCOT ISO suggests a binary or severe only VSL to coincide with the VSL Guideline document. Additionally, ERCOT ISO would recommend adding “at least” in the R5 VSL to better clarify that a minimum of one of the three actions is required and not all three. The responsible entity that issued an Operating Instruction during an Emergency did not take ‘at least’ one of the following actions:

Yes

ERCOT ISO believes the draft standard could be improved and offers the following suggestions for the SDT’s consideration.

**Definition of Operating Instruction** The definition of Operating Instruction could be improved by making the following changes: 1) Delete the word “interconnected” before BES in the first sentence. It is not used instances where BES is used. Unless there is a substantive reason for using interconnected in some BES references and not others, the standard should be consistent to mitigate ambiguity; 2) “Potential Options” in the parenthetical is redundant – delete “potential”. Also, “option” and “alternatives” in the parenthetical are also redundant – delete one of them; 3) The parenthetical doesn’t need to be a parenthetical – make it the last sentence in the definition. As revised, the definition would read as follows: Operating Instruction — A command by operating personnel responsible for the Real-time operation of the Bulk Electric System (BES) to change or preserve the state, status, output, or input of an Element of the BES or Facility of the BES. A discussion of general information to resolve BES operating concerns is not a command and is not considered an Operating Instruction.

**Purpose Section** The purpose statement could be improved by making the following changes: 1) Delete “the issuance of” in the first sentence. It is inherent that a communication is “issued”. Therefore, this language is superfluous and should be deleted to mitigate any potential ambiguity; 2) Delete “predefined” in the first sentence. This adjective is not needed - the existence of communication protocols means they are predefined. Therefore, this is superfluous language and should be deleted to mitigate potential ambiguity. As revised, the purpose section would read as follows: Purpose: To improve communications for Operating Instructions with communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).

**Requirements Section R1** 1) ERCOT ISO disagrees with changing “have” to “develop” in the first sentence. The point of this requirement is to have protocols that meet the minimum requirements. Obviously, in order to have the protocols an entity would need to develop them, but that is not the focus – as noted, having the protocols is the intent; 2) Change “and” to “or” in the following - “...for its operating personnel that issue or receive Operating Instructions...” The intent is to make the obligation to have protocols applicable to all operating personnel of the relevant functions. It may be that some functions only issue or only receive operating instructions. In those cases this requirement would not apply to those entities because the requirement is conjunctive – issue and receive. By making it disjunctive by using “or” the requirement applies to all circumstances – i.e. issue and receive or just issue or just receive; 3) The change suggested in (2) above should be made in R1.1 as well; 4) Also in R1.1, the triggering condition for using another language besides English - i.e. “unless otherwise agreed to” – is unclear in terms of how that would work. How do you demonstrate that such

an agreement is in place? Also, practically speaking, the ability to reach such an agreement assumes that all operators are capable of speaking the alternative language. It seems way too complicated because it would depend on the languages spoken by the different operators at different entities, and their schedules would have to be coordinated. These issues are less of a concern for allowing alternative languages for internal communications because the entity's personnel know one another and are located in the same place/organization. ERCOT ISO appreciates the intent of allowing for this exception, but it is difficult to see how it would work in practice, and even assuming it could work, the requirement is unclear as to what sort of agreement would be required;

5) R1.2 – Change “repeated information” to “response”. First, this change promotes consistency in terminology. Second, it is more consistent with the intent that the receiver is not required to repeat the directive verbatim – response contemplates flexibility as long as intent is there, while repeated information seems to require a verbatim reply;

6) The last bullet in R1.2 requires the issuer to take an alternative action if a response is not received or if the instruction is not understood. It is unclear what this means. Is the obligation related to trying to re-issue the instruction, or does it require the issuer take an alternative operating action? This is a communications standard, not an operations standard. Accordingly, the intent of this bullet should be clarified, and if it requires the issuer to take an alternative operating action, ERCOT ISO questions whether that obligation should be in a COM standard. Operational requirements are already covered in other standards, and if entities act under those other standards then the relevant communications protocols would apply to those “alternative” operating actions. ERCOT ISO believes that the “alternative action” described in the third bullet of R1.2 and R5 should be limited only to communications and not operating actions. ERCOT ISO would recommend replacing R1.2 and R5 third bullet with the following: Attempt an alternative means to communicate the Operating Instruction if a response is not received or if the Operating Instruction was not understood by the receiver, if deemed necessary by the issuer. ERCOT ISO also recommends including “or receiving” to capture that the training should be prior to that individual operator issuing ‘or receiving’ an Operating Instruction to address the subparts of R1 that deal with receiving Operating Instructions.

7) R1.4 – Delete “single-party”. It is clear that an issuer is one entity without having to add “single-party”. Accordingly, this is superfluous language and should be deleted to mitigate ambiguity. If this deletion is made, “operating instruction” would have to be moved to where “single-party” was in the sentence;

8) R1.4 requires the issuer to “confirm” or “verify” that the instruction was received by at least one entity. They are the same thing – delete one of them for clarity and to mitigate ambiguity;

9) R1.5 requires the communication protocols to specify the instances where time identification is required and to specify the format for time identification. As written, this appears to require the protocols to specifically list all relevant instances and, where relevant, requires the use of a specific time ID format. The SDT should consider revising this so the requirement imposes a general obligation for the protocols to time ID instructions when necessary, but not require the establishment of an exclusive list. This will accomplish the goal of time stamping and provide the entity with flexibility to implement the requirement, which will also mitigate the need to revise protocols if an entity determines prospectively that time ID is not needed in some instances on the list and is

needed in other instances that are not on the list. Similarly, the protocols should not require a specific format. Providing flexibility with respect to format will mitigate the potential for form over substance violations of the protocols – time ID is the point, not the format; 10) R1.6 requires the protocols to establish nomenclature for transmission elements. It is unclear how this will facilitate clearer communications unless all entities that are issuers or recipients of instructions use the same nomenclature. As drafted, it appears that it is an independent obligation that applies to each entity. If that is the case, each entity could use different nomenclature, which arguably could have a negative impact on communications. R4 1) ERCOT ISO understands the inclusion of R4 as a means to make normal operations Operating Instructions not subject to zero tolerance enforcement. However, ERCOT ISO has reservations concerning potential subjectivity surrounding who determines “appropriate” and “as necessary”. As a general comment, these types of “internal controls” requirements are better handled through the RAI initiative and subsequent CMEP processes. However, if the language remains, ERCOT ISO believes the clarity and effectiveness of the standard will benefit by clarifying that the entity who is conducting the assessments determine the appropriateness and necessity, and that the role of the ERO is simply to review if such activities were performed. ERCOT ISO recommends modifications as below. 4.1. Assess adherence by its operating personnel that issue or receive Operating Instructions to the documented communications protocols ‘required’ in ‘by the subparts’ of Requirement R1, , provide feedback to those operating personnel and take corrective action, as ‘deemed’ appropriate ‘by the entity’ to address deviations from the documented protocols. 4.2. Assess the effectiveness of its documented communications protocols ‘required’ in ‘by the subparts of’ Requirement R1, for its operating personnel that issue or receive Operating Instructions and modify its documented communication protocols, as ‘deemed’ necessary ‘by the entity’. Additionally, ERCOT ISO recommends including language to specify that R4 only be required to apply to those communication protocols that are identified in the subparts of R1, and not to other practices that an entity may choose to employ or improve upon. This clarification will mitigate creating a “fill in the blank” type standard approach for future potential changes to the R1 documented communication protocols. R5 1) How does the term “Emergency” in this requirement align with/relate to the term “Reliability Directive” in other standards, both in terms of meaning and scope of related responsibilities – is there overlap that could create ambiguity or unnecessary redundancy? There is a concern regarding the use of “Operating Instruction during an Emergency”. While ERCOT ISO understands the rationale behind replacing Reliability Directive with the new terminology based on the FERC NOPR potentially remanding the term, to avoid overlap/redundancy/confusion if this is retained, any potential conflicts must be addressed through other projects. Use of Reliability Directive up until this draft created clear synergy between COM-003/002 and the IRO/TOP revisions. If the term is not remanded, ERCOT ISO would support a more uniform approach by including Reliability Directive; 2) Change “repeated information” to “response” in first two bullets. See comment 5 in R1 comments above for rationale for this suggested change; 3) Third bullet – see comment 6 under R1 comments – same comment for the third bullet under R5; R7 1) Delete “single party” and delete either “confirm” or “verify” – see comments 7 and 8 under R1 for rationale for these suggested revisions. Measures M4 is too prescriptive and inappropriately

imposes requirements on the entity. This measure should align with previous comments concerning R4. M4 should be modified to reflect appropriate measures or types of evidence that should be provided without being overly prescriptive with respect to the level of quality of evidence. Additionally each part should be included and reflect the requirements without imposing additional requirements. M5-M7 should not identify attestations from the issuer or include “dated and time stamped” as part of the measure. Compliance should be demonstrated by the relevant entity – third parties should not be required either directly or indirectly to support the compliance activities of another entity by providing attestations. “Dated and time stamped” goes to the quality of evidence and is not appropriate for a measure. ERCOT ISO comments that inclusion of attestations, documented observations, procedures, or other equivalent evidence would improve M5-M7.

We do not agree with the following VSLs: i) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or “cap” to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs. ii) R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.” iii) R6: Same comments as in R5. iv) R7: Same comments as in R5.

Yes

1. R1.4. – [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. • Some ISO's issues multiple-party burst Operating Instruction to Generator Operators through electronic means Associated real-time requirement: R7. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. NOTE – ERCOT does not support the following Comment: The SRC members (excluding ERCOT) do not believe this requirement is necessary for reliability. Moreover, the Standard Drafting Team has not provided any, nor have we been made aware of the substantiated rationale for keeping this Requirement except that the SDT believes is it necessary.

2. R1.6. – [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. Comment: This Requirement is vague and needs to be clarified for Registered Entities to know how to comply with it; how would one "specify nomenclature" system-wide? Even though the posted "Rationale and Technical Justification" (RTJ) document notes that R1.6 is limited in scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations), this RTJ document should define these terms and substantiate to what registered entities this needs to apply. For example, if the intent is to apply this requirement to Inter-Area tie-lines, then it should probably be limited to Reliability Coordinator-to-Reliability Coordinator communications. If the intent is to apply this requirement to every type of transmission – say generation interconnection facilities – it should be clear so that Registered Entities can clearly understand the burdens associated with this new Requirement.

3. R2. and R3. – ..."shall conduct initial training for each of its operating personnel ..." Note – ERCOT and IESO do not support the following Comment: The SRC members, (excluding ERCOT and IESO) do not believe a training Requirement is necessary; Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a Standard Requirement. Additionally, to the extent that the SDT concludes that training on 3-part communication is necessary to ensure an adequate level of reliability, then any training requirements should this would already be covered under the PER Standard, which requiring training on job tasks. To the extent training requirements should be imposed on GOP/DP personnel, the PER Standard could be slightly modified to include them. Overall, if NERC is going to add additional training requirements, they should be located in PER to avoid complexity in the organization of NERC Standards. Finally, under RAI principles, NERC and Regions can determine what type of monitoring is appropriate of Responsible Entities' compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment. In conclusion, even though the BOT resolved that there should be training associated with the COM requirements, it would be beneficial to

address the BOT's concern through existing Standards (PER). Basic principles of drafting regulation should strive to avoid making the organization and relationship among NERC Standards more complex than need to be. 4. Measurement 6. Measurement 6 needs to be revised so that it is consistent with NERC Enforcement policies. Specifically, the last sentence needs to be rewritten so that "Such evidence may include, but is not limited to, dated and time-stamped voice recordings[,] dated operator logs, an attestation from the issuer of the Operating Instruction, voice recordings (if the entity has such recordings), memos and transcripts." NERC has repeatedly affirmed that a Registered Entity may provide an attestation that it has complied with a Standard. See NERC Compliance Process Bulletin#2011-001 ("Data Retention Requirements") (May 20, 2011), at p 3 (in the context of explaining that the CMEP requires a registered entity to demonstrate that it was compliant through the entire audit period, NERC stated that some examples of evidence may include "An attestation of any employee who has participated in the activity on a regular basis throughout the audit period, supported by other corroborating evidence (such as schedules, emails and other applicable documentation). Recipients of oral Operating Instructions during an Emergency have ample means of maintaining records, providing corroborating material, etc... demonstrating that they adhered to the emergency Operating Instruction. To establish an expectation that other Registered Entities may be maintaining audit evidence for the Registered Entity to which the Requirement applies is inconsistent with NERC's enforcement rules and establishes a flawed practice and expectation with regard to recordkeeping requirements and "audit trails."

Indiana Municipal Power Agency

Yes

Requirement R3 is not clear in defining if it covers all Operating Instructions received by a Distribution Provider and Generator Operator. Distribution Providers and Generator Operators can receive Operating Instructions from outside parties (Balancing Authority, Reliability Coordinator, and Transmission Operator) and from internal parties (its own Market Operations). The current word in Requirement 3 requires Distribution Providers and Generator Operators to repeat back both outside and internal parties Operating Instructions. IMPA does not believe this was the intent of the SDT since there are no requirements that cover Distribution Providers or Generator Operators issuing Operating Instructions (the Generator Operator's Market Operations issuing an Operating Instruction to its generating power plant; Generator Operators cannot issue Operating Instructions to any Registered Entities such as the Balancing Authority or Reliability Coordinator). IMPA also believes that operating personnel need to know at the time an instruction is given if it is an Operating Instruction or a Directive. This clarification needs to come from the entity giving the

instruction and reviewing the call afterwards to make that determination is very problematic.

Comment 1 Systematic Approach to Training is already covered in PER-005-1 and including a requirement for training would seem to be redundant. Comment 2 The applicability of Distribution Provider (DP) functional responsibility presents potential for confusion. New England LCC's (Transmission Operators) operate at the direction of ISO-NE the Regional Transmission Operator (RTO) and enforcing the communication protocols to distribution companies/distribution providers may present challenges, identifying, documenting and implementing COM-002-4 to the DP. Comment 3 The language used in Requirement 1.6 is vague and needs to be clarified for Registered Entities to know how to comply with it. How would one "specify nomenclature" system-wide?
Individual
Jen Fiegel
Oncor Electric Delivery Company LLC
No

The Operating Instruction during an Emergency is unclear, vague, and subject to interpretation. By using the NERC defined term of Emergency, certain tasks that are a non-emergency action would now be considered an Emergency. Oncor supports GTC's recommendation of the removal of the terms "or limit" within this definition. One could argue that every single Operating Instruction is utilized to limit failures of transmission facilities. Emergency should be more appropriately defined without this ambiguity. We submit, for the SDT's consideration, a revised definition of Emergency in an attempt to remove this ambiguity. Emergency – Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that would adversely affect the reliability of the Bulk Electric System. Oncor does not believe that COM-002-4 accurately reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. Oncor understands that the inclusion of Distribution Providers to this standard stems from various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions, continues to recommend that Distribution Providers be removed from the applicability of COM-002-4. Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, Oncor supports the alternatives recommended by GTC as an opportunity to address this. In addition, the COM-002-4 does not align with the evaluation and findings of the NERC Reliability Issues Steering Committee (RISC) and Operating Committee (OC) which supports the importance of clear communications but found no evidence that non-emergency communications represent a reliability gap.

No

COM-002-4 goes beyond the August 2003 Blackout Report Recommendation number 26, FERC Order 693 for neither identify requirements for normal operations. EOP-001-2, R3.1 and COM-002-2, R2 already address the requirements of the Blackout Report and FERC Order 693. The intent of the 2003 Blackout recommendation was to provide tighter communication during emergency situations. Due to the ambiguity that exists between Operating Instruction and Operating Instruction during an Emergency, we believe that this recommendation was not addressed. In addition, the NERC BOT directed the NERC Operating Committee (OC) to evaluate the COM standards (previously COM-003) and responses from the Reliability Issues Steering Committee (RISC), the Independent Experts Review and NERC Management. Their report issued September 23, 2013 to the NERC BOT Chairman identifies the importance of clear communications but found no evidence including the NERC event analysis process nor recent events which supports that non-emergency communications represents a reliability gap. The OC created a guideline for verbal communications which provides industry best practices and recommended utilizing the guideline to promote continuous improvement versus implementing a mandatory standard.

Yes

Yes

Oncor recommends Requirement 4 and Measurement 4 be removed. The “assess adherence and assess effectiveness” language mirrors the same concepts as the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards which FERC directed the removal of. The removal or modification of this language was included in the Final Rule of NERC CIP V5 (Order No. 791). FERC stated that IAC language was “overly-vague, lacking definition and guidance is needed” and that these control concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements. Reliability Standards must be revised to focus on strategic and critical reliability objectives incorporating requirements for meeting and sustaining reliability of the BES. The current state of Standards must transition from a prescriptive zero tolerance approach to results-based requirements which assure the reliability and security of the critical infrastructure. A reliability results-based approach should not be an additive to the Reliability Standards; hence, controls requirements should not be incorporated within the Standards, rather controls should be considered at the Program level. Reliability Standards should define the results (“what”) Entities are mandated to meet and maintain and the “how” should be handled by each Entity for there is not a “one size fits all”. Incorporating detective controls as requirements and prescriptive measurements can lead to unintended consequences and again, an additive versus a process that helps provide a registered entity with reasonable assurance they comply with the Standard(s) or the operating function(s) and processes that the Standard(s) require. Rewording of R1.6 as follows: “Specify the nomenclature to be used for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction to Neighboring Entities.” While the Technical Justification document suggests that R1.6 applies to communication with neighboring entities, it is unclear that this requirement, as worded in the current draft of COM-002-4, is specifically discussing communication with neighboring entities. M2 should include “initial training” and be reworded as follows in order to maintain consistency with the requirement: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.”

Revision 8 addresses the Board Resolution, but it goes beyond the resolution by including GOP’s and DP’s as applicable entities thereby creating redundant and unnecessary compliance obligations for many of those entities. See comments below in response #4. Furthermore, while the new approach in this draft is an improvement, it does not achieve the desired goal to move away from a zero tolerance focus on the use of three part

communication within this standard. If time is allowed for further work on this standard, we offer potential adjustments below in response #4. A couple points of potential confusion: - Question 1 and the link to the Board Resolution on the Project page cites a November 19, 2013 Resolution; however, the link takes readers to a November 7, 2013 Resolution. We assume the November 7, 2013 Resolution is the correct reference. - The first bullet of the November 7, 2013 Board Resolution refers to the Operating Committee Guidelines for good communication practice. This OC document does not appear to be linked to the Project page. It is unlikely that many stakeholders would have found and/or reviewed the document relative to the proposed COM-002-4 draft.

No

2003 Blackout Report Recommendation No. 26 reads: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate (footnote omitted). NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date." While Exelon believes that COM-002-4 goes beyond the Recommendation and includes the requirement to implement communication protocols for operating BES elements in non-emergency and other non-critical situations, Exelon also recognizes that the NERC Board believes that the words "especially for" in the recommendation are the reason to include a standard for normal communications. We also understand that in paragraph 540 of Order No. 693, FERC directed the ERO to expand the applicability of the communication standard to distribution providers (DP's) but that directive tied back to communications protocols "especially for communications during alerts and emergencies." Although Recommendation 26 addresses "key parties" and FERC directive addresses DP's in the context of Blackout Recommendation No. 26, we don't believe that either was intended to include DP's and GOP's for non-emergency /Operating Instructions communications.

Yes

- A "qualified" application of COM-002-4 for a DP that performs voltage reduction or load shedding as directed by an RC, BA or TOP could clarify the standard and place the emphasis on the functional entities that matter most.
- Remove R6 and M6. The BA, RC or TOP, as issuers, record Operating Instructions (OI). R1.2 requires an entity issuing an OI to confirm the receiver's response, reissue if necessary and take alternate action if the receiver does not confirm or understand the OI. Similarly, per R5, issuers of an OI are required to confirm the receiver's response, reissue if necessary and take alternate action if the receiver does not confirm or understand the OI. There is little reliability benefit in requiring the DP and GOP receiver documenting their role in this exchange. The training requirement for receivers of OI's in R3 is sufficient.
- If R6 and M6 are not removed. R6. To clarify, suggest that the word

“Operating Instruction” be inserted after “excluding written” so it is clear it is applicable to both conditions. M6. Need a comma after “voice recordings” so as to separate it from dated operator logs. “Voice recordings” is repeated twice in M6. M7. “Voice recordings” is repeated twice in M7. • R6 / M6. Exelon is concerned that demonstrating compliance with R6 may prove difficult for some entities. A generator operator may not have voice recording available at the entity’s facility and it may not be possible to procure voice recording or attestations from the issuer of an Operating Instruction. The measurement says dated operator logs are acceptable evidence. The RSAW further discusses auditor discretion and risk assessment respecting this requirement and measure. If audited per the measurement and RSAW guidance, log entries would be acceptable evidence but we are concerned that an auditor may find otherwise. • Should this proposal fail to pass ballot, we encourage the drafting team to build on the positive work done in this version and address the compliance concerns that remain. All stakeholders would be best served if this standard could incent improvement in communication through effective self-assessment and applied lessons learned. This iteration presents an opportunity to truly step away from placing the compliance burden that judges operators for their use of three-part communication and to focus on programmatic measures to promote effective communication. Specifically, replacing R5, R6 and R7 with meaningful assessment criteria to include in entity review programs could increase the qualitative components of the program, focus on efforts to improve effective communication and remove the zero tolerance compliance approach that currently exists. • While it’s been difficult to keep “starting over” with new standard language approaches, we believe that this version sets solid groundwork to address the hurdles and conflicts of previous approaches. Should more time be allowed to continue development of this most recent proposal, we would welcome the chance to discuss our ideas further.

Individual

Alice Ireland

Xcel Energy

Yes

Xcel Energy is voting negative because the standard no longer contains clarity for all parties on when they have entered an emergency state and therefore 3-part communication would be required. Since the requirements to conduct 3-part communication on emergency operating instructions will remain zero tolerance, it is important that the line of when the entity entered an emergency state be clear to the registered entities involved as well as ERO compliance and enforcement personnel. We think incorporating some of the mechanics from COM-002-3 could easily remedy our concerns. Alternatively, please consider requiring an Operating Instruction that is issued during an Emergency situation be identified as ‘This is an Emergency.’.

ReliabilityFirst
No
ReliabilityFirst submits the following comments related to the VSL for the SDTs consideration: 1. Requirement R4 VSL - For the Lower VSL, ReliabilityFirst recommends gradating the number of months an entity is late in assessing adherence and effectiveness of the documented communications protocols. For example, there is a big difference if an entity is late by one month or 12 months. As drafted, there is a big difference if an entity is late by one month or 12 months. As drafted, an entity that is late by 12 months would still fall under the Lower VSL. ReliabilityFirst recommends gradating the VSLs in three month intervals. For example, the last "AND" text for the Lower VSL would read: "The responsible entity exceeded twelve (12) but less than or equal to fifteen (15) calendar months between assessments." The Moderate VSL would read; "The responsible entity exceeded fifteen (15) but less than or equal to eighteen (18) calendar months between assessments." The High and Severe VSLs would follow the same rationale. 2. Requirement R5 VSL - Requirement R5 does not speak to instability, uncontrolled, separation, or cascading failures occurring as a result of correctly issuing an oral two-party, person-to-person Operating Instruction. To be consistent with the requirement, ReliabilityFirst recommends deleting the text after the AND qualifier and deleting the Moderate VSL. Hence, there will

only be one Severe VSL for this requirement. 3. Requirement R6 VSL - Similar comment as the Requirement R5 VSL 4. Requirement R7 VSL - Similar comment as the Requirement R5 VSL

Yes

ReliabilityFirst submits the following comments for consideration: 1. Requirements R1, R2, R3 and R4 - The term “operating personnel” is used throughout the draft standard. This term is undefined and it is unclear to which individuals the communications protocol applies. ReliabilityFirst recommends defining this term to eliminate any confusion and remove any questions around who encompasses “operating personnel”. ReliabilityFirst suggests replacing the term “operating personnel” with the draft PER-005-2 definition of “System Operator” (e.g., “An individual at a Control Center of a Balancing Authority, Transmission Operator, or Reliability Coordinator, who operates or directs the operation of the Bulk Electric System in Real-time.”). ReliabilityFirst believes it is the intent of the standard to apply to individuals who operate or direct the operation of the Bulk Electric System in Real-time, and not personnel that may be involved in supporting roles. 2. Requirement R4 a. The intent of Requirement R4 a. R4.1 appears to limit possible violations for deviations to the context of emergency operations, while only requiring that Responsible Entities to assess and correct deviations “as appropriate” in the non-Emergency setting. ReliabilityFirst is concerned that the qualifier “as appropriate” is vague and creates concerns similar to those expressed by the Commission in Order 791. In Order 791, the Commission supported the RAI’s goal to develop a framework for the ERO Enterprise’s use of discretion in the compliance monitoring and enforcement space, but rejected the codification of “identify, assess, and correct” language within the CIP Version 5 Reliability Standards because it is vague. ReliabilityFirst is also concerned that the qualifier “as appropriate” codifies discretion within COM-002-4. ReliabilityFirst believes that neither discretion nor controls should be codified in Reliability Standards. Rather, the ERO Enterprise should utilize discretion in the compliance monitoring and enforcement space when determining the relevant scope of audits and whether to decline to pursue a noncompliance as a violation. With the RAI, the ERO Enterprise is developing a singular and uniform framework to inform the ERO Enterprise’s use of discretion in the compliance monitoring and enforcement space. Therefore, ReliabilityFirst recommends removing the qualifier “as appropriate” from R4.1 and allowing the ongoing RAI effort to create a meaningful and unambiguous framework that the ERO Enterprise will utilize to inform its use of discretion in the compliance monitoring and enforcement of all Reliability Standards. ReliabilityFirst cautions that codifying discretion in some Reliability Standards may create confusion once the ERO Enterprise begins to implement RAI discretion in its compliance monitoring and enforcement work. For example, there may be confusion of whether discretion codified in certain Requirements of Reliability Standards precludes the ERO Enterprise’s use of RAI discretion for those Requirements where discretion is not codified. b. Flowing from 2.a. above, ReliabilityFirst recommends that Measure 4 be modified to remove discretion, and should read as follows: M4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in

fulfillment of Requirement R4. The entity shall also provide evidence that it took appropriate corrective actions as part of its assessment for all instances of operating personnel's nonadherence to the protocols developed in Requirement R1.

Individual

Richard Vine

California ISO

Yes

1. Requirement R4 is an administrative task, not a reliability-related task. The ISO does not see the value added or where BES reliability is enhanced by R4. 2. The ISO uses an Automated Dispatch System (ADS) to direct dispatch levels of generation in the ISO Balancing Authority Area. Though different ADS instructions are sent to multiple parties (different Generators) each individual instruction is an electronic communication that is "resource specific" (i.e. – we send one resource an electronic communication to position its unit at a specific level and another resource a different electronic communication to position its resource at a different level, etc.) In this respect the ISO considers the ADS to be a "single-party to single-party" communication rather than a "single-party to multiple-party burst" communication. The ISO requests standards drafting team confirmation that it does not interpret R1.4 (or R7 which contains similar language in the Emergency context) to apply to resource-specific ADS dispatch instructions.

Yes

Yes

Tri-State G&T disagrees with removing the term reliability directive. The proposed definition for Reliability Directive should be modified to provide technical justification, as requested in the November 21, 2013 FERC NOPR, and require Reliability Coordinators to use Reliability Directives to issue instructions to maintain reliable operations. As addressed in the NOPR, Reliability Directives from an entity responsible for the reliable operation of the BES should be mandatory at all times, not just during emergencies. Owners, Operators and others

responsible for reliability of the BES have used the term reliability directive effectively for many years. Removing this term does not enhance the reliability of the BES and places a burden on industry to adjust to accommodate a new method to accomplish what is done today with reliability directives. Our proposal is to make Reliability Directives applicable to RC, TOP and BA's to ensure reliable operation the BES. The term Operating Instructions should be applicable to Operators who issue commands to control elements essential to the reliable operation of the BES. We do not believe the term, as currently defined, should apply to Reliability Coordinators. According to the NERC Functional Model, Reliability Coordinators are not real time operators and are not operating personnel. Reliability Coordinators oversee the reliability of the BES and direct real time operations as needed to assure reliability of the BES. TSGT requests clarification of the term operating personnel, which positions is this term referring to? As previously stated, if operating personnel are the personnel that operate BES elements, then operating personnel should not include Reliability Coordinators since that is not the role they currently provide. TSGT requests clarification on the proposed multiple-party burst communication. This method of communication is not widely used and we are concerned that the use of this type of communication may create additional reliability issues. TSGT requests a clarification of time identification in R1.5.

Yes

No

Recoomendation 26 of the August 2003 Blackout Report was to "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." Technology is now available and already in use in some places that allow receiptants of an All-Call/Burst Message type Operating Instruction to press a button on the phone keypad to acknowledge understanding of the Operating Instruction. This allows the issuer a quick and easy way to confirm the understanding of all recieptants of the Operating Instruction. Allowing the issuer of an Operating Instruction to seek confirmation from only one recipient in R7 ignores the recommendation from the Black Out Report to use new technology.

Yes

Yes

1). R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction. 2).

Specific to R.6, consideration should be given to revise the verbiage from, “during an Emergency” to “identified by the sender as constituting an Emergency directive.” The rationale for the recommendation is offered to provide clarity to the Requirement, as it is anticipated that there will be cases when it is not clear the Operating Instruction is associated with an Emergency. Additionally, the definition of “Emergency” in the NERC Glossary is broad and consequently it may be difficult, at times, to determine which inputs are subject to COM-002-4 requirements, especially if the TO or TOP calls a plant operator directly rather than going through the respective dispatchers. Note: On the 1/17/14 COM-002-4 SDT webinar the question was asked, how a DP or GOP would know that an Operating Instruction occurred during an Emergency. The drafting team stated that after every Operating Instruction the DP should call its TOP to determine if the Operating Instruction occurred during an Emergency. Luminant once again reiterates that it would be more efficient and the industry would benefit as a whole, if the sender of the Operational Instruction, states the instruction is associated with an Emergency.

I feel that the requirement to an assessment to communication protocols is somewhat excessive and should be left as a part of the audit process or following NERCs RAI directive be left up to the internal compliance department of the company rather than having this as a requirement in the standard.

I appreciate the work done on this Standard by the SDT. The current version of the draft is much improved. I propose one change before supporting this proposed standard. That change is in Requirement 4 where I believe the standard would be improved by replacing the "at least once every twelve (12) calendar months" language with "at least annually, with no more than X months between reviews." Such a change to the language of Requirement 4 would allow each entity to determine the best cycle for its review of adherence to and effectiveness of its communications protocols per CAN-0010. If that language is used, I believe that 15 months is an appropriate value for 'X'.

