		<p>Communication capability; however, it does not preclude or limit the Reliability Coordinator from establishing Interpersonal Communication capability with others. The RCSDT does not see where there is a need to communicate with other Reliability Coordinator’s from one interconnection to another. No change made.</p> <p>2. R3.5 and R4.3: The phrase “synchronously connected within the same Interconnection” is also improper; it needs to be removed. TOPs do communicate with other TOPs including those asynchronously connected and in another Interconnection (e.g. between Quebec and all of its asynchronously interconnected neighbors). The reason that was used in response to the above comments (coordination among TOPs for DC tie operation) contradicts with the inclusion of this phrase in R3.5 and R4.3.</p> <p>The RCSDT has made clarifying changes by adding Parts to R3 and R4 to address asynchronous connections between Transmission Operators and have eliminated the phrase “within the same interconnection.”</p> <p>COM-001-2, R3.5 and R4.3: Use of the phrase “within the same interconnection.” The RCSDT recognizes that operating activities occurring inside an interconnection that is not synchronously interconnected with another interconnection cannot cause immediate effects upon that interconnection. Any changes in flow across any asynchronous tie between those interconnections must take place through a coordinated interchange energy scheduling process, except for contingency loss the asynchronous ties. In the case of the latter, there is no other path which can be used to address the loss of the asynchronous tie, nor is any synchronous tie immediately affected. The standard does not require such involved RCs to have Interpersonal Communication capability, but does not preclude it. Any rearrangement of scheduled flows on other asynchronous ties must be done through a pre-existing interchange energy scheduling process. No change made.</p> <p>3. R4 and R6: Not requiring an Alternative Interpersonal Communication capability between the BAs and the DP and GOP can result in a reliability gap. If Interpersonal Communication capability between the BAs and these entities is required to begin</p>

Organization	Yes or No	Question 6 Comment
		<p>with to enable BAs to communicate with these entities (such as operating instructions or Reliability Directives) to ensure reliable operations, then an alternative capability is also needed to ensure this objective is achieved when the primary capability fails.</p> <p>The RCSDT refers the Order No. 693 in Paragraph 508 to clarify the reason the DP and GOP are not required to have Alternative Interpersonal Communication and is as follows: “(1) expands the applicability to include Generator Operators and Distribution Providers and includes Requirements for their telecommunications facilities; (2) identifies specific requirements for telecommunications facilities for use in normal and Emergency conditions that reflect the roles of the applicable entities and their impact on Reliable Operation and (3) includes adequate flexibility for compliance with the Reliability Standard, adoption of new technologies and cost-effective solutions.” In addition, R11 requires the DP and GOP to consult with its BA and TOP to determine a mutually agreeable action for restoration. No change made.</p> <p>4. To preclude the possibility of problems arising from having different languages spoken between entities, COM-001-1.1 R4 should remain as it was or those ideas kept in the revised requirement. R4 read:</p> <p><i>“R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.”</i></p> <p>According to the proposed implementation plan for COM-001-2, R4 pertaining to the use of English will remain in effect upon the effective date of COM-001-3. This requirement is being revised and will be included in Standard COM-003-1, Operating Personnel Communications Protocols. COM-001-1.1, R4 will be retired at midnight the day before COM-003-1 becomes effective. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>5. Measure M3 does not cover the added R3.5 condition (having Interpersonal Communications capability with each adjacent TOP). M3 needs to be revised.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make to Measure, M3.</p> <p>For IRO-001:</p> <p>The Data Retention Section does not reflect the revised requirements. As examples: the Electric Reliability Organization is no longer a responsible entity; the Reliability Coordinator should replace the ERO for keeping data for R1.</p> <p>Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider should replace the Reliability Coordinator for keeping data for R2.</p> <p>And, in the Data Retention Section, R4 and M4 are mentioned. However, there are only three requirements with their corresponding measures in the standard.</p>
<p><b>Response:</b> The RCSDT thanks you for your comment and has made conforming changes to IRO-001-3.</p>		
MRO NSRF		<p>Has the SDT looked at combining COM-002-3 and IRO-001-3 into a single Standard? It would allow Entities a one stop shopping place to refer to issuing and receiving a Reliability Directive.</p> <p>The RCSDT understands some of the benefits with combining the standards; however, at this juncture, it would further delay the progress of the standards. No change made.</p> <p>The definition of Interpersonal Communication is:</p> <p>“Any medium that allows two or more individuals to interact, consult, or exchange information.” As stated in Question 4, the use of the word “any” will bring in mediums that are outside the scope of this Standard.</p> <p>The RCSDT appreciates your comment and has made clarifying changes by removing the phrase “any of” in COM-001, R11. Additionally, the RCSDT made a clarifying</p>

Organization	Yes or No	Question 6 Comment
		<p>change to indicate the DP and GOP only need to consult with the entity affected by the failure.</p> <p>The NSRF recommends the following:</p> <p>Interpersonal Communication: The primary (or designated) medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>The RCSDT emphasizes the requirement refers only to Interpersonal Communication capabilities. Adding the phrase “to the primary” is not needed. Please refer to the definitions of Interpersonal Communication and Alternative Interpersonal Communication for clarification. No change made.</p> <p>In Standard COM-002-3 the MRO NSRF recommends that the Effective Date be the first day of the second calendar quarter after applicable regulatory approval, to be the same as COM-001-2 and IRO-001-3. In that way all 3 standards would be effective at the same time, making implementation much smoother.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to adjust IRO-001 to be the same as COM-001 and COM-002.</p> <p>The below section will lead to entities hold evidence past the 12 month retention period. This ambiguous wording will force entities to hold data past the 12 month period as stated in the following paragraph, after the below sighting. Recommend that the first paragraph within 1.3 be deleted in its entirety.</p> <p>1.3. Data Retention The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been updated to be consistent with the Standards Drafting Guidelines.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response:</b> See response above.</p>		
<p>CCG, CPG, CECD</p>		<p>Comments: IRO-001-3 uses the term ‘direct’ in its purpose statement, R1, R2 and R3. To avoid confusion with a Reliability Directive (both for auditors and entities), we suggest the following: To establish the authority of Reliability Coordinators to make requests of other entities to prevent an Emergency or Adverse Reliability Impacts to the Bulk Electric System.</p> <p>The RCSDT feels the use of “direct” and “directed” is consistent with the purpose and application of those terms in other standards. No change made.</p> <p>R1: Each Reliability Coordinator shall have the authority to act or request others to act (which could include issuing Reliability Directives) to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts.</p> <p>The RCSDT feels the use of “direct” and “directed” is consistent with the purpose and application of those terms in other standards. The RCSDT believes by using the word “request” make the requirement conditional and is not consistent with the purpose of the standard. No change made.</p> <p>R2: Each Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider shall comply with its Reliability Coordinator’s request unless compliance with the request cannot be physically implemented, or unless such actions would violate safety, equipment, regulatory or statutory requirements, or unless the TOP, BA, GOP or DP convey a business reason not to comply with the request but express that they will comply if a Reliability Directive is given.</p> <p>The RCSDT feels the use of “direct” and “directed” is consistent with the purpose and application of those terms in other standards. The RCSDT believes by using the word “request” make the requirement conditional and is not consistent with the purpose of the standard. No change made.</p> <p>R3: Each Transmission Operator, Balancing Authority, Generator Operator, and</p>

Organization	Yes or No	Question 6 Comment
		<p>Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform as requested in accordance with Requirement R2.</p> <p>The RCSDT feels the use of “direct” and “directed” is consistent with the purpose and application of those terms in other standards. The RCSDT believes by using the word “request” make the requirement conditional and is not consistent with the purpose of the standard. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>LG&amp;E and KU Services Company</p>		<p>COM-001-2</p> <p>Regarding COM-001-2 and proposed definitions, LG&amp;E and KU Services recommends changing the terms being defined from “Interpersonal Communications” and “Alternative Interpersonal Communication” to “Means for Interpersonal Communication” and “Alternative Means for Interpersonal Communication.” A communication is an exchange of information, not a medium. The medium is simply the means. LG&amp;E and KU Services Company further recommend that each requirement be rewritten with these new defined terms as appropriate and that the word “capabilities” currently following the defined terms be removed from each of the requirements.</p> <p>We suggest the definition for “Means for Interpersonal Communication” be: “A medium utilizing electromagnetic energy that allows two or more individuals to interact, consult or exchange information.”</p> <p>We suggest the definition for “Alternative Means for Interpersonal Communication” be: “Any Means for Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Means for Interpersonal Communications used for day-to-day operation.”</p> <p>The RCSDT thanks you for your comment; however, great lengths were taken in communicating mediums regarding IC and AIC and finds that adding “Means” to the</p>

Organization	Yes or No	Question 6 Comment
		<p>proposed terms being defined diminishes clarity of the definition. No change made.</p> <p>Finally, LG&amp;E and KU Services Company request clarification that the requirements to have in place Interpersonal Communications and Alternative Interpersonal Communications do not establish non-compliance for the unavailability of either medium provided the reporting requirements set forth in the standard are otherwise met.</p> <p>The RCSDT believes a condition of non-compliance will not be created if the entity meets all of the requirements for Interpersonal Communication and Alternative Interpersonal Communication capability. For example, the applicable entity has a failure of the IC and notifies the identified entities and begins using its AIC. No change made.</p> <p>All Proposed Standards LG&amp;E and KU Services Company suggest that the first paragraph in section 1.3 Data Retention be removed from all proposed standards. It states: ...For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. While LG&amp;E and KU Services Company is confident that the SDT intended to clarify entities' data retention responsibilities, this paragraph could be clarified to indicate that it does not require that any additional evidence be retained and provided beyond that written in the standard's requirements.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been updated to be consistent with the Standards Drafting Guidelines.</p>
<p><b>Response:</b> See response above.</p>		
<p>Bonneville Power Administration</p>		<p>BPA supports COM-001-2, COM-002-3 and IRO-001-3 as written and has no comments or concerns at this time.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response:</b> Thank you for your comment.</p>		
<p>SPP Standards Review Group</p>		<p>COM-001-2: Requirement 10 is too open ended as written.</p> <p>The measure, M10, indicates that only impacted entities need to be notified. The requirement should be changed to make it consistent with the measure. The requirement would then read: <i>“Each RC, TOP And BA shall notify impacted entities as identified...”</i></p> <p>Requirements 3 and 5 places the responsibility for establishing Interpersonal Communication capability on the TOP and BA. It is quite conceivable that a TOP or BA may not know all, or newly, registered DPs and GOPs in its respective area.</p> <p>The word “impacted” was removed in previous postings. For further clarification, the RCSDT has modified M10 to remove the word “impacted” to be consistent with R10. For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>In Requirements 7 and 8, the DP and GOP, respectively, are in turn responsible for establishing Interpersonal Communication capability. The TOPs/BAs and the DPs/GOPs should not be responsible for this. The DPs and GOPs should be held accountable for requesting that capability of their TOP and BA.</p> <p>The standard establishes requirement for communication capability appropriate to ensure reliability. There is no requirement for it to be different from the Interpersonal Communication capability that its Balancing Authority has with it, nor the Interpersonal Communication capability that its Transmission Operator has with it. Cooperation and coordination is always encouraged and is an excellent practice, but is not required by this standard. Thank you for your suggestion. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>Therefore, we suggest adding the following phrase at the end of Requirements 3.3, 3.4, 5.3 and 5.4 - ‘that has requested Interpersonal Communications capability.’ Then R3.3 would read:</p> <p><i>“Each Distribution Provider within its Transmission Operator Area that has requested Interpersonal Communications capability.”</i></p> <p>The SDT does not agree that these changes to R3.3, R3.4, R5.3 and R5.4 are necessary. The current R7 and R8 require the DP and the GOP to have this capability. It is not a request. No change made.</p> <p>COM-002-3:</p> <p>Requirement 2/Measure 2: There is an inconsistency between the requirement and the measure. The requirement allows the recipient to repeat, restate, rephrase or recapitulate the directive. Measure 1 only mentions repeating the directive.</p> <p>The RCSDT agrees that M2 needs to match the phrasing used in R2 and has made clarifying changes.</p>
<p><b>Response:</b> See response above.</p>		
<p>Dominion</p>		<p>COM-001-2; M9 reads <i>“at least on a monthly basis”</i>, Dominion suggests that this be changed to <i>“at least once per calendar month”</i> as written in R2.</p> <p>The RCSDT agrees and the language in M9 has been changed to agree with the language in COM-001-2, R9.</p> <p>M8 Dominion suggests removing the second <i>“that”</i> in the first sentence of the measure.</p> <p>COM-001-2, M8: The RCSDT agrees and the language in M8 has been changed to delete the additional <i>“that.”</i></p> <p>M10 Dominion suggests this be revised to coincide with changes made in R10 (deleting impacted and adding as identified in Requirements R1 through R6),</p>

Organization	Yes or No	Question 6 Comment
		<p>therefore M10 should read:</p> <p><i>“Each Reliability Coordinator, Transmission Operator, and Balancing Authority, shall have and provide upon request evidence that it notified entities as identified in Requirements R1 through R6 within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasted 30 minutes or longer. Evidence could include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent evidence. (R10.)”</i></p> <p>The RCSDT thanks you for your comment and has made conforming changes to make change “impacted” to “identified” entities.</p> <p>M12 needs to be removed.</p> <p>The RCSDT appreciates your comment and has deleted Measure M12 that was left in error.</p> <p>IRO-001-3;</p> <p>R2 - Dominion questions the phrase “physically implemented” and recommends that the intent be clarified in the language.</p> <p>The RCSDT believes there may be conditions were an entity may not be able to physically implement the direction. For example, an entity that does not have the right to access certain equipment or cannot manually operate a broken apparatus. We feel the proposed language achieves the intended purpose. No change made.</p> <p>Dominion notes the following comment and response posted under Consideration of Comments on Initial Ballot - Reliability Coordination (Project 2006-06) Date of Initial Ballot: February 25 - March 7, 2011:”</p> <p><i>IRO-001 R2, R3, and R4 have replaced “Directives” with the word direction in lower case (while it appears that “Directives” is a subset of “directions”). We believe that this muddies the waters and could bring numerous conversations and dialog into scope unnecessarily. The end result is that the RC has the right to issue and use</i></p>

Organization	Yes or No	Question 6 Comment
		<p><i>“Directives” and anything short of this could just be communications. For example, a number of entities that are Reliability Coordinators also facilitate energy markets. There are many communications related to markets that probably should be out of scope with respect to the standards. Furthermore, it might not be clear what role (e.g., Reliability Coordinator, market operator, etc) the staff at these entities are fulfilling.</i></p> <p><i>Response: IRO-001 is written to cover both typical daily operating scenarios and also emergency scenarios. The required performance encompasses issuing and responding to Reliability Directives as well as other directions. The requirement language specifically ties back to Requirement R2 which states that the RC “shall take actions or direct actions, which could include issuing Reliability Directives.” This is the “direction in accordance with Requirement R2” stated in R3 and the “direction in accordance with Requirement R3” stated in R4.”Dominion believes the entity’s comments remain valid and the response provided by the SDT does not address all aspects of the concern.</i></p> <p>Dominion suggests that the language be changed to “Reliability Directive” consistent with COM-002.</p> <p>The word “direction” connects with the language in the R1 (act or direct). Reliability Directives is a subset of “direction.” No change made.</p> <p>M2 - need to add the following words “compliance with, physically, unless” which were included in R2, therefore M2 should read:</p> <p><i>“Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's direction(s) per Requirement R1 unless compliance with the direction per Requirement R1 could not be physically</i></p>

Organization	Yes or No	Question 6 Comment
		<p><i>implemented or unless such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall have and provide copies of the safety, equipment, regulatory or statutory requirements as evidence for not complying with the Reliability Coordinator’s direction. (R2)“</i></p> <p>The RCSDT thanks you for your comment and has added the word “physically” to the IRO-001-2 Measure M2.</p> <p>Section 1.3, the second bullet; need to add calendar to 12 calendar months</p> <p>The RCSDT appreciates your comments and conforming changes have been made to the Data Retention section.</p>
<p><b>Response:</b> See response above.</p>		
<p>FirstEnergy</p>		<p>Definition of Interpersonal Communications.</p> <p>We understand that the team does not want to be prescriptive as far as the specific types of communication mediums since we live in an age of many forms of communication. But in this case it may be helpful to give examples in the definition. An auditor may interpret Interpersonal Communication to strictly include voice-related and two-way conversations. Depending on the circumstances, other mediums may be adequate, such as blast calls or instant messaging. This should be clarified in the definition.</p> <p>COM-001-2.</p> <p>In R9, it should be clear that the 2-hour timeframe is for initiation of corrective action because mitigation may take much longer. We suggest the last sentence of R9 state: “If the test is unsuccessful, the responsible entity shall, within 2 hours, initiate action to repair or designate a replacement Alternative Interpersonal Communications capability.</p>

Organization	Yes or No	Question 6 Comment
		<p>COM-001-2, R9: The requirement is to initiate repair or designate an Alternative Interpersonal Communication capability within two hours. The requirement is NOT to have the repair completed within two hours. The requirement recognizes that the entity may use its Alternative Interpersonal Communication capability now as its Interpersonal Communication capability, and then, if it decides to do so, designate another, if you may, “new” Alternative Interpersonal Communication capability. This is not required, but is an option that the entity can consider. The entity may already have a maintenance and repair agreement in place that will respond and repair the failed capability. No change made.</p> <p>In R10, the phrase “R1 through R6” should state “R1 through R8.”</p> <p>The RCSDT thanks you for your comment; alternatively, the RCSDT has modified the language of R10 to refer to R1, R3, and R5, rather than “R1 through R6,” since the responsible entities are limited to the RC, the TOP, and the BA in these requirements.</p> <p>COM-002-3</p> <p>In R2, the use of the term recapitulate may not be appropriate. This term means “to summarize” the directive. Three-part communication during emergency situations should assure that the essential details of the directives are understood and a summary may inadvertently leave out important information.</p> <p>The RCSDT carefully considered the use of the term “recapitulate,” and believes it correctly captures the intent. No change made.</p> <p>The effective date of COM-002-3 should be consistent with COM-001-2 and IRO-001-3 and state “the 1st calendar day of the 2nd calendar quarter.” It currently shows the “1st calendar quarter in the standard and implementation plan.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to adjust IRO-001 to be the same as COM-001 and COM-002.</p> <p>IRO-001-3</p> <p>The third bullet under Data Retention addresses requirement R4 and measure M4</p>

Organization	Yes or No	Question 6 Comment
		<p>neither of which exist in the standard.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p> <p>In R1, the word “and” is missing between Generator Operator and Distribution Provider.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to IRO-001, R2.</p> <p>VSL for R2 - “N/A” should be removed from the High VSL - Furthermore, the VSL should include language for instances when the entity cannot meet the RC’s directive as afforded by R2.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to IRO-001, R2 VSL.</p>
<p><b>Response:</b> See response above.</p>		
<p>MISO Standards Collaborators</p>		<p>The Data Retention Section in IRO-001 does not reflect the revised requirements. For example: the Electric Reliability Organization is no longer a responsible entity; the Reliability Coordinator should replace the ERO for keeping data for R1; Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider should replace the Reliability Coordinator for keeping data for R2; and there is no R4/M4.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p> <p>Additional comments associated with COM-002</p> <p>We are concerned with the use of ‘shall’ in the measurement sections. ‘Shall’ statements should only be used in the Requirements, as these are the only enforceable items in the standard. The measures should not limit how we show compliance. If there are specific issues that the drafting team is proposing to be a requirement, they should be added to the requirements section of the standard.</p> <p>The RCSDT has checked the usage of “shall” in other standards and has found it to be</p>

Organization	Yes or No	Question 6 Comment
		<p>consistent with writing measures. The RCSDT notes the measures are examples and the entity is not limited to those examples. No change made.</p> <p>Measurement M1 should also allow entities to develop procedures that are distributed to and trained on in advance with recipients of directives that meet the requirements for the communication of what constitutes a Reliability Directive. The last sentence in the measurement should be revised to read:</p> <p><i>“Such evidence could include, but is not limited to, dated and time-stamped voice recordings, dated and time-stamped transcripts of voice recordings, or dated operator logs to show that it identified the action as a Reliability Directive to the recipient or approved procedures that identify what constitutes a Reliability Directive and when Reliability Directives are issued.”</i></p> <p>The RCSDT believes that M1 does not preclude an entity from developing, having or utilizing procedures as evidence to address Reliability Directives. No change made.</p> <p>(R1) The Data Retention section states; ‘For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.’</p> <p>It is unclear on how an entity would be expected to provide evidence beyond 3 months when requested if the data retention period and established procedures do not require the evidence to be retained.</p> <p>The SDT should provide examples of what other types of evidence could be expected or the phrase should be removed.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been updated to be consistent with the Standards Drafting Guidelines.</p>
<p><b>Response:</b> See response above.</p>		

Organization	Yes or No	Question 6 Comment
<p>Florida Municipal Power Agency</p>		<p>In the definition of Interpersonal Communication, the use of the word “medium” is ambiguous. Suggestions for alternatives: “system”, “channel.”</p> <p>The RCSDT deliberately stayed away from the use of primary and secondary mediums, and prefers to use communications capabilities. Further, the RCSDT has gone to great lengths to provide some flexibility for those DPs and GOPs with little or no impact on the reliability of the BES. FERC directed NERC to provide for this consideration. Therefore, we use the language as proposed in R11. Mutually agreeable implies that both parties are willing to accept the outcome. It doesn’t mean that a DP or GOP must comply with the wishes of its TOP or BA because as you state that could be beyond the control of the DP or GOP. But what transpires in the consultation is a realization of what the situation is, what the impacts to reliability are and a determination of what is amicable to both parties. No change made.</p> <p>COM-001-2, R1 and R3, the phrase:</p> <p>“have Interpersonal Communications capabilities”, what if the communication system fails? Is that an immediate non-compliance (especially R3.3 and R3.4 which do not require a redundant system).</p> <p>Suggest using EOP-008 type of language to allow restoration of failed equipment without non-compliance.</p> <p>The RCSDT reviewed both EOP-008-0 and EOP-008-1, which is subject to future enforcement. In either version, the team believes there is no need to add additional language to the standard.</p> <p>The RCSDT believes that prescribing a device or medium would limit an entity; therefore, “capability” is used to avoid being prescriptive and to provide flexibility. This was not intended by the drafting team. The intent is to give the entity the flexibility in meeting the requirement. A loss of Interpersonal Communication capability is covered by R10, notification of Interpersonal Communication capability failure. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>COM-001-2, R9 - "Each ... shall test its Alternative Interpersonal Communications capability", suggest adding the phrase "to each entity for which Alternative Interpersonal Communications is required" to add clarity. In addition, the type of testing is unclear and ambiguous.</p> <p>The RCSDT proposes that R9 correctly identifies and provides clarity for the entities required to have Alternative Interpersonal Communication capability. No change made</p> <p>The is also ambiguity in the terms "direct", "directive", "direction" and "Reliability Directive." The SDT may want to consider using the terms "instruct" and "instruction" in place of "direct", "directive", "direction" to more clearly distinguish from a Reliability Directive.</p> <p>The RCSDT feels the use of "direct" and "directed" is consistent with the purpose and application of those terms in other standards. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>ACES Power Marketing Standards Collaborators</p>		<p>The following comments are regarding IRO-001-3.</p> <p>We disagree with including "authority" in this standard. FERC Order 693a, paragraph 112, made it clear that the authority of a registered entity is established through the approval of the standards by FERC. Thus, a Reliability Coordinator gets its authority to issue Reliability Directives by having a requirement that states it must issue Reliability Directives approved by the Commission. Please change "shall have authority to act" in Requirement R1 back to "shall act."</p> <p>Please also remove all other vestiges of authority from the standards including in the purpose, measures and VSLs.</p> <p>The RCSDT believes that other standards (i.e., IRO-009 - R3 &amp; R4, EOP-002 - R1 &amp; R8) address the action of others and if the term "authority" is omitted, creates a generic requirement such as what has been suggested puts the RC in a double jeopardy</p>

Organization	Yes or No	Question 6 Comment
		<p>situation. No change made.</p> <p>The word “direction” connects with the language in the R1 (act or direct). Reliability Directives is a subset of “direction.” No change made.</p> <p>Requirement R1 should require the use of Reliability Directives. The requirement compels the Reliability Coordinator “to direct others to act to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impact.” Reliability Directives are necessary to address Adverse Reliability Impacts or Emergencies and trigger the use of three-part communications identified in COM-002-3.</p> <p>The RCSDT views R1 as an authority requirement to direct others, which could include a subset of direction called, Reliability Directive. Requirement R2 is the response requirement for the recipient. The judgment the recipient is under is that the recipient must comply with the direction, unless the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements. Requirement R3 is simply requires the recipient to inform the issuer of its inability to perform the direction. No change made.</p> <p>COM-002-3 R1 really compels the Reliability Coordinator to use a Reliability Directive for Emergencies and Adverse Reliability Impacts with the opening clause:</p> <p>“When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive.”</p> <p>What else could be more important for a Reliability Coordinator to issue a Reliability Directive than for an Emergency or Adverse Reliability Impact?</p> <p>Thus, not requiring the use of Reliability Directives for Adverse Reliability Impacts and Emergencies makes IRO-001-3 R1 and COM-002-3 R1 inconsistent. For clarity and consistency, Requirement R2 and R3 should also be clear that the responsible entities will respond to the Reliability Coordinator’s Reliability Directives.</p>

Organization	Yes or No	Question 6 Comment
		<p>Furthermore, this would make the standard consistent with how Reliability Directives are handled by the Transmission Operator in the draft TOP-001-2 standard proposed by the Real-Time Operations drafting team (Project 2007-03).</p> <p>The RCSDT development of IRO-001-3 R1 states “...which could include issuing Reliability Directives...” and therefore does not preclude its use if it is determined by the RC to use it. There may be instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. No change made.</p> <p>The Data Retention section needs to be modified. The first bullet applies to the Electric Reliability Organization and Requirement R1 and Measure M1. The actual requirement and measure apply to the Reliability Coordinator. Furthermore, five calendar years exceeds the audit period of three years for a Reliability Coordinator.</p> <p>The RCSDT thanks you for your comment and has removed this bullet.</p> <p>The second bullet incorrectly applies to the Reliability Coordinator and Requirement R2 and Measure M2. Requirement R2 and Measurement M2 apply to Transmission Operators, Balancing Authorities, Generator Operators and Distribution Providers. The third bullet mentions Requirement R4 and Measurement M4.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p> <p>There is no Requirement R4 and Measurement M4 in the standard.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p> <p>The VSLs for Requirement R1 are not consistent with the requirement. The VSL states that it is for failure to act while the requirement compels the Reliability Coordinator to have the authority to act. This modifies the requirement which is not allowed under FERC VSL guidelines.</p> <p>The RCSDT thanks you for your comment and will correct the R1 VSL to have the phrase "exercise their authority" inserted between "to" and "take" in the first</p>

Organization	Yes or No	Question 6 Comment
		<p>sentence.</p> <p>The VSLs for Requirement R2 need to include the “unless” clause from the requirement. Otherwise, the VSL implies that the responsible entity violated the requirement for failing to follow the directive even if they could not for one of the reasons listed in the requirement. This again is not consistent with FERC guidelines that state VSLs cannot modify the requirement.</p> <p>The RCSDT did not include the “unless such actions would violate safety, equipment, regulatory or statutory requirements” portion of the requirement in the VSL because if an entity could not perform the directed action, there is no violation. No change made.</p> <p>The following comments pertain to COM-001-2.</p> <p>We recommend striking “capability” from all of the requirements. It is not clear to us how this helps when a definition for Interpersonal Communications is written already and applies to a communication medium. Furthermore, we think it causes confusion and actually contradicts the intent of the standard. Because Requirements R1, R3, R5, R7 and R8 focus on capability, the responsible entity will be in violation anytime its medium that it uses for the primary capability does not function properly. Whereas if the requirement stated that the responsible entity was to designate a primary communications medium, the responsible entity is not in violation if that medium is not functioning properly. It would be clear that Requirement R2, R4 and R6 are intended to be complementary.</p> <p>The RCSDT believes that prescribing a device or medium would limit an entity; therefore, “capability” is used to avoid being prescriptive and to provide flexibility. This was not intended by the drafting team. The intent is to give the entity the flexibility in meeting the requirement. A loss of Interpersonal Communication capability is covered by R10, notification of Interpersonal Communication capability failure. No change made.</p> <p>Furthermore, it is not clear why Requirements R1, R3, R5, R7 and R8 state that the</p>

Organization	Yes or No	Question 6 Comment
		<p>responsible entity shall “have” when the companion Requirements R2, R4, and R6 state “designate.”</p> <p>The RCSDT believes the requirements achieve the desired intent of the standard. Each entity listed must “have” an Interpersonal Communication capability and for Alternative Interpersonal Communication capability able to “designate” the alternate. The team established these requirements to provide flexibility to the industry. No change made.</p> <p>Since Requirement R10 deals with a failure of its Interpersonal Communications capabilities and not Alternate Interpersonal Communications capability, it should only refer to the entities in Requirements R1, R3, and R5. Currently, it includes R1 through R6.</p> <p>COM-001-2, R10: The RCSDT thanks you for pointing this out. The RCSDT has modified the language of R10 to refer to R1, R3, and R5, rather than “R1 through R6,” since the responsible entities are limited to the RC, the TOP, and the BA in these requirements.</p> <p>(COM-001 M1)</p> <p>We suggest changing “physical assets” to “demonstration of physical assets.” Since evidence is provided to the auditor and the auditor takes the evidence with them, providing them evidence that is a “physical asset” would be problematic. We believe that the VSLs could be written to provide more gradations. For example, if a Transmission Operator or Balancing Authority failed to have Interpersonal Communications capability with a Distribution Provider but had Interpersonal Communications capability with all other required entities, it has met the vast majority of the requirement. Since VSLs are a measure of how much the requirement was missed by the responsible entity, jumping to a Severe VSL does not seem to adequately capture that the responsible entity met the vast majority of the requirement. Requirements R4 and R6 even seem to recognize this by not including Distribution Provider in the list of entities to which the Transmission Operator or</p>

Organization	Yes or No	Question 6 Comment
		<p>Balancing Authority are required to designate Alternate Interpersonal Communications capability.</p> <p>The following comments pertain to COM-002-3.</p> <p>The RCSDT believes the Measures address the needed examples of evidence. No change made.</p> <p>While COM-002-3 is well written to explain the three-part communications requirements and makes it perfectly clear when Reliability Directive has been issued, the opening clause leaves the responsible entity open to second guessing on whether they should have issued a Reliability Directive. This problem could be solved by changing the opening clause to:</p> <p>“When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive.” In the second bullet of Requirement R3, we suggest using “Restate” in place of “Reissue.”</p> <p>The responsible entity is not really reissuing the Reliability Directive. They are still in the act of trying to get the Reliability Directive issued and are simply re-communicating it because it was not understood.</p>
<p><b>Response:</b> The RCSDT believe the offered suggestion does not improve COM-002-3, R1. No change made.</p>		
<p>Kansas City Power &amp; Light</p>		<p>R9 - considering the reliability of communication systems and System Operator attention may be on more important operational concerns, a 2-hour response to a problem with the alternative means of communication is over sensitive. Allowing for sometime in an operating shift would be more in line, such as 8 hours.</p> <p>COM-001-2, R9: The requirement is to initiate repair or designate an Alternative Interpersonal Communication capability within two hours. The requirement is NOT to have the repair completed within two hours. The requirement recognizes that the entity may use its Alternative Interpersonal Communication capability now as its Interpersonal Communication capability, and then, if it decides to do so, designate</p>

Organization	Yes or No	Question 6 Comment
		<p>another, if you may, “new” Alternative Interpersonal Communication capability. This is not required, but is an option that the entity can consider. The entity may already have a maintenance and repair agreement in place that will respond and repair the failed capability. No change made.</p> <p>Violation Severity Levels for COM-001-2: The VSL’s for requirements R1-R8 and R11 do not recognize the efforts of Entities to meet the requirements. If an Entity failed to establish communications or alternative communications with 1 Entity out of 20 should that be Severe?</p> <p>The RCSDT believes the requirements are essential to reliable operations; however, the requirement is Severe more so because it is a pass-fail requirement, and by definition makes it Severe (binary requirement). No change made.</p> <p>Implementation Plan for COM-001-2: The implementation plan is too aggressive at completing in 6 months after regulatory approvals. Establishing agreements with other RC’s, TOP’s and BA’s for alternative “interpersonal communications” regarding the various types of communications available that meet these requirements will take more than 6 months. Recommend 12 months to allow Entities sufficient time to reach agreements and to establish the communications.</p> <p>The RCSDT believes that six months is adequate considering additional facilities should not have to be built to establish communications with the DP and GOP; similarly, compliance documentation should not impose significant work on the entities’ part. No change made.</p>
<p><b>Response:</b> See response above.</p>		
Southern Company		<p>We question why the first paragraph of Section 1.3 - Data Retention has been included in each of these three standards. We suggest that it should be removed from each standard.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been</p>

Organization	Yes or No	Question 6 Comment
		<p>updated to be consistent with the Standards Drafting Guidelines.</p> <p>We suggest the drafting team look at Standard EOP-008, Requirements R3 and R8 and add appropriate language in Standard COM-001-2, to avoid instantaneous non-compliance for loss of Interpersonal Communications and/or alternate Interpersonal communications (R1 and R2).</p> <p>The RCSDT reviewed both EOP-008-0 and EOP-008-1, which is subject to future enforcement. In either version, the team believes there is no need to add additional language to the standard.</p> <p>The RCSDT believes that prescribing a device or medium would limit an entity; therefore, “capability” is used to avoid being prescriptive and to provide flexibility. This was not intended by the drafting team. The intent is to give the entity the flexibility in meeting the requirement. A loss of Interpersonal Communication capability is covered by R10, notification of Interpersonal Communication capability failure. No change made.</p> <p>COM-001-2 Dominion VP:</p> <p>COM-001-2; M9 reads “at least on a monthly basis”, Dominion suggests that this be changed to “at least once per calendar month” as written in R9. This change should also be corrected in the VSLs.</p> <p>The RCSDT agrees and the language in M9 has been changed to agree with the language in R9 and the R9 VSL.</p> <p>M8 - We suggest removing the second “that” in the first sentence of the measure.</p> <p>COM-001-2, M8: The RCSDT agrees and the language in M8 has been changed to delete the additional “that.”</p> <p>M10 - Dominion suggests this be revised to coincide with changes made in R10 (deleting impacted and adding as identified in Requirements R1 through R6), therefore M10 should read:</p>

Organization	Yes or No	Question 6 Comment
		<p>“Each Reliability Coordinator, Transmission Operator, and Balancing Authority, shall have and provide upon request evidence that it notified entities as identified in Requirements R1 through R6 within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasted 30 minutes or longer. Evidence could include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent evidence. (R10.)”</p> <p>The word “impacted” was removed in previous postings. For further clarification, the RCSDT has modified M10 to remove the word “impacted” to be consistent with R10. For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5,” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>M12 needs to be removed.</p> <p>The RCSDT thanks you for your comment and has made the deletion.</p> <p>Southern: Definition of Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communications used for day-to-day operation.</p> <p>Comments:</p> <p>-The proposed definition uses the term “medium.”</p> <p>What is the scope of that?</p> <p>Telephony is a “medium” but there is wired, wireless, satellite, etc. Was “medium” intended to differentiate voice, paper, text, email, teletype, or something else?</p> <p>-Similar to that last question - does the qualifying term “same” when modifying infrastructure mean something like voice versus written?</p> <p>What about situations where the primary telephone system is Voice Over Internet</p>

Organization	Yes or No	Question 6 Comment
		<p>Protocol (VOIP) and it is using the same computer network infrastructure as an email or messaging system. That is the “same infrastructure” but a different “medium”</p> <p>R1 Each Reliability Coordinator shall have Interpersonal Communications capability with the following entities: ...”</p> <p>The RCSDT believes that prescribing a device or medium would limit an entity; therefore, “capability” is used to avoid being prescriptive and to provide flexibility. This was not intended by the drafting team. The intent is to give the entity the flexibility in meeting the requirement. A loss of Interpersonal Communication capability is covered by R10, notification of Interpersonal Communication capability failure. No change made.</p> <p>Comments</p> <p>-In later requirements it is proposed that the entity “...shall designate an...” It is suggested that for consistency and auditability, this concept be used for R1, R3, R5, R7 and R8.</p> <p>Each entity listed must “have” an Interpersonal Communication capability and for Alternative Interpersonal Communication capability able to “designate” the alternate. The team established these requirements to provide flexibility to the industry. No change made.</p> <p>In addition, the qualifier of “primary” should be used such that the requirements read “... shall have designated, primary Interpersonal Communications capability with the following entities:” Although it is appropriate that “Alternative” be capitalized since it is used in a defined term (i.e. Alternative Interpersonal Communication”) that bounds acceptable alternative methods , we do not see the need to capital “primary.”</p> <p>The RCSDT emphasizes the requirement refers only to Interpersonal Communication capabilities. Adding the phrase “to the primary” is not needed. Please refer to the definitions of Interpersonal Communication and Alternative Interpersonal Communication for clarification. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>R9 Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communications capability at least once per calendar month.</p> <p>Comments</p> <ul style="list-style-type: none"> <li>-The requirement is unclear if the required monthly test is a general functionality test or if there is the expectation of testing the designated Alternative Interpersonal Communications with all of the entities defined in the subrequirements of R2, R4, and R6.</li> <li>-There is no expectation of testing the primary Interpersonal Communications is this intentional or an oversight?</li> </ul> <p>Although functional testing of this should be done as a normal course of business, should an explicit test be required with each entity in the subrequirements of R1, R3, R5, R7 and R8 to insure, for example, that all the phone numbers are correct?</p> <p>The RCSDT intends each Alternative Interpersonal Communication capability to be verified functional by testing. If an entity has only one such capability, then only one test would be required. You further ask whether the absence of required testing of the “primary” (word is not in the requirement) Interpersonal Communication capability is intentional. The RCSDT intentionally left it out because the Communication capability is used routinely and the use is sufficient to demonstrate functionality. With respect to phone numbers, these are procedural matters to be addressed by each individual entity and by including phone numbers it would make the requirement prescriptive. The requirement is to test capability. No change made.</p> <p>R10 Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1 through R6 within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer.</p>

Organization	Yes or No	Question 6 Comment
		<p>Comments</p> <p>-The following scenario seems plausible: The Interpersonal Communications fails and is detected at 14:00 and gets fixed at 14:35. It lasted more than 30 minutes but is fixed. As written the requirement would require the responsible entity to notify entities identified in R1 through R6 by 15:00 (i.e. 60 minutes from detection) even though the problem no longer exists. Is that the expectation?</p> <p>The RCSDT proposes that upon detection of failure that continues at least 30 minutes, starts the 60-minute clock. The 30 minutes allows an entity time to restore or determine if it can restore its Interpersonal Communication capability before the clock starts. No change made.</p> <p>General Question</p> <p>-Does COM-001 apply only to primary control centers or back-ups, per EOP-008, as well?</p> <p>The RCSDT reviewed both EOP-008-0 and EOP-008-1, which is subject to future enforcement. In either version, the team believes there is no need to add additional language to the standard. No change made.</p> <p>COM-002-3 Southern</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient.</p> <p>Comment</p> <p>It is recommended that the requirement be clarified that the Reliability Directive be identified as such during its delivery. (e.g., "...shall identify the action as a Reliability Directive to the recipient during its delivery.")</p> <p>The RCSDT believes the suggestion is overly prescriptive and limits the ability for an</p>

Organization	Yes or No	Question 6 Comment
		<p>entity to meet the requirement. No change made.</p> <p>R2 Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive shall repeat, restate, rephrase or recapitulate the Reliability Directive.</p> <p>Comment</p> <p>-It is recommended that the requirement be clarified that an entity receiving a Reliability Directive repeat, restate, rephrase or recapitulate it immediately upon receiving it. (e.g., "...shall repeat, restate, rephrase or recapitulate the Reliability Directive immediately upon receiving it."). As written, there is not limit as to when the entity must repeat it (i.e. they could wait 2 hours).</p> <p>The proposed requirement uses the term "upon recognition." No change made.</p> <p>General Question</p> <p>-The Standard is not clear as to what each entity is to do when more than one entity receives a Reliability Directive at the same time (e.g. during a RC area teleconference call) . Is, for example, a roll call of receiving entities expected to be held so that they individually can repeat, restate, rephrase or recapitulate the Reliability Directive followed by individual confirmation required in R3?</p> <p>The question about whether a roll call of receiving entities is expected to be held is asking for prescription of "how" to accomplish what is required. The RCSDT recognizes that there is more than one way to accomplish the confirmation when more than one entity received a Reliability Directive at the same time. What is required is for the recipient to respond in such a way that the issuer may determine whether the message has been properly understood. One way for that to occur would be, as you suggest, for the entities to individually respond. Another way would be for a pre-established protocol or procedure (e.g. roll-call, all-call, etc.) to be in place and used in such cases. The RCSDT has determined that prescribing "how" to ensure that "what" is required has been accomplished is not required and that the individually adopted procedures or protocols could offer many different ways to</p>

Organization	Yes or No	Question 6 Comment
		<p>ensure effectiveness. No change made. The RCSDT concept is that “All Call” compliance is related to having a document that explains how the entity responds. No change made.</p> <p>IRO-001-3 Dominion VP:</p> <p>R2 - Dominion questions the phrase “physically implemented” and recommends that the intent be clarified in the language.</p> <p>The RCSDT believes there may be conditions where an entity may not be able to physically implement the direction; for example, an entity that does not have the right to access certain equipment or cannot manually operate a broken apparatus. We feel the proposed language achieves the intended purpose. No change made.</p> <p>Dominion notes the following comment and response posted under Consideration of Comments on Initial Ballot - Reliability Coordination (Project 2006-06) Date of Initial Ballot: February 25 - March 7, 2011:</p> <p><i>“IRO-001 R2, R3, and R4 have replaced “Directives” with the word direction in lower case (while it appears that “Directives” is a subset of “directions”). We believe that this muddies the waters and could bring numerous conversations and dialog into scope unnecessarily. The end result is that the RC has the right to issue and use “Directives” and anything short of this could just be communications. For example, a number of entities that are Reliability Coordinators also facilitate energy markets. There are many communications related to markets that probably should be out of scope with respect to the standards. Furthermore, it might not be clear what role (e.g., Reliability Coordinator, market operator, etc) the staff at these entities are fulfilling.</i></p> <p><i>Response: IRO-001 is written to cover both typical daily operating scenarios and also emergency scenarios. The required performance encompasses issuing and responding to Reliability Directives as well as other directions. The requirement language specifically ties back to Requirement R2 which states that the RC “shall take actions or direct actions, which could include issuing Reliability Directives.” This is the</i></p>

Organization	Yes or No	Question 6 Comment
		<p><i>“direction in accordance with Requirement R2” stated in R3 and the “direction in accordance with Requirement R3” stated in R4.”Dominion believes the entity’s comments remain valid and the response provided by the RCSDT does not address all aspects of the concern. Dominion suggests that the language be changed to “Reliability Directive” consistent with COM-002.</i></p> <p>The word “direction” connects with the language in the R1 (act or direct). Reliability Directives is a subset of “direction.” No change made.</p> <p>M2 - need to add the following words “compliance with, physically, unless” which were included in R2, therefore M2 should read:</p> <p><i>“Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator’s direction(s) per Requirement R1 unless compliance with the direction per Requirement R1 could not be physically implemented or unless such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall have and provide copies of the safety, equipment, regulatory or statutory requirements as evidence for not complying with the Reliability Coordinator’s direction.”</i></p> <p>The RCSDT thanks you for your comment and has added the word “physically” to the IRO-001-2 Measure, M2.</p> <p>(R2) “Section 1.3, the second bullet; need to add calendar to 12 calendar months Southern General recommendation</p> <p>The RCSDT appreciates your comments and conforming changes have been made to the Data Retention section.</p>

Organization	Yes or No	Question 6 Comment
		<p>-It is recommended that where the verb “direct/directed” or noun “direction” is used in Purpose, R1, R2 and R3, that it be replaced with the verb “instruct/instructed” or noun “instruction”, as appropriate. This would help the industry avoid confusion often referred to as “big D” or “little d” directives. It is noted that the term “Reliability Directive” does that to a great degree but avoiding the verb/noun “direct/direction” would augment the difference.</p> <p>The RCSDT feels the use of direct and directed is consistent with the purpose and application of those terms in other standards. No change made.</p> <p>R1 Each Reliability Coordinator shall have the authority to act or direct others to act (which could include issuing Reliability Directives) to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts.</p> <p>Comment</p> <p>-At what point in time is “identified” referring to in “...to prevent identified events or...” Is it referring to current or future events? One might assume both since the “Time Horizon” is defined as Real-time Operations, Same Day Operations and Operations Planning but the requirement may be enhanced if explicitly stated (“...to prevent events identified in real-time or in the future or to mitigate the magnitude...”).</p> <p>The context of “identified” is when a set of system conditions is recognized that could lead to an Emergency or Adverse Reliability Impact, which may require action. See standards IRO-008 and IRO-009. No change made.</p> <p>-For clarity, the scope of the authority should be limited to the Reliability Coordinator Area (“...that result in an Emergency or Adverse Reliability Impacts within its Reliability Coordinator Area”). As written, it implies the authority should extend outside its RC Area.</p> <p>The RCSDT believes that limiting the scope to the RC’s area would be too limiting and not account for potential conditions where an adjacent RC may have lost its wide-</p>

Organization	Yes or No	Question 6 Comment
		<p>area view and requests the assistance of another RC or vice-versa. No change made.</p> <p>R2 Editorial comment - The words “compliance with” are in a different font in the posted version.</p> <p>The RCSDT thanks you for your comment and has corrected the font in IRO-001, R2.</p> <p>R3 Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform as directed in accordance with Requirement R2.</p> <p>Comment</p> <p>The requirement states the responsible entities shall “inform” its RC when unable to perform as directed but it is unclear when the notification needs to take place. Although the term “as soon as practical” may seem be un-measurable, as written now there is no time deadline to perform the notification - i.e. it could be 4 hours later after recognition.</p> <p>The proposed requirement uses the term “upon recognition.” No change made.</p>
<p><b>Response:</b> See response above.</p>		
Central Lincoln		<p>As stated in our prior comments, we continue to have problems with COM-002, R2 and R3 as written. The SDT’s answer (“It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive”) addresses our concern perfectly, and we would agree with such an expectation. Unfortunately, the expressed expectation is not in the proposed standard or even in a proposed guideline for the standard.</p>
<p><b>Response:</b> The RCSDT believes this is a process or procedure question that should be determined by the entity in how it handles communication with the RC. The standard, as written does, not preclude the entity from having a procedure. No change made.</p>		

Organization	Yes or No	Question 6 Comment
<p>Entergy Services, Inc</p>		<p>Entergy does not agree with including the DP and GOP in this standard. However, if they are to be included and are required to have the communications capability indicated, they should be included in R10. Why would it be important for the TOP to notify the DP that their communications method has failed, but it is not important for the DP to notify the TOP when their communications method has failed? The distinction doesn't seem reasonable or meaningful.</p> <p>The RCSDT stresses that R11 grants the DP and GOP flexibility in determining, in conjunction with its TOP or BA, when its Interpersonal Communication capability must be restored. This would provide allowances for those entities, which have little or no impact on the reliability of the BES while not requiring them to obtain Alternative Interpersonal Communication capabilities. Making the proposed changes would eliminate this flexibility. Removing R11, takes away the RCSDT's effort to include those provisions in the standard. No change made.</p> <p>Additionally, in the draft of COM-002-3 requirement 2 contains the language that the recipient of the directive shall "repeat, restate, rephrase or recapitulate" the directive. Why are so many synonyms of repeat necessary? Repeat or restate should be sufficient to get the point across.</p> <p>The RCSDT used the additional words to facilitate complete understanding. No change.</p>
<p><b>Response:</b> See response above.</p>		
<p>Independent Electricity System Operator</p>		<p>(1) The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in the Effective Dates Section A5 on P. 4 of the draft standard COM-001, COM-002 and IRO-001, and on P. 2 of COM-001's Implementation Plan and P. 1 of COM-002's and IRO-001's Implementation Plans, to the following effect:", or as otherwise made effective pursuant to the laws applicable to such ERO</p>