Additional comments received from Marcus Pelt, Southern Company

**Definition of Emergency**

Southern does not agree with replacing Reliability Directive with Emergency as it is currently used in Draft 8. In the NERC Glossary, the term Emergency is defined as follows:

Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

This definition is very broad and, if read literally, every breaker operation on the system would be considered an Emergency. This causes a great deal of concern. If this is the case and absent any compliance guidance to state otherwise, it would require Operating Entities to add additional staff to listen to all voice recordings to review adherence to the strict 100% compliance requirement for communications issued/received during Emergencies. These requirements/measures create an undue burden for Operating Entities and would likely not garner support from the industry.

We suggest that the SDT modify this approach to scope down actions that could be considered "Emergencies" by allowing entities to define and make it very clear that the expectation is not for Operating Entities to have to review all voice recordings (could be millions in a single year) to ensure compliance, but only a representative sample of voice recordings for both non-emergency and emergency communications.

From a DP and GOP standpoint, the RSAW and technical justification wording states that an attestation that no emergency had been called requiring a three part response would suffice for evidence. The rationale and technical justification document has some very good

explanations of the INTENT of the drafting team and how they want the industry to view the standard requirements. If the standard and the subsequent audits adhered ONLY to what was in the justification document, then there should be little or no concerns. Unfortunately, the justification document carries no statutory weight and the standard as written does.

# Consideration of Comments

## Project 2007-02 Operating Personnel Communications Protocols

The Project 2007-02 Drafting Team thanks all commenters who submitted comments on the proposed draft COM-002-4 (Operating Personnel Communications Protocols) standard. These standards were posted for a 30-day public comment period from January 2, 2014 through January 31, 2014.

Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 70 sets of comments, including comments from approximately 185 different people from approximately 125 companies representing all 10 Industry Segments as shown in the table on the following pages.

As a result of select industry stakeholder comments, the Operating Personnel Communications Protocols Standards Drafting Team (OPCP SDT) made minor, non-substantive changes to COM-002-4 after the most recent comment and ballot period in order to clarify the OPCP SDT's intent and better align the language in the measures with the requirements. Requirement R4.1 was altered from "as appropriate" to "as deemed appropriate by the entity" in order to highlight the OPCP SDT's intent. In Measure M2 the words "its initial" were added to the sentence "shall provide its initial training records . . ." in order to align the language in Measure M2 with the language in Requirement R2. Measure M4 was altered to include the phrase "as part of its assessment" and "of any corrective actions taken" within the sentence "The entity shall provide, as part of its assessment, evidence of any corrective actions taken." Lastly, Measure M6 and M7 were changed to add the parenthetical "(if an entity has such recordings)" after the words "time-stamped recordings," and the second entry for "time-stamped recordings" was removed due to redundancy.

All comments submitted may be reviewed in their original format on the standard's [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/comm/SC/Documents/Appendix\\_3A\\_StandardsProcessesManual.pdf](http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf)

## **Index to Questions, Comments, and Responses**

1. Do you agree that that the COM-002-4 standard addresses the NERC Board of Trustees November 19, 2013 Resolution? If not, please explain in the comment area. ....	15
2. Do you agree that COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26, and FERC Order 693? If not, please explain in the comment area.....	30
3. Do you agree with the VRFs and VSLs for the Requirements? If not, please explain. ....	44
4. Do you have any additional comments? Please provide them here. ....	56

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. **Do you agree that the COM-002-4 standard addresses the NERC Board of Trustees November 19, 2013 Resolution? If not, please explain in the comment area.**

**Summary Consideration:** The OPCP SDT would like to thank all parties who took the time to submit comments. The NERC Board of Trustees Resolution directed the OPCP SDT to continue development of a combined COM-002- and COM-003 standard that, among other things, requires the use of the three-part communication for both Emergency Communications and non-emergency communications that change or preserve the state, status, output, or input of the Bulk Electric System; requires training and periodic review of communications subject to the communications protocols; and requires entities to assess the effectiveness of their communications protocols as well as their operators adherence to the protocols. Additionally, the Resolution directed that entities must use three-part communication when issuing and/or receiving Operating Instructions during Emergency Communications without exception. The following is provided as a summary response to the comments on Question 1. Any necessary additional responses are provided to individual commenters below.

Several commenters, including SERC OC Review Group, Georgia Transmission Company, and NRECA, commented that Distribution Providers should not be included as an applicable entity to COM-002-4 or that, if included, the applicability be limited to Distribution Providers who “shed 300 MW or more of load in a single manually initiated operation or have switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource . . .”

The OPCP SDT chose to include Distribution Providers in the Applicability section because they can be and are on the receiving end of some Operating Instructions. The OPCP SDT could not determine a technical basis to support a threshold to exclude certain Distribution Providers. The OPCP SDT continues to believe that the language in COM-002-4, R6 that limits the application of R6 to only a Distribution Provider “that receives an oral two-party, person-to-person Operating Instruction during an Emergency” properly excludes Distribution Providers that do not receive Operating Instructions from the requirement. The inclusion of Distribution Providers is also responsive to the FERC directive to include Distribution Providers as an applicable entity under the standard.

Other commenters noted that the requirements do not differentiate clearly between the actions operators must take during non-Emergency and Emergency situations. In COM-002-4, the same protocols are to be used for Operating Instructions in all operating conditions, i.e., non-emergency, alert, and Emergency communications. The OPCP SDT believes that one set of communication protocols should be used at all times by operators in order to improve consistency and minimize confusion. The standard uses the phrase “Operating Instruction during an Emergency” in certain Requirements (R5, R6, and R7) to provide a demarcation for what is subject to a zero-tolerance compliance/enforcement approach. Where “Operating Instruction during an Emergency” is not used, an entity will be assessed based on the language of the other requirements, which focus on whether an entity met the initial training requirement (either R2 or R3) and/or whether an entity performed the assessment and took corrective actions according to

Requirement R4. Separately listing out Requirements R5, R6, and R7 and using “Operating Instruction during an Emergency” in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an “Operating Instruction during an Emergency.” The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions.

Several commenters also stated they believe the issuer of an Operating Instruction during an Emergency should be required to indicate to the recipient that the instruction being issued is for the purpose of preventing or alleviating an Emergency. The OPCP SDT has considered these comments but asserts that such a requirement could distract operators, causing them to focus on determining whether or not a situation meets the definition of an Emergency, rather than resolving the issue at hand. Because the protocols do not differ based on the operating condition, the OPCP SDT determined that it was not necessary to require such indication in the protocols mandated by the standard. The OPCP SDT notes that the standard does not preclude entities from adding its own protocols to do so.

Some parties expressed a concern that the definition of “Emergency” was unclear, vague, and subject to interpretation. Commenters also expressed concern about the auditor’s ability to make a distinct determination as to what Operating Instructions were in response to an Emergency and at what point the actual Emergency began, as Emergency communications triggers the zero-tolerance compliance approach. The NERC Glossary of Terms defines Emergency as “Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.” It is expected that these are abnormal and rare circumstances, and that there will be no confusion about the state. The term is an established NERC Glossary term that has been successfully used in other standards. Additionally, redefining the NERC Glossary term “Emergency” has implications in other reliability standards beyond COM-002-4.

It was also suggested by several individuals and entities that the inclusion of a training requirement was not necessary and/or would be better suited for inclusion in PER-005. The OPCP SDT consulted with the PER-005 Standard Drafting Team and was advised that while training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. The OPCP SDT asserts it is essential for all operators to have a common level of understanding and be trained in three-part communication. Because PER-005 would not meet the NERC Board of Trustees November 7, 2013 Resolution to mandate training, the OPCP SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. The OPCP SDT further asserts requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.

Other entities have commented that the requirements in COM-002-4 subject entities to double jeopardy as a result of the currently effective TOP and IRO requirements. The OPCP SDT disagrees with this assertion, as COM-002-4 only deals with communications and communication protocols, whereas the TOP and IRO family of standards govern the actions which an entity must perform.

Some parties asked how an entity would specify system wide nomenclature in their protocols, or stated they believed this was not necessary since Project 2007-03 chose to eliminate TOP-002-2a, Requirement R18 when it developed TOP-002-3. This requirement stated “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” The standard drafting team addressed this issue in the FAQ document posted on the project page. The following response was provided: “COM-002-4, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations) for Operating Instructions. This supports both parties being familiar with each other’s interface Elements and Facilities, minimizing hesitation and confusion when referring to equipment for the Operating Instruction.” The nomenclature is not specified as “system wide.” Requirement R1 Part 1.6 only requires entities to specify what, if any, nomenclature must be used for Transmission interface Elements or Transmission interface Facilities (e.g., tie lines and tie substations). The OPCP SDT did not want to be overly prescriptive in instructing an entity on how it should identify its nomenclature.

Lastly, some commenters noted that they felt the “assess adherence and assess effectiveness” contained within Requirement R4, the associated Measure, and VRFs/VSLs was similar to the “identify assess and correct” (IAC) language contained in certain CIP Version 5 requirements, which FERC directed NERC to remove or clarify. However, the OPCP SDT asserts that there is a difference in the language, and that the ambiguity FERC identified in the IAC language is not an issue in the COM-002-4 standard. The OPCP SDT added clarifying language in the requirements to specify the actions that an entity is expected to take.

Organization	Yes or No	Question 1 Comment
SERC OC Review Group	No	<p>The SERC OC Review Group appreciates the efforts that the OPCP SDT has made on this draft standard and the flexibility demonstrated to address the constantly evolving feedback received. We do not believe the proposed requirements and measures clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.</p> <p>Applicability Section:4.1.2 Distribution Provider: We understand that it would be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives. Therefore, we are respectfully recommending an alternative that parallels the recently FERC approved CIP-003-5 that we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended:4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single</p>

Organization	Yes or No	Question 1 Comment
		<p>manually initiated operation.4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.</p> <p>General Requirement Comment: The OPCP SDT is respectfully requested to review the Requirements to ensure that it is clear that “during an Emergency” is only applicable to the entities involved.</p> <p>Requirement 1: The proposed standard still contains requirements that mandate the use of, and training to include, 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. While we agree that the OPCP SDT has stated in its Rationale and Technical Justification document that the proposed measures don’t specifically require that auditors verify compliance of this for the requirements (and associated measures), a strict read leads to a different conclusion. We are concerned that, absent a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. We respectfully recommend modifying requirement 1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm their understanding through use of 3 part communication. To accomplish this we propose a new R1.1. The current R1.1 through R1.6 would be renumbered R1.2 through R1.7Current R1 language: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] 1.1.Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations. Proposed R1 language: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [Violation Risk Factor: Low][Time</p>

Organization	Yes or No	Question 1 Comment
		<p>Horizon: Long-term Planning]Proposed R1.1: ADD: Require that its operating personnel identify, at the time of issuance, when the Operating Instruction is being issued to alleviate or avoid an Emergency R1.2: Based on the OPCP SDT comments and zero tolerance for Emergency communications we propose a new bullet be added to R1.2. Current R1.2 language: Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions: o Confirm the receiver’s response if the repeated information is correct. o Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver. o Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver. Proposed R1.2: Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions: o Confirm the receiver’s response if the repeated information is correct. o Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver. o Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver. o ADD: Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an EmergencyR1.3: We respectfully recommend a word change (correct to understood) in 1.3, bullet 1. Current 1.3 sub-bullet 1 follows: Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct. Proposed 1.3, sub-bullet 1: Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was understood.</p> <p>Requirement R2: This group feels that R2 should be eliminated as redundant with the systematic approach to training requirements of PER-005 (Operations Personnel Training) which are applicable to all BAs, RCs &amp; TOPs. Communications protocols must be included in each company’s specific reliability-related task list. Inherent in systematic approach is initial training on all reliability-related tasks, since each task must be analyzed as to its Difficulty, Importance &amp; Frequency (DIF analysis). As a result of the DIF analysis, systematic approach would require that communications protocols have both initial and continuing training.</p> <p>Requirement R3: We agree with the OPCP SDT concern that Operating Personnel should not be placed in a position to receive an oral two-party, person-to-person Operating Instruction</p>

Organization	Yes or No	Question 1 Comment
		<p>prior to being trained. This Group understands that OPCP SDT included an initial training requirement in the standard in response to the NERC Board of Trustees’ resolution, which directs that a training requirement be included in the COM-002-4 standard. We would like to recommend that the term “initial” be removed so not to give the impression that training is a one-time effort. Current R3 language: Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] Proposed R3 language: Each Distribution Provider and Generator Operator shall conduct training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning]</p> <p>Requirements R5, R6, and R7: This Group feels that the relationship between R1, R5, R6, and R7 requires further clarification to remove possible opportunities for different interpretations which could result in uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. The concern centers on the absence of a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. This is the reason for the R1 modifications. If the recommended R1 modifications are accepted then R5, R6, and R7 should be considered for deletion (incorporating specific items deemed necessary by the OPCP SDT as bullets or sub-requirements of R1).</p> <p>Measures: Measure 1: Base on the Group’s recommendations above we propose for consideration the following modification to Measure 1: Current M1 language: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. Proposed M1 language: Revised M1: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence</p>

Organization	Yes or No	Question 1 Comment
		<p>that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2).</p> <p><b>Response: Requirement R1 states “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum:” The Measure and, therefore, evidence, is proof of the developed protocols.</b></p> <p>Measure 2,5,6, and 7: If our recommendations are accepted then Measures 2, 5, 6, and 7 should be deleted incorporating specific items deemed necessary by the OPCP SDT as bullets or sub-requirements of R1 Measure 3: To align M3 with our R3 recommendation we propose deleting the word “initial”. Current M3 language: Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3. Proposed M3 language: Each Distribution Provider and Generator Operator shall provide its training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p>
Northeast Power Coordinating Council	No	The proposed Requirements and Measures do not clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.
Duke Energy	No	(1)Duke Energy believes that Operating Instruction during an Emergency is unclear, vague, and subject to interpretation. By using the NERC defined term of Emergency, certain tasks that Duke Energy believes is a non-emergency action would now be considered an Emergency and subject to zero tolerance. Duke submits, for consideration by the OPCP SDT,

Organization	Yes or No	Question 1 Comment
		<p>a revised definition of Emergency in an attempt to remove this ambiguity. Emergency - Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that would adversely affect the reliability of the Bulk Electric System.</p>
<p>Dominion</p>	<p>No</p>	<p>We do not believe the proposed requirements and measures clearly delineate the differences in the actions required to be taken by the issuer and recipient depending upon whether or not the Operating Instruction is being given to alleviate or avoid an Emergency.</p>
<p>ACES Standards Collaborators</p>	<p>No</p>	<p>(1) We disagree that the current draft addresses the NERC Board resolution because the Board charged the drafting team with developing an “essential set of communications protocols” for reliable operation of the BES. The proposed standard conflicts with other existing reliability standards, which would subject entities to double jeopardy. Therefore, the standard includes more than an “essential set” of requirements as stated in the NERC Board Resolution.</p> <p>(2) For example, the “nomenclature” protocol in Requirement R1 is duplicative with TOP-002 R18. Since FERC issued a NOPR proposing to remand the TOP standards, the requirement of using “uniform line identifiers” will remain as an enforceable standard. Having a nomenclature requirement in COM-002-4 will subject entities to double jeopardy and is not an “essential set of communication protocols.”</p> <p>(3) Another example of a redundant requirement is training. Communications that impact the BES will be covered in a reliability related task as part of the systematic approach to training. This will also subject entities to double jeopardy with PER-005 R1 and is not an “essential set of communication protocols.”</p> <p>(4) We appreciate the efforts of the drafting team in working to address the FERC directives and NERC November 2013 BOT Resolution, but we do not believe that COM-002-4 accurately</p>

Organization	Yes or No	Question 1 Comment
		<p>reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. We understand that the inclusion of Distribution Providers to this standard stems from various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions. Thus, we continue to recommend that Distribution Providers be removed from the applicability of COM-002-4.</p> <p>(5) Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, we recommend an alternative that parallels the recently FERC approved CIP-003-5 applicability section 4.1.2, which we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative can be used as technical justification to clarify those Distribution Providers that have an impact on the BES is recommended:"4.1.2 Distribution Provider that:            4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started."</p>
NRECA	No	<p>NRECA appreciates the efforts of the drafting team in working to address the FERC directives and NERC BOT Resolution November 2013, but does not believe that COM-002-4 accurately reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. NRECA understands that the inclusion of Distribution Providers to this standard stems from various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to</p>

		<p>shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions, continues to recommend that Distribution Providers be removed from the applicability of COM-002-4. Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, NRECA is recommending an alternative that parallels the recently FERC approved CIP-003-5 that we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended: 4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation. 4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started. NRECA proposes to recommend an "affirmative" ballot to its members if the applicability is modified in the next posting as provided.</p>
<p>Oncor Electric Delivery Company LLC</p>	<p>No</p>	<p>The Operating Instruction during an Emergency is unclear, vague, and subject to interpretation. By using the NERC defined term of Emergency, certain tasks that are a non-emergency action would now be considered an Emergency. Oncor supports GTC's recommendation of the removal of the terms "or limit" within this definition. One could argue that every single Operating Instruction is utilized to limit failures of transmission facilities. Emergency should be more appropriately defined without this ambiguity. We submit, for the OPCP SDT's consideration, a revised definition of Emergency in an attempt to remove this ambiguity. Emergency - Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that would adversely affect the reliability of the Bulk Electric System. Oncor does not believe that COM-002-4 accurately reflects the proper applicability for entities that have an impact on the operations of the Bulk Electric System in normal and emergency conditions. Oncor understands that the inclusion of Distribution Providers to this standard stems from</p>

Organization	Yes or No	Question 1 Comment
		<p>various FERC directives, but because of the relationship of Distribution Providers with Transmission Operators as identified in NERC's functional model in being only a receiver of instructions to implement voltage reduction or to shed load to prevent the failure of the BES, or related to restoration activities as coordinated with the Transmission Operator; the TOP is ultimately responsible for the proper execution of the instructions, continues to recommend that Distribution Providers be removed from the applicability of COM-002-4. Knowing that it will be difficult to remove the Distribution Provider from the applicability of COM-002-4 per FERC's directives, Oncor supports the alternatives recommended by GTC as an opportunity to address this. In addition, the COM-002-4 does not align with the evaluation and findings of the NERC Reliability Issues Steering Committee (RISC) and Operating Committee (OC) which supports the importance of clear communications but found no evidence that non-emergency communications represent a reliability gap.</p>
<p>Exelon Corp and its affiliated business units</p>	<p>No</p>	<p>Revision 8 addresses the Board Resolution, but it goes beyond the resolution by including GOP's and DP's as applicable entities thereby creating redundant and unnecessary compliance obligations for many of those entities. See comments below in response #4. Furthermore, while the new approach in this draft is an improvement, it does not achieve the desired goal to move away from a zero tolerance focus on the use of three part communication within this standard. If time is allowed for further work on this standard, we offer potential adjustments below in response #4. A couple points of potential confusion:- Question 1 and the link to the Board Resolution on the Project page cites a November 19, 2013 Resolution; however, the link takes readers to a November 7, 2013 Resolution. We assume the November 7, 2013 Resolution is the correct reference. - The first bullet of the November 7, 2013 Board Resolution refers to the Operating Committee Guidelines for good communication practice. This OC document does not appear to be linked to the Project page. It is unlikely that many stakeholders would have found and/or reviewed the document relative to the proposed COM-002-4 draft.</p> <p><b>Response: The November 7 reference is correct and has been updated.</b></p>

2. **Do you agree that COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26, and FERC Order No. 693? If not, please explain in the comment area.**

Summary Consideration: The OPCP SDT thanks all those who took the opportunity to comment on Question 2. The August 2003 Blackout Report Recommendation number 26 called entities to tighten communications protocols especially during Emergencies and alerts. The following is provided as a summary response to the comments on Question 2. Any necessary additional responses are provided to individual commenters below.

Some commenters expressed concern that neither the August 2003 Blackout Report Recommendation number 26 nor FERC Order No. 693 recommended the use of three-part communication. FERC Order No. 693 Paragraph 531 states “We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies, either as part of COM-002-2 or as a new Reliability Standard. We note that the ERO’s response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.” FERC also states that the goal is to establish communication uniformity as much as practical on a continent-wide basis to eliminate possible ambiguities in communications during normal, alert, and emergency conditions. The existing COM-002-2 includes three-part communication and the OPCP SDT determined that three-part communication is a necessary protocol.

Other commenters stated that Recommendation 26 from the 2003 Blackout report is about situational awareness and not about what System Operators should say in their conversations. The OPCP SDT asserts that situational awareness is improved by operationally sound communication protocols, which decrease the possibility of miscommunications.

Other commenters stated that Recommendation 26 of the 2003 Blackout Report continues to be misinterpreted. The recommendation is focused on how the ERO should communicate with governmental agencies. It states, “Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties, [including state and local officials] are able to give and receive timely and accurate information.” FERC Order No. 693 Paragraph 534 states “In response to MISO’s contention that Blackout Report Recommendation No. 26 has been fully implemented, we note that Recommendation No. 26 addressed two matters. We believe MISO is referring to the second part of the recommendation requiring NERC to “[u]pgrade communication system hardware where appropriate” instead of tightening communications protocols. While we commend the ERO for taking appropriate action in upgrading its NERCNet, we remind the industry to continue their efforts in addressing the first part of Blackout Recommendation No. 26.” In response, the OPCP SDT has not focused on hardware issues, instead focusing on communication protocols.

One commenter stated that allowing the issuer of an Operating Instruction to seek confirmation from only one recipient in Requirement R7 ignores the recommendation from the Blackout Report to use new technology. The OPCP SDT asserts that it is important that the issuer of a written or oral single-party to multiple-party burst Operating Instruction make sure that the communication channel was complete. This can be accomplished by confirming with at least one party that the communication was received. This is not limited to any particular technology that could be employed for the necessary confirmation.

Certain commenters indicated that COM-002-4 goes outside the scope of Recommendation 26 of the Blackout Report because it deals with both non-Emergency and Emergency communications. However, the OPCP SDT contends that operators are often not aware they are in an Emergency situation until after the event has ended. Therefore, in order to mitigate a potential reliability gap, it is essential that COM-002-4 require a single set of communication protocols that are always used by operators.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	We do not agree that the blackout recommendation calls for the use of 3 part communication for every Operating Instruction and note that neither the NERC Board nor the OPCP SDT has provided any evidence that indicates a direct correlation between errors due to communication problems and events that adversely impact the BES. The justification for reliability standard Requirements that require 3 part communication for every Operating Instruction, and having to enforce compliance with the same, is not supported.
NERC Standards Review Forum	No	As it has been stated in previous comments, Recommendation 26 from the 2003 Blackout report is about situational awareness and who and what entities need to be contacted during emergencies. It is not about what System Operators should say in their conversations.

Organization	Yes or No	Question 2 Comment
Duke Energy	No	(1)Based on our comments to Question 1, Duke Energy does not believe that the OPCP SDT has addressed Recommendation 26 of the August 2003 Blackout report. The intent of the 2003 Blackout recommendation was to provide tighter communication during normal and emergency situations. Due to the ambiguity that exists between Operating Instruction and Operating Instruction during an Emergency, we believe that this recommendation was not addressed.
SPP Standards Review Group	No	Our understanding of Recommendation 26 is that it deals strictly with communications during emergencies which COM-002-3 had already addressed. The addition of non-emergency communications, which are not mentioned in Recommendation 26 at all, has expanded the scope of the standard beyond that called for by the recommendation. The addition of non-emergency communications has added additional compliance burden for the responsible entities without clearly improving the reliability of the BES.
Dominion	No	We do not agree that the blackout recommendation calls for the use of 3 part communication for every Operating Instruction and note that neither the NERC Board nor the OPCP SDT has provided any evidence that indicates a direct correlation between errors due to communication problems and events that adversely impacted the BES. Therefore we find it difficult to support reliability standard requirements that require 3 part communication for every Operating Instruction and enforce compliance with same.
ACES Standards Collaborators	No	(1) We believe recommendation number 26 of the 2003 Blackout Report continues to be misinterpreted. The recommendation is focused on how the ERO should

Organization	Yes or No	Question 2 Comment
		<p>communicate with governmental agencies. It states, "Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties, [including state and local officials] are able to give and receive timely and accurate information." The recommendation does not state anywhere to utilize three-part communication. COM-002-4 does not address the development of hotline networks or "upgrading communication system hardware where appropriate" for contacting governmental agencies, including state and local officials.</p>
Luminant	No	<p>Recommendation 26 of the August 2003 Blackout Report was to "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." Technology is now available and already in use in some places that allow recipients of an All-Call/Burst Message type Operating Instruction to press a button on the phone keypad to acknowledge understanding of the Operating Instruction. This allows the issuer a quick and easy way to confirm the understanding of all recipients of the Operating Instruction. Allowing the issuer of an Operating Instruction to seek confirmation from only one recipient in R7 ignores the recommendation from the Black Out Report to use new technology.</p>
Georgia Transmission Corporation	No	<p>Comments: GTC recognizes FERC Order 693 directs the revision of COM-002 to include the DP and specifically states how essential it is that the TOP, BA and RC have communications with DPs. Additionally, GTC observes Order 693 also identifies the need for tightened communications protocols, especially for communications during alerts and emergencies and that such protocols shall be established with uniformity as much as practical on a continent wide basis to eliminate possible ambiguities in communications during emergency conditions. If the Standard requires the use of 3</p>

Organization	Yes or No	Question 2 Comment
		<p>part communications by the issuers of Operating Instructions, then it would seem sensible that receivers of Operating Instructions be trained for awareness and proper participation of such protocols. GTC sees parallels of this approach in other Standards such as restoration training of DPs identified in the TOPs restoration plan as required in EOP-005-2. GTC believes the current proposal of COM-002-4 still contains ambiguities that should be addressed before GTC can provide an affirmative ballot. GTC is offering 3 alternatives such that if any of them is adopted by the OPCP SDT, GTC would modify our position to cast an affirmative vote in the next recirculation. Alternative 1 (Modify the DP applicability): Applicability Section:4.1.2 Distribution Provider: GTC is recommending an alternative that parallels the recently FERC approved CIP-003-5 that we believe accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES when in an Emergency. The following alternative to clarify those Distribution Providers that have an impact on the BES is recommended:4.1.2 Distribution Provider that:4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation.4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started. Alternative 2 (Modify the DP applicability per above, modify R3; Eliminate R6): Alternative 2 is an extension of alternative 1 for additional clarities. Requirement 3: Revise R3 to insert the words [during an Emergency] within the sentence "...who can receive an oral two-party, person-to-person Operating Instruction [during an Emergency] prior to that individual operator...". Additionally, replace the word "receive" with the word "request" in the first bullet of R3. The word "receive" is ambiguous and the word "request" is consistent with the receiver using his words to request a confirmation. GTC maintains that R3 is sufficient to satisfy FERC Order 693 for the DP applicability during emergencies, and would ensure uniformity on a continent wide basis to eliminate possible ambiguities in communications during emergency conditions. GTC prefers the elimination of R6. GTC does not believe that a receiver of an Operating Instruction in the field</p>

Organization	Yes or No	Question 2 Comment
		<p>performing field switching activities should be required to document evidence of following the oral communication practices. Issuers of Operating Instructions are already recording the Operating Instruction communications and have the capability to do so. Issuers are also required to ensure the receiver responds accordingly per R5. Issuers are required to confirm the receiver’s response is correct or else reissue if incorrect; issuers can also take an alternative action. Having the receiver document the implementation of these practices for compliance is redundant and duplicative to the issuer’s requirements. This is an unnecessary, administrative requirement that introduces a double jeopardy situation that does not enhance the reliability of the BES. The OPCP SDT should recognize that all reliability bases are covered with the training requirements of the issuers in R1, the training requirement of the receivers in R3, and the performance of these are monitored via the issuers recording capabilities in R5 and R7. With this approach, issuers can be satisfied that receivers are prepared to receive instructions in accordance with their training, and the options the issuers have per R5 in a live scenario. The receivers could not expose or cause a non-compliance situation to the issuers. However, the issuers could expose the receivers to a non-compliance situation if a recording is lost or damaged and the receiver was on hiscell phone in the field taking orders and performing switching, hence the double jeopardy and GTC’s plea to remove this requirement 6. Alternative 3 (Modify the DP applicability above, Modify R3 above, Modify R6, create separate DP requirement): Requirement 6: If the OPCP SDT decides that R6 must remain, then GTC requires the following changes to modify our negative vote to affirmative. GTC appreciates the drafting team making concessions to eliminate the need for DPs and GOPs being required to have documented communication protocols. Additionally, GTC appreciates the drafting team’s willingness to limit the scope of performing the 3 part communications to those Operating Instructions received during an Emergency. These drafting team concessions are a testament to the team, along with industry, of understanding that the DP will typically have a very limited role in receiving Operating Instructions from the BA or TOP to protect the BES during an Emergency. This role is typically limited to operating non-BES equipment (load serving stations) to</p>

Organization	Yes or No	Question 2 Comment
		<p>shed load or reduce voltage to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the BES. GTC would submit that the TOP would further limit the DPs role to “manual” load shed type situations when the “automatic” load shed schemes misoperate or malfunction as designed. This is highlighted in the NERC functional model which identifies this real time function of the DP “Implements voltage reduction and sheds load as directed by the Transmission Operator or Balancing Authority”. During an Emergency, which NERC defines as any abnormal condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the BES, the aforementioned function is what the DP will be called upon to implement. The ambiguity that arises is captured within the various types of utility registrations with NERC, and GTC believes the OPCP SDT can accommodate two distinct types of DPs which GTC believes to be critical to pass this Standard. GTC observed there are 298 entities in the NERC registry that are true DP function only. Most of these are DP/LSE and would not own BES assets, but they would be directly connected to the BES, hence registration. These entities own load serving substations and implementing voltage reduction or shedding load in an Emergency would not be ambiguous. However, GTC observed there are 242 entities in the NERC registry that are registered DPs, and also registered TOs that own BES assets. To these integrated entities, the scope of communications during an Emergency would be more ambiguous, as these entities may perform actions at transmission stations on a routine basis that the other DP only type entities would not have to consider. With the addition of R6 as written, these entities have an amplified burden of compliance risk associated with their TO registration even though R6 applies to them as a DP. This burden is the separation of those Operating Instructions performed at transmission stations which occurs more often than the Emergency event which requires a manual operation for reduction of voltage or load shed at load serving stations. GTC believes this ambiguity is significant enough to justify the separation of the DP from R6 to provide a standalone requirement commensurate to the DPs function as documented in the NERC functional model.</p>