Organization	Yes or No	Question 6 Comment
		<p>governmental authorities.”</p> <p>The RCSDT is uncertain where the conflict exists. The standard IRO-001 uses the term “after applicable” and the others “following applicable.” The RCSDT has updated the standards to use the most current effective date language.</p> <p>(2) COM-001: Measure M9: - “monthly basis.” Suggest changing “monthly basis” to “at least once per calendar month” to be consistent the wording in R9.</p> <p>The RCSDT thanks you for your comment and has made the conforming change in the COM-001, Measure M9.</p> <p>(3) IRO-001: Measures M1, M2, M3 - The types of evidence are listed in paragraph form. This is not consistent with presentation style in COM-001-2 Measures, where evidence is listed in bullet format. Suggest using bullet form for consistency.</p> <p>The RCSDT agrees and has made all the Measures bullet form in COM-001-2, but not in COM-002-3 and IRO-001-3.</p> <p>(4) IRO-001, Data Retention Section:</p> <p>i. The retention requirements do not reflect the revised requirements. For example: the Electric Reliability Organization is no longer a responsible entity; the Reliability Coordinator should replace the ERO for keeping data for R1; Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider should replace the Reliability Coordinator for keeping data for R2; and there is no R4/M4.</p> <p>Data retention related to IRO-001-2, R2/M2 was changed to agree with your suggestion. The changes were more involved – several sections were changed, including removing the reference to R4/M4.</p> <p>ii. Section 1.3, second paragraph: “The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider... shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of</p>

		<p>time as part of an investigation:</p> <p>"The word "or" between Generator Operator and Distribution Provider should be changed to "and."</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p>
<p><b>Response:</b> See response above.</p>		
<p>Hydro-Quebec TransEnergie</p>		<p>For COM-001:</p> <p>R1.2 and R2.2: The phrase "within the same Interconnection" is improper; it needs to be removed. RCs between two Interconnections still need to communicate with each other for reliability coordination (e.g. between Quebec and the other RCs in the NPCC region to coordinate reliability issues including curtailing interchange transactions crossing an Interconnection boundary). The SDT's response to industry comments on the previous posting that the phrase was added to address the ERCOT situation (that ERCOT does not need to communicate with other RCs and that such coordination takes place between TOPs) leaves a reliability gap.</p> <p>Requirement R1 addresses a reliability need for adjacent Reliability Coordinators synchronously connected within the same Interconnection to have Interpersonal Communication capability; however, it does not preclude or limit the Reliability Coordinator from establishing Interpersonal Communication capability with others. The RCSDT does not see where there is a need to communicate with other Reliability Coordinator's from one interconnection to another. No change made.</p> <p>2. R3.5 and R4.3: The phrase "synchronously connected within the same Interconnection" is also improper; it needs to be removed. TOPs do communicate with other TOPs including those asynchronously connected and in another Interconnection (e.g. between Quebec and all of its asynchronously interconnected neighbors). The reason that was used in response to the above comments (coordination among TOPs for DC tie operation) contradicts with the inclusion of this</p>

Organization	Yes or No	Question 6 Comment
		<p>phrase in R3.5 and R4.3.</p> <p>The RCSDT has made clarifying changes by adding a Part to R3 and R4 to address asynchronous connections between Transmission Operators and have eliminated the phrase “within the same interconnection.”</p> <p>3. R4 and R6: Not requiring an Alternative Interpersonal Communication capability between the BAs and the DP and GOP can result in a reliability gap. If Interpersonal Communication capability between the BAs and these entities is required to begin with to enable BAs to communicate with these entities (such as operating instructions or Reliability Directives) to ensure reliable operations, then an alternative capability is also needed to ensure this objective is achieved when the primary capability fails.</p> <p>The RCSDT refers the Order No. 693 in Paragraph 508 to clarify the reason the DP and GOP are not required to have Alternative Interpersonal Communication and is as follows: “(1) expands the applicability to include Generator Operators and Distribution Providers and includes Requirements for their telecommunications facilities; (2) identifies specific requirements for telecommunications facilities for use in normal and emergency conditions that reflect the roles of the applicable entities and their impact on Reliable Operation and (3) includes adequate flexibility for compliance with the Reliability Standard, adoption of new technologies and cost-effective solutions.” In addition, R11 requires the DP and GOP to consult with its BA and TOP to determine a mutually agreeable action for restoration. No change made.</p> <p>4. To preclude the possibility of problems arising from having different languages spoken between entities, COM-001-1.1 R4 should remain as it was or those ideas kept in the revised requirement. R4 read: “R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.” 5. Measure M3</p>

Organization	Yes or No	Question 6 Comment
		<p>does not cover the added R3.5 condition (having Interpersonal Communications capability with each adjacent TOP). M3 needs to be revised.</p> <p>According to the proposed implementation plan for COM-001-2, R4 pertaining to the use of English will remain in effect upon the effective date of COM-001-3. This requirement is being revised and will be included in Standard COM-003-1, Operating Personnel Communications Protocols. COM-001-1.1, R4 will be retired at midnight the day before COM-003-1 becomes effective. No change made.</p> <p>For IRO-001:</p> <p>The Data Retention Section does not reflect the revised requirements. As examples: the Electric Reliability Organization is no longer a responsible entity; the Reliability Coordinator should replace the ERO for keeping data for R1.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Data Retention section.</p> <p>Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider should replace the Reliability Coordinator for keeping data for R2.</p> <p>The RCSDT has made conforming changes by correcting an error in the data retention section</p> <p>And, in the Data Retention Section, R4 and M4 are mentioned. However, there are only three requirements with their corresponding measures in the standard.</p> <p>The RCSDT has made conforming changes by correcting an error in the data retention section</p>
<p><b>Response:</b> See response above.</p>		
NIPSCO		<p>In IRO-001 R2 an "and" is missing after Generator Operator, and the comma should be removed.</p> <p>Why are there 3 different Effective Dates for this project, each standard being</p>

Organization	Yes or No	Question 6 Comment
		different? To simplify, can't they all be made identical?
<p><b>Response:</b> The RCSDT thanks you for your comment and has made conforming changes to IRO-001 R2 and the effective dates to the second quarter after regulatory approval.</p>		
<p>Oncor Electric Delivery Company LLC</p>		<p>For COM-001-2</p> <p>Oncor takes the position that contacting all impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer as prescribed in R1 through R6 is not doable within the ERCOT interconnect for a Transmission Operator.</p> <p>Oncor takes the position that notification only to the RC and BA is sufficient and that those two entities have the operational functionality to contact within the prescribed time all affected Distribution Providers, Generator Operators, and other Transmission Operators.</p> <p>The RCSDT proposes that upon detection of failure that continues at least 30 minutes, starts the 60-minute clock. The 30 minutes allows an entity time to restore or determine if they can restore Interpersonal Communication capability before the clock starts. No change made.</p> <p>R10 - Oncor takes the position that the word “impacted” added to R10 will clarify that notification only needs to be made to the entities that are effected by the failure of a communication path. This will also more align with the language in M10.</p> <p>The word “impacted” was removed in previous postings. For further clarification, the RCSDT has modified M10 to remove the word “impacted” to be consistent with R10. For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5,” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>For COM-002-3</p> <p>Oncor request clarity about what constitutes a “recipient.” For example, if a</p>

Organization	Yes or No	Question 6 Comment
		<p>Transmission Grid Operator performing the functions of a Transmission Operator issues a Reliability Directive to its own field operations personnel to perform an action on behalf of the same entity, does the field operations personnel as the recipient become in affect a “Transmission Operator” subject to R2?</p> <p>The term “recipient” in this case is referring to Functional entity to Functional entity communication. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Consolidated Edison Co. of NY, Inc.</p>		<p>Regarding COM-002 Requirement R1, we recommend that this requirement be reworded as follows: “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall require that the Reliability Directive be communicated using three-part communications as described in Requirements R2 and R3 of this standard.”</p> <p>The reason for this recommended rewording are threefold:</p> <ol style="list-style-type: none"> <li>1. Good operating practice calls for use of three-part communications at all times. The recommended re-write encourages the use of the good operating practice of three-part communications at all times, but does not require it.</li> <li>2. It is not good operating practice to require that an additional (unnecessary) phrase be used during emergency situations. During emergency situations, it is best to use standard operating protocols so as to limit unnecessary burdens on operating personnel during critical and stressful times.</li> <li>3. By implementing the proposed new R1 requirement, it would effectively weaken the need for rigorous compliance with any and all directives issued by the RC’s, TO’s or BA’s.</li> </ol> <p>The RCSDT respectfully disagrees, the recipient needs clarity when a Reliability Directive is communicated. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>Regarding IRO-001 Requirement R1, we recommend that the current requirement R3 be reinstated as the new requirement R1. That is, the new requirement R1 should read as follows: R1. The Reliability Coordinator shall have clear decision-making authority to act and to direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.</p> <p>We do not support any further dilution of Reliability Coordinator authority to enforce Reliability Directives through deletion of the 30-minute maximum response time period. The timely actions in response to any Reliability Coordinator issued Reliability Directives is an essential part of the process.</p> <p>The RCSDT believe these concerns are addressed in other performance-based standards (IRO-008 and IRO-009) that require action and contain timing requirement when addressing IROs. The omission of TSP, LSE, and PSE does not diminish reliability and brings the standard into conformity with COM-001 and COM-002. No change made.</p>
<p><b>Response:</b> See response above.</p>		
We Energies		<p>COM-001, Although a great improvement over existing COM-001, and eliminates the data component see comments:</p> <ul style="list-style-type: none"> <li>-For R5.1 Can the solutions included to meet R1 be included, same R3.2 and R5.2, same R5.3 and R7.2, same R5.4 and R8.1</li> <li>-For R5.2 Can the solutions included to meet R2 be included, same R4.2 and R6.2</li> </ul> <p>COM-001-2, R5: In a word: Yes. The requirement is to have capability and that capability does not have to be different than the entity on the other end has. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>-R9 a 2 hour response for a once a month test seems extreme, as would require a secondary Alternate Interpersonal Communications capability</p> <p>-M9 is reasonable, but should include something about communication actual repair and or time estimates</p> <p>COM-001-2, R9: The requirement is to “initiate action to repair or designate a replacement Alternative Interpersonal Communication capability...” within two hours. The RCSDT recognizes that many different contracts or other arrangements may exist to address repair. However, the RCSDT finds that entities should know what they have and how to initiate repair and those two hours to do so is reasonable. No change made.</p> <p>COM-001-2, M9: The requirement is to have evidence that either repair was initiated or an Alternative Interpersonal Communication capability was designated within two hours. The RCSDT understands that, in extreme cases, the entity may need to make its initial Alternative Interpersonal Communication capability its Interpersonal Communication capability and then designate another Alternative Interpersonal Communication capability if the repair times are so long that to continue in that mode for that long would present a reliability risk. Such arrangements, if they exist at all, are very rare. No change made.</p> <p>-R10 The use of R1 through R6 implies notification of both Interpersonal Communications and Alternate Interpersonal Communications failures. Do you notify if you become aware after the link is back up if it was down for GT 30 minutes, and Doesn’t address notifying when restored?</p> <p>COM-001-2, R10: The RCSDT thanks you for pointing this out. The RCSDT has modified the language of R10 to refer to R1, R3, and R5, rather than “R1 through R6,” since the responsible entities are limited to the RC, the TOP, and the BA in these requirements.</p> <p>Yes, there is no requirement to notify identified entities the Interpersonal Communication have been restored.</p>

Organization	Yes or No	Question 6 Comment
		<p>-R11 Implies that R8 and R9 are independent and redundant to R5.3, R5.4 and R3.3 and R3.4.</p> <p>COM-001-2, R11: The RCSDT believes you intended to refer to R7 and R8, rather than R8 and R9. The RCSDT does not believe that the language implies that the communications capability required by R7 and R8 are independent, but they may be. If the entity which is registered as a DP is also registered as a GOP (probably unlikely), then the capability could be met by the same medium. Neither does the RCSDT believe that R11 implies that R7 and R8 are redundant to R3.3 and R3.4 or to R5.3 and R5.4. No change made.</p> <p>R11 is not clear on the purpose of the statement “determine a mutually agreeable time for restoration” this could be driven by forces outside the control any of the entities. I think” provide estimated restoration and actual restoration time and determine mutually agreeable alternative during outage” would be better.</p> <p>The RCSDT notes that R11 does not limit the sources of information used by the DP or GOP in establishing a mutually agreeable action for restoration of its Interpersonal Communication capability with its TOP or BA. That is precisely why R11 is written in this manner. This allows flexibility on the part of the TOP and BA in determining when the Interpersonal Communication capability must be restored. In situations where there is little or no impact to the reliability of the BES, some flexibility could be allowed without requiring the acquisition of Alternative Interpersonal Communication capability. No change made.</p> <p>Update M9 accordingly</p> <p>See comment above concerning R9.</p> <p>COM-002</p> <p>-Since all the Requirements are related to Reliability Directives, is it implied that all “Emergency Communications” are Reliability Directives even if not designated as such per R1.</p>

Organization	Yes or No	Question 6 Comment
		<p>The RCSDT would like to highlight that communications is not a defined term in the NERC Glossary of Terms used in Reliability Standards ,nor is it defined in this standard. Thus, the plain meaning of communications is intended. The RCSDT has not implied a defined term in the wording of the purpose statement of the standard, nor in the Requirements themselves, that any communication is a Reliability Directive unless the issuing functional entity identifies the actions to be taken as a Reliability Directive. Therefore, not all communications during Emergencies will be Reliability Directives. No change made.</p> <p>COM-002, R2: The RCSDT included some examples of how to provide the evidence needed for Measure M2. The examples are not intended to be an all-inclusive list. The RCSDT does point out, though, that dated operator logs could provide such evidence. The RCSDT does not believe that the recipient has the alternative to refuse to perform as required. However, the RCSDT does bring attention to standard IRO-001-3, which requires entities to comply with directions unless compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory, or statutory requirements. No change made.</p> <p>-The M2 measure could be difficult for a recipient such as a Distribution Provider or Generator Operator. A recipient’s phone may not be recorded but an initiator’s always should. If a receiver refused to meet the R2 requirement, an initiator should have an alternative. i.e., repeat the directive and provide potential penalties if recipient refuses to comply. Should the initiator have responsibility for providing the entire 3-way evidence as M3 implies?</p> <p>The RCSDT would like to highlight that communications is not a defined term in the NERC Glossary of Terms used in Reliability Standards nor is it defined in this standard. Thus, the plain meaning of communications is intended. The RCSDT has not implied a defined term in the wording of the purpose statement of the standard, nor in the Requirements themselves, that any communication is a Reliability Directive unless the issuing functional entity identifies the actions to be taken as a Reliability Directive. Organization	Yes or No	Question 6 Comment
		<p>Reliability Directives. No change made.</p> <p>COM-002 M3: The Measure is correct as written. The issuer only needs the evidence that it confirmed the response was accurate or reissued according to the requirement. Evidence does not necessarily mean the entity must have the entire three-way conversation captured (i.e., recording), but evidence the entity confirmed or reissued according to requirement. No change made.</p> <p>IRO-001</p> <p>Although a great improvement over existing IRO-001, see comments:</p> <ul style="list-style-type: none"> <li>-R2 needs to be clear that it is the Reliability Coordinator’s Reliability Directive that must be complied with not just any Reliability Coordinator’s direction as stated.</li> <li>-The M2 measure could be difficult, as the operator would have to have access to documents proving the safety, equipment, regulatory or statutory requirements, which may be the assessment of an individual applying the safety rule.</li> </ul> <p>Is the measure requiring a deposition of the individual to be performed for each instance?</p> <p>The RCSDT notes that the intent of the standard is not intended to limit the RC authority to issue Reliability Directives. The Reliability Coordinator issuing the Reliability Directive is the one, which the recipient must comply. It is assumed that a BA or TOP has a relationship with one and only one RC for a given Balancing Area or Transmission Operator Area (some may have multiple, disconnected areas, that are subject to different RCs). Still need a way to communicate to mutually agree. No change made.</p> <p>With an assumed data retention of 90 day (voice) or 12 month document retention the deposition would be unlikely to be acquired prior to the retention period ending.</p> <p>Data retention is a significant issue when the data being recorded is voluminous, supporting a 90-day retention period. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>-R3 needs to be clear that it is the inability to perform the Reliability Coordinator’s Reliability Directive that must be communicated not just any “Reliability Coordinator’s as directed.”</p> <p>The RCSDT believes there is a misunderstanding about IRO-001, R3. The requirement specifically says “direction” and is in alignment with Requirement R1. Please note a Reliability Directive is a subset of “direction” that the RC may perform in accordance with R1. No change made.</p> <p>-The Data Retention section does not align with the standard:</p> <p>The Reliability Coordinator shall retain its evidence for the most recent 90 calendar days for voice recordings or 12 months for documentation for Requirement R2, Measure M2.</p> <p>The RCSDT thanks you for your comment. The RC has been removed from the measure and replaced with the corresponding R2 responsible entities (BA, DP, GOP, and TOP).</p> <p>R2 and M2 apply to the Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider.</p> <p>There is no R4 and M4.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p>
<p><b>Response:</b> See response above.</p>		
<p>City of Jacksonville Beach dba/ Beaches Energy Services</p>		<p>COM-001-2, R9 - "Each ... shall test its Alternative Interpersonal Communications capability." I would suggest adding the phrase "...to each entity for which Alternative Interpersonal Communications is required." to add clarity.</p>
<p><b>Response:</b> The RCSDT proposes that R9 correctly identifies and provides clarity for the entities required to have Alternative Interpersonal Communication capability. No change made.</p>		

Organization	Yes or No	Question 6 Comment
<p>Indiana Municipal Power Agency</p>		<p>For R2 in IRO-001-3, the requirement needs to have the entities comply with their Reliability Coordinator’s direction received in R1. Currently, requirement 2 directions are not linked back to R1 which means entities would have to comply with all Reliability Coordinator’s directions regardless if they are associated with R1.</p> <p>The RCSDT agrees with your comment and believes the requirements does not need a linkage. No change made.</p> <p>For R7 in COM-001-2, IMPA does not believe that every Distribution Provider needs to be included in requirement 7. IMPA recommends stating that requirement 7 only applies to Distribution Providers who own an UFLS or UFLS system.</p> <p>The expectation is that a Distribution Provider that is registered with NERC is obligated to comply. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Luminant Energy Company LLC</p>		<p>IRO-001-3 R1 is not consistent with the direction taken in COM-002-3 which requires the Reliability Coordinator to identify Reliability Directive as such. The same approach should be taken with IRO-001-3 R1 so that the Reliability Coordinator is required to identify directions that are made to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts as such prior to or when issuing the directions. This extra specification is needed to eliminate any possible confusion in areas where the market operator and Reliability Coordinator are the same entity. In these areas, the Reliability Coordinator/market operator routinely gives directions to other entities that are not to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts. Without the added clarification the receiving entity may not know the urgency of the situation and may not know to inform the Reliability Coordinator if they are unable to perform as required by R3.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response:</b> The RCSDT views R1 as an authority requirement to direct others, which could include a subset of direction called Reliability Directive. Requirement R2 is the response requirement for the recipient. The judgment the recipient is under is that the recipient must comply with the direction, unless the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements. Requirement R3 simply requires the recipient to inform the issuer of its inability to perform the direction. No change made.</p>		
<p>NextEra Energy, Inc.</p>		<p>NextEra has the following additional comments.</p> <p>COM-002-3</p> <p>The purpose of COM-002-3 is:</p> <p>“To ensure Emergency communications between operating personnel are effective.”</p> <p>This stated purpose is not the same as the specific requirement that three-way communication is used for a Reliability Directive. Thus, NextEra requests that the purpose be revised to read as follows:</p> <p>“To ensure that when a Reliability Directive is given that the Reliability Directive is explicitly stated and three-way communication is used.”</p> <p>The majority of stakeholders did not raise any issues with the purposed statement, and the RCSDT believes the current purpose statement is adequate. No change made.</p> <p>Consolidation of COM-002-3 and IRO-001-3</p> <p>NextEra notes a continuing area of concern with the somewhat unsynchronized approach taken in the drafting process. Reliability Standards COM-002 and IRO-001 are now on version three, and still there is a somewhat unsynchronized approach being proposed. A clear and consolidated approach seems easily achievable with minimal effort. Thus, as proposed below, NextEra requests that COM-002-3 and IRO-001-3 be combined, which also would appear to allow for the retirement of certain requirements, such as TOP-001-1 R1-4.</p> <p>The standard TOP-001-1, R1 through R4 is under the purview of another team. No</p>

Organization	Yes or No	Question 6 Comment
		<p>change made.</p> <p>NextEra also is concerned that the current approach may have contributed to several significant misstatements in IRO-001-3, R1-3, which use the terms “direct,” “direction” and “directed,” instead of the term Reliability Directive as used in COM-002-3. COM-002-3 and IRO-001-3 indicate that three-way communication only is required when a Reliability Directive is issued.</p> <p>The word “direction” connects with the language in the R1 (act or direct). Reliability Directives is a subset of “direction,” No change made.</p> <p>This begs the question of what are the potentially other, lower classes of directives in IRO-001-3 R1-3?</p> <p>And why do they need to be followed with or without three-way communication?</p> <p>Reliability Directives are identified as such at the time they are issued so the recipient understands the magnitude of the action being directed. No change made.</p> <p>Thus, at a minimum, NextEra requests that the terms direct, direction and directed be deleted from IRO-001-3 R1-3, respectively, and that Reliability Directive be inserted. This change, and other proposed changes, are reflected in NextEra’s overall proposal to combine COM-002-3 and IRO-001-3 into one COM-002-3 standard: {Note: If the term Adverse Reliability Impact is revised as proposed by NextEra, then the term would not need to be stricken.</p> <p>The RCSDT understands some of the benefits with combining the standards; however, at this point, it would further delay the progress of the standards.</p> <p>The word “direction” connects with the language in the R1 (act or direct). Reliability Directives is a subset of “direction.” No change made.</p> <p><i>R1. Each Reliability Coordinator shall have the authority to act and to issue a Reliability Directive to a Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider within its operating region to prevent identified events that may lead to, or to mitigate the magnitude or duration of, an Emergency.</i></p>

		<p><i>accordance with Requirement R6. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>Conclusion</p> <p>Given the importance of having clear and concise Reliability Standards on the issue of directives and three-way communication, until the above concerns raised by NextEra in items 4 through 6 are addressed, NextEra intends to continue to vote “no” on COM-001-2, COM-002-3 and IRO-001-3.</p> <p>The RCSDT thanks you for your comment and believes the revisions made to this set of standards is valuable to the industry and within the scope of the project. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Manitoba Hydro</p>		<p>COM-001-2-Definition ‘Interpersonal Communication’ - for clarity, the definition should explicitly state that data exchange is not included.</p> <p>The standard COM-001 is for Interpersonal Communication capability, which facilitates the communication (i.e., “... to interact, consult, or exchange information.”) and not the exchange of data which is addressed in IRO-010. No change made.</p> <p>-R9 - for clarity, the wording ‘... within 2 hours’ should be replaced with ‘... within 2 hours of the unsuccessful test’. Conforming change required to M9 as well.</p> <p>The RCSDT proposes that R9 correctly identifies and provides clarity for the entities required to have Alternative Interpersonal Communication capability. No change made.</p> <p>-R10 - for clarity, the wording ‘... as identified in R1 through R6...’ should be replaced with ‘... with which it is required to have Interpersonal Communications capability or Alternative Interpersonal Communication capability...’.</p>

Organization	Yes or No	Question 6 Comment
		<p>The RCSDT has modified the language of R10 to refer to R1, R3, and R5, rather than “R1 through R6,” since the responsible entities are limited to the RC, the TOP, and the BA in these requirements.</p> <p>-M6 - the term ‘Adjacent’ needs to be capitalized in the last sentence of the paragraph as ‘Adjacent Balancing Authority’ is a NERC defined term.</p> <p>The RCSDT thanks you for your comment and recognizes the confusion created by having “Adjacent” start the sentence. This gave the appearance of a defined NERC glossary term. The RCSDT has made conforming measures to eliminate this problem. See changes to COM-001-2, R1.2, R2.2, R3.5, R4.3, R5.5, and R6.3.</p> <p>-M7 - ‘that’ in the first line is repeated</p> <p>The RCSDT thanks you for your comment and has made conforming changes to remove the additional word “that.”</p> <p>-M9 - the wording ‘on a monthly basis’ should be replaced with ‘once per calendar month’ to be consistent with the wording of the R9.</p> <p>The RCSDT agrees and the language in M9 has been changed to agree with the language in R9 and the R9 VSL.</p> <p>-M11 - the words ‘that experiences a failure of any of its Interpersonal Communications capabilities’ should be added after Operator to be consistent with the wording of the Requirement</p> <p>The RCSDT thanks you for your comment and has made the conforming changes to Measure M11.</p> <p>-Compliance</p> <p>- 1.3 bulleted sentences - the term ‘historical data’ should be removed. The term ‘evidence’ is sufficiently descriptive and is consistently used in other requirements</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Data Retention section.</p>

Organization	Yes or No	Question 6 Comment
		<p>-Data Retention</p> <p>(1.3) - The data retention requirements are too uncertain for two reasons. First, the requirement to “provide other evidence” if the evidence retention period specified is shorter than the time since the last audit introduces uncertainty because a responsible entity has no means of knowing if or when an audit may occur of the relevant standard.</p> <p>Secondly, it is unclear what ‘other evidence’, besides the specified logs, recordings and emails, an entity may be asked to provide to demonstrate it was compliant for the full time period since their last audit.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been updated to be consistent with the Standards Drafting Guidelines.</p> <p>This comment also applies to COM-002-3 and IRO-001-3.</p> <p>-Data Retention (1.3) - COM-002-3 requires that voice recordings are kept for the most recent 3 calendar months but COM-001-2 requires that they be kept for the most recent 12 calendar months. Manitoba Hydro does not see the reliability benefit of storing voice recordings for longer than 3 months and suggests that voice recordings be removed as evidence for COM-001-2.</p> <p>The RCSDT thanks you for your comment and has provided a retention period of 90 days for voice recordings, if chosen by the entity, as a matter of media storage, and 12 months for all other evidence.</p> <p>Evidence of the availability of Interpersonal Communications and Alternative Interpersonal Communications can be demonstrated using the other forms of evidence listed.</p> <p>The RCSDT thanks you for your comment. The measures provide a significant listing of potential evidence, which allows for compliance flexibility. The measures are examples and the entity is not limited to those examples. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>-VSLs (general comment)</p> <p>- for clarity, use for example R1.1 and R1.2 to refer to requirements instead of Part 1.1 and Part 1.2.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Data Retention section.</p> <p>-VSLs R4 - a reference to R4.3 is missing</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the VSL section.</p> <p>COM-002-3-Title</p> <p>- to capture the purpose and intent of the standard, the title should be changed to 'Emergency Communications'.</p> <p>The RCSDT believes the title adequately captures the standard's scope. No change made.</p> <p>-R2 - for clarity, the words 'back to the sender' should be added to the end of the sentence</p> <p>The RCSDT believes the current wording clearly identifies the issuer. No change made.</p> <p>-R3 - for clarity, the words 'to the recipient' should be added to both of the bulleted sentences after 'confirm' and 'reissue'. The words 'evident from the response' should be added to the end of the second bullet.</p> <p>The RCSDT believes the current wording is clear as to who is the recipient. No change made.</p> <p>-A question for the drafting team: has it been discussed whether there should be an additional requirement which indicates that the Reliability Coordinator, Transmission Operator and Balancing Authority shouldn't take any action in a Reliability Directive</p>

Organization	Yes or No	Question 6 Comment
		<p>until such time as it has been confirmed accurate by the sender?</p> <p>If so, does the team feel that it's a worthwhile requirement to consider?</p> <p>RCSDT believes having an additional requirement is unnecessary and would be overly prescriptive. No change made.</p> <p>-M2 - the words 'restated, rephrased or recapitulated' should be added after 'repeated' to be consistent with wording of the requirement.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Measure, M2 in COM-002.</p> <p>-M3 - the words 'to show' should be deleted from the end of this paragraph.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Measure, M3 in COM-002.</p> <p>IRO 001-3-Purpose</p> <p>- the words 'to the Bulk Electric System' already appear in the definitions of Emergency and Adverse Reliability Impact and do not need to be repeated here.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Purpose in IRO-001.</p> <p>-Effective Date</p> <p>- the effective date should be changed to the 2nd calendar quarter following BOT approval in jurisdictions not requiring regulatory approval to be consistent with jurisdictions requiring regulatory approval.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make IRO-001 the same as COM-001 and COM-002.</p> <p>-General comment</p> <p>- There are repeated references to 'identified events'</p>

Organization	Yes or No	Question 6 Comment
		<p>- it is not clear what this is referring to.</p> <p>The context of “identified” is when a set of system conditions is recognized that could lead to an Emergency or Adverse Reliability Impact, which may require action. See standards IRO-008 and IRO-009. No change made.</p> <p>M1 - M1 refers to Adverse Reliability Impacts “within its Reliability Coordinator Area.” The requirement does not refer to ‘within its Reliability Coordinator Area’ - the wording in the measure and in the requirement should be consistent.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to IRO-001, M1 to remove the phrase “within its Reliability Coordinator Area.”</p> <p>M2 - missing the word ‘physically’ when describing that a direction could not be implemented, should be consistent with the wording in the requirement.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make IRO-001 measure M2.</p> <p>Compliance</p> <p>- the entire section needs to be updated as it refers to requirements and measures that don’t exist.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make IRO-001 Compliance section 1.3 to remove the invalid references.</p> <p>-VSLs R2 - the reference to ‘fully comply’ is very vague. It is only a violation if the entity does not fall within the exception.</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make IRO-001, R2, High VSL to be more consistent with the R2.</p> <p>- R2 VSL - For clarity, change “RC’s directive” to “Reliability Coordinator’s Reliability Directive.”</p> <p>The RCSDT thanks you for your comment and has made conforming changes to make</p>

		IRO-001, VSL R2, High VSL.
<b>Response:</b> See response above.		
Great River Energy		<p>In IRO-001-3 "authority" should be removed and the verbiage returned to "shall act."</p> <p>The RCSDT believes that other standards (i.e., IRO-009, R3 &amp; R4 and EOP-002, R1 &amp; R8) address the action of others and if the term "authority" is omitted, creates a generic requirement such as what has been suggested puts the RC in a double jeopardy situation. No change made.</p> <p>In COM-002-3 R2 and in Applicability we suggest removing the Distribution Provider as the RC would not likely give a Reliability Directive to a Distribution Provider. The Reliability Directive would more likely come from the Transmission Operator to the Distribution Provider.</p> <p>The RCSDT believes that other standards (i.e., IRO-009 - R3 &amp; R4, EOP-002 - R1 &amp; R8) address the action of others and if the term "authority" is omitted, creates a generic requirement such as what has been suggested puts the RC in a double jeopardy situation. No change made.</p> <p>In COM-002-3 R3 we "replacing "Reissue" with "Restate." You are not technically reissuing the Reliability Directive.</p> <p>COM-002-3, R3: The communications described are not intended to be a once-through process. Effective communications, sometimes referred to as three-part or three-way, often may be effective only after numerous iterations. The RCSDT believes the likely first effort to clarify would be to re-issue the instructions just to determine whether the recipient simply "heard wrong." Using the word re-state seems to imply that the wording is incorrect in some way or for some other reason needs to be said a different way. The RCSDT believes it is more likely that the issuer is attempting to bet the recipient to understand and therefore believes that reissue is more appropriate. No change made.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response:</b> See response above.</p>		
<p>Orange and Rockland Utilities, Inc.</p>		<p>Regarding COM-002 Requirement R1, we recommend that this requirement be reworded as follows:</p> <p><i>“When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall require that the Reliability Directive be communicated using three-part communications as described in Requirements R2 and R3 of this standard.”</i></p> <p>The reason for this recommended rewording are threefold:</p> <ol style="list-style-type: none"> <li><i>1. Good operating practice calls for use of three-part communications at all times. The recommended re-write encourages the use of the good operating practice of three-part communications at all times, but does not require it.</i></li> <li><i>2. It is not good operating practice to require that an additional (unnecessary) phrase be used during emergency situations. During emergency situations, it is best to use standard operating protocols so as to limit unnecessary burdens on operating personnel during critical and stressful times.</i></li> <li><i>3. By implementing the proposed new R1 requirement, it would effectively weaken the need for rigorous compliance with any and all directives issued by the RC’s, TO’s or BA’s. Regarding IRO-001 Requirement R1, we recommend that the current requirement R3 be reinstated as the new requirement R1.</i></li> </ol> <p>That is, the new requirement R1 should read as follows:</p> <p><i>“R1. The Reliability Coordinator shall have clear decision-making authority to act and to direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken</i></p>

Organization	Yes or No	Question 6 Comment
		<p><i>without delay, but no longer than 30 minutes.”</i></p> <p>We do not support any further dilution of Reliability Coordinator authority to enforce Reliability Directives through deletion of the 30 minute maximum response time period. The timely actions in response to any Reliability Coordinator issued Reliability Directives is an essential part of the process.</p>
<p><b>Response:</b> The RCSDT development of IRO-001-3 R1 states “...which could include issuing Reliability Directives...” and, therefore, does not preclude its use if it is determined by the RC to use it. There may be instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. No change made.</p>		
<p>Niagara Mohawk (dba National Grid)</p>		<p>COM-001-3</p> <p>- Some requirements are overly prescriptive and not results based.</p> <p>R7 &amp; R8 are not necessary. Every entity at a minimum has a contact with a phone as their "Interpersonal Communications capability." Just need to require that every entity has a plan if they lose their primary communication channel ("Interpersonal Communications capability").</p> <p>The standard establishes requirement for communication capability appropriate to ensure reliability. There is no requirement for it to be different from the Interpersonal Communication capability that its Balancing Authority has with it nor the Interpersonal Communication capability that its Transmission Operator has with it. Cooperation and coordination is always encouraged and is an excellent practice, but is not required by this standard. Thank you for your suggestion. No change made.</p> <p>COM-002-3</p> <p>- Requiring RCs, TOPs and BAs to state an action as a "reliability directive" complicates communications during a time when response time and clarity are important. If those issuing a directive don't get a repeat back they just need to ask for one. The requirement just needs to define "what" is required not "how." This</p>

Organization	Yes or No	Question 6 Comment
		<p>can be handled by procedures and training.</p> <p>The requirement is aimed at being a performance-based requirement and states a description of “what” communication must take place, but does not prescribe “how” the communication is to be made. Adding the suggested phrase “immediately upon receiving it” introduces the ambiguous term “immediately” for which there is neither plain meaning nor simple explanation. What must happen is that the recipient must respond in such a way that the issuer may determine whether the message has been properly understood. The RCSDT concludes that the proposed language gives plain meaning. No change made.</p> <p>- Delete reference to "adverse reliability impact" from the "Directive" definition. The "adverse reliability impact" definition is not clear, is this an actual event or contingency?</p> <p>The words imply it is an actual event which is already covered in the "Directive" definition. If the intent is to apply directives to potential stability or cascading contingencies it should say so.</p>
<p><b>Response:</b> The RCSDT thanks you for your comment; however, the RCSDT believes the definition captures two independent conditions, anticipated and after or post event. The definition of Emergency implies situations where the event is anticipated or currently happening. Likewise, the definition of Adverse Reliability Impact clearly identifies as a potential or actual event in the phrase, “an event that results in.” Both conditions are important to the definition. The RCSDT notes that the term, “Adverse Reliability Impact,” is a currently defined NERC Glossary term. The term as it appears in the standard is the revised term is the NERC Board of Trustee adopted term: The impact of an event that results in Bulk Electric System instability or Cascading. No change made.</p>		
American Electric Power		<p>COM-001-02</p> <p>R9: A two hour limit to repair or designate a replacement Alternative Interpersonal Communications capability is overly aggressive.</p> <p>COM-001-2, R9: The requirement is to initiate repair or designate an Alternative Interpersonal Communication capability within two hours. The requirement is NOT to have the repair completed within two hours. The requirement recognizes that the</p>

Organization	Yes or No	Question 6 Comment
		<p>entity may use its Alternative Interpersonal Communication capability now as its Interpersonal Communication capability, and then, if it decides to do so, designate another, if you may, “new” Alternative Interpersonal Communication capability. This is not required, but is an option that the entity can consider. The entity may already have a maintenance and repair agreement in place that will respond and repair the failed capability. No change made.</p> <p>COM-002-03</p> <p>R1: Should this requirement also include references to a manual action?</p> <p>The RCSDT believes adding the word “manual” is unnecessary and overly prescriptive. No change made.</p> <p>COM-002-03</p> <p>R3:The text “to resolve any misunderstandings” is unnecessary and should be removed.</p> <p>The RCSDT believes this phrase is essential to the process of communications. No change made.</p> <p>COM-002-3 VSL’s:</p> <p>As we have stated on previous projects, all severity levels need to be commensurate with both:</p> <p>a) the degree by which the requirement was violated, and</p> <p>The RCSDT has followed the VSL Guidelines in properly assigning the VSL as binary. No change made.</p> <p>b) by the impact of the violation to the BES. In this case, a single VSL of “Severe” violates both principles.</p> <p>The RCSDT notes the Violation Risk Factors define the potential impact to the BES; whereas, the VSL is how badly an entity violated the requirement. No change made.</p>

Organization	Yes or No	Question 6 Comment
		<p>There needs to be more gradients across the severity levels, and the single VSL of “Severe” incorrectly makes the assumption that the impact to the BES was severe.</p> <p>The RCSDT has followed the VSL Guidelines in properly assigning the VSL as binary. No change made.</p> <p>IRO-001-3</p> <p>R1, R2, R3: Having this requirement apply to actions and/or directions (which may be different than Reliability Directives) may put the recipient in a position that they are judged on whether or not they acted on communication that was not a Reliability Directive.</p> <p>The RCSDT views R1 as an authority requirement to direct others, which could include a subset of direction called, Reliability Directive. Requirement R2 is the response requirement for the recipient. The judgment the recipient is under is that the recipient must comply with the direction, unless the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements. Requirement R3 is simply requires the recipient to inform the issuer of its inability to perform the direction. No change made.</p> <p>The draft states that the purpose of this standard is “To establish the capability and authority of Reliability Coordinators to direct other entities to prevent an Emergency or Adverse Reliability Impacts to the Bulk Electric System.” The key word used is “direct”, so communications that need to be acted upon should be Reliability Directives only. The addition of any non-defined term is in conflict with the definition and intent of the term Reliability Directive. This could potentially cause confusion, especially at critical times when communication is key.</p>
<p><b>Response:</b> See response above.</p>		
Georgia Transmission		The following comments are regarding IRO-001-3.

Organization	Yes or No	Question 6 Comment
Corporation		<p>Requirement R1 should require the use of Reliability Directives. The requirement compels the Reliability Coordinator “to direct others to act to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impact.” Reliability Directives are necessary to address Adverse Reliability Impacts or Emergencies and trigger the use of three-part communications identified in COM-002-3.</p> <p>The RCSDT views R1 as an authority requirement to direct others, which could include a subset of direction called, Reliability Directive. Requirement R2 is the response requirement for the recipient. The judgment the recipient is under is that the recipient must comply with the direction, unless the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements. Requirement R3 is simply requires the recipient to inform the issuer of its inability to perform the direction. No change made.</p> <p>COM-002-3 R1 really compels the Reliability Coordinator to use a Reliability Directive for Emergencies and Adverse Reliability Impacts with the opening clause:</p> <p>“When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive.” What else could be more important for a Reliability Coordinator to issue a Reliability Directive than for an Emergency or Adverse Reliability Impact?</p> <p>Thus, not requiring the use of Reliability Directives for Adverse Reliability Impacts and Emergencies makes IRO-001-3 R1 and COM-002-3 R1 inconsistent.</p> <p>The RCSDT development of IRO-001-3 R1 states “...which could include issuing Reliability Directives...” and, therefore, does not preclude its use if it is determined by the RC to use it. There may be instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. No change made.</p> <p>It is recommended that the treatment of Reliability Directives shall be consistent</p>

Organization	Yes or No	Question 6 Comment
		<p>with those being developed for TOP-001-2 as proposed by the Real-Time Operations drafting team (Project 2007-03).</p> <p>The RCSDT is using the term in the same context in this standard as it is in TOP-001-2. No change made.</p> <p>As such, consider using the following language for R2: “Each TOP, BA, and GOP shall comply with each identified Reliability Directive issued and identified as such by its RC, unless such actions would violate safety, equipment, regulatory, or statutory requirements.”</p> <p>The RCSDT is addressing a directive (P487, Order 693) to include the DP in COM-001 and the RCSDT has included the DP in COM-002 and IRO-001 applicability because these standards are related to reliability communications. The RCSDT agrees with the point that communication will most likely be from the BA or TOP; however, the communications may come from the RC. No change made.</p> <p>Accordingly, please consider using the following language for R3:</p> <p>“Each TOP, BA, and GOP shall inform its RC of its inability to perform an identified Reliability Directive issued by that RC.” Again, we do not believe the DP would receive an identified Reliability Directive directly from the RC and the DP applicability should be removed from this standard. The DP is appropriately captured under COM-002 and TOP-001 with respect to Reliability Directives.</p> <p>Accordingly, NERC’s Reliability Functional Model V5 describes and identifies the DP’s relationships with other functional entities to TOP and BA with respect to Real Time.</p> <p>Real Time<sup>9</sup></p> <p>7. Implements voltage reduction and sheds load as directed by the Transmission Operator or Balancing Authority.</p>

<sup>9</sup> NERC Functional Model Version 5, “Functional Entity – Distribution Provider,” pg 47, ([http://www.nerc.com/files/Functional\\_Model\\_V5\\_Final\\_2009Dec1.pdf](http://www.nerc.com/files/Functional_Model_V5_Final_2009Dec1.pdf))

Organization	Yes or No	Question 6 Comment
		<p>8. Implements system restoration plans as coordinated by the Transmission Operator.</p> <p>9. Directs Load-Serving Entities to communicate requests for voluntary load curtailment.</p> <p>The following comments are regarding COM-001-2.</p> <p>With respect to the Functional Model V5, please see Page 31, “18. Issues corrective actions and emergency procedures directives (e.g., curtailments or load shedding) to Transmission Operators, Balancing Authorities, Generator Operators, Distribution Providers, and Interchange Coordinators.” No change made.</p> <p>The SDT should include an additional qualifier to Interpersonal Communications within the context of these requirements, for example (operational or dispatch center communications??). Technically, the air we breathe, as well as other mediums like “any” cell phone, fax lines, and/or email accounts would qualify under this proposed definition of Interpersonal Communication. Assuming at least one employed individual can speak, all entities could demonstrate compliance of this capability at all times, therefore, it is not clear the intent of these requirements are accurately being presented.</p> <p>The RCSDT appreciates your comment and has made clarifying changes by removing the phrase “any of” in COM-001, R11. Additionally, the RCSDT made a clarifying change to indicate the DP and GOP only need to consult with the entity affected by the failure.</p> <p>It is recommended to include the use of “signed attestation letters” as examples of evidence under M4 and M11 and other measures as appropriate.</p> <p>The RCSDT proposes that R4 and R11 allow for compliance flexibility. A “signed attestation letter” is one form of evidence. The measures are examples and the entity is not limited to those examples. No change made.</p>

<b>Response:</b> See response above.		
BGE		No comment.
<b>Response:</b> No comment provided.		
Nebraska Public Power District		<p>Comments: COM-001-2:</p> <p>Requirement 10 is too open ended as written. The measure, M10, indicates that only impacted entities need to be notified. The requirement should be changed to make it consistent with the measure. The requirement would then read ‘Each RC, TOP And BA shall notify impacted entities as identified...’Requirements 3 and 5 place the responsibility for establishing Interpersonal Communication capability on the TOP and BA. It is quite conceivable that a TOP or BA may not know all, or newly, registered DPs and GOPs in its respective area.</p> <p>The word “impacted” was removed in previous postings. For further clarification, the RCSDT has modified M10 to remove the word “impacted” to be consistent with R10. For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5,” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>In Requirements 7 and 8, the DP and GOP, respectively, are in turn responsible for establishing Interpersonal Communication capability. The TOPs/BAs and the DPs/GOPs should not be responsible for this. The DPs and GOPs should be held accountable for requesting that capability of their TOP and BA. Therefore, we suggest adding the following phrase at the end of Requirements 3.3, 3.4, 5.3 and 5.4 - ‘that has requested Interpersonal Communications capability.’</p> <p>Then R3.3 would read ‘Each Distribution Provider within its Transmission Operator Area that has requested Interpersonal Communications capability.’</p> <p>The standard establishes requirement for communication capability appropriate to</p>

Organization	Yes or No	Question 6 Comment
		<p>ensure reliability. There is no requirement for it to be different from the Interpersonal Communication capability that its Balancing Authority has with it nor the Interpersonal Communication capability that its Transmission Operator has with it. Cooperation and coordination is always encouraged and is an excellent practice, but is not required by this standard. Thank you for your suggestion. No change made.</p> <p>Requirement 9: could be construed to mean that the repair or replacement due to an unsuccessful test should be completed within 2 hours. In any case a rewording of the second sentence of Requirement 9 would make it clear and we would suggest the following:</p> <p>“ The responsible entity shall, within 2 hours of the unsuccessful test, provide notification to the proper authority in order to initiate repair or designate a replacement Alternative Interpersonal Communications capability. “</p> <p>COM-001-2, R9: The requirement is to initiate repair or designate an Alternative Interpersonal Communication capability within two hours. The requirement is NOT to have the repair completed within two hours. The requirement recognizes that the entity may use its Alternative Interpersonal Communication capability now as its Interpersonal Communication capability; and then, if it decides to do so, designate another, if you may, “new” Alternative Interpersonal Communication capability. This is not required, but is an option that the entity can consider. The entity may already have a maintenance and repair agreement in place that will respond and repair the failed capability. No change made.</p> <p>COM-002-3:</p> <p>Requirement 2/Measure 2: There is an inconsistency between the requirement and the measure. The requirement allows the recipient to repeat, restate, rephrase or recapitulate the directive. Measure 1 [See M2] only mentions repeating the directive.</p> <p>The RCDST appreciates your observation. The phrases “restate, rephrase or</p>

Organization	Yes or No	Question 6 Comment
		<p>recapitulate,” have been added to Measure, M2.</p> <p>Requirement 3: The second bullet in Requirement 3 appears to require the reissuance of an entire Reliability Directive if only a single point in the directive is not correctly repeated, restated, rephrased or recapitulated. Is this what the SDT intended?</p> <p>Shouldn’t consideration be given for that portion of the directive that was communicated properly? Then only a new, revised directive containing the portion of the original directive that was misunderstood would need to be reissued.</p> <p>The RCSDT’s intention of the requirement is to confirm the communication is confirmed accurate and, if not, any misunderstanding is corrected. The requirement does not limit the entity to reissuing the entire Reliability Directive. So an entity is not precluded from only correcting the portion of the misunderstanding. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Georgia System Operations</p>		<p>Requirement R1 should require the use of Reliability Directives. The requirement compels the Reliability Coordinator “to direct others to act to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impact.” Reliability Directives are necessary to address Adverse Reliability Impacts or Emergencies and trigger the use of three-part communications identified in COM-002-3.</p> <p>COM-002-3 R1 really compels the Reliability Coordinator to use a Reliability Directive for Emergencies and Adverse Reliability Impacts with the opening clause: “When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive.” What else could be more important for a Reliability Coordinator to issue a Reliability Directive than for an Emergency or Adverse Reliability Impact? Thus, not requiring the use of Reliability Directives for Adverse Reliability Impacts and Emergencies makes IRO-001-3 R1 and</p>

Organization	Yes or No	Question 6 Comment
		<p>COM-002-3 R1 inconsistent.</p> <p>The RCSDT development of IRO-001-3 R1 states “...which could include issuing Reliability Directives...” and, therefore, does not preclude its use if it is determined by the RC to use it. There may be instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. No change made.</p> <p>It is recommended that the treatment of Reliability Directives shall be consistent with those being developed for TOP-001-2 as proposed by the Real-Time Operations drafting team (Project 2007-03).</p> <p>The RCSDT is using the term in the same context in this standard as it is in TOP-001-2. No change made.</p> <p>As such, consider using the following language for R2: “Each TOP, BA, and GOP shall comply with each identified Reliability Directive issued and identified as such by its RC, unless such actions would violate safety, equipment, regulatory, or statutory requirements.”</p> <p>Accordingly, please consider using the following language for R3:</p> <p>“Each TOP, BA, and GOP shall inform its RC of its inability to perform an identified Reliability Directive issued by that RC.” Again, we do not believe the DP would receive an identified Reliability Directive directly from the RC and the DP applicability should be removed from this standard. The DP is appropriately captured under COM-002 and TOP-001 with respect to Reliability Directives.</p> <p>The RCSDT believes the latitude afforded in R2 and R3 allows for normal operational dialogue that may not require the use of Reliability Directive. The RC determines when Reliability Directive is applicable. No change made.</p> <p>With respect to the Functional Model V5, please see Page 31, “18. Issues corrective actions and emergency procedures directives (e.g., curtailments or load shedding) to Transmission Operators, Balancing Authorities, Generator Operators, Distribution</p>

Organization	Yes or No	Question 6 Comment
		<p>this proposed definition of Interpersonal Communication. Assuming at least one employed individual can speak, all entities could demonstrate compliance of this capability at all times, therefore, it is not clear the intent of these requirements are accurately being presented.</p> <p>The RCSDT appreciates your comment and has made clarifying changes by removing the phrase “any of” in COM-001, R11. Additionally, the RCSDT made a clarifying change to indicate the DP and GOP only need to consult with the entity affected by the failure.</p> <p>The RCSDT agrees with your assessment of “medium” and included the term to allow flexibility for an entity to communicate as they determine and demonstrate compliance. Two or more individuals are required for communication to occur where they interact, consult or exchange information. No change made.</p> <p>The RCSDT proposes that R4 allows for compliance flexibility. “Signed attestation letters” could qualify as “equivalent evidence” as stated in M4 and M11. No change made. It is recommended to include the use of “signed attestation letters” as examples of evidence under M4 and M11 and other measures as appropriate.</p> <p>The RCSDT proposes that R4 and R11 allow for compliance flexibility. A “signed attestation letter” is one form of evidence. The measures are examples and the entity is not limited to those examples. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Ingleside Cogeneration LP</p>		<p>Ingleside Cogeneration LP is concerned that the entity-to-entity organization of the COM Standards is quickly being outdated by voice and video conferencing or one-to-many broadcasts. In addition, email may be a preferred mode of most communications to and from small Generator Operators.</p> <p>It is not clear that these technologies are precluded from consideration by COM-001 and COM-002 - which means that some auditors may believe that they are. This leads to inconsistent application of the compliance criteria, and may discourage the</p>

Organization	Yes or No	Question 6 Comment
		<p>use of some powerful technologies. It appears to us that some technical guidelines would be appropriate to help entities and auditors decide which are applicable under these Standards.</p>
<p><b>Response:</b> The RCSDT proposes that COM-001-2 and COM-002-3, as written, allows flexibility for an entity to communicate where two or more individuals are required for communication to occur and they interact, consult or exchange information. Compliance is contained in the measures and an entity must determine if their communication method can demonstrate compliance with the requirements. No change made.</p>		
<p>Duke Energy</p>		<p>- COM-001-2 does not specify how much time an entity is allowed to restore failed Interpersonal Communications capability or failed Alternative Interpersonal Communications capability.</p> <p>R1 through R6 require that the RC, TOP and BA have both. R7 and R8 require that DPs and GOPs have Interpersonal Communications capability. An auditor could find an entity non-compliant with these requirements upon failure of either capability.</p> <p>The RCSDT thanks you for your comment. Requirements R7 and R8 have been revised to account for the failure of Interpersonal Communication capability. The intent of R11 is to require the responsible entity to take action upon the failure of its Interpersonal Communication.</p> <p>R9, R10 and R11 specify actions to take upon failure, but do not relieve entities of responsibility under R1 through R8.</p> <p>The RCSDT believes non-compliance is not due solely to the failure of any Interpersonal Communication capability, but must be accompanied by a failure to consult with the applicable Transmission Operator or Balancing Authority to establish mutually agreeable action for restoration. No change made.</p> <p>-COM-001-2 R9, M9 and VSLs - M9 and VSLs should be revised to be consistent with wording of R9 phrase “at least once per calendar month.”</p> <p>The RCSDT agrees with your comments and has aligned M9 and the R9 VSL to the R9</p>

Organization	Yes or No	Question 6 Comment
		<p>to use “once each calendar month.”</p> <p>-COM-001-2 R10, M10 and VSLs - Clarity is needed regarding when the 60-minute clock starts. For example, suppose a failure is detected immediately upon occurrence of the failure. Does the 60-minute clock start immediately, or after the failure has lasted 30 minutes? When does the 60-minute clock start if a failure is detected and the entity is unsure when it occurred?</p> <p>The RCSDT proposes that upon detection of failure that continues at least 30 minutes, starts the 60-minute clock. The 30 minutes allows an entity time to restore or determine if it can restore its Interpersonal Communication capability before the clock starts. No change made.</p> <p>-COM-001-2 R10, M10 and VSLs - If the failure only lasts for 35 minutes, it appears that the RC, TOP or BA is still required to notify entities identified in R1 through R6. Is this the drafting team’s intent?</p> <p>Yes. The clock starts upon detection of failure of at least 30 minutes. No change made.</p> <p>-COM-001-2 R10, M10 and VSLs - Should be revised since the RC, TOP and BA are only required to have Alternative Interpersonal Communications capability with other RCs, TOPs and BAs per R2, R4 and R6.</p> <p>For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5,” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>Suggested rewording for R10:</p> <p><i>“Each Reliability Coordinator, Transmission Operator and Balancing Authority shall notify entities with which it is required to have Alternative Interpersonal Communications capability as identified in R2, R4 and R6 within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer.”</i></p>

Organization	Yes or No	Question 6 Comment
		<p>-COM-001-2 M11 and VSL - Replace the word “their” with the word “its.” The RCSDT agrees and has modified M11 and VSL, as you suggested.</p> <p>-COM-001-2 Data Retention - The way Data Retention is being enforced, this whole section could just be reduced to a blanket statement that an entity must be able to provide evidence that it has been in compliance since its last audit. The RCSDT has provided the Data Retention section consistent with the approved Standard Drafting Team Guidelines. No change made.</p> <p>-COM-002-3 R2, M2 and VSL - Replace “and” with “or.” The RCSDT agrees with your comment and modifies R2, M2, and VSL accordingly. Also, the phrase “repeat, restate, rephrase or recapitulate” seems excessive and may be intended to avoid a violation where an entity fails to repeat the Reliability Directive word for word. Suggested rewording: “Each Balancing Authority, Transmission Operator, Generator Operator or Distribution Provider that is the recipient of a Reliability Directive shall repeat the Reliability Directive back to the issuer with sufficient accuracy so that understanding can be confirmed.” The RCSDT believes the term suggested “sufficient accuracy” is subject to interpretation. The RCSDT proposes the terms to allow a recipient to convey the message back to the issuer without a word-for-word requirement as long as the issuer confirms the accuracy of the response or reissues it to resolve any misunderstanding. No change made.</p> <p>-COM-002-3 R3, M3 - Replace “and” with “or.” The RCSDT agrees with your comment and modifies R3, M3, and VSL accordingly.</p> <p>-IRO-001-3 - We believe that the Purpose and the Requirements of this standard should be focused solely on situations where the Reliability Coordinator issues Reliability Directives to prevent an Emergency or Adverse Reliability Impact.</p>

Organization	Yes or No	Question 6 Comment
		<p>The RCSDT development of IRO-001-3 R1 states “...which could include issuing Reliability Directives...” and, therefore, does not preclude its use if it is determined by the RC to use it. There may be instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. No change made.</p> <p>IRO-001-3 - The Purpose should be rewritten as follows: “To establish the authority of Reliability Coordinators to issue Reliability Directives to other entities to prevent an Emergency or the impact of an event that results in Bulk Electric System instability or Cascading.”</p> <p>The RCSDT appreciates the suggested rewording; however, the RCSDT development of the IRO-001-3 Purpose Statement allows for instances where the RC discusses operational issues in normal dialogue with entities that do not require the use of Reliability Directive. The requirements of IRO-001-3 allow the RC to issue a Reliability Directive if they determine one should be issued. No change made.</p> <p>-IRO-001-3 - R1 should be rewritten as follows: “Each Reliability Coordinator shall have authority to act or to issue Reliability Directives to others, including but not limited to the Transmission Operator, Balancing Authority and Generator Operator within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or the impact of an event that results in Bulk Electric System instability or Cascading.”</p> <p>The RCSDT appreciates the suggested rewording; however, the Functional Model V5 addresses the scope of the RC function. No change made.</p> <p>-IRO-001-3 - R2 should be rewritten as follows:  <i>“Each Transmission Operator, Balancing Authority, Generator Operator or Distribution Provider shall comply with a Reliability Directive issued by the Reliability Coordinator unless the Reliability Directive cannot be physically implemented or unless such action would violate safety, equipment, regulatory, or statutory requirements.”</i></p>

Organization	Yes or No	Question 6 Comment
		<p>The RCSDT appreciates the suggested rewording; however, as written R2 allows for normal operational dialogue without having to invoke a Reliability Directive by the RC. No change made.</p> <p>-IRO-001-3 - R3 should be rewritten as follows: “Each Transmission Operator, Balancing Authority, Generator Operator or Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to comply with a Reliability Directive in accordance with Requirement R2.</p> <p>The RCSDT appreciates the suggested rewording; however, as written R2 allows for normal operational dialogue without having to invoke a Reliability Directive by the RC. No change made.</p> <p>-IRO-001-3 Measures and VSLs - Should be revised to conform with the above suggested revisions to requirements.</p>
<p><b>Response:</b> See response above.</p>		
ISO New England		none
ERCOT ISO		<p>Regarding COM-001-2:</p> <p>We are not clear on the time horizon of requirements for COM-001-2. Based upon the purpose statement, it appears that establishment would be ahead of real time. Wording in the requirements could be construed as maintaining at all times vs. establishing communications.</p> <p>The RCSDT proposes that compliance with requirements of the standard must be demonstrated. The Purpose Statement is not measured. No change made.</p> <p>The timeline for mandatory/effectiveness may not be acceptable to establish communications with DPs if hardware procurement/projects must take place.</p> <p>The RCSDT considered concerns about the implementation of the requirements by DP and GOPs and concluded the requirements are achievable within the</p>

Organization	Yes or No	Question 6 Comment
		<p>implementation period. No change made.</p> <p>Regarding IRO-001-3:</p> <p>We have some concern for the removal of LSE in particular from R2 and R3 from current IRO-001-2 for the ERCOT region. The ERCOT region has QSEs that manage Load Resources. There may be some QSEs that are not registered as a GOP that deploy Load Resources. Per the current LSE JRO, QSEs with Load Resources are registered as LSEs. Not requiring LSEs to deploy Load Resource directives could be perceived as a reliability gap created from the previous version to this version. PSEs could be removed as long as they fall under BA authority.</p> <p>The RCSDT believes the DP is the correct entity because the LSE does not own assets. The definition of LSE is, “The functional entity that secures energy and transmission service (and reliability related services) to serve the electrical demand and energy requirements of its end use customers.” In contrast, the definition of a DP is, “The functional entity that provides facilities that interconnect an End-use Customer load and the electric system for the transfer of electrical energy to the End-use Customer. Additionally, the Functional Model V5 demonstrates this under the Reliability Coordinator, “18. Issues corrective actions and emergency procedures directives (e.g., curtailments or load shedding) to Transmission Operators, Balancing Authorities, Generator Operators, Distribution Providers, and Interchange Coordinators.” No change made.</p> <p>The Data Retention section should be corrected to match the new requirements numbers and elimination of the previous version R1 with ERO.</p> <p>The Version History mentions six requirements retired, but only details five.</p> <p>The RCSDT thanks you for your comments. The Data Retention language has been updated to be consistent with the Standards Drafting Guidelines.</p>
<p><b>Response:</b> See response above.</p>		

Organization	Yes or No	Question 6 Comment
ReliabilityFirst		<p>Comments on COM-001-2</p> <p>1. Applicability Section</p> <p>a. RFC recommends adding the Generator Owner to the applicably section of the standard along with corresponding Requirements R8 and R11. ReliabilityFirst believes to maintain system reliability and based on certain business practices in effect, Generator Owners need to be required to have associated Interpersonal Communications with its Balancing Authority and Transmission Operator.</p> <p>The RCSDT considered this situation and have concluded Generator Owners do not operate facilities of the BES. Under the Functional Model V5 Generator Owners have these Relationships with Other Functional Entities. The following is an excerpt from the Functional Model V5 concerning the Generator Owner. No change made.</p> <ol style="list-style-type: none"> <li>1. Provides generator information to the Transmission Operator, Reliability Coordinator, Balancing Authority, Transmission Planner, and Resource Planner.</li> <li>2. Provides unit maintenance schedules and unit retirement plans to the Transmission Operator, Balancing Authority, Transmission Planner, and Resource Planner.</li> <li>3. Develops an interconnection agreement with Transmission Owner on a facility basis.</li> <li>4. Receives approval or denial of transmission service request from Transmission Service Provider.</li> <li>5. Provides reliability related services to Purchasing-Selling Entity pursuant to agreement.</li> <li>6. Reports the annual maintenance plan to the Reliability Coordinator, Balancing Authority and Transmission Operator.</li> <li>7. Revises the generation maintenance plans as requested by the Reliability Coordinator.</li> </ol>

Organization	Yes or No	Question 6 Comment
		<p>2. Requirement R7 and R8</p> <p>a. ReliabilityFirst seeks further clarity on why the Distribution Provider and Generator Operator are not required to designate an Alternative Interpersonal Communications capability?</p> <p>Requirements R7 and R8 require the Distribution Providers and Generator Operators to have Interpersonal Communications capability but there is not corresponding requirement to have an Alternative Interpersonal Communications capability.</p> <p>ReliabilityFirst recommends adding two new requirements for the Distribution Provider and Generator Operator to designate an Alternative Interpersonal Communications capability. This will be consistent with how Requirements R1 through R6 are set up.</p> <p>The standard establishes requirement for communication capability appropriate to ensure reliability. In addition, R7 and R8 are responsive to FERC Order No. 693. Entities may use the telephone cited in the example as their Interpersonal Communication capability. Requirement R11, as modified, addresses the loss of Interpersonal Communication capability. No change made.</p> <p>3. Requirement R9</p> <p>a. Assuming new requirements for the Distribution Provider and Generator Operator to designate an Alternative Interpersonal Communications capability (based on previous comment) are added to the standard, the Distribution Provider and Generator Operator will need to be added to Requirement R9 to test its Alternative Interpersonal Communications capability at least once per calendar month.</p> <p>The RCSDT thanks you for your comment and believes the DP and GOP only need Interpersonal Communication capability and it meets the respective FERC directive. No change made.</p> <p>4. Requirement R10</p> <p>a. Based on the ReliabilityFirst comment submitted for Question 4, ReliabilityFirst</p>

Organization	Yes or No	Question 6 Comment
		<p>believes the Distribution Provider and Generator Operator should be included in Requirement R10.</p> <p>The RCSDT proposes that DP and GOP are included in the requirement. “... shall notify entities...” as identified in R1 through R6. No change made.</p> <p>b. Since Interpersonal Communications capabilities is a very important piece of operating the BES in a reliable manner, ReliabilityFirst believes the timeframe in which an entity is required to notify the entities is too long. ReliabilityFirst recommends the following language for Requirement R10:</p> <p>i. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider and Generator Operator shall notify entities as identified in Requirements R1 through R8 of a failure of its Interpersonal Communications capabilities that lasts 15 minutes or longer. The notification shall be made within 30 minutes of the detection of a failure.</p> <p>The RCSDT proposed the time frame to allow sufficient time for an entity to determine if IC could be restored. No change made.</p> <p>5. VSLs for Requirement R1 through R8</p> <p>a. ReliabilityFirst suggest gradating the VSLs for R1 through R8. Listed below is an example of how to gradate the VSL for R1. The same type of approach could be used for R2 through R8 as well.</p> <p>i. High VSL- the Reliability Coordinator failed to have Interpersonal Communications capability with one or more of the entities listed in Parts 1.1 or 1.2.</p> <p>ii. Severe VSL - The Reliability Coordinator failed to have Interpersonal Communications capability with one or more of the entities listed in Parts 1.1 and 1.2.</p> <p>The RCSDT has applied the VSL to the Severe column because not having Interpersonal Communication capability with any entity is detrimental to reliability.</p>

Organization	Yes or No	Question 6 Comment
		<p>No change made.</p> <p>6. VSL for Requirement R9</p> <p>a. For consistency with the requirement language, ReliabilityFirst recommends adding the words “at least on a monthly basis” to the Lower, Moderate and High VSLs and adding the words “if the test was unsuccessful” to the end of the Lower, Moderate and High VSLs.</p> <p>Listed below is an example of the Lower VSL.</p> <p>i. The responsible entity tested the Alternative Interpersonal Communications capability at least once per calendar month but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communications in more than 2 hours and less than or equal to 4 hours if the test was unsuccessful.</p> <p>The RCSDT notes the requirement requires the entity to perform the test each month. If the test is not performed during each month, there is no other option for gradating the severity of the violation. No change made.</p> <p>7. VSL for Requirement R10</p> <p>a. ReliabilityFirst provided alternate language for R10 in the comments listed above. If the alternated language is not incorporated, ReliabilityFirst recommends the following language for the Lower VSL. Similar language could be used for the Moderate, High and Severe VSLs as well.</p> <p>i. The responsible entity failed to notify entities as identified in Requirements R1 through R6 more than 60 minutes but less than or equal to 70 minutes of the detection of a failure of its Interpersonal Communications capabilities.</p> <p>b. If the alternate language for R10, in the comments listed above, is incorporated, ReliabilityFirst recommends the following language for the Lower VSL. Similar language could be used for the Moderate, High and Severe VSLs as well.</p> <p>i. The responsible entity failed to notify entities as identified in Requirements R1</p>

Organization	Yes or No	Question 6 Comment
		<p>through R6 more than 30 minutes but less than or equal to 740 minutes of the detection of a failure of its Interpersonal Communications capabilities</p> <p>c. For Moderate VSL (the VSL after the OR statement), ReliabilityFirst recommends using a percentage rather than the “least one, but not all” statement. For example, if there is say 100 impacted entities and the applicable entity only notify 1, they would only fall under the Moderate. In another scenario there is say 100 impacted entities and the applicable entity only notified 99, they would also fall under the Moderate as well. The use of percentages will help even this out.</p> <p>The RCSDT made conforming changes to the VSLs to address a number of comments and changes to the requirements.</p> <p>8. VSL for Requirement R11</p> <p>a. For consistency with the requirement language, ReliabilityFirst recommends the following language:</p> <p>i. The responsible entity that experiences a failure of any of its Interpersonal Communication capabilities failed to consult with their Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability.</p> <p>Comments on COM-002-3</p> <p>The RCSDT has made conforming changes to the VSLs due to comments received about the R11.</p> <p>1. Requirement R1</p> <p>a. Based on ReliabilityFirst suggested change to the definition of “Reliability Directive” as noted in Question 5, ReliabilityFirst recommends deleting Requirement R1. Based on the suggested definition, any communication initiated, where an action by the recipient is required, is considered a “Reliability Directive.” Thus, there would no longer be a need for responsible entity to identify the action as a</p>

Organization	Yes or No	Question 6 Comment
		<p>“Reliability Directive” to the recipient.</p> <p>In coordination with the RTOSDT work on the TOP family of standards, the RCSDT does not propose that the Reliability Directive definition contain a requirement for action to be taken. Therefore, R1 is retained as a requirement for the “action” to be taken. No change made.</p> <p>2. VSL for Requirement R3</p> <p>a. For consistency with the requirement language, ReliabilityFirst recommends the following language:</p> <p>The RCSDT has followed the VSL Guidelines in properly assigning the VSL as binary. No change made.</p> <p><i>i. The responsible entity issued a Reliability Directive, but failed to confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate.</i></p> <p>Comments on IRO-001-3</p> <p>1. Requirement R1</p> <p>a. ReliabilityFirst seeks further clarity on why Requirement R1 only requires the Reliability Coordinator to have the “authority to act” rather than requiring the Reliability Coordinator to actually “take action” to prevent identified events that result in an Emergency or Adverse Reliability Impacts. Having the “authority to act” does not inherently require the Reliability Coordinator to take action, if appropriate.</p> <p>The RCSDT proposes that R1 reflects the Purpose of IRO-001-3. No change made.</p> <p>b. ReliabilityFirst seeks further clarity on the language “to prevent identified events.” If the event was already identified, how can the Reliability Coordinator act to prevent it? ReliabilityFirst recommends adding the word “potential” in between the words “prevent” and “identified.”</p> <p>The context of “identified” is when a set of system conditions is recognized that</p>

Organization	Yes or No	Question 6 Comment
		<p>could lead to an Emergency or Adverse Reliability Impact, which may require action. See standards IRO-008 and IRO-009. No change made.</p> <p>2. Requirement R3</p> <p>a. There is no time qualifier specified in Requirement R3 dealing with the timeframe in which the applicable entity has to inform its Reliability Coordinator of its inability to perform as directed in accordance with Requirement R2. Without a time qualifier, Requirement R3 is open ended and could cause issues if the applicable entity does not inform its Reliability Coordinator upon recognition of its inability to perform as directed in a timely manner. ReliabilityFirst recommends the following language for Requirement R3:</p> <p><i>i. Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator within 30 minutes upon recognition of its inability to perform as directed in accordance with Requirement R2.</i></p> <p>The RCSDT proposes the term “upon recognition of its inability to perform” does not require a time limit. No change made.</p> <p>The Measure M3, has been updated to include the phrase “upon recognition of its inability” to be consistent with R3.</p> <p>3. VSL for Requirement R1</p> <p>a. Requirement R1 requires the Reliability Coordinator to “...have the authority to act” - and the VSL does not reflect this language. ReliabilityFirst had questioned why Requirement R1, does not specifically require the RC to take action or direct actions in a comment submitted under Requirement R1. If the SDT does not change the language in Requirement R1, ReliabilityFirst recommends the following language:</p> <p><i>i. The Reliability Coordinator failed to have the authority to take action or direct actions, to prevent an identified event that resulted in an Adverse Reliability Impact.</i></p> <p>The RCSDT made conforming changes to the VSL.</p>

Organization	Yes or No	Question 6 Comment
		<p>4. VSL for Requirement R2</p> <p>a. For the High VSL, the words “fully comply” are ambiguous and open to interpretation. ReliabilityFirst recommends only having a Severe VSL.</p> <p>b. The Severe VSL states “directive” while Requirement R2 states “direction.” To be consistent, ReliabilityFirst recommends the following language:</p> <p><i>i. “The Responsible Entity failed to comply with its Reliability Coordinator’s direction”</i></p> <p>The RCSDT thanks you for your comment and has made conforming changes to the VSL.</p>
<p><b>Response:</b> See response above.</p>		
<p>City of Vero Beach</p>		<p>In the definition of Interpersonal Communication, the use of the word “medium” is ambiguous. Suggestions for alternatives: “system”, “channel.”</p> <p>The RCSDT proposes the term “medium” to allow entities flexibility on how they communicate and meet compliance with the requirements. No change made.</p> <p>COM-001-2, R1 and R3, the phrase: “have Interpersonal Communications capabilities”, what if the communication system fails?</p> <p>The RCSDT proposes that AIC is in force at that time. No change made.</p> <p>Is that an immediate non-compliance (especially R3.3 and R3.4 which do not require a redundant system). Suggest using EOP-008 type of language to allow restoration of failed equipment without non-compliance.</p> <p>The RCSDT reviewed both EOP-008-0 and EOP-008-1, which is subject to future enforcement. In either version, the team believes there is no need to add additional language to the standard. No change made.</p> <p>The RCSDT believes that prescribing a device or medium would limit an entity; therefore, “capability” is used to avoid being prescriptive and to provide flexibility. This was not intended by the drafting team. The intent is to give the entity the</p>

Organization	Yes or No	Question 6 Comment
		<p>flexibility in meeting the requirement. A loss of Interpersonal Communication capability is covered by R10, notification of Interpersonal Communication capability failure. No change made.</p> <p>COM-001-2, R9 - "Each ... shall test its Alternative Interpersonal Communications capability", suggest adding the phrase "to each entity for which Alternative Interpersonal Communications is required" to add clarity. In addition, the type of testing is unclear and ambiguous.</p> <p>The RCSDT proposes that R9 correctly identifies and provides clarity for the entities required to have Alternative Interpersonal Communication capability. No change made.</p> <p>The is also ambiguity in the terms "direct", "directive", "direction" and "Reliability Directive." The SDT may want to consider using the terms "instruct" and "instruction" in place of "direct," "directive," or "direction" to more clearly distinguish from a Reliability Directive.</p> <p>The RCSDT feels the use of direct and directed is consistent with the purpose and application of those terms in other standards and is consistent with previous postings. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>NV Energy</p>		<p>The meaning of R9 is open to some interpretation. It states that if the monthly test is unsuccessful, the entity shall "initiate action to repair or designate a replacement" AIC within 2 hours. The meaning of this is unclear in several ways:</p> <p>First, does "initiate action" apply to the remainder of the sentence or just to the "repair" option?</p> <p>Second, what constitutes initiation of action?</p> <p>Is it the intent of the SDT that the alternate interpersonal communications be</p>

Organization	Yes or No	Question 6 Comment
		<p>restored within a 2-hour limit?</p> <p>If so, the words do not clearly state that, and it seems an impossible task to ensure no more than 2-hr outage to an alternate communications medium. I am voting affirmative under the interpretation that one must only "initiate" the repair or "initiate" the designation of a replacement option within this tight 2-hour limit.</p>
<p><b>Response:</b> The requirement is to initiate repair or designate an Alternative Interpersonal Communication capability within two hours. The requirement is NOT to have the repair completed within two hours. The requirement recognizes that the entity may use its Alternative Interpersonal Communication capability now as its Interpersonal Communication capability; and then, if it decides to do so, designate another, if you may, "new" Alternative Interpersonal Communication capability. This is not required, but is an option that the entity can consider. The entity may already have a maintenance and repair agreement in place that will respond and repair the failed capability. No change made.</p>		
<p>Midwest Independent Transmission System Operator</p>		<p>COM-001-2, R2 and R6:</p> <p>MISO requests clarification as to whether the designation of Interpersonal Communications and Alternative Interpersonal Communications methods by Responsible Entities must be formally documented and/or agreed upon with those entities with which communications capability must be established.</p> <p>The RCSDT has provided flexibility to the responsible entity with regard to implementation and compliance. Please note that Interpersonal Communication is a "shall have" and Alternative Interpersonal Communication capability is "designate." Please refer to the Measures for suitable evidence, which may be used to support compliance with the requirement. No change made.</p> <p>COM-001-2, R9:</p> <p>MISO suggests that the designation of Alternative Interpersonal Communications methods should not require formal documentation and may be agreed upon (when necessary) informally with those entities with which communications capability must be established in the event of an unsuccessful test of its Alternative Interpersonal</p>

Organization	Yes or No	Question 6 Comment
		<p>Communications capability.</p> <p>The RCSDT has provided flexibility to the responsible entity with regard to implementation and compliance. Please note that Interpersonal Communication is a “shall have” and Alternative Interpersonal Communication capability is “designate.” Please refer to the Measures for suitable evidence, which may be used to support compliance with the requirement. No change made.</p> <p>COM-001-2, Requirement R10:</p> <p>MISO requests clarification as to whether “impacted entities” refers to those entities with which the Responsible Entity must have Interpersonal Communications and Alternative Interpersonal Communications capability.</p> <p>Further, MISO requests clarification as to whether the notification required by R10 must be made using the Alternative Interpersonal Communications method selected by the Responsible Entity.</p> <p>The word “impacted” was removed in previous postings. For further clarification, the RCSDT has modified M10 to remove the word “impacted” to be consistent with R10. For additional clarity, the RCSDT also changed the phrase in R10 and M10, “R1 through R6” to “R1, R3, and R5,” to clarify that it applies to the capabilities with the RC, the TOP, and the BA.</p> <p>With respect to the method used by the Responsible Entity, the standard does not provide the “how” or any prescriptive method for accomplishing the requirement. No change made.</p> <p>COM-002-3, R1 - R3:</p> <p>MISO respectfully submits that, while it appreciates the distinction in responsibilities proposed in the new COM-002-3 and acknowledges that such distinction is beneficial, these requirements increase compliance risk and potential penalty liability without attendant benefit to the reliability of the Bulk Electric System. MISO respectfully suggests that Requirements 2 and 3 be converted into sub-requirements</p>

Organization	Yes or No	Question 6 Comment
		<p>as follows:</p> <p><i>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p><i>R1.1. When the Reliability Coordinator, Transmission Operator or Balancing Authority identifies a stated action as a Reliability Directive, the receiving Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall repeat, restate, rephrase or recapitulate the Reliability Directive to the issuing Reliability Coordinator, Transmission Operator or Balancing Authority. [Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p><i>R1.2. When the Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive receives a response from the receiving Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider, it shall then either [Violation Risk Factor: High][Time Horizon: Real-Time]:</i></p> <ul style="list-style-type: none"> <li>-Confirm that the response from the recipient of the Reliability Directive (in accordance with Requirement R2) was accurate, or</li> <li>-Reissue the Reliability Directive to resolve any misunderstandings.</li> </ul> <p>The RCSDT contends the requirements in the proposed standard have been constructed in accordance with standard development guidelines to have only one performance per requirement. The suggested change places three independent actions within one requirement. No change made.</p>
<p><b>Response:</b> See response above.</p>		
Texas Reliability Entity		<p>(1) There are numerous errors in the Mapping Document in referencing the current version of the standard and requirement. Specifically, referencing IRO-001-2 where it appears that the document should reference standard IRO-001-3. In addition, the</p>

Organization	Yes or No	Question 6 Comment
		<p>notes on page 2 of COM-002-3 are incorrect.</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p> <p>(2) In the VRF/VSL Justification document, there are numerous errors in referring to standard versions and requirements.</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p> <p>(3) In IRO-001-3, R1 - What is an “identified event,” and who “identifies” an event that requires compliance with this requirement R1? An RC may choose not to “identify” an event, such as a limit violation, and run the risk of causing or exacerbating an emergency. If the RC does not “identify” the event, it may become an actual event and then fall within the standard.</p> <p>The context of “identified” is when a set of system conditions are recognized that could lead to an Emergency or Adverse Reliability Impact, which may require action. See standards IRO-008 and IRO-009. The RC named in R1 is the entity that identifies the even that requires compliance. No change made.</p> <p>(4) In the VSL for IRO-001-3, R1, there should be language in the VSL to capture the term “Emergency,” which was added in the Requirement. The High VSL for R2 needs to be fixed.</p> <p>The RCSDT thanks you for your comments and has made conforming corrections. The “N/A” in R2 of COM-002-3 was removed.</p> <p>(5) In IRO-001-3, R1, remove the “s” in the phrase “Adverse Reliability Impacts.”</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p> <p>(6) Referring to the Implementation Plan for IRO-001 - There is a different list in the Implementation Plan (R2, R4, R5, R6, R7, R9) than the Revision History of the Standard (R2, R4, R5, R6, R8). Where is the retirement of R1 shown?</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p> <p>(7) Referring to COM-001-2: Measure 7, the word “that” is inadvertently repeated in</p>

Organization	Yes or No	Question 6 Comment
		<p>the first sentence.</p> <p>COM-001-2, M8: The RCSDT agrees and the language in Measure M8 has been changed to delete the additional “that.”</p> <p>(8) In COM-001-2, Measure 9, is “at least on a monthly basis” to be interpreted differently than “at least once per calendar month” as stated in the requirement?</p> <p>The RCSDT thanks you for your comments and has made conforming corrections to Measure M9 and the R9 VSL.</p> <p>(9) In COM-001-2, there is a “Measure 12” bullet that should be removed.</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p> <p>(10) Referring to COM-002-3: Electronic directives (which may be issued over many different types of electronic communication channels) are increasingly necessary to manage the modern, dynamic Bulk Power System (generation and transmission) on a real-time basis. The effective use of electronic directives is undermined by this proposed Standard in its current form. This draft standard, in conjunction with other standards that refer to directives, appears to require that directives (at least Reliability Directives) be given verbally. The failure of the NERC standards to address electronic directives may cause significant manpower issues for BAs with large portfolios of generation to manage.</p> <p>The RCSDT proposes that COM-001-2 and COM-002-3, as written, allows flexibility for an entity to communicate where two or more individuals are required for communication to occur and they interact, consult or exchange information. Compliance is contained in the Measures and an entity must determine if its communication method can demonstrate compliance with the requirements. No change made.</p> <p>(11) In the VSL for COM-001-2 R4, a reference to Part 4.3 should be added.</p> <p>The RCSDT thanks you for your comments and has made conforming corrections.</p>

Organization	Yes or No	Question 6 Comment
		<p>(12) In IRO-001-3, Part 1.3 Data Retention, the reference in the first bullet to “Electric reliability Organization” is incorrect. We think it should say “Reliability Coordinator” instead.</p> <p>The other references to entities and to Requirements in this Part 1.3 also appear to be incorrect and need to be updated and corrected.</p> <p>The RCSDT thanks you for your comment and has made conforming changes.</p> <p>(13) Referring to COM-001-2, the prior version of this standard included Requirement R5: “Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.” This Requirement has been removed from the present draft of COM-001-2.</p> <p>The RCSDT removed this requirement because it did not have a reliability benefit. No change made.</p> <p>The mapping document seems to suggest that this Requirement was moved to EOP-008, but it is not there. We are concerned that removal of this Requirement will result in a reduction in the level of BES reliability and introduce a potential reliability gap.</p> <p>As stated in the Implementation Plan, the RCSDT proposes retiring COM-001-1, R5 as it is redundant with EOP-008-0, R1 as well as replacement EOP-008-1, R1. No change made.</p>
<p><b>Response:</b> See response above.</p>		
<p>Hydro One Networks Inc.</p>		<p>(1) The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after “applicable regulatory approval” in the Effective Dates Section A5 on P. 4 of the draft standard</p>

Organization	Yes or No	Question 6 Comment
		<p>COM-001, COM-002 and IRO-001, and on P. 2 of COM-001’s Implementation Plan and P. 1 of COM-002’s and IRO-001’s Implementation Plans, to the following effect:”, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.”</p> <p>The RCSDT is uncertain where the conflict exists. The standard IRO-001 uses the term “after applicable” and the others “following applicable.” The RCSDT has updated the standards to use the most current effective date language.</p> <p>(2) COM-001: Measure M9: - “monthly basis.” Suggest changing “monthly basis” to “at least once per calendar month” to be consistent the wording in R9.</p> <p>The RCSDT thanks you for your comment and has made conforming changes the Measure M9 and the R9 VSL.</p> <p>(3) IRO-001: Measures M1, M2, M3 - The types of evidence are listed in paragraph form. This is not consistent with presentation style in COM-001-2 Measures, where evidence is listed in bullet format. Suggest using bullet form for consistency.</p> <p>The RCSDT appreciates your comments and has made all the Measures bullet form in COM-001-2, but not in COM-002-3 and IRO-001-3.</p> <p>(4) IRO-001, Data Retention Section:</p> <p>i. The retention requirements do not reflect the revised requirements. For example: the Electric Reliability Organization is no longer a responsible entity; the Reliability Coordinator should replace the ERO for keeping data for R1; Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider should replace the Reliability Coordinator for keeping data for R2; and there is no R4/M4.</p> <p>ii. Section 1.3, second paragraph:</p> <p>“The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, or Distribution Provider... shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to</p>

Organization	Yes or No	Question 6 Comment
		<p>retain specific evidence for a longer period of time as part of an investigation.”</p> <p>The word “or” between Generator Operator and Distribution Provider should be changed to “and.”</p> <p>The RCSDT thanks you for your comment and has made conforming changes to the Data Retention section.</p>
<p><b>Response:</b> See response above.</p>		
<p>New York Independent System Operator</p>		<p>COM-001</p> <p>The drafting team has complicated the requirements by having different requirements between RC/TOP/BA and other entities such as GOP/LSE/DP. The proposal is for redundancy to be required only between RC/TOP/BA. The requirement should be simplified to require all identified entities to have plans for loss of primary communication channels. This could include third parties as a communication channel.</p> <p>The RCSDT refers the Order No. 693 in Paragraph 508 to clarify the reason the DP and GOP are not required to have Alternative Interpersonal Communication and is as follows: “(1) expands the applicability to include Generator Operators and Distribution Providers and includes Requirements for their telecommunications facilities; (2) identifies specific requirements for telecommunications facilities for use in normal and emergency conditions that reflect the roles of the applicable entities and their impact on Reliable Operation and (3) includes adequate flexibility for compliance with the Reliability Standard, adoption of new technologies and cost-effective solutions.” In addition, R11 requires the DP and GOP to consult with its BA and TOP to determine a mutually agreeable action for restoration. No change made.</p> <p>COM-002</p> <p>The drafting team added a requirement to identify a Reliability Directive is being initiated during an emergency to track 3-part communication for compliance</p>

Organization	Yes or No	Question 6 Comment
		<p>purposes. This will change and complicate the communication protocols between normal and emergency operations simply to simplify compliance assessments. The NYISO is asking for clarification that an entity may identify Reliability Directives as a category of communications to be communicated through procedures and training; and will not require a different communication protocol between normal and emergency operations. Affective communications can only be achieved through consistent processes for all conditions. Compliance assessments should be made on when we are in an emergency or not, and not on how the dialogue was initiated.</p> <p>The RCSDT believes the standard allows for this condition, and the method of implementation is up to the entity. No change made.</p>
<p><b>Response:</b> See response above.</p>		

END OF REPORT

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. Draft SAR Version 1 posted January 15, 2007.
2. Draft SAR Version 1 Comment Period ended February 14, 2007.
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007.
4. Draft Version 2 SAR comment period ended April 17, 2007.
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010.
11. Fourth posting of revised standards on January 25, 2011 with comment period closed on March 7, 2011.
12. Initial ballot conducted February 25 through March 7, 2011.
13. Draft version 5 of the standard and response to comments March 7, 2011 – January 9, 2012.
14. Fifth posting of revised standards on January 9, 2012 with comment period closed on February 9, 2012.
15. Successive ballot conducted January 30 through February 9, 2011.
16. Draft version 6 of the standard and response to comments February 9, 2011 – June 5, 2012.
17. Sixth posting of revised standard on June 7, 2012 with comment period closed on July 6, 2012.
18. Successive ballot conducted June 27 through July 6, 2012.

**Proposed Action Plan and Description of Current Draft:**

The SDT began working on revisions to the standards in August 2007. The current posting contain revisions based on stakeholder comments on the initial ballot. The team is posting for a successive ballot.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Post standards for a successive ballot.	January-February 2012
2. Respond to comments on successive ballot.	March - April 2012
3. Standard posted for second successive ballot.	June 2012
4. Standard posted for recirculation ballot.	September 2012
5. Standard to be sent to BOT for approval.	November 2012
6. Standard filed with regulatory authorities.	January 2013

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

The RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

## A. Introduction

### 1. Title: Communications

2. Number: COM-001-2

3. Purpose: To establish Interpersonal Communication capabilities necessary to maintain reliability.

### 4. Applicability:

4.1. Transmission Operator

4.2. Balancing Authority

4.3. Reliability Coordinator

4.4. Distribution Provider

4.5. Generator Operator

5. Effective Date: The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

## B. Requirements

**R1.** Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply):  
*[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

1.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.

1.2. Each adjacent Reliability Coordinator within the same Interconnection.

**R2.** Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

2.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.

2.2. Each adjacent Reliability Coordinator within the same Interconnection.

**R3.** Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply):  
*[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

3.1. Its Reliability Coordinator.

3.2. Each Balancing Authority within its Transmission Operator Area.

- 3.3. Each Distribution Provider within its Transmission Operator Area.
  - 3.4. Each Generator Operator within its Transmission Operator Area.
  - 3.5. Each adjacent Transmission Operator synchronously connected.
  - 3.6. Each adjacent Transmission Operator asynchronously connected.
- R4.** Each Transmission Operator shall designate an Alternative Interpersonal Communication capability with the following entities: [*Violation Risk Factor: High*] [*Time Horizon: Real-time Operations*]
- 4.1. Its Reliability Coordinator.
  - 4.2. Each Balancing Authority within its Transmission Operator Area.
  - 4.3. Each adjacent Transmission Operator synchronously connected.
  - 4.4. Each adjacent Transmission Operator asynchronously connected.
- R5.** Each Balancing Authority shall have Interpersonal Communication capability with the following entities (unless the Balancing Authority experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): [*Violation Risk Factor: High*] [*Time Horizon: Real-time Operations*]
- 5.1. Its Reliability Coordinator.
  - 5.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 5.3. Each Distribution Provider within its Balancing Authority Area.
  - 5.4. Each Generator Operator that operates Facilities within its Balancing Authority Area.
  - 5.5. Each adjacent Balancing Authority.
- R6.** Each Balancing Authority shall designate an Alternative Interpersonal Communication capability with the following entities: [*Violation Risk Factor: High*] [*Time Horizon: Real-time Operations*]
- 6.1. Its Reliability Coordinator.
  - 6.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 6.3. Each adjacent Balancing Authority.
- R7.** Each Distribution Provider shall have Interpersonal Communication capability with the following entities (unless the Distribution Provider experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): [*Violation Risk Factor: High*] [*Time Horizon: Real-time Operations*]
- 7.1. Its Balancing Authority.
  - 7.2. Its Transmission Operator.
- R8.** Each Generator Operator shall have Interpersonal Communication capability with the following entities (unless the Generator Operator experiences a failure of its

Interpersonal Communication capability in which case Requirement R11 shall apply):  
*[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

**8.1.** Its Balancing Authority.

**8.2.** Its Transmission Operator.

**R9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations, Same-day Operations]*

**R10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5 within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

**R11.** Each Distribution Provider and Generator Operator that experiences a failure of its Interpersonal Communication capability shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

### **C. Measures**

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that it has Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R1.)

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R2.)

- M3.** Each Transmission Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority, Distribution Provider, and Generator Operator within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communication. (R3.)
- M4.** Each Transmission Operator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R4.)
- M5.** Each Balancing Authority shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator and Generator Operator that operates Facilities within its Balancing Authority Area, each Distribution Provider within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R5.)
- M6.** Each Balancing Authority shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator that operates Facilities within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R6.)
- M7.** Each Distribution Provider shall have and provide upon request evidence that that it has Interpersonal Communication capability with its Transmission Operator and its Balancing Authority, which could include, but is not limited to:

- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R7.)
- M8.** Each Generator Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Balancing Authority and its Transmission Operator, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R8.)
- M9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it tested, at least once each calendar month, its Alternative Interpersonal Communication capability designated in Requirements R2, R4, or R6. If the test was unsuccessful, the entity shall have and provide upon request evidence that it initiated action to repair or designated a replacement Alternative Interpersonal Communication capability within 2 hours. Evidence could include, but is not limited to dated and time-stamped: test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R9.)
- M10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified entities as identified in Requirements R1, R3, and R5 within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to dated and time-stamped: test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)
- M11.** Each Distribution Provider and Generator Operator that experienced a failure of its Interpersonal Communication capability shall have and provide upon request evidence that it consulted with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine mutually agreeable action to restore the Interpersonal Communication capability. Evidence could include, but is not limited to dated: operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R11.)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

#### **1.2. Compliance Monitoring and Enforcement Processes**

Compliance Audit  
Self-Certification  
Spot Checking  
Compliance Investigation  
Self-Reporting  
Complaint

### **1.3. Data Retention**

The Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain evidence of Requirements R1, R2, R9, and R10, Measures M1, M2, M9, and M10 for the most recent twelve calendar months.
- The Transmission Operator shall retain evidence of Requirements R3, R4, R9, and R10, Measures M3, M4, M9, and M10 for the most recent twelve calendar months.
- The Balancing Authority shall retain evidence of Requirements R5, R6, R9, and R10, Measures M5, M6, M9, and M10 for the most recent twelve calendar months.
- The Distribution Provider shall retain evidence of Requirements R7 and R11, Measures M7 and M11 for the most recent twelve calendar months.
- The Generator Operator shall retain evidence of Requirements R8 and R11, Measures M8 and M11 for the most recent twelve calendar months.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, or Generator Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **1.4. Additional Compliance Information**

None.

**2. Violation Severity Levels**

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Reliability Coordinator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Reliability Coordinator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R2	N/A	N/A	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R2, Parts 2.1 or 2.2.	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R2, Parts 2.1 or 2.2.
R3	N/A	N/A	The Transmission Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Transmission Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R4	N/A	N/A	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	N/A	N/A	The Balancing Authority failed to have Interpersonal Communication capability with one of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Balancing Authority failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R6	N/A	N/A	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.
R7	N/A	N/A	The Distribution Provider failed to have Interpersonal Communication capability with one of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider experienced a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Distribution Provider failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider experienced a failure of its Interpersonal Communication capability in accordance with Requirement R11.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
<b>R8</b>	N/A	N/A	The Generator Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Generator Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R11.
<b>R9</b>	The Reliability Coordinator, Transmission Operator, and Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 2 hours and less than or equal to 4 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, and Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 4 hours and less than or equal to 6 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, and Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 6 hours and less than or equal to 8 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, and Balancing Authority failed to test the Alternative Interpersonal Communication capability once each calendar month.  OR The Reliability Coordinator, Transmission Operator, and Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 8 hours upon an unsuccessful test.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
<b>R10</b>	The Reliability Coordinator, Transmission Operator, and Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5 upon the detection of a failure of its Interpersonal Communication capability in more than 60 minutes but less than or equal to 70 minutes.	The Reliability Coordinator, Transmission Operator, and Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5 upon the detection of a failure of its Interpersonal Communication capability in more than 70 minutes but less than or equal to 80 minutes.	The Reliability Coordinator, Transmission Operator, and Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5 upon the detection of a failure of its Interpersonal Communication capability in more than 80 minutes but less than or equal to 90 minutes.	The Reliability Coordinator, Transmission Operator, and Balancing Authority failed to notify the identified entities identified in Requirements R1, R3, and R5 upon the detection of a failure of its Interpersonal Communication capability in more than 90 minutes.
<b>R11</b>	N/A	N/A	N/A	The Distribution Provider or Generator Operator that experienced a failure of its Interpersonal Communication capability failed to consult with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of the Interpersonal Communication capability.

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 4, 2007	Regulatory Approval — Effective Date	New
1	April 6, 2007	Requirement 1, added the word “for” between “facilities” and “the exchange.”	Errata
2	TBD	Revised in accordance with SAR for Project 2006-06, Reliability Coordination (RC SDT). Replaced R1 with R1-R8; R2 replaced by R9; R3 included within new R1; R4 remains enforce pending Project 2007-02; R5 redundant with EOP-008-0, retiring R5 as redundant with EOP-008-0, R1; retiring R6, relates to ERO procedures; R10 & R11, new.	Revised

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007.
2. Draft SAR Version 1 Comment Period ended February 14, 2007.
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007.
4. Draft Version 2 SAR comment period ended April 17, 2007.
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version ~~2 of 2~~ standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010.
11. Fourth posting of revised standards on January 25, 2011 with comment period closed on March 7, 2011.
- ~~11.~~ 12. Initial ~~ballot~~ Ballot conducted February 25 through March 7, 2011.
13. Draft version 5 of the standard and response to comments March 7, 2011 – January 9, 2012.
14. Fifth posting of revised standards on January 9, 2012 with comment period closed on February 9, 2012.
15. Successive ballot conducted January 30 through February 9, 2011.
16. Draft version 6 of the standard and response to comments February 9, 2011 – June 5, 2012.
17. Sixth posting of revised standard on June 7, 2012 with comment period closed on July 6, 2012.
18. Successive ballot conducted June 27 through July 6, 2012.

**Proposed Action Plan and Description of Current Draft:**

The SDT began working on revisions to the standards in August 2007. The current posting ~~contains~~ contains revisions based on stakeholder comments on the initial ballot. The team is posting for a successive ballot.

**Future Development Plan:**

Anticipated Actions	Anticipated Date
1. Post <del>standards</del> <u>Standards</u> for a successive ballot.	January-February 2012
2. Respond to comments on <del>successive</del> <u>Successive</u> ballot.	March - April 2012
<u>3. Standard posted for second successive ballot.</u>	<u>June 2012</u>
<u>3-4. Standard</u> <del>Standards</del> posted for recirculation ballot.	<u>September</u> <del>May</del> 2012
<u>4-5. Standard</u> <del>Standards</del> to be sent to BOT for approval.	<u>November</u> <del>June</del> 2012
<u>5-6. Standard</u> <del>Standards</del> filed with regulatory authorities.	<u>January 2013</u> <del>August 2012</del>

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

The RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal ~~Communication~~Communications used for day-to-day operation.