Organization	Yes or No	Question 2 Comment
		<p>Proposed R6 language: Remove Distribution Provider from R6. Create a separate standalone requirement for the DP.R#. Each Distribution Provider that receives an oral two-party, person-to-person Operating Instruction to implement voltage reduction or shed load during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either:* Repeat, not necessarily verbatim, the Operating Instruction and request confirmation from the issuer that the response was correct, or* Request that the issuer reissue the Operating Instruction.</p> <p><b>Response: Please see the Summary Responses to Question 1 and Question 2.</b></p>
Nebraska Public Power District	No	<p>Recommendation 26 calls for work to be done to improve the effectiveness of communications in emergency situations. The purpose of the standard is to improve communications. However, the focus of the standard is primarily 3-part communications. There is no supporting documentation or data that 3-part communications improves the effectiveness of communications. Focusing on 3-part communications provides an easy target from a compliance perspective but all it teaches us is to mechanically repeat back what we have been instructed to do. We're focusing on the 'how' and 'what' rather than the 'why'. Keeping the 'why' in mind improves communications and the reliability of the BES. Keeping the 'why' in mind also leads to improved situational awareness. Improving effective communications is difficult to quantify in a standard and even more difficult to measure. We may be better off focusing on the principles contained in the OC's Reliability Guideline System Operator Verbal Communications - Current Industry Practices.</p>
Georgia System Operations Corporation	No	<p>GSOC recommends modifying R1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm</p>

Organization	Yes or No	Question 2 Comment
		<p>understanding through use of 3 part communication. This would require a revised R1.1Proposed R1: ADD: Require that its operating personnel identify, at the time of issuance, when the Operating Instruction is being issued to alleviate or avoid an Emergency. Proposed R1.2: ADD: Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency. Proposed R1.3: change the word “correct” to “understood” Requirement 2: GSOC believes R2 should be eliminated as redundant with the systematic approach to training requirements of PER-005-2(Operating Personnel Training) which are applicable to all Bas, RCs and TOPs. Communication protocols must be included in each company’s specific reliability-related task list. GSOC believes the current proposal of COM-002-4 still contains ambiguities that can be resolved with the following alternative. GSOC recognizes the following alternative in that it parallels the recently FERC approved CIP-003-5. GSOC believes this alternative more accurately captures those DPs that receive Operating Instructions associated with the reliability of the BES. 4.1.2 Distribution Provider that: 4.1.2.1 Has capability to shed 300 MW or more of load in a single manually initiated operation.4.1.2.2 Has switching obligations related to Any Cranking Path and group of Elements meeting the initial switching requirements from a Blackstart Resource up to and including the first interconnection point of the starting station service of the next generation unit(s) to be started.</p> <p><b>Response: The OPCP SDT disagrees with the suggested edits to Requirement R1. R1 currently requires entities to set protocols for use when issuing Operation Instructions. The Requirement calls for the development of protocols to cover ALL Operating Instructions. How an entity must use the protocols for Operating Instructions during Emergencies is covered by a separate requirement. Please see the Summary Response to Question 1 for responses to your comments regarding the inclusion of Distribution Providers and training.</b></p>

Organization	Yes or No	Question 2 Comment
Electric Reliability Council of Texas, Inc.	No	<p>This standard is not responsive to the Blackout Recommendation #26. The prevention of miscommunication is the current focus of this standard, while nothing in the Blackout Report commented on an instruction not being followed due to miscommunication. Rather, the Blackout Report focused on a lack of situational awareness based on one entity not understanding what the other entity was describing because different entities used different terminology. Flow of communications or “who” should be notified was also lacking in addition to “what” needed to be communicated. The report highlighted that effective communication was based on communication of important and prioritized information to each other in a timely way. In essence, this focuses on communication protocols to prevent miscommunications while Recommendation #26 focused on effective communication protocols that improve situational awareness, where the former is process and the latter is substantive. That being said, and regardless of whether COM-002-4 addresses the August 2003 Blackout Report Recommendation number 26 or not, ERCOT ISO can support the COM-002-4 standard. However, ERCOT ISO believes the draft standard could be improved and offers suggestions in Question 4 below, for the OPCP SDT’s consideration.</p>
Oncor Electric Delivery Company LLC	No	<p>COM-002-4 goes beyond the August 2003 Blackout Report Recommendation number 26, FERC Order 693 for neither identify requirements for normal operations. EOP-001-2, R3.1 and COM-002-2, R2 already address the requirements of the Blackout Report and FERC Order 693. The intent of the 2003 Blackout recommendation was to provide tighter communication during emergency situations. Due to the ambiguity that exists between Operating Instruction and Operating Instruction during an Emergency, we believe that this recommendation was not addressed. In addition, the NERC BOT directed the NERC Operating Committee (OC) to evaluate the COM standards (previously COM-003) and responses from the Reliability Issues Steering Committee (RISC), the Independent Experts Review and NERC Management. Their</p>

Organization	Yes or No	Question 2 Comment
		<p>report issued September 23, 2013 to the NERC BOT Chairman identifies the importance of clear communications but found no evidence including the NERC event analysis process nor recent events which supports that non-emergency communications represents a reliability gap. The OC created a guideline for verbal communications which provides industry best practices and recommended utilizing the guideline to promote continuous improvement versus implementing a mandatory standard.</p>
NRECA	No	See response to Question 1
Exelon Corp and its affiliated business units	No	<p>2003 Blackout Report Recommendation No. 26 reads: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate (footnote omitted). NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date." While Exelon believes that COM-002-4 goes beyond the Recommendation and includes the requirement to implement communication protocols for operating BES elements in non-emergency and other non-critical situations, Exelon also recognizes that the NERC Board believes that the words "especially for" in the recommendation are the reason to include a standard for normal communications. We also understand that in paragraph 540 of Order No. 693, FERC directed the ERO to expand the applicability of the communication standard to distribution providers (DP's) but that directive tied</p>

Organization	Yes or No	Question 2 Comment
		back to communications protocols “especially for communications during alerts and emergencies.” Although Recommendation 26 addresses “key parties” and FERC directive addresses DP’s in the context of Blackout Recommendation No. 26, we don’t believe that either was intended to include DP’s and GOP’s for non-emergency Operating Instructions communications.
The United Illuminating Company	No	
Ingleside Cogeneration LP	Yes	COM-002-4 adds requirements that call for protocols that add precision to operations communications as called for in both documents. However, in the latest draft, ICLP believes the compliance approach has been modified in a manner that ensures that routine Operating Communications are conducted using a common protocol - but do not involve significant tracking resources. In addition, the use of operator training and regular review of its effectiveness is consistent with other NERC standards related to operator capabilities. As it is written now, CIP-002-4 introduces new expectations related to routine communications, but only puts incremental pressures on existing processes and equipment necessary to address them.
CenterPoint Energy Houston Electric LLC	Yes	CenterPoint Energy agrees that the COM-002-4 standard addresses both the August 2003 Blackout Report Recommendation 26 and FERC Order 693.
SERC OC Review Group		We are concerned that this draft goes further than mentioned in the blackout recommendation that NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications

### 3. Do you agree with the VRFs and VSLs for the Requirements? If not, please explain.

Summary Consideration: The OPCP SDT thanks all commenters who submitted comments for Question 3. The following is provided as a summary response to the comments on Question 3. Any necessary additional responses are provided to individual commenters below. It should be noted that VSLs must be developed based on established criteria. Please refer to the “VRF/VSL Justification” document posted with the standard on the project page for additional information.

Several commenters stated that they did not feel a Severe VSL was appropriate for Requirement R1. The OPCP SDT has reviewed these comments but maintains the position that if an entity fails to include three-part communication in its communication protocols or the entity does not have any documented communication protocols, then that violation would warrant a Severe VSL as those elements represent the most significant elements of Requirement R1. Feedback received during development indicated a preference for a graduated VSL for Requirement R1 with higher importance placed on more critical protocols.

Other comments noted the Lower VSL for Requirement R4 is triggered by an entity failing to evaluate its documented communication protocols for Requirement R1 every 12 calendar months, but there is not a cap on the amount of time that may pass between evaluations and the violation results in a greater VSL. The OPCP SDT discussed the issue and determined that the requirement to perform the review is more important than penalizing an entity for the amount of time they missed the time window. The purpose of the requirement is to encourage entities to perform periodic reviews each year. The team determined that 12 months was the appropriate maximum period and that missing the 12-month time window should be the only demarcation point necessary.

Commenters also stated they felt the VSLs for Requirements R5–R7 were not appropriate because the difference between a Severe VSL and a Moderate VSL is triggered by whether or not an Emergency situation occurred. The OPCP SDT provided justification for the VSLs in the “VRF/VSL Justification” document posted on the project page. If an entity, when issuing an Operating Instruction during an Emergency, did not use three-part communication or take an alternative action if the receiver does not respond, yet instability, uncontrolled separation, or cascading failures did not occur as a result, the entity violated the requirement with a “Medium” VSL. The value of “Medium” is justified based upon a significant element (or a moderate percentage) of the required performance being missing, but the performance or product measured still has significant value in meeting the intent of the requirement, which is to avoid action or inaction that is harmful to the reliability of the Bulk Electric System. If an entity, when issuing an Operating Instruction during an Emergency, did not use three-part communication or take an alternative action if the receiver does not respond, and instability, uncontrolled separation, or cascading failures occurred as a result, the entity violated the requirement with a “Severe” VSL. The value of “Severe” is justified because the performance outcome does not meet the intent of the requirement.

In response to comments, the OPCP SDT made non-substantive clarifying changes to Measures M2, M4, M6, and M7.

Organization	Yes or No	Question 3 Comment
<p>Northeast Power Coordinating Council</p>	<p>No</p>	<p>Regarding Requirement R4, the LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no maximum or “cap” to the delayed assessment, and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even if the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs. Regarding Requirement R5, the MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. Suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL be: “AND instability, uncontrolled separation, or cascading failures occurred as a result.” The same comments apply for Requirements R6 and R7. We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19, 2013 Resolution, which is to enforce ‘zero tolerance’ only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency.</p>
<p>NERC Standards Review Forum</p>	<p>No</p>	<p>R1, The NSRF does not understand why there is a Severe VSL for normal everyday Operating Instructions. This Severe VSL is imposing the “zero defect” language that</p>

Organization	Yes or No	Question 3 Comment
		the industry is trying to move away from. We understand if there were no protocols as in “The responsible entity did not develop any documented communications protocols as required in Requirement R1”, but not the sub requirements of R1.2 and R1.3. The highest VSL should be High. Save the Severe VSL for R5, R6, and R7.
Colorado Springs Utilities	No	<p>We do not agree with the following VSLs:1) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or “cap” to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs.2)</p> <p>R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.”3) R6: Same comments as in R5.4) R7: Same comments as in R5.</p>
Southern Company; Southern Company Services, Inc; Alabama Power Company;	No	R3 VSL is listed as high and severe; The concern is that if an operator receives instruction and performs accurately using 3-part, but can’t show initial training for Operating Instruction and Operating instruction during an Emergency, would this

Organization	Yes or No	Question 3 Comment
<p>Georgia power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation and Energy Marketing</p>		<p>warrant a high or severe VSL. While there is the potential of risk if Operating Instructions are received prior to being trained, this should not somehow imply that incorrect operations were performed as a result of no training. The severe category should be reserved only for those instances in which Operating Instructions were received prior to being trained *and* which resulted in an emergency operation or reliability issue. As a result, we suggest “demoting” each existing VSL to a lower level, and editing the High and Severe VSL and limit it to only those instances that resulted in an emergency operation or reliability issue (suggestions provided below). Low - An individual operator at the responsible entity receiving an Operating Instruction prior to being trained. Moderate - An individual operator at the responsible entity received an Operating Instruction during an Emergency prior to being trained. High - An individual operator at the responsible entity received an Operating Instruction prior to being trained *and* resulting in an emergency operation or reliability issue. Severe - An individual operator at the responsible entity received an Operating Instruction during an Emergency prior to being trained *and* resulting in an emergency operation or reliability issue.</p>
<p>DTE Electric</p>	<p>No</p>	<p>The evidence needed to avoid violation is not clear. The VSL for R2 is not reasonable and an auditing nightmare. It should state an operator did not receive training on the documented communication protocol. Adding "prior to issuing an operating instruction" cannot be determined without excessive investigation. A check that all operators received training is appropriate. Same issue with R3 as listed for R2.</p>
<p>SPP Standards Review Group</p>	<p>No</p>	<p>We suggest changing the Moderate VSLs for R5, R6 and R7 to Lower. If the failure to completely follow through with the protocols contained in R1 had no adverse impact on the situation, then this VSL is purely administrative and is not deserving of being Moderate. The Lower and Moderate VSLs for R1 contain specific details regarding</p>

Organization	Yes or No	Question 3 Comment
		each of the Parts referenced in each of the VSLs. In the High and Severe VSLs for R1 only reference is made to the Parts while the details contained in the Parts is not included in the VSLs. Either the details should be removed from the Lower and Moderate VSLs or the details need to be included in the High and Severe VSLs.
Dominion	No	We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19th, 2013 Resolution, which is to enforce 'zero tolerance' only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency.
ACES Standards Collaborators	No	(1) We disagree with some of the requirements of including training and several aspects of the communication protocols. Since we disagree with the underlying requirements, we also disagree with the corresponding VSLs and VRFs.
ISO/RTO Council Standards Review Committee	No	We do not agree with the following VSLs:i) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or "cap" to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the time period that an entity failed the 12 month update requirement. Absent this "cap", or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs.ii) R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a

Organization	Yes or No	Question 3 Comment
		condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation which should be captured by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.”iii) R6: Same comments as in R5.iv) R7: Same comments as in R5.
Liberty Electric Power LLC	No	The "Moderate" VSL for R6 should be modified in the same manner as the "Severe" VSL. In addition to repeating the Directive, the RE needs to fail to take action as directed. Suggest the following language: "AND the RE failed to take action as requested by the issuer of the Operating Instruction".
NRECA	No	Will need to be modified dependent on applicability modifications.
Georgia Transmission Corporation	No	Modify in accordance with selected alternative drafted above.
Independent Electricity System Operator	No	We do not agree with the following VSLs:i) R4: The LOW VSL suggests that an entity is assigned a LOW VSL if assessments are conducted more than 12 months apart. There is no max or “cap” to the delayed assessment and hence an entity may be 18, 19 or more months late in conducting the next assessment. In other standards, this could well be assessed a MEDIUM or HIGH or even a SEVERE violation, depending on the

Organization	Yes or No	Question 3 Comment
		<p>time period that an entity failed the 12 month update requirement. Absent this “cap”, or staggered caps, the proposed HIGH and SEVERE VSLs can only be assessed based on whether or not there was ever an assessment, even the last assessment was done 3 or 4 years prior to an audit. This is inconsistent with the general guideline for VSLs.ii) R5: The MEDIUM VSL and SEVERE VSL are identical, except the latter has a condition that is associated with the impact of the violation. This is inconsistent with the intent of the VSL, which is to assess the “extent to which” the requirement was violated, not the impact of the violation that should have been reflected by the VRF. This is also inconsistent with the VSL principle and guideline. We suggest removing the MEDIUM VSL, and the condition under the proposed SEVERE VSL that: “AND Instability, uncontrolled separation, or cascading failures occurred as a result.”iii) R6: Same comments as in R5.iv) R7: Same comments as in R5.</p>
American Electric Power	No	The AND qualifier provided for R5 which qualifies that Instability, uncontrolled separation, or cascading failures occurred, should also be used for R3.
CenterPoint Energy Houston Electric LLC	No	CenterPoint Energy does not agree with the Severe VSL for Requirement R1. The Company strongly believes that the focus of any Reliability Standard should be on enhancing the reliable operation of the BES and not on documents. Simply failing to document a procedure should never warrant a Severe VSL as long as the entity is operating according to the Standard.
Georgia System Operations Corporation	No	R1 - GSOC requests that there not be applied a Severe VSL for normal everyday Operating Instructions.

Organization	Yes or No	Question 3 Comment
Electric Reliability Council of Texas, Inc.	No	<p>R2 and R3 VSLs should not have the “during an Emergency” distinction between a high and severe VSL. VSL’s grade the severity or “how bad” did an entity violate a requirement. The risk and situation of non-compliance is included in the VRF and not the VSL. ERCOT ISO would recommend percentage indicator across the severity levels as detailed in the VSL guideline document.R5-R7 VSLs should remove “Instability, uncontrolled separation, or cascading failures occurred as a result.” as that stipulation is not appropriate in the VSLs. The resulting impact of non-compliance is addressed in the enforcement process and not in how severe an entity did not comply with a requirement. ERCOT ISO suggests a binary or severe only VSL to coincide with the VSL Guideline document. Additionally, ERCOT ISO would recommend adding “at least” in the R5 VSL to better clarify that a minimum of one of the three actions is required and not all three.The responsible entity that issued an Operating Instruction during an Emergency did not take ‘at least’ one of the following actions:</p>
ReliabilityFirst	No	<p>ReliabilityFirst submits the following comments related to the VSL for the OPCP SDTs consideration:1. Requirement R4 VSL - For the Lower VSL, ReliabilityFirst recommends gradating the number of months an entity is late in assessing adherence and effectiveness of the documented communications protocols. For example, there is a big difference if an entity is late by one month or 12 months. As drafted, an entity that is late by 12 months would still fall under the Lower VSL. ReliabilityFirst recommends gradating the VSLs in three month intervals. For example, the last “AND” text for the Lower VSL would read: “The responsible entity exceeded twelve (12) but less than or equal to fifteen (15) calendar months between assessments.” The Moderate VSL would read; “The responsible entity exceeded fifteen (15) but less than or equal to eighteen (18) calendar months between assessments.” The High and</p>

Organization	Yes or No	Question 3 Comment
		<p>Severe VSLs would follow the same rationale.2. Requirement R5 VSL - Requirement R5 does not speak to instability, uncontrolled, separation, or cascading failures occurring as a result of correctly issuing an oral two-party, person-to-person Operating Instruction. To be consistent with the requirement, ReliabilityFirst recommends deleting the text after the AND qualifier and deleting the Moderate VSL. Hence, there will only be one Severe VSL for this requirement.3. Requirement R6 VSL - Similar comment as the Requirement R5 VSL4. Requirement R7 VSL - Similar comment as the Requirement R5 VSL</p>
Manitoba Hydro	Yes	<p>Although Manitoba Hydro agrees with the VRFs and VSLs for the Requirements, we have the following comments: 1) VSLs, R2 - the term 'individual operator' is used in this VSL where throughout the standard operating personnel is used. 2) VSLs, R5 - text of VSLs refer to Requirement R6 instead of R5.3) VSLs, R6 - inconsistent drafting as the words 'that received an oral, ....' is not included here, but does appear in the VSL for R7.4) VSLs, R5, R6, R7 - the final criteria for a Severe VSL is for a specific outcome of non-compliance which does not seem appropriate when measuring compliance. Depending on the outcome of the circumstances, the VSL may be High or Severe. The outcome itself is not something that is related to the entity's compliance with the standard. The entity may take the same action and comply to the same degree and by virtue of the outcome alone they are moved from a High to a Severe VSL.</p>

SERC OC Review Group		<p>We believe that the VRFs/VSLs should be modified to better reflect the stated intent of the NERC Board of Trustees November 19th, 2013 Resolution, which is to enforce 'zero tolerance' only for failure to use 3 part communications by the issuer or recipient of an Operating Instruction when it is issued to alleviate or avoid an Emergency. VSL for R1: Modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency Current VSL for R1 language: The responsible entity did not include Requirement R1, Part 1.2 in its documented communications protocols OR The responsible entity did not include Requirement R1, Part 1.3 in its documented communications protocols OR The responsible entity did not develop any documented communications protocols as required in Requirement R1. Proposed VSL for R1 language: Moderate - The responsible entity did not require the issuer and receiver of an oral or written Operating Instruction to use the English language, unless agreed to otherwise, as required in Requirement R1, Part 1.2. An alternate language may be used for internal operations. Severe - The responsible entity did not include Requirement R1, Part 1.1, in its documented communications protocols OR Requirement R1, Part 1.3 in its documented communications protocols OR The</p>

Organization	Yes or No	Question 3 Comment
		<p>responsible entity did not include Requirement R1, Part 1.4 in its documented communications protocols OR The responsible entity did not develop any documented communications protocols as required in Requirement R1 OR the responsible entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency. VSL for R3: This Group recommends that the “High VSL for R3” be deleted. The reason for the High VSL deletion is to align with the concept that the standard should provide that compliance with the standard should only entail assessing whether an entity has utilized their documented communications for Operating Instructions that are not issued during an Emergency.VSL for R2, R5, R6, and R7: If the OPCP SDT modifies the requirements based on this Group’s recommendation VSL for R2, R5, R6, and R7 can be deleted except for any sections that are applicable in revised requirements.</p>

4. Do you have any additional comments? Please provide them here.

**Summary Consideration:** The OPCP SDT thanks all parties who took the opportunity to comment on Question 4. The responses to comments submitted for Question 4 are provided in individual responses below. Many of the same themes carry from Question 1.

Organization	Yes or No	Question 4 Comment
Salt River Project	No	
Southern Company; Southern Company Services, Inc; Alabama Power Company; Georgia power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation and Energy Marketing	No	<p>R1.2: Correct the formatting of the third bullet to match the first two so that it is clear that there are three options permitted not just two with a sub bullet to number two.</p> <p>R3: Is worded a little confusing. Suggestion would be to add the text below. Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction that requires them to either: [Violation Risk Factor: Low][Time Horizon: Long-term Planning] o Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or o Request that the issuer reissue the Operating Instruction.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>R4 - In NERC’s own Q&amp;A document for RAI prepared by the Risk-Based Reliability Compliance Working Group (RBRCWG), the following statements are made: “An entity can voluntarily establish internal controls designed to reduce its control risk, which could have a positive influence on the scoping of compliance monitoring by the Regional Entity. Conversely, the entity can voluntarily elect to not establish internal controls or share them with the Regional Entity.” This is inconsistent with the direction</p>

Organization	Yes or No	Question 4 Comment
		<p>of the proposed Standard COM-002-4, R4. This not only requires an internal control, but also requires that the control be shared with the Regional Entity (during audits). Also, consider that an entity can develop and implement a robust communication protocol consistent with COM-002-4 requirements and flawlessly follow its communication protocol, yet be found in violation of COM-002-4 by failing to demonstrate that it has adequate (subjective) management (internal) controls in place. This is inconsistent with the RAI guidance provided by NERC regarding the voluntary nature of internal controls. So, in principle, internal controls should not be dictated in a reliability standard. This goes against the principle of “Results-Based” standards. The intended result is effective communications. This can be attained with Requirements 1 through 3. No one will argue that internal controls won’t help ensure that the desired results are achieved. However, Requirement 4 is not absolutely necessary for the results to be achieved, and therefore, should not be included in the standard and should be removed.</p> <p><b>Response: The OPCP SDT will share this comment with the NERC staff coordinating the RAI documents. It is not an accurate statement that an entity can be found to have violated COM-002-4 by failing to demonstrate that it has adequate controls in place. The entity will be measured based on the language of the requirement, which requires an assessment, feedback to operating personnel, and corrective actions as appropriate.</b></p> <p>Definition of Operating Instruction: The term “command” in the definition of Operating Instruction implies authority, and Southern believes it should be made clear that Operating Instructions (for purposes of this standard) are commands issued by those functional entities that are expressly granted the responsibility and authority by the NERC Reliability Standards to take actions or direct the actions of others to ensure the reliability of the BES. These are the Balancing Authority, Reliability Coordinator and Transmission Operator only. No other functions are expressly authorized in the NERC Reliability Standards to issue a command. Our proposed definition Operating Instruction should be: Operating Instruction - A command originated by a Balancing Authority, Transmission Operator or Reliability Coordinator responsible for the Real-</p>

Organization	Yes or No	Question 4 Comment
		<p>time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)</p> <p><b>Response: Definitions must be written to provide flexibility to be used in other Reliability Standards. Therefore, the proper place to note the functional entities is the requirement text itself. The requirements in the standard provide the bounds that only Operating Instructions issued by BAs, TOPs, and RCs are applicable to the standard.</b></p> <p>Measures:M4: The inclusion of Emergency here is inappropriate due to the non-inclusion of Emergency in R4. Also change the RSAW to reflect this change as well. Suggested rewording:”Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4. The entity shall provide evidence that it took appropriate corrective actions as part of its assessment for all identified instances where operating personnel did not adhere to the protocols developed in Requirement R1”</p> <p><b>Response: Requirement R4 is written broadly to cover assessment of Operating Instructions under all operating conditions. The measure adds some additional clarity on certain situations that are of particular interest and almost certainly would call for corrective action. However, the OPCP SDT team revisited the language of M4 and revised the language to better track the requirement language. The drafting team also addressed this issue in the FAQ document posted on the project page. The following response was provided: “The purpose of COM-002-4 is ‘To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could</b></p>

Organization	Yes or No	Question 4 Comment
		<p>lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).’ If the deviation from the protocol contributed to an emergency, the purpose of this standard was not met. The entity must determine what caused that deviation and address any necessary corrective actions.”</p> <p>Definition of Emergency Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System. If read literally, EVERY breaker operation on the system IS an EMERGENCY. This causes a great deal of concern. From a DP and GOP standpoint, the RSAW and technical justification wording states that an attestation that no emergency had been called requiring a three part response would suffice for evidence. The rationale and technical justification document has some very good explanations of the INTENT of the drafting team and how they want the industry to view the standard requirements. If the standard and the subsequent audits adhered ONLY to what was in the justification document, then there should be little or no concerns. Unfortunately, the justification document carries no statutory weight and the standard as written does.</p> <p><b>Response: Since an entity will be required to file a Reportable Event for damage or destruction of a Facility (damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area, or Transmission Operator Area that results in actions to avoid a BES Emergency), BES Emergency requiring public appeal for load reduction, BES Emergency requiring system-wide voltage reduction, BES Emergency requiring manual firm load shedding, and BES Emergency resulting in automatic firm load shedding per EOP-004-2, entities will be aware of the Emergency. This does not include every breaker operation.</b></p>
Arizona Public Service Co.	No	
DTE Electric	No	None

Organization	Yes or No	Question 4 Comment
Bonneville Power Administration	No	
Idaho Power Company	No	
Virginia State Corporation Commission, Member OC	No	
SERC OC Review Group	Yes	<p>The SERC OC Review Group understands the position that the OPCP SDT is working in and greatly appreciates the patience and dedication shown in developing this draft standard. Thank you. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Review Group only and should not be construed as the position of the SERC Reliability Corporation, or its board or its officers.</p> <p><b>Response: The OPCP SDT thanks you for your comments.</b></p>
North American Generator Forum - Standards Review Team (NAGF-SRT)	Yes	<p>1) R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction.</p> <p><b>Response: Requirement R1 only describes what should be covered in an entity’s documented communication protocols. R3 only includes the bullets to identify what an operator must be trained to do. Therefore, what action an entity may take is not relevant for these requirements. However, to address the concern, it is important that the issuer and receiver understand the Operating Instruction prior to determining whether the action can or cannot be completed.</b> 2) Specific to R.6,</p>

Organization	Yes or No	Question 4 Comment
		<p>consideration should be given to revise the verbiage from, “during an Emergency” to “identified by the sender as constituting an Emergency directive.” The rationale for the recommendation is offered to provide clarity to the Requirement, as it is anticipated that there will be cases when it is not clear the Operating Instruction is associated with an Emergency. Additionally, the definition of “Emergency” in the NERC Glossary is broad and consequently it may be difficult, at times, to determine which inputs are subject to COM-002-4 requirements, especially if the TO or TOP calls a plant operator directly rather than going through the respective dispatchers. Note: On the 1/17/14 COM-002-4 OPCP SDT webinar the question was asked, how a DP or GOP would know that an Operating Instruction occurred during an Emergency. The drafting team stated that after every Operating Instruction the DP should call its TOP to determine if the Operating Instruction occurred during an Emergency. The NAGF-SRT once again reiterates that it would be more efficient and the industry would benefit as a whole, if the sender of the Operational Instruction, states the instruction is associated with an Emergency.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “Separately listing out Requirements R5, R6, and R7 and using ‘Operating Instruction during an Emergency’ in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an ‘Operating Instruction during an Emergency.’ The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies. In other words, it is not the drafting team’s expectation that the operator must differentiate between Emergency and non-Emergency Operating Instructions.” In order to draft appropriate VSLs, separate requirements were needed for the different operating conditions. The protocols are the same for all operating conditions. The OPCP SDT did not intend the phrase “during an Emergency” to carry an obligation to identify the communication as one that constitutes an Emergency directive.</b></p>

Organization	Yes or No	Question 4 Comment
		<p>Please see the response to Question 1, which addresses the concern regarding the identification of an Emergency.</p> <p>3) Specific to Measures M5 and M6, which contain language associated with the issuer and the recipient both maintaining evidence of two-party communication respectively. It is recommended that M5 be revised such that the all associated evidence is maintained by the issuer and M6 be deleted in its entirety. Consolidating the evidence requirements would benefit the industry by reducing duplication of efforts, associated with maintaining evidence by different entities, in support of the same requirement.</p> <p><b>Response: Each entity must provide its evidence of compliance. No entity can be required to provide evidence for another entity’s compliance.</b></p>
<p>Northeast Power Coordinating Council</p>	<p>Yes</p>	<p>Regarding Part 1.4, it must be considered that some ISOs issue multiple-party burst Operating Instruction to Generator Operators through electronic means.</p> <p><b>Response: Requirement R1, Part 1.4 only applies to written or oral single-party to multiple-party burst Operating Instructions. An electronic signal is not covered in this standard. If the electronic communication is written, the entity must put in place the ability to ensure that the Operating Instruction was received by at least one receiver of the Operating Instruction.</b></p> <p>Regarding Part 1.6, the requirement is vague and needs to be clarified for Registered Entities to know how to comply. How would one “specify the nomenclature” system wide?</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “COM-002-4, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie</b></p>