## A. Introduction

1. **Title:** Communications
2. **Number:** COM-001-2
3. **Purpose:** To establish Interpersonal Communication capabilities ~~for the exchange of Interconnection and operating information~~ necessary to maintain reliability.
4. **Applicability:**
  - 4.1. Transmission Operator
  - 4.2. Balancing Authority
  - 4.3. Reliability Coordinator
  - 4.4. Distribution Provider
  - 4.5. Generator Operator
5. **Effective Date:** The first day of the second calendar quarter ~~beyond the date that this standard is approved by~~ following applicable regulatory ~~authorities, approval~~— or in those jurisdictions where ~~no~~ regulatory approval is ~~not~~ required, the ~~standard becomes effective on the~~ first day of the first calendar quarter ~~beyond the date this standard is approved by the NERC following~~ Board of Trustees, ~~or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, adoption.~~

## B. Requirements

- ~~R1.~~ Each Reliability Coordinator shall have Interpersonal ~~Communication~~ **Communications** capability with the following entities ~~(unless the : [Violation Risk Factor: High][Time Horizon: Real-time Operations])~~
- ~~R1.1.~~ All Transmission Operators and Balancing Authorities within its Reliability Coordinator ~~experiences a failure of its Area.~~
- ~~R1.2.~~ Adjacent Reliability Coordinators within the same Interconnection.
- ~~R2.R1.~~ Each Reliability Coordinator shall designate an Alternative Interpersonal ~~Communication~~ **Communications** capability ~~in which case Requirement R10 shall apply): with the following entities: [Violation Risk Factor: High][Time Horizon: Real-time Operations]~~
- ~~R2.1.R1.1.~~ All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
- ~~R2.2.R1.2.~~ Each adjacent ~~Adjacent~~ Reliability ~~Coordinator~~ **Coordinators** within the same Interconnection.
- ~~R3.R2.~~ Each ~~Reliability Coordinator~~ **Transmission Operator** shall ~~designate an Alternative~~ **have** Interpersonal ~~Communication~~ **Communications** capability with the following entities: ~~[Violation Risk Factor: High][Time Horizon: Real-time Operations]~~

- 2.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
- 2.2. Each adjacent Reliability Coordinator within the same Interconnection.
- R3.** Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): [Violation Risk Factor: High] [Time Horizon: Real-time Operations]
  - R3.1.** 3.1. Its Reliability Coordinator.
  - R3.2.** 3.2. Each Balancing Authority within its Transmission Operator Area.
  - R3.3.** 3.3. Each Distribution Provider within its Transmission Operator Area.
  - R3.4.** 3.4. Each Generator Operator within its Transmission Operator Area.
  - R3.5.** 3.5. ~~Each adjacent~~ ~~Adjacent~~ Transmission ~~Operator~~ ~~Operators~~ synchronously connected ~~within the same Interconnection.~~
  - 3.6. Each adjacent Transmission Operator asynchronously connected.
- R4.** Each Transmission Operator shall designate an Alternative Interpersonal ~~Communication~~ ~~Communications~~ capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - R4.1.** 4.1. Its Reliability Coordinator.
  - R4.2.** 4.2. Each Balancing Authority within its Transmission Operator Area.
  - R4.3.** 4.3. ~~Each adjacent~~ ~~Adjacent~~ Transmission ~~Operator~~ ~~Operators~~ synchronously connected ~~within the same Interconnection.~~
  - 4.4. Each adjacent Transmission Operator asynchronously connected.
- R5.** Each Balancing Authority shall have Interpersonal ~~Communication~~ ~~Communications~~ capability with the following entities (unless the Balancing Authority experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - R5.1.** Its Reliability Coordinator.
  - R5.2.** Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - R5.3.** Each Distribution Provider within its Balancing Authority Area.
  - R5.4.** Each Generator Operator that operates Facilities within its Balancing Authority Area.
  - R5.5.** ~~Each adjacent~~ ~~Adjacent~~ Balancing ~~Authority~~ ~~Authorities.~~
- R6.** Each Balancing Authority shall designate an Alternative Interpersonal ~~Communication~~ ~~Communications~~ capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - R6.1.** Its Reliability Coordinator.

- R6.2.** Each Transmission Operator that operates Facilities within its Balancing Authority Area.
- R6.3.** ~~Each adjacent~~ Adjacent Balancing ~~Authority~~ Authorities.
- R7.** Each Distribution Provider shall have Interpersonal ~~Communication~~ Communications capability with the following entities ~~(unless the Distribution Provider experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply):~~ *÷ [Violation Risk Factor: High] [~~H~~] Time Horizon: Real-time Operations]*
- 7.1.** ~~Its Balancing Authority.~~
- R7.1.** ~~7.2.~~ Its Transmission Operator.
- R7.2.** ~~Its Balancing Authority.~~
- R8.** Each Generator Operator shall have Interpersonal ~~Communication~~ Communications capability with the following entities ~~(unless the Generator Operator experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply):~~ *÷ [Violation Risk Factor: High] [~~H~~] Time Horizon: Real-time Operations]*
- R8.1.** ~~8.1.~~ Its Balancing Authority.
- R8.2.** ~~8.2.~~ Its Transmission Operator.
- R9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal ~~Communication~~ Communications capability at least once ~~each~~per calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal ~~Communication~~ Communications capability within 2 hours. *[Violation Risk Factor: Medium][Time Horizon: Real-time ~~Operations, Same-day~~ Operations]*
- R10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1, ~~R3, and R5 through R6~~ within 60 minutes of the detection of a failure of its Interpersonal ~~Communication~~ ~~capability~~ Communications capabilities that lasts 30 minutes or longer. *[Violation Risk Factor: Medium] [~~H~~] Time Horizon: Real-time Operations]*
- R11.** Each Distribution Provider and Generator Operator that experiences a failure of ~~any of~~ its Interpersonal Communication ~~capability~~ capabilities shall consult ~~each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator~~with their Transmission Operator, ~~or Balancing Authority as applicable~~ to determine a mutually agreeable ~~action~~time for the restoration of ~~its~~ Interpersonal Communication capability. *[Violation Risk Factor: Medium] [~~H~~] Time Horizon: Real-time Operations]*

### C. Measures

- M1.** Each Reliability Coordinator shall have and provide upon request evidence that it has Interpersonal ~~Communication~~ Communications capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with ~~each~~ adjacent Reliability ~~Coordinator~~ Coordinators within the same Interconnection, ~~which, Evidence~~ could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or
- electronic communications,
- ~~or equivalent evidence.~~ (R1.)

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that it designated an Alternative Interpersonal ~~Communication~~Communications capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability ~~Coordinator~~Coordinators within the same Interconnection, ~~which, Evidence~~ could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or
- electronic communications,
- ~~or equivalent evidence.~~ (R2.)

**M3.** Each Transmission Operator shall have and provide upon request evidence that it has Interpersonal ~~Communication~~Communications capability with its Reliability Coordinator, ~~and within its Transmission Operator Area~~ each Balancing Authority, Distribution Provider, and Generator Operator within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which, Evidence could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or

- ~~electronic communication~~~~communications~~
- ~~or equivalent evidence.~~ (R3.)

M4. Each Transmission Operator shall have and provide upon request evidence that it designated an Alternative Interpersonal ~~Communication~~~~Communications~~ capability with its Reliability Coordinator, ~~and with~~ each Balancing Authority within its Transmission Operator Area, and ~~each~~ adjacent Transmission ~~Operator asynchronously and Operators~~ synchronously connected, ~~which within the same Interconnection.~~ Evidence could include, but is not limited to:

- physical assets, ~~or~~
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time stamped~~ voice recordings, ~~or dated and time stamped~~ transcripts of voice recordings, ~~or~~
- ~~electronic communications.~~
- ~~or equivalent evidence.~~ (R4.)

M5. Each Balancing Authority shall have and provide upon request evidence that it has Interpersonal ~~Communication~~~~Communications~~ capability with its Reliability Coordinator, each Transmission ~~Operator and Generator~~ Operator that operates Facilities within its Balancing Authority Area, each Distribution Provider within its Balancing Authority Area, ~~each Generator Operator that operates Facilities within its Balancing Authority Area,~~ and each adjacent Balancing Authority, ~~which.~~ Evidence could include, but is not limited to:

- physical assets, ~~or~~
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time stamped~~ voice recordings, ~~or dated and time stamped~~ transcripts of voice recordings, ~~or~~
- ~~electronic communications.~~
- ~~or equivalent evidence.~~ (R5.)

M6. Each Balancing Authority shall have and provide upon request evidence that it designated an Alternative Interpersonal ~~Communication~~~~Communications~~ capability with its Reliability Coordinator, each Transmission Operator that operates Facilities within its Balancing Authority Area, and ~~each~~ adjacent Balancing ~~Authority,~~ ~~which Authorities.~~ Evidence could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or
- ~~electronic communications.~~
- ~~or equivalent evidence (R6.)~~

**M7.** Each Distribution Provider shall have and provide upon request evidence that that it has Interpersonal ~~Communication~~Communications capability with its Transmission Operator and its Balancing Authority, ~~which~~ ~~Evidence~~ could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or
- ~~electronic communications.~~
- ~~or equivalent evidence (R7.)~~

**M8.** Each Generator Operator shall have and provide upon request evidence that ~~that~~ it has Interpersonal ~~Communication~~Communications capability with its Balancing Authority and its Transmission Operator, ~~which~~ ~~Evidence~~ could include, but is not limited to:

- physical assets, or
- ~~dated~~ evidence, such as, equipment specifications and installation documentation,
- ~~dated~~ test records,
- ~~dated~~ operator logs,
- ~~dated and time-stamped~~ voice recordings, ~~or dated and time-stamped~~ transcripts of voice recordings, or
- ~~electronic communications.~~
- ~~or equivalent evidence (R8.)~~

- M9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it tested, at least once each calendar month~~on a monthly basis~~, its Alternative Interpersonal Communication capability~~Communications capabilities~~ designated in Requirements R2, R4, or R6. If the test was unsuccessful, the entity shall have and provide upon request evidence that it initiated action to repair or designated a replacement Alternative Interpersonal Communication~~Communications~~ capability within 2 hours. Evidence could include, but is not limited to dated and time-stamped: test records, ~~dated~~ operator logs, ~~dated~~ voice recordings, ~~or dated~~ transcripts of voice recordings, or electronic communications, ~~or equivalent evidence~~. (R9.)
- M10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified ~~impacted~~ entities as identified in Requirements R1, R3, and R5 within 60 minutes of the detection of a failure of its Interpersonal Communication capability~~Communications capabilities~~ that lasted 30 minutes or longer. Evidence could include, but is not limited to dated and time-stamped: test records, operator logs, ~~dated~~ voice recordings, ~~or dated~~ transcripts of voice recordings, or electronic communications, ~~or equivalent evidence~~. (R10.)
- M11.** Each Distribution Provider and Generator Operator that experienced a failure of its Interpersonal Communication capability shall have and provide upon request evidence that it consulted with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator~~their Transmission Operator, or Balancing Authority as applicable~~ to determine a mutually agreeable action~~time~~ to restore the Interpersonal Communication capability. Evidence could include, but is not limited to dated: operator logs, ~~dated~~ voice recordings, ~~or dated~~ transcripts of voice recordings, or electronic communications, ~~or equivalent evidence~~. (R11.)

~~**M12.**~~

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

~~The For entities that do not work for the~~ Regional Entity, ~~the Regional Entity~~ shall serve as the Compliance Enforcement Authority (CEA) ~~unless the applicable entity is owned, operated, or controlled by the-~~

~~For Reliability Coordinators that work for their~~ Regional Entity. In such cases, the ERO or a Regional Entity approved by ~~the ERO and~~ FERC or other applicable governmental ~~authority~~authorities shall serve as the CEA, Compliance Enforcement Authority.

**1.2. Compliance Monitoring and Enforcement Processes**

Compliance Audit

Self-Certification

Spot Checking  
Compliance ~~Violation~~ Investigation  
Self-Reporting  
Complaint

### 1.3. Data Retention

~~The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.~~

The Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- o ~~The Each~~ Reliability Coordinator shall ~~retain~~ keep the most recent twelve months of historical data (evidence of) ~~for~~ Requirements R1, R2, R9, and R10, Measures M1, M2, M9, and M10 for the most recent twelve calendar months.
- o ~~The Each~~ Transmission Operator shall ~~retain~~ keep the most recent twelve months of historical data (evidence of) ~~for~~ Requirements R3, R4, R9, and R10, Measures M3, M4, M9, and M10 for the most recent twelve calendar months.
- o ~~The Each~~ Balancing Authority shall ~~retain~~ keep the most recent twelve months of historical data (evidence of) ~~for~~ Requirements R5, R6, R9, and R10, Measures M5, M6, M9, and M10 for the most recent twelve calendar months.
- o ~~The Each~~ Distribution Provider shall ~~retain~~ keep the most recent twelve months of historical data (evidence of) ~~for~~ Requirements R7 and R11, Measures M7 and M11 for the most recent twelve calendar months.
- o ~~The Each~~ Generator Operator shall ~~retain~~ keep the most recent twelve months of historical data (evidence of) ~~for~~ Requirements R8 and R11, Measures M8 and M11 for the most recent twelve calendar months.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, or Generator Operator is found non-compliant ~~with a requirement~~, it shall keep information related to the ~~non-compliance~~ non-compliance until mitigation is complete and approved ~~the Compliance Enforcement Authority finds it compliant~~ or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Additional Compliance Information**

~~None.~~

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	<u>The Reliability Coordinator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.</u> N/A	The Reliability Coordinator failed to have Interpersonal <del>Communication</del> <del>Communications</del> capability with <del>two</del> <del>one</del> or more of the entities listed in <u>Requirement R1</u> , Parts 1.1 or 1.2, <u>except when the Reliability Coordinator experienced a failure of its Interpersonal Communication capability in accordance with Requirement R10.</u>

# Implementation Plan and Mapping Document

## COM-001-2 Communications

### Requested Approval

The RC SDT requests the approval of COM-001-2 – Communications and two new NERC Glossary terms.

### Requested Retirement

The RC SDT request the retirement of standard COM-001-1.1, Requirements R1, R2, R3, R5, R6 and the associated sub-requirements, except Requirement R4. This Requirement R4 is being revised for inclusion in Standard COM-003-1, Operating Personnel Communications Protocols and will be retired when COM-003-1 becomes effective.

### Prerequisite Approvals

None.

### Defined Terms in the NERC Glossary

The RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

### Conforming Changes to Requirements in Already Approved Standards

The RC SDT proposes retiring COM-001-1.1, Requirement R5 as it is redundant with EOP-008-0, Requirement R1 as well as EOP-008-1, Requirement R1.

### Revisions to Approved Standards and Definitions

The RCSDT revised the COM-001-1 standard and is proposing retiring four Requirements (R1, R4, R5, and R6). The COM-001-1 standard, Requirement R1 is proposed to be replaced with COM-001-2, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 to achieve clarity to which entities were required to have to reliable communications. Requirement R2 in COM-001-1 will become Requirement R9 in COM-001-2. Requirement R3 in COM-001-1 has been included within Requirement R1 of COM-001-2. Requirement R4 will remain enforceable until its revision is included in COM-003-1 that is being developed under Project 2007-02 – Operating Personnel Communication Protocols. Requirement R5 in COM-001-1 is redundant with EOP-008-0, Requirement R1 and EOP-008-1, Requirement R1 and will be retired upon the effective date of COM-001-2. The COM-001-1 standard, Requirement R6 will be retired as it is an ERO procedural requirement and does not impact reliability. Changes were made to

eliminate redundancies between standards (existing and proposed), to align with the ERO Rules of Procedure and to address known issues and certain directives in FERC Order 693.

### Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Operator
- Generator Operator
- Distribution Provider

### Effective Date

The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

### New or Revised Standards

COM-001-2                    In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.

### Standard for Retirement

COM-001-1.1,            Midnight of the day immediately prior to the Effective Date of COM-001-2 in the  
Requirements            particular Jurisdiction in which the new standard is becoming effective. Note:  
R1, R2, R3, R5,            Requirement R4 will remain effective until its inclusion in the standard COM-003-1  
and R6                      currently under development.

### Implementation Plan for Definitions

**Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.

**Alternative Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.

## Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard becomes effective. If the drafting team is recommending the retirement or revision of a requirement, that text is [blue](#).

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p><b>R1.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information: <i>[Violation Risk Factor: High]</i></p> <p><b>R1.1.</b> Internally. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.2.</b> Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.3.</b> With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.4.</b> Where applicable, these facilities shall be redundant and diversely routed. <i>[Violation Risk Factor: High]</i></p>	<p><b>COM-001-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p> <p><b>R1.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R1.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R2.</b> Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R2.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R2.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R3.</b> Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator experiences a failure of its Interpersonal</p>

	connected.
<p><b>Notes:</b> The requirements were made clearer as to which capabilities specific entities were required to have to reliable communications.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p><b>R1.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information: <i>[Violation Risk Factor: High]</i></p> <ul style="list-style-type: none"> <li><b>R1.1.</b> Internally. <i>[Violation Risk Factor: High]</i></li> <li><b>R1.2.</b> Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities. <i>[Violation Risk Factor: High]</i></li> <li><b>R1.3.</b> With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability. <i>[Violation Risk Factor: High]</i></li> <li><b>R1.4.</b> Where applicable, these facilities shall be redundant and diversely routed. <i>[Violation Risk Factor: High]</i></li> </ul>	<p><b>COM-001-2</b></p> <p><b>R5.</b> Each Balancing Authority shall have Interpersonal Communication capability with the following entities (unless the Balancing Authority experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> <li><b>R5.1.</b> Its Reliability Coordinator.</li> <li><b>R5.2.</b> Each Transmission Operator that operates Facilities within its Balancing Authority Area.</li> <li><b>R5.3.</b> Each Distribution Provider within its Balancing Authority Area.</li> <li><b>R5.4.</b> Each Generator Operator that operates Facilities within its Balancing Authority Area.</li> <li><b>R5.5.</b> Each adjacent Balancing Authority.</li> </ul> <p><b>R6.</b> Each Balancing Authority shall designate an Alternative Interpersonal Communication capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> <li><b>R6.1.</b> Its Reliability Coordinator.</li> </ul>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p><b>R6.2.</b> Each Transmission Operator that operates Facilities within its Balancing Authority Area.</p> <p><b>R6.3.</b> Each adjacent Balancing Authority.</p> <p><b>R7.</b> Each Distribution Provider shall have Interpersonal Communication capability with the following entities (unless the Distribution Provider experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R7.1.</b> Its Transmission Operator.</p> <p><b>R7.2.</b> Its Balancing Authority.</p> <p><b>R8.</b> Each <b>Generator Operator</b> shall have Interpersonal Communication capability with the following entities (unless the Generator Operator experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R8.1.</b> Its Balancing Authority.</p> <p><b>R8.2.</b> Its Transmission Operator.</p>
<p><b>Notes:</b> The requirements we made clearer as to which capabilities specific entities were required to have for reliable interpersonal communications. Requirements R7 and R8 were created to address the FERC directive (Order No. 693, P508) to “(1) expand the applicability to include generator operators and distribution providers and includes Requirements for their telecommunications facilities;”</p>	
COM-001-1.1	COM-001-2

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>R2.</b> Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications. <i>[Violation Risk Factor: Medium]</i></p>	<p><b>R9.</b> Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours. <i>[Violation Risk Factor: Medium][Time Horizon: Real-time Operations]</i></p>
<p><b>Notes:</b></p>	
<p><b>COM-001-1.1</b></p> <p><b>R3.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas. <i>[Violation Risk Factor: Lower]</i></p>	<p><b>COM-001-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator experiences a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> <li><b>R1.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</li> <li><b>R1.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</li> </ul>
<p><b>Notes:</b></p>	
<p><b>COM-001-1.1</b></p> <p><b>R4.</b> Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use</p>	<p><b>None - retire</b></p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations. <i>[Violation Risk Factor: Medium]</i></p>	<ul style="list-style-type: none"> <li>▪ This requirement is being vetted by the OPCPSDT in Project 2007-02 – Operating Personnel Communication Protocols (COM-003-1). This requirement and measure will be removed from COM-001-1.1 upon the effective date of COM-003-1.</li> </ul>
<p><b>Notes:</b></p>	
<p><b>COM-001-1.1</b></p> <p><b>R5.</b> Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities. <i>[Violation Risk Factor: Lower]</i></p>	<p><b>EOP-008-0</b></p> <p><b>R1.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have a plan to continue reliability operations in the event its control center becomes inoperable. The contingency plan must meet the following requirements:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> The contingency plan shall not rely on data or voice communication from the primary control facility to be viable.</li> <li><b>R1.2.</b> The plan shall include procedures and responsibilities for providing basic tie line control and procedures and for maintaining the status of all inter-area schedules, such that there is an hourly accounting of all schedules.</li> <li><b>R1.3.</b> The contingency plan must address monitoring and control of critical transmission facilities, generation control, voltage control, time and frequency control, control of critical substation devices, and logging of significant power system events. The plan shall list the critical facilities.</li> <li><b>R1.4.</b> The plan shall include procedures and responsibilities for</li> </ul>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>maintaining basic voice communication capabilities with other areas.</p> <p><b>R1.5.</b> The plan shall include procedures and responsibilities for conducting periodic tests, at least annually, to ensure viability of the plan.</p> <p><b>R1.6.</b> The plan shall include procedures and responsibilities for providing annual training to ensure that operating personnel are able to implement the contingency plans.</p> <p><b>R1.7.</b> The plan shall be reviewed and updated annually.</p> <p><b>R1.8.</b> Interim provisions must be included if it is expected to take more than one hour to implement the contingency plan for loss of primary control facility.</p> <p><b>EOP-008-1</b></p> <p><b>R1.</b> Each Reliability Coordinator, Balancing Authority, and Transmission Operator shall have a current Operating Plan describing the manner in which it continues to meet its functional obligations with regard to the reliable operations of the BES in the event that its primary control center functionality is lost. This Operating Plan for backup functionality shall include the following, at a minimum: [Violation Risk Factor = Medium] [Time Horizon = Operations Planning]</p> <p><b>1.1.</b> The location and method of implementation for providing backup functionality for the time it takes to restore the primary control center functionality.</p> <p><b>1.2.</b> A summary description of the elements required to support the backup functionality. These elements shall include, at a</p>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>minimum:</p> <ul style="list-style-type: none"> <li><b>1.2.1.</b> Tools and applications to ensure that System Operators have situational awareness of the BES.</li> <li><b>1.2.2.</b> Data communications.</li> <li><b>1.2.3.</b> Voice communications.</li> <li><b>1.2.4.</b> Power source(s).</li> <li><b>1.2.5.</b> Physical and cyber security.</li> <li><b>1.3.</b> An Operating Process for keeping the backup functionality consistent with the primary control center.</li> <li><b>1.4.</b> Operating Procedures, including decision authority, for use in determining when to implement the Operating Plan for backup functionality.</li> <li><b>1.5.</b> A transition period between the loss of primary control center functionality and the time to fully implement the backup functionality that is less than or equal to two hours.</li> <li><b>1.6.</b> An Operating Process describing the actions to be taken during the transition period between the loss of primary control center functionality and the time to fully implement backup functionality elements identified in Requirement R1, Part 1.2. The Operating Process shall include at a minimum: <ul style="list-style-type: none"> <li><b>1.6.1.</b> A list of all entities to notify when there is a change in operating locations.</li> <li><b>1.6.2.</b> Actions to manage the risk to the BES during the transition from primary to backup functionality as well as</li> </ul> </li> </ul>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>during outages of the primary or backup functionality.</p> <p><b>1.6.3.</b> Identification of the roles for personnel involved during the initiation and implementation of the Operating Plan for backup functionality.</p>
<p><b>Notes:</b> The RC SDT proposes retiring COM-001-1.1, Requirement R5 as it is redundant with EOP-008-0, Requirement R1 as well as EOP-008-1 Requirement R1.</p>	
<p><b>COM-001-1</b></p> <p><b>R6.</b> Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.” <i>[Violation Risk Factor: Lower]</i></p>	<p><b>None – retire</b></p>
<p><b>Notes:</b> The RC SDT is recommending that R6 be retired. This is an ERO procedural issue and should not be in a reliability standard. It should be included in the ERO Rules of Procedure.</p>	
<p><b>None</b></p>	<p><b>New Requirement</b></p> <p><b>R11.</b> Each Distribution Provider and Generator Operator that experiences a failure of its Interpersonal Communication capability shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability. <i>[Violation Risk Factor: Medium][Time Horizon: Real-time Operations]</i></p>
<p><b>Notes:</b></p>

## Implementation Plan and Mapping Document for COM-001-2 – Communications

### Approvals Requested Approval

The RC SDT requests the approval of COM-001-2 – Communications and two new NERC Glossary terms.

### Requested Retirement

The RC SDT request the retirement of standard COM-001-1.1, Requirements R1, R2, R3, R5, R6 and the associated sub-requirements, except Requirement R4. This Requirement R4 is being revised for inclusion in Standard COM-003-1, Operating Personnel Communications Protocols and will be retired when COM-003-1 becomes effective.

### Prerequisite Approvals

- None.

### Defined Terms in the NERC Glossary

The RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication ~~Communications~~ used for day-to-day operation.

### Conforming Changes to Requirements in Already Approved Standards

The RC SDT proposes retiring COM-001-1.1, Requirement R5 as it is redundant with EOP-008-0, Requirement R1 as well as EOP-008-1, Requirement R1.

- ~~None.~~

## Revisions to Approved Standards and Definitions

The RCSDT revised the COM-001-1 standard and is proposing retiring four ~~Requirements~~ requirements (R1, R4, R5, and R6). ~~The~~ COM-001-1 ~~standard, Requirement~~ requirement R1 is proposed to be replaced with COM-001-2, ~~Requirements~~ requirements R1, R2, R3, R4, R5, R6, R7, and R8 to achieve clarity to which entities were required to have to reliable communications. Requirement R2 in COM-001-1 will become ~~Requirement~~ requirement R9 in COM-001-2. Requirement R3 in COM-001-1 has been included within ~~Requirement~~ R1 of COM-001-2. Requirement R4 will remain enforceable until its ~~revision is included in~~ inclusion into COM-003-1 that is being ~~developed~~ revised under Project 2007-02 – Operating Personnel Communication Protocols. ~~and becomes mandatory and enforceable.~~ Requirement R5 in COM-001-1 is redundant with EOP-008-0, ~~Requirement~~ R1 and EOP-008-1, ~~Requirement~~ R1 and will be retired upon the effective date of COM-001-2. ~~The~~ COM-001-1 ~~standard, Requirement;~~ requirement R6 will be retired as it is an ERO procedural requirement and does not impact reliability. Changes were made to eliminate redundancies between standards (existing and proposed), to align with the ERO Rules of Procedure and to address ~~known~~ issues ~~and certain directives~~ in FERC Order 693.

### Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Operator
- Generator Operator
- Distribution Provider

### Effective ~~Date~~ Dates

The first day of the second calendar quarter ~~beyond the date that this standard is approved by~~ following applicable regulatory ~~authorities, approval~~— or in those jurisdictions where ~~no~~ regulatory approval is ~~not~~ required, the ~~standard becomes effective on the~~ first day of the first calendar quarter ~~beyond the date this standard is approved by the NERC~~ following Board of Trustees, ~~or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.~~ adoption.

### New or Revised Standards

#### COM-001-2

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.

### Standard for Retirement

COM-001-1.1, Requirements R1, R2, R3, R5, and R6      Midnight of the day immediately prior to the Effective Date of COM-001-2 in the particular Jurisdiction in which the new standard is becoming effective. Note: Requirement R4 will remain effective until its inclusion in the standard COM-003-1 currently under development.

### Implementation Plan for Definitions

**Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.

**Alternative Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.

## Retirements

~~COM-001-1.1 will be retired at midnight the day before COM-001-2 becomes effective with the exception of Requirement R4. This requirement is being revised and will be included in Standard COM-003-1, Operating Personnel Communications Protocols. COM-001-1.1, Requirement R4 will be retired at midnight the day before COM-003-1 becomes effective.~~

## Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard becomes effective. ~~is implemented~~. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p><del>■ COM-001-1.1</del></p> <p><del><b>R1.</b>— Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of interconnection and operating information. <i>[Violation Risk Factor: High]</i></del></p> <p><del><b>R1.1.</b>— Internally. <i>[Violation Risk Factor: High]</i></del></p> <p><del><b>R1.2.</b>— Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities. <i>[Violation Risk Factor: High]</i></del></p> <p><del><b>R1.3.</b>— With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability. <i>[Violation Risk Factor: High]</i></del></p> <p><del><b>R1.4.</b>— Where applicable, these facilities shall be redundant and diversely routed. <i>[Violation Risk Factor: High]</i></del></p>	<p><b>COM-001-2</b></p> <p><b>R1.</b>— Each Reliability Coordinator shall have Interpersonal Communications capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R1.1.</b>— All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R1.2.</b>— Adjacent Reliability Coordinators within the same Interconnection.</p> <p><b>R2.</b>— Each Reliability Coordinator shall designate an Alternative Interpersonal Communications capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R2.1.</b>— All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R2.2.</b>— Adjacent Reliability Coordinators within the same Interconnection.</p> <p><b>R3.</b>— Each Transmission Operator shall have Interpersonal Communications capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p>

If you have questions please contact Scott Barfield-McGinnis at [scott.barfield@nerc.net](mailto:scott.barfield@nerc.net) or by telephone at 404-446-9689.

### Background

The RCSDT has revised the COM-001-2 standard based on stakeholder comments received during the successive ballot, formal comment period and quality review of the standard.

The two proposed definitions remain the same, except letter “s” on “Communications” the definition of Alternative Interpersonal Communication to make it singular. The RCSDT has addressed comments on the Purpose statement to align it with the intent of requiring entities to have communication capability. The effective date language was updated to reflect the current guidelines for standards.

**Purpose:** To establish Interpersonal Communication capabilities necessary to maintain reliability.

Several commenters had suggestions for improvements to the language in the requirements. The RCSDT addressed the use of “Adjacent...” starting requirements and giving the appearance of a defined glossary term by rephrasing the occurrence with “Each adjacent...” Other corrections include using the singular rather than plural for clarity.

Several commenters raised concerns about the use of “...synchronously connected within the same interconnection.” To address this, the RCSDT shortened the two requirements using this phrase to “...synchronously connected” and added an a corresponding additional requirement to each to address DC connections. See the following Requirement Parts below:

- 3.5. Each adjacent Transmission Operator synchronously connected. (Revised)
- 3.6. Each adjacent Transmission Operator asynchronously connected. (New)
- 4.3. Each adjacent Transmission Operator synchronously connected. (Revised)
- 4.4. Each adjacent Transmission Operator asynchronously connected. (New)

Some commenters had concerns about conditions of non-compliance if the entity’s Interpersonal Communication capability failed. To address this concern, the RCSDT added conforming language to Requirements R1, R3, R5, R7 and R8 that bridges the potential gap in non-compliance for a failed Interpersonal Communication capability. The VSLs were updated to reflect this change.

Requirement R10 was revised to remove R1-R6 and more accurately use R1, R3, and R5. Requirement R11 was revised the phrase “mutually agreeable time” to remove the word “time” and replace it with “action.” The Measures M10 and M11 were also corrected. Additionally, the bullets in Measures M1-M8 were cleaned up for clarity. All of the examples of evidence in the Measures were reformatted and cleaned up to more accurately reflect the scope of each requirement.

Based on comments received, the Compliance Section 1.1, Compliance Enforcement Authority, was updated to reflect the current guidelines for standards. Additionally, Section 1.3, Data Retention, was updated to reflect the current guidelines for standards and the bulleted items reformatted for clarity.

The VSLs were updated to make singular, note the applicable Requirement number, and to add the Parts 3.6 and 4.4 due to being added to the requirements, R3 and R4. Additionally, the RCSDT added High VSLs for Requirements R1 through R8 to conform with VSL Guidelines. Requirements R1 through R8 are not binary only.

**You do not have to answer all questions. Enter all comments in Simple Text Format.**

1. The RCSDT has revised the parts of Requirements R1, R2, R3, R4, R5, and R6 of COM-001-2 that began only with "Adjacent..." to begin with "Each adjacent..." to avoid the appearance of creating a defined glossary phrase. Do you agree with the changes? If not, please explain in the comment area below.

Yes

No

Comments:

2. The RCSDT has revised parts of two requirements (Parts 3.5 and 4.3) in COM-001-2 and added two additional parts (Parts 3.6 and 3.4) to address concerns about the phrase "synchronously connected within the same Interconnection." Do you agree these changes address concerns where entities might only be adjacent across an Interconnection for where connected by a Direct Current (DC) tie? If not, please explain in the comment area below.

Yes

No

Comments:

3. The RCSDT made minor changes and reformatted the evidence examples in the Measures of COM-001-2 for greater clarity. Do you agree with these revisions? If not, please explain in the comment area below.

Yes

No

Comments:

4. Do you have any other comments on COM-001-2, not expressed in questions above, for the RCSDT?

Comments:

**A. Introduction**

- 1. Title:** **Telecommunications**
- 2. Number:** COM-001-1.1
- 3. Purpose:** Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information necessary to maintain reliability.
- 4. Applicability**
  - 4.1.** Transmission Operators.
  - 4.2.** Balancing Authorities.
  - 4.3.** Reliability Coordinators.
  - 4.4.** NERCNet User Organizations.
- 5. Effective Date:** May 13, 2009

**B. Requirements**

- R1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
  - R1.1.** Internally.
  - R1.2.** Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities.
  - R1.3.** With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
  - R1.4.** Where applicable, these facilities shall be redundant and diversely routed.
- R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications.
- R3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.
- R4.** Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.
- R5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.
- R6.** Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.”

**C. Measures**

- M1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include, but is not limited to communication facility test-procedure documents, records of testing, and maintenance records for communication facilities or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)
- M2.** The Reliability Coordinator, Transmission Operator or Balancing Authority shall have and provide upon request evidence that could include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent, that will be used to determine compliance to Requirement 4.
- M3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy that will be used to confirm that it meets Requirement 5.
- M4.** The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to documented procedures, operator logs, voice recordings or transcripts of voice recordings, electronic communications, etc that will be used to determine if it adhered to the (User Accountability and Compliance) requirements in Attachment 1-COM-001. (Requirement 6)

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations

Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

For Measure 1 each Reliability Coordinator, Transmission Operator, Balancing Authority shall keep evidence of compliance for the previous two calendar years plus the current year.

For Measure 2 each Reliability Coordinator, Transmission Operator, and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 3, each Reliability Coordinator, Transmission Operator, Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement 5.

For Measure 4, each Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

Attachment 1 — COM-001 — NERCnet Security Policy

**2. Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:

**2.3.1** The Transmission Operator, Balancing Authority or Reliability Coordinator used a language other than English without agreement as specified in R4.

**2.3.2** There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities as specified in R5.

**2.4. Level 4:** Telecommunication systems are not actively monitored, tested, managed or alarmed as specified in R2.

**3. Levels of Non-Compliance — NERCnet User Organization**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

**3.3. Level 3:** Not applicable.

**3.4. Level 4:** Did not adhere to the requirements in Attachment 1-COM-001, NERCnet Security Policy.

**E. Regional Differences**

None Identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

## Standard COM-001-1.1 — Telecommunications

---

1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 6, 2007	Requirement 1, added the word “for” between “facilities” and “the exchange.”	Errata
1.1	October 29, 2008	BOT adopted errata changes; updated version number to “1.1”	Errata

**Attachment 1 — COM-001 — NERCnet Security Policy**

**Policy Statement**

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost-effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

**NERC’s Security Mission Statement**

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

**Implementation and Responsibilities**

This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

**NERCnet User Organizations**

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

**Responsibilities**

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC-authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- Advise staff on NERCnet Security Policy.
- Ensure that all NERCnet users understand their obligation to protect these assets.
- Conduct self-assessments for compliance.

**User Accountability and Compliance**

All users of NERCnet shall be familiar and ensure compliance with the policies in this document.

Violations of the NERCnet Security Policy shall include, but not be limited to any act that:

- Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.
- Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data.

Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.

# Violation Risk Factor and Violation Severity Level Justifications

## COM-001-2 - Communications

### Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: COM-001-2 – Communications

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Reliability Coordination Standard Drafting Team (SDT) applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSL for the requirements under this project.

#### **NERC Criteria – Violation Risk Factors**

##### ***High Risk Requirement***

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***Medium Risk Requirement***

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

***Lower Risk Requirement***

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

**FERC Violation Risk Factor Guidelines**

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

***Guideline 1 – Consistency with the Conclusions of the Final Blackout Report***

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

<sup>1</sup> North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) (“VRF Rehearing Order”).

<sup>2</sup> Id. at footnote 15.

- Appropriate use of transmission loading relief

***Guideline 2 – Consistency within a Reliability Standard***

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

***Guideline 3 – Consistency among Reliability Standards***

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

***Guideline 4 – Consistency with NERC’s Definition of the Violation Risk Factor Level***

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC’s definition of that risk level.

***Guideline 5 – Treatment of Requirements that Co-mingle More Than One Obligation***

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are eleven requirements in the standard. None of the eleven requirements were assigned a “Lower” VRF. Requirements R1-R8 are assigned a “High” VRF while the other three requirements are assigned a “Medium” VRF.

**NERC Criteria – Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order of Violation Severity Levels**

FERC’s VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

***Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

***Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

... unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF and VSL Justifications**

VRF Justifications – COM-001-2, R1-R6	
Proposed VRF	High
NERC VRF Discussion	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement specifies which functional entities that are required to have Interpersonal Communication capability and Alternative Interpersonal Communication capability. The VRFs for each requirement are consistent with each other and are only applied at the Requirement level.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: These requirements are facility requirements that provide communications capability between functional entities. There are no similar facility requirements in the standards. The approved VRF for COM-001-1.1, R1 (which proposed R1-R6 replaces) is High and therefore the proposed VRF for R1-R6 is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to have Interpersonal Communication capability and Alternative Interpersonal Communication capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the Bulk Power System and could lead to Bulk Power System instability, separation, or cascading failures. Therefore, this requirement is assigned a High VRF.
FERC VRF G5	Guideline 5- Treatment of Requirements that Co-mingle More than One

<b>VRF Justifications – COM-001-2, R1-R6</b>	
<b>Proposed VRF</b>	<b>High</b>
Discussion	Obligation: Each of the six requirements, R1-R6, contains only one objective; therefore, only one VRF was assigned.

## Violation Risk Factor and Violation Severity Level

### Justifications ~~Assignments~~

## COM-001-2 - Communications

### Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: COM-001-2 – Communications

~~COM-001-2 – Telecommunications~~

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

### Justification for Assignment of Violation Risk Factors in COM-001-2

The Reliability Coordination Standard Drafting Team (SDT) applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSL for the requirements under this project.~~in COM-001-2:~~

### NERC Criteria – Violation Risk Factors

#### ***High Risk Requirement***

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

#### ***Medium Risk Requirement***

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk

electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### ***Lower Risk Requirement***

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1,2</sup>

#### **Guideline (1 ~~→~~) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

— In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System.<sup>3,4</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange

- Appropriate use of transmission loading relief.

**Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

**Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) — Consistency with NERC’s Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC’s definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

**VRF for COM-001-2:**

There are eleven requirements in the standard COM-001-2. None of the eleven requirements were assigned a “Lower” VRF. Requirements R1-R8 are assigned a “High” VRF while the other three requirements are assigned a “Medium” VRF.

## NERC Criteria – Violation Severity Levels

### Violation Severity Levels (VSLs) define the degree to which compliance with VRF for COM-001-2, Requirements R1-R6:

- ~~● FERC’s Guideline 2 — Consistency within a requirement was not achieved Reliability Standard. Each requirement must specifies which functional entities that are required to have at least one VSL. While it is preferable to have four VSLs Interpersonal Communications capability and Alternative Interpersonal Communications capability. The VRFs for each requirement, some are consistent with each other and are only applied at the Requirement level.~~
- ~~● FERC’s Guideline 3 — Consistency among Reliability Standards. These requirements do not have multiple “degrees” of noncompliant performance, and may have are facility requirements that provide communications capability between functional entities. There are no similar facility requirements in the standards. The approved VRF for COM-001-1.1, R1 (which proposed R1-R6 replaces) is High and therefore the proposed VRF for R1-R6 is consistent.~~
- ~~● FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to have Interpersonal Communications capability and Alternative Interpersonal Communications capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or cascading failures. Therefore, this requirement is assigned a High VRF.~~
- ~~● FERC’s Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. COM-001-2, Requirements R1-R6 contain only one objective, therefore only one, two, or three VSLs. VRF was assigned.~~

### VRF for COM-001-2, Requirement R7:

- ~~● FERC’s Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.~~
- ~~● FERC’s Guideline 3 — Consistency among Reliability Standards. COM-001-2, Requirement R7 is an analog to Parts 3.3 and 5.3 and they have the same VRF (High).~~
- ~~● FERC’s Guideline 4 — Consistency with NERC’s Definition of a VRF. Failure to have Interpersonal Communications capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or cascading failures. Therefore, this requirement was assigned a High VRF.~~

- ~~FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. COM-001-2, Requirement R7 addresses a single objective and has a single VRF.~~

**VRF for COM-001-2, Requirement R8:**

- ~~FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.~~
- ~~FERC's Guideline 3 — Consistency among Reliability Standards. COM-001-2, Requirement R8 is an analog to Parts 3.4 and 5.4 and they have the same VRF (High).~~
- ~~FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have Interpersonal Communications capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the bulk power system and could lead to bulk power system instability, separation, or cascading failures. Therefore, this requirement was assigned a High VRF.~~
- ~~FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. COM-001-2, Requirement R8 addresses a single objective and has a single VRF.~~

**VRF for COM-001-2, Requirement R9:**

- ~~FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.~~
- ~~FERC's Guideline 3 — Consistency among Reliability Standards. COM-001-2, Requirement R9 is a requirement for entities to test their Alternative Interpersonal Communications capability and to take restorative action should the test fail and is a replacement requirement for COM-001-1.1, R2, which has an approved VRF of Medium.~~
- ~~FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. COM-001-2, Requirement R9 is a requirement for entities to test their Alternative Interpersonal Communications capability and to take restorative action should the test fail. The act of testing in and of itself is not likely to “directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium-risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures...” Therefore, this requirement was assigned a Medium VRF.~~
- ~~FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. COM-001-2, Requirement R9 addresses a single objective and has a single VRF.~~

**VRF for COM-001-2, Requirement R10:**

- ~~FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.~~
- ~~FERC's Guideline 3 — Consistency among Reliability Standards. COM-001-2, Requirement R10 is a new requirement that was assigned a Medium VRF. When evaluating the VRF to be assigned to this requirement, the SDT took into account that this requirement~~

~~is a notification item, not an actual action that has a direct impact on the bulk power system. Therefore, the simple act of failing to notify another entity of the failure of Interpersonal Communications capability, while it may impair the entity's ability communicate, does not, in itself, lead to bulk power system instability, separation, or cascading failures. Therefore, this requirement was assigned a Medium VRF.~~

- ~~● FERC's Guideline 4—Consistency with NERC's Definition of a VRF. COM-001-2, Requirement R10 mandates that entities notify entities of a failure of Interpersonal Communications capability. Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to notify another entity of the failure. Therefore, this requirement was assigned a Medium VRF.~~
- ~~● FERC's Guideline 5—Treatment of Requirements that Co-mingle More Than One Objective. TOP-001-2, Requirement R10 addresses a single objective and has a single VRF.~~

#### **VRF for COM-001-2, Requirement R11:**

- ~~● FERC's Guideline 2—Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.~~
- ~~● FERC's Guideline 3—Consistency among Reliability Standards. COM-001-2, Requirement R11 is a new requirement that was assigned a Medium VRF. When evaluating the VRF to be assigned to this requirement, the SDT took into account that this requirement is a consultation item, not an actual action that has a direct impact on the bulk power system. Therefore, the simple act of failing to consult with another entity on the failure of Interpersonal Communications capability and its restoration, while it may impair the entity's ability communicate, does not, in itself, lead to bulk power system instability, separation, or cascading failures. Therefore, this requirement was assigned a Medium VRF.~~
- ~~● FERC's Guideline 4—Consistency with NERC's Definition of a VRF. COM-001-2, Requirement R11 mandates that entities consult with other entities regarding restoration of Interpersonal Communications capability. Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to consult with another entity on restoration times. Therefore, this requirement was assigned a Medium VRF.~~
- ~~● FERC's Guideline 5—Treatment of Requirements that Co-mingle More Than One Objective. TOP-001-2, Requirement R11 addresses a single objective and has a single VRF.~~

**Justification for Assignment of Violation severity levels should be Severity Levels for COM-001-2**

~~In developing the VSLs for the TOP standard, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the guidelines shown in the table below none compliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:~~

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

**FERC Order of Violation Severity Levels**

FERC’s VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in ~~the standard TOP xxx x~~ meet the FERC Guidelines for assessing VSLs:

**Guideline 1 ~~–~~: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline 2 ~~–~~: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline 3 ~~–~~ Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4 ~~–~~ Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF and VSL Justifications**

## Standards Announcement

### Project 2006-06 Reliability Coordination

Ballot Window Extended for COM-001-2 – Successive Ballot and Non-Binding Poll

#### Extended

The ballot window for the successive ballot of COM-001-2 and a non-binding poll of the associated VRF/VSLs will be **extended one day at a time until a quorum is achieved**.

#### **Instructions**

Members of the ballot pools associated with this project may log in and submit their vote for the Standards and opinion in the non-binding polls of the associated VRFs and VSLs by clicking [here](#).

#### **Next Steps**

The drafting team will consider all comments received for COM-001-2 during the formal comment and ballot period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

#### **Background**

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measureable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2.

Additional information is available on the [project page](#).

#### **Standards Development Process**

The [Standards Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement Project 2006-06 Reliability Coordination

Ballot Windows Open through 8 p.m. Friday, July 6, 2012

Successive and Non-Binding Poll: COM-001-2

Recirculation and Non-Binding Polls: COM-002-3 and IRO-001-3

### Now Available

A successive ballot for COM-001-2 and a non-binding poll of the associated VRF/VSLs and recirculation ballots for COM-002-3 and IRO-001-3 and non-binding polls for the associated VRF/VSLs are open through **8 p.m. Eastern on Friday, July 6, 2012.**

### **Instructions**

Members of the ballot pools associated with this project may log in and submit their vote for the Standards and opinion in the non-binding polls of the associated VRFs and VSLs by clicking [here](#).

Voters can submit their comments via the [electronic comment form](#).

### **Next Steps**

The drafting team will consider all comments received for COM-001-2 during the formal comment and ballot period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

### **Background**

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measureable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2.

## Standards Announcement Project 2006-06 Reliability Coordination

Formal Comment Period: June 7-July 6, 2012

Upcoming: June 27 – July 6, 2012  
Successive and Non-Binding Poll: COM-001-2  
Recirculation and Non-Binding Polls: COM-002-3 and IRO-001-3

### [Now Available](#)

A formal comment period for **COM-001-2 – Communications** is open through **8 p.m. Eastern on Friday, July 6, 2012**. In response to industry comments, the Drafting Team made substantive changes to COM-001-2 – Communications requiring an additional comment period and successive ballot. The Drafting Team made minor changes to the VSLs but did not make substantive changes to **COM-002-3 – Communication and Coordination** and **IRO-001-3 – Reliability Coordination – Responsibilities and Authorities** requirements which passed the previous successive ballots.

### Instructions for Commenting

A formal comment period for COM-001-2 is open through **8 p.m. Eastern on Friday, July 6, 2012**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

Commenters and voters **must** submit comments through the [electronic comment form](#). Due to modifications to NERC's balloting software, voters are no longer able to submit comments via the balloting software.

### Next Steps

A successive ballot for COM-001-2 and a non-binding poll of the associated VRF/VSLs and recirculation ballots for COM-002-3 and IRO-001-3 and non-binding polls for the associated VRF/VSLs will be conducted on Wednesday, June 27 through 8 p.m. Eastern on Friday, July 6, 2012.

### Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measureable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization

Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2. Additional information is available on the [project page](#).

The Project 2006-06 standards are an important part of the ERO's strategic goal to develop technically sufficient standards with requirements that provide clear and unambiguous performance expectations and reliability benefits.

## Standards Announcement Project 2006-06 Reliability Coordination

### Successive, Recirculation and Non-Binding Poll Results

#### [Now Available](#)

A successive ballot for **COM-001-2 – Communications** and a non-binding poll of the associated VRF/VSLs and recirculation ballots for **COM-002-3 – Communication and Coordination** and **IRO-001-3 – Reliability Coordination – Responsibilities and Authorities** and non-binding polls for the associated VRF/VSLs concluded on Friday, July 6, 2012.

Voting statistics for each ballot are listed below, and the [Ballots Results](#) page provides a link to the detailed results.