Organization	Yes or No	Question 4 Comment
		<p>substations) for Operating Instructions. This supports both parties being familiar with each other’s interface Elements and Facilities, minimizing hesitation and confusion when referring to equipment for the Operating Instruction.” The nomenclature is not specified “system-wide.”</p> <p>Regarding Requirements R2 and R3, those “training” requirements aren’t necessary. Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a standard’s requirement. Under RAI principles, NERC and Regions can determine what type of monitoring is appropriate for Responsible Entities’ compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment. The proposed standard still contains requirements that mandate the use of, and training to include 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. As stated in the Rationale and Technical Justification document the proposed Measures and RSAW don’t specifically require that auditors verify compliance of this for the Requirements (and associated Measures), however a strict read leads us to a different conclusion. Under the RSAW for R1 it states that the entity shall provide its documented communications protocols developed for this requirement and the auditor shall review the documented communications protocols provided by the entity and ensure they address the Parts of R1 (including the use of 3 part communications). The RSAW contains similar actions relative to Requirements R2 and R3 in that the entity is to provide evidence consisting of agendas, learning objectives, or course materials that it provides pursuant to these requirements. Given this, an auditor can enforce to a ‘zero defect tolerance’ if the auditor chooses to do so, and in fact would argue that an audit would be deficient if it failed to validate whether the learning objective included ensuring that 3 part communication was used during issuance or receipt of each Operating Instruction. Suggest that the training requirements contained with R2 and R3 be removed and placed within the PER-005 Operations Personnel Training standard. PER-005 should be the home of all system operator related training requirements.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: Please refer to the summary response in Question 1 above.</b></p> <p>There are no clear and concise differences between Requirements R1, R5 and R6. This creates uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. Absent a Requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. Suggest revising Requirement R1 so that it applies to all Operating Instructions, but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request that the recipient confirm their understanding through use of 3 part communication. Remove Requirements R5, R6 and R7 (incorporating items deemed necessary by the OPCP SDT as bullets or Parts of R1). Suggested rewording for Part 1.1:1.1. Require that its operating personnel identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency.</p> <ul style="list-style-type: none"> <li>o Request recipient use 3 part communication when the Operating Instruction is being issued to alleviate or avoid an Emergency.</li> </ul> <p>Revise M1, VRF/VSLs and RSAW so that strict compliance with use of 3 part communication is only applied when an Operating Instruction is issued to alleviate or avoid an Emergency as identified by the issuer at the time of issuance. Suggested revisions to M1:M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2). VSL for R1 - modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency</p> <p><b>Response: The OPCP SDT has not modified Measure M1 as suggested above because the entity's performance is limited to the development of the protocols. The OPCP</b></p>

Organization	Yes or No	Question 4 Comment
		<p>SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “Separately listing out Requirements R5, R6, and R7 and using ‘Operating Instruction during an Emergency’ in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an ‘Operating Instruction during an Emergency.’ The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies. In other words, it is not the drafting team’s expectation that the operator must differentiate between Emergency and non-Emergency Operating Instructions.”</p> <p>Measure M4 requires compliance demonstration beyond Requirement R4. Specifically, entities must provide evidence that appropriate corrective action was taken for all instances where an operating personnel’s non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency.</p> <p><b>Response: The OPCP SDT has adjusted the language of Measure M4 to better align with the language in Requirement R4.</b></p> <p>The format of the standard should be changed to conform to the current NERC direction-the measures get listed with the associated requirement, and the rationale get included in the standard, not a separate document.</p>
NERC Standards Review Forum	Yes	<ol style="list-style-type: none"> <li>Per section one of this document, the OPCP SDT states: The Project 2007-02 OPCP SDT removed the term “Reliability Directive” in order to avoid complications that may result from the Notice of Proposed Rulemaking issued by the Federal Energy Regulatory Commission on November 21, 2013 proposing to remand the definition of “Reliability Directive.” But within the latest Implementation Plan, there still is the prerequisite of approving the term “Reliability Directive”. Please update whichever documentation that should be corrected in order to provide the</li> </ol>

Organization	Yes or No	Question 4 Comment
		<p>industry with accurate information so that we can determine if this Standard supports the reliability of the BES.</p> <p><b>Response: The OPCP SDT thanks you for your comment. However the clean version of the Implementation Plan does not contain the words “Reliability Directive.” The words do appear in the redline to the last posted version in strikethrough.</b></p>
Colorado Springs Utilities	Yes	<p>Comments: 1. R1.4. - [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. o Some ISO’s issues multiple-party burst Operating Instruction to Generator Operators through electronic means. Associated real-time requirement: R7. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. Comment: The SRC does not believe this requirement is necessary for reliability. Moreover, the Standard Drafting Team has not provided any , nor have we been made aware of the substantiated rationale for keeping this Requirement except that the OPCP SDT believes is it necessary.</p> <p><b>Response: The OPCP SDT asserts that it is important that the issuer of a written or oral single-party to multiple-party burst Operating Instruction makes sure that the communication channel was complete. This can be accomplished by confirming with at least one party that the communication was received.</b></p> <p>2. R1.6. - [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Specify the nomenclature for Transmission interface Elements and Transmission interface</p>

Organization	Yes or No	Question 4 Comment
		<p>Facilities when issuing an oral or written Operating Instruction. Comment: This requirement is vague and needs to be clarified for Registered Entities to know how to comply with it; how would one “specify nomenclature” system-wide? Comment: This requirement was dropped from TOP-002-2a, requirement 18. Communication on transmission equipment must be equipment specific. Nomenclature should not be used, rather entities should always be correctly communicating using the unique and specific equipment identifiers. Adding nomenclature will reduce not improve reliability.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>3. R2. and R3. - ...”shall conduct initial training for each of its operating personnel ...”Comment: The SRC does not believe a training Requirement is necessary; Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a Standard Requirement. Under RAI principles, NERC and Regions can determine what type of monitoring is appropriate of Responsible Entities’ compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>
<p>Florida Municipal Power Agency</p>	<p>Yes</p>	<p>FMPA is voting “affirmative” on this standard, yet we have concerns with the RSAW language and lack of criteria on how an entity will be assessed and audited. There is language in the RSAW “Notes to Auditor” for multiple requirements (R4-R7) that is of concern. (See example below) The RSAW language is not clear regarding the nature and extent of audit procedures that will be applied because there is reference to scoping the audit based on “certain risk factors to the Bulk Electric System”. It is not clear what “risk factors” will be used. As an example in R5 auditing “can range from exclusion of a requirement from audit scope to the auditor reviewing, in accordance</p>

Organization	Yes or No	Question 4 Comment
		<p>with the above Compliance Assessment Approach, evidence associated with the entity’s responses to numerous Operating Instructions issued during Emergencies.” This is essentially a zero tolerance approach, yet, also appears to be an attempt to apply Reliability Assurance Initiative (RAI) concepts, that have not been finalized and communicated to the industry. It is uncertain whether these concepts have been fully developed yet; and therefore, this leaves too much auditor discretion, without providing the industry information or criteria on how “risk” will be assessed. Stakeholders continue to await the details of these RAI concepts that are being utilized in RSAWS. Clarity is needed around how an entity’s risk to the BES will be assessed due to compliance or non-compliance with this standard. This would also be beneficial for an entity to know, so that they can lessen that risk, as appropriate. Example language from RSAW: “The extent of audit procedures applied related to this requirement will vary depending on certain risk factors to the Bulk Electric System. In general, more extensive audit procedures will be applied where risks to the Bulk Electric System are determined by the auditor to be higher for non-compliance with this requirement. Based on the auditor’s assessment of risk, as described above, specific audit procedures applied for this requirement may range from exclusion of this requirement from audit scope to the auditor reviewing, in accordance with the above Compliance Assessment Approach, evidence associated with the entity’s responses to numerous Operating Instructions issued during Emergencies. “</p> <p><b>Response: The OPCP SDT thanks you for your comments. We will convey the RSAW comments to the RSAW drafting team. For more information about the NERC RAI program, please refer to the February 5, 2014 agenda for the Board of Trustees Compliance Committee. An update on RAI was provided. In addition, information about RAI may be found here: <a href="http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx">http://www.nerc.com/pa/comp/Pages/Reliability-Assurance-Initiative.aspx</a>.</b></p>

Organization	Yes or No	Question 4 Comment
PPL NERC Registered Affiliates	Yes	<p>These comments are submitted on behalf of the following PPL NERC Registered Affiliates: Louisville Gas and Electric Company and Kentucky Utilities Company; PPL EnergyPlus, LLC; PPL Electric Utilities Corporation; and PPL Generation, LLC, on behalf of its NERC registered entities. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.</p> <p>Each of the PPL NERC Registered Affiliates recognize the need for and support the use of three part communications for Operating Instructions. However, we are abstaining from voting on this standard because we believe that the current version of COM-002-4 requires change to ensure consistency with the OPCP SDT’s intent. If these clarifications are made, the PPL NERC Registered Affiliates would support the proposed standard.</p> <p>First, the PPL NERC Registered Affiliates request that the OPCP SDT revise Measure M.4 to specifically state that sampling is allowed in performing the assessments required by Requirements R.4.1 and R.4.2. This is consistent with the OPCP SDT’s oral statements during the January 17, 2014 webinar and the FAQ (“An entity could perform an assessment by listening to random samplings of each of their operating personnel issuing and/or receiving Operating Instructions....”). Additionally, for consistency and to avoid ambiguity, the OPCP SDT should also conform the wording in Measure M.4 to Measures M.5-M.7 (i.e., “Such evidence may include, but is not limited to,...”). Therefore, we recommend that the OPCP SDT revise Measure M.4 as follows: M4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments. Such evidence may include, but is not limited to, sampling results, spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4....</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “An entity could perform an assessment by listening to random samplings of each of their operating personnel</b></p>

Organization	Yes or No	Question 4 Comment
		<p>issuing and/or receiving Operating Instructions. If there were instances where an Operator deviated from the entity’s protocols, the entity would provide feedback to the operator in question in any method it sees as appropriate. An example would be counseling or retraining the operator on the protocols.</p> <p>An entity could assess the effectiveness of its protocols by reviewing instances where operators deviated from those protocols and determining if whether the deviations were caused by operator error or by flaws in the protocols that need to be changed.” The OPCP SDT asserts that this, in conjunction with the RSAW, provides sufficient clarity.</p> <p>Second, the PPL NERC Registered Affiliates request that the OPCP SDT clarify in the proposed standard that only a failure to use three-part communications during an Emergency is a violation of COM-002-4. Therefore, we recommend that the standard’s requirements be further revised to indicate that if an entity does not adhere to its documented communications protocols developed in accordance with Requirement R.1 during a non-Emergency, such action shall not be considered a noncompliance event under Requirement R.1.</p> <p><b>Response:</b> The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The standard uses the phrase ‘Operating Instruction during an Emergency’ in certain Requirements (R5, R6, and R7) to provide a demarcation for what is subject to a ‘zero tolerance’ compliance/enforcement approach and what is not. This is necessary to allow the creation of Violation Severity Levels for each compliance/enforcement approach. Where ‘Operating Instruction during an Emergency’ is not used, an entity will be assessed under a compliance/enforcement approach that focuses on whether or not an entity met the initial training Requirement (either R2 or R3) and whether or not an entity performed the assessment and took corrective action according to Requirement R4. The proposed COM-002-4 does not contain a Requirement to adhere to all documented communications protocols during non-Emergency conditions. Under COM-002-4, the assessment and training documentation will</p>

Organization	Yes or No	Question 4 Comment
		<p>provide auditors assurance that responsible entities are using their documented communications protocols and taking corrective actions as necessary.”</p>
<p>Duke Energy</p>	<p>Yes</p>	<p>(1)Duke Energy suggests rewording R1.6 as follows: “Specify the nomenclature to be used for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction to neighboring entities.” While the Technical Justification document suggests that R1.6 applies to communication with neighboring entities, it is unclear that this requirement, as worded in the current draft of COM-002-4, is specifically discussing communication with neighboring entities.</p> <p><b>Response: The OPCP SDT asserts that the existing language provides sufficient clarity.</b></p> <p>(2)M2 should include “initial training” and be reworded as follows in order to maintain consistency with the requirement:”Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.”</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Measure M2.</b></p>

Organization	Yes or No	Question 4 Comment
SPP Standards Review Group	Yes	<p>The removal of Reliability Directive from the definition of Operating Instruction has removed clarity from a compliance viewpoint. Without this clarity, which could also be provided by requiring a statement which identifies the Emergency situation as an Emergency, the operator does not know that he is in an Emergency situation. Although the operator’s response may be the same as it is in a non-emergency, the compliance hook of zero tolerance is there. We need a mechanism in place that we can use to identify when we are in an Emergency situation which prevents Monday-morning quarterbacking during an audit regarding whether an Emergency actually occurred or not. Reliability Directive gave us that indication. We recommend requiring an Operating Instruction that is issued during an Emergency situation be identified as ‘This is an Emergency.’</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “Separately listing out Requirements R5, R6, and R7 and using ‘Operating Instruction during an Emergency’ in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an ‘Operating Instruction during an Emergency.’ The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies. In other words, it is not the drafting team’s expectation that the operator must differentiate between Emergency and non-Emergency Operating Instructions.”</b></p> <p><b>Additionally, since an entity will be required to file a Reportable Event for damage or destruction of a Facility (damage or destruction of a Facility within its Reliability Coordinator Area, Balancing Authority Area, or Transmission Operator Area that results in actions to avoid a BES Emergency), BES Emergency requiring public appeal for load reduction, BES Emergency requiring system-wide voltage reduction, BES Emergency requiring manual firm load shedding, and BES Emergency resulting in</b></p>

Organization	Yes or No	Question 4 Comment
		<p><b>automatic firm load shedding per EOP-004-2, entities will be aware of the Emergency.</b></p> <p>Recommendation 26 calls for work to be done to improve the effectiveness of communications in emergency situations. The purpose of the standard is to improve communications. However, the focus of the standard is primarily 3-part communications. There is no supporting documentation or data to support the position that 3-part communications improves the effectiveness of communications. Focusing on 3-part communications provides an easy target from a compliance perspective but all it teaches us is to mechanically repeat back what we have been instructed to do. We're focusing on the 'how' and 'what' rather than the 'why'. Keeping the 'why' in mind improves communications and the reliability of the BES. Keeping the 'why' in mind also leads to improved situational awareness. Improving effective communications is difficult to quantify in a standard and even more difficult to measure. We may be better off focusing on the principles contained in the OC's Reliability Guideline System Operator Verbal Communications - Current Industry Practices.</p> <p><b>Response: The OPCP SDT thanks you for your comment.</b></p> <p>We suggest that R2 and R3 are already provided for in PER-005 and therefore are redundant in this standard. If there is a need to include a training requirement in this standard, that requirement could consist of a statement to include protocol training in the entity's reliability task list.</p> <p><b>Response: Please see the summary response for Question 1.</b></p> <p>Measure 4 adds an additional requirement regarding the failure to follow protocols which in turn leads to an Emergency. The Measure basically requires the responsible entity to assess those particular situations even though they are not specifically called out in the requirement. We recommend adding the following sentence at the end of R4.1: 'Such assessment shall include, at a minimum, any instance that is an Emergency.'</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The OPCP SDT considered the suggested edits. The OPCP SDT chose to revise Measure M4 to better align with the language in Requirement R4.</b></p> <p>We recommend that the drafting team consider moving R4 back to language similar to that contained in R5 of Posting 7. This language is much clearer and eliminates Paragraph 81 concerns of administrative burden associated with the required 12-month assessments and removes the ambiguity of ‘corrective actions’ and ‘as appropriate’.</p> <p>In the last line of the Evidence Requested table in the R2 section of the RSAW, the following evidence is requested: ‘Organization chart or similar artifact identifying the operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System and the date such personnel began operating the Real-time Bulk Electric System.’ This implies that an entity will be found non-compliant if operating personnel operate the Real-time BES prior to receiving training on issuing Operating Instructions. This is not what is stated in the requirement. This entry should be reworded to the following: ‘Organization chart or similar artifact identifying the operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System and the date such personnel began issuing Operating Instructions.’ Similarly, this change needs to be made in the Compliance Assessment Approach Specific to COM-002-4, R2 table. That entry should read: ‘Verify applicable operating personnel, or a sample thereof, received the required training prior to the date they began issuing Operating Instructions by agreeing selected personnel names to training records.’</p> <p><b>Response: The OPCP SDT has provided your comments to the RSAW team.</b></p>
Bureau of Reclamation	Yes	Reclamation requests that R5 include a bullet requiring the issuer of an Operating Instruction during an Emergency to identify the situation as an Emergency. This is important because R6 requires recipients of Operating Instructions to repeat the

Organization	Yes or No	Question 4 Comment
		<p>instructions during Emergencies, but it may not be clear to the recipient that an Emergency is occurring.</p> <p><b>Response: Please see the summary response for Question 1.</b></p> <p>Reclamation reiterates that R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction. The drafting team could choose to address this point with a footnote explaining that the requirement to repeat the instruction does not obligate the recipient to perform the action if he repeats the instruction, but then explains that he cannot perform the action because doing so would violate safety, equipment, regulatory, or statutory requirements.</p> <p><b>Response: Requirement R1 only describes what should be covered in an entity’s documented communication protocols. Requirement R3 only includes the bullets to identify what an operator must be trained to do. Therefore, what action an entity may take is not relevant for these requirements—actions are addressed by other standards (e.g. IRO-001 and TOP-001). However, to address the concern, it is important that the issuer and receiver understand the Operating Instruction prior to determining whether the action can or cannot be completed.</b></p>
Dominion	Yes	<p>The proposed standard still contains requirements that mandate the use of, and training to include, 3 part communications during issuance of all Operating Instructions, including those issued during non-Emergency situations. While Dominion agrees that the OPCP SDT has stated in its Rationale and Technical Justification document that the proposed measures and RSAW don’t specifically require that auditors verify compliance of this for the requirements (and associated measures), a</p>

Organization	Yes or No	Question 4 Comment
		<p>strict read leads us to a different conclusion. Under the RSAW for R1 it states that the entity shall provide its documented communications protocols developed for this requirement and the auditor shall review the documented communications protocols provided by entity and ensure they address the Parts of R1 (including the use of 3 part communications). The RSAW contains similar actions relative to R2 and R3 in that the entity is to provide evidence consisting of agendas, learning objectives, or course materials that it provides pursuant to these requirements. Given this, Dominion believes an auditor can enforce to a 'zero defect tolerance' if it chooses to do so and in fact would argue that an audit would be deficient if it failed to validate whether the learning objective included insuring that 3 part communication was used during issuance or receipt of each Operating Instruction.</p> <p><b>Response: The OPCP SDT disagrees. Requirement R1 is limited to what protocols must be included in the documented protocols of an entity. Requirements R2 and R3 require training. Requirement R4 requires an assessment of the use of the protocols.</b></p> <p>Dominion also finds there are not clear and concise differences between requirements 1, 5 and 6 resulting in uncertainty as to whether the Operating Instruction is being issued to alleviate or avoid an Emergency. Dominion is concerned that, absent a requirement that the issuer make a definitive statement as to whether an Operating Instruction is being issued to alleviate or avoid an Emergency, neither the recipient (during) nor an auditor (after) would be able to make such determination. Having said this, we could support the standard if it were revised in a fashion similar to that described below. 1. Modify requirement 1 so that it applies to all Operating Instructions but requires that those being issued to alleviate or avoid an Emergency be specifically identified as such and that the issuer explicitly request recipient confirm their understanding through use of 3 part communication.</p> <p><b>Response: The OPCP SDT reiterates that Requirement R1 only concerns what protocols must be included in the documented protocols. The drafting team</b></p>

Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1. For each Operating Instruction issued to alleviate or avoid an Emergency; entity shall provide evidence that it identified such at time Operating instruction was issued (R1.1) and requested recipient use of 3 part communication (R1.2). o VSL for R1 - modify Severe to include any instance where entity either (1) failed to identify, at the time of issuance, that the Operating Instruction is being issued to alleviate or avoid an Emergency or (2) failed to request recipient use 3 part communication when the Operating Instruction was issued to alleviate or avoid an Emergency</p>
<p>ACES Standards Collaborators</p>	<p>Yes</p>	<p>(1) We disagree with training requirements as they are redundant with PER-005. Similar to a FERC directive, the drafting team should be able to provide the BOT with technical justification that other alternatives exist to developing a new requirement such as pointing to an existing requirement. Training is already included in the PER requirements. The drafting team should provide the feedback from industry and show that there is an already existing enforceable standard that covers this issue of training and there are no gaps in reliability.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
		<p>(2) We do not think the Distribution Provider should be an applicable function. Most Distribution Providers simply do not have a materially impact on BES reliability. We suggest an alternative to have the standard apply to those DP that may impact the BES. According to the FERC-approved CIP version 5 standards, a Distribution Provider is subject to the standards if the DP has UFLS/UVLS systems that have the capability of shedding 300 MW or more of load. We ask the drafting team to consider revising the applicability section to mirror the CIP standards. There was technical justification provided during the development of those standards, NERC and FERC both approved those standards, and therefore, a precedent exists for this reasonable approach to focusing on entities that pose an impact, however minimal, to the BES.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>(3) Many DPs have no practical way to demonstrate compliance with “repeat backs.” Many DPs do not have recording systems for the telephonic communications. This puts the DP in a position to request the voice recordings or attestations from the issuer. The issuer is not obligated to provide the data and, in fact, history has shown that many registered entities will not provide this type of data to a third party for fear of compliance issues being identified with the issuer. Thus, from a practical perspective the standard puts the DP in the position of having to use weak evidence to demonstrate compliance. This is an unreasonable burden on the DP.</p> <p>(4) We recommend that the drafting team remove references to “taking alternative actions.” This is ambiguous and could potentially tie in actions that should be taken in accordance to directives in IRO-001 and TOP-001. COM-002 is related only to communications, so taking alternative actions must be limited to alternative communications.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “If an operator issues an Operating Instruction during an Emergency and, based on the response from the receiver, or lack thereof, chooses to take an alternative action, that operator has satisfied Requirement R5 and is not in violation.</b></p>

Organization	Yes or No	Question 4 Comment
		<p>The following scenario is provided as an example of an alternative action:  <b>A Transmission Operator (TOP) calls a Generator Operator (GOP) to reduce generation due to an Emergency. The GOP does not respond verbally. At that point the TOP could:</b></p> <ul style="list-style-type: none"> <li>• <b>Ask if the GOP understood the Operating Instruction (alternative action).</b></li> <li>• <b>Hang up and redial the GOP, assuming that the communication line was dead (alternative action),</b></li> <li>• <b>Request a different generator that is effective to reduce (alternative action); or</b></li> <li>• <b>Call a different contact at the GOP (alternative action)."</b></li> </ul> <p>(5) We suggest that the "assess adherence and assess effectiveness" language in R4 be removed from COM-002-4. This language is similar to the "Identify, Assess and Correct (IAC)" language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>(6) Thank you for the opportunity to comment.</p>
<p>ISO/RTO Council Standards Review Committee</p>	<p>Yes</p>	<p>1. R1.4. - [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. o Some ISO's issues multiple-party burst Operating Instruction to Generator Operators through electronic means Associated real-time requirement: R7. Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating</p>

Organization	Yes or No	Question 4 Comment
		<p>Instruction was received by at least one receiver of the Operating Instruction. NOTE - ERCOT does not support the following Comment: The SRC members (excluding ERCOT) do not believe this requirement is necessary for reliability. Moreover, the Standard Drafting Team has not provided any, nor have we been made aware of the substantiated rationale for keeping this Requirement except that the OPCP SDT believes is it necessary.</p> <p><b>Response: The OPCP SDT asserts that it is important that the issuer of a written or oral single-party to multiple-party burst Operating Instruction makes sure that the communication channel was complete. This can be accomplished by confirming with at least one party that the communication was received.</b></p> <p>2. R1.6. - [Documented communications protocols for its operating personnel that issue and receive Operating Instructions shall, at a minimum] Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction. Comment: This Requirement is vague and needs to be clarified for Registered Entities to know how to comply with it; how would one “specify nomenclature” system-wide? Even though the posted “Rationale and Technical Justification” (RTJ) document notes that R1.6 is limited in scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations), this RTJ document should define these terms and substantiate to what registered entities this needs to apply. For example, if the intent is to apply this requirement to Inter-Area tie-lines, then it should probably be limited to Reliability Coordinator-to-Reliability Coordinator communications. If the intent is to apply this requirement to every type of transmission - say generation interconnection facilities - it should be clear so that Registered Entities can clearly understand the burdens associated with this new Requirement.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>3. R2. and R3. - ...”shall conduct initial training for each of its operating personnel ...” Note - ERCOT and IESO do not support the following Comment: The SRC members, (excluding ERCOT and IESO) do not believe a training Requirement is necessary;</p>

Organization	Yes or No	Question 4 Comment
		<p>Responsible Entities must adhere to the Requirements of NERC Standards and how they accomplish this should not be dictated by a Standard Requirement. Additionally, to the extent that the OPCP SDT concludes that training on 3-part communication is necessary to ensure an adequate level of reliability, then any training requirements should this would already be covered under the PER Standard, which requires training on job tasks. To the extent training requirements should be imposed on GOP/DP personnel, the PER Standard could be slightly modified to include them. Overall, if NERC is going to add additional training requirements, they should be located in PER to avoid complexity in the organization of NERC Standards. Finally, under RAI principles, NERC and Regions can determine what type of monitoring is appropriate of Responsible Entities' compliance with the new COM Standard based on the quality of their Training programs. This would further support reliability by changing the requirement from a one-time audit (i.e., initial training) to an ongoing assessment. In conclusion, even though the BOT resolved that there should be training associated with the COM requirements, it would be beneficial to address the BOT's concern through existing Standards (PER). Basic principles of drafting regulation should strive to avoid making the organization and relationship among NERC Standards more complex than need to be.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>4. Measurement 6. Meaurement 6 needs to be revised so that it is consistent with NERC Enforcement policies. Specifically, the last sentence needs to be rewritten so that "Such evidence may include, but is not limited to, dated and time-stamped voice recordings[,] dated operator logs, an attestation from the issuer of the Operating Instruction, voice recordings (if the entity has such recordings), memos and transcripts." NERC has repeatedly affirmed that a Registered Entity may provide an attestation that it has complied with a Standard. See NERC Compliance Process Bulletin#2011-001 ("Data Retention Requirements") (May 20, 2011), at p 3 (in the context of explaining that the CMEP requires a registered entity to demonstrate that it was compliant through the entire audit period, NERC stated that some examples of evidence may include "An attestation of any employee who has participated in the</p>

Organization	Yes or No	Question 4 Comment
		<p>activity on a regular basis throughout the audit period, supported by other corroborating evidence (such as schedules, emails and other applicable documentation). Recipients of oral Operating Instructions during an Emergency have ample means of maintaining records, providing corroborating material, etc... demonstrating that they adhered to the emergency Operating Instruction. To establish an expectation that other Registered Entities may be maintaining audit evidence for the Registered Entity to which the Requirement applies is inconsistent with NERC's enforcement rules and establishes a flawed practice and expectation with regard to recordkeeping requirements and "audit trails."</p> <p><b>Response: The list of examples of evidence is not exhaustive. The measure simply provides examples.</b></p>
Luminant	Yes	<p>1). R1.3 and R3 should also allow the receiver of an Operating Instruction to respond by explaining that a requested action cannot be performed (e.g., due to safety, equipment, regulatory, or statutory requirements as described in TOP-001 R3 and IRO-001 R8). The requirement to either repeat or request that the instruction be reissued does not account for the realistic situation that an entity may not be able to perform an Operating Instruction.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>2). Specific to R.6, consideration should be given to revise the verbiage from, "during an Emergency" to "identified by the sender as constituting an Emergency directive." The rationale for the recommendation is offered to provide clarity to the Requirement, as it is anticipated that there will be cases when it is not clear the Operating Instruction is associated with an Emergency. Additionally, the definition of "Emergency" in the NERC Glossary is broad and consequently it may be difficult, at times, to determine which inputs are subject to COM-002-4 requirements, especially if the TO or TOP calls a plant operator directly rather than going through the respective</p>

Organization	Yes or No	Question 4 Comment
		<p>dispatchers.Note: On the 1/17/14 COM-002-4 OPCP SDT webinar the question was asked, how a DP or GOP would know that an Operating Instruction occurred during an Emergency. The drafting team stated that after every Operating Instruction the DP should call its TOP to determine if the Operating Instruction occurred during and Emergency. Luminant once again reiterates that it would be more efficient and the industry would benefit as a whole, if the sender of the Operational Instruction, states the instruction is associated with an Emergency.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p><b>As a clarifier, the OPCP SDT provided the response during the webinar that, if a receiver was unsure whether there was an Emergency or not, the receiver could ask the issuer for clarification.</b></p>
<p>Public Utility District No.1 of Snohomish County</p>	<p>Yes</p>	<p>While the Public Utility District No.1 of Snohomish County supports this draft of COM-002-4, we see an issue with R2 and R3 of this standard. These requirements both deal with entities conducting training for its personnel, and feel it would be more appropriate if they were addressed in the PER family of standards.The Public Utility District No.1 of Snohomish County also supports the comments submitted by the SERC OC Review Group.Thank you very much.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>
<p>The United Illuminating Company</p>	<p>Yes</p>	<p>PER-005-2 introduced the concept of a Transmission Owner local control center that issues and receives instructions independent of a TOP, RC or BA. COM-002-4 should apply to Transmission Owners.</p> <p><b>Response: The OPCP SDT thanks you for your comment. Please refer to question 9 in the FAQ document posted on the project page for a response to your comment.</b></p>