Standard	Approval	Non-binding Poll Results
COM-001-2 (Successive)	Quorum: 75.37% Approval: 72.16%	Quorum: 75.37% Supportive Opinions: 73.71%
COM-002-3 (Recirculation)	Quorum: 85.34% Approval: 81.71%	Quorum: 84.16% Supportive Opinions: 79.16%
IRO-001-3 (Recirculation)	Quorum: 85.04% Approval: 81.72%	Quorum: 83.87 % Supportive Opinions: 86.91%

#### Next Steps

The drafting team is considering all comments submitted for COM-001-2, and based on the comments will determine whether to make additional changes. If the drafting team determines that no substantive changes to the standard are required, the team will submit the standard and associated documents for a recirculation ballot. If the drafting team makes substantive changes to the standard, the team will submit its consideration of comments, along with the revised standard and associated documents, for a quality review prior to posting for another successive ballot.

COM-002-3 – Communication and Coordination and IRO-001-3 – Reliability Coordination – Responsibilities and Authorities will be presented to the NERC Board of Trustees for adoption and subsequently filed with regulatory authorities. The VRFs and VSLs for both standards (unchanged from

those included in the versions of the standards posted for recirculation ballot) will be presented to the board for approval.

### **Background**

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2.

Additional information is available on the [project page](#).

The definition of Alternative Interpersonal Communication is "Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation." Does the Alternative Interpersonal Communication have to be a different technology? For example, if a satellite phone is used, but it calls the same land-line on the other end, does this qualify as Alternative Interpersonal Communication? How does a TOP notify a DP of a failure in its Interpersonal Communications capability per R10, if it there is no Alternative Interpersonal Communication required? Within Requirement 10, the entities to be notified should not reference R1, R3, and R5 but should instead reference R2, R4, and R6 respectively. This change is necessary because the requirements we are referring to are those that have Alternative Interpersonnel Communications. You cannot expect notification to entities where an Alternative Interpersonnel Communication does not exist.

FE supports COM-001-2 and has no further comments. PLEASE NOTE: THE FOLLOWING COMMENTS RELATE TO COM-002-3 AND IRO-001-3 SINCE WE WERE NOT ABLE TO PROVIDE COMMENTS ON THE RECIRCULATION BALLOT AND WANTED TO EXPLAIN OUR REASONS FOR NOT SUPPORTING THOSE STANDARDS: Although we believe the team made significant improvements to the standard, and would support a 3-part communication standard, we believe the introduction of both COM-002-2 which utilizes Reliability Directives and COM-003-1 which utilizes Operating Communications cause confusion for system operators and may in fact be detrimental to reliability. We do not support two standards on three-part communication. We suggest, as we have in the past, that the subject of three-part communication be addressed in a single standard, and that the requirements be developed for simplicity. The industry is, and has been, using three-part communication for decades and although we agree it should be more consistently practiced and standardized, the required communications protocols should be simple while meeting the goal of BES reliability. Introducing complicated requirements and standards that have different definitions such as Reliability Directive and Operating Communication may cause the operator to hesitate when issuing directives in real-time and every second counts when a potential system emergency must be mitigated. Therefore, FE does not support the creation of both COM-003-1 nor the revisions to COM-002-2 and IRO-001-3 which introduce the "Reliability Directive" term and ask NERC to reevaluate the need to have two separate standards for three-part communication.

PacifiCorp
Sandra Shaffer
No
No
PacifiCorp does not understand the RCSDT's rationale for creating separate sub-requirements for adjacent Transmission Operators that are synchronously and asynchronously connected, in both R3.5/R3.6 and R4.3/R4.4. PacifiCorp recommends the following singular sub-requirement for both R3 and R4: "Each adjacent Transmission Operator (whether synchronously or asynchronously connected)."

Change R11 and replace "experiences a failure" with "detects a failure" because one may have a

failure, but if it's undetected for some period of time because no communications are taking place, it's unclear when one actually "experienced a failure." We note that R10 uses the terminology "detection of a failure." Using consistent terminology in R10 and R11 would result in less confusion for compliance because there would not be an issue as to whether a difference was intended by the SDT between "experiences" and "detects" in the two requirements.

City of Tallahassee (TAL)

Yes

Yes

Yes

For Measure 7, the first line duplicates the word "that".

TAL has no comments on COM-001-2. However, for COM-002-3, under Data Retention, the second bullet requires the BA, TOP, GOP, and DP to retain evidence for R1, M1; however, R1 is not applicable to the GOP or DP. This should read R2, M2. Also, there is room for debate on the clarity of the VSLs for R3. Specifically, the use of the word "accurately" could be interpreted to mean "verbatim" in cases where varying verbiage results in the same understanding and action between the parties, and therefore no re-issuance of the directive is required in the eyes of the issuer.

Individual

Andrew Gallo

City of Austin dba Austin Energy

Yes

Yes

(1) Both instances of "Reliability Coordinator" in the VSLs for R3 should be "Transmission Operator" to match the language of the standard. (2) Both instances of "Reliability Coordinator" in the VSLs for R5 should be "Balancing Authority" to match the language of the standard. (3) In the VSLs for R9 and R10 the use of "and" seems incorrect. Austin Energy suggests the following revisions for all VSL levels (only the Lower VSL shown for simplicity and revised words suggested in capital letters): R9, Lower VSL: "The Reliability Coordinator, Transmission Operator, OR Balancing Authority..." R10, Lower VSL: "The Reliability Coordinator, Transmission Operator, OR Balancing Authority failed to notify the entities identified in Requirements R1, R3, OR R5, RESPECTIVELY, upon the detection ..."

Individual

Kasia Mihalchuk

Manitoba Hydro

Yes

Yes

Yes

Manitoba Hydro would like additional clarification added to the definition of interpersonal communication. The definition should explicitly state that interpersonal communication does not data links (e.g. the ICCP data link). Also, does interpersonal communication include emails? Under the Effective Date Section, the effective date language has a few issues in its drafting. It would be clearer to use the word 'following' as opposed to the word 'beyond' (and this would also be more consistent with the drafting of similar sections in other standards). The words 'the standard becomes effective' in the third line are not needed. The words 'made pursuant to the laws applicable to such ERO governmental authorities' may not be appropriate. It's not the laws applicable to the governmental authorities that are relevant, but the laws applicable to the entity itself. We would suggest wording like 'or as otherwise made effective pursuant to the laws applicable to the Balancing Authority'. Also, ERO is not defined. R11 and M11 – would suggest replacing 'action' with 'plan of action' or 'action plan' M3 and M4 – the word 'and' between asynchronously and synchronously should more appropriately be 'or' M10 – the semi colon after stamped should be deleted Compliance Section – Compliance Enforcement Authority is defined as CEA, but then both the acronym and the entire term is later used in the document. Should either not define, or use acronym consistently.

Individual

Steve Alexanderson P.E.

Central Lincoln

Prior Central Lincoln Comment 1)The new requirement presents us with a paradoxical situation. The communication has failed, so we must consult; yet consultation requires communication. We note that the SDT used the word "any", implying that multiple communication paths are required. The reality of the situation at Central Lincoln, due to our remote location, is that a single back hoe incident at the right location can take out all of our of our communication capability (including the terrestrial portion of the cellular networks) with our BA/TO; making this requirement impossible to meet for this circumstance using our present capabilities. Prior RCSDT Response 1) The RCSDT appreciates your comment and has made clarifying changes by removing the phrase "any of" in COM-001, R11. Additionally, the RCSDT made a clarifying change to indicate the DP and GOP only need to consult with the entity affected by the failure. Furthermore, R11 addresses the direction given in Order 693 that DP and GOP entities do not necessarily need to have Alternative Interpersonal Communication capability. The requirement allows flexibility in "consult with" by not naming the method. If all communications are out, then the DP or GOP may have to meet the requirement by an in-person consultation. New Central Lincoln Response 1) Thank you for the changes made. We realize that in-person consultation is an option, but find it not too hard to imagine the same event that disrupts communications might also block roads. We don't believe entities should be found non-compliant and sanctioned for events beyond their control. Prior Central Lincoln Comment 2) We also note that no time limit was indicated. Most interruptions are brief, and fixed before consultation could reasonably take place. CEAs will be finding entities non-compliant for quickly fixing problems at their end without first consulting to ensure the restoration time was agreeable. To avoid non-compliance, entities will be forced to delay repairs while they investigate alternative communication paths for consultation purposes. We fail to see how such an outcome improves reliability. Prior RCSDT Response 2) The DP and GOP are only required to have Interpersonal Communication capability. If the DP or GOP restores its Interpersonal Communication capability before it could reasonably contact the affected entity by another method, there is no failure to comply. The DP or GOP could then consult with the affected entity to determine a mutually agreeable action. In this case, the RCSDT believes the "action" would then be the entities acknowledging the failure and the repair; therefore, no mutually agreeable action is needed. The RCSDT recognizes there is no way to account for all the various circumstances in a failure. To comply, the DP and GOP are still required to consult the entity which the failure affected regardless of whether the Interpersonal Communication capability was restored or is still failed. No change made. New Central Lincoln Response 2) If consultation after restoration is acceptable, we

suggest that this be made clear in the requirement. Presently it is not at all clear, and there is no accompanying guidance document to suggest so. We also remain unclear what reliability benefit would result from such a consultation following restoration. While accounting for all the various failures might be impossible, we would like to see a few of the more common ones discussed in a guidance document. Prior Central Lincoln Comment 3) The new requirement is one sided, requiring the DP and GOP to consult with no corresponding requirement for the TO or BA to have personnel available for such a consultation. Consultation failure or failure to mutually agree due to actions or inactions on the part of the TO or BA should not result in an enforcement action against the DP or GOP, yet that is how the requirement is written. Prior RCSDT Response 3) The RCSDT notes that once the failure has been detected, the responsible entity must make the consultation with the BA or TOP; that relieves the compliance burden. While the RCSDT understands your concern about single points of failure, the question becomes should this relieve the DP or GOP of the requirement for having Interpersonal Communication capabilities. No change made. New Central Lincoln Response 3) The requirement remains one-sided. If a consultation effort fails due to actions or inactions taken by the BA/TO, the DP or GOP is the only entity that can be found non-compliant. Prior Central Lincoln Comment 4) The new requirement fails to add any "clarity" to the other requirements, and we don't see that the stakeholders thought there was a problem with DP/GOP obligation clarity. Instead, it adds new obligations with no justification for how they enhance reliability. We suggest removing the requirement. Prior RCSDT Response 4) Based on the RCSDT's understanding of the comments received on the previous posting, the industry desired additional clarity on specifically what communication capabilities the DP and GOP were required to have. There was confusion that the standard did not specifically say that the DP and GOP were required to have Alternative Interpersonal Communication capabilities. R11 clarifies that a DP and GOP are not required to have Alternative Interpersonal Communication capability if the DP or GOP consult with their TOP or BA, whichever is applicable in the given situation, and they mutually agree that the restoration action does not adversely impact the reliability of the BES. No change made. New Central Lincoln Response 4) We disagree that R11 clarifies anything regarding Alternative Interpersonal Communication capabilities; the requirement says nothing on the matter. If other requirements remain unclear, we suggest they be clarified within those requirements. We ask that R11 be removed. Alternatively we suggest that a plan for communication failure be developed by the affected entities prior to a failure, applicable to both the BA/TO and DP/GOP. Prior Central Lincoln Comment 5) As stated in our prior comments, we continue to have problems with COM-002, R2 and R3 as written. The SDT's answer ("It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive") addresses our concern perfectly, and we would agree with such an expectation. Unfortunately, the expressed expectation is not in the proposed standard or even in a proposed guideline for the standard. Prior RCSDT Response 5) The RCSDT believes this is a process or procedure question that should be determined by the entity in how it handles communication with the RC. The standard, as written does, not preclude the entity from having a procedure. No change made. New Central Lincoln Response 5) We agree that this is a procedure issue, but disagree that the procedure lies with the entity receiving the Reliability Directive. The SDT's words inside the quotation marks above state it is the issuer of the Directive that should request a return call. Procedures like this, in order to ensure the Directive gets to the party who understands it and can take the needed action, are the responsibility of the issuer. If reliability is at risk, it is little to ask that issuers of Reliability Directives be required to attempt to reach the proper party prior to identifying, delivering the directive, and asking for repetition.

Individual
Michelle D'Antuono
Ingleside Cogeneration LP (Occidental Chemical in the ballot body)
Yes
Ingleside Cogeneration LP agrees that the modification removes all doubt that a glossary definition is inferred. We support all clarifications of this kind.
Yes
No
Ingleside Cogeneration LP would like to see the project team include references to intermediaries which act as a single point of contact between GOPs and BAs/TOPs. This is a very common and

necessaray communications hierarchy – as it is just not possible for the BA/TOP to otherwise coordinate the actions of multiple GOPs. We believe that it is appropriate that GOP must retain evidence that Interpersonal Communication capability is maintained up to the intermediary – but the BA or TOP must be responsible for the remainder of the link. This accountability matches the most common contractual arrangements where both the BA/TOP and the GOP have signed agreements with the intermediary.

Ingleside Cogeneration LP generally agrees with the modifications that the SDT has made to COM-001-2. However, we cannot vote to accept the standard unless requirement R10 is modified to include a minimum communications outage duration before consultation with the BA or TOP is necessary. This is similar to R10, which allows an outage to extend up to 30 minutes – thus avoiding the need for a notification that an insignificant interruption in service took place. The following language could be added to R11 as shown in the brackets below: R11. Each Distribution Provider and Generator Operator that experiences a failure of its Interpersonal Communication capability [that lasts 30 minutes or longer] shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability.

The SERC OC SRG would like to thank the Standard Drafting Team for their service. “The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”

Individual

Laura Lee

Duke Energy

Yes

Yes

Yes

Distribution Providers and Generator Operators have significant responsibilities that require reliable means of communications with other entities, such as implementing load shedding and adjusting real and reactive power. The requirements for the Distribution Provider and Generator Operator should therefore be consistent with those for the Reliability Coordinator, Transmission Operator and Balancing Authority, namely, they should be required to designate Alternative Interpersonal Communication capability, to test this capability and to notify appropriate entities when its Interpersonal Communication capability has failed. The definition of Interpersonal Communication should also be expanded to clearly include the drafting team’s intent that the capability is NOT for the exchange of data.

“Adjacent Balancing Authority” is a defined term in the NERC Glossary, and use of the non-defined term “adjacent Balancing Authority” in this draft will cause confusion. Exactly what difference is intended by using the lower-case “a” instead of the defined term?
No
The proposed revision to include Transmission Operators asynchronously connected (Parts 3.5 and 4.4) is an appropriate revision to the Standard. The Reliability Coordinator responsibilities for communications with a Reliability Coordinator across an asynchronous connection do not appear to be addressed in this revision. Did the RCSDT have a particular reason not to address the RC issue? We believe each RC should have Interpersonal Communication capability with all neighboring RCs regardless of Interconnection boundaries, the type of connection, or whether a connection exists.
Yes
In the Measures for R3 and R4 (M3 and M4), should the phrase “each adjacent Transmission Operator asynchronously AND synchronously connected” be changed to “each adjacent Transmission Operator asynchronously OR synchronously connected”? In the VSLs for R3 it appears that “Reliability Coordinator” should be “Transmission Operator”. In the VSLs for R5 it appears that “Reliability Coordinator” should be “Balancing Authority”. In the Severe VSL for R10 the phrase “failed to notify the identified entities identified” should probably be “failed to notify the entities identified”.

Dominion
Connie Lowe
Yes

Yes
Yes
<p>Dominion has no additional comments on COM-001-2, but does have the below comments on IRO-001-3: Dominion believes that our previous comment remains valid and the response provided by the SDT does not address all aspects of our concerns. Dominion suggests that the language of 'direction' be changed to 'Reliability Directive' to remain consistent with COM-002. Another alternative would be as written below; IRO-001-3 uses the term 'direct' in its purpose statement, R1, R2 and R3. To avoid confusion with a Reliability Directive (both for auditors and entities), we suggest the following: To establish the authority of Reliability Coordinators to make requests of other entities to prevent an Emergency or Adverse Reliability Impacts to the Bulk Electric System. R1: Each Reliability Coordinator shall have the authority to act or request others to act (which could include issuing Reliability Directives) to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts. R2: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator's request unless compliance with the request cannot be physically implemented, or unless such actions would violate safety, equipment, regulatory or statutory requirements, or unless the TOP, BA, GOP or DP convey a business reason not to comply with the request but express that they will comply if a Reliability Directive is given. R3: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform as requested in accordance with Requirement R2." Or we could cite Southwest Transmission Cooperative, Inc. comments which read "COM-002-3 R1 really compels the Reliability Coordinator to use a Reliability Directive for Emergencies and Adverse Reliability Impacts with the opening clause: "When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive." What else could be more important for a Reliability Coordinator to issue a Reliability Directive than for an Emergency or Adverse Reliability Impact? Thus, not requiring the use of Reliability Directives for Adverse Reliability Impacts and Emergencies makes IRO-001-3 R1 and COM-002-3 R1 inconsistent. For clarity and consistency, IRO-001-3 Requirement R2 and R3 should also be clear that the responsible entities will respond to the Reliability Coordinator's Reliability Directives.</p>
Individual
John Brockhan
CenterPoint Energy Houston Electric, LLC
Yes
Yes
Yes
<p>1. For R10, there can be a large number of entities to notify for an Interpersonal Communication failure. During normal operations, 60 minutes can be enough time to make all the notifications. However, during emergency or adverse conditions, 60 minutes may not be sufficient. Thus, at the end of R10, the following should be added: "unless certain adverse conditions (e.g. severe weather, multiple events) prevent the completion of notification within the 60 minutes." 2. For R11, the change from "mutually agreeable time" to "mutually agreeable action" is not an improvement. It should not be the concern of the other entities how (what action) the capability is restored, only that it is restored and that the entity with the failure can be reached in the interim. Thus, we suggest the following: "to determine a mutually agreeable alternative until Interpersonal Communication capability is restored."</p>

Notwithstanding our opposition to R1.2.
Yes
Yes
Notwithstanding our opposition to R1.2.
<p>1. COM-001 We continue to disagree with R1.2, the phrase “within the same Interconnection” is troublesome. RCs between two Interconnections still need to communicate with each other for reliability coordination (e.g. between Quebec and the other RCs in the NPCC region to curtail interchange transactions crossing Interconnection boundary). The SDT’s previous response that the phrase was added to address the ERCOT situation and citing that ERCOT does not need to communicate with other RCs leaves a reliability gap. The SDT’s latest response that R1 as written does not preclude or limit the Reliability Coordinator from establishing Interpersonal Communication capability with others is inconsistent with the basic principle for having a reliability standard. A standard should stipulate the requirements based on what is needed to ensure reliability, not on what is not precluded. If there is a reliability need for RCs across Interconnection boundary to coordination operations, then Interpersonal Communication shall be provided. If we apply the SDT’s philosophy (that the standard does not preclude...), then one can argue that the standard does not need to stipulate a requirement to have Interpersonal Communication as without such a requirement, the standard does not preclude any operating entities to have it. Finally, we would reiterate the fact that RCs between asynchronously interconnected systems do communicate, e.g. between Quebec and its neighbor RCs. We are also aware that RCs in the Western Interconnection and those in the Eastern Interconnection do communicate as needed to coordinate TLR for transactions crossing Interconnection boundary.</p> <p>2. The follow comments address data retention for COM-002-3: a. The first bullet in Section D1.3 stipulates that “The Reliability Coordinator, Transmission Operator, and Balancing Authority shall retain evidence of Requirement R1 and R3, Measure M1 and M2 for the most recent 3 calendar months.” We believe M2 should be M3. b. The second bullet: “The Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall retain evidence of Requirement R1, Measure M1 for the most recent 3 calendar months.” We believe R1 and M1 should read R2 and M2 since DP is only responsible for meeting R2. c. Section 2 “Violation Severity Levels” : R# R2 Severe includes the Balancing Authority as one of the listed entities; however this is inconsistent with R2 / M2 which do not include the Balancing Authority. To be consistent with R2 / M2, the Balancing Authority should be removed from VSL R# R2. While these can be regarded as typos, and do not contribute to a show-stopper vote for some, we urge the SDT and the Standards Committee to pay closer attention to the accuracy of all elements in the standard.</p> <p>3. IRO-001-3: o Section 1.3 Data Retention (second bullet) states: ♣ The Operator, Balancing Authority, Generator Operator, or Distribution Provider shall retain for Requirements R2 and R3, Measures M2 and M3 shall retain voice recordings for the most recent 90 calendar days or documentation for the most recent 12 calendar months. • The statement above appears to be missing “Transmission” before the word Operator. • The statement above repeats “shall retain” and the highlighted instance is not required. • The statement above states “or” Distribution provider, implying that one entity needs to retain evidence. Starting the sentence with “Each” rather than “The” and replacing “or” with “and” may provide clarity. The same would apply to the introduction sentence prior to the bullets. COM-002-3 section D. Compliance 1.3 Data Retention provides an example of the suggested format. ♣ Here is an example of the revised sentence: “Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall retain voice recordings for the most recent 90 calendar days or documentation for the most recent 12 calendar months, for Requirements R2 and R3, Measures M2 and M3”.</p>

Defining Interpersonal Communication as “Any medium that allows two or more individuals to interact, consult, or exchange information” will also include all Alternative Interpersonal Communications since “Any medium” is all inclusive. Consider replacing the definition of Interpersonal

Communication with the following: Primary Interpersonal Communication: The normal communication medium that two or more individuals use to interact, consult, or exchange information relating to day-to-day operations. Consider replacing the definition of Alternative Interpersonal Communication with the following: Alternative Interpersonal Communication: Any communication medium that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as the designated Primary Interpersonal Communication. R1, R3, R5, R7, R8 should require entities to designate Primary Interpersonal Communication. R10 and R11 should address failures to designated Primary and Alternate Interpersonal Communication. R9 in all VSL levels the phrase "failed to initiate action to repair" or designate a replacement is subject to interpretation. Does "initiate action" include notification to the proper party to investigate and repair or does it require repairs to begin within specified times as listed in severity levels?

Individual

Steve Alexanderson P.E.

Central Lincoln

Prior Central Lincoln Comment 1) The new requirement presents us with a paradoxical situation. The communication has failed, so we must consult; yet consultation requires communication. We note that the SDT used the word "any", implying that multiple communication paths are required. The reality of the situation at Central Lincoln, due to our remote location, is that a single back hoe incident at the right location can take out all of our of our communication capability (including the terrestrial portion of the cellular networks) with our BA/TO; making this requirement impossible to meet for this circumstance using our present capabilities. Prior RCSDT Response 1) The RCSDT appreciates your comment and has made clarifying changes by removing the phrase "any of" in COM-001, R11. Additionally, the RCSDT made a clarifying change to indicate the DP and GOP only need to consult with the entity affected by the failure. Furthermore, R11 addresses the direction given in Order 693 that DP and GOP entities do not necessarily need to have Alternative Interpersonal Communication capability. The requirement allows flexibility in "consult with" by not naming the method. If all communications are out, then the DP or GOP may have to meet the requirement by an in-person consultation. New Central Lincoln Response 1) Thank you for the changes made. We realize that in-person consultation is an option, but find it not too hard to imagine the same event that disrupts communications might also block roads. We don't believe entities should be found non-compliant and sanctioned for events beyond their control. Prior Central Lincoln Comment 2) We also note that no time limit was indicated. Most interruptions are brief, and fixed before consultation could reasonably take place. CEAs will be finding entities non-compliant for quickly fixing problems at their end without first consulting to ensure the restoration time was agreeable. To avoid non-compliance, entities will be forced to delay repairs while they investigate alternative communication paths for consultation purposes. We fail to see how such an outcome improves reliability. Prior RCSDT Response 2) The DP and GOP are only required to have Interpersonal Communication capability. If the DP or GOP restores its Interpersonal Communication capability before it could reasonably contact the affected entity by another method, there is no failure to comply. The DP or GOP could then consult with the affected entity to determine a mutually agreeable action. In this case, the RCSDT believes the "action" would then be the entities acknowledging the failure and the repair; therefore, no mutually agreeable action is needed. The RCSDT recognizes there is no way to account for all the various circumstances in a failure. To comply, the DP and GOP are still required to consult the entity which the failure affected regardless of whether the Interpersonal Communication capability was restored or is still failed. No change made. New Central Lincoln Response 2) If consultation after restoration is acceptable, we suggest that this be made clear in the requirement. Presently it is not at all clear, and there is no accompanying guidance document to suggest so. We also remain unclear what reliability benefit would result from such a consultation following restoration. While accounting for all the various failures might be impossible, we would like to see a few of the more common ones discussed in a guidance document. Prior Central Lincoln Comment 3) The new requirement is one sided, requiring the DP and GOP to consult with no corresponding requirement for the TO or BA to have personnel available for such a consultation. Consultation failure or failure to mutually agree due to actions or inactions on the part of the TO or BA should not result in an enforcement action against the DP or GOP, yet that is how the requirement is written. Prior RCSDT Response 3) The RCSDT notes that once

the failure has been detected, the responsible entity must make the consultation with the BA or TOP; that relieves the compliance burden. While the RCSDT understands your concern about single points of failure, the question becomes should this relieve the DP or GOP of the requirement for having Interpersonal Communication capabilities. No change made. New Central Lincoln Response 3) The requirement remains one-sided. If a consultation effort fails due to actions or inactions taken by the BA/TO, the DP or GOP is the only entity that can be found non-compliant. Prior Central Lincoln Comment 4) The new requirement fails to add any "clarity" to the other requirements, and we don't see that the stakeholders thought there was a problem with DP/GOP obligation clarity. Instead, it adds new obligations with no justification for how they enhance reliability. We suggest removing the requirement. Prior RCSDT Response 4) Based on the RCSDT's understanding of the comments received on the previous posting, the industry desired additional clarity on specifically what communication capabilities the DP and GOP were required to have. There was confusion that the standard did not specifically say that the DP and GOP were required to have Alternative Interpersonal Communication capabilities. R11 clarifies that a DP and GOP are not required to have Alternative Interpersonal Communication capability if the DP or GOP consult with their TOP or BA, whichever is applicable in the given situation, and they mutually agree that the restoration action does not adversely impact the reliability of the BES. No change made. New Central Lincoln Response 4) We disagree that R11 clarifies anything regarding Alternative Interpersonal Communication capabilities; the requirement says nothing on the matter. If other requirements remain unclear, we suggest they be clarified within those requirements. We ask that R11 be removed. Alternatively we suggest that a plan for communication failure be developed by the affected entities prior to a failure, applicable to both the BA/TO and DP/GOP. Prior Central Lincoln Comment 5) As stated in our prior comments, we continue to have problems with COM-002, R2 and R3 as written. The SDT's answer ("It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive") addresses our concern perfectly, and we would agree with such an expectation. Unfortunately, the expressed expectation is not in the proposed standard or even in a proposed guideline for the standard. Prior RCSDT Response 5) The RCSDT believes this is a process or procedure question that should be determined by the entity in how it handles communication with the RC. The standard, as written does, not preclude the entity from having a procedure. No change made. New Central Lincoln Response 5) We agree that this is a procedure issue, but disagree that the procedure lies with the entity receiving the Reliability Directive. The SDT's words inside the quotation marks above state it is the issuer of the Directive that should request a return call. Procedures like this, in order to ensure the Directive gets to the party who understands it and can take the needed action, are the responsibility of the issuer. If reliability is at risk, it is little to ask that issuers of Reliability Directives be required to attempt to reach the proper party prior to identifying, delivering the directive, and asking for repetition.

There are a couple of cut & paste errors in the VSLs for R3 and R5. In R3, Reliability Coordinator in the High and Severe VSLs should be replaced with Transmission Operator. In R5, Reliability Coordinator in the High and Severe VSLs should be replaced with Balancing Authority.

R11 remains an issue even with the revision. The purpose of R11 should be to inform the BA and TO of a loss of interpersonal communications capability so that the BA or TO can react effectively to grid conditions in an emergency. The methods of repair for generator telephone and data lines are properly the business decisions of the generator, and there is no benefit to the reliability of the BES if a standard requires a generator to attempt to gain consensus from the BA and TO on his repair actions. Taking the time to discuss a "mutually agreed action" will delay the start of repairs, and lengthen the time of a communications outage as generators first must discuss the issue with the BA and TO instead of initiating the action on their own and informing those entities of the failure. Further, failure to follow a mutually agreed action plan could become a topic of exploration for audit staff. As telecommunications repairs are generally not in the scope of expertise of electrical generators, this places the entities at the mercy of contractor repair schedules, making following any mutually agreed action problematic. Further, there is no duration trigger on R11, as opposed to the RC/TO/BA requirement in R10. This forces the generator to inform the listed entities even of losses of capability which last a handful of seconds. If a small generator has a single line into the control room, and the control room operator is on the phone to the TOP, does he then have to inform the TO and BA at the end of the call that they would have received a busy signal? If the operator knocks the phone from the cradle, is the requirement to inform triggered? In a strict reading of the language, it would be. Suggested rewrite of R11: " Upon discovery of an unresolved loss of interpersonal communications which has the potential to last more than 15 minutes, the GOP shall inform the entities listed in R8 of the status of interpersonal communications. The GOP shall initiate the process to restore the interpersonal communications, and inform the entities listed in R8 of the restoration of communications when repairs are complete. "

Yes
: The NSRF understands the importance of Interpersonal Communications and Alternate Interpersonal Communications and always having the ability to communicate with others. The NSRF questions why per R9 (and similar time requirement per R10) that when testing the Alternate Interpersonal Communications is unsuccessful, why there is a two hour time limit to initiate an action, repair, or designate a replacement. Project 2012-08.1 defines "Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements. The loss of an Alternate Interpersonal Communication will not

immediately impact the Reliable Operations of the BPS. Recommend that this not be contained within the Standard as entity's will view this as a Good Utility Practice. R10 The NSRF recommends that "applicable" be inserted between "...notify entities..." . This will assure that RC's will inform per R1, TOP's will inform per R3 and BA's will inform per R5. This will assure that an interpretation is not require as in Interpretation 2010-INT-01, TOP-006.

If 3.5 and 4.3 were made to read: "Each connected adjacent Transmission Operator." then 3.6 and 4.4 (not 3.4 as indicated in the question) would not be required. If 3.6 and 4.4 are to be kept, then the wording of 3.6 and 4.4 should be made to read: "Each adjacent Transmission Operator asynchronously connected through a DC tie." Systems cannot be asynchronously connected.

LG&E and KU Services

Brent.Ingebrigtsen

Regarding COM-001-2 and proposed definitions, LG&E and KU Services recommends changing the terms being defined from "Interpersonal Communications" and "Alternative Interpersonal Communication" to "Means for Interpersonal Communication" and "Alternative Means for Interpersonal Communication." A communication is an exchange of information, not a medium. The medium is simply the means. LG&E and KU Services Company further recommend that each requirement be rewritten with these new defined terms as appropriate and that the word "capabilities" currently following the defined terms be removed from each of the requirements. We suggest the definition for "Means for Interpersonal Communication" be: "A medium utilizing electromagnetic energy that allows two or more individuals to interact, consult or exchange information." We suggest the definition for "Alternative Means for Interpersonal Communication" be: "Any Means for Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Means for Interpersonal Communications used for day-to-day operation." Regarding R1 through R10, , it is unclear what "shall have Interpersonal Communications capability" means. That could mean that the responsible entity simply has to have an IC capability that is different from our designated AIC capability (as R1 through R8 suggest). That could also mean, differently, that the responsible entity has to designate an IC capability (as R10 suggests). It is also unclear whether the IC capability can change, e.g. from email to land line. There is nothing in the Standard that makes this clear. Regarding R11, as written it is unclear who would be responsible for non-compliance if the consulting entities did not "determine a mutually agreeable action for the restoration of its Interpersonal Communication capability."

This seems excessive. It should be sufficient to say "each adjacent TOP" regardless of whether they are connected synchronously or via a DC tie.

Yes

R9 – The Standard requires that when there is a failure to a primary or alternate communication system that action is initiated within 2 hours of the communication failure. It is not clear what the term “action” means. Tacoma requests clarification for what “actions” are intended by the standard. R10 – Interpersonal Communication is defined as “any medium that allows two or more individuals to interact, consult, or exchange information”. As it is written, R10 requires an entity to contact another entity “within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer”. This contact may not be possible in a situation where there is “a failure of Interpersonal Communication capability”. R11 - The lack of a time line in R11 seems inconsistent with the time line requirements in R9 and R10. If there is a communication failure affecting the GO and DP then the standard only requires that they agree on an action to restore communication but does not assign a timeline.

Adjacent is still an ambiguous term. Does the SDT mean to refer to entities which share an interface/tie-line; entities which have geographically abutting service territories or Areas; entities within the same geographical region but not necessarily “touching”; etc.? Is this the same as or different from “neighboring,” and what is the meaning of that term? Perhaps this term deserves a glossary entry.
No
See previous comment on “adjacent”.
No
See the comment on “evidence” included in the comment section of question 4.
CSU appreciates the work the SDT has put into this standard, along with the others in this project and the opportunity to comment. We agree with the goal to encourage consistent communications and availability of robust & redundant communication paths. CSU appreciates that the SDT appears to have tried to write some flexibility into this standard. As written, however, this draft of COM-001-2 in its entirety seems to us unwieldy and unmanageable. It appears each entity may choose its own ‘primary’ and Alternate “Interpersonal Communication” capabilities. Entity A may select email as its ‘primary’ capability, while Entity B might not select that among either ‘primary’ or “Alternate,” and may not pay any attention on the real-time desk to email (only the designated “Alternate” requires testing). Also, DOs & GOs are not expected to maintain a backup (“Alternate”) communications capability. It is unclear how those entities can then comply with R11 if their one and only interpersonal communication capability has failed. Sufficient evidence includes “physical assets.” Does that mean we can point to the phone on the desk and the email program on the desktop PC and we’re compliant? Are photographs of physical assets sufficient evidence to submit for the pre-audit questionnaire? There is no requirement for the communications capabilities to be either diverse or redundant. If both our capabilities, in the end, rely on the POTS/PSTN system, is that acceptable?
Individual
Patrick Brown
Essential Power, LLC
It is unclear what we are trying to accomplish in R11. If the intent is to coordinate the restoration of communications, then there should be an additional requirement that the GOP have a Communications Recovery Plan, and R11 should focus on the coordination and implementation of that Plan. If the intent is to maintain continuous communications, then there should be an additional requirement for the GOP to maintain an Alternative Interpersonal Communications capability, and R11 should focus on the coordination and implementation of that capability.

Exelon Corporation and its affiliates
The definition of Interpersonal Communication requires further clarification. The use of the term "Any medium" opens the definition up to broad interpretation. It's not clear whether the definition means to apply to the point of communication owned, managed, and operated by the entity, or the total communications pathway? For example if entity A's phone system is working fine, but Entity B is experiencing trouble, does Entity A have a compliance concern if Entity B experiences a communication breakdown on their end of the medium? Please provide greater insight on the intended compliance obligation and consider the following revision to the definition: Interpersonal Communication: Any medium, owned, managed, or operated by the applicable entity, that allows two or more individuals to interact, consult, or exchange information. R9 provides ambiguous instruction for the resolution process surrounding tests and failures of Alternative Interpersonal Communication capability. Please confirm whether the intent of the requirement is to initiate repairs within two hours, or to effect repairs within two hours, with the alternate option being to designate a replacement Alternative Interpersonal Communication if repairs cannot be completed within two hours. R10 has similar ambiguity, referencing a 60 minute notification timeframe requirement upon the detection of a failure lasting 30 minutes or longer. Please confirm the intended start of the requirement notification. Does the clock for notification begins at the point of failure, at the point of discovery, or at the point that the failure is discovered to have been effective for 30 minutes or greater? Thank you for the opportunity to comment.

Darryl Curtis
Oncor Electric Delivery Company LLC
Yes
Yes
Yes
Oncor takes the position that the premise of R3 does not provide a reliability enhancement but may in effect; increase the risk to reliability by placing notification requirements on the Transmission Operator that could best be managed by the Reliability Coordinator. In fact, Oncor takes the position that as a Transmission Operator, it is being placed into the position of having to continually validate the registration status of every entity that may be registered as a Distribution Provider, Transmission Operator, and Generator Operator within its Transmission Operator Area. Oncor takes the position that since each of these entities are in the applicability section of the standard, the Distribution Provider, Transmission Operator, and Generator Operator should be responsible for seeking

Interpersonal Communication capability with the Transmission Operator and the Transmission Operator should then reciprocate Interpersonal Communication capability in response to their initial request. This eliminates an unnecessary compliance obligation of the Transmission Operator to manage "who is" and "who is not" registered as a Generator Operator, Distribution Provider or Transmission Operator. Oncor recommends the following change to the standard language Remove 3.3 & 3.4 because R7 and R8 already cover the GO and DP seeking Interpersonal Communication capability with the Transmission Operator. Oncor also takes the position that the Reliability Coordinator (RC) is in the best position and not the Transmission Operator to make extensive notifications on a broad basis in the event of a failure of its Interpersonal Communication. In accordance with that position, the Transmission Operator should make a single notification to the RC, and the RC would then make the notification to all impacted entities in the event of the failure of the Transmission Operator's Interpersonal Communication. Oncor proposes the following language for R10 "R10. Each Transmission Operator shall notify the Reliability Coordinator and the Balancing Authority within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. After notification by any Transmission Operator, the Reliability Coordinator shall immediately notify entities as identified in Requirements R1, R3, and R5 of any Transmission Operator's detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer Each Reliability Coordinator and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5 within 60 minutes of the detection of a failure of its own Interpersonal Communication capability that lasts 30 minutes or longer."

While MISO appreciates the SDT's modifications to Measure M10 since the last draft, the Measure remains ambiguous as to which parties should be contacted when an entity experiences a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. MISO respectfully submits the following changes for Measure 10: "Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified the entities as identified in Requirements R1, R3, and R5, as applicable, within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to dated and time-stamped: test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)"

MISO respectfully submits that the subject matter of COM-001-1 is better addressed through an official NERC certification – that is, by having NERC certify that a registered entity has the appropriate communications facilities – than through a formal Reliability Standard. Furthermore, the Reliability Standards surrounding communications should be performance based and specifically targeted toward testing, maintenance, and implementation of corrective actions when an issue arises or is

otherwise detected. As a result of narrowing the focus of these standards, enforcement would then be tailored toward a Registered Entity's failure to take such actions when necessary, a direct benefit and correlation to enhancement of the reliability of the BES. Under the currently proposed approach, the lack of a communication medium or a finding that a communication medium is "inadequate" or does not otherwise qualify under the standard would result in a non-compliance. Finally, MISO respectfully submits that: • Distribution Providers (DPs) and Generator Operators (GOPs) should have alternate communication media as well. • If an alternate communication tool is tested once a month, there is no need to address deficiencies within two hours; six hours is sufficient in such instances. • The standard should acknowledge that if more than two independent communication mechanisms are available, the VRF/VSL associated with missing a timing requirement is minimal. The SDT should require reporting times of failed mediums for GOP and DP similar to that for RC/BA/TOP.

Scott Berry

Indiana Municipal Power Agency

IMPA does not like the wording in R11 that states "mutually agreeable action for the restoration of its Interpersonal Communication capability." IMPA sees that entities will have to prove that the action taken by entities was "mutually agreeable" to the parties involved which will be very problematic. IMP believes as long as the entities who owns the equipment is taking steps to get it back into service that is all that should be required by any requirement of this standard.

We continue to believe that use of "physical assets" instead of "demonstration of physical assets" is problematic. Auditors must be able to take evidence with them and they could not take the physical assets. They could, however, take notes they record from demonstration of the physical assets with them. While we understand that the auditors will understand they can't take the "physical assets", it does not change the fact that the listing "physical assets" as evidence is technically not correct.

(1) The definition of Alternative Interpersonal Communication needs further refinement. As it is written, the primary Interpersonal Communication that is used to satisfy R1, R3, and R5 is also an Alternative Interpersonal Communication. This primary Interpersonal Communication established in R1, R3, and R5 meet all of the requirements of Alternative Interpersonal Communication. It is a Interpersonal Communication and it is capable of replacing the Interpersonal Communication used as the Alternative Interpersonal Communication (which by definition is an Interpersonal Communication) in R2, R4, and R6. Thus, each Interpersonal Communication used in R1, R3, and R5 really are an Interpersonal Communication and Alternative Interpersonal Communication. One solution may be to add a third definition: Primary Interpersonal Communication. It would essentially be an Interpersonal Communication that is designated as primary or the normal communication system. Then Alternative Interpersonal Communication would be defined based on the ability of the Interpersonal Communication to substitute for the Primary. R1, R3, and R5 would need to be changed to refer to the Primary Interpersonal Communication. Another option might be to simply stick with the two existing definitions and use "primary" in R1, R3, and R5. Regardless of the option selected, "another" needs to be added before the second use of Interpersonal Communication for absolute clarity. (2) We appreciate that the drafting team added another VSL for requirements R1 through R8, however, we believe additional levels should be populated. For example, if a Transmission Operator or Balancing Authority failed to have Interpersonal Communications capability with a Distribution Provider but had Interpersonal Communications capability with all other required entities, it has met the vast majority

of the requirement. Since VSLs are a measure of how much the requirement was missed by the responsible entity, a Lower VSL seems most appropriate for failing to have Interpersonal Communication capability with a DP. (3) It seems odd to change the effective date language from what NERC has consistently used throughout the standards. "Following" was replaced with "beyond the date this standard is approved". For consistency with the rest of NERC standards, we recommend changing it back to the original language. (4) We appreciate the changes to R1, R3, R5, R7 and R8 that attempt to clarify that a failure of the primary Interpersonal Communication capability is not a violation of these requirements. However, we believe these requirements will never be approved by the Commission. As they are written, they literally say that R1, R3, R5, R7, and R8 apply when the responsible entity has Interpersonal Communication capability and they don't apply when you don't have the capability but rather other requirements apply. This means R1, R3, R5, R7 and R8 could never be violated which begs the question why are they even needed. Because Commission approval is unlikely for these requirements, we continue to believe the best solution is to focus the requirements on having a communication medium rather than capability. If "capability" were struck from all of the requirements, the requirements would then focus on a communication medium as defined in Interpersonal Communication and Alternative Interpersonal Communication. This solution would still keep the requirements technology neutral since a medium could be any communication system or device and actually provide more flexibility in the requirements. Because the requirements would focus on having a medium in place rather than a capability, failure of the medium would not automatically translate into a violation which means the problematic "unless [responsible entity] experiences a failure of its Interpersonal Communication capability ..." language could be dropped. Dropping this language would improve the likelihood that the Commission would approve the standard. (5) The VRF for R7 should be Medium. Failure for the DP to have Interpersonal Communication with its BA or TOP does not meet the basic requirement of a High VRF. A High VRF requires that violation of the requirement would "directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures." We cannot fathom any situation where failure of a BA and TOP being able to communicate would directly lead to or cause instability, separation, or cascading. It could, however, lead to the inability to know the electrical state of part of the transmission system. This fits the Medium VRF definition. Furthermore, the fact that R4 and R6 do not include DP in the list of functional entities for a TOP and BA to have Alternative Interpersonal Communication further supports a Medium VRF. (6) In Measure M11, we believe entity affected should be replaced with its TOP and BA. This makes the measure clearer and easier to read without the need to refer back to the requirement. (7) We disagree with the data retention period. Because voice recordings are mentioned in the measures as one type of evidence for demonstrating compliance to the requirements, the data retention period should not exceed 90 days. Many companies do not store voice recordings longer than this. To compel a responsible entity to store voice recordings for longer should be justified. We do not see this justification. (8) We continue to believe that the DP should not be included in this standard. However, we recognize that the drafting team is attempting to address a FERC directive. An equally efficient and effective alternative would be to leave the responsibility to the BA and TOP. Parts 3.3 and 5.3 require the TOP and BA respectively to have Interpersonal Communication capability with the DP. This will be required whether the standard applies to DP or not based on the Commission directive because the Commission expressed concern about the BA and TOP having communications with the DP during an emergency such as a blackstart event. Because DPs will have to follow directives from the RC, TOP, and BA per IRO-001-3, it is in the best interest of the DP to cooperate with assisting the BA and TOP in establishing this capability. Thus, Parts 3.3 and 5.3 could be relied on exclusively for establishing this Interpersonal Communication Capability without adding unnecessary additional compliance burden on the DP that does not support reliability.

Individual

Kathleen Goodman

ISO New England Inc

No

The ISO-NE continues to believe that these a certification types of requirements and that they do not belong in a standard.

No

The ISO-NE continues to believe that these a certification types of requirements and that they do not

belong in a standard.

The ISO-NE continues to believe that these a certification types of requirements and that they do not belong in a standard. ISO-NE believes that the requirement to have a medium to communicate should be required to be certified. When you are operating as a registered entity, the requirements should be performance based such as taking corrective actions and if you fail to communicate for any reason you will be found non-compliance. The lack of a communication medium should not be a defense for non compliance of the performance based standards. The SDT should require reporting times of failed mediums for GOP and DP similar to that for RC/BA/TOP.

Group

ISO/RTO Standards Review Committee

Gregory Campoli

The IRC continues to believe that these a certification types of requirements and that they do not belong in a standard. The SRC believes that the requirement to have a medium to communicate should be required to be certified. When you are operating as a registered entity, the requirements should be performance based such as taking corrective actions and if you fail to communicate for any reason you will be found non-compliance. The lack of a communication medium should not be a defense for non compliance of the performance based standards. The SDT should require reporting times of failed mediums for GOP and DP similar to that for RC/BA/TOP.

# Consideration of Comments

## Project 2006-06 Reliability Coordination

The Reliability Coordination Standard Drafting Team (RCSDT) thanks all commenters who submitted comments on the successive posting of the COM-01-2 reliability standard for Project 2006-06—Reliability Coordination. These standards were posted for a 30-day public comment period from June 7, 2012 through July 6, 2012. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 41 sets of comments, including comments from approximately 136 different people from approximately 90 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

### Summary Consideration

The RCSDT received comments from stakeholders, where a majority of those comments were focused on compliance elements of the standards, various typographical errors, and other minor ambiguities. The RCSDT believes it has been responsive to the many comments and has either provided adequate explanation, where applicable, as well as incorporating the suggested clarifications or corrections. There was one minority issue raised by several commenters which the RCSDT addressed, but did not make a revision to the standard. These commenters suggested adding a time threshold to Requirement R11 that would trigger the Distribution Provider and Generation Operator to consult with its Balancing Authority and Transmission Operator after losing its Interpersonal Communication capability for a defined period. The RCSDT believed this would be unnecessarily prescriptive and notes that each entity along with its affected neighbors, should, by procedures, identify what constitutes the detection of a failure of its capability and the acceptable time threshold for restoration. Revisions made to the standards are summarized in the following sections by standard.

### COM-001-2

In the last posting and successive ballot, the standard received approval from 72.16% of the ballot body and fewer overall comments from previous postings. The RCSDT made minor, non-substantive changes to the standard based on these comments. The RCSDT believes it has addressed stakeholder comments and concerns in such a way that the standard is improved and meets the expectations expressed in comments for reliability and industry approval. Now that the standard has achieved industry consensus, this standard will advance to a recirculation ballot.

*Purpose:* No change.

*Effective Date:* No change.

**Requirements:** Changes were minor. The RCSDT for Requirements R1, R3, R5, R7, R8, and R11 changed the term “experiences” in the phrase “experiences a failure” to “detects.” This more appropriately aligns with the performance expectation that an entity must detect a failure first which would start the threshold for performance. The change maintains the intent while adding clarity and measurability.

The RCSDT also notes a minor change in Requirement R5, Part 5.5 and Requirement R6, Part 6.3 concerning “adjacent.” The team, during the revisions of draft 6, inadvertently changed “Adjacent” to a lower case when making revisions to the two parts that began with capitalized term. Commenters regarding draft 5 were concerned that the capitalized term would imply a NERC Glossary term, such as, “Adjacent Reliability Coordinator,” and cause confusion since there was no such term. The RCSDT recognizes that the glossary term should have remained, in the case of Parts 5.5 and 6.3, “Adjacent Balancing Authority.”

One commenter argued that the Violation Risk Factor (VRF) for Requirement R7 should be Medium, not High. The RCSDT considered this argument and concluded the change had merit based on the risk a Distribution Provider has in the scope of communications. Furthermore, the RCSDT also considered the VRF with regard to the Generator Operator in Requirement R8, but concluded the VRF should remain High because the Generator Operator may have a role as a blackstart resource in a Reliability Coordinator’s restoration plan.

Other commenters raised a concern that the relationship in Requirement R10 between the functions and the requirements listed were not clear. The suggested solution was to use the phrase, “as applicable”; however, the RCSDT opted to use the term “respectively” to more appropriately make the distinction between the functions and the listed requirements (i.e., the Reliability Coordinator (R1), Transmission Operator (R3), and Balancing Authority (R5)). This change was also applied to Measure M11.

**Measures:** One commenter recognized an error in Measure M3. The conjunction between asynchronously and synchronously should have been “or,” not “and” to accurately reflect the situation in Requirement R3, Parts 3.5 and 3.6. The extra word “that” was removed from Measure M7, as it was a typographical error. Measure M10 was updated to include the word “respectively” to coincide with the revision to Requirement R10. The Measure M11 was revised to reflect the changes in Requirement R11 to change the word “experiences” to “detects.” Last, the colon in Measures M9, M10, and M11 was moved to the appropriate location in each sentence.

**Compliance, Compliance Enforcement Authority:** No change.

**Compliance, Data Retention:** A commenter raised the question about the Measures allowing voice recordings, but requiring an entity to maintain this evidence for 12 calendar months. Standard drafting guidelines recommend that voice recordings be retained for 90 calendar days. The RCSDT agreed that 90 calendar days is the recommended practice and modified each of the data retention bulleted items to reflect the specific case of voice recordings.

**Violation Severity Levels:** Several of the Violation Severity Levels (VSL) required updating to account for the term changes in the requirements and the correction of certain typographical errors. For the word change from “experiences” to “detects,” the following VSLs were revised; R1, R3, R5, R7, R8, and R11. The Requirement R3 VSL had the “Reliability Coordinator” listed where it should have been the “Transmission Operator.” Likewise, the same error appeared in the Requirement R5 VSL where “Reliability Coordinator” should have been “Balancing Authority.” A commenter discovered a minor conjunction error in the Requirement R9 VSL in the listing of functional entities. The conjunction was changed from “and” to “or” to accurately reflect the construction of the VSLs. The same issue was revealed in the Requirement R10 VSL and was corrected, as well as removing the additional “identified” that was not needed.

### Additional Information

All comments submitted may be reviewed in their original format on the standard’s project page:

[http://www.nerc.com/filez/standards/Reliability\\_Coordination\\_Project\\_2006-6.html](http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/files/Appendix\\_3A\\_StandardsProcessesManual\\_20120131.pdf](http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf)

**Index to Questions, Comments, and Responses**

1. The RCSDT has revised the parts of Requirements R1, R2, R3, R4, R5, and R6 of COM-001-2 that began only with “Adjacent...” to begin with “Each adjacent...” to avoid the appearance of creating a defined glossary phrase. Do you agree with the changes? If not, please explain in the comment area below. ....15

2. The RCSDT has revised parts of two requirements (Parts 3.5 and 4.3) in COM-001-2 and added two additional parts (Parts 3.6 and 3.4) to address concerns about the phrase “synchronously connected within the same Interconnection.” Do you agree these changes address concerns where entities might only be adjacent across an Interconnection for where connected by a Direct Current (DC) tie? If not, please explain in the comment area below. ....20

3. The RCSDT made minor changes and reformatted the evidence examples in the Measures of COM-001-2 for greater clarity. Do you agree with these revisions? If not, please explain in the comment area below. ....26

4. Do you have any other comments on COM-001-2, not expressed in questions above, for the RCSDT? ....30

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. The RCSDT has revised the parts of Requirements R1, R2, R3, R4, R5, and R6 of COM-001-2 that began only with “Adjacent...” to begin with “Each adjacent...” to avoid the appearance of creating a defined glossary phrase. Do you agree with the changes? If not, please explain in the comment area below.

**Summary Consideration:** Twenty-seven stakeholders completing the comment form support the changes by the RCSDT. Of those, there were two commenters not in support of the RCSDT’s change to the sentence structure from “Adjacent...” to “Each adjacent...” This change was made to eliminate the ambiguity that a glossary term was intended by the drafting team and to achieve greater clarity. Another comment concerned the meaning of “adjacent” in terms of geography. The RCSDT notes that due to asynchronous connection (DC tie), some entities may not be geographically adjacent, but electrically adjacent; therefore, adjacency for synchronously connected entities is applied in the typical manner for entities which are, as a rule, geographically adjacent. Additionally, one commenter questioned the revision in Draft 6, Requirement R5, Part 5.5 and Requirement R6, Part 6.3, when the RCSDT applied “Each” before “adjacent,” and by doing so inadvertently changed the glossary term “Adjacent Balancing Authority” to just “adjacent Balancing Authority” which is not a glossary term. The RCSDT notes that the spirit of the phrase “adjacent Balancing Authority” remains accurate and that this was a clerical error.

A single entity argued the requirements should be certification requirements, and not in a standard. The RCSDT directs the commenter to Section 500 of the NERC Rules of Procedure which address certification. The certification process is a program to identify entities that are applicable to and responsible for the reliability standards.

Organization	Yes or No	Question 1 Comment
Colorado Springs Utilities	No	Adjacent is still an ambiguous term. Does the SDT mean to refer to entities which share an interface/tie-line; entities which have geographically abutting service territories or Areas; entities within the same geographical region but not necessarily “touching”; etc.? Is this the same as or different from “neighboring,” and what is the meaning of that term? Perhaps this term deserves a glossary entry.
<b>Response:</b> The RCSDT believes this standard is not about geographical neighbors, it is about the effect of being electrical neighbors. No change made.		
NV Energy	No	If "Adjacent", a capitalized word, must be in the Definitions section merely

Organization	Yes or No	Question 1 Comment
		because it's capitalized, what about "Each"? Other sentences have capitalized words, such as "If", "Its" and "All". If "Adjacent" is in the Definitions merely because it's capitalized, please also add "If", "Its" and "All".
<p><b>Response:</b> The RCSDT modified the usage of “Adjacent” in draft 5 of COM-001-2 to eliminate the appearance of a defined term to achieve clarity within the requirements because it started the sentence. No change made.</p>		
MISO	No	While MISO disagrees with the modifications to COM-001-1 proposed in COM-001-2 generally, it does not disagree with the clarity provided in the proposed addition of “Each” in front of “Adjacent”.
<p><b>Response:</b> The RCSDT thanks you for your support of the modification to “Adjacent.” No change made.</p>		
ISO New England Inc	No	The ISO-NE continues to believe that these a certification types of requirements and that they do not belong in a standard.
<p><b>Response:</b> NERC maintains an Organization Certification Program, the goal of which is to ensure that organizations who apply to register or are registered to perform certain reliability functions deemed particularly crucial to the reliability of the bulk power system will meet or exceed certain minimum criteria (i.e., Reliability Standards) demonstrating they are capable of performing the tasks (i.e., Requirements) for these functions. The process for certification of organizations is included in the NERC Rules of Procedure, Section 500 and Appendix 5A. For example, the first paragraph of Section 500 – Organization Registration and Certification states: “The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards...” No change made.</p>		
PacifiCorp	No	
Ingleside Cogeneration LP (Occidental Chemical in the ballot	Yes	Ingleside Cogeneration LP agrees that the modification removes all doubt that a glossary definition is inferred. We support all clarifications of this

Organization	Yes or No	Question 1 Comment
body)		kind.
<b>Response:</b> The RCSDT thanks you for your comment.		
Texas Reliability Entity	Yes	“Adjacent Balancing Authority” is a defined term in the NERC Glossary, and use of the non-defined term “adjacent Balancing Authority” in this draft will cause confusion. Exactly what difference is intended by using the lower-case “a” instead of the defined term?
<b>Response:</b> The RCSDT agrees “adjacent Balancing Authority” should be “Adjacent Balancing Authority,” the defined NERC Glossary term. This change was made during the draft 6 process and a typo was made during editing of the other usages of “adjacent.” Error correction made.		
Independent Electricity System Operator	Yes	Notwithstanding our opposition to R1.2.
<b>Response:</b> Thank you for your support. No change made.

2. The RCSDT has revised parts of two requirements (Parts 3.5 and 4.3) in COM-001-2 and added two additional parts (Parts 3.6 and 3.4) to address concerns about the phrase “synchronously connected within the same Interconnection.” Do you agree these changes address concerns where entities might only be adjacent across an Interconnection for where connected by a Direct Current (DC) tie? If not, please explain in the comment area below.

**Summary Consideration:** Thirty-one stakeholders completing the comment form support the changes by the RCSDT. Of those, seven provided comments. Two comments suggested combining Requirements R3, Parts 3.5 and 3.6 and Requirement R4, Parts 4.3 and 4.4 to have one part each that says “...synchronously or asynchronously connected.” The RCSDT believes this is a semantic change and having each condition in each requirement separates the emphases and provides the desired clarity. One commenter raised the issue of “adjacent” addressed in Question 1 above. A commenter expressed concern about the Reliability Coordinator not being required to have an Interpersonal Communication capability across an interconnection. The RCSDT notes that some Reliability Coordinators communicate with other Reliability Coordinators across interconnections; however, the requirement is to have the Interpersonal Communication capability within the same interconnection. Two commenters questioned why the synchronous and asynchronous conditions were in the requirements. The RCSDT added these to achieve a greater level of clarity that not all Transmission Operators are geographically adjacent. For example, the RCSDT considered phrases like “electrically connected,” but that creates the problem that all Transmission Operators are electrically connected. The use of adjacent and the synchronous and asynchronous conditions in each part achieve the necessary clarity based on transmission operations.

A single entity argued the requirements should be certification requirements and not in a standard. The RCSDT directs the commenter to Section 500 of the NERC Rules of Procedure which address certification. The certification process is a program to identify entities that are applicable to and responsible for the reliability standards.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	<p>If 3.5 and 4.3 were made to read: “Each connected adjacent Transmission Operator.” Then 3.6 and 4.4 (not 3.4 as indicated in the question) would not be required.</p> <p>If 3.6 and 4.4 are to be kept, then the wording of 3.6 and 4.4 should be made to read: “Each adjacent Transmission Operator asynchronously connected through a DC tie.” Systems cannot be asynchronously connected.</p>

**Response:** The RCSDT thanks you for your comments. These are semantic changes and the current Requirement R3, Parts 3.5 and 3.6 and Requirement R4, Parts 4.3 and 4.4 provide the clarity requested by industry stakeholders represented by the ballot. No

Organization	Yes or No	Question 2 Comment
change made.		
Colorado Springs Utilities	No	See previous comment on “adjacent”.
<b>Response:</b> Please see the RCSDT’s response above in question 1. No change made.		
PacifiCorp	No	PacifiCorp does not understand the RCSDT’s rationale for creating separate sub-requirements for adjacent Transmission Operators that are synchronously and asynchronously connected, in both R3.5/R3.6 and R4.3/R4.4. PacifiCorp recommends the following singular sub-requirement for both R3 and R4: “Each adjacent Transmission Operator (whether synchronously or asynchronously connected).”
<b>Response:</b> The RCSDT thanks you for your comments. These are semantic changes and the current Requirement R3, Parts 3.5 and 3.6 and Requirement R4, Parts 4.3 and 4.4 provide the clarity requested by industry stakeholders represented by the ballot. No change made.		
Texas Reliability Entity	No	<p>The proposed revision to include Transmission Operators asynchronously connected (Parts 3.5 and 4.4) is an appropriate revision to the Standard.</p> <p>The Reliability Coordinator responsibilities for communications with a Reliability Coordinator across an asynchronous connection do not appear to be addressed in this revision. Did the RCSDT have a particular reason not to address the RC issue?</p> <p>We believe each RC should have Interpersonal Communication capability with all neighboring RCs regardless of Interconnection boundaries, the type of connection, or whether a connection exists.</p>
<b>Response:</b> The RCSDT thanks you for your support of the improvements to Requirements R3 part 3.5 and R4 part 4.4. The RCSDT made additional clarifying changes from draft 5 to draft 6 in Requirements R3 and R4 to address the issue that some Transmission Operators (not Reliability Coordinators) that may not be adjacent for situations other than synchronously connected within the same Interconnection in the traditional understanding. For example, some entities have connections beyond the interconnection and some connections are asynchronous. To address this concern, the RCSDT separated the requirements to identify “synchronously		

Organization	Yes or No	Question 2 Comment
<p>connected” and “asynchronously connected,” and removed the “within the same Interconnection” to achieve this clarity. No change made.</p> <p>Requirements for the Reliability Coordinator are addressed in Requirements R1 and R2, which do not specify the synchronous or asynchronous connection. Additionally, the parts 1.2 and 2.2 only require the Reliability Coordinator to have an Interpersonal Communication and Alternative Interpersonal Communication capability with other Reliability Coordinators within the same Interconnection. For example, the loss of a DC tie does not result in a negative reliability impact and is analogous to a load or generator loss because flows would not redistribute. Each end of the DC tie must adjust generation to account for the loss of the DC tie; therefore, no coordination is required between entities. The standard does not preclude the Reliability Coordinator from having a capability with another Reliability Coordinator in another Interconnection. No change made.</p>		
NV Energy	No	<p>What difference does a synchronous or asynchronous connection make? Do not both have a reliability impact on the two entities on either side? Since there is a reliability impact, regardless of connection type, a separate Requirement is superfluous.</p>
<p><b>Response:</b> The RCSDT made additional clarifying changes from draft 5 to draft 6 in Requirements R3 and R4 to address the issue that some Transmission Operators may not be adjacent for situations other than synchronously connected within the same Interconnection in the traditional understanding. For example, some entities have connections beyond the interconnection and some connections are asynchronous. To address this concern, the RCSDT separated the requirements to identify “synchronously connected” and “asynchronously connected,” and removed the “within the same Interconnection” to achieve this clarity. For example, the loss of a DC-Tie does not result in a negative reliability impact and is analogous to a load or generator loss because flows would not redistribute. Each end of the DC-Tie must adjust generation to account for the loss of the DC-Tie; therefore, no coordination is required between entities. No change made.</p>		
MISO	No	<p>While MISO disagrees with the modifications to COM-001-1 proposed in COM-001-2 generally, it does not disagree with the proposed removal of “within the same interconnection.”</p>
<p><b>Response:</b> The RCSDT thanks you for your support in removing “...within the same Interconnection.” No change made.</p>		
ISO New England Inc	No	<p>The ISO-NE continues to believe that these a certification types of requirements and</p>

Organization	Yes or No	Question 2 Comment
		that they do not belong in a standard.
<p><b>Response:</b> NERC maintains an Organization Certification Program, the goal of which is to ensure that organizations who apply to register or are registered to perform certain reliability functions deemed particularly crucial to the reliability of the bulk power system will meet or exceed certain minimum criteria (i.e., Reliability Standards) demonstrating they are capable of performing the tasks (i.e., Requirements) for these functions. The process for certification of organizations is included in the NERC Rules of Procedure, Section 500 and Appendix 5A. For example, the first paragraph of Section 500 – Organization Registration and Certification states: “The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards...” No change made.</p>		
Tacoma Power	Yes	This seems excessive. It should be sufficient to say “each adjacent TOP” regardless of whether they are connected synchronously or via a DC tie.
<p><b>Response:</b> The RCSDT thanks you for your comment. The clarifications for asynchronous and synchronous were based on industry stakeholder comment. No change made.</p>

**3. The RCSDT made minor changes and reformatted the evidence examples in the Measures of COM-001-2 for greater clarity. Do you agree with these revisions? If not, please explain in the comment area below.**

**Summary Consideration:** Twenty-eight stakeholders completing the comment form question support the changes by the RCSDT. Of those, three offered substantive comments. One commenter noted that having “physical assets” listed as one type of evidence in the Measures M1 through M8 is problematic. The RCSDT believes an entity may utilize any number of options to demonstrate compliance with the requirements. One commenter had concerns about the use of an intermediary for Interpersonal Communication capability. The RCSDT emphasizes that an entity may employ any number of approaches to achieve the requirements. Another commenter suggested inserting “applicable” as a clarification in Measure M10 to more clearly state the relationship between the entities and the associated requirements. In consideration of the suggestion, the RCSDT inserted the word “respectively,” rather than “applicable” to more accurately note the relationship. Additionally, the RCSDT applied the same consideration to Requirement R10 to achieve the same clarity. The RCSDT also removed a typographical error revealed by a commenter.

Organization	Yes or No	Question 3 Comment
Colorado Springs Utilities	No	See the comment on "evidence" included in the comment section of question 4.
<b>Response:</b> Please see the RCSDT’s response in question 4. No change made.		
ACES Power Marketing Standards Collaborators	No	We continue to believe that use of “physical assets” instead of “demonstration of physical assets” is problematic. Auditors must be able to take evidence with them and they could not take the physical assets. They could, however, takes notes they record from demonstration of the physical assets with them. While we understand that the auditors will understand they can’t take the “physical assets”, it does not change the fact that the listing “physical assets” as evidence is technically not correct.
<b>Response:</b> The RCSDT believes that physical assets are demonstration of evidence for Interpersonal Communication capability. The responsible entity may exercise other methods of evidence for the physical assets (e.g., photographs or other documentation). No change made.		
Ingleside Cogeneration LP (Occidental Chemical in the	No	Ingleside Cogeneration LP would like to see the project team include references to intermediaries which act as a single point of contact between GOPs and BAs/TOPs. This is a very common and necessary communications hierarchy - as it is just not possible for the

Organization	Yes or No	Question 3 Comment
ballot body)		BA/TOP to otherwise coordinate the actions of multiple GOPs. We believe that it is appropriate that GOP must retain evidence that Interpersonal Communication capability is maintained up to the intermediary - but the BA or TOP must be responsible for the remainder of the link. This accountability matches the most common contractual arrangements where both the BA/TOP and the GOP have signed agreements with the intermediary.
<p><b>Response:</b> The RCSDT believes the standard provides the “what” to do, not the “how” to implement the standard. Having an intermediary for communication is one approach in “how” the entity may implement the standard. No change made.</p>		
MISO	No	<p>While MISO appreciates the SDT’s modifications to Measure M10 since the last draft, the Measure remains ambiguous as to which parties should be contacted when an entity experiences a failure of its Interpersonal Communication capability that lasts 30 minutes or longer.</p> <p>MISO respectfully submits the following changes for Measure 10:</p> <p>”Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified the entities as identified in Requirements R1, R3, and R5, as applicable, within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to dated and time-stamped: test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)”</p>
<p><b>Response:</b> The RCSDT agrees with the ambiguity in Measure M10 and proposes to clarify Requirement R10, Measure M10, and R10 VSL by inserting the word “respectively,” rather than the suggested “as applicable.” The word “respectively” is used rather than “applicable” because “applicable” is open to interpretation. For example, adding the word “respectively” means that the Reliability Coordinator in R1 is not required to notify the entities identified in Requirement R3 or R5. The RCSDT intended the requirements to map to the entity. Clarifying changes made.</p>		
City of Tallahassee (TAL)	Yes	For Measure 7, the first line duplicates the word "that".
<p><b>Response:</b> The RCSDT appreciates you bringing awareness to this typo. The additional “that” has been removed from Measure M7 in COM-001-</p>

#### 4. Do you have any other comments on COM-001-2, not expressed in questions above, for the RCSDT?

**Summary Consideration:** There were several minority comments concerning the proposed standards COM-002-3 and IRO-001-3 that the RCSDT could not respond to because they were approved by industry. Other comments revealed errors in the standard that the RCSDT corrected. Most comments were continuances from previous comment periods, along with various minority comments which the RCSDT provided. Commenters raised the issue that having a communication capability should be a matter of the NERC Certification process, as raised in the above questions. The RCSDT noted that certification was the process to ensure registered entities could perform those tasks associated with the reliability standards and that each entity should address this issue with NERC if further information is needed. Also from previous comment periods, commenters noted this standard should be a Results-Based Standard (RBS). The RCSDT did not disagree that the RBS format would be beneficial, but the current standard, as written, achieves the necessary goals set forth in the Standards Authorization Request (SAR).

Other minority continuances from previous comment periods include the use of “means,” “primary,” and other words or suggestions in the proposed definitions. The RCSDT maintains that these words are problematic and did not alter the definitions. Additionally, the definitions describe the “what” for communications, not the “how.” Some commenters noted that requiring the Generation Operator or Distribution Provider to have an Interpersonal Communication capability is redundant and unnecessary because they would already have a capability by virtue of it being established by the Balancing Authority and Transmission Operator. The RCSDT responded that each entity (i.e., both ends of the communication) is required to have the communication capability which is coordinated with the other entity to establish the capability. Other comments included requests to specifically say that the proposed COM-001-2 is “not for the exchange of data.” The RCSDT did not feel it necessary to insert such a clause, but pointed the commenter to reliability standards IRO-010 and IRO-014 which address data and information.

A commenter questioned having the ability to select other communications as needed; however, the RCSDT notes that an entity cannot randomly choose or designate other communication capabilities without coordinating the capability with other parties. Each applicable entity must know what its Interpersonal Communication capability is with others and, if applicable, its Alternative Interpersonal Communication capability with others. The same commenter questioned how the standard achieves “diversely routed,” as written in the current standard COM-001-1. The RCSDT contends “diversely routed” is achieved through the proposed definitions. The proposed definition of Alternative Interpersonal Communication contains, “...not utilize the same infrastructure (medium) as Interpersonal Communication used for day-to-day operation.”

There were other minority comments about time limits and notifications. One commenter suggested having a defined notification process using a hierarchal format. The RCSDT did not agree with this concept due to the diverse relationships between entities making it impractical. One noted that the 60-minute notification time was insufficient. The RCSDT considered this, as in previous drafts, and contends the period is adequate. Another did not agree with the two-hour limit on initiating action to repair or designating an

Alternative Interpersonal Communication capability. Again, the RCSDT holds that the time elements have been considered and supported by industry.

There were minority comments about the Measures and VSLs. The RCSDT inserted the word “respectively” in Requirement R10 and similarly in Measure M10 to clarify the expected relationship between the listed functional entities and the listed requirements. Some commenters noted that the use of “physical assets” is an inappropriate listing of evidence in the measures. The RCSDT disagreed that having the asset can be one form of demonstrating the necessary evidence. A commenter requested additional granularity in the VSLs in addition to what the RCSDT provided in the draft 6 posting. The RCSDT believes that having two (High and Severe) VSLs is the appropriate VSL granularity given the expected number of entities required to have a communication capability. More importantly, the reliability need is not to miss having a communication capability with any entity necessary for reliability operations. The same commenter requested a lower VSL for Requirements R1, R3 and R5 because, in this case, the Reliability Coordinator, Transmission Operator, and Balancing Authority are all required to have an Alternative Interpersonal Communication capability. The RCSDT contends that a violation should not be contingent on the preponderance of other mitigating requirements. Both VRFs and VSLs are to be evaluated on an individual requirement level without regard to other contributing circumstances. A comment suggested lowering the VRF on Requirement R7 from High to Medium. The RCSDT agreed and made the change since the loss of a communication capability with the Distribution Provider does not present the same level of risk that a Generator Operator would (e.g., during blackstart restoration).

Other minority comments related to the effective date language and data retention. The effective date language governed by NERC staff and the RCSDT only addresses the time elements within the template language. A question was raised about voice recordings generally having only a 90-calendar day retention, but the data retention specified 12 calendar months. The RCSDT recognizes this oversight and added clarifying language to account for voice recordings.

The majority comments in Question 4, also raised in previous comment periods, are related to Requirement R11, which had six distinct reoccurring themes: (1) A threshold for determining when to report a failure of the Generation Operator or Distribution Provider communication capability. (2) The reliability benefit of having to consult with the Balancing Authority or Transmission Operator when neither the Generation Operator nor Distribution Provider are required to have an Alternative Interpersonal Communication capability. (3) Consultation for the purpose of determining a mutually agreeable action for the restoration of its Interpersonal Communication capability. (4) What does “action” constitute? (5) Changing the language to specifically name the entities to be notified in the corresponding Measure M11. (6) The Generation Operator and Distribution Provider should be required to have an Alternative Interpersonal Communication capability. The RCSDT appropriately responded to all six issues as follows:

For item (1) a threshold is not provided to allow flexibility for the Generation Operator or Distribution Provider to determine what constitutes a failure of its Interpersonal Communication capability. The reliability benefit argued in (2) about consulting with the Balancing Authority or Transmission Operator is for the purpose of bringing awareness to these entities that communications are

compromised and to know what is being done to restore the capability. In issue (3) the purpose is to consult, the requirement clarifies the reliability purpose to determine a mutually agreeable action for restoration. The reliability goal is for the Balancing Authority or Transmission Operator to maintain awareness the communication capability has failed and what is being done to restore the capability. The Generation Operator or Distribution Provider is free to employ an Alternative Interpersonal Communication capability, but has no requirement to do so. The RCSDT responded to item (4) regarding what “action” meant. Action can be a number of things which the entity under takes to restore its capability. It could include, but is not limited to: contacting internal staff to initiate a repair, contacting a third party for repair, seeking assistance to troubleshoot the problem, or implementing its procedure(s) regarding the restoration of the capability. There was a suggestion concerning item (5) to explicitly name the entities in Requirement R11. The RCSDT agreed it would improve readability, but it would not be inconsistent with the way the measure is written using the reference to the two requirements. Item (6) was also raised in previous comment periods and the RCSDT noted that only requiring the Generation Operator and Distribution Provider to have an Interpersonal Communication capability is consistent with the direction provided in Order 693.

Organization	Yes or No	Question 4 Comment
City of Austin dba Austin Energy		<p>(1) Both instances of “Reliability Coordinator” in the VSLs for R3 should be “Transmission Operator” to match the language of the standard.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R3 VSL. The reference to “Reliability Coordinator” has been changed to Transmission Operator for Requirement R3 in both the High and Severe VSL. Error correction made.</p> <p>(2) Both instances of “Reliability Coordinator” in the VSLs for R5 should be “Balancing Authority” to match the language of the standard.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R5. The reference to “Reliability Coordinator” has been changed to Balancing Authority for Requirement R5 in both the High and Severe VSL. Error correction made.</p> <p>(3) In the VSLs for R9 and R10 the use of “and” seems incorrect.</p> <p>Austin Energy suggests the following revisions for all VSL levels (only the Lower VSL shown for simplicity and revised words suggested in capital letters):</p>

Organization	Yes or No	Question 4 Comment
		<p>R9, Lower VSL: “The Reliability Coordinator, Transmission Operator, OR Balancing Authority...”</p> <p><b>Response:</b> RCSDT appreciates you bringing awareness to this error in Requirement R9 VSL. The use of “and” between the responsible entities and the requirement references has been corrected to “or” for proper construction in Requirements R9 and R10 VSLs. Error correction made.</p> <p>R10, Lower VSL: “The Reliability Coordinator, Transmission Operator, OR Balancing Authority failed to notify the entities identified in Requirements R1, R3, OR R5, RESPECTIVELY, upon the detection ...”</p> <p><b>Response:</b> The RCSDT agrees with the ambiguity in Measure M10 and proposes to clarify Requirement R10, Measure M10, and R10 VSL by inserting the word “respectively.” For example, adding the word “respectively” means that the Reliability Coordinator in R1 is not required to notify the entities identified in Requirement R3 or R5. The RCSDT intended the requirements to map to the entity. Clarifying changes made.</p>
<p><b>Response:</b> Please see responses above.</p>		
<p>ACES Power Marketing Standards Collaborators</p>		<p>(1) The definition of Alternative Interpersonal Communication needs further refinement. As it is written, the primary Interpersonal Communication that is used to satisfy R1, R3, and R5 is also an Alternative Interpersonal Communication. This primary Interpersonal Communication established in R1, R3, and R5 meet all of the requirements of Alternative Interpersonal Communication. It is an Interpersonal Communication and it is capable of replacing the Interpersonal Communication used as the Alternative Interpersonal Communication (which by definition is an Interpersonal Communication) in R2, R4, and R6. Thus, each Interpersonal Communication used in R1, R3, and R5 really are an Interpersonal Communication and Alternative Interpersonal Communication. One solution may be to add a third definition: Primary Interpersonal Communication. It would essentially be an</p>

Organization	Yes or No	Question 4 Comment
		<p>Interpersonal Communication that is designated as primary or the normal communication system. Then Alternative Interpersonal Communication would be defined based on the ability of the Interpersonal Communication to substitute for the Primary. R1, R3, and R5 would need to be changed to refer to the Primary Interpersonal Communication. Another option might be to simply stick with the two existing definitions and use “primary” in R1, R3, and R5. Regardless of the option selected, “another” needs to be added before the second use of Interpersonal Communication for absolute clarity.</p> <p><b>Response:</b> The definitions clarify the need to differentiate the communication capabilities. The RCSDT notes that, in this last ballot, industry stakeholder consensus does not support the use of “primary” as a part of Interpersonal Communication. No change made.</p> <p>(2) We appreciate that the drafting team added another VSL for requirements R1 through R8, however, we believe additional levels should be populated. For example, if a Transmission Operator or Balancing Authority failed to have Interpersonal Communications capability with a Distribution Provider but had Interpersonal Communications capability with all other required entities, it has met the vast majority of the requirement. Since VSLs are a measure of how much the requirement was missed by the responsible entity, a Lower VSL seems most appropriate for failing to have Interpersonal Communication capability with a DP.</p> <p><b>Response:</b> The RCSDT added the High VSL for Requirements R1 through R8 from draft 5 to draft 6 to account for greater granularity in a violation. For each applicable responsible entity named in each of the requirements, the number of entities for which it must have an Interpersonal Communication or Alternative Interpersonal Communication may vary significantly. The RCSDT believed that adding one additional VSL was an appropriate solution to account for variability in the number of entities. No change made.</p> <p>(3) It seems odd to change the effective date language from what NERC has consistently used throughout the standards. “Following” was replaced with “beyond</p>

Organization	Yes or No	Question 4 Comment
		<p>the date this standard is approved”. For consistency with the rest of NERC standards, we recommend changing it back to the original language.</p> <p><b>Response:</b> The RCSDT appreciates your comment. The language in the Effective Date section is standard language adopted by NERC and used throughout the body of standards currently under development by teams. The RCSDT is not able to alter this language. No change made</p> <p>(4) We appreciate the changes to R1, R3, R5, R7 and R8 that attempt to clarify that a failure of the primary Interpersonal Communication capability is not a violation of these requirements. However, we believe these requirements will never be approved by the Commission. As they are written, they literally say that R1, R3, R5, R7, and R8 apply when the responsible entity has Interpersonal Communication capability and they don’t apply when you don’t have the capability but rather other requirements apply. This means R1, R3, R5, R7 and R8 could never be violated which begs the question why are they even needed. Because Commission approval is unlikely for these requirements, we continue to believe the best solution is to focus the requirements on having a communication medium rather than capability. If “capability” were struck from all of the requirements, the requirements would then focus on a communication medium as defined in Interpersonal Communication and Alternative Interpersonal Communication. This solution would still keep the requirements technology neutral since a medium could be any communication system or device and actually provide more flexibility in the requirements. Because the requirements would focus on having a medium in place rather than a capability, failure of the medium would not automatically translate into a violation which means the problematic “unless [responsible entity] experiences a failure of its Interpersonal Communication capability ...” language could be dropped. Dropping this language would improve the likelihood that the Commission would approve the standard.</p> <p><b>Response:</b> The RCSDT thoughtfully considered the comments about where an entity might be exempt from the requirement(s). No situation exempts an applicable entity from the requirement(s) of this standard. No change made.</p>

Organization	Yes or No	Question 4 Comment
		<p>(5) The VRF for R7 should be Medium. Failure for the DP to have Interpersonal Communication with its BA or TOP does not meet the basic requirement of a High VRF. A High VRF requires that violation of the requirement would “directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.” We cannot fathom any situation where failure of a BA and TOP being able to communicate would directly lead to or cause instability, separation, or cascading. It could, however, lead to the inability to know the electrical state of part of the transmission system. This fits the Medium VRF definition. Furthermore, the fact that R4 and R6 do not include DP in the list of functional entities for a TOP and BA to have Alternative Interpersonal Communication further supports a Medium VRF.</p> <p><b>Response:</b> The RCSDT thanks you for your comments and changed Requirement R7 to Medium VRF. Further consideration has been given to the Requirement R8 VRF; however, the RCSDT concluded the Generator Operator has a higher importance and risk to reliability, particularly blackstart capability. Change made to Requirement R7 VRF. No change made to Requirement R8 VRF.</p> <p>(6) In Measure M11, we believe entity affected should be replaced with its TOP and BA. This makes the measure clearer and easier to read without the need to refer back to the requirement.</p> <p><b>Response:</b> The RCSDT agrees that naming the specific entities in the measure adds to the readability; however, changing the word “entity” to the named entities in Requirements R7 and R8 would be inconsistent with the way the measure is written using the reference to the two requirements. No change made.</p> <p>(7) We disagree with the data retention period. Because voice recordings are mentioned in the measures as one type of evidence for demonstrating compliance to the requirements, the data retention period should not exceed 90 days. Many companies do not store voice recordings longer than this. To compel a responsible entity to store voice recordings for longer should be justified. We do not see this</p>

Organization	Yes or No	Question 4 Comment
		<p>justification.</p> <p><b>Response:</b> The RCSDT agrees with the comment about the issue concerning the time period for retaining voice recording. The data retention has been revised to reflect a period of 90 calendar days for all evidence related to the requirements. Clarifying change made.</p> <p>(8) We continue to believe that the DP should not be included in this standard. However, we recognize that the drafting team is attempting to address a FERC directive. An equally efficient and effective alternative would be to leave the responsibility to the BA and TOP. Parts 3.3 and 5.3 require the TOP and BA respectively to have Interpersonal Communication capability with the DP. This will be required whether the standard applies to DP or not based on the Commission directive because the Commission expressed concern about the BA and TOP having communications with the DP during an emergency such as a blackstart event. Because DPs will have to follow directives from the RC, TOP, and BA per IRO-001-3, it is in the best interest of the DP to cooperate with assisting the BA and TOP in establishing this capability. Thus, Parts 3.3 and 5.3 could be relied on exclusively for establishing this Interpersonal Communication Capability without adding unnecessary additional compliance burden on the DP that does not support reliability.</p> <p><b>Response:</b> The RCSDT thanks you for your comment and agrees that the standard is addressing FERC directives concerning the Distribution Provider. Entities on each end of the communication capability must have a responsibility to have communications. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
MRO NSRF		<p>The NSRF understands the importance of Interpersonal Communications and Alternate Interpersonal Communications and always having the ability to communicate with others. The NSRF questions why per R9 (and similar time requirement per R10) that when testing the Alternate Interpersonal Communications</p>

Organization	Yes or No	Question 4 Comment
		<p>is unsuccessful, why there is a two-hour time limit to initiate an action, repair, or designate a replacement.</p> <p><b>Response:</b> The RCSDT believes that the Reliability Coordinator, Transmission Operator and Balancing Authority, as reliability entities for Requirement R9, must initiate action to repair or designate an Alternative Interpersonal Communication capability timely so that in the event the Alternative Interpersonal Communication capability is called upon, the capability will be available. Having the measurable time period in the requirement ensures that entities will not delay action in addressing the unsuccessful testing of the capability. No change made.</p> <p>Project 2012-08.1 defines “Reliable Operation” means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements. The loss of an Alternate Interpersonal Communication will not immediately impact the Reliable Operations of the BPS. Recommend that this not be contained within the Standard as entity’s will view this as a Good Utility Practice.</p> <p><b>Response:</b> The RCSDT agrees that the loss of an entity’s Alternative Interpersonal Communication capability should not affect “Reliable Operation” of the Bulk Power System; however, the regulatory directive in Order No. 693 addressing the proposed definitions of “Bulk Power System,” “Reliability Standard,” and “Reliable Operations” must be reviewed collectively. The proposed definition for “Reliability Standard” contains the defined term “Reliable Operations,” and is defined as: <i>“A requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation</i></p>

Organization	Yes or No	Question 4 Comment
		<p><i>capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.”</i> In the current paradigm, having an Alternative Interpersonal Communication capability is: <i>“A requirement to provide for Reliable Operation of the Bulk Power System,”</i> as the proposed definition of “Reliability Standard” defines and is necessary to support communications between and among the applicable entities in the standard. The RCSDT has addressed the scope of the SAR in addressing communication requirements for entities through an open industry consensus process.</p> <p>R10 The NSRF recommends that “applicable” be inserted between “...notify entities...” This will assure that RC’s will inform per R1, TOP’s will inform per R3 and BA’s will inform per R5. This will assure that an interpretation is not required as in Interpretation 2010-INT-01, TOP-006.</p> <p><b>Response:</b> The RCSDT agrees with the ambiguity in Measure M10 and proposes to clarify Requirement R10, Measure M10, and R10 VSL by inserting the word “respectively,” rather than the suggested: “as applicable.” The word “respectively” is used rather than “applicable” because “applicable” is open to interpretation. For example, adding the word “respectively” means that the Reliability Coordinator in R1 is not required to notify the entities identified in Requirement R3 or R5. The RCSDT intended the requirements to map to the entity. Clarifying changes made.</p>
<p><b>Response:</b> See responses above.</p>		
<p>CenterPoint Energy Houston Electric, LLC</p>		<p>1. For R10, there can be a large number of entities to notify for an Interpersonal Communication failure. During normal operations, 60 minutes can be enough time to make all the notifications. However, during emergency or adverse conditions, 60 minutes may not be sufficient. Thus, at the end of R10, the following should be added: “unless certain adverse conditions (e.g. severe weather, multiple events)</p>

Organization	Yes or No	Question 4 Comment
		<p>prevent the completion of notification within the 60 minutes.”</p> <p><b>Response:</b> The RCSDT contends that 60 minutes is sufficient for notification because the BA, RC, and TOP are required to have an Alternative Interpersonal Communication capability, and should have the ability to accomplish the required notification. Also, the loss of Interpersonal Communication capability may not always impact the entire capability. This time frame does not apply to the DP and GOP since the Alternative Interpersonal Communication capability is not required for these functional entities. <b>No change made.</b></p> <p>2. For R11, the change from “mutually agreeable time” to “mutually agreeable action” is not an improvement. It should not be the concern of the other entities how (what action) the capability is restored, only that it is restored and that the entity with the failure can be reached in the interim. Thus, we suggest the following: “to determine a mutually agreeable alternative until Interpersonal Communication capability is restored.”</p> <p><b>Response:</b> The RCSDT agrees the desired end result is restoring the capability, and appreciates the suggested modification; however, the suggestion presents other issues; such as: What if an alternative is not available? The RCSDT believes the most appropriate and measureable way to address the loss of the Distribution Provider or Generation Operator’s capability is to require the entities to communicate the action taken to restore the capability. <b>No change made.</b></p>
<p><b>Response:</b> Please see responses above.</p>		
<p>Independent Electricity System Operator</p>		<p>1. COM-001:</p> <p>We continue to disagree with R1.2, the phrase “within the same Interconnection” is troublesome. RCs between two Interconnections still need to communicate with each other for reliability coordination (e.g. between Quebec and the other RCs in the NPCC region to curtail interchange transactions crossing Interconnection boundary). The SDT’s previous response that the phrase was added to address the ERCOT situation and citing that ERCOT does not need to communicate with other RCs leaves a</p>

Organization	Yes or No	Question 4 Comment
		<p>reliability gap. The SDT’s latest response that R1 as written does not preclude or limit the Reliability Coordinator from establishing Interpersonal Communication capability with others is inconsistent with the basic principle for having a reliability standard. A standard should stipulate the requirements based on what is needed to ensure reliability, not on what is not precluded. If there is a reliability need for RCs across Interconnection boundary to coordination operations, then Interpersonal Communication shall be provided. If we apply the SDT’s philosophy (that the standard does not preclude...), then one can argue that the standard does not need to stipulate a requirement to have Interpersonal Communication as without such a requirement, the standard does not preclude any operating entities to have it.</p> <p>Finally, we would reiterate the fact that RCs between asynchronously interconnected systems do communicate, e.g. between Quebec and its neighbor RCs. We are also aware that RCs in the Western Interconnection and those in the Eastern Interconnection do communicate as needed to coordinate TLR for transactions crossing Interconnection boundary.</p> <p><b>Response:</b> From the Functional Model V5, Functional Entity - Reliability Coordinator, the RCSDT notes the following: “Balancing operations. The Reliability Coordinator ensures that the generation-demand balance is maintained within its Reliability Coordinator Area; which, in turn, ensures that the Interconnection frequency remains within acceptable limits. The Balancing Authority has the responsibility for generation-demand-interchange balance in the Balancing Authority Area. The Reliability Coordinator may direct a Balancing Authority within its Reliability Coordinator Area to take whatever action is necessary to ensure that this balance does not adversely impact reliability.” Based on the last sentence, the Reliability Coordinator does not have the responsibility for these transactions. No change made.</p> <p>2. The follow comments address data retention for COM-002-3:</p> <p>a. The first bullet in Section D 1.3 stipulates that “The Reliability Coordinator, Transmission Operator, and Balancing Authority shall retain evidence of Requirement</p>

Organization	Yes or No	Question 4 Comment
		<p>R1 and R3, Measure M1 and M2 for the most recent 3 calendar months.” We believe M2 should be M3.</p> <p><b>Response:</b> The RCSDT agrees with your assessment that M2 should be M3 and has advised NERC staff of the typo in COM-002-3. Error correction made.</p> <p>b. The second bullet: “The Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall retain evidence of Requirement R1, Measure M1 for the most recent 3 calendar months.” We believe R1 and M1 should read R2 and M2 since DP is only responsible for meeting R2.</p> <p><b>Response:</b> The RCSDT agrees with your assessment that R1 and M1 should be R2 and M2. The RCSDT has advised NERC staff of the typo in COM-002-3. Error correction made.</p> <p>c. Section 2 “Violation Severity Levels”: R# R2 Severe includes the Balancing Authority as one of the listed entities; however, this is inconsistent with R2 / M2 which do not include the Balancing Authority. To be consistent with R2 / M2, the Balancing Authority should be removed from VSL R# R2.</p> <p><b>Response:</b> The RCSDT agrees with your assessment and has advised NERC staff that the VSL for Requirement R2 should have the entity “Reliability Coordinator” replaced with “Balancing Authority” in COM-002-3 to be consistent with the named entities in Requirement R2. Error correction made.</p> <p>While these can be regarded as typos, and do not contribute to a show-stopper vote for some, we urge the SDT and the Standards Committee to pay closer attention to the accuracy of all elements in the standard.</p> <p>3. IRO-001-3:</p> <p>Section 1.3 Data Retention (second bullet) states:</p> <p>The Operator, Balancing Authority, Generator Operator, or Distribution Provider shall retain for Requirements R2 and R3, Measures M2 and M3 shall retain voice recordings for the most recent 90 calendar days or documentation for the most</p>

Organization	Yes or No	Question 4 Comment
		<p>recent 12 calendar months.</p> <p>- The statement above appears to be missing “Transmission” before the word Operator.</p> <p><b>Response:</b> The RCSDT agrees with your assessment of IRO-001-3 and has advised NERC staff that in the second bullet of Section D, 1.3 section, the word “Transmission” needs to be inserted in front of “Operator.” Error correction made.</p> <p>- The statement above repeats “shall retain” and the highlighted instance is not required.</p> <p><b>Response:</b> The RCSDT agrees with your assessment of IRO-001-3 and has advised NERC staff that in the second bullet of Section D, 1.3, the first occurrence of “shall retain” needs to be removed. Error correction made.</p> <p>- The statement above states “or” Distribution provider, implying that one entity needs to retain evidence. Starting the sentence with “Each” rather than “The” and replacing “or” with “and” may provide clarity. The same would apply to the introduction sentence prior to the bullets. COM-002-3 section D. Compliance 1.3 Data Retention provides an example of the suggested format.</p> <p><b>Response:</b> The RCSDT agrees with your assessment of IRO-001-3 and has advised NERC staff that in the second bullet of Section D, 1.3, the “or” between the responsible entities should be an “and.” Error correction made.</p> <p>Here is an example of the revised sentence: “Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall retain voice recordings for the most recent 90 calendar days or documentation for the most recent 12 calendar months, for Requirements R2 and R3, Measures M2 and M3”.</p>
<p><b>Response:</b> Please see responses above.</p>		
Bonneville Power		BPA thanks you for the opportunity to comment on Project 2006-06, COM-001-2 and

Organization	Yes or No	Question 4 Comment
Administration		has no comments or concerns at this time.
<p><b>Response:</b> The RCSDT thanks you for your comment.</p>		
Public Service Enterprise Group		<p>Change R11 and replace “experiences a failure” with “detects a failure” because one may have a failure, but if it’s undetected for some period of time because no communications are taking place, it’s unclear when one actually “experienced a failure.” We note that R10 uses the terminology “detection of a failure.” Using consistent terminology in R10 and R11 would result in less confusion for compliance because there would not be an issue as to whether a difference was intended by the SDT between “experiences” and “detects” in the two requirements.</p>
<p><b>Response:</b> The RCSDT agrees with your assessment of the differences in terms and has changed “experiences” to “detects” in Requirement R11 to be consistent with Requirement R10. Change made.</p>		
Colorado Springs Utilities		<p>CSU appreciates the work the SDT has put into this standard, along with the others in this project and the opportunity to comment. We agree with the goal to encourage consistent communications and availability of robust &amp; redundant communication paths. CSU appreciates that the SDT appears to have tried to write some flexibility into this standard. As written, however, this draft of COM-001-2 in its entirety seems to us unwieldy and unmanageable.</p> <p>It appears each entity may choose its own ‘primary’ and Alternate “Interpersonal Communication” capabilities. Entity A may select email as its ‘primary’ capability, while Entity B might not select that among either ‘primary’ or “Alternate,” and may not pay any attention on the real-time desk to email (only the designated “Alternate” requires testing).</p> <p><b>Response:</b> The requirements require the applicable entity to have a communication capability with the defined entities in each requirement. An applicable entity should not be changing its Interpersonal Communication capability independently without coordinating the change with the defined entities in a given requirement. The</p>

Organization	Yes or No	Question 4 Comment
		<p>proposed definition says, “...between two or more individuals...” No change made.</p> <p>Also, DOs &amp; GOs are not expected to maintain a backup (“Alternate”) communications capability. It is unclear how those entities can then comply with R11 if their one and only interpersonal communication capability has failed.</p> <p><b>Response:</b> The RCSDT, from draft 5 to 6 of COM-001-3, added clarifying language in Requirement R7 for the Distribution Provider and in Requirement R8 for the Generator Operator to account for the potential gap of compliance. The language was: “... (unless the &lt;responsible entity&gt; experiences a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply).” The RCSDT also notes this parenthetical was updated to more appropriately address the detection of the failure and now reads: “... (unless the &lt;responsible entity&gt; detects a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply).” No change made.</p> <p>Sufficient evidence includes “physical assets.” Does that mean we can point to the phone on the desk and the email program on the desktop PC and we’re compliant? Are photographs of physical assets sufficient evidence to submit for the pre-audit questionnaire?</p> <p><b>Response:</b> The RCSDT believes that physical assets are demonstration of evidence for Interpersonal Communication capability. The responsible entity may exercise other methods of evidence for the physical assets (e.g., photographs or other documentation). No change made.</p> <p>There is no requirement for the communications capabilities to be either diverse or redundant. If both our capabilities, in the end, rely on the POTS/PSTN system, is that acceptable?</p> <p><b>Response:</b> The RCSDT agrees that the requirements do not specifically address this condition within the requirements themselves; however, the issue of redundancy is addressed within the proposed defined term “Alternative Interpersonal Communication.” The definition reads: “Any Interpersonal Communication that is</p>

Organization	Yes or No	Question 4 Comment
		able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.” No change made.
<b>Response:</b> Please see responses above.		
Detroit Edison		<p>Defining Interpersonal Communication as “Any medium that allows two or more individuals to interact, consult, or exchange information” will also include all Alternative Interpersonal Communications since “Any medium” is all inclusive. Consider replacing the definition of Interpersonal Communication with the following:</p> <p>Primary Interpersonal Communication: The normal communication medium that two or more individuals use to interact, consult, or exchange information relating to day-to-day operations.</p> <p><b>Response:</b> The RCSDT notes that previous drafts received comments recommending the use of terms; such as, “primary,” “secondary,” “device,” “means,” and “medium” with regard to the proposed definitions. The RCSDT thanks you for your suggestion; however, the requirements are for “capability” and adding such proposed terms is not needed to achieve the necessary clarity. No change made.</p> <p>Consider replacing the definition of Alternative Interpersonal Communication with the following:</p> <p>Alternative Interpersonal Communication: Any communication medium that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as the designated Primary Interpersonal Communication.</p> <p><b>Response:</b> This suggestion has only added the word “Primary” to the definition. The RCSDT contends that the use of terms, such as, “primary,” “secondary,” “device,” “means,” and “medium” with regard to the proposed definitions is not needed to achieve the necessary clarity. No change made.</p> <p>R1, R3, R5, R7, R8 should require entities to designate Primary Interpersonal</p>