Organization	Yes or No	Question 4 Comment
Liberty Electric Power LLC	Yes	<p>COM-002 remains a zero defect standard, and there is no FERC directive to provide a zero defect standard in response to either blackout recommendation 26 or Paragraph 535 of Order 693. Further, there is no requirement for the issuer of an Operating Instruction in an Emergency to indicate the Emergency status. The webinar response to queries over the lack of Emergency Status Indication was to suggest the RE "call and inquire" if the OI was in fact a Directive. This adds to the regulatory burden while offering zero benefit. Identification of an Emergency has positive effects far beyond three part communications. The realization of risk to the BES should create a heightened sense of urgency among all parties. The standard must require announcement of Emergency status in order to penalize RE's for actions which are not violations in a non-Emergency situation.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p><b>As a clarifier, the OPCP SDT provided the response during the webinar that, if a receiver was unsure whether there was an Emergency or not, the receiver could ask the issuer for clarification.</b></p>
Wisconsin Electric Power Company	Yes	<p>The proscribed training requirements embedded in R2 and R3 should be removed. The existence and usage of protocols should be the primary focus of the standard and regulatory review, creating a training requirement within the standard shifts focus to training content and administration. Additionally, PER-005-1 requires the Balancing Authority, Reliability Coordinator, and Transmission Operator to have a systematic approach to training (SAT). The adoption and management of a SAT would presumably include communications protocols as a task for potential training. The current draft version of PER-005-2 includes a similar requirement for a SAT applicable to the Generator Operator.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: Please see the summary response to Question 1.</b></p> <p>The annual assessment and corrective action process defined in R4 should be made applicable to Operating Instructions during an Emergency. Although the NERC Glossary of terms provides a definition of Emergency, two reasonable people looking at a situation can disagree as to when an Operating Instruction is issued during an Emergency. Creating a zero defect standard applicable to inherently ambiguous situations shifts focus from the adoption of communication protocols to discussion of when an Operating Instruction is issued during an Emergency. During an entities annual assessment process, the focus would be on classification of an Emergency instead of process improvement for communications. An alternate approach would be to draft the standard so as to require the explicit identification of an Operating Instruction and/or Emergencies so as to remove the ambiguity.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>Finally, the definition of Operating Instruction references a command issued by operating personnel, without sufficiently defining operating personnel.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity. The requirements in the standard define which operating personnel are applicable to the standard.</b></p>
NRECA	Yes	<p>NRECA suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: Please see the summary response to Question 1.</b></p>
<p>Ingleside Cogeneration LP</p>	<p>Yes</p>	<p>ICLP would like to see the innovative approach that the drafting team used to develop COM-002-4 applied to other standards as well. The issue that continues to arise is not so much whether mandatory requirements are based upon sound reliability principles, but how they can be reasonably enforced. In this case, it is clear that many entities do not have the tools or resources to examine every Operating Instruction in detail in order to assure 100% compliance with a rigorous communication protocol. Conversely, training and retention programs are common - and have proven to be an effective means to drive consistent Operator performance.</p> <p><b>Response: The OPCP SDT thanks you for your comment.</b></p>
<p>Clark Public Utilities</p>	<p>Yes</p>	<p>For the purposes of Requirements 5 and 6, Clark believes it should be an obligation of the issuer of Operating Instruction given during an emergency to identify it as an Emergency Operating Instruction. It should not an obligation of the reciever to determine after-the-fact whether an Operating Instruction is an Emergency or not. All Operating Instructions issued by a BA, RC, or TOP should be regarded with importance but a specification by the issuer that the instruction is in response to an Emergency will alert the receiver that a particular Operating Instruction action requirement has a role in the overall reliability of the BES resulting in a higher level of BES reliability.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>
<p>Manitoba Hydro</p>	<p>Yes</p>	<p>1) The protocols at minimum should require full name identification.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The OPCP SDT considered your suggestion but asserts that the requirement for “full name identification” does not need to be a mandated communication protocol.</b></p> <p>2) R2 - the description of the applicable operating personnel (i.e. that are responsible for Real-Time operation of the interconnected BES) is different in this part than others (that state it’s for operating personnel that issue and receive certain Operating Instructions). Is that purposeful?</p> <p><b>Response: The OPCP SDT chose that language in Requirement R2 to designate what personnel must be trained.</b></p> <p>3) R5, R6, R7 and R8 - the numbering seems to be mixed up.</p> <p><b>Response: The OPCP SDT is not sure to what you are referring. The standard has no Requirement R8.</b></p> <p>4) M2 and M3 - are not drafted consistently given the consistency in drafting of requirements R2 and R3. M3 refers to ‘its initial’ training records while M2 does not and M3 refers to training records ‘for its operating personnel’ while M2 does not.</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Measure M2.</b></p> <p>5) M4 - contains a section of text that is not reflective of the requirement itself and has no basis for appearing in the measure. The requirement states only that the entity need only take corrective action to address deviations. The extra text that discusses instances where non adherence is the sole or partial cause of an Emergency should be deleted.</p> <p><b>Response: The OPCP SDT clarified the language in Measure M4 to better align with the language in Requirement R4.</b></p> <p>6) M6, M7 - the words ‘if the entity has such recordings’ seem unnecessary. This qualifying language isn’t attached to any other type of evidence that is listed as a</p>

Organization	Yes or No	Question 4 Comment
		<p>possibility; presumably all of those are subject to the same qualifier and would only be presented as evidence if the entity had them.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p>
<p>Georgia Transmission Corporation</p>	<p>Yes</p>	<p>Comments: GTC suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards which FERC directed the removal of. The removal or modification of this language was included in the Final Rule of NERC CIP V5 (Order No. 791). FERC stated that IAC language was “overly-vague, lacking definition and guidance is needed” and that these control concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>Lastly, GTC recommends a revision to the NERC Glossary term Emergency. GTC recommends the removal of the terms “or limit” within this definition. One could argue that every single Operating Instruction is utilized to limit failures of transmission facilities. Emergency should be more appropriately defined without this ambiguity: Proposed: Emergency or BES Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing definition of Emergency provides sufficient clarity.</b></p>

Organization	Yes or No	Question 4 Comment
American Transmission Company, LLC	Yes	<p>ATC recommends changing the language in Requirement 4 to read as follows:” Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every calendar year, and no more than every 15 months: “ .....This would be consistent with the NERC’s annual requirement assessment made in NERC’s Compliance Application Notice (CAN)- 0010 issued on November16, 2011. In doing so, it should drive consistency among the CEA on how it is enforced.</p> <p><b>Response: The OPCP SDT thanks you for your comments. The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p>
Independent Electricity System Operator	Yes	<p>Recently, FERC directed NERC to eliminate the ambiguity with language “identify, assess, and correct” deficiencies for the CIP standards. Although it supported NERC’s move away from a “zero tolerance” approach to compliance, FERC wanted NERC provide more guidance regarding enforceability with the self-identify/assess/correct approach to compliance. NERC may want to consider that FERC may raise the same concerns with this proposed standard.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>According to the draft standard, if DPs and GOPs receive an Operating Instruction, they can provide an attestation from the issuer of the Operating Instruction to demonstrate compliance - they do not need to develop documented communications protocols. The lighter compliance burden on DPs and GOPs may result in a higher administrative burden for the RC/BA/TOP to provide attestations.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The Measures provide various options that the drafting team considered as ways to demonstrate compliance for Requirement R6. It is not an exhaustive list, and in no way places an expectation on</b></p>

Organization	Yes or No	Question 4 Comment
		<p>any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.”</p>
<p>Pepco Holdings Inc.</p>	<p>Yes</p>	<p>Please provide the rational as to why the standard is not applicable to TOs.</p> <p><b>Response: The OPCP SDT thanks you for your comment. Please refer to question 9 in the FAQ document posted on the project page for a response to your comment.</b></p>
<p>American Electric Power</p>	<p>Yes</p>	<p>AEP believes the most recent changes represent a major step back in regards to clarity (as compared to the draft proposed in October 2013), and has driven us to change our voting position from affirmative to negative. We are concerned by the removal of Reliability Directive, and instead, now basing requirements on whether or not the communications are made during an Emergency. Who determines whether or not an Emergency state exists, and in addition, how would that be communicated? AEP recommends returning to the fundamentals and approach taken in the previous draft. If the phase “Reliability Directive” is to be remanded, we encourage the drafting team to pursue alternative language which would not require the need to know whether or not the communications are being made during an “Emergency”. For example, perhaps the drafting team could change R1 (as taken from the October 2013 draft) to state something like the following: “Require the issuer to identify the action as a directive or instruction...”.R4.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>2: Though M4 specifies the kinds of evidence needed to meet R4, we believe it would be too subjective in determining whether or not the entity’s efforts properly assessed the effectiveness of the documented communications protocols.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The measures provide various options that the OPCP SDT considered to demonstrate compliance for Requirement R4. It is not intended to be an exhaustive list.</b></p>
<p>Utility Services, Inc</p>	<p>Yes</p>	<p>Smaller DPs and GOPs will have a significant problems demonstrating compliance with Requirement 6 as written.</p> <ol style="list-style-type: none"> <li>1. As there is no requirement to notify these entities that an Operating Instruction is being issued during an Emergency, they will not be aware of which communications will be subject to compliance review.</li> <li>2. Since these entities typically do not record phone conversations they would have to rely on other forms of evidence. Log book enties will not document if three part communication was used and since the entities are not made aware of Emergency conditions, they will not know to maintain a higher level of documentation to demonstrate compliance.</li> <li>3. Approaching the issuer for confirmation of OIs during Emergency conditions and seeking Attestations from these entities will create a significant administrative burden not only for the small entities, but for the Issuer of the OI as well.</li> <li>4. Any additional tasks that must be performed during Emergency situations runs contrary to the intent of the standard, which is to normalize communication protocols during all situations, and not have separate procedures during normal and Emergency conditions.</li> </ol> <p><b>Response: Please see the summary response to Question 1.</b></p>
<p>Platte River Power Authority</p>	<p>Yes</p>	<p>Platte River takes exception to the requirement for alpha-numeric clarifiers for communications.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The OPCP SDT thanks you for your comment but notes the requirement for alpha-numeric clarifiers was from a previous draft of this standard and is no longer contained in the current version.</b></p>
<p>Nebraska Public Power District</p>	<p>Yes</p>	<p>1) Applicability for Distribution Providers (DP’s) should be qualified similar to qualification used for DP applicability in version 5 of CIP-003. Applicability needs to be focused on DP employees that may receive instructions relative to the BES.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>2) R1: Since Requirements R5, R6 and R7 are zero tolerance, R1 protocols should state that when there is an emergency condition on the system that those issuing Operating Instructions during an emergency shall state that “this is an emergency”. Reason Number 1, there needs to be a triggering mechanism that tells both the issuer and receiver that 3 part communication is zero tolerance and in effect during an emergency; Reason Number 2, there is question in the industry as to when the “emergency” begins and ends; and Reason Number 3 the RSAW for R5, R6 and R7 are telling the auditor (in the auditors note) to predetermine before an audit what are emergencies on an entities system, which could potentially create an issue of what is a determined emergency between the auditor and the entity. By inserting a triggering mechanism as suggested will create a demarcation for operating instructions during emergencies.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>3) R2 and R3 are already provided for in PER-005 and therefore are redundant in this standard. If there is a need to include a training requirement in this standard, that requirement could consist of a statement to include protocol training in the entity’s reliability task list.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
		<p>4) R4 as written puts a huge administrative burden on entities to administer assessments of ‘each’ of its operating personnel that issue and/or receive Operating Instructions. As in previous drafts of this Standard, entities should determine and document their own assessments to the Standard and so that adherence and effectiveness fits their program. In addition, the 12-month requirement in the Standard now provides for an administrative burden and compliance trap in order to remain compliant to the 12-month requirement. We’re a TOP and do many switching orders a day with operating personnel throughout the state. R4 requires us to assess adherence to communications protocols by our operating personnel (see FAQ #22 says "each" issuer/reciever) that receive these operating instructions and provide feedback to the operating personnel, and take corrective actions when appropriate. Currently, we have over 800 switch personnel, and some of these are not NPPD employees. We utilize personnel from some of our public power partners, such as rural power districts and municipalities. The 12 calendar month clock will be different for each person. So, day-to-day will be a challenge to ensure we capture compliance documentation on each person that changes the state of a BES element. The drafting team should revert back language similar to R5 of posting #7 (with exception to the “implement” language) so that entities can manage their own compliance controls and can develop assessments that fit their program. NPPD would suggest the following for Requirement 4:R4. Each BA, RC and TOP shall have a documented method to evaluate the communication protocols developed in R1 that: 4.1 Assess adherence to the communications protocols developed in R1; 4.2 Assess the effectiveness of the communications protocols in R1; 4.3 Provide feedback to issuers and receivers of Operating Instructions; and 4.4 Modify communication protocols as necessary as a result evaluated communication protocols in this R4.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “An entity could perform an assessment by listening to random samplings of each of their operating personnel issuing and/or receiving Operating Instructions. If there were instances where an Operator deviated from the entity’s protocols, the entity would provide feedback to</b></p>

Organization	Yes or No	Question 4 Comment
		<p>the operator in question in any method it sees as appropriate. An example would be counseling or retraining the operator on the protocols.</p> <p>An entity could assess the effectiveness of its protocols by reviewing instances where operators deviated from those protocols and determining if whether the deviations were caused by operator error or by flaws in the protocols that need to be changed.”</p> <p>The posted RSAW provides additional guidance on sampling. There was never an intention that every communication of an Operating Instruction must be assessed.</p>
CenterPoint Energy Houston Electric LLC	Yes	<p>CenterPoint Energy would like to thank the COM-002-4 Standard Drafting Team and appreciates the OPCP SDT’s time and effort dedicated in the development of this standard, in engaging the industry, and incorporating industry feedback into the standard. The removal of the requirement to identify an Operating Instruction in an emergency or a Reliability Directive to the receiver is viewed as a positive change. CenterPoint Energy believes that operating personnel’s focus should always be on monitoring and controlling the reliability of the BES rather than a compliance burden of correctly identifying and aligning company specific communication protocols to normal versus emergency operations. Overall, CenterPoint Energy agrees with the standard, but still has general concerns. The Company believes the prescriptiveness of the requirements: particularly R1.1 thru R1.6 exceeds the necessary components needed in establishing communication protocols for tightened reliable communications.</p> <p><b>Response: The OPCP SDT thanks you for your comment. The OPCP SDT asserts that Requirement R1 Parts 1.1 to 1.6 are an essential set of communication protocols and are not overly prescriptive.</b></p>

Organization	Yes or No	Question 4 Comment
MISO	Yes	<p>We recommend the drafting team: (1) Remove the attestation for another provision</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The Measures provide various options that the drafting team considered as ways to demonstrate compliance for Requirement R6. It is not an exhaustive list, and in no way places an expectation on any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.”</b></p> <p>(2) Restrict the zero-defect component of the standard to those operating instructions directly related to the emergency (e.g. redistpach instructions for IROs, committment instructions during EEAs, synchronizing during restoration, etc.)</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>(3) Maintain Reliability Directives in the toolkit as the clear indicator of an Operating Instruction that is directly applicable to the emergency.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The OPCP SDT debated whether to remove the term ‘Reliability Directive’ in response to comments suggesting it should be removed from the definition of ‘Operating Instruction’ and in light of FERC’s issuance of the TOP/IRO Notice of Proposed Rulemaking (NOPR), which proposes to remand the definition of ‘Reliability Directive’ along with the proposed TOP and IRO standards. To avoid unnecessary complications with the timing of the NOPR and posting Draft 8, the OPCP SDT consulted with the Project 2007-03 Real-time Transmission Operations and the Project 2006-06 Reliability Coordination Standard Drafting Teams to ask whether they believed removal of the term ‘Reliability Directive’ in the COM-002-4 standard would cause concerns. Both teams agreed that the COM-002-4 standard did not need to require a protocol to identify Reliability Directives as such and that the definition of Operating Instruction</b></p>

Organization	Yes or No	Question 4 Comment
		<p>could be used absent the term Reliability Directive in COM-002-4 to set the protocols. The OPCP SDT ultimately voted to remove the term. The OPCP SDT also decided to incorporate the phrase “Operating Instruction during an Emergency” in certain Requirements, where needed, to identify Requirements that are subject to a zero-tolerance compliance/enforcement approach.”</p> <p>We believe that DPs and LSEs don’t need stringent requirements.</p> <p>They just need to follow Directives or explain why they cannot. We understand that the drafting team is trying to meet a deadline, however we'd support the drafting team addressing all of the industry comments even if it requires more time to get this standard right.</p> <p><b>Response: COM-002-4 is not applicable to LSEs. DPs only have two applicable requirements.</b></p>
PJM Interconnection	Yes	<p>PJM supports the draft standard as it strikes a good balance between the industry and the NERC BOT November, 2013 resolutions. The standard provides the industry some flexibility regarding how communication protocols are developed. It also makes it cleaner and easier for operators to use the same protocol for all Operating Instructions, whether in an emergency or not, while not burdening System Operators with issues around how compliance will be measured. PJM does not support the addition of a new training requirement under R1. PJM recommends that all training requirements be included in one standard and not spread throughout families of standards. Consolidation of all training requirements under a single training standard will help in development of a clear, more organized training process.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
Georgia System Operations Corporation	Yes	<p>With consideration that an Emergency may not be initially recognized by system operators for several minutes, GSOC requests Requirements R5 thru R7 include the word “recognized” precede the work “Emergency”. GSOC cites the newly effective EOP-004-2, R2 currently affords this consideration. It requires reporting “within 24 hours of recognition of meeting an event type threshold”. In addition, GSOC recommends R5 thru R7 replace the words “during an Emergency” with “addressing a recognized Emergency” so as to avoid confusion should there be Operating Instructions issued during an Emergency that may have nothing to do with an Emergency.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>GSOC suggests that the “assess adherence and assess effectiveness” language in R4 be removed from COM-002-4. This language is similar to the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards. The removal or modification of this language was included in the Final Rule on NERC CIP V5 Standards (Order No. 791). FERC stated that IAC language and concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements</p> <p><b>Response: The OPCP SDT asserts that there is a substantive enough difference in the language of COM-002-4 and CIP version 5 so as not to be problematic. FERC stated concern was with the ambiguity around “identify, assess, and correct.” The OPCP SDT added clarifying language in the requirements to specify the actions that an entity is expected to take.</b></p>
Electric Reliability Council of Texas, Inc.	Yes	<p>ERCOT ISO believes the draft standard could be improved and offers the following suggestions for the OPCP SDT’s consideration.</p> <p>Definition of Operating Instruction. The definition of Operating Instruction could be improved by making the following changes:1) Delete the word “interconnected”</p>

Organization	Yes or No	Question 4 Comment
		<p>before BES in the first sentence. It is not used instances where BES is used. Unless there is a substantive reason for using interconnected in some BES references and not others, the standard should be consistent to mitigate ambiguity;2) “Potential Options” in the parenthetical is redundant - delete “potential”. Also, “option” and “alternatives” in the parenthetical are also redundant - delete one of them;3) The parenthetical doesn’t need to be a parenthetical - make it the last sentence in the definition.As revised, the definition would read as follows:Operating Instruction - A command by operating personnel responsible for the Real-time operation of the Bulk Electric System (BES) to change or preserve the state, status, output, or input of an Element of the BES or Facility of the BES. A discussion of general information to resolve BES operating concerns is not a command and is not considered an Operating Instruction.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>Purpose Section: The purpose statement could be improved by making the following changes:1) Delete “the issuance of” in the first sentence. It is inherent that a communication is “issued”. Therefore, this language is superfluous and should be deleted to mitigate any potential ambiguity;2) Delete “predefined” in the first sentence. This adjective is not needed - the existence of communication protocols means they are predefined. Therefore, this is superfluous language and should be deleted to mitigate potential ambiguity. As revised, the purpose section would read as follows:Purpose: To improve communications for Operating Instructions with communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>Requirements SectionR1</p>

Organization	Yes or No	Question 4 Comment
		<p>1) ERCOT ISO disagrees with changing “have” to “develop” in the first sentence. The point of this requirement is to have protocols that meet the minimum requirements. Obviously, in order to have the protocols an entity would need to develop them, but that is not the focus - as noted, having the protocols is the intent;2) Change “and” to “or” in the following - “...for its operating personnel that issue or receive Operating Instructions...” The intent is to make the obligation to have protocols applicable to all operating personnel of the relevant functions. It may be that some functions only issue or only receive operating instructions. In those cases this requirement would not apply to those entities because the requirement is conjunctive - issue and receive. By making it disjunctive by using “or” the requirement applies to all circumstances - i.e. issue and receive or just issue or just receive;3) The change suggested in (2) above should be made in R1.1 as well;</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>4) Also in R1.1, the triggering condition for using another language besides English - i.e. “unless otherwise agreed to” - is unclear in terms of how that would work. How do you demonstrate that such an agreement is in place? Also, practically speaking, the ability to reach such an agreement assumes that all operators are capable of speaking the alternative language. It seems way too complicated because it would depend on the languages spoken by the different operators at different entities, and their schedules would have to be coordinated. These issues are less of a concern for allowing alternative languages for internal communications because the entity’s personnel know one another and are located in the same place/organization. ERCOT ISO appreciates the intent of allowing for this exception, but it is difficult to see how it would work in practice, and even assuming it could work, the requirement is unclear as to what sort of agreement would be required;</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The drafting team included this part to carry forward the same use of English language included in COM-001-1,</b></p>

Organization	Yes or No	Question 4 Comment
		<p>Requirement R4 and to retire this requirement from COM-001. The requirement continues to permit the issuer and receiver to use an agreed to alternate language. This has been retained since use of an alternate language on a case-by-case basis may serve to better facilitate effective communications where the use of English language may create additional opportunities for miscommunications. Part 1.1 requires the use of English language when issuing oral or written (e.g. switching orders) Operating Instructions. This creates a standard language (unless agreed to otherwise) for use when issuing commands that could change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. It also clarifies that an alternate language can be used internally within the organization. The phrase has been modified slightly from the language in COM-001-1, Requirement R4 to incorporate the term ‘Operating Instruction,’ which defines the communications that require the use of the documented communications protocols.”</p> <p>5) R1.2 - Change “repeated information” to “response”. First, this change promotes consistency in terminology. Second, it is more consistent with the intent that the receiver is not required to repeat the directive verbatim - response contemplates flexibility as long as intent is there, while repeated information seems to require a verbatim reply;</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>6) The last bullet in R1.2 requires the issuer to take an alternative action if a response is not received or if the instruction is not understood. It is unclear what this means. Is the obligation related to trying to re-issue the instruction, or does it require the issuer take an alternative operating action? This is a communications standard, not an operations standard. Accordingly, the intent of this bullet should be clarified, and if it requires the issuer to take an alternative operating action, ERCOT ISO questions whether that obligation should be in a COM standard. Operational requirements are already covered in other standards, and if entities act under those other standards</p>

Organization	Yes or No	Question 4 Comment
		<p>then the relevant communications protocols would apply to those “alternative” operating actions. ERCOT ISO believes that the “alternative action” described in the third bullet of R1.2 and R5 should be limited only to communications and not operating actions. ERCOT ISO would recommend replacing R1.2 and R5 third bullet with the following: Attempt an alternative means to communicate the Operating Instruction if a response is not received or if the Operating Instruction was not understood by the receiver, if deemed necessary by the issuer .ERCOT ISO also recommends including “or receiving” to capture that the training should be prior to that individual operator issuing ‘or receiving’ an Operating Instruction to address the subparts of R1 that deal with receiving Operating Instructions.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “If an operator issues an Operating Instruction during an Emergency and, based on the response from the receiver, or lack thereof, chooses to take an alternative action, that operator has satisfied Requirement R5 and is not in violation.” It does not require an alternate action, but it allows the operator to take an alternate action if necessary and not be in violation of the requirement for three-part communication.</b></p> <p>7) R1.4 - Delete “single-party”. It is clear that an issuer is one entity without having to add “single-party”. Accordingly, this is superfluous language and should be deleted to mitigate ambiguity. If this deletion is made, “operating instruction” would have to be moved to where “single-party” was in the sentence;8) R1.4 requires the issuer to “confirm” or “verify” that the instruction was received by at least one entity. They are the same thing - delete one of them for clarity and to mitigate ambiguity;</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>9) R1.5 requires the communication protocols to specify the instances where time identification is required and to specify the format for time identification. As written, this appears to require the protocols to specifically list all relevant instances and, where relevant, requires the use of a specific time ID format. The OPCP SDT should</p>

Organization	Yes or No	Question 4 Comment
		<p>consider revising this so the requirement imposes a general obligation for the protocols to time ID instructions when necessary, but not require the establishment of an exclusive list. This will accomplish the goal of time stamping and provide the entity with flexibility to implement the requirement, which will also mitigate the need to revise protocols if an entity determines prospectively that time ID is not needed in some instances on the list and is needed in other instances that are not on the list. Similarly, the protocols should not require a specific format. Providing flexibility with respect to format will mitigate the potential for form over substance violations of the protocols - time ID is the point, not the format;</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The OPCP SDT has included this part to add necessary clarity to Operating Instructions to reduce the risk of miscommunications. The inclusion of ‘specify when time identification required’ allows for an entity to evaluate its particular circumstances and communications to determine when it may be appropriate to use time identification in its Operating Instructions. The drafting team recognized from comments the need to provide this flexibility while still requiring an entity to address this part in its documented communication protocols. Clarifying time and time zone (where necessary) contributes to reducing misunderstandings and reduces the risk of a grave error during BES operations. This is not exclusively for entities in multiple time zones, but Operating Instructions between entities in multiple time zones is one example of instances that may need time identification when issuing and receiving Operating Instructions.”</b></p> <p>10) R1.6 requires the protocols to establish nomenclature for transmission elements. It is unclear how this will facilitate clearer communications unless all entities that are issuers or recipients of instructions use the same nomenclature. As drafted, it appears that it is an independent obligation that applies to each entity. If that is the case, each entity could use different nomenclature, which arguably could have a negative impact on communications.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: Please see the summary response to Question 1.</b></p> <p>R4 1) ERCOT ISO understands the inclusion of R4 as a means to make normal operations Operating Instructions not subject to zero tolerance enforcement. However, ERCOT ISO has reservations concerning potential subjectivity surrounding who determines “appropriate” and “as necessary”. As a general comment, these types of “internal controls” requirements are better handled through the RAI initiative and subsequent CMEP processes. However, if the language remains, ERCOT ISO believes the clarity and effectiveness of the standard will benefit by clarifying that the entity who is conducting the assessments determine the appropriateness and necessity, and that the role of the ERO is simply to review if such activities were performed. ERCOT ISO recommends modifications as below. 4.1. Assess adherence by its operating personnel that issue or receive Operating Instructions to the documented communications protocols ‘required’ in ‘by the subparts’ of Requirement R1, , provide feedback to those operating personnel and take corrective action, as ‘deemed’ appropriate ‘by the entity’ to address deviations from the documented protocols.4.2. Assess the effectiveness of its documented communications protocols ‘required’ in ‘by the subparts of’ Requirement R1, for its operating personnel that issue or receive Operating Instructions and modify its documented communication protocols, as ‘deemed’ necessary ‘by the entity’. Additionally, ERCOT ISO recommends including language to specify that R4 only be required to apply to those communication protocols that are identified in the subparts of R1, and not to other practices that an entity may choose to employ or improve upon. This clarification will mitigate creating a “fill in the blank” type standard approach for future potential changes to the R1 documented communication protocols.</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Requirement R4.</b></p> <p>R51) How does the term “Emergency” in this requirement align with/relate to the term “Reliability Directive” in other standards, both in terms of meaning and scope of related responsibilities - is there overlap that could create ambiguity or unnecessary</p>

Organization	Yes or No	Question 4 Comment
		<p>redundancy? There is a concern regarding the use of “Operating Instruction during an Emergency”. While ERCOT ISO understands the rationale behind replacing Reliability Directive with the new terminology based on the FERC NOPR potentially remanding the term, to avoid overlap/redundancy/confusion if this is retained, any potential conflicts must be addressed through other projects. Use of Reliability Directive up until this draft created clear synergy between COM-003/002 and the IRO/TOP revisions. If the term is not remanded, ERCOT ISO would support a more uniform approach by including Reliability Directive;</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>2) Change “repeated information” to “response” in first two bullets. See comment 5 in R1 comments above for rationale for this suggested change;3) Third bullet - see comment 6 under R1 comments - same comment for the third bullet under R5;</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>R71) Delete “single party” and delete either “confirm” or “verify” - see comments 7 and 8 under R1 for rationale for these suggested revisions.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>Measures</p> <p>M4 is too prescriptive and inappropriately imposes requirements on the entity. This measure should align with previous comments concerning R4. M4 should be modified to reflect appropriate measures or types of evidence that should be provided without being overly prescriptive with respect to the level of quality of evidence. Additionally each part should be included and reflect the requirements without imposing additional requirements.</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Measure M4. In addition, the list of evidence is</b></p>

Organization	Yes or No	Question 4 Comment
		<p><b>not an exhaustive list and in no way places an expectation on any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.</b></p> <p>M5-M7 should not identify attestations from the issuer or include “dated and time stamped” as part of the measure. Compliance should be demonstrated by the relevant entity - third parties should not be required either directly or indirectly to support the compliance activities of another entity by providing attestations. “Dated and time stamped” goes to the quality of evidence and is not appropriate for a measure. ERCOT ISO comments that inclusion of attestations, documented observations, procedures, or other equivalent evidence would improve M5-M7.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The Measures provide various options that the drafting team considered as ways to demonstrate compliance for Requirement R6. It is not an exhaustive list, and in no way places an expectation on any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.” The same comment applies to Measures M5 and M7.</b></p>
<p>Indiana Municipal Power Agency</p>	<p>Yes</p>	<p>Requirement R3 is not clear in defining if it covers all Operating Instructions received by a Distribution Provider and Generator Operator. Distribution Providers and Generator Operators can receive Operating Instructions from outside parties (Balancing Authority, Reliability Coordinator, and Transmission Operator) and from internal parties (its own Market Operations). The current word in Requirement 3 requires Distribution Providers and Generator Operators to repeat back both outside and internal parties Operating Instructions. IMPA does not believe this was the intent of the OPCP SDT since there are no requirements that cover Distribution Providers or Generator Operators issuing Operating Instructions (the Generator Operator’s Market Operations issuing an Operating Instruction to its generating power plant; Generator</p>

Organization	Yes or No	Question 4 Comment
		<p>Operators cannot issue Operating Instructions to any Registered Entities such as the Balancing Authority or Reliability Coordinator). IMPA also believes that operating personnel need to know at the time an instruction is given if it is an Operating Instruction or a Directive. This clarification needs to come from the entity giving the instruction and reviewing the call afterwards to make that determination is very problematic.</p> <p><b>Response: The OPCP SDT thanks you for your comments and has considered them. The definition of Operating Instruction is “A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)” Conversations concerning market dispatch are not considered Operating Instructions. The OPCP SDT addressed the issue of identifying Emergencies in the FAQ document posted on the project page. The following response was provided: “Separately listing out Requirements R5, R6, and R7 and using ‘Operating Instruction during an Emergency’ in them does not require a different set of protocols to be used during Emergencies or mandate the identification of a communication as an ‘Operating Instruction during an Emergency.’ The same protocols are required to be used in connection with the issuance of Operating Instructions for all operating conditions. Their use is measured for compliance/enforcement differently using the operating condition as an indicator of which compliance/enforcement approach applies. In other words, it is not the drafting team’s expectation that the operator must differentiate between Emergency and non-Emergency Operating Instructions.”</b></p>

Organization	Yes or No	Question 4 Comment
New York Independent System Operator	Yes	<p>The NYISO would like to request confirmation that Operating Instructions are limited to verbal or written communications and that electronic dispatch signals are not in scope for this standard. The NYISO would also note that we support comments submitted by both the IRC/SRC and NPCC/RSC.</p> <p><b>Response: The OPCP SDT thanks you for your comments. The definition of Operating Instruction was intentionally written broadly to include many forms of communication. The requirements in COM-002-4 only apply to oral and written Operating Instructions. Electronic dispatch signals are not in the scope of COM-002-4.</b></p>
Northeast Utilities	Yes	<p>Comment 1 Systematic Approach to Training is already covered in PER-005-1 and including a requirement for training would seem to be redundant.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>Comment 2 The applicability of Distribution Provider (DP) functional responsibility presents potential for confusion. New England LCC’s (Transmission Operators) operate at the direction of ISO-NE the Regional Transmission Operator (RTO) and enforcing the communication protocols to distribution companies/distribution providers may present challenges, identifying, documenting and implementing COM-002-4 to the DP.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>Comment 3 The language used in Requirement 1.6 is vague and needs to be clarified for Registered Entities to know how to comply with it. How would one “specify nomenclature” system-wide?</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
Oncor Electric Delivery Company LLC	Yes	<p>Oncor recommends Requirement 4 and Measurement 4 be removed. The “assess adherence and assess effectiveness” language mirrors the same concepts as the “Identify, Assess and Correct (IAC)” language that was included in the CIP V5 standards which FERC directed the removal of. The removal or modification of this language was included in the Final Rule of NERC CIP V5 (Order No. 791). FERC stated that IAC language was “overly-vague, lacking definition and guidance is needed” and that these control concepts would be best addressed in the NERC compliance processes, such as through the NERC Reliability Assurance Initiative (RAI), rather than standards requirements. Reliability Standards must be revised to focus on strategic and critical reliability objectives incorporating requirements for meeting and sustaining reliability of the BES. The current state of Standards must transition from a prescriptive zero tolerance approach to results-based requirements which assure the reliability and security of the critical infrastructure. A reliability results-based approach should not be an additive to the Reliability Standards; hence, controls requirements should not be incorporated within the Standards, rather controls should be considered at the Program level. Reliability Standards should define the results (“what”) Entities are mandated to meet and maintain and the “how” should be handled by each Entity for there is not a “one size fits all”. Incorporating detective controls as requirements and prescriptive measurements can lead to unintended consequences and again, an additive versus a process that helps provide a registered entity with reasonable assurance they comply with the Standard(s) or the operating function(s) and processes that the Standard(s) require.</p> <p><b>Response: Please see the summary response to Question 1.</b></p> <p>Rewording of R1.6 as follows: “Specify the nomenclature to be used for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction to Neighboring Entities.” While the Technical Justification document suggests that R1.6 applies to communication with neighboring entities, it is unclear that this requirement, as worded in the current draft of COM-002-4, is specifically discussing communication with neighboring entities.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response: Please see the summary response to Question 1.</b></p> <p>M2 should include “initial training” and be reworded as follows in order to maintain consistency with the requirement: “Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.”</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Measure M2.</b></p>
<p>Exelon Corp and its affiliated business units</p>	<p>Yes</p>	<p>o A “qualified” application of COM-002-4 for a DP that performs voltage reduction or load shedding as directed by an RC, BA or TOP could clarify the standard and place the emphasis on the functional entities that matter most.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>o Remove R6 and M6. The BA, RC or TOP, as issuers, record Operating Instructions (OI). R1.2 requires an entity issuing an OI to confirm the receiver’s response, reissue if necessary and take alternate action if the receiver does not confirm or understand the OI. Similarly, per R5, issuers of an OI are required to confirm the receiver’s response, reissue if necessary and take alternate action if the receiver does not confirm or understand the OI. There is little reliability benefit in requiring the DP and GOP receiver documenting their role in this exchange. The training requirement for receivers of OI’s in R3 is sufficient.</p> <p><b>Response: The OPCP SDT chose to include Distribution Providers and Generator Operators in the Applicability section because they can be on the receiving end of some Operating Instructions. The OPCP SDT determined that if Distribution Providers and Generator Operators were not included as applicable entities in this</b></p>

Organization	Yes or No	Question 4 Comment
		<p>standard, it could create a gap. Additionally, it is important that the Distribution Provider and Generator Operator perform three-part communication when receiving an “Operating Instruction during an Emergency.” That necessitates Requirement R6.</p> <p>o If R6 and M6 are not removed.R6. To clarify, suggest that the word “Operating Instruction” be inserted after “excluding written” so it is clear it is applicable to both conditions.M6. Need a comma after “voice recordings” so as to separate it from dated operator logs.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p> <p>"Voice recordings" is repeated twice in M6. M7. "Voice recordings" is repeated twice in M7.</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Measures M6 and M7.</b></p> <p>o R6 / M6. Exelon is concerned that demonstrating compliance with R6 may prove difficult for some entities. A generator operator may not have voice recording available at the entity’s facility and it may not be possible to procure voice recording or attestations from the issuer of an Operating Instruction. The measurement says dated operator logs are acceptable evidence. The RSAW further discusses auditor discretion and risk assessment respecting this requirement and measure. If audited per the measurement and RSAW guidance, log entries would be acceptable evidence but we are concerned that an auditor may find otherwise.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: “The Measures provide various options that the drafting team considered as ways to demonstrate compliance for Requirement R6. It is not an exhaustive list, and in no way places an expectation on any entity that they must provide evidence of another party's compliance. It simply provides a few options to consider.”</b></p>

Organization	Yes or No	Question 4 Comment
		<p>o Should this proposal fail to pass ballot, we encourage the drafting team to build on the positive work done in this version and address the compliance concerns that remain. All stakeholders would be best served if this standard could incent improvement in communication through effective self-assessment and applied lessons learned. This iteration presents an opportunity to truly step away from placing the compliance burden that judges operators for their use of three-part communication and to focus on programmatic measures to promote effective communication. Specifically, replacing R5, R6 and R7 with meaningful assessment criteria to include in entity review programs could increase the qualitative components of the program, focus on efforts to improve effective communication and remove the zero tolerance compliance approach that currently exists. o While it’s been difficult to keep “starting over” with new standard language approaches, we believe that this version sets solid groundwork to address the hurdles and conflicts of previous approaches. Should more time be allowed to continue development of this most recent proposal, we would welcome the chance to discuss our ideas further.</p>
Xcel Energy	Yes	<p>Xcel Energy is voting negative because the standard no longer contains clarity for all parties on when they have entered an emergency state and therefore 3-part communication would be required. Since the requirements to conduct 3-part communication on emergency operating instructions will remain zero tolerance, it is important that the line of when the entity entered an emergency state be clear to the registered entities involved as well as ERO compliance and enforcement personnel. We think incorporating some of the mechanics from COM-002-3 could easily remedy our concerns. Alternatively, please consider requiring an Operating Instruction that is issued during an Emergency situation be identified as ‘This is an Emergency.’.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
ReliabilityFirst	Yes	<p>ReliabilityFirst submits the following comments for consideration:</p> <ol style="list-style-type: none"> <li>1. Requirements R1, R2, R3 and R4 - The term “operating personnel” is used throughout the draft standard. This term is undefined and it is unclear to which individuals the communications protocol applies. ReliabilityFirst recommends defining this term to eliminate any confusion and remove any questions around who encompasses “operating personnel”. ReliabilityFirst suggests replacing the term “operating personnel” with the draft PER-005-2 definition of “System Operator” (e.g., “An individual at a Control Center of a Balancing Authority, Transmission Operator, or Reliability Coordinator, who operates or directs the operation of the Bulk Electric System in Real-time.”). ReliabilityFirst believes it is the intent of the standard to apply to individuals who operate or direct the operation of the Bulk Electric System in Real-time, and not personnel that may be involved in supporting roles.</li> </ol> <p><b>Response: The OPCP SDT considered the use of the term “System Operator” when developing the standard. However, since the standard applies to Distribution Providers and Generator Operators, the term could not be used without altering the definition, which would impact other standards.</b></p> <ol style="list-style-type: none"> <li>2. Requirement R4a. The intent of Requirement R4             <ol style="list-style-type: none"> <li>a. R4.1 appears to limit possible violations for deviations to the context of emergency operations, while only requiring that Responsible Entities to assess and correct deviations “as appropriate” in the non-Emergency setting. ReliabilityFirst is concerned that the qualifier “as appropriate” is vague and creates concerns similar to those expressed by the Commission in Order 791. In Order 791, the Commission supported the RAI’s goal to develop a framework for the ERO Enterprise’s use of discretion in the compliance monitoring and enforcement space, but rejected the codification of “identify, assess, and correct” language within the CIP Version 5 Reliability Standards because it is vague. ReliabilityFirst is also concerned that the qualifier “as appropriate” codifies discretion within COM-002-4. ReliabilityFirst believes that neither discretion nor controls should be codified in Reliability Standards. Rather, the</li> </ol> </li> </ol>

Organization	Yes or No	Question 4 Comment
		<p>ERO Enterprise should utilize discretion in the compliance monitoring and enforcement space when determining the relevant scope of audits and whether to decline to pursue a noncompliance as a violation. With the RAI, the ERO Enterprise is developing a singular and uniform framework to inform the ERO Enterprise’s use of discretion in the compliance monitoring and enforcement space. Therefore, ReliabilityFirst recommends removing the qualifier “as appropriate” from R4.1 and allowing the ongoing RAI effort to create a meaningful and unambiguous framework that the ERO Enterprise will utilize to inform its use of discretion in the compliance monitoring and enforcement of all Reliability Standards. ReliabilityFirst cautions that codifying discretion in some Reliability Standards may create confusion once the ERO Enterprise begins to implement RAI discretion in its compliance monitoring and enforcement work. For example, there may be confusion of whether discretion codified in certain Requirements of Reliability Standards precludes the ERO Enterprise’s use of RAI discretion for those Requirements where discretion is not codified.</p> <p><b>Response: The OPCP SDT considered your suggestion and made non-substantive clarifying changes to the wording of Requirement R4. Concerning your RAI comment, please see the summary response to Question 1.</b></p> <p>b. Flowing from 2.a. above, ReliabilityFirst recommends that Measure 4 be modified to remove discretion, and should read as follows: M4. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of Requirement R4. The entity shall also provide evidence that it took appropriate corrective actions as part of its assessment for all instances of operating personnel’s nonadherence to the protocols developed in Requirement R1.</p> <p><b>Response: The OPCP SDT clarified the language in Measure M4 to better align with the language in Requirement R4.</b></p>

Organization	Yes or No	Question 4 Comment
California ISO	Yes	<p>1. Requirement R4 is an administrative task, not a reliability-related task. The ISO does not see the value added or where BES reliability is enhanced by R4. 2. The ISO uses an Automated Dispatch System (ADS) to direct dispatch levels of generation in the ISO Balancing Authority Area. Though different ADS instructions are sent to multiple parties (different Generators) each individual instruction is an electronic communication that is “resource specific” (i.e. - we send one resource an electronic communication to position its unit at a specific level and another resource a different electronic communication to position its resource at a different level, etc.) In this respect the ISO considers the ADS to be a “single-party to single-party” communication rather than a “single-party to multiple-party burst” communication. The ISO requests standards drafting team confirmation that it does not interpret R1.4 (or R7 which contains similar language in the Emergency context) to apply to resource-specific ADS dispatch instructions.</p> <p><b>Response: The OPCP SDT thanks you for your comments. The definition of Operating Instruction was intentionally written broadly to include many forms of communication. The Requirements in COM-002-4 only apply to oral and written Operating Instructions. Electronic dispatch signals are not in the scope of COM-002-4.</b></p>
Tri-State Generation and Transmission Association Inc.	Yes	<p>Tri-State G&amp;T disagrees with removing the term reliability directive. The proposed definition for Reliability Directive should be modified to provide technical justification, as requested in the November 21, 2013 FERC NOPR, and require Reliability Coordinators to use Reliability Directives to issue instructions to maintain reliable operations. As addressed in the NOPR, Reliability Directives from an entity responsible for the reliable operation of the BES should be mandatory at all times, not just during emergencies. Owners, Operators and others responsible for reliability of the BES have</p>

Organization	Yes or No	Question 4 Comment
		<p>used the term reliability directive effectively for many years. Removing this term does not enhance the reliability of the BES and places a burden on industry to adjust to accommodate a new method to accomplish what is done today with reliability directives. Our proposal is to make Reliability Directives applicable to RC, TOP and BA's to ensure reliable operation the BES.</p> <p><b>Response: The OPCP SDT addressed this issue in the FAQ document posted on the project page. The following response was provided: "The OPCP SDT debated whether to remove the term 'Reliability Directive' in response to comments suggesting it should be removed from the definition of 'Operating Instruction' and in light of FERC's issuance of the TOP/IRO Notice of Proposed Rulemaking (NOPR), which proposes to remand the definition of 'Reliability Directive' along with the proposed TOP and IRO standards. To avoid unnecessary complications with the timing of the NOPR and posting Draft 8, the OPCP SDT consulted with the Project 2007-03 Real-time Transmission Operations and the Project 2006-06 Reliability Coordination Standard Drafting Teams to ask whether they believed removal of the term 'Reliability Directive' in the COM-002-4 standard would cause concerns. Both teams agreed that the COM-002-4 standard did not need to require a protocol to identify Reliability Directives as such and that the definition of Operating Instruction could be used absent the term Reliability Directive in COM-002-4 to set the protocols. The OPCP SDT ultimately voted to remove the term. The OPCP SDT also decided to incorporate the phrase 'Operating Instruction during an Emergency' in certain Requirements, where needed, to identify Requirements that are subject to a zero-tolerance compliance/enforcement approach."</b></p> <p>The term Operating Instructions should be applicable to Operators who issue commands to control elements essential to the reliable operation of the BES. We do not believe the term, as currently defined, should apply to Reliability Coordinators. According to the NERC Functional Model, Reliability Coordinators are not real time operators and are not operating personnel. Reliability Coordinators oversee the reliability of the BES and direct real time operations as needed to assure reliability of the BES. TSGT requests clarification of the term operating personnel, which positions is</p>

Organization	Yes or No	Question 4 Comment
		<p>this term referring to? As previously stated, if operating personnel are the personnel that operate BES elements, then operating personnel should not include Reliability Coordinators since that is not the role they currently provide.</p> <p><b>Response: Since Reliability Coordinators “direct Real-time operations as needed to assure reliability of the BES,” they can issue Operating Instructions and, as such, must be applicable entities to this standard.</b></p> <p>TSGT requests clarification on the proposed multiple-party burst communication. This method of communication is not widely used and we are concerned that the use of this type of communication may create additional reliability issues.</p> <p><b>Response: Information about multiple-party burst communication may be found in the Operating Committee “Reliability Guideline: System Operator Verbal Communications – Current Industry Practices” located at <a href="http://www.nerc.com/comm/OC/Related%20Files%20DL/OC%20Approved_COM-002-2%20Guideline_6-24-2012_For%20Posting_w%20line%20numbers_Clean_Version%202.pdf">http://www.nerc.com/comm/OC/Related%20Files%20DL/OC%20Approved_COM-002-2%20Guideline_6-24-2012_For%20Posting_w%20line%20numbers_Clean_Version%202.pdf</a>.</b></p> <p>TSGT requests a clarification of time identification in R1.5.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>
The Empire District Electric Company	Yes	<p>I feel that the requirement to an assessment to communication protocols is somewhat excessive and should be left as a part of the audit process or following NERCs RAI directive be left up to the internal compliance department of the company rather than having this as a requirement in the standard.</p> <p><b>Response: Please see the summary response to Question 1.</b></p>

Organization	Yes or No	Question 4 Comment
HHWP	Yes	<p>I appreciate the work done on this Standard by the OPCP SDT. The current version of the draft is much improved. I propose one change before supporting this proposed standard. That change is in Requirement 4 where I believe the standard would be improved by replacing the "at least once every twelve (12) calendar months" language with "at least annually, with no more than X months between reviews." Such a change to the language or Requirement 4 would allow each entity to determine the best cycle for its review of adherence to and effectiveness of its communications protocols per CAN-0010. If that language is used, I believe that 15 months is an appropriate value for 'X'.</p> <p><b>Response: The OPCP SDT considered your suggestion but asserts that the existing language provides sufficient clarity.</b></p>

Additional Comments

Avista Utilities  
 Scott Kinney

Comment:

Although we believe the team made significant improvements to the standard, and support a 3-part communication standard, we are concerned that the scope of the standard and the sheer number of operating communications may overwhelm entities in terms of monitoring and evidence retention. COM-002-4 will require all communication channels to not just be recorded (which is done today) but will require a sampling of the recordings to be reviewed by compliance personal for self-monitoring purposes, provide documented feedback to operating personnel and provide samples to auditors. This standard may result in the registered entities spending more time monitoring and collecting data than the realized reliability benefits. Also, the evidence that is produced and provided to the auditors leaves much open for interpretation. We are concerned an auditor may not be able to differentiate between ‘emergency’ and ‘non emergency’ operating instructions for audit purposes.

Response: Please see the summary response to Question 1.

END OF REPORT

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting of the SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of COM-003-1 Standard posted November 2009 for Informal Comments closed January 15, 2010.
7. Version 2 draft of COM-003-1 Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20, 2012.
8. Version 3 draft of COM-003-1 Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of COM-003-1 Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of COM-003-1 Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.
11. Version 6 draft of COM-003-1 Standard posted June 2013 for Formal Comments, Ballot closed July 19, 2013.
12. COM-003-1 renumbered as COM-002-4. Posting 7, Version 1 draft of COM-002-4 Standard posted October 2013 for Formal Comment, Ballot closed November 7, 2013.
13. On December 12, 2013, the SC approved a waiver of the Standard Processes Manual to shorten the formal comment and ballot period, from 45 days to 30 days.
14. Version 2, Posting 8, draft of COM-002-4 Standard posted January 2014 for Formal Comment, Ballot closed February 4, 2014.

**Description of Current Draft:**

This is the second draft of a revised standard (eighth posting of a communications standard) requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The standard drafting team is posting this standard for a final 10 day ballot period.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
----------------------------	-------------------------

**COM-002-4 – Operating Personnel Communications Protocols**

---

1. Board adopts standard	May 2014
--------------------------	----------

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

Operating Instruction -A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-002-4
3. **Purpose:** To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Reliability Coordinator
    - 4.1.4 Transmission Operator
    - 4.1.5 Generator Operator
5. **Effective Date:** The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
  - 1.1. Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.2. Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Confirm the receiver's response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.

- Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- 1.3.** Require its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions:
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct.
  - Request that the issuer reissue the Operating Instruction.
- 1.4.** Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
- 1.5.** Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
- 1.6.** Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction. *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- R3.** Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every twelve (12) calendar months: *[Violation Risk Factor: Medium][Time Horizon: Operations Planning]*
- 4.1.** Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action, as deemed appropriate by the entity, to address deviations from the documented protocols.
- 4.2.** Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.

- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- Confirm the receiver's response if the repeated information is correct (in accordance with Requirement R6).
  - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or
  - Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- R6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R7.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]

### **C. Measures**

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.
- M3.** Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.
- M4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of

Requirement R4. The entity shall provide, as part of its assessment, evidence of any corrective actions taken where an operating personnel's non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency and for all other instances where the entity determined that it was appropriate to take a corrective action to address deviations from the documented protocols developed in Requirement R1.

- M5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issued an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence that the issuer either: 1) confirmed that the response from the recipient of the Operating Instruction was correct; 2) reissued the Operating Instruction if the repeated information was incorrect or if requested by the receiver; or 3) took an alternative action if a response was not received or if the Operating Instruction was not understood by the receiver. Such evidence could include, but is not limited to, dated and time-stamped voice recordings, or dated and time-stamped transcripts of voice recordings, or dated operator logs in fulfillment of Requirement R5.
- M6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that was the recipient of an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence to show that the recipient either repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction in fulfillment of Requirement R6. Such evidence may include, but is not limited to, dated and time-stamped voice recordings (if the entity has such recordings), dated operator logs, an attestation from the issuer of the Operating Instruction, memos or transcripts.
- M7.** Each Balancing Authority, Reliability Coordinator and Transmission Operator that issued a written or oral single or multiple-party burst Operating Instruction during an Emergency shall provide evidence that the Operating Instruction was received by at least one receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings (if the entity has such recordings), dated operator logs, electronic records, memos or transcripts.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall each keep data or evidence for each applicable Requirement for the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **Compliance Monitoring and Assessment Processes**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting of the SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of COM-003-1 Standard posted November 2009 for Informal Comments closed January 15, 2010.
7. Version 2 draft of COM-003-1 Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20, 2012.
8. Version 3 draft of COM-003-1 Standard posted August 2012 for Formal Comments, Ballot closed September 22, 2012.
9. Version 4 draft of COM-003-1 Standard posted November 2012 for Formal Comments, Ballot closed December 13, 2012.
10. Version 5 draft of COM-003-1 Standard posted March 2013 for Formal Comments, Ballot closed April 5, 2013.
11. Version 6 draft of COM-003-1 Standard posted June 2013 for Formal Comments, Ballot closed July 19, 2013.
12. COM-003-1 renumbered as COM-002-4. Posting 7, Version 1 draft of COM-002-4 Standard posted October 2013 for Formal Comments, Ballot closed November 7, 2013.
13. On December 12, 2013, the ~~Standards Committee~~ SC approved a waiver of the Standard Processes Manual to shorten the formal comment and ballot period, from 45 days to 30 days.
- 13-14. Version 2, Posting 8, draft of COM-002-4 Standard posted January 2014 for Formal Comment, Ballot closed February 4, 2014.

### Description of Current Draft:

This is the second draft of a revised standard (eighth posting of a communications standard) requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The standard drafting team is posting this standard for a ~~shortened 30-day formal Comment and 10-day Ballot period per the Standards Committee wavier~~ final 10 day ballot period.

### Future Development Plan:

**COM-002-4    Operating Personnel Communications Protocols**

<del>3.1.</del> Board adopts standard	<del>TBD</del> <u>May</u> 2014

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

Operating Instruction ——A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-002-4
3. **Purpose:** To improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES).
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Reliability Coordinator
    - 4.1.4 Transmission Operator
    - 4.1.5 Generator Operator
5. **(Proposed)-Effective Date:** The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements

- R1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall develop documented communications protocols for its operating personnel that issue and receive Operating Instructions. The protocols shall, at a minimum: [*Violation Risk Factor: Low*][*Time Horizon: Long-term Planning*]
  - 1.1. Require its operating personnel that issue and receive an oral or written Operating Instruction to use the English language, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.2. Require its operating personnel that issue an oral two-party, person-to-person Operating Instruction to take one of the following actions:
    - Confirm the receiver's response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver.

- Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- 1.3. Require its operating personnel that receive an oral two-party, person-to-person Operating Instruction to take one of the following actions:
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct.
  - Request that the issuer reissue the Operating Instruction.
- 1.4. Require its operating personnel that issue a written or oral single-party to multiple-party burst Operating Instruction to confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction.
- 1.5. Specify the instances that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.
- 1.6. Specify the nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.
- R2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall conduct initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System on the documented communications protocols developed in Requirement R1 prior to that individual operator issuing an Operating Instruction. *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- R3.** Each Distribution Provider and Generator Operator shall conduct initial training for each of its operating personnel who can receive an oral two-party, person-to-person Operating Instruction prior to that individual operator receiving an oral two-party, person-to-person Operating Instruction to either: *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall at least once every twelve (12) calendar months: *[Violation Risk Factor: Medium][Time Horizon: Operations Planning]*
- 4.1. Assess adherence to the documented communications protocols in Requirement R1 by its operating personnel that issue and receive Operating Instructions, provide feedback to those operating personnel and take corrective action, as deemed appropriate by the entity, to address deviations from the documented protocols.
- 4.2. Assess the effectiveness of its documented communications protocols in Requirement R1 for its operating personnel that issue and receive Operating Instructions and modify its documented communication protocols, as necessary.

- R5.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*
- Confirm the receiver's response if the repeated information is correct (in accordance with Requirement R6).
  - Reissue the Operating Instruction if the repeated information is incorrect or if requested by the receiver, or
  - Take an alternative action if a response is not received or if the Operating Instruction was not understood by the receiver.
- R6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that receives an oral two-party, person-to-person Operating Instruction during an Emergency, excluding written or oral single-party to multiple-party burst Operating Instructions, shall either: *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*
- Repeat, not necessarily verbatim, the Operating Instruction and receive confirmation from the issuer that the response was correct, or
  - Request that the issuer reissue the Operating Instruction.
- R7.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator that issues a written or oral single-party to multiple-party burst Operating Instruction during an Emergency shall confirm or verify that the Operating Instruction was received by at least one receiver of the Operating Instruction. *[Violation Risk Factor: High][Time Horizon: Real-time Operations]*

### C. Measures

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide its initial training records related to its documented communications protocols developed for Requirement R1 such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R2.
- M3.** Each Distribution Provider and Generator Operator shall provide its initial training records for its operating personnel such as attendance logs, agendas, learning objectives, or course materials in fulfillment of Requirement R3.
- M4.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide evidence of its assessments, including spreadsheets, logs or other evidence of feedback, findings of effectiveness and any changes made to its documented communications protocols developed for Requirement R1 in fulfillment of

Requirement R4. The entity shall provide, as part of its assessment, ~~evidence of any corrective actions taken that it took appropriate corrective actions as part of its assessment for all instances~~ where an operating personnel's non-adherence to the protocols developed in Requirement R1 is the sole or partial cause of an Emergency and for all other instances where the entity determined that it was appropriate to take a corrective action to address deviations from the documented protocols developed in Requirement R1.

- M5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issued an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence that the issuer either: 1) confirmed that the response from the recipient of the Operating Instruction was correct; 2) reissued the Operating Instruction if the repeated information was incorrect or if requested by the receiver; or 3) took an alternative action if a response was not received or if the Operating Instruction was not understood by the receiver. Such evidence could include, but is not limited to, dated and time-stamped voice recordings, or dated and time-stamped transcripts of voice recordings, or dated operator logs in fulfillment of Requirement R5.
- M6.** Each Balancing Authority, Distribution Provider, Generator Operator, and Transmission Operator that was the recipient of an oral two-party, person-to-person Operating Instruction during an Emergency, excluding oral single-party to multiple-party burst Operating Instructions, shall have evidence to show that the recipient either repeated, not necessarily verbatim, the Operating Instruction and received confirmation from the issuer that the response was correct, or requested that the issuer reissue the Operating Instruction in fulfillment of Requirement R6. Such evidence may include, but is not limited to, dated and time-stamped voice recordings (if the entity has such recordings), dated operator logs, an attestation from the issuer of the Operating Instruction, ~~voice recordings (if the entity has such recordings)~~, memos or transcripts.
- M7.** Each Balancing Authority, Reliability Coordinator and Transmission Operator that issued a written or oral single or multiple-party burst Operating Instruction during an Emergency shall provide evidence that the Operating Instruction was received by at least one receiver. Such evidence may include, but is not limited to, dated and time-stamped voice recordings (if the entity has such recordings), dated operator logs, electronic records, ~~voice recordings (if the entity has such recordings)~~, memos or transcripts.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances

where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall each keep data or evidence for each applicable Requirement for the current calendar year and one previous calendar year, with the exception of voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

### **1.3. Additional Compliance Information**

None

3	November 7, 2012	Adopted by Board of Trustees	

## Implementation Plan

### Operating Personnel Communications Protocols

#### COM-002-4

#### Standards Involved

Approval:

- COM-002-4 – Operating Personnel Communications Protocols

Retirements:

- COM-001-1.1 Requirement R4 – Telecommunications
- COM-002-2 – Communication and Coordination
- COM-002-3 – Communication and Coordination

#### Prerequisite Approvals

None

#### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

#### Operating Instruction —

A command by operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. (A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)

#### Applicable Entities

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### Conforming Changes to Other Standards

None

**Effective Date**

COM-002-4 and the definition of “Operating Instruction” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Retirement of Existing Standards:**

COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

# Implementation Plan

## Operating Personnel Communications Protocols

### COM-002-4

#### Standards Involved

Approval:

- COM-002-4 – Operating Personnel Communications Protocols

Retirements:

- COM-001-1.1 Requirement R4 – Telecommunications
- COM-002-2 – Communication and Coordination
- COM-002-3 – Communication and Coordination

#### Prerequisite Approvals

None

~~Approval of the definition of “Reliability Directive”~~

#### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

##### **Operating Instruction —**

A command by operating personnel responsible for the Real-time ~~generation control and~~ operation of the interconnected Bulk Electric System to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. ~~(A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction.)~~ ~~—A Reliability Directive is one type of an Operating Instruction.~~

#### Applicable Entities

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### Conforming Changes to Other Standards

None

**Effective Date**

COM-002-4 and the definition of “Operating Instruction” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Retirement of Existing Standards:**

COM-001-1.1 Requirement R4, COM-002-2, and COM-002-3, as applicable, shall be retired at midnight of the day immediately prior to the effective date of COM-002-4 in the particular jurisdiction in which the new standard is becoming effective.

## Standards Announcement

### Project 2007-02 Operating Personnel Communications Protocols COM-002-4

Final Ballot Now Open through April 7<sup>th</sup>, 2014

#### [Now Available](#)

A final ballot for **COM-002-4 – Operating Personnel Communications Protocols** is open through **8 p.m. Eastern on Monday, April 7<sup>th</sup>, 2014.**

Background information for this project can be found on the [project page](#).

As a result of select industry stakeholder comments, the Operating Personnel Communications Protocols Standards Drafting Team (OPCP SDT) made minor, non-substantive changes to COM-002-4 after the most recent comment and ballot period in order to clarify the OPCS SDT's intent and better align the language in the measures with the requirements. Requirement R4.1 was altered from "as appropriate" to "as deemed appropriate by the entity" in order to highlight the OPCS SDT's intent. In Measure M2 the words "its initial" were added to the sentence "shall provide its initial training records . . ." in order to align the language in Measure M2 with the language in Requirement R2. Measure M4 was altered to include the phrase "as part of its assessment" and "of any corrective actions taken" within the sentence "The entity shall provide, as part of its assessment, evidence of any corrective actions taken." Lastly, Measure M6 and M7 were changed to add the parenthetical "(if an entity has such recordings)" after the words "time-stamped recordings," and the second entry for "time-stamped recordings" was removed due to redundancy.

#### Instructions

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member does not participate in the final ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking [here](#).

## Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, the standard will be submitted to the Board of Trustees for adoption.

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Wendy Muller](#), Standards Development Administrator, or at 404-446-2560.*

## Standards Announcement

### Project 2007-02 Operating Personnel Communications Protocols COM-002-4

#### Final Ballot Results

#### [Now Available](#)

A final ballot of **COM-002-4 – Operating Personnel Communications Protocols** concluded at **8 p.m. Eastern on Monday, April 7, 2014.**

The standard achieved a quorum and received sufficient votes for approval. Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the ballot.

Ballot Results
Quorum: 78.21%
Approval: 77.62%

Background information for this project can be found on the [project page](#).

#### Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

**NERC Board of Trustees Input Responses**

## **Communication Protocols**

### **Response to NERC Board of Trustees Questions by the Independent Experts**

**Question 1.** Proposed COM-002-3 Reliability Standard provides a standard that addresses communication protocols in an emergency. Are there circumstances that are not an emergency (as defined in COM-002-3) that can lead to reliability risks if not appropriately addressed by a standard? If so, what are these circumstances and how important is it that there be a standard to address them?