Organization	Yes or No	Question 4 Comment
		<p>Communication.</p> <p><b>Response:</b> This suggestion has only added the word “Primary” to the defined term. The RCSDT contends that the use of terms, such as, “primary,” “secondary,” “device,” “means,” and “medium” with regard to the proposed definitions is not needed to achieve the necessary clarity. No change made.</p> <p>R10 and R11 should address failures to designated Primary and Alternate Interpersonal Communication.</p> <p><b>Response:</b> This suggestion has only added the word “Primary” to Requirements R10 and R11. The RCSDT contends that the use of terms, such as, “primary,” “secondary,” “device,” “means,” and “medium” with regard to the proposed definitions is not needed to achieve the necessary clarity. No change made.</p> <p>R9 in all VSL levels the phrase "failed to initiate action to repair" or designate a replacement is subject to interpretation. Does "initiate action" include notification to the proper party to investigate and repair or does it require repairs to begin within specified times as listed in severity levels?</p> <p><b>Response:</b> The RCSDT notes that the requirement is for the entity to “initiate action,” which may include, but is not limited to, notifying or request repair to restore the capability. The available alternative is to designate an Alternative Interpersonal Communication capability. No change made.</p>
<p><b>Response:</b> Please see response above.</p>		
<p>Duke Energy</p>		<p>Distribution Providers and Generator Operators have significant responsibilities that require reliable means of communications with other entities, such as implementing load shedding and adjusting real and reactive power. The requirements for the Distribution Provider and Generator Operator should therefore be consistent with those for the Reliability Coordinator, Transmission Operator and Balancing Authority, namely, they should be required to designate Alternative Interpersonal Communication capability, to test this capability and to notify appropriate entities</p>

Organization	Yes or No	Question 4 Comment
		<p>when its Interpersonal Communication capability has failed.</p> <p><b>Response:</b> The RCSDT thanks you for your comment about requiring the Distribution Provider and Generation Operator to have the requirements similar to that of the Reliability Coordinator, Transmission Operator, and Balancing Authority. The standard, as proposed, has included the Distribution Provider and Generation Operator in accordance with the regulatory statements in Order No. 693, Paragraphs 483, 491, 495, 496, and 503 which recognized the need for Distribution Providers and Generation Operators to have flexibility in meeting the communication capability requirements and not to burden smaller entities (i.e., DPs and GOPs) with the additional requirement of adding communication redundancy. No change made.</p> <p>The definition of Interpersonal Communication should also be expanded to clearly include the drafting team’s intent that the capability is NOT for the exchange of data.</p> <p>With respect to the standard being tacit on “not for the exchange of data,” the RCSDT believes this concern is addressed within the earlier IRO-014-1 – Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators standard and now the proposed IRO-014-2 – Coordination Among Reliability Coordinators adopted by the NERC Board of Trustees August 4, 2011. No change made.</p>
<p><b>Response:</b> Please see the responses above.</p>		
<p>Dominion</p>		<p>Dominion has no additional comments on COM-001-2, but does have the below comments on IRO-001-3:</p> <p>Dominion believes that our previous comment remains valid and the response provided by the SDT does not address all aspects of our concerns. Dominion suggests that the language of ‘direction’ be changed to ‘Reliability Directive’ to remain consistent with COM-002. Another alternative would be as written below;</p> <p>IRO-001-3 uses the term ‘direct’ in its purpose statement, R1, R2 and R3. To avoid confusion with a Reliability Directive (both for auditors and entities), we suggest the</p>

Organization	Yes or No	Question 4 Comment
		<p>following: To establish the authority of Reliability Coordinators to make requests of other entities to prevent an Emergency or Adverse Reliability Impacts to the Bulk Electric System.</p> <p>R1: Each Reliability Coordinator shall have the authority to act or request others to act (which could include issuing Reliability Directives) to prevent identified events or mitigate the magnitude or duration of actual events that result in an Emergency or Adverse Reliability Impacts.</p> <p>R2: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall comply with its Reliability Coordinator’s request unless compliance with the request cannot be physically implemented, or unless such actions would violate safety, equipment, regulatory or statutory requirements, or unless the TOP, BA, GOP or DP convey a business reason not to comply with the request but express that they will comply if a Reliability Directive is given.</p> <p>R3: Each Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform as requested in accordance with Requirement R2.”</p> <p>Or we could cite Southwest Transmission Cooperative, Inc. comments which read “COM-002-3 R1 really compels the Reliability Coordinator to use a Reliability Directive for Emergencies and Adverse Reliability Impacts with the opening clause: “When a Reliability Coordinator, Transmission Operator, or Balancing Authority determines actions need to be executed as a Reliability Directive.” What else could be more important for a Reliability Coordinator to issue a Reliability Directive than for an Emergency or Adverse Reliability Impact?</p> <p>Thus, not requiring the use of Reliability Directives for Adverse Reliability Impacts and Emergencies makes IRO-001-3 R1 and COM-002-3 R1 inconsistent. For clarity and consistency, IRO-001-3 Requirement R2 and R3 should also be clear that the responsible entities will respond to the Reliability Coordinator’s Reliability Directives.</p>
<p><b>Response:</b> The RCS DT thanks you for your support of COM-001-2. The standards COM-002-3 and IRO-001-3 were approved by</p>		

Organization	Yes or No	Question 4 Comment
<p>industry in July 2012; therefore, the RCSDT is not able to respond to Dominion’s comments and consider changes to the standard. No change made.</p>		
<p>FirstEnergy</p>		<p>FE supports COM-001-2 and has no further comments.</p> <p>PLEASE NOTE: THE FOLLOWING COMMENTS RELATE TO COM-002-3 AND IRO-001-3 SINCE WE WERE NOT ABLE TO PROVIDE COMMENTS ON THE RECIRCULATION BALLOT AND WANTED TO EXPLAIN OUR REASONS FOR NOT SUPPORTING THOSE STANDARDS:</p> <p>Although we believe the team made significant improvements to the standard, and would support a 3-part communication standard, we believe the introduction of both COM-002-2 which utilizes Reliability Directives and COM-003-1 which utilizes Operating Communications cause confusion for system operators and may in fact be detrimental to reliability.</p> <p>We do not support two standards on three-part communication. We suggest, as we have in the past, that the subject of three-part communication be addressed in a single standard, and that the requirements be developed for simplicity. The industry is, and has been, using three-part communication for decades and although we agree it should be more consistently practiced and standardized, the required communications protocols should be simple while meeting the goal of BES reliability. Introducing complicated requirements and standards that have different definitions such as Reliability Directive and Operating Communication may cause the operator to hesitate when issuing directives in real-time and every second counts when a potential system emergency must be mitigated.</p> <p>Therefore, FE does not support the creation of both COM-003-1 nor the revisions to COM-002-2 and IRO-001-3 which introduce the “Reliability Directive” term and ask NERC to reevaluate the need to have two separate standards for three-part communication.</p>
<p><b>Response:</b> The RCSDT thanks you for your support of COM-001-2. The standards COM-002-3 and IRO-001-3 were approved by industry in July 2012; therefore, the RCSDT is not able to respond to FirstEnergy’s comments and consider changes to the standard.</p>		

Organization	Yes or No	Question 4 Comment
No change made.		
Indiana Municipal Power Agency		<p>IMPA does not like the wording in R11 that states "mutually agreeable action for the restoration of its Interpersonal Communication capability." IMPA sees that entities will have to prove that the action taken by entities was "mutually agreeable" to the parties involved which will be very problematic. IMPA believes as long as the entity who owns the equipment is taking steps to get it back into service that is all that should be required by any requirement of this standard.</p>
<p><b>Response:</b> The RCSDT addressed the concern about “mutually agreeable restoration time” by revising the phrase to “mutually agreeable action,” which allows the applicable entities to reach consensus on the effort needed to restore communications. Additionally, working toward a mutually agreeable action also ensures that both parties understand the magnitude of the loss of their Interpersonal Communication capability and agree to the actions needed to restore and minimize the time the capability is unavailable. From a compliance standpoint, the Distribution Provider and Generation Operator that is working to restore its Interpersonal Communication capability is not out of compliance as far as the entity is meeting the requirement for taking action to restore its capability. It is practical on the part of the Balancing Authority or Transmission Operator to reach a mutual agreement, as it will facilitate restoring the capability. No change made.</p>		
Texas Reliability Entity		<p>In the Measures for R3 and R4 (M3 and M4), should the phrase “each adjacent Transmission Operator asynchronously AND synchronously connected” be changed to “each adjacent Transmission Operator asynchronously OR synchronously connected”?</p> <p><b>Response:</b> The RCSDT agrees with your assessment in COM-001-2 and has changed the word in Measure M3 from “and” to “or” between the words “asynchronously and synchronously.” Error correction made.</p> <p>In the VSLs for R3 it appears that “Reliability Coordinator” should be “Transmission Operator”.</p> <p><b>Response:</b> The RCSDT agrees with your assessment and has advised NERC staff that the VSL for Requirement R3 should have the entity “Reliability Coordinator” replaced with “Transmission Operator” in COM-002-3 to be consistent with the named entities</p>

Organization	Yes or No	Question 4 Comment
		<p>in Requirement R3. Error correction made.</p> <p>In the VSLs for R5 it appears that “Reliability Coordinator” should be “Balancing Authority”.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R5 VSL. The reference to “Reliability Coordinator” has been changed to Balancing Authority for Requirement R5 in both the High and Severe VSL. Error correction made.</p> <p>In the Severe VSL for R10 the phrase “failed to notify the identified entities identified” should probably be “failed to notify the entities identified”.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R10 VSL Severe column. The first occurrence of “identified” has been removed. Error correction made.</p>
<p><b>Response:</b> Please see the above responses.</p>		
<p>Ingleside Cogeneration LP (Occidental Chemical in the ballot body)</p>		<p>Ingleside Cogeneration LP generally agrees with the modifications that the SDT has made to COM-001-2. However, we cannot vote to accept the standard unless requirement R10 is modified to include a minimum communications outage duration before consultation with the BA or TOP is necessary. This is similar to R10, which allows an outage to extend up to 30 minutes - thus avoiding the need for a notification that an insignificant interruption in service took place.</p> <p>The following language could be added to R11 as shown in the brackets below:</p> <p>R11. Each Distribution Provider and Generator Operator that experiences a failure of its Interpersonal Communication capability [that lasts 30 minutes or longer] shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability.</p>

Organization	Yes or No	Question 4 Comment
<p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of its Interpersonal Communication capability. The RCSDT believes it is inappropriate to establish a single defined threshold applicable to the numerous entities applicable to this standard. No change made.</p>		
<p>Essential Power, LLC</p>		<p>It is unclear what we are trying to accomplish in R11. If the intent is to coordinate the restoration of communications, then there should be an additional requirement that the GOP have a Communications Recovery Plan, and R11 should focus on the coordination and implementation of that Plan.</p> <p>If the intent is to maintain continuous communications, then there should be an additional requirement for the GOP to maintain an Alternative Interpersonal Communications capability, and R11 should focus on the coordination and implementation of that capability.</p>
<p><b>Response:</b> The RCSDT thanks you for your comments. The intent of Requirement R11 is to require the Distribution Provider and Generator Operator to consult with its Balancing Authority or Transmission Operator, as the case may be, to mutually agree on the action needed to restore the Interpersonal Communication capability. Additionally, working toward a mutually agreeable action also ensures that both parties understand the magnitude of the loss of their Interpersonal Communication capability and impact to reliability; therefore, both need to agree on the actions needed to restore and minimize the time the capability is unavailable. It is practical on the part of the Balancing Authority or Transmission Operator to reach a mutual agreement, as it will facilitate restoring the capability. No change made.</p>		
<p>Manitoba Hydro</p>		<p>Manitoba Hydro would like additional clarification added to the definition of interpersonal communication. The definition should explicitly state that interpersonal communication does not data links (e.g. the ICCP data link). Also, does interpersonal communication include emails?</p> <p><b>Response:</b> With respect to the standard being tacit on “not for the exchange of data,” the RCSDT believes this concern is addressed within the earlier IRO-014-1 – Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators standard and now the proposed IRO-014-2 – Coordination Among Reliability Coordinators adopted by the NERC Board of Trustees August 4, 2011.</p>

Organization	Yes or No	Question 4 Comment
		<p>Additionally, Requirement R3 in IRO-010-1a – Reliability Coordinator Data Specification and Collection states: Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. No change made.</p> <p>Under the Effective Date Section, the effective date language has a few issues in its drafting. It would be clearer to use the word ‘following’ as opposed to the word ‘beyond’ (and this would also be more consistent with the drafting of similar sections in other standards). The words ‘the standard becomes effective’ in the third line are not needed. The words ‘made pursuant to the laws applicable to such ERO governmental authorities’ may not be appropriate. It’s not the laws applicable to the governmental authorities that are relevant, but the laws applicable to the entity itself. We would suggest wording like ‘or as otherwise made effective pursuant to the laws applicable to the Balancing Authority’.</p> <p><b>Response:</b> NERC staff note that the phrase: “... the standard becomes effective” is a clarifying statement that needs to remain. This phrase would become more important if the heading “Effective Date” was not used. The phrase, “made pursuant to the laws applicable to such ERO governmental authorities” is a reference to governmental entities that have authority over BPS reliability within a jurisdictional territory; for example, in the United States, the Federal Energy Regulatory Commission; and in Canada, those parties delegated authority by Canadian provinces. Therefore, the statement is appropriate because the laws that are applicable to “such ERO governmental entities” will determine the effective date under the circumstances, not necessarily the laws that are applicable to functional entities. No change made.</p> <p>Also, ERO is not defined.</p> <p><b>Response:</b> The RCSDT appreciates your comment. The language in the Effective Date section is standard language adopted by NERC and used throughout the body of</p>

Organization	Yes or No	Question 4 Comment
		<p>standards currently under development by teams. The RCSDT is not able to alter this language. No change made</p> <p>R11 and M11 - would suggest replacing ‘action’ with ‘plan of action’ or ‘action plan’</p> <p><b>Response:</b> The RCSDT believes the use of “action” is sufficient for Requirement R11 and Measure M11 and that adding “plan” does not add clarity. The RCSDT understands that whatever actions are mutually agreed upon will constitute a plan which the Distribution Provider or Generation Operator will use in the restoration of its Interpersonal Communication capability. No change made.</p> <p>M3 and M4 - the word ‘and’ between asynchronously and synchronously should more appropriately be ‘or’</p> <p><b>Response:</b> The RCSDT agrees with your assessment and has changed the word in Measure M3 from “and” to “or” between the words “asynchronously and synchronously”. Error correction made.</p> <p>M10 - the semi colon after stamped should be deleted</p> <p><b>Response:</b> The RCSDT agrees with your assessment and has added a colon at the appropriate location and changed the current colon to a comma for the Measures M9, M10, and M11. Error correction made.</p> <p>Compliance Section - Compliance Enforcement Authority is defined as CEA, but then both the acronym and the entire term is later used in the document. Should either not define, or use acronym consistently.</p> <p><b>Response:</b> The RCSDT notes that the usage of the acronyms is consistent with the NERC style guide. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
MISO		<p>MISO respectfully submits that the subject matter of COM-001-1 is better addressed through an official NERC certification - that is, by having NERC certify that a registered</p>

Organization	Yes or No	Question 4 Comment
		<p>entity has the appropriate communications facilities - than through a formal Reliability Standard.</p> <p><b>Response:</b> NERC maintains an Organization Certification Program, the goal of which is to ensure that organizations who apply to register or are registered to perform certain reliability functions deemed particularly crucial to the reliability of the bulk power system will meet or exceed certain minimum criteria (i.e., Reliability Standards) demonstrating they are capable of performing the tasks (i.e., Requirements) for these functions. The process for certification of organizations is included in the NERC Rules of Procedure, Section 500 and Appendix 5A. For example, the first paragraph of Section 500 – Organization Registration and Certification states: “The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards...” The RCSDT has addressed the scope of the SAR in addressing communication requirements for entities through an open industry consensus process.</p> <p>Furthermore, the Reliability Standards surrounding communications should be performance based and specifically targeted toward testing, maintenance, and implementation of corrective actions when an issue arises or is otherwise detected. As a result of narrowing the focus of these standards, enforcement would then be tailored toward a Registered Entity’s failure to take such actions when necessary, a direct benefit and correlation to enhancement of the reliability of the BES.</p> <p><b>Response:</b> The RCSDT thanks you for your comment. Although this standard is not a Results-Based Standard (RBS), it achieves the need to require both Interpersonal Communication and Alternative Interpersonal Communication capability of the applicable entities to ensure reliable operations of the Bulk Electric System. The RCSDT believes the requirements achieve the needed level of communications to ensure reliable operations. No change made.</p>

Organization	Yes or No	Question 4 Comment
		<p>Under the currently proposed approach, the lack of a communication medium or a finding that a communication medium is “inadequate” or does not otherwise qualify under the standard would result in a non-compliance.</p> <p><b>Response:</b> The RCSDT is not sure what is meant by a “lack of communication medium.” The applicable entity either has the necessary Interpersonal Communication and Alternative Interpersonal Communication capability or does not. The requirements account for conditions where the capability is unavailable and has provided language to avoid situations of non-compliance due to the strict language construction of the requirements. No change made.</p> <p>Finally, MISO respectfully submits that:</p> <ul style="list-style-type: none"> <li>-Distribution Providers (DPs) and Generator Operators (GOPs) should have alternate communication media as well.</li> </ul> <p><b>Response:</b> The RCSDT thanks you for your comment about requiring the Distribution Provider and Generation Operator to have the requirements similar to that of the Reliability Coordinator, Transmission Operator, and Balancing Authority. The standard, as proposed, has included the Distribution Provider and Generation Operator in accordance with the regulatory statements in Order No. 693, Paragraphs 483, 491, 495, 496, and 503 which recognized the need for Distribution Providers and Generation Operators to have flexibility in meeting the communication capability requirements and not to burden smaller entities (i.e., DPs and GOPs) with the additional requirement of adding communication redundancy. No change made.</p> <ul style="list-style-type: none"> <li>-If an alternate communication tool is tested once a month, there is no need to address deficiencies within two hours; six hours is sufficient in such instances.</li> </ul> <p><b>Response:</b> The RCSDT contends the time frame has been through industry consensus, and two hours has been determined acceptable. No change made.</p> <ul style="list-style-type: none"> <li>-The standard should acknowledge that if more than two independent communication mechanisms are available, the VRF/VSL associated with missing a</li> </ul>

Organization	Yes or No	Question 4 Comment
		<p>timing requirement is minimal.</p> <p><b>Response:</b> The RCSDT agrees that the applicable entities in Requirements R1, R3, and R6 are required to designate an Alternative Interpersonal Communication capability; however, this does not create a rationale for lowering the VRF/VSL. The VRF is a measure of the risk, if violated, and the VSL is a measure of non-compliance with the specific requirement.</p> <p>The RCSDT added the High VSL for Requirements R1 through R8 from draft 5 to draft 6 to account for greater granularity in a violation. For each applicable responsible entity named in each of the requirements, the number of entities for which it must have an Interpersonal Communication or Alternative Interpersonal Communication may vary significantly. The RCSDT believed that adding one additional VSL was an appropriate solution to account for variability in the number of entities. No change made.</p> <p>The SDT should require reporting times of failed mediums for GOP and DP similar to that for RC/BA/TOP.</p> <p><b>Response:</b> The RCSDT thanks you for your comment about requiring the Distribution Provider and Generation Operator to have the requirements similar to that of the Reliability Coordinator, Transmission Operator, and Balancing Authority. The standard, as proposed, has included the Distribution Provider and Generation Operator in accordance with the regulatory statements in Order No. 693, Paragraphs 483, 491, 495, 496, and 503 which recognized the need for Distribution Providers and Generation Operators to have flexibility in meeting the communication capability requirements and not to burden smaller entities (i.e., DPs and GOPs) with the additional requirement of adding communication redundancy. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
<p>Oncor Electric Delivery Company LLC</p>		<p>Oncor takes the position that the premise of R3 does not provide a reliability enhancement but may in effect; increase the risk to reliability by placing notification</p>

Organization	Yes or No	Question 4 Comment
		<p>requirements on the Transmission Operator that could best be managed by the Reliability Coordinator. In fact,</p> <p>Oncor takes the position that as a Transmission Operator, it is being placed into the position of having to continually validate the registration status of every entity that may be registered as a Distribution Provider, Transmission Operator, and Generator Operator within its Transmission Operator Area. Oncor takes the position that since each of these entities are in the applicability section of the standard, the Distribution Provider, Transmission Operator, and Generator Operator should be responsible for seeking Interpersonal Communication capability with the Transmission Operator and the Transmission Operator should then reciprocate Interpersonal Communication capability in response to their initial request. This eliminates an unnecessary compliance obligation of the Transmission Operator to manage "who is" and "who is not" registered as a Generator Operator, Distribution Provider or Transmission Operator.</p> <p><b>Response:</b> The RCSDT notes this is not within the scope of the SAR. No change made.</p> <p>Oncor recommends the following change to the standard language:</p> <p>Remove 3.3 &amp; 3.4 because R7 and R8 already cover the GO and DP seeking Interpersonal Communication capability with the Transmission Operator.</p> <p><b>Response:</b> The RCSDT thanks you for your comment and notes that the standard is addressing FERC directives concerning the Generation Owner and Distribution Provider. Entities on each end of the communication capability must have a responsibility to have communications. No change made.</p> <p>Oncor also takes the position that the Reliability Coordinator (RC) is in the best position and not the Transmission Operator to make extensive notifications on a broad basis in the event of a failure of its Interpersonal Communication. In accordance with that position, the Transmission Operator should make a single notification to the RC, and the RC would then make the notification to all impacted</p>

Organization	Yes or No	Question 4 Comment
		<p>entities in the event of the failure of the Transmission Operator’s Interpersonal Communication.</p> <p><b>Response:</b> The RCSDT notes this implementation is entity-specific and is not achievable by all entities. Each entity is required to make the notifications as applicable to the requirements. No change made.</p> <p>Oncor proposes the following language for R10</p> <p>“R10. Each Transmission Operator shall notify the Reliability Coordinator and the Balancing Authority within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer.</p> <p>After notification by any Transmission Operator, the Reliability Coordinator shall immediately notify entities as identified in Requirements R1, R3, and R5 of any Transmission Operator's detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer.</p> <p>Each Reliability Coordinator and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5 within 60 minutes of the detection of a failure of its own Interpersonal Communication capability that lasts 30 minutes or longer.”</p> <p><b>Response:</b> The RCSDT disagrees with the method. Each entity is required to make the notifications as applicable to the requirements. No change made.</p>
<p><b>Response:</b> Please see the above responses.</p>		
Central Lincoln		<p>Prior Central Lincoln Comment</p> <p>1) The new requirement presents us with a paradoxical situation. The communication has failed, so we must consult; yet consultation requires communication. We note that the SDT used the word “any”, implying that multiple communication paths are required. The reality of the situation at Central Lincoln, due to our remote location, is that a single back hoe incident at the right location can take out all of our of our communication capability (including the terrestrial portion of the cellular networks)</p>

Organization	Yes or No	Question 4 Comment
		<p>with our BA/TO; making this requirement impossible to meet for this circumstance using our present capabilities.</p> <p>Prior RCSDT Response</p> <p>1) The RCSDT appreciates your comment and has made clarifying changes by removing the phrase “any of” in COM-001, R11. Additionally, the RCSDT made a clarifying change to indicate the DP and GOP only need to consult with the entity affected by the failure. Furthermore, R11 addresses the direction given in Order 693 that DP and GOP entities do not necessarily need to have Alternative Interpersonal Communication capability. The requirement allows flexibility in “consult with” by not naming the method. If all communications are out, then the DP or GOP may have to meet the requirement by an in-person consultation.</p> <p>New Central Lincoln Response</p> <p>1) Thank you for the changes made. We realize that in-person consultation is an option, but find it not too hard to imagine the same event that disrupts communications might also block roads. We don’t believe entities should be found non-compliant and sanctioned for events beyond their control.</p> <p><b>Response:</b> The RCSDT understands the paradoxical situation presented here. The standard addresses the essential communication capability needed to operate the Bulk Electric System reliably. No change made.</p> <p>Prior Central Lincoln Comment</p> <p>2) We also note that no time limit was indicated. Most interruptions are brief, and fixed before consultation could reasonably take place. CEAs will be finding entities non-compliant for quickly fixing problems at their end without first consulting to ensure the restoration time was agreeable. To avoid non-compliance, entities will be forced to delay repairs while they investigate alternative communication paths for consultation purposes. We fail to see how such an outcome improves reliability.</p> <p>Prior RCSDT Response</p>

Organization	Yes or No	Question 4 Comment
		<p>2) The DP and GOP are only required to have Interpersonal Communication capability. If the DP or GOP restores its Interpersonal Communication capability before it could reasonably contact the affected entity by another method, there is no failure to comply. The DP or GOP could then consult with the affected entity to determine a mutually agreeable action. In this case, the RCSDT believes the "action" would then be the entities acknowledging the failure and the repair; therefore, no mutually agreeable action is needed. The RCSDT recognizes there is no way to account for all the various circumstances in a failure. To comply, the DP and GOP are still required to consult the entity which the failure affected regardless of whether the Interpersonal Communication capability was restored or is still failed. No change made.</p> <p>New Central Lincoln Response</p> <p>2) If consultation after restoration is acceptable, we suggest that this be made clear in the requirement. Presently it is not at all clear, and there is no accompanying guidance document to suggest so. We also remain unclear what reliability benefit would result from such a consultation following restoration. While accounting for all the various failures might be impossible, we would like to see a few of the more common ones discussed in a guidance document.</p> <p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of its Interpersonal Communication capability. The RCSDT believes it is inappropriate to establish a single-defined threshold or attempt to make a list of the various failures which may potentially affect the numerous entities applicable to this standard. No change made.</p> <p>Prior Central Lincoln Comment</p> <p>3) The new requirement is one sided, requiring the DP and GOP to consult with no corresponding requirement for the TO or BA to have personnel available for such a consultation. Consultation failure or failure to mutually agree due to actions or</p>

Organization	Yes or No	Question 4 Comment
		<p>inactions on the part of the TO or BA should not result in an enforcement action against the DP or GOP, yet that is how the requirement is written.</p> <p>Prior RCSDT Response</p> <p>3) The RCSDT notes that once the failure has been detected, the responsible entity must make the consultation with the BA or TOP; that relieves the compliance burden. While the RCSDT understands your concern about single points of failure, the question becomes should this relieve the DP or GOP of the requirement for having Interpersonal Communication capabilities. No change made.</p> <p>New Central Lincoln Response</p> <p>3) The requirement remains one-sided. If a consultation effort fails due to actions or inactions taken by the BA/TO, the DP or GOP is the only entity that can be found non-compliant.</p> <p><b>Response:</b> The RCSDT addressed the concern about “mutually agreeable restoration time” by revising the phrase to “mutually agreeable action,” which allows the applicable entities to reach consensus on the effort needed to restore communications. Additionally, working toward a mutually agreeable action also ensures that both parties understand the magnitude of the loss of their Interpersonal Communication capability and agree to the actions needed to restore and minimize the time the capability is unavailable. From a compliance standpoint, the Distribution Provider and Generation Operator that is working to restore its Interpersonal Communication capability is not out of compliance as far as the entity is meeting the requirement for taking action to restore its capability. It is practical on the part of the Balancing Authority or Transmission Operator to reach a mutual agreement, as it will facilitate restoring the capability. No change made.</p> <p>Prior Central Lincoln Comment</p> <p>4) The new requirement fails to add any “clarity” to the other requirements, and we don’t see that the stakeholders thought there was a problem with DP/GOP obligation clarity. Instead, it adds new obligations with no justification for how they enhance</p>

Organization	Yes or No	Question 4 Comment
		<p>reliability. We suggest removing the requirement.</p> <p>Prior RCSDT Response</p> <p>4) Based on the RCSDT’s understanding of the comments received on the previous posting, the industry desired additional clarity on specifically what communication capabilities the DP and GOP were required to have. There was confusion that the standard did not specifically say that the DP and GOP were required to have Alternative Interpersonal Communication capabilities. R11 clarifies that a DP and GOP are not required to have Alternative Interpersonal Communication capability if the DP or GOP consult with their TOP or BA, whichever is applicable in the given situation, and they mutually agree that the restoration action does not adversely impact the reliability of the BES. No change made.</p> <p>New Central Lincoln Response</p> <p>4) We disagree that R11 clarifies anything regarding Alternative Interpersonal Communication capabilities; the requirement says nothing on the matter. If other requirements remain unclear, we suggest they be clarified within those requirements. We ask that R11 be removed. Alternatively, we suggest that a plan for communication failure be developed by the affected entities prior to a failure, applicable to both the BA/TO and DP/GOP.</p> <p><b>Response:</b> The RCSDT contends the desired result is restoring the capability and that the most appropriate and measureable way to address the loss of the Distribution Provider or Generation Operator’s capability is to require the entities to communicate the action taken to restore the capability. No change made.</p> <p>Prior Central Lincoln Comment</p> <p>5) As stated in our prior comments, we continue to have problems with COM-002, R2 and R3 as written. The SDT’s answer (“It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive”) addresses our concern perfectly, and we would agree with such an expectation. Unfortunately, the expressed expectation</p>

Organization	Yes or No	Question 4 Comment
		<p>is not in the proposed standard or even in a proposed guideline for the standard.</p> <p>Prior RCSDT Response</p> <p>5) The RCSDT believes this is a process or procedure question that should be determined by the entity in how it handles communication with the RC. The standard, as written does, not preclude the entity from having a procedure. No change made.</p> <p>New Central Lincoln Response</p> <p>5) We agree that this is a procedure issue, but disagree that the procedure lies with the entity receiving the Reliability Directive. The SDT’s words inside the quotation marks above state it is the issuer of the Directive that should request a return call. Procedures like this, in order to ensure the Directive gets to the party who understands it and can take the needed action, are the responsibility of the issuer. If reliability is at risk, it is little to ask that issuers of Reliability Directives be required to attempt to reach the proper party prior to identifying, delivering the directive, and asking for repetition.</p> <p><b>Response:</b> The standard COM-002-3 was approved by industry in July 2012; therefore, the RCSDT is not able to respond to Central Lincoln’s comments and consider changes to the standard. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
Liberty Electric Power		<p>R11 remains an issue even with the revision. The purpose of R11 should be to inform the BA and TO of a loss of interpersonal communications capability so that the BA or TO can react effectively to grid conditions in an emergency. The methods of repair for generator telephone and data lines are properly the business decisions of the generator, and there is no benefit to the reliability of the BES if a standard requires a generator to attempt to gain consensus from the BA and TO on his repair actions.</p> <p>Taking the time to discuss a "mutually agreed action" will delay the start of repairs,</p>

Organization	Yes or No	Question 4 Comment
		<p>and lengthen the time of a communications outage as generators first must discuss the issue with the BA and TO instead of initiating the action on their own and informing those entities of the failure. Further, failure to follow a mutually agreed action plan could become a topic of exploration for audit staff. As telecommunications repairs are generally not in the scope of expertise of electrical generators, this places the entities at the mercy of contractor repair schedules, making following any mutually agreed action problematic.</p> <p><b>Response:</b> The RCSDT notes that the purpose of consulting with the appropriate entities ensures those entities are aware of the loss of Interpersonal Communication capabilities and will have the necessary information to adjust reliability operations accordingly. There is nothing in Requirement R11 preventing the Distribution Provider or Generator Operator from taking action beforehand. No change made.</p> <p>Further, there is no duration trigger on R11, as opposed to the RC/TO/BA requirement in R10. This forces the generator to inform the listed entities even of losses of capability which last a handful of seconds. If a small generator has a single line into the control room, and the control room operator is on the phone to the TOP, does he then have to inform the TO and BA at the end of the call that they would have received a busy signal? If the operator knocks the phone from the cradle, is the requirement to inform triggered? In a strict reading of the language, it would be.</p> <p>Suggested rewrite of R11:</p> <p>"Upon discovery of an unresolved loss of interpersonal communications which has the potential to last more than 15 minutes, the GOP shall inform the entities listed in R8 of the status of interpersonal communications. The GOP shall initiate the process to restore the interpersonal communications, and inform the entities listed in R8 of the restoration of communications when repairs are complete."</p> <p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of its Interpersonal Communication capability. The RCSDT believes it is inappropriate to</p>

Organization	Yes or No	Question 4 Comment
		establish a single-defined threshold applicable to the numerous entities applicable to this standard. No change made.
<b>Response:</b> Please see responses above.		
Tacoma Power		<p>R9 - The Standard requires that when there is a failure to a primary or alternate communication system that action is initiated within 2 hours of the communication failure. It is not clear what the term “action” means. Tacoma requests clarification for what “actions” are intended by the standard.</p> <p><b>Response:</b> The RCSDT notes that the requirement is for the entity to “initiate action,” which may include, but is not limited to, notifying or requesting repair to restore the capability. The option is to designate an Alternative Interpersonal Communication capability. Additionally, there is no time constraint for the Interpersonal Communication capability, only the AIC. No change made.</p> <p>R10 - Interpersonal Communication is defined as “any medium that allows two or more individuals to interact, consult, or exchange information”. As it is written, R10 requires an entity to contact another entity “within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer”. This contact may not be possible in a situation where there is “a failure of Interpersonal Communication capability”.</p> <p><b>Response:</b> The RCSDT notes that the responsible entities named in Requirement R10 are also required to have a designated Alternative Interpersonal Communication capability and should be able to make the necessary notifications. No change made.</p> <p>R11 – The lack of a time line in R11 seems inconsistent with the time line requirements in R9 and R10. If there is a communication failure affecting the GO and DP then the standard only requires that they agree on an action to restore communication but does not assign a timeline.</p> <p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of</p>

Organization	Yes or No	Question 4 Comment
		its Interpersonal Communication capability. The RCSDT believes it is inappropriate to establish a single-defined threshold applicable to the numerous entities applicable to this standard. No change made.
<b>Response:</b> Please see responses above.		
LG&E and KU Services		<p>Regarding COM-001-2 and proposed definitions, LG&amp;E and KU Services recommends changing the terms being defined from “Interpersonal Communications” and “Alternative Interpersonal Communication” to “Means for Interpersonal Communication” and “Alternative Means for Interpersonal Communication.” A communication is an exchange of information, not a medium. The medium is simply the means. LG&amp;E and KU Services Company further recommend that each requirement be rewritten with these new defined terms as appropriate and that the word “capabilities” currently following the defined terms be removed from each of the requirements.</p> <p><b>Response:</b> The RCSDT notes that commenters recommended using the terms, such as, “primary,” “secondary,” “device,” “means,” and “medium” with regard to the proposed definitions. The RCSDT thanks you for your suggestion; however, the requirements are for “capability” and adding such proposed terms is not needed to achieve the necessary clarity. No change made.</p> <p>We suggest the definition for “Means for Interpersonal Communication” be: “A medium utilizing electromagnetic energy that allows two or more individuals to interact, consult or exchange information.” We suggest the definition for “Alternative Means for Interpersonal Communication” be: “Any Means for Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Means for Interpersonal Communications used for day-to-day operation.” Regarding R1 through R10, it is unclear what “shall have Interpersonal Communications capability” means. That could mean that the responsible entity simply has to have an IC capability that is different from our designated AIC capability (as R1 through R8 suggest). That could also mean,</p>

Organization	Yes or No	Question 4 Comment
		<p>differently, that the responsible entity has to designate an IC capability (as R10 suggests). It is also unclear whether the IC capability can change, e.g. from email to land line. There is nothing in the Standard that makes this clear. Regarding R11, as written it is unclear who would be responsible for non-compliance if the consulting entities did not “determine a mutually agreeable action for the restoration of its Interpersonal Communication capability.”</p> <p><b>Response:</b> The RCSDT believes the definitions and requirements are clear and does not agree with the proposed definition changes. The requirements and definition allow the entity to determine the medium. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
<p>City of Tallahassee (TAL)</p>		<p>TAL has no comments on COM-001-2.</p> <p>However, for COM-002-3, under Data Retention, the second bullet requires the BA, TOP, GOP, and DP to retain evidence for R1, M1; however, R1 is not applicable to the GOP or DP. This should read R2, M2.</p> <p><b>Response:</b> The RCSDT agrees with your assessment that R1 and M1 should be R2 and M2. The RCSDT has advised NERC staff of the typo in COM-002-3.</p> <p>Also, there is room for debate on the clarity of the VSLs for R3. Specifically, the use of the word "accurately" could be interpreted to mean "verbatim" in cases where varying verbiage results in the same understanding and action between the parties, and therefore no re-issuance of the directive is required in the eyes of the issuer.</p> <p><b>Response:</b> The standard COM-002-3 was approved by industry in July 2012; therefore, the RCSDT is not able to respond to the City of Tallahassee’s comment to consider changes to the standard. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
<p>American Electric Power</p>		<p>The definition of Alternative Interpersonal Communication is “Any Interpersonal</p>

Organization	Yes or No	Question 4 Comment
		<p>Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.” Does the Alternative Interpersonal Communication have to be a different technology? For example, if a satellite phone is used, but it calls the same land-line on the other end, does this qualify as Alternative Interpersonal Communication?</p> <p><b>Response:</b> The proposed definitions only specify that the alternative has to utilize a separate medium. The standard is not technology dependent and allows entities flexibility in selecting the capability appropriate for its need. No change made.</p> <p>How does a TOP notify a DP of a failure in its Interpersonal Communications capability per R10, if it there is no Alternative Interpersonal Communication required? Within Requirement 10, the entities to be notified should not reference R1, R3, and R5 but should instead reference R2, R4, and R6 respectively. This change is necessary because the requirements we are referring to are those that have Alternative Interpersonal Communications. You cannot expect notification to entities where an Alternative Interpersonal Communication does not exist.</p> <p><b>Response:</b> The RCSDT notes that Requirement R10 applies to the TOP and that the TOP is required to have AIC per Requirement R4. The RCSDT disagrees with the suggested change in the requirement references because the current references are specific to the entities that apply to the Interpersonal Communication capability. No change made.</p> <p>With regard to the requirement references in R10, the RCSDT agrees with the ambiguity in both the Requirement R10 and Measure M10 and proposes to clarify Requirement R10, Measure M10, and R10 VSL by inserting the word “respectively.” For example, adding the word “respectively” means that the Reliability Coordinator in R1 is not required to notify the entities identified in Requirement R3 or R5. The RCSDT intended the requirements to map to the entity. Clarifying changes made.</p>
<p><b>Response:</b> Please see the responses above.</p>		

Organization	Yes or No	Question 4 Comment
<p>Exelon Corporation and its affiliates</p>		<p>The definition of Interpersonal Communication requires further clarification. The use of the term “Any medium” opens the definition up to broad interpretation. It’s not clear whether the definition means to apply to the point of communication owned, managed, and operated by the entity, or the total communications pathway? For example if entity A’s phone system is working fine, but Entity B is experiencing trouble, does Entity A have a compliance concern if Entity B experiences a communication breakdown on their end of the medium?</p> <p>Please provide greater insight on the intended compliance obligation and consider the following revision to the definition:</p> <p>Interpersonal Communication: Any medium, owned, managed, or operated by the applicable entity, that allows two or more individuals to interact, consult, or exchange information.</p> <p><b>Response:</b> The RCSDT notes that each requirement does not prescribe the “how,” “why,” “who,” or “where” concerning the failure or loss of its Interpersonal Communication (or Alternative Interpersonal Communication) capability. It is the responsibility of the applicable entity to perform the “what” of each requirement. There is no compliance risk based on the “how,” “why,” “who,” or “where.” No change made.</p> <p>The RCSDT appreciates the suggested changes to the defined term. The suggestion introduces specifics which make the definition less flexible and more prescriptive. Such a change could potentially be invalidated by the way an entity operates in the future. No change made.</p> <p>R9 provides ambiguous instruction for the resolution process surrounding tests and failures of Alternative Interpersonal Communication capability. Please confirm whether the intent of the requirement is to initiate repairs within two hours, or to effect repairs within two hours, with the alternate option being to designate a replacement Alternative Interpersonal Communication if repairs cannot be completed within two hours.</p>

Organization	Yes or No	Question 4 Comment
		<p><b>Response:</b> The RCSDT notes that the requirement is for the entity to “initiate action,” which may include, but is not limited to, notifying or request repair to restore the capability. The option is to designate an Alternative Interpersonal Communication capability. No change made.</p> <p>R10 has similar ambiguity, referencing a 60 minute notification timeframe requirement upon the detection of a failure lasting 30 minutes or longer. Please confirm the intended start of the requirement notification. Does the clock for notification begins at the point of failure, at the point of discovery, or at the point that the failure is discovered to have been effective for 30 minutes or greater? Thank you for the opportunity to comment.</p> <p><b>Response:</b> The RCSDT notes the 60-minute clock starts at the point the failure has reached the 30-minute threshold. This is to allow time for intermittent failures to be resolved. No change made.</p>
<p><b>Response:</b> Please see the responses above.</p>		
<p>ISO/RTO Standards Review Committee</p>		<p>The IRC continues to believe that these a certification types of requirements and that they do not belong in a standard.</p> <p>The SRC believes that the requirement to have a medium to communicate should be required to be certified.</p> <p><b>Response:</b> NERC maintains an Organization Certification Program, the goal of which is to ensure that organizations who apply to register or are registered to perform certain reliability functions deemed particularly crucial to the reliability of the bulk power system will meet or exceed certain minimum criteria (i.e., Reliability Standards) demonstrating they are capable of performing the tasks (i.e., Requirements) for these functions. The process for certification of organizations is included in the NERC Rules of Procedure, Section 500 and Appendix 5A. For example, the first paragraph of Section 500 – Organization Registration and Certification states: “The purpose of the Organization Registration Program is to clearly identify those</p>

Organization	Yes or No	Question 4 Comment
		<p>entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards...” The RCSDT has addressed the scope of the SAR in addressing communication requirements for entities through an open industry consensus process. No change made.</p> <p>When you are operating as a registered entity, the requirements should be performance based such as taking corrective actions and if you fail to communicate for any reason you will be found non-compliance. The lack of a communication medium should not be a defense for non-compliance of the performance based standards.</p> <p><b>Response:</b> The RCSDT thanks you for your comment. Although this standard is not a Results-Based Standard (RBS), it achieves the need to require both Interpersonal Communication and Alternative Interpersonal Communication capability of the applicable entities to ensure reliable operations of the Bulk Electric System. The RCSDT believes the requirements achieve the needed level of communications to ensure reliable operations. No change made.</p> <p>The SDT should require reporting times of failed mediums for GOP and DP similar to that for RC/BA/TOP.</p> <p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of its Interpersonal Communication capability. The RCSDT believes it is inappropriate to establish a single-defined threshold applicable to the numerous entities applicable to this standard. No change made.</p>
<b>Response:</b>		
ISO New England Inc		The ISO-NE continues to believe that these a certification types of requirements and that they do not belong in a standard.

Organization	Yes or No	Question 4 Comment
		<p>ISO-NE believes that the requirement to have a medium to communicate should be required to be certified.</p> <p><b>Response:</b> NERC maintains an Organization Certification Program, the goal of which is to ensure that organizations who apply to register or are registered to perform certain reliability functions deemed particularly crucial to the reliability of the bulk power system will meet or exceed certain minimum criteria (i.e., Reliability Standards) demonstrating they are capable of performing the tasks (i.e., Requirements) for these functions. The process for certification of organizations is included in the NERC Rules of Procedure, Section 500 and Appendix 5A. For example, the first paragraph of Section 500 – Organization Registration and Certification states: “The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards...” The RCSDT has addressed the scope of the SAR in addressing communication requirements for entities through an open industry consensus process. No change made.</p> <p>When you are operating as a registered entity, the requirements should be performance based such as taking corrective actions and if you fail to communicate for any reason you will be found non-compliance. The lack of a communication medium should not be a defense for non compliance of the performance based standards.</p> <p><b>Response:</b> The RCSDT thanks you for your comment. Although this standard is not a Results-Based Standard (RBS), it achieves the need to require both Interpersonal Communication and Alternative Interpersonal Communication capability of the applicable entities to ensure reliable operations of the Bulk Electric System. The RCSDT believes the requirements achieve the needed level of communications to ensure reliable operations. No change made.</p> <p>The SDT should require reporting times of failed mediums for GOP and DP similar to</p>

Organization	Yes or No	Question 4 Comment
		<p>that for RC/BA/TOP.</p> <p><b>Response:</b> The RCSDT notes that the requirement allows flexibility for the Distribution Provider and Generator Operator to define what constitutes a failure of its Interpersonal Communication capability. The RCSDT believes it is inappropriate to establish a single-defined threshold applicable to the numerous entities applicable to this standard. No change made.</p>
<p><b>Response:</b> Please see responses above.</p>		
<p>SERC OC Standards Review Group</p>		<p>The SERC OC SRG would like to thank the Standard Drafting Team for their service.”The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”</p>
<p><b>Response:</b> The RCSDT thanks you for your support.</p>		
<p>SPP Standards Review Group</p>		<p>There are a couple of cut &amp; paste errors in the VSLs for R3 and R5.</p> <p>In R3, Reliability Coordinator in the High and Severe VSLs should be replaced with Transmission Operator.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R3 VSL. The reference to “Reliability Coordinator” has been changed to Transmission Operator for Requirement R3 in both the High and Severe VSL. Error correction made.</p> <p>In R5, Reliability Coordinator in the High and Severe VSLs should be replaced with Balancing Authority.</p> <p><b>Response:</b> The RCSDT appreciates you bringing awareness to this error in Requirement R5. The reference to “Reliability Coordinator” has been changed to Balancing Authority for Requirement R5 in both the High and Severe VSL. Error correction made.</p>

END OF REPORT

## A. Introduction

1. **Title:** **Communications**
2. **Number:** COM-001-2
3. **Purpose:** To establish Interpersonal Communication capabilities necessary to maintain reliability.
4. **Applicability:**
  - 4.1. Transmission Operator
  - 4.2. Balancing Authority
  - 4.3. Reliability Coordinator
  - 4.4. Distribution Provider
  - 4.5. Generator Operator
5. **Effective Date:** The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

## B. Requirements

- R1. Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 1.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
  - 1.2. Each adjacent Reliability Coordinator within the same Interconnection.
- R2. Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 2.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
  - 2.2. Each adjacent Reliability Coordinator within the same Interconnection.
- R3. Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 3.1. Its Reliability Coordinator.
  - 3.2. Each Balancing Authority within its Transmission Operator Area.

- 3.3. Each Distribution Provider within its Transmission Operator Area.
  - 3.4. Each Generator Operator within its Transmission Operator Area.
  - 3.5. Each adjacent Transmission Operator synchronously connected.
  - 3.6. Each adjacent Transmission Operator asynchronously connected.
- R4.** Each Transmission Operator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 4.1. Its Reliability Coordinator.
  - 4.2. Each Balancing Authority within its Transmission Operator Area.
  - 4.3. Each adjacent Transmission Operator synchronously connected.
  - 4.4. Each adjacent Transmission Operator asynchronously connected.
- R5.** Each Balancing Authority shall have Interpersonal Communication capability with the following entities (unless the Balancing Authority detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 5.1. Its Reliability Coordinator.
  - 5.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 5.3. Each Distribution Provider within its Balancing Authority Area.
  - 5.4. Each Generator Operator that operates Facilities within its Balancing Authority Area.
  - 5.5. Each Adjacent Balancing Authority.
- R6.** Each Balancing Authority shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 1.1. Its Reliability Coordinator.
  - 1.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 1.3. Each Adjacent Balancing Authority.
- R7.** Each Distribution Provider shall have Interpersonal Communication capability with the following entities (unless the Distribution Provider detects a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*
- 7.1. Its Balancing Authority.
  - 7.2. Its Transmission Operator.
- R8.** Each Generator Operator shall have Interpersonal Communication capability with the following entities (unless the Generator Operator detects a failure of its Interpersonal

Communication capability in which case Requirement R11 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

**8.1.** Its Balancing Authority.

**8.2.** Its Transmission Operator.

**R9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations, Same-day Operations]*

**R10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

**R11.** Each Distribution Provider and Generator Operator that detects a failure of its Interpersonal Communication capability shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

### **C. Measures**

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that it has Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R1.)

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R2.)