**Answer 1.** Yes, there are circumstances that are not an emergency that can lead to reliability risks if the communications are not clearly understood and followed. It is for this reason that the Independent Experts believe that the Standards must address clear protocols for all circumstances. Some examples are as follows:

- Communications where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element or Facility of the Bulk Electric System can put the BES at risk if the instruction is not understood correctly. This is possible even if the BES is not currently experiencing an Emergency or an Adverse Reliability Impact. For example, the action could put the BES in an insecure state for the next contingency.
- While operators must always be aware of the consequences of actions they take, they should not be required to categorize the current situation or potential consequence as an Emergency or Adverse Reliability Impact to decide what communication protocol is appropriate. In addition, it may be clear that action is required even before the operator has determined that the BES is facing an Emergency or an Adverse Reliability Impact.
  - This confusion will remain if there are different communication protocols for actions under a Reliability Directive and other situations with the proposed definition of Operating Instruction.
- Most entities require safety related communications, such as closing a breaker, to use three-part communications regardless of the impact on the BES. Inconsistent protocols for a subset of reliability related actions can cause confusion.
- For peak human performance, communication protocols should be as consistent as possible, having no distinction between emergency and non-emergency situations.

The bottom line is that the Independent Experts believe that it is very important for the Standards to address communications protocols for non-emergency situations.

## **Communication Protocols**

### **Response to NERC Board of Trustees Questions by the Independent Experts**

**Question 2.** Does the latest draft of the COM-003-1 Reliability Standard address such circumstances appropriately? Is it a “quality standard” on the basis of the criteria that are being used to assess existing and future standards by the Independent Experts Panel?

**Answer 2.** As written, COM 003-1 Draft 6 does not address non-emergency communication appropriately since it allows for the development of non-consistent communication protocols across RCs as well as providing for a difference in communication protocols between emergency and non-emergency conditions.

- Non-consistent communication protocols can hinder coordination between adjacent RCs, as well as the TOPs and BAs in their respective RC footprints, thus negatively impacting reliable operations
- The current COM-003-1 as drafted does not align with IRO-014-1, IRO-015-1 and IRO-016-1, which require coordination between RCs, as adjacent RCs could have different communication protocols.
- FERC Order 693 P. 532 determined “We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions.”
- Providing for a difference in protocol between emergency and non-emergency conditions creates a situation where an Operator must not only focus on what they are saying but also must make a decision as to what is the appropriate communication protocol to use.
- COM 003-1 R2 and R3 do not support a reliability objective; rather they only serve to mitigate compliance risk.

The Independent Experts scoring and comments are in Attachment 2. We find that COM 003-1 draft 6 is not a “quality standard”. Requirement 1 received a content score of zero out of three and a quality score of 7 out of 12. Requirements 2 and 3 should be deleted. The key deficiencies are as described above.

**Question 3.** Are there changes you would recommend to improve the current draft of the COM-003-1 Reliability Standard? Describe how the enhancements would address any gaps in bulk-power system reliability.

**Answer 3.** Following is a summary of our recommendations for COM-002-2, COM-002-3 and COM-003-1. Example language for an improved combined COM standard is in Attachment 1.

While the recommendations below allow situations where three-part

## Communication Protocols

### Response to NERC Board of Trustees Questions by the Independent Experts

communications is not required we believe this will not cause confusion. The distinction between an Operating Instruction and other communications such as discussion of alternatives or providing information where no action is to be taken should be clear.

- There should be only one communications protocol standard that covers both emergency and non-emergency situations.
  - **Combine COM-002-2, COM-002-3 and COM-003-1.**
- To the greatest extent practical the standard should provide for a **consistent continent-wide set of communications protocol.**
  - One exception would be the time zone for verbal and written operating communications.
- Expand applicability of COM 003-1 draft 6 to include GOs and TOs.
- Retire the term Reliability Directive in the Glossary of Terms<sup>1</sup>.
  - Develop a new Glossary definition for **Operating Instruction:**  
*Communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.*
- **Describe the attributes of three-part communications.**
- Address other communications protocols (see Attachment 1).
- Matters used to demonstrate compliance or to mitigate compliance risk should not be a Requirement in the Standard but should instead be provided elsewhere in the Standard.
- **This Standard is a candidate for an internal controls compliance assessment pilot project where corrected deficiencies are not necessarily reported as violations.**
- Some versions of COM-003-1 addressed "all call" or "blast" messages. We believe that the requirement for three-part communications should only apply to communications between two parties. It is not practical to have responses to "all call" or "blast" messages.

**Question 4.** Should the proposed COM-002-3 Reliability Standard approved by the Board be rescinded and a new standard developed that addresses communications during both emergency and non-emergency conditions? If so, what key issues would

---

<sup>1</sup> Retirement of the term Reliability Directive will require minor, non-substantive edits to IRO-001-3, TOP-001-1 and TOP-001-2.

## **Communication Protocols**

### **Response to NERC Board of Trustees Questions by the Independent Experts**

it address, including an appropriate definition of “non-emergency conditions”?

**Answer 4.** Yes. The Independent Experts recommend that COM-002-2, COM-002-3 and COM-003-1 be combined to address both emergency and non-emergency conditions. As proposed by the Independent Experts there is no need to specifically define “non-emergency conditions.” Please see detailed recommendations in response to Question 3.

**Question 5.** Do you have any additional input regarding the development of the COM-003-1 Reliability Standard for the Board to consider in its deliberations on next steps?

**Answer 5.** The Independent Experts considered whether communication protocols could be managed by the use of a guideline, but determined that a guideline is not appropriate because:

- 3-part communications and other uniform communication protocols are crucial to maintain reliability when the state of the system is changed or maintained; and
- while 3-part communication and other uniform communication protocols are typically used today, they are not uniformly applied. A guideline would not ensure application; and
- a guideline would not fulfill the FERC directives in Order No. 693.

After reviewing responses to the five questions, the Independent Experts are recommending the Board should rescind approval of COM-002-3 and direct a redraft to combine COM-002-2, COM-002-3 and COM-003-1. Given the disparate views that have delayed completion of this work the Board should describe the expected attributes of a revised Standard and set a limited timeline for bringing the revised Standard to the Board for approval.

The Independent Experts also recommend that internal controls become the cornerstone for compliance assessment of a combined COM standard but should not be a Requirement in the Standard. The level and method for internal controls is left to the entity’s discretion but would be a good candidate for a guideline. Controls might include:

- Implementing a training program;
- Implementing a management process to periodically verify performance; and
- Taking corrective actions when needed in a timely manner.

The more effective an entity’s controls, the more benefit can be realized by the entity during compliance assessment. Therefore, the Experts recommend that this standard become the FERC-approved pilot for risk-based compliance monitoring. In

## **Communication Protocols**

### **Response to NERC Board of Trustees Questions by the Independent Experts**

this pilot, a determination of whether a possible violation (PV) would be assessed would be based on consideration of an entity's internal controls, as described below. Consideration of internal controls and internal compliance programs are basic auditing concepts and principles designed to be forward-looking. These concepts follow the Government Auditing Standards.<sup>2</sup>

Under this compliance assessment method, not all acts of non-compliance with the Requirements are reported as possible violations or violations. This transfers focus to accomplishing the reliability related task of providing clear, accurate communications and eliminates compliance concerns regarding zero-defect tolerance. While details should be provided in the NERC petition that reflect the Reliability Assurance Initiative (RAI) effort, high level concepts include:

- Compliance Enforcement Authorities' (CEAs) would communicate with an entity to understand the entity's internal controls.
- The level of evidence review (sample size) would be determined by the strength of an entity's internal controls and would be drawn from recent communications.
- Where non-compliant communications were in the gathered samples, the CEA would see if the entity's internal controls had identified the root cause of the non-compliance and whether the entity had taken corrective action to address the cause. If so, the CEA would note the non-compliance and verify that improved internal controls to prevent this cause were effective at the next compliance assessment. No PV would be assessed.
- Where non-compliant communications were not addressed, were prevalent or systemic, or were addressed but improved internal controls were not able to prevent recurrence, a PV would be assessed.

Again, this compliance assessment method would be detailed and included for FERC approval in the NERC petition for this standard.

---

**Attachment 1**  
**Example Requirements for Combined COM Standard**

Applicable Functional Entities:

Reliability Coordinator  
Balancing Authority  
Transmission Operator  
Generator Operator\*  
Distribution Provider\*  
Transmission Owner\*  
Generator Owner\*

\*These functional entities are to be subject to this Standard for communication protocols regarding BES Elements and Facilities, but there is no requirement for these entities to be certified under PER-003, and applicability to this standard is not intended to suggest otherwise. For Distribution Providers this Standard only applies to communication protocols regarding UVLS, UFLS and load shedding equipment.

Revise Definition:

**Operating Instruction** — Communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

**R1.** Each Applicable Functional Entity shall use the following three-part protocol when communicating an Operating Instruction internally or externally:

**1.1.** The issuer states an Operating Instruction.

**1.2.** The receiver of an Operating Instruction shall take one of the following actions:

**1.2.1.** Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.

**1.2.2.** Request that the issuer reissue the Operating Instruction.

**1.3.** The issuer shall wait for a response from the receiver. After the response is received, or if no response is received, the issuer shall take one of the following actions:

**1.3.1.** Confirm the receiver's response if the repeated information is correct (not necessarily verbatim).

**1.3.2.** Reissue the Operating Instruction if the repeated information is incorrect or if the receiver does not issue a response.

**1.3.3.** Reissue the Operating Instruction if requested by the receiver.

- R2.** Each Applicable Functional Entity shall use the following protocols when communicating an Operating Instruction internally or externally:
- 2.1.** Use the English language for all communications between and among operating personnel responsible for the real-time control and operation of the interconnected Bulk Electric System unless otherwise required by law or regulation.
  - 2.2.** Use the 24-hour clock format when referring to clock times.
  - 2.3.** To the extent that a common time zone is not in use for each of the three interconnections – Eastern, Western and ERCOT, every communication that includes a clock time shall include the time zone.
  - 2.4.** Use common nomenclature of interface Elements and/or Facilities.
  - 2.5.** Use NATO or other alpha-numeric clarifiers when issuing an oral Operating Instruction in instances where the nomenclature of Facilities or Elements are in alpha-numeric format (e.g. a circuit breaker designated as “12B”).

## Attachment 2 Independent Experts Score for COM 003-1 draft 6

Standard Number	Req Number	Text of Requirement <i>(If text is incomplete, please see entire requirement posted on NERC.com)</i>	Passed the Reliability Principle test?	Passed the Para 81 or Guide test?	Content Score 0-3	Quality Score 0-12	IE top 16 priority standards to improve	Identified as one of the key impactful requirements (high is whatever top #)
COM-003-1	R1	R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator, in each Reliability Coordinator area, shall develop, subject to the Reliability Coordinator's approval, documented communication protocols for the issuance of Operating Instructions in that Reliability Coordinator's area.  The documented communication protocols will address, where applicable, the following:  The use of the English language when issuing or responding to an oral or written Operating Instruction, unless another language is mandated by law or regulation.  The instances, if any, that require time identification when issuing an oral or written Operating Instruction and the format for that time identification.  The nomenclature for Transmission interface Elements and Transmission interface Facilities when issuing an oral or written Operating Instruction.  The instances, if any, where alpha-numeric clarifiers are necessary when issuing an oral Operating Instruction and the format for those clarifiers.  The instances where the issuer of an oral two party, person-to-person Operating Instruction requires the receiver to repeat, restate, rephrase, or recapitulate the Operating Instruction and the issuer to:  Confirm that the response from the recipient of the Operating Instruction was accurate; or  Reissue the Operating Instruction to resolve a misunderstanding.	Yes	Yes	0	7	Yes	High
COM-003-1	R2	Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement its communication protocols developed in Requirement R1 so that the failure to use the protocols by the issuer of an Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.	No					N/A
COM-003-1	R3	Each Balancing Authority, Transmission Operator, Generator Operator and Distribution Provider shall repeat, restate, rephrase, or recapitulate an Operating Instruction when required by the issuer of an Operating Instruction in its communication protocols developed in Requirement R1 so that the failure to repeat, restate, rephrase, or recapitulate the Operating Instruction does not result in an operating condition that requires the issuance of a Reliability Directive by the original issuer of the Operating Instruction or by another Balancing Authority, Reliability Coordinator, or Transmission Operator.	No					N/A

### Independent Experts Content Score Details for COM 003-1 draft 6

Standard Number	Req Number	Supports a Reliability Objective (as defined by the Reliability Principles) (Yes/No/Maybe)	Para 81 Retire requirement?	Appropriate as a guide rather than a standard?	Is everything covered?	Are the correct Functional Entities Identified?	Does the content seem to be technically correct? (Including correct level of actions for accountability - Who, What, When)	Passed the Reliability Principle test?	Passed the Para 81 or Guide test?	Content Score 0-3
COM-003-1	R1	Yes - #1, 3	No	No	No - this should cover both emergency and Normal communications. *Protocols should not be unique to each RC; there should be continent wide consistency for the protocols. These protocols should be identified in the standard. (supported by FERC Order No. 693 P.532). *Protocols need to be strengthened/tightened - see answers to questions. **"All-calls" should be addressed in the requirement separate from 3-part communication. *3-part communication should be used whenever an RC, TO or BA requests action to be taken on the system (BPS), regardless of whether it is identified as a Reliability Directive.	No - If standard was drafted appropriately, this requirement would lay out the protocols and all of the applicable entities would be subject to them. Currently, only the BA, DPs, GOP, RC and TOP are subject to the standard. The GO and TO functional entities should also be included.	No - this should cover both emergency and Normal communications. *Protocols should not be unique to each RC; there should be continent wide consistency for the protocols. These protocols should be identified in the standard. (supported by FERC Order No. 693 P.532). *Protocols need to be strengthened/tightened - see answers to questions. **"All-calls" should be addressed in the requirement separate from 3-part communication. *3-part communication should be used whenever an RC, TO or BA requests action to be taken on the system (BPS), regardless of whether it is identified as a Reliability Directive.	Yes	Yes	0
COM-003-1	R2	No - this requirement only serves to mitigate compliance risk						No		
COM-003-1	R3	No - this requirement only serves to mitigate compliance risk						No		

### Independent Experts Quality Score Details for COM 003-1 draft 6

Standard Number	Req Number	Should it be kept as it is and not consolidated with other standards or requirements?	Is it RBS format? Drafted as one of these requirement types: Performance, Risk-based (preventative), Capability, & Format for subparts	Is it technology neutral? (Yes/No)	Applicability - are the expectations for each function clear?	Does the requirement align with the Purpose?	Is it a higher solution than the lowest common denominator (considering cost)?	Measurability	Technical basis in engineering and operations	Complete? Self-contained	Clear language? Is RRO clarified?	Can it be practically implemented?	Consistent Terminology	Quality Score 0-12
COM-003-1	R1	No - should be collapsed with COM-002-3	Yes	Yes	Yes	No - this requirements does not reduce the possibility of miscommunications; it increases the possibility of miscommunications	No - however it would be lower if there were no protocols	Yes	No - will allow for inconsistent protocols that may hinder communications	Yes	Yes	No - conflicts with IRO-014-1, IRO-015-1 and IRO-016-1 (which may be retired under pending standards (IRO-014-2))	Yes	7

Fred Gorbet, Chair  
NERC Board of Trustees

Gerry Cauley, President and CEO  
NERC

Gentlemen,

At the August 2013 Board of Trustees meeting, the Reliability Issues Steering Committee (RISC) was asked by the Board to provide answers to a series of questions related to Operating Personnel Communication Protocols – COM-003-1. The RISC provides the responses below.

Please reach out to me if you have any questions or concerns.

Sincerely,

*Chris Schwab*

Chair, Reliability Issues Steering Committee

cc: RISC Members

3353 Peachtree Road NE

**RISC Response to Questions from the  
August 15, 2013, NERC Board of Trustees Resolution regarding  
Operating Personnel Communication Protocols – COM-003-1**

**Question 1.**

Proposed COM-002-3 Reliability Standard provides a standard that addresses communication protocols in an emergency. Are there circumstances that are not an emergency (as defined in COM-002-3) that can lead to reliability risks if not appropriately addressed by a standard? If so, what are these circumstances and how important is it that there be a standard to address them?

**Response:**

Yes, there is a category of non-emergency circumstances that could possibly lead to a reliability risk. Some such circumstances could include the switching of bulk electric system facilities (e.g., capacitor banks, etc.), manual ramp-up or ramp-down of generation, and oral alerts. However, the RISC believes that such categorization should be defined by the Operating Committee, as they have the greatest amount of experience and knowledge in this area.

In the ten years since the 2003 Northeast Blackout, much progress has been made in the area of communications. The “Arizona-Southern California Outages on September 8, 2011” report cited 27 causes and recommendations; ineffective or confusing non-emergency communications was not listed as a cause. Similarly, the “Report on Outages and Curtailments During the Southwest Cold Weather Event of February 1-5, 2011” listed 26 Key Findings and Recommendations for the electric industry, none of which included ineffective or confusing non-emergency communications.

Additionally, it appears that NERC event analysis data has not yielded evidence of a reliability gap regarding non-emergency communication as a contributing factor to bulk electric system events.

The RISC suggests that the Operating Committee should be tasked with defining the non-emergency circumstances that can lead to a reliability risk that threatens the BES. This activity should be based on review of available data and the application of the expertise and knowledge of the Operating Committee.

While the RISC recognizes there is limited empirical data indicating that communication errors in non-emergency situations have led to reliability problems, the RISC believes a standard will be developed in response to this concern. The RISC believes it is critical that the standard be developed based on the risk to reliability associated with whatever special circumstances are identified.

**Question 2.**

Does the latest draft of the COM-003-1 Reliability Standard address such circumstances appropriately? Is it a “quality standard” on the basis of the criteria that are being used to assess existing and future standards by the Independent Experts Panel?

**Response:**

The COM-003-1 standard does address such circumstances, but may not do so at an appropriate level of prescription, and does not represent a quality standard.

Any standard that is developed should include requirements that are results-based, minimize disruptive administrative requirements, and be complementary to any other methods used for addressing system operator communication.

**Question 3.**

Are there changes you would recommend to improve the current draft of the COM-003-1 Reliability Standard? Describe how the enhancements would address any gaps in bulk-power system reliability.

**Response:**

Please see our answer to question 5.

**Question 4.**

Should the proposed COM-002-3 Reliability Standard approved by the Board be rescinded and a new standard developed that addresses communications during both emergency and non-emergency conditions? If so, what key issues would it address, including an appropriate definition of “non-emergency conditions”?

**Response:**

The RISC does not recommend the Board rescind its approval of the proposed COM-002-3. The RISC does recommend the immediate filing of the COM-002-3 standard, as well as the COM-002-2 Interpretation, since both will improve reliability of the BES. As work on COM-003-1 progresses, it is critical that it be complementary to COM-002-3, and that there are clear delineations between emergency and non-emergency communications and the associated obligations created by the standard.

**Question 5.**

Do you have any additional input regarding the development of the COM-003-1 Reliability Standard for the Board to consider in its deliberations on next steps?

**Response:**

The RISC offers the following guiding principles in the development of a COM-003-1 standard:

- A risk-informed process should be used to define a risk-based standard. The standard should be drafted based on expert opinion and data to recognize the differing risks of the categories defined by the OC in which a failure to communicate clearly during non-emergency circumstances could possibly lead to a threat to the BES.
  - For those categories that present the greater risk, it is appropriate to be more prescriptive and more uniform within and across regions and reliability coordination areas.
  - For those categories that present less risk, it is appropriate to allow more flexibility.
- The enforcement regime for such a standard cannot be zero-tolerance. Focus should be on the quality of an entity's communication protocols, the quality of their associated training, and how the entity ensures their protocols are followed.
- There must be clear delineations between emergency and non-emergency communications and the associated obligations created by the standards.
- The standard should not address protocols for electronic pulsing for Automatic Generation Control or electronically delivered alerts.

**NERC Management Response to  
the Questions of the NERC Board of Trustees  
on Reliability Standard COM-003-1**

September 6, 2013

At the August 14-15, 2013 meeting of the Board of Trustees (“Board”) of the North American Electric Reliability Corporation (“NERC”), the Board considered action on Agenda Item 7a: Operating Personnel Communication Protocols – COM-003-1 to discuss next steps for the development of a Reliability Standard<sup>1</sup> to respond to the Federal Energy Regulatory Commission’s (“FERC”) directives in Order No. 693 concerning communications. On August 15th, the Board passed a resolution to consider at its next meeting how best to act with respect to: (1) the disposition of the Board-approved interpretation of the currently effective COM-002-2 Reliability Standard; (2) the Board-approved COM-002-3 Reliability Standard; and (3) the draft COM-003-1 Reliability Standard, including whether to exercise the authority the Board has with respect to actions it can take under Section 321 of the NERC Rules of Procedure.

The Board directed NERC’s Reliability Issues Steering Committee, the Independent Experts Review Panel, and NERC management to respond to certain questions related to the draft COM-003-1 Reliability Standard. The following is NERC management’s responses to the questions posed in the Board resolution.

**Question 1**

Proposed COM-002-3 Reliability Standard provides a standard that addresses communication protocols in an emergency. Are there circumstances that are not an emergency (as defined in COM-002-3) that can lead to reliability risks if not appropriately addressed by a standard? If so, what are these circumstances and how important is it that there be a standard to address them?

**NERC Management Response**

Yes, there are non-emergency circumstances that can lead to reliability risks not covered by the proposed COM-002-3 Reliability Standard that need to be addressed in a mandatory and enforceable Reliability Standard.

For example, miscommunication by operating personnel could result in switching errors during routine switching of Bulk Electric System Elements, which could jeopardize the reliable operation of the Bulk Electric System. Examples of incorrect switching include opening or closing the wrong Bulk Electric System Element. This incorrect switching could directly cause or exacerbate a serious reliability impact. Additionally, switching often involves enabling or disabling protective relaying on Bulk Electric System Elements. If this action is not performed

---

<sup>1</sup> Unless otherwise designated, all capitalized terms shall have the meaning set forth in the *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”), available at [http://www.nerc.com/files/Glossary\\_of\\_Terms.pdf](http://www.nerc.com/files/Glossary_of_Terms.pdf).

correctly, the system may be left in a vulnerable state where a future action or system condition could place the Bulk Electric System in an Emergency or result in an Adverse Reliability Impact.

Ineffective communications during non-emergency conditions could also lead to a lack of situational awareness for system operators of adjacent systems. This lack of situational awareness could result in a system operator expecting the Bulk Electric System to be in a certain configuration to take action on its system that could place the Bulk Electric System in an Emergency or could have an Adverse Reliability Impact. In fact, a lack of situational awareness was cited as a common factor in several events that contributed to the August 14, 2003 electric power blackout in large portions of the Midwest and Northeast United States and Ontario, Canada (“2003 Blackout”).<sup>2</sup> The 2003 Blackout report noted:

*“Under normal conditions, parties with reliability responsibility need to communicate important and prioritized information to each other in a timely way, to help preserve the integrity of the grid. This is especially important in emergencies. During emergencies, operators should be relieved of duties unrelated to preserving the grid. A common factor in several of the events described above was that information about outages occurring in one system was not provided to neighboring systems.”*<sup>3</sup>

The report continues, in the context of Recommendation 26, that on the date of the blackout, Reliability Coordinator and control area communications regarding conditions in northeastern Ohio were, in some cases, ineffective, unprofessional, and confusing.<sup>4</sup> Such communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade.<sup>5</sup> The 2003 Blackout Report notes that consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.<sup>6</sup> Furthermore, the need to tighten communications protocols and improve communications systems was raised by several commenters in response to the interim blackout report.

Regardless of whether the circumstance is an emergency or non-emergency, any communication that directs a system operator to change or preserve the current state of the Bulk Electric System has the potential to create a reliability risk. For this reason, it is appropriate and necessary to develop a Reliability Standard that defines the communication expectations in both emergency and non-emergency circumstances.<sup>7</sup> Unlike a voluntary guideline, a mandatory and enforceable standard would allow the ERO to hold entities accountable for their communications

---

<sup>2</sup> See U.S.-Canada Power System Outage Task Force, *Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations*, available at <http://www.nerc.com/pa/trm/ea/Pages/Blackout-August-2003.aspx>.

<sup>3</sup> *Id.* at 109 (emphasis added).

<sup>4</sup> *Id.* at 161.

<sup>5</sup> *Id.*

<sup>6</sup> *Id.*

<sup>7</sup> In 2012, the Operating Committee recognized the need to provide guidance for utilities when developing a System Operator verbal communications program. This document provides a general framework to assist entities in identifying the concepts and steps to consider when developing an effective System Operator verbal communications program. However, the use of the concepts presented in the document is strictly voluntary.

and would allow the ERO to assure that entities are meeting expectations for effective communications. However, it is not necessary to develop a mandatory and enforceable Reliability Standard to define protocols for communication for all circumstances. For example, discussions between system operators of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns, while important and valuable, do not necessitate coverage by a mandatory and enforceable Reliability Standard.

The following examples of actual events are provided to support the need to develop a Reliability Standard that covers circumstances that are emergencies and non-emergencies:

<b>Desired Action</b>	<b>Communication</b>	<b>Response</b>	<b>Consequence</b>	<b>Impact to Reliability</b>
Deploy Reserve Capacity	All call executed. No clarity in directive for action.	No response (no verbal response and no specific actions taken by all call recipients)	All call repeated six minutes later with clarity and acknowledgment.	Frequency recovery significantly delayed until corrective actions were implemented
Alleviate overloads	TOP and TO discussed options to alleviate overloads in area. No directive was actually given with a resulting delay in executing relief actions.	No specific actions taken because of confusion or lack of understanding.	Operators' communications lacked clarity and directness, which led to delays in executing the appropriate course of action. Action items were not summarized at the end of the discussions, leading to confusion over what appropriate actions were to be taken.	Emergency rating on a transmission line was exceeded for 3 hours and 5 minutes.
Shared Recognition of System Conditions	The RC attempts to ensure that identification of an abnormal condition is communicated to all system operators without delay.	Vital information was not exchanged.	The communications problems exacerbated the Event, because TOP was unable to take timely corrective action internally and in coordination with other entities.	Establishment of a shared understanding of system conditions delayed restoration.

All of these examples included communications that directed a system operator to change or preserve the current state of the Bulk Electric System. While the first example included

communications that would have been covered under COM-002-3, the last two examples included some communications that would not have been covered under COM-002-3, but would be covered under the proposed COM-003-1 standard.

## **Question 2**

Does the latest draft of the COM-003-1 Reliability Standard address such circumstances appropriately? Is it a “quality standard” on the basis of the criteria that are being used to assess existing and future standards by the Independent Experts Panel?

## **NERC Management Response**

Yes, the latest draft of the COM-003-1 standard does attempt to address the circumstances described above, but it is not a “quality standard.”

The current draft of COM-003-1 addresses non-emergency communications by requiring recipients to follow commands that change or preserve the state, status, output, or input of an Element of the Bulk Electric System (i.e., Operating Instructions). Therefore, in combination with COM-002-3, which covers communications during emergencies, the current draft of COM-003-1 technically addresses the communications of concern as described in the answer to Question 1.

However, the latest draft of COM-003-1 is not a “quality standard.” While Requirement R1 does meet some of the quality criteria defined by the Independent Experts Panel, the Requirement is deficient because it does not include a baseline set of protocols for both emergency and non-emergency conditions. Requirements R2 and R3 are confusing and appear to only mitigate compliance risk for applicable entities. Attachment 1 provides an analysis by NERC management of the requirements included in the latest draft of the COM-003-1 standard using the criteria established by the Independent Experts Panel. In short, NERC management’s analysis finds that: (1) the expectations for each function are not clear; (2) the requirements do not align with the purpose of the Reliability Standard; and (3) the Reliability Standard represents a “lowest common denominator”<sup>8</sup> standard.

The current draft of COM-003-1 is also not a quality standard because it:

- 1. Artificially distinguishes “Operating Instructions” from “Reliability Directives” to separate the protocols from those in COM-002-3.** This separation gives the appearance that three-part communications is the only protocol necessary for Reliability Directives, while several more protocols are necessary for Operating Instructions. It is as

---

<sup>8</sup> Earlier versions of the draft COM-003-1 standard more appropriately addressed the circumstances identified in the response to Question 1 (Drafts 1-4). Prior drafts established mandatory uniform communication protocols for use in emergency and non-emergency situations. Later drafts shifted from that approach in response to industry comments focused on mitigating compliance risk. The standard drafting team, in performing their responsibility, made modifications to the standard in an attempt to achieve ballot body consensus while attempting to maintain essential communication protocols.

important, if not more important, that common communications protocols be used for emergency communications. Taking time to clearly delineate when a Reliability Directive is issued and differs from an Operating Instruction also may not be a practical exercise during a real-time situation.

- 2. Does not strike the proper balance between prescriptiveness and flexibility to establish communication protocols.** COM-003-1 requires entities to self-define the conditions for which they apply the protocols in Requirement R1 of COM-003-1, including when three-part communication is necessary. This preserves avenues for potential miscommunication between parties by not creating a clear baseline of required protocols for communications.
- 3. Creates a reverse incentive to issue emergency directives by connecting compliance risk in COM-003-1 to the issuance of Reliability Directives in COM-002.** This connection between compliance risk in COM-003-1 and the issuance of Reliability Directives in COM-002-3 creates an incentive to not issue a Reliability Directive to take emergency action in order to avoid compliance risk under COM-003-1. This connection should be removed to eliminate the reverse incentive.
- 4. Requires approval of communications protocols by the Reliability Coordinator.** The current draft of COM-003-1 makes communications protocols subject to the approval of the Reliability Coordinator. The Reliability Coordinator should not have the responsibility or the authority to determine third-party protocols. Either the entity should have the ability to determine the necessary protocols, or the Reliability Standard should state the protocols.

### Question 3

Are there changes you would recommend to improve the current draft of the COM-003-1 Reliability Standard? Describe how the enhancements would address any gaps in bulk-power system reliability.

### NERC Management Response

Yes, NERC management recommends combining the proposed COM-002-3 and COM-003-1 standards to provide a single standard to address communications protocols for emergency and non-emergency operations. A recommended draft standard is included in Attachment 2. At a minimum, the standard should:

- Require the use of established communications protocols for operations to be used in both non-emergency and emergency operations;
- Require certain baseline protocols to be used by all entities;<sup>9</sup>

---

<sup>9</sup> These protocols must include the use of the English language for all communications in order to retire a similar requirement that remains in COM-001 that is not reflected in the Board-approved proposed Reliability Standard COM-001-2. This issue was specifically deferred to the proposed COM-003-1 Reliability Standard.

- Require that the communications procedure be implemented;
- Require training of system operators on the communications procedure and demonstrate evidence of that training; and
- Specify a process to review communications with system operators and provide feedback on adherence to the communication protocols and identify any necessary changes to the protocols.

Also, the definition of Operating Instruction should be modified to encompass Reliability Directives. Merging the definitions eliminates the ambiguity inherent in attempting to clearly define what classifies as an Operating Instruction and what necessitates the issuance of a Reliability Directive during real-time conditions. As noted above, these two definitions are currently artificially distinguished in the current proposed COM-003-1 and COM-002-3. With this modification, COM-002-3 and COM-003-1 can be combined into a single standard to cover emergency and non-emergency communications.

Additionally, entities should be accountable for incorrect use of communication protocols in connection with a Reliability Directive, without exception. For all other Operating Instructions, compliance should be measured using standard audit practices. During an audit, an entity should present the method they used to sample communications to determine the effectiveness of their communication. They should also show how they document and determine the level of corrective actions in connection with the deficiencies that are identified, and ensure that operators are consistent in their application of protocols. This approach will provide the reasonable assurance that, while occasional non-emergency communications may not always follow every protocol, operators are proficient in the protocol use.

#### **Question 4**

Should the proposed COM-002-3 Reliability Standard approved by the Board be rescinded and a new standard developed that addresses communications during both emergency and non-emergency conditions? If so, what key issues would it address, including an appropriate definition of “non-emergency conditions”?

#### **NERC Management Response**

Yes, the Board of Trustees should withdraw its approval of proposed Reliability Standard COM-002-3. NERC management recommends the drafting of a single standard that addresses communication during emergency and non-emergency operations. This would provide a holistic approach to creating communication protocols. The key elements of a single combined standard have already been identified in the response to Question 3. Withdrawing approval of COM-002-3 will allow the combined standard to cover issues such as protocols related to use of one-way

burst messaging systems (i.e., all-calls) that are currently not reflected in the COM-002-3 Reliability Standard.<sup>10</sup>

Withdrawing approval of COM-002-3 would also allow for any adjustments to COM-002-3 needed to prevent conflict between the final language of a COM-003-1 Reliability Standard and COM-002-3 should the standards remain separate. Otherwise, any further development of a COM-003-1 standard will face the same difficulty the current standard drafting team encountered working with the approved language in COM-002-3 to craft a complimentary COM-003-1.

### **Question 5**

Do you have any additional input regarding the development of the COM-003-1 Reliability Standard for the Board to consider in its deliberations on next steps?

### **NERC Management Response**

Yes, additional input for the Board's consideration on the interpretation of COM-002-2 and compliance concerns related to the development of COM-003-1 is provided below.

First, NERC management recommends holding the filing of the interpretation of COM-002-2 until development of a standard covering both emergency and non-emergency conditions is completed. By submitting the interpretation, NERC places the issue of the proper scope of COM-002-2 before FERC for decision prior to the completion of further development work, which could impact the development of a single communications standard. The issue raised in the interpretation should instead be addressed through an appropriately scoped single standard proposed for FERC approval. Similarly, if the Board does not withdraw approval of COM-002-3, NERC management also recommends holding the filing of COM-002-3 so that FERC will consider COM-002-3 along with the proposed COM-003-1 standard to reduce the risk of a remand of COM-002-3.

Second, concerns over creating an operational and compliance environment that requires mining of hundreds, thousands or millions of routine/normal communications to prove compliance or make a finding of reasonable assurance of compliance was consistently cited in comments to all drafts of COM-003-1. NERC plans to address this issue in the compliance section of the standard and in development of the RSAW concurrently with development of the standard.

---

<sup>10</sup> The standard drafting team for proposed COM-002-3 deferred the issue of protocols related to use of one-way burst messaging systems (i.e. all-calls) to the COM-003-1 Reliability Standard. All-calls can be calls initiated by one party to multiple parties where the receiving parties are in a "listen only" mode. All-calls of this nature cannot be used with a requirement for the use of three-part communication procedures specified in COM-002-3. During development of COM-003-1, NERC received a number of comments that the introduction of protocols for all-calls would create a conflict between the requirement in COM-002-3 to use three-part communication and the specific protocols for all-calls developed in COM-003-1. The result is a lack of protocols for all-calls in both standards.

**NERC Management Analysis of COM-003-1 Draft 6 Using Independent Experts Panel Criteria**

Requirement Number	Should it be kept as it is and not consolidated with other standards/requirements?	Is it RBS format? Drafted as one of these requirement types: Performance, Risk-based (preventative), Capability, & Format for subparts	Is it technology neutral? (Yes/No)	Applicability - are the expectations for each function clear?	Does the requirement align with the Purpose?	Is it a higher solution than the lowest common denominator (considering cost)?
R1	No - should be collapsed with COM-002-3	Yes	Yes	Yes	No	No
R2	No	Yes	Yes	No	No	No
R3	No	Yes	Yes	No	No	No

Requirement Number	Measurability	Technical basis in engineering and operations	Complete? Self-contained	Clear language? Is RRO clarified?	Can it be practically implemented?	Consistent Terminology	Quality Score 0-12
R1	Yes	No	Yes	Yes	Yes	Yes	8
R2	Yes	No	Yes	No	Yes	Yes	6
R3	Yes	No	Yes	No	Yes	Yes	6

## **Attachment 2**

### **Sample Requirements for a Communication Standard for Non-emergency and Emergency Operations**

Operating Instruction — A command by operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. A discussion of general information and of potential options or alternatives to resolve Bulk Electric System operating concerns is not a command and is not considered an Operating Instruction. A Reliability Directive is one form of an Operating Instruction.

While Distribution Provider is listed below, the standard would only be applicable to Distribution Providers that operate Bulk Electric System Elements (e.g. under frequency load shedding and under voltage load shedding).

- R1.** Each Balancing Authority, Distribution Provider, Reliability Coordinator, and Transmission Operator shall develop one or more written communications protocols. The protocols must: [*Violation Risk Factor: Low*][*Time Horizon: Long-term Planning*]
- 1.1.** Require the use of the English language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System, unless agreed to otherwise. An alternate language may be used for internal operations.
  - 1.2.** Require the issuer of an oral two party, person-to-person Operating Instruction to wait for a response from the receiver. After the response is received, or if no response is received, require the issuer to take one of the following actions:
    - Confirm the receiver's response if the repeated information is correct.
    - Reissue the Operating Instruction if the repeated information is incorrect or if the receiver does not issue a response.
    - Reissue the Operating Communication if requested by the receiver.
  - 1.3.** Require the receiver of an oral two party, person-to-person Operating Instruction to take one of the following actions:
    - Repeat the Operating Instruction and wait for confirmation from the issuer that the repetition was correct.
    - Request that the issuer reissue the Operating Instruction.
  - 1.4.** Require the issuer of an oral Operating Instruction to verbally or electronically confirm receipt from one or more receiving parties when issuing the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all-call system).
  - 1.5.** Require the receiver of an oral Operating Instruction to request clarification from the initiator if the communication is not understood when receiving the Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all-call system).
  - 1.6.** Include other communications protocols as deemed necessary by the entity.
- R2.** Each Balancing Authority, Distribution Provider, Reliability Coordinator, and Transmission Operator shall implement the written communications protocols developed in Requirement R1. [*Violation Risk Factor: High*][*Time Horizon: Real-time Operations*]
- R3.** Each Balancing Authority, Distribution Provider, Reliability Coordinator, and Transmission Operator shall train their operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System on their

written communications protocols specified in Requirement R1. *[Violation Risk Factor: Low][Time Horizon: Long-term Planning]*

- R4.** Each Balancing Authority, Distribution Provider, Reliability Coordinator, and Transmission Operator shall implement a method to review communications with their operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System that provides feedback on adherence to the documented communication protocols specified in Requirement R1. *[Violation Risk Factor: Low][Time Horizon: Real-time Operations]*
- R5.** Each Balancing Authority, Distribution Provider, Reliability Coordinator, and Transmission Operator shall implement a method for evaluating the documented communication protocols specified in Requirement R1 that: *[Violation Risk Factor: Low][Time Horizon: Real-time Operations]*
- 5.1.** Performs ongoing assessments of adherence to the documented communication protocols,
  - 5.2.** Evaluates the effectiveness of the documented communication protocols, and
  - 5.3.** Provides feedback to improve the effectiveness of operator communication, which may include the addition of communication protocols.

September 23, 2013

Mr. Fred Gorbet  
Chairman  
NERC Board of Trustees

RE: Operating Committee Response to COM-003-1 Reliability Standard

Dear Mr. Gorbet:

At the August 15, 2013 NERC Board of Trustees (Board) meeting, the NERC Operating Committee (OC) was directed to review the responses from the Reliability Issues Steering Committee (RISC), the Independent Experts Review Panel and NERC management to five questions pertaining to the draft COM-003-1 Reliability Standard. These were included in the NERC OC meeting material for the committee to review in preparation for the meeting discussion. Armed with this information, the OC reviewed and discussed the five questions at their September 17-18, 2013 meeting. Following are the NERC OC's perspectives and thoughts on the five questions answered.

Clear communication is important for the reliable operation of the system in both normal and emergency conditions. As such, the OC believes that incentives are currently in place and three-part communications are currently being used for many operational communications. The need for clear communications is not something new, it has always been vital for safe operations to protect utility personnel, the public, and assets, as well as for ensuring reliable operations. In recognition of this need, the OC created Reliability Guideline: System Operator Verbal Communications - Current Industry Practices. The purpose of this reliability guideline is "...to document and share current verbal BES communications practices and procedures from across the industry that have been found to enhance the effectiveness of system operator communications programs. These (practices and procedures) are not mapped to existing or future mandatory requirements, but rather are intended to show the breadth of industry practices concerning verbal communications."

As noted in the RISC's comments, there is little evidence that non-emergency communications represent a reliability gap. NERC's Events Analysis process has not identified non-emergency operational communications as a concern. In addition, neither the February 2011 Southwest Cold Weather Event nor the September 2011 Arizona-Southern California Blackout reports identified non-emergency operational communications as a concern. Hence, the NERC OC recommends that a standard is not needed for non-emergency operational communications. However, if a standard is developed for non-emergency operational communications, the NERC OC has the following comments:

The existing COM-003-1 Standard Drafting Team (SDT) has been through several iterations without success. A fresh start is needed with a new team. This team should have substantial operational experience, preferably extensive on-shift experience.

A Reliability Assurance Initiative (RAI) or non-zero tolerance approach is recommended for a communication standard. This could set a benchmark on how Reliability Standards can be focused on improving future performance through internal controls that include program development, training, monitoring, evaluation and correction. Such action would also recognize that many operational communications are problem identification and solution finding discussions that should not be subjected to a three part communications process.

In addition, consideration should be given to limiting the additional compliance and administrative burdens for NERC, the Regional Entities, and the industry created by a new standard, since there is little evidence that non-emergency communication represents a significant risk.

The OC's responses to the five questions follow.

**Question 1:** Proposed COM-002-3 Reliability Standard provides a standard that addresses communication protocols in an emergency. Are there circumstances that are not an emergency (as defined in COM-002-3) that can lead to reliability risks if not appropriately addressed by a standard? If so, what are these circumstances and how important is it that there be a standard to address them?

#### OC Response

- The NERC OC agrees non-emergency communications in real-time operations can lead to reliability risks. However, the OC does not believe that this alone creates a need for a separate standard to address communications during normal operations. The electric system is designed and operated to limit the effect of a (n-1) contingency. The OC also believes incentives are currently in place today, such as personnel and public safety and human error prevention, to ensure proper communications in normal operations and that additional standards are not required.
- If the Board chooses to move forward with the standard development, the OC could support a single standard that addresses operational communication that provides continuity across all operational states. We would suggest starting with a clean slate to develop one standard replacing COM-002 and COM-003. See Q5.

**Question 2:** Does the latest draft of the COM-003-1 Reliability Standard address such circumstances appropriately? Is it a "quality standard" on the basis of the criteria that are being used to assess existing and future standards by the Independent Experts Review Panel?

#### OC Response

- The OC does not consider the draft COM-003-1 as a quality standard.
- The OC could support a single communications standard that addresses operational communications under all operational states as outlined in the OC responses below.

Question 3: Are there changes you would recommend to improve the current draft of the COM-003-1 Reliability Standard? Describe how the enhancements would address any gaps in Bulk-Power System reliability.

#### OC Response

- This response is based on the OC's response to Question 1.

The OC could support a single communications standard that addresses operational communications under all operational states. Our recommendation to improve the standard would be to modify the standard for entities to self monitor, evaluate, and correct communication deficiencies with a goal of future performance improvement, as opposed to a zero defect type of standard. Under no circumstances do we believe that a zero defect approach is constructive or warranted in the context of operational communications.

Question 4: Should the proposed COM-002-3 Reliability Standard approved by the Board be rescinded and a new standard developed that addresses communications during both emergency and non-emergency conditions? If so, what key issues would it address, including an appropriate definition of "non-emergency conditions"?

#### OC Response

- This response is based on the OC's response to Question 1.

The OC believes that all Board action with regard to proposed COM-002-3 be placed on hold and expedite moving forward with a new COM standard.

The OC could support a single communications standard that addresses operational communications under all operating states as outlined in the OC responses to questions 3 and 5.

Question 5: Do you have any additional input regarding the development of the COM-003-1 Reliability Standard for the Board to consider in its deliberations on next steps?

#### OC Response

- If the Board determines it is necessary to move forward with a standard, the OC recommends taking a clean slate approach (i.e., a new SAR and new SDT) to develop one standard addressing operational communications. The standard should focus on communication categories where three-part communications can be applied in an effective and practical way such as topology changes, and not including less practical categories such as "all calls," routine adjustments such as resource dispatch instructions within the normal operational range of the resource, and leaving space for problem solving discussions. The standard should not be zero tolerance based. The standard should focus on self monitoring, evaluating, and correcting any communication deficiencies.

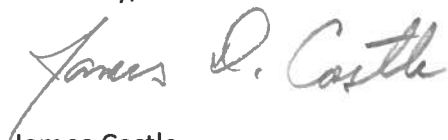

## Other Considerations

- Compliance (Move away from zero tolerance and get to a programmatic and results based standard – e.g., FAC-003-3)
- Training (How will a new standard impact training across the industry?)
- Timing (Consolidating COM-002 and 003 into a single standard takes more time but results in a better product than two separate standards.)
- Refrain from creating new glossary terms, such as “operating instructions.”

In summary, the OC believes that a standard is not needed for non-emergency operational communications. However, if the Board chooses to move forward with a standard development, the OC could support a single standard that addresses operational communication that provides continuity across all operational states.

The Operating Committee thanks the Board of Trustees for allowing us the opportunity to provide feedback regarding the draft COM-003-1 Reliability Standard.

Sincerely,

James Castle  
Operating Committee Chair

**Operating Committee Reliability Guideline: “System Operator Verbal Communications – Current Industry Practices”**

# Reliability Guideline: System Operator Verbal Communications – Current Industry Practices

## Preamble

It is in the public interest for NERC to develop guidelines that are useful for maintaining or enhancing the reliability of the Bulk Electric System (BES). Reliability Guidelines provide suggested guidance on a particular topic for use by BES users, owners, and operators according to each entity's circumstances. Reliability Guidelines are not to be used to provide binding norms, establish mandatory reliability standards, or create parameters by which compliance to standards is monitored or enforced.

## Introduction

This Reliability Guideline is available to electricity sector organizations responsible for the operation of the BES. It provides general concepts that may be considered when developing a system operator verbal communications program. This guideline provides a general framework for identifying the concepts and steps to consider for an effective system operator verbal communications program. This document, written in the form of a guideline, is a collection of industry practices compiled by the NERC Operating Committee (OC). The use of these methodologies and guidelines is strictly voluntary. Entities should consider goals of going beyond the standards to facilitate a higher level of reliable operations without the expectation of having to be perfect in meeting the goals for compliance purposes. As BES communications practices, procedures and technologies change, electric entities are encouraged to implement such changes as appropriate.

## Purpose

The purpose of this guideline is to document and share current verbal BES communications practices and procedures from across the industry that have been found to enhance the effectiveness of system operator communications programs. These are not mapped to existing or future mandatory requirements, but rather are intended to show the breadth of industry practices concerning verbal communications.

## Guideline Details

Components of an effective system operator verbal communications program may include:

### I. Verbal Communications Tools

System operators use a variety of tools for communicating information with other system operators. The tool used for communicating specific information with various recipients depends on a number of factors, such as the urgency, importance, and intended impact of the information being communicated. The urgency, importance, and impact of the specific information are highly dependent on the role and responsibility of each party to the communication. As an example, email may be the

appropriate tool if the information exchange is not urgent, while a one-on-one phone call may be the best method to communicate both urgent and important information. Also, in some cases multiple tools may be used to communicate the same information to different parties.

Tools used for system operator communications and some typical applications for those tools are as follows:

#### 1. Voice Communications

- a. Public Switched Telephone Network (PSTN) – This is the most common communication tool for system operators to use to communicate with other system operators and field personnel. It is highly reliable and secure. Application examples include:
  - i. Dedicated conference call arrangements
  - ii. Dedicated circuits between facilities
  - iii. Multi-party initiated calls
  - iv. Speed dial functionality
- b. Private Internal Telecommunications Systems – Some utilities have found economies of scale by installing their own communications network utilizing microwave and/or fiber optic telecommunications networks. These networks perform the same function as the PSTN discussed above.
- c. Voice Over Internet Protocol (VOIP) – The communication protocols, technologies, methodologies, and transmission techniques involved in the delivery of voice communications and multimedia sessions over Internet Protocol (IP) networks, such as the Internet, rather than the public switched telephone network (PSTN).
- d. Cell phones – These are widely used by field personnel to contact system operators. They are reliable in urban and suburban settings but are less reliable in remote areas. Cell phones function similarly to traditional phones but are more susceptible to background noise.
- e. Radios – A common communication medium for municipal utilities and vertically integrated utilities in which uses extend beyond operation of the BES. The communication method for radios differs from other devices because they are not full duplex devices and, therefore, do not allow simultaneous transmission from both parties. Also, radio transmissions are typically not encrypted and are accessible to third parties via scanners, etc.
- f. Government Emergency Telecommunications Service (GETS) and Wireless Priority Service (WPS) – GETS and WPS provide an emergency access and priority processing in the local and long-distance segments of the PSTN or cellular networks. GETS and WPS are intended to be used in an emergency or crisis situation when the PSTN or cellular network is congested and

the probability of completing a call over normal or other telecommunications means has significantly decreased.

- g. Satellite phones – Typically used as emergency voice communication medium between functional entities and their respective reliability coordinators. Satellite phones function similarly to traditional phones and cell phones; however, a clear view of the sky for the antenna is required. A lesson learned from the industry’s Y2K preparation was that for satellite phones to be most effective in emergency/outage conditions, entities have to ensure their phones do not require transmitting through any ground relaying stations (i.e., that their phones have direct point-to-point functionality).
  - h. All Call/Blast Call Functionality – Some entities utilize technology that blasts general messaging and directives with multiple entities. Blast calls and messaging systems are effective tools to rapidly share information with multiple parties or to get group action.
2. Other Communications Tools
- a. Email – Typically used to communicate information that is not time sensitive. Used to communicate system status and events to a broad array of support staff/management as well as interconnected entities.
  - b. Messaging Systems – An internal system used by reliability coordinators to send messages to their Balancing Authorities (BA) and Transmission Operators (TOP) or an external system used by Reliability Coordinators (RC) to send messages to other RC (e.g., the RC Information System).
  - c. Fax (short for facsimile) – Sometimes called telecopying, faxing is the telephonic transmission of scanned printed material (both text and images), normally to a telephone number connected to a printer or other output device.

## II. Policies and Procedures

The following are excerpts of policies and procedures currently in use by a sampling of industry members. When developing formal communications policies and procedures, the registered entity may consider addressing the following items:

- 1. Policy Applicability
  - a. Who – To whom the procedure applies
  - b. When – Under what condition the specific communications policy or procedure is to be used (e.g., normal or emergency conditions)
  - c. How – Technique to be used for emergency communications versus normal communications
    - i. There are two schools of thought regarding utilization of three-part communication for routine operating instructions. Every routine communication opportunity has a

different impact on the reliability of the BES, and many routine communication opportunities have no impact on reliability. While the industry has disparate viewpoints on the necessity of the use of three-part communication for all real-time communications, most agree that the point is to be effective when it counts for reliability — not that every communication opportunity has a reliability impact.

1. One thought is that the three-part communication protocol is special and reserved to address real-time emergencies in order to make those communications stand out from normal communications.
  2. Another school of thought is that the three-part communication protocol is good practice for both normal and emergency operating instructions.
- d. If an entity determines it would utilize the three-part communication protocol for routine operating instructions, that entity should define when its system operators are expected to utilize the protocol, including coordinating with entities regarding when the use of three-part communication is expected. In addition, entities could consider beginning the communication with the phrase “This instruction requires a three-part communication.” Further, entities should consider providing system operators a general format or a script that can be applied when using three-way communications. Some entities provide these written scripts at each system operator position and may ask the receiver to write out the transmitted directive.

2. Use of Three-Part Communication for Routine Operating Instructions<sup>1</sup> – The following is an example of when the three-part communication protocol for routine operating instructions could be implemented:

SAMPLE TEXT from an internal procedure:

- a. For any actionable item, there should be specific three-part communication by the receiver to ensure there is no misunderstanding of the details involved. An actionable item is instruction or information conveyed in which one party is informing the other that:
  - i. A physical change needs to be made or has been made to BES facilities pre- or post-contingency (e.g., generation starts, transmission reconfigurations, manual redispatches, voltage changes); or
  - ii. A change needs to be made in the computer systems used to operate the BES (e.g., updating operating limits, forecasts, schedules).

3. Elements of Effective Communication

- a. Communication Etiquette – At all times, professionalism and professional tone and manner are essential. Communications are best undertaken in a courteous, business-like fashion.
- b. Opening Phrase – It is important that both parties understand with whom they are speaking; therefore, the person answering the phone or making a call should state the following information: company, location, name, and function.
- c. Acknowledgement – Whenever a call is made or received, the initiating party should clearly communicate the purpose of the call so that all issues are fully understood and addressed.
- d. Content – The person requesting action should speak in a clear and calm manner, review the information and request three-way communication, if appropriate. If any action is to be taken, the recipient will fully understand when that action is expected to be taken (e.g., now, at a specific time, or “some” time). Closing – At the end of any call, those communicating want to confirm that what was expected was completed, that no other activity is required, and whether there is a clear commitment for call-back.

---

<sup>1</sup> While the practice of using three-part communications for routine communications may be a good practice, the failure to use three-part communications for routine communications is not considered to undermine reliability.

4. Barriers to Effective Verbal Communications
  - a. Sender or receiver not stating his or her name and/or work location when using a telephone or radio.
  - b. Sender attempting to communicate with someone already engaged in another conversation.
  - c. Sender stating too much information or multiple actions in one message.
  - d. Sender not giving enough information for the receiver to understand the message.
  - e. Sender not explicitly verifying that receiver understood the message.
  - f. Receiver failing to ask for needed clarification of the message, if required.
  - g. Receiver taking action before the communication is complete.
  - h. Receiver not writing the message on paper, if there are several items (more than two) to remember.
  - i. Receiver mentally preoccupied with another task (e.g., driving, texting, personal calls).
  - j. Message not being stated loudly enough to be heard.
  - k. Enunciating words poorly.
  - l. Distractions to communications (e.g., background noise).

### **III. Communications Training for System Operators**

Effective communication is one of the most important defenses in the prevention of errors and events. Training provides an opportunity to ensure that personnel know their company's requirements and expectations for verbal communications, and it also reinforces good communication practices through the use of drills and exercises.

Communications training can be based on company-specific policies and procedures for verbal communications. The goal of communications training is to ensure effective verbal communications during real-time operations. The following practices are provided for consideration in the development of training exercises and drills and for management observation/coaching involving verbal communications:

1. Classroom Training and Management Review
  - a. Classroom training can focus on company-specific policies and procedures for verbal communications. The trainer wants to be clear on what communications protocols are expected to be followed, when they are expected to be followed, and by whom. The trainer also wants to emphasize the benefits of following the specific protocols.

- b. Classroom training on effective communication is most thorough when it addresses the following: 1) basis for use (why it is used); 2) when to use specific communications protocols (provide specific examples); 3) roles and responsibilities for each participant (include the significance of active listening); and 4) behavior expectations of each participant.
  - c. Effective communication principles can be reinforced during system operator training simulations, exercises, or drills. Performance objectives or competencies can be established and measured as part of these activities. Feedback assessments (both self and instructor) can be part of the communications training process.
  - d. Management or peer observations (e.g., operator coaching session) can be utilized to determine if the tools for effective communication are practiced by personnel in the actual job environment. These observations provide an opportunity to recognize personnel who meet or exceed expectations for use of effective communication tools. They also provide an opportunity in a non-punitive environment to coach personnel who need to improve their use of communication tools. The observations can be considered to determine if changes or improvements are needed when training on communication tools.
  - e. Management involvement in system operator training, exercises, and drills can be used to provide feedback and encourage a strong communications program.
2. Communication Practices – The following beneficial practices are provided for consideration in the development or modification of training on effective communication:
- a. Incorporate a “Communication Topic” as part of each continuing training cycle.
  - b. Ensure training on communication stresses effective, active listening. Even though the “Sender or Initiator” of three-part communication is expected to ensure the message is understood, the individual(s) receiving the message want to be engaged and actively listening for effective communication to occur.
  - c. Use quizzes or reminders administered by email or other online testing applications to emphasize key aspects of effective communication. This tool can also be used to provide feedback on department or group level understanding of key points.
  - d. Incorporate internal and external operating experience related to communication as part of initial and continuing training. The operating experience can be based on: 1) management observations; 2) performance trends; 3) review of tapes from actual communication, including system events in which directives were provided; or 4) related events from other industries.
  - e. Use small groups or breakouts as part of training to conduct peer reviews of actual communication. Audio tapes of actual operators can be reviewed by small groups to identify proper communication and areas for improvement. In addition, system operators

may opt to review and critique their own voice recordings to identify lessons learned and opportunities for improvement.

- f. Conduct training seminars or communications workshops that involve operators and other parties (e.g., receivers) they communicate with to educate all involved parties on the expectations for effective communication.
- g. As part of training, incorporate videos that depict proper usage of tools for effective communication. Videos depicting operators in “real world” situations demonstrating proper use of tools for effective communication can enhance buy-in by personnel. Videos can also be used to depict scenarios in which tools for effective communication are *not* properly used. Participants can critique or identify the area(s) for improvement in the use of the tools for effective communication.
- h. Structure field trips or benchmark trips to other industries (e.g., nuclear plants, aviation control centers) that allow operators to listen to another perspective. This can help reinforce a good balance on when to use three-part communication.

#### **IV. Performance Assessment**

Successful implementation of verbal communications programs often includes the development and maintenance of a comprehensive series of controls and leadership practices that develop, reinforce, and maintain effective communication. Examples of some effective elements of control programs are listed below.

1. For many reasons the electric industry records most of its operational communications. These recordings provide a rich vehicle for assessment, feedback, and learning when coupled with periodic reviews of the recordings for the elements of effective communication.
2. In line with feedback and training programs, shift supervisors or operations leaders at many operating entities assess a specific number of hours of recordings or a specific number of recordings that may cover various topical areas (e.g., switching evolutions, AVR notifications, SPS notifications, etc.) within an established period of time (e.g., every quarter or month) for each of the operators under his or her leadership. Those leaders are then expected to share their reviews with the operators involved. Such feedback is often most effective when it is provided soon after an operational event has transpired. Some entities prefer such recording review sessions be made in an informal coaching session. Other entities have tied effective communication to the very formal aspect of annual performance goals and the resulting performance reviews. Periodic assessments, including grading or scoring of calls, can quickly provide needed feedback to ensure a system operator will be successful in achieving such a performance goal throughout the course of the year. Entities may choose to reflect that success in employee performance compensation.

3. Recognition Programs – Consider development of positive reinforcement programs that recognize good system operator communications.
4. System Operator Assessments – Some entities assess the following:
  - a. Was the operator following the company’s communication policy?
  - b. When three-part communication was required, were each of the three elements of three-part communication evident?
  - c. If the receiver did not effectively repeat back the communication the first time, did the sender pursue the receiver until the receiver did repeat back the elements of the reliability directive?
  - d. How professional was the actual communication in both content and tone?
  - e. The focus of these reviews might involve more than the spoken word, since some entities also include reviewing the resulting field paperwork. Such reviews help organizations ensure good housekeeping and see that the complete company policy is being implemented.
5. Event Analysis
  - a. If an operating entity has a system event that triggers a category 2 or higher event review in accordance with the NERC Events Analysis Process, or if the operating entity has any other event for which it wants to further assess its operations, this circumstance provides the operating entity an opportunity to delve into assessing the effectiveness of its communications.
  - b. When the system event’s recordings are pulled and reviewed, it provides an opportunity for leaders, operators, and trainers to assess the effectiveness of their communications as related to that event and, in some cases, to access broader operating practices.
  - c. Communication often involves parties beyond the organizational structure of one operating entity. As such, when a third party (the receiver) of a communication has not facilitated effective communication (either by not following agreed-upon protocol or by unprofessionalism) this circumstance provides an opportunity for the reviewing leader to share his or her observations with the receiver’s leader to enable learning across both operating entities.

## **V. Aids to Communication**

1. Recorders – Typically used to preserve a record of conversations to assist in the review of incidents. Also used to check conversations to ensure communications are effective and appropriate.
2. System Operator Logs – Used as a knowledge transfer device between system operators in the same control room, as well as for management to respond to inquiries about situations that

occurred days, weeks or even months afterward. Used in conjunction with all other forms of communication.

3. Checklists – Used as an aid to ensure consistency in the information contained in routine communications. A typical use of a checklist is during shift turnover of system operators to ensure appropriate operating information is communicated to the system operator coming on-shift.
4. Standard Verbal Cues - To develop a common understanding of the urgency and attention required for a verbal communication entities may develop standard phraseology such as:
  - a. “This is a directive”: This is a simple way to let the receiver know that the next statement will relay an expected mandatory action and will require a “repeat back” of the order.
  - b. “I (we) have a problem”: Important information is forthcoming.
  - c. “I need your help”: Action is needed, albeit not for an emergency.
  - d. “Are you ready to copy/write?”: When you want the recipient to write down the message.
  - e. “Say again”: When you need the sender to repeat a message
5. Tailgate Sessions – These are information sharing sessions prior to an important job or evolution. They are a give and take briefing of the scope of the task to be done, special safety precautions and an opportunity to ask clarifying questions. The intent of the session is to ensure everyone knows the goal and has the necessary tools and information. A clear transition from a tailgate session to formal communications such as a standard verbal cue should be used.
6. Standard (or Special) Operating Instructions – These may be known by various other names. Rather than issue a set of complex instructions verbally, the sender provides an advance copy of written steps. When the order is given, the sender ensures the recipient has the correct document (name and date/version) and gives the instruction to complete certain steps or the entire procedure.