- M3.** Each Transmission Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority, Distribution Provider, and Generator Operator within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously or synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communication. (R3.)
- M4.** Each Transmission Operator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R4.)
- M5.** Each Balancing Authority shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator and Generator Operator that operates Facilities within its Balancing Authority Area, each Distribution Provider within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R5.)
- M6.** Each Balancing Authority shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator that operates Facilities within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R6.)
- M7.** Each Distribution Provider shall have and provide upon request evidence that it has Interpersonal Communication capability with its Transmission Operator and its Balancing Authority, which could include, but is not limited to:

- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R7.)
- M8.** Each Generator Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Balancing Authority and its Transmission Operator, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R8.)
- M9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it tested, at least once each calendar month, its Alternative Interpersonal Communication capability designated in Requirements R2, R4, or R6. If the test was unsuccessful, the entity shall have and provide upon request evidence that it initiated action to repair or designated a replacement Alternative Interpersonal Communication capability within 2 hours. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R9.)
- M10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)
- M11.** Each Distribution Provider and Generator Operator that detected a failure of its Interpersonal Communication capability shall have and provide upon request evidence that it consulted with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine mutually agreeable action to restore the Interpersonal Communication capability. Evidence could include, but is not limited to: dated operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R11.)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

## 1.2. Compliance Monitoring and Enforcement Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

## 1.3. Data Retention

The Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator for Requirements R1, R2, R9, and R10, Measures M1, M2, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Transmission Operator for Requirements R3, R4, R9, and R10, Measures M3, M4, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Balancing Authority for Requirements R5, R6, R9, and R10, Measures M5, M6, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Distribution Provider for Requirements R7 and R11, Measures M7 and M11 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Generator Operator for Requirements R8 and R11, Measures M8 and M11 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, or Generator Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

## 1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Reliability Coordinator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Reliability Coordinator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R2	N/A	N/A	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R2, Parts 2.1 or 2.2.	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R2, Parts 2.1 or 2.2.
R3	N/A	N/A	The Transmission Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the Transmission Operator detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Transmission Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the Transmission Operator detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R4	N/A	N/A	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.

**Standard COM-001-2 — Communications**

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	N/A	N/A	The Balancing Authority failed to have Interpersonal Communication capability with one of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the Balancing Authority detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Balancing Authority failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the Balancing Authority detected a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R6	N/A	N/A	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.
R7	N/A	N/A	The Distribution Provider failed to have Interpersonal Communication capability with one of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider detected a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Distribution Provider failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider detected a failure of its Interpersonal Communication capability in accordance with Requirement R11.

**Standard COM-001-2 — Communications**

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
<b>R8</b>	N/A	N/A	The Generator Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator detected a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Generator Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator detected a failure of its Interpersonal Communication capability in accordance with Requirement R11.
<b>R9</b>	The Reliability Coordinator, Transmission Operator, or Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 2 hours and less than or equal to 4 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, or Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 4 hours and less than or equal to 6 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, or Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 6 hours and less than or equal to 8 hours upon an unsuccessful test.	The Reliability Coordinator, Transmission Operator, or Balancing Authority failed to test the Alternative Interpersonal Communication capability once each calendar month.  OR The Reliability Coordinator, Transmission Operator, or Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 8 hours upon an unsuccessful test.
<b>R10</b>	The Reliability Coordinator, Transmission Operator, or Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, respectively upon the detection of a failure of its Interpersonal Communication capability in more than 60 minutes but less than or equal to 70 minutes.	The Reliability Coordinator, Transmission Operator, or Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, respectively upon the detection of a failure of its Interpersonal Communication capability in more than 70 minutes but less than or equal to 80 minutes.	The Reliability Coordinator, Transmission Operator, or Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, respectively upon the detection of a failure of its Interpersonal Communication capability in more than 80 minutes but less than or equal to 90 minutes.	The Reliability Coordinator, Transmission Operator, or Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, respectively upon the detection of a failure of its Interpersonal Communication capability in more than 90 minutes.

### Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007.
2. Draft SAR Version 1 Comment Period ended February 14, 2007.
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007.
4. Draft Version 2 SAR comment period ended April 17, 2007.
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010.
11. Fourth posting of revised standards on January 25, 2011 with comment period closed on March 7, 2011.
12. Initial ballot conducted February 25 through March 7, 2011.
13. Draft version 5 of the standard and response to comments March 7, 2011 – January 9, 2012.
14. Fifth posting of revised standards on January 9, 2012 with comment period closed on February 9, 2012.
15. Successive ballot conducted January 30 through February 9, ~~2011~~2012.
16. Draft version 6 of the standard and response to comments February 9, ~~2011~~2012 – June ~~5~~7, 2012.
17. Sixth posting of revised standard on June 7, 2012 with comment period closed on July 6, 2012.
18. Successive ballot conducted June 27 through July 6, 2012.
19. ~~Draft~~Revised version 6 of the standard and response to comments July 6, 2011+2 – July ~~XX~~September 5, 2012.

20. Recirculation ballot conducted July ~~XX~~ September 5 through August ~~XX~~ September 14, 2012.

**Proposed Action Plan and Description of Current Draft:**

The SDT began working on revisions to the standards in August 2007. The current posting contain revisions based on stakeholder comments on the initial ballot. The team is posting for a successive ballot.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Post standards for a successive ballot.	January-February 2012
2. Respond to comments on successive ballot.	March - April 2012
3. Standard posted for second successive ballot.	June 2012
4. Standard posted for recirculation ballot.	September 2012
5. Standard to be sent to BOT for approval.	November 2012
6. Standard filed with regulatory authorities.	January 2013

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

The RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

## A. Introduction

1. **Title:** **Communications**
2. **Number:** COM-001-2
3. **Purpose:** To establish Interpersonal Communication capabilities necessary to maintain reliability.
4. **Applicability:**
  - 4.1. Transmission Operator
  - 4.2. Balancing Authority
  - 4.3. Reliability Coordinator
  - 4.4. Distribution Provider
  - 4.5. Generator Operator
5. **Effective Date:** The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

## B. Requirements

- R1. Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator ~~detects~~~~experiences~~ a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 1.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
  - 1.2. Each adjacent Reliability Coordinator within the same Interconnection.
- R2. Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 2.1. All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.
  - 2.2. Each adjacent Reliability Coordinator within the same Interconnection.
- R3. Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator ~~detects~~~~experiences~~ a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
  - 3.1. Its Reliability Coordinator.
  - 3.2. Each Balancing Authority within its Transmission Operator Area.

- 3.3. Each Distribution Provider within its Transmission Operator Area.
  - 3.4. Each Generator Operator within its Transmission Operator Area.
  - 3.5. Each adjacent Transmission Operator synchronously connected.
  - 3.6. Each adjacent Transmission Operator asynchronously connected.
- R4.** Each Transmission Operator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 4.1. Its Reliability Coordinator.
  - 4.2. Each Balancing Authority within its Transmission Operator Area.
  - 4.3. Each adjacent Transmission Operator synchronously connected.
  - 4.4. Each adjacent Transmission Operator asynchronously connected.
- R5.** Each Balancing Authority shall have Interpersonal Communication capability with the following entities (unless the Balancing Authority ~~detects~~~~experiences~~ a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 5.1. Its Reliability Coordinator.
  - 5.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 5.3. Each Distribution Provider within its Balancing Authority Area.
  - 5.4. Each Generator Operator that operates Facilities within its Balancing Authority Area.
  - 5.5. Each ~~A~~adjacent Balancing Authority.
- R6.** Each Balancing Authority shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 6.1. Its Reliability Coordinator.
  - 6.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
  - 6.3. Each ~~A~~adjacent Balancing Authority.
- R7.** Each Distribution Provider shall have Interpersonal Communication capability with the following entities (unless the Distribution Provider ~~detects~~~~experiences~~ a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): *[Violation Risk Factor: ~~Medium~~High] [Time Horizon: Real-time Operations]*
- 7.1. Its Balancing Authority.
  - 7.2. Its Transmission Operator.
- R8.** Each Generator Operator shall have Interpersonal Communication capability with the following entities (unless the Generator Operator ~~detects~~~~experiences~~ a failure of its

Interpersonal Communication capability in which case Requirement R11 shall apply):  
*[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*

**8.1.** Its Balancing Authority.

**8.2.** Its Transmission Operator.

**R9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations, Same-day Operations]*

**R10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

**R11.** Each Distribution Provider and Generator Operator that detects/experiences a failure of its Interpersonal Communication capability shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

### C. Measures

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that it has Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R1.)

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R2.)

- M3.** Each Transmission Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority, Distribution Provider, and Generator Operator within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously ~~or~~ synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communication. (R3.)
- M4.** Each Transmission Operator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R4.)
- M5.** Each Balancing Authority shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator and Generator Operator that operates Facilities within its Balancing Authority Area, each Distribution Provider within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R5.)
- M6.** Each Balancing Authority shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator that operates Facilities within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R6.)
- M7.** Each Distribution Provider shall have and provide upon request evidence ~~that~~ that it has Interpersonal Communication capability with its Transmission Operator and its Balancing Authority, which could include, but is not limited to:

- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R7.)
- M8.** Each Generator Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Balancing Authority and its Transmission Operator, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R8.)
- M9.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it tested, at least once each calendar month, its Alternative Interpersonal Communication capability designated in Requirements R2, R4, or R6. If the test was unsuccessful, the entity shall have and provide upon request evidence that it initiated action to repair or designated a replacement Alternative Interpersonal Communication capability within 2 hours. Evidence could include, but is not limited to: ~~dated and time-stamped~~ test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R9.)
- M10.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to: ~~dated and time-stamped~~ test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)
- M11.** Each Distribution Provider and Generator Operator that ~~detected~~experienced a failure of its Interpersonal Communication capability shall have and provide upon request evidence that it consulted with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine mutually agreeable action to restore the Interpersonal Communication capability. Evidence could include, but is not limited to: ~~dated~~ operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R11.)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional

Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

## 1.2. Compliance Monitoring and Enforcement Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

## 1.3. Data Retention

The Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator ~~for shall retain evidence of~~ Requirements R1, R2, R9, and R10, Measures M1, M2, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Transmission Operator ~~for shall retain evidence of~~ Requirements R3, R4, R9, and R10, Measures M3, M4, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Balancing Authority ~~for Requirements shall retain evidence of Requirements~~ R5, R6, R9, and R10, Measures M5, M6, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Distribution Provider ~~for shall retain evidence of~~ Requirements R7 and R11, Measures M7 and M11 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- The Generator Operator ~~for shall retain evidence of~~ Requirements R8 and R11, Measures M8 and M11 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, or Generator Operator is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Additional Compliance Information**

None.

**2. Violation Severity Levels**

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Reliability Coordinator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator <del>detected</del> <u>experienced</u> a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Reliability Coordinator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R1, Parts 1.1 or 1.2, except when the Reliability Coordinator <del>detected</del> <u>experienced</u> a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R2	N/A	N/A	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R2, Parts 2.1 or 2.2.	The Reliability Coordinator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R2, Parts 2.1 or 2.2.
R3	N/A	N/A	The Transmission Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the <u>Transmission Operator</u> <del>detected</del> <u>Reliability Coordinator experienced</u> a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Transmission Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R3, Parts 3.1, 3.2, 3.3, 3.4, 3.5, or 3.6, except when the <u>Transmission Operator</u> <del>detected</del> <u>Reliability Coordinator experienced</u> a failure of its Interpersonal Communication capability in accordance with Requirement R10.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	N/A	N/A	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.	The Transmission Operator failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R4, Parts 4.1, 4.2, 4.3, or 4.4.
R5	N/A	N/A	The Balancing Authority failed to have Interpersonal Communication capability with one of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the <del>Balancing Authority detected Reliability Coordinator experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R10.	The Balancing Authority failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R5, Parts 5.1, 5.2, 5.3, 5.4, or 5.5, except when the <del>Balancing Authority detected Reliability Coordinator experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R10.
R6	N/A	N/A	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with one of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.	The Balancing Authority failed to designate Alternative Interpersonal Communication capability with two or more of the entities listed in Requirement R6, Parts 6.1, 6.2, or 6.3.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	The Distribution Provider failed to have Interpersonal Communication capability with one of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider <del>detected</del> <del>experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Distribution Provider failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R7, Parts 7.1 or 7.2, except when the Distribution Provider <del>detected</del> <del>experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R11.
R8	N/A	N/A	The Generator Operator failed to have Interpersonal Communication capability with one of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator <del>detected</del> <del>experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R11.	The Generator Operator failed to have Interpersonal Communication capability with two or more of the entities listed in Requirement R8, Parts 8.1 or 8.2, except when a Generator Operator <del>detected</del> <del>experienced</del> a failure of its Interpersonal Communication capability in accordance with Requirement R11.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R9	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 2 hours and less than or equal to 4 hours upon an unsuccessful test.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 4 hours and less than or equal to 6 hours upon an unsuccessful test.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 6 hours and less than or equal to 8 hours upon an unsuccessful test.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority failed to test the Alternative Interpersonal Communication capability once each calendar month.</p> <p>OR</p> <p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority tested the Alternative Interpersonal Communication capability but failed to initiate action to repair or designate a replacement Alternative Interpersonal Communication in more than 8 hours upon an unsuccessful test.</p>
R10	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, <u>respectively</u> upon the detection of a failure of its Interpersonal Communication capability in more than 60 minutes but less than or equal to 70 minutes.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, <u>respectively</u> upon the detection of a failure of its Interpersonal Communication capability in more than 70 minutes but less than or equal to 80 minutes.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority failed to notify the entities identified in Requirements R1, R3, and R5, <u>respectively</u> upon the detection of a failure of its Interpersonal Communication capability in more than 80 minutes but less than or equal to 90 minutes.</p>	<p>The Reliability Coordinator, Transmission Operator, <del>orand</del> Balancing Authority failed to notify the <del>identified</del>-entities identified in Requirements R1, R3, and R5, <u>respectively</u> upon the detection of a failure of its Interpersonal Communication capability in more than 90 minutes.</p>

2	TBD	Revised in accordance with SAR for Project 2006-06, Reliability Coordination (RC SDT). Replaced R1 with R1-R8; R2 replaced by R9; R3 included within new R1; R4 remains enforce pending Project 2007-02; R5 redundant with EOP-008-0, retiring R5 as redundant with EOP-008-0, R1; retiring R6, relates to ERO procedures; R10 & R11, new.	Revised

## A. Introduction

1. **Title:** ~~Telecommunications~~Communications
2. **Number:** COM-001-~~1~~2
3. **Purpose:** ~~Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information~~To establish Interpersonal Communication capabilities necessary to maintain reliability.
4. **Applicability:**
  - 4.1. Transmission ~~Operators~~Operator
  - 4.2. Balancing ~~Authorities~~Authority
  - 4.3. Reliability ~~Coordinators~~Coordinator
  - 4.4. ~~NERCNet User Organizations.~~
5. ~~Effective Date:~~ May 13, 2009
  - 4.4. Distribution Provider
  - 4.5. Generator Operator
5. **Effective Date:** The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

## B. Requirements

- ~~R1.~~ Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
- ~~R1.1.~~ Internally.
- R1. Between shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator ~~and its~~ detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- ~~R1.2.~~ All Transmission Operators and Balancing Authorities.
- ~~R1.3.~~ With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
- ~~R1.4.~~ Where applicable, these facilities shall be redundant and diversely routed.
- 1.1. Each within its Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications Area.

~~R2. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.~~

~~1.2. Unless agreed to otherwise, each Each adjacent Reliability Coordinator within the same Interconnection.~~

~~R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time generation control and operation of the interconnected Bulk Electric System: Operations]*~~

~~R3. 2.1. All Transmission Operators and Balancing Authorities may use an alternate language for internal operations.~~

~~Each within its Reliability Coordinator, Area.~~

~~2.2. Each adjacent Reliability Coordinator within the same Interconnection.~~

~~R3. Each Transmission Operator shall have Interpersonal Communication capability with the following entities (unless the Transmission Operator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*~~

~~3.1. Its Reliability Coordinator.~~

~~3.2. Each Balancing Authority within its Transmission Operator Area.~~

~~3.3. Each Distribution Provider within its Transmission Operator Area.~~

~~3.4. Each Generator Operator within its Transmission Operator Area.~~

~~3.5. Each adjacent Transmission Operator, and synchronously connected.~~

~~3.6. Each adjacent Transmission Operator asynchronously connected.~~

~~R4. Each Transmission Operator shall designate an Alternative Interpersonal Communication capability with the following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*~~

~~4.1. Its Reliability Coordinator.~~

~~4.2. Each Balancing Authority within its Transmission Operator Area.~~

~~4.3. Each adjacent Transmission Operator synchronously connected.~~

~~4.4. Each adjacent Transmission Operator asynchronously connected.~~

~~R5. Each Balancing Authority shall have Interpersonal Communication capability with the following entities (unless the Balancing Authority detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*~~

~~5.1. Its Reliability Coordinator.~~

- 5.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
- 5.1.5.3. ~~Each Distribution Provider within its Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities Area.~~
- 5.4. ~~Each NERCNet User Organization~~Generator Operator that operates Facilities within its Balancing Authority Area.
- 5.5. Each Adjacent Balancing Authority.
- R6. Each Balancing Authority shall ~~adhere to~~ designate an Alternative Interpersonal Communication capability with ~~the requirements~~ following entities: *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 1.1. Its Reliability Coordinator.
- 1.2. Each Transmission Operator that operates Facilities within its Balancing Authority Area.
- 1.3. Each Adjacent Balancing Authority.
- R7. Each Distribution Provider shall have Interpersonal Communication capability with the following entities (unless the Distribution Provider detects a failure of its Interpersonal Communication capability in Attachment which case Requirement R11 shall apply): *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*
- 7.1-COM-001, “NERCNet Security Policy.”. Its Balancing Authority.
- 7.2. Its Transmission Operator.
- R8. Each Generator Operator shall have Interpersonal Communication capability with the following entities (unless the Generator Operator detects a failure of its Interpersonal Communication capability in which case Requirement R11 shall apply): *[Violation Risk Factor: High] [Time Horizon: Real-time Operations]*
- 8.1. Its Balancing Authority.
- 8.2. Its Transmission Operator.
- R9. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall test its Alternative Interpersonal Communication capability at least once each calendar month. If the test is unsuccessful, the responsible entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communication capability within 2 hours. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations, Same-day Operations]*
- R10. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall notify entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasts 30 minutes or longer. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

R11. Each Distribution Provider and Generator Operator that detects a failure of its Interpersonal Communication capability shall consult each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine a mutually agreeable action for the restoration of its Interpersonal Communication capability. [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations*]

### C. Measures

M1. Each Reliability Coordinator, ~~Transmission Operator and Balancing Authority~~ shall have and provide upon request evidence that it has Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to ~~communication facility test-procedure documents, records of testing, and maintenance records for communication facilities;~~

- physical assets, or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)
- ~~The Reliability Coordinator, Transmission Operator or Balancing Authority shall have and provide upon request~~ dated evidence that could include, but is not limited to, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings or, transcripts of voice recordings, or electronic communications, or equivalent, that will be used to determine compliance to Requirement 4. (R1.)

~~M1.~~M2. Each Reliability Coordinator, ~~Transmission Operator and Balancing Authority~~ shall ~~have and provide upon request its current operating instructions and procedures, either electronic or hard copy that will be used to confirm that it meets Requirement 5.~~ shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with all Transmission Operators and Balancing Authorities within its Reliability Coordinator Area and with each adjacent Reliability Coordinator within the same Interconnection, which could include, but is not limited to:

- ~~The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to documented procedures~~ physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings or, transcripts of voice recordings, or electronic communications. (R2.)

M3. Each Transmission Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority, Distribution Provider, and Generator Operator within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously or synchronously connected, which could include, but is not limited to:

- physical assets, or

- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, electronic communications, or electronic communication. (R3.)
- M4.** Each Transmission Operator shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Balancing Authority within its Transmission Operator Area, and each adjacent Transmission Operator asynchronously and synchronously connected, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R4.)
- M5.** Each Balancing Authority shall have and provide upon request evidence that it has Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator and Generator Operator that operates Facilities within its Balancing Authority Area, each Distribution Provider within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R5.)
- M6.** Each Balancing Authority shall have and provide upon request evidence that it designated an Alternative Interpersonal Communication capability with its Reliability Coordinator, each Transmission Operator that operates Facilities within its Balancing Authority Area, and each adjacent Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R6.)
- M7.** Each Distribution Provider shall have and provide upon request evidence that will be used it has Interpersonal Communication capability with its Transmission Operator and its Balancing Authority, which could include, but is not limited to:
- physical assets, or
  - dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R7.)

M8. Each Generator Operator shall have and provide upon request evidence that it has Interpersonal Communication capability with its Balancing Authority and its Transmission Operator, which could include, but is not limited to determine if it adhered:

- physical assets, or
- dated evidence, such as, equipment specifications and installation documentation, test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R8.)

M2-M9. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it tested, at least once each calendar month, its Alternative Interpersonal Communication capability designated in Requirements R2, R4, or R6. If the test was unsuccessful, the entity shall have and provide upon request evidence that it initiated action to the (User Accountability and Compliance) requirements in Attachment 1 COM-001. (Requirement 6) repair or designated a replacement Alternative Interpersonal Communication capability within 2 hours. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R9.)

M10. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have and provide upon request evidence that it notified entities as identified in Requirements R1, R3, and R5, respectively within 60 minutes of the detection of a failure of its Interpersonal Communication capability that lasted 30 minutes or longer. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R10.)

M11. Each Distribution Provider and Generator Operator that detected a failure of its Interpersonal Communication capability shall have and provide upon request evidence that it consulted with each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator Operator, to determine mutually agreeable action to restore the Interpersonal Communication capability. Evidence could include, but is not limited to: dated operator logs, voice recordings, transcripts of voice recordings, or electronic communications. (R11.)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority**

~~NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations~~

~~Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities~~

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

## 1.2. Compliance Monitoring and ~~Reset Time Frame~~ Enforcement Processes

~~One or more of the following methods will be used to assess compliance:~~

~~— Self certification (Conducted annually with submission according to schedule.)~~

~~— Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~

~~— Periodic Audit (Conducted once every three years according to schedule.)~~

~~— Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case by case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

## 1.3. Data Retention

~~For Measure 1 each~~ The Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall keep data or evidence ~~to show~~ compliance for the previous two calendar years plus the current year. as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- ~~• For Measure 2 each~~ The Reliability Coordinator, Transmission Operator for Requirements R1, R2, R9, and Balancing Authority R10, Measures M1, M2, M9, and M10 shall ~~keep~~ retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days of historical data (evidence).
- ~~• For Measure 3, each Reliability Coordinator, The~~ Transmission Operator, for Requirements R3, R4, R9, and R10, Measures M3, M4, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- ~~• The~~ Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement 5. for Requirements R5, R6, R9, and R10, Measures M5, M6, M9, and M10 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.
- ~~• For Measure 4, each~~ The Distribution Provider for Requirements R7 and R11, Measures M7 and M11 shall retain written documentation for the most

recent twelve calendar months and voice recordings for the most recent 90 calendar days.

- The Generator Operator for Requirements R8 and R11, Measures M8 and M11 shall retain written documentation for the most recent twelve calendar months and voice recordings for the most recent 90 calendar days.

If a Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity, Distribution Provider, or Generator Operator is found non-compliant the entity, it shall keep information related to the ~~none compliance~~ non-compliance until ~~found compliant~~ mitigation is complete and approved or for two years plus the current year time specified above, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance ~~Monitor~~ Enforcement Authority shall keep the last ~~periodic~~ audit report records and all requested and submitted subsequent ~~compliance~~ audit records.

#### 1.4. Additional Compliance Information

Attachment 1 — COM-001 — NERCnet Security Policy

#### ~~2. — Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Not applicable.~~

~~2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~2.3.1 — The Transmission Operator, Balancing Authority or Reliability Coordinator used a language other than English without agreement as specified in R4.~~

~~2.3.2 — There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities as specified in R5.~~

~~2.4. Level 4: Telecommunication systems are not actively monitored, tested, managed or alarmed as specified in R2.~~

#### ~~3. — Levels of Non-Compliance — NERCnet User Organization~~

~~3.1. Level 1: Not applicable.~~

~~3.2. Level 2: Not applicable.~~

~~3.3. Level 3: Not applicable.~~

~~3.4. Level 4: Did not adhere to the requirements in Attachment 1 COM-001, NERCnet Security Policy.~~

None.

## **Attachment 1 — COM-001 — NERCnet Security Policy**

### **Policy Statement**

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

### **NERC’s Security Mission Statement**

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

### **Implementation and Responsibilities**

— This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

#### **NERCnet User Organizations**

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

#### **Responsibilities**

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- ~~• Advise staff on NERCnet Security Policy.~~
- ~~• Ensure that all NERCnet users understand their obligation to protect these assets.~~
- ~~• Conduct self assessments for compliance.~~

### **User Accountability and Compliance**

~~All users of NERCnet shall be familiar and ensure compliance with the policies in this document.~~

~~Violations of the NERCnet Security Policy shall include, but not be limited to any act that:~~

- ~~• Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.~~
- ~~• Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data:  
Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.~~

- ~~Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.~~
- ~~Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data:~~
  - ~~Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.~~

# Implementation Plan and Mapping Document

## COM-001-2 Communications

### Requested Approval

COM-001-2 – Communications

Definition: Interpersonal Communication

Definition: Alternative Interpersonal Communication

### Requested Retirement

COM-001-1.1 – Telecommunications, except Requirement R4

Requirement R4 is being revised for inclusion in Standard COM-002-4, Operating Personnel Communications Protocols and will be requested for retirement upon the effective date COM-002-4.

### Prerequisite Approvals

None.

### Defined Terms in the NERC Glossary

The RCSDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

### Conforming Changes to Requirements in Already Approved Standards

The RCSDT proposes retiring COM-001-1.1 Requirement R5 as it is redundant with EOP-008-0, Requirement R1 as well as EOP-008-1 Requirement R1.

### Revisions to Approved Standards and Definitions

The RCSDT revised the COM-001-1.1 standard proposes retiring four Requirements (R1, R4, R5, and R6). The COM-001-1.1 standard, Requirement R1 is proposed for replacement with COM-001-2, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 to achieve clarity to which entities are required to have to reliable communications. Requirement R2 in COM-001-1.1 will become Requirement R9 in COM-001-2. Requirement R3 in COM-001-1.1 is included within Requirement R1 of COM-001-2. Requirement R4 will remain effective until its inclusion in COM-003-1 that is currently under development in Project 2007-02 – Operating Personnel Communication Protocols. Requirement R5 in COM-001-1.1 is redundant with EOP-008-0, Requirement R1 and EOP-008-1, Requirement R1 and is

proposed for retirement upon the effective date of COM-001-2. The COM-001-1.1 standard, Requirement R6 is proposed for retirement as it is an ERO procedural requirement and does not impact reliability. Requirements R10 and R11 are new requirements. Changes were made to eliminate redundancies between standards (existing and proposed), to align with the ERO Rules of Procedure and to address known issues and certain directives in FERC Order 693.

### **Applicable Entities**

- Reliability Coordinator
- Balancing Authority
- Transmission Operator
- Generator Operator
- Distribution Provider

### **Effective Date**

#### **New or Revised Standards**

COM-001-2      The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

#### **Standard for Retirement**

COM-001-1.1, Requirements R1, R2, R3, R5, and R6      Midnight of the day immediately prior to the Effective Date of COM-001-2 in the particular Jurisdiction in which the new standard is becoming effective. Note: Requirement R4 will remain effective until its inclusion in the standard COM-003-1 currently under development.

## New or Revised Definitions

**Interpersonal Communication** – The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

**Alternative Interpersonal Communication** – The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard becomes effective. If the drafting team is recommending the retirement or revision of a requirement, that text is [blue](#).

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p><b>R1.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information: <i>[Violation Risk Factor: High]</i></p> <p><b>R1.1.</b> Internally. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.2.</b> Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.3.</b> With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.4.</b> Where applicable, these facilities shall be redundant and diversely routed. <i>[Violation Risk Factor: High]</i></p>	<p><b>COM-001-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities (unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply): <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R1.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R1.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R2.</b> Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R2.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R2.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R3.</b> Each Transmission Operator shall have Interpersonal</p>

# Implementation Plan and Mapping Document

## COM-001-2 Communications

### Requested Approval

The RC SDT requests the approval of COM-001-2 – Communications ~~and two new NERC Glossary terms.~~

Definition: Interpersonal Communication

Definition: Alternative Interpersonal Communication

### Requested Retirement

The RC SDT request the retirement of standard COM-001-1.1 – Telecommunications, Requirements R1, R2, R3, R5, R6 and the associated sub requirements, except Requirement R4. This Requirement R4 is being revised for inclusion in Standard COM-002-4, Operating Personnel Communications Protocols and will be requested for retirement upon the retired when COM-003-1 becomes effective date COM-002-4.

### Prerequisite Approvals

None.

### Defined Terms in the NERC Glossary

The ~~RCS DT~~ RC SDT proposes the following new definitions:

**Interpersonal Communication:** Any medium that allows two or more individuals to interact, consult, or exchange information.

**Alternative Interpersonal Communication:** Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

### Conforming Changes to Requirements in Already Approved Standards

The ~~RCS DT~~ RC SDT proposes retiring COM-001-1.1, Requirement R5 as it is redundant with EOP-008-0, Requirement R1 as well as EOP-008-1, Requirement R1.

### Revisions to Approved Standards and Definitions

The RCS DT revised the COM-001-1.1 standard ~~proposes and is proposing~~ retiring four Requirements (R1, R4, R5, and R6). The COM-001-1.1 standard, Requirement R1 is proposed ~~for replacement to be replaced~~ with COM-001-2, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 to achieve clarity to which entities ~~are were~~ required to have to reliable communications. Requirement R2 in COM-001-1.1 will become Requirement R9 in COM-001-2. Requirement R3 in COM-001-1.1 ~~is has been~~ included within Requirement R1 of COM-001-2. Requirement R4 will remain ~~effective enforceable~~ until its inclusion revision is included in COM-003-1 that is ~~currently being developed~~ under development in Project 2007-02 – Operating Personnel Communication Protocols. Requirement R5 in COM-001-1.1 is redundant

with EOP-008-0, Requirement R1 and EOP-008-1, Requirement R1 and is proposed for retirement will be retired upon the effective date of COM-001-2. The COM-001-1.1 standard, Requirement R6 is proposed for retirement will be retired as it is an ERO procedural requirement and does not impact reliability. Requirements R10 and R11 are new requirements. Changes were made to eliminate redundancies between standards (existing and proposed), to align with the ERO Rules of Procedure and to address known issues and certain directives in FERC Order 693.

### Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Transmission Operator
- Generator Operator
- Distribution Provider

### Effective Date

#### New or Revised Standards

COM-001-2      The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

#### Standard for Retirement

COM-001-1.1, Requirements R1, R2, R3, R5, and R6      Midnight of the day immediately prior to the Effective Date of COM-001-2 in the particular Jurisdiction in which the new standard is becoming effective. Note: Requirement R4 will remain effective until its inclusion in the standard COM-003-1 currently under development.

### New or Revised Definitions

**Interpersonal Communication** – The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

**Alternative Interpersonal Communication** – The first day of the second calendar quarter beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

### New or Revised Standards

~~COM-001-2~~      ~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the second calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees adoption.~~

### Standard for Retirement

~~COM-001-1.1, Requirements R1, R2, R3, R5, and R6~~      ~~Midnight of the day immediately prior to the Effective Date of COM-001-2 in the particular Jurisdiction in which the new standard is becoming effective. Note: Requirement R4 will remain effective until its inclusion in the standard COM-003-1 currently under development.~~

### Implementation Plan for Definitions

~~**Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.~~

~~**Alternative Interpersonal Communication** – Entities shall use this definition when implementing the standard COM-001-2, which uses this defined term.~~

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard becomes effective. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>COM-001-1.1</b></p> <p><b>R1.</b> Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information: <i>[Violation Risk Factor: High]</i></p> <p><b>R1.1.</b> Internally. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.2.</b> Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.3.</b> With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability. <i>[Violation Risk Factor: High]</i></p> <p><b>R1.4.</b> Where applicable, these facilities shall be redundant and diversely routed. <i>[Violation Risk Factor: High]</i></p>	<p><b>COM-001-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall have Interpersonal Communication capability with the following entities <u>(unless the Reliability Coordinator detects a failure of its Interpersonal Communication capability in which case Requirement R10 shall apply):-</u> <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R1.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R1.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R2.</b> Each Reliability Coordinator shall designate an Alternative Interpersonal Communication capability with the following entities: <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations]</i></p> <p><b>R2.1.</b> All Transmission Operators and Balancing Authorities within its Reliability Coordinator Area.</p> <p><b>R2.2.</b> Each adjacent Reliability Coordinator within the same Interconnection.</p> <p><b>R3.</b> Each Transmission Operator shall have Interpersonal Communication capability with the following entities <u>(unless the</u></p>

# Violation Risk Factor and Violation Severity Level Justifications

## COM-001-2 - Communications

### Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: COM-001-2 – Communications

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Reliability Coordination Standard Drafting Team (SDT) applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSL for the requirements under this project.

#### **NERC Criteria – Violation Risk Factors**

##### ***High Risk Requirement***

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***Medium Risk Requirement***

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

***Lower Risk Requirement***

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

**FERC Violation Risk Factor Guidelines**

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

***Guideline 1 – Consistency with the Conclusions of the Final Blackout Report***

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

<sup>1</sup> North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) (“VRF Rehearing Order”).

<sup>2</sup> Id. at footnote 15.

- Appropriate use of transmission loading relief

***Guideline 2 – Consistency within a Reliability Standard***

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

***Guideline 3 – Consistency among Reliability Standards***

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

***Guideline 4 – Consistency with NERC’s Definition of the Violation Risk Factor Level***

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC’s definition of that risk level.

***Guideline 5 – Treatment of Requirements that Co-mingle More Than One Obligation***

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are eleven requirements in the standard. None of the eleven requirements were assigned a “Lower” VRF. Requirements R1-R8 are assigned a “High” VRF while the other three requirements are assigned a “Medium” VRF.

**NERC Criteria – Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order of Violation Severity Levels**

FERC’s VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

***Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

***Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

... unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF and VSL Justifications**

VRF Justifications – COM-001-2, R1-R6	
Proposed VRF	High
NERC VRF Discussion	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement specifies which functional entities that are required to have Interpersonal Communication capability and Alternative Interpersonal Communication capability. The VRFs for each requirement are consistent with each other and are only applied at the Requirement level.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: These requirements are facility requirements that provide communications capability between functional entities. There are no similar facility requirements in the standards. The approved VRF for COM-001-1.1, R1 (which proposed R1-R6 replaces) is High and therefore the proposed VRF for R1-R6 is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to have Interpersonal Communication capability and Alternative Interpersonal Communication capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the Bulk Power System and could lead to Bulk Power System instability, separation, or cascading failures. Therefore, this requirement is assigned a High VRF.
FERC VRF G5	Guideline 5- Treatment of Requirements that Co-mingle More than One

VRF Justifications – COM-001-2, R1-R6	
Proposed VRF	High
Discussion	Obligation: Each of the six requirements, R1-R6, contains only one objective; therefore, only one VRF was assigned.

# Violation Risk Factor and Violation Severity Level Justifications

## COM-001-2 - Communications

### Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: COM-001-2 – Communications

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Reliability Coordination Standard Drafting Team (SDT) applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSL for the requirements under this project.

#### **NERC Criteria – Violation Risk Factors**

##### ***High Risk Requirement***

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***Medium Risk Requirement***

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

***Lower Risk Requirement***

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

**FERC Violation Risk Factor Guidelines**

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

***Guideline 1 – Consistency with the Conclusions of the Final Blackout Report***

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities

<sup>1</sup> North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

<sup>2</sup> Id. at footnote 15.

- Appropriate use of transmission loading relief

***Guideline 2 – Consistency within a Reliability Standard***

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

***Guideline 3 – Consistency among Reliability Standards***

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

***Guideline 4 – Consistency with NERC’s Definition of the Violation Risk Factor Level***

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC’s definition of that risk level.

***Guideline 5 – Treatment of Requirements that Co-mingle More Than One Obligation***

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC’s VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC’s Reliability Standards and implies that these requirements should be assigned a “High” VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

There are eleven requirements in the standard. None of the eleven requirements were assigned a “Lower” VRF. Requirements R1-R8 are assigned a “High” VRF while the other three requirements are assigned a “Medium” VRF.

**NERC Criteria – Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance, and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order of Violation Severity Levels**

FERC’s VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

***Guideline 1 – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

***Guideline 2 – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3 – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4 – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

... unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF and VSL Justifications**

VRF Justifications – COM-001-2, R1-R6	
Proposed VRF	High
NERC VRF Discussion	
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report: N/A
FERC VRF G2 Discussion	Guideline 2- Consistency within a Reliability Standard: Each requirement specifies which functional entities that are required to have Interpersonal Communication capability and Alternative Interpersonal Communication capability. The VRFs for each requirement are consistent with each other and are only applied at the Requirement level.
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards: These requirements are facility requirements that provide communications capability between functional entities. There are no similar facility requirements in the standards. The approved VRF for COM-001-1.1, R1 (which proposed R1-R6 replaces) is High and therefore the proposed VRF for R1-R6 is consistent.
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs: Failure to have Interpersonal Communication capability and Alternative Interpersonal Communication capability could limit or prevent communication between entities and directly affect the electrical state or the capability of the Bulk Power System and could lead to Bulk Power System instability, separation, or cascading failures. Therefore, this requirement is assigned a High VRF.
FERC VRF G5	Guideline 5- Treatment of Requirements that Co-mingle More than One

VRF Justifications – COM-001-2, R1-R6	
Proposed VRF	High
Discussion	Obligation: Each of the six requirements, R1-R6, contains only one objective; therefore, only one VRF was assigned.

R11	N/A	N/A	N/A	The Distribution Provider or Generator Operator <u>that detected a failure of its Interpersonal Communication capability</u> failed to consult with <u>each entity affected by the failure, as identified in Requirement R7 for a Distribution Provider or Requirement R8 for a Generator's Transmission Operator, and Balancing Authority</u> to determine a mutually agreeable action for the restoration of the Interpersonal Communication capability.
VSL Justifications – COM-001-2, R11				
NERC VSL Guidelines		Meets NERC’s VSL guidelines. This is a binary requirement and the VSL is severe.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance		The proposed requirement is new and there are no comparable existing VSLs.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language		Guideline 2a: N/A Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.		
FERC VSL G3 Violation Severity Level		The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the		

Proposed VSLs for COM-001-2, R11	
Assignment Should Be Consistent with the Corresponding Requirement	requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

## Standards Announcement Project 2006-06 Reliability Coordination

Recirculation Ballot Windows Open through 8 p.m. Monday, September 17, 2012

### Now Available

The drafting team for **COM-001-2 – Communications** has posted its consideration of comments received during a parallel formal comment period and successive ballot that ended July 11, 2012. The drafting team made the following clarifying changes to the standard:

- In Requirements R1, R3, R5, R7, R8 and R 11 the word ‘experiences’ was changed to ‘detects’. Respective changes were also made to the measures.
- In Requirement R7 the VRF was changed from high to medium.
- In Requirement R10 the word ‘respectively’ was added to connect referenced requirements to the responsible entities named in the requirement. The respective change was also made in the measure.
- In Measure M3 ‘and’ was changed to ‘or’.
- The Data Retention section was updated for readability and retention of voice recordings was added.

A recirculation ballot of COM-001-1 is open from **Thursday, September 6, 2012 through 8 p.m. Eastern on Monday, September 17, 2012.**

### Instructions

In the recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not participate in the recirculation ballot, that member’s vote cast in the previous ballot will be carried over as that member’s vote in the recirculation ballot.

Members of the ballot pool associated with this project may log in and submit their vote by clicking [here](#).

### Next Steps

If approved, the standard will be presented to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

## Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measureable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2.

Additional information is available on the [project page](#).

## Standards Development Process

The [Standards Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Project 2006-06 Reliability Coordination

### Recirculation Ballot Results

#### [Now Available](#)

A recirculation ballot of **COM-001-2 – Communications** concluded on Monday, September 17, 2012.

Voting statistics are listed below, and the [Ballots Results](#) page provides a link to the detailed results.

Approval
Quorum: 80.35%
Approval: 75.01%

#### Next Steps

The standard will be presented to the Board of Trustees in November.

#### Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measureable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to the scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standard IRO-003-2.

Additional information is available on the [project page](#).

#### Standards Development Process

The [Standards Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## **Summary of Development History**

### **Project 2007-02 – Operating Personnel Communications Protocols**

The development record for proposed Reliability Standard COM-002-4 is summarized below.

#### **I. Overview of the Standard Drafting Team**

When evaluating a proposed Reliability Standard, the Commission is expected to give “due weight” to the technical expertise of the ERO<sup>1</sup>. The technical expertise of the ERO is derived from the standard drafting team. For this project, the standard drafting team consisted of industry experts, all from a diverse set of experiences. A roster of the standard drafting team members is included in Exhibit P.

#### **II. Standard Development History**

##### **A. Standard Authorization Request (SAR) Development**

Project 2007-02- Operating Personnel Communications Protocols was initiated on March 1, 2007 as a SAR for revisions to existing standards and development of a new standard. The SAR was posted for 30-day comment period from March 15, 2007 to April 17, 2007. NERC received 23 sets of comments, including comments from sixty-nine different individuals from more than forty-five companies representing 9 of the 10 industry segments. Based on comments received, a revised SAR was posted with a solicitation for drafting team members from April 18, 2007 to May 2, 2007.

##### **B. First Posting – COM-003-1 Comment Period**

COM-003-1 was first posted for a 45-day comment period from November 30, 2009 to January 15, 2010. NERC received 71 sets of comments from more than 280 different individuals

---

<sup>1</sup> Section 215(d)(2) of the Federal Power Act; 16 U.S.C. §824(d) (2) (2012).

from over 100 companies representing nine of the 10 industry segments. In response to comments, the standard drafting team made the following changes to the draft COM-003-1

Standard:

- The three proposed defined terms (Communications Protocol, Three-part Communication and Interoperability Communication) were removed.
- The term “Operating Communication” was introduced, replacing “Interoperability Communication.”
- The requirement to have a Communications Protocol Operating Procedure was removed, based on comments that it was administrative in nature.
- Transmission Service Providers and Load Serving Entities were removed from the applicability section based on their roles and expected communications.
- Requirement R4 was modified to no longer mandate “Central Standard Time” and allowed entities to specify the time zone in the communication.
- The requirement for repeat-back of communications, Requirement R5, was modified to add the phrase “not necessarily verbatim” to address concerns regarding potential audit citations if a repeat-back was not word-for-word or verbatim.
- The requirement to use the NATO alphabet was modified to allow other alpha-numeric clarifiers to address the concern that requiring strict adherence to and precise pronunciation of the NATO phonetic alphabet is overly prescriptive, and the proposed standard should allow for other phonetic clarifiers where clarity on alpha-numeric information is necessary.

- The requirement to use pre-determined, mutually agreed upon line and equipment identifiers was modified to apply only to interface Elements, not Elements or Facilities internal to the footprint of an entity.

### **C. Second Posting – COM-003-1 Comment Period**

The second draft of the COM-003-1 standard was posted for a 45-day comment period from May 7, 2012 to June 20, 2012. NERC received 94 sets of comments from approximately 292 different individuals from approximately 166 companies representing all 10 industry segments. A common theme among many entities was that the approach to COM-003-1 should be changed. Most agreed with the comments submitted by the NERC Operating Committee that applicable entities should be required to

- a. develop written communication protocols that address the elements in COM-003-1,
- b. train on those protocols, and
- c. develop internal controls to find and correct deviances from those protocols.

In response to comments, the proposed standard was modified to use the approach suggested by the NERC Operating Committee. Additionally, the term “Operating Communication” was changed to “Operating Instruction” and modified to limit the communications that were applicable to the standard to just those that were a command to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

### **D. Third Posting – COM-003-1 Comment Period**

The third draft of the COM-003-1 standard was posted for a 30-day comment period from August 22, 2012 to September 20, 2012. NERC received 80 sets of comments from approximately 232 different individuals from approximately 141 companies representing all 10

industry segments. In response to comments, the standard drafting team made the following changes to the draft COM-003-1 Standard:

- The term “Operating Instruction” was modified to clarify the scope and intent of the term; and
- The concept of “identify, assess, and correct” introduced in the development of version 5 of the CIP standards was incorporated.

#### **E. Fourth Posting – COM-003-1 Comment Period**

The fourth draft of the COM-003-1 standard was posted for a 30-day comment period from November 14, 2012 to December 13, 2012. In response to comments, the standard drafting team made the following changes to the draft COM-003-1 Standard:

- The concept of “identify, assess, and correct” was removed.
- References to the term “Reliability Directive” were added to clarify the protocols applied to Reliability Directives and Operating Instructions.
- The requirement to use a 24 hour clock reference was modified to allow flexibility for entities to define their time specification.
- The requirement to use three part communication for all Operating Instructions was modified to allow entities the flexibility to determine when three part communication was required.
- A requirement for coordination of communication protocols among entities was added.
- A requirement for entities to develop method(s) to assess System Operators’ communication practices and implement corrective actions necessary to meet the expectations in its documented communication protocols was added.

### **F. Fifth Posting – COM-003-1 Comment Period**

The fifth draft of the COM-003-1 standard was posted for a 30-day comment period from March 7, 2013 to April 5, 2013. NERC received 78 sets of comments from approximately 215 different individuals from approximately 130 companies representing all 10 industry segments. In response to comments, the standard drafting team made the following changes to the draft COM-003-1 Standard:

- References to the term “Reliability Directive” were removed to address concerns of double jeopardy with COM-002-3.
- References to “all call” communications was removed to address concerns of double jeopardy with COM-002-3.
- The requirement for coordination of communication protocols among entities was modified to require entities to jointly develop protocols.

### **G. Sixth Posting – COM-003-1 Comment Period**

The sixth draft of the COM-003-1 standard was posted for a 30-day comment period from June 20, 2013 to July 19, 2013. NERC received 80 sets of comments from approximately 50 different organizations or individuals. Following draft 6, the standard drafting team created draft 7 as COM-002-4, a single combined standard of the Board-approved COM-002-3 Reliability Standard and proposed COM-003-1.

### **H. First Posting – COM-002-4 Comment Period**

COM-002-4 was first posted for a 14-day comment period from October 21, 2013 to November 4, 2013. NERC received 77 sets of comments from approximately 178 different individuals from approximately 115 companies representing all 10 industry segments. In

response to comments, the standard drafting team made the following changes to the draft COM-002-4 Standard:

- The definition of Operating Instruction was revised to remove the reference to Reliability Directive.
- The standard was revised to clarify that DPs and GOPs are required to train their operators prior to receiving an Operating Instruction and also use three-part communication when receiving an Operating Instruction during an Emergency.
- Requirement R1 was revised to provide more clarity, as well as provide more latitude to operating personnel issuing an Operating Instruction.
- Part 1.8 was removed, which required entities to specify which instances required alphanumeric clarifiers in their communications protocols.
- The seventh posting's Requirement R2 was removed, which required documented communications protocols for GOPs and DPs that receive Operating Instructions.
- Requirements R3 and R4 were removed and Requirements R2 and R3 were added in the eighth posting.
- The phrase "consistent pattern" was removed for the revised VRFs and VSLs.
- The VRFs and VSLs was modified to better reflect the differences in severity of violating documents requirement (*i.e.* Requirement R1), violating a training or assessment requirement (*i.e.* Requirement R2, R3 and R4) and violating a requirement when issuing or receiving an Operation Instruction during an Emergency (*i.e.* Requirements R5, R6 and R7).

## **I. Second Posting – COM-002-4 Comment Period**

The second draft of the COM-002-4 standard was posted for a 30-day public comment period from January 2, 2014 to January 31, 2014. NERC received 70 sets of comments from approximately 185 different individuals from approximately 125 companies representing all 10 industry segments. In response to comments, the standard drafting team made the following changes to the draft COM-002-4 Standard:

- Requirement R4.1 was altered from “as appropriate “ to “as deemed appropriate by the entity”
- In Measure M2 the words “its initial” was added to the sentence “shall provide its initial training records ...” in order to align the language in Measure M2 with the language in Requirement R2
- Measure M4 was altered to include the phrase “as part of its assessment” and “of any corrective actions taken” within the sentence “The entity shall provide, as part of its assessment, evidence of any corrective actions taken”
- Measure M6 and M7 were changes to add the parenthetical “(if an entity has such recording)” after the words “time-stamped recordings,” and the second entry for “time-stamped recordings” was removed due to redundancy.

## **J. Final Ballot**

Proposed Reliability Standard COM-002-4 was posted for a 10-day final ballot period from March 28, 2014 through April 7, 2014. The proposed Reliability Standard received a quorum of 78.21% and an approval of 77.62%.

## **K. Board of Trustees Approval**

Proposed Reliability Standard COM-002-4 was adopted by NERC Board of Trustees on May 6, 2014.

## Project 2007-02 Operating Personnel Communications Protocols

Related Files

**Status:**

A final ballot for **COM-002-4 - Operating Personnel Communications Protocols** concluded at **8 p.m. Eastern on Monday, April 7, 2014**. The standard achieved a quorum and received sufficient votes for approval. Voting statistics can be found via the link below. The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

**Purpose/Industry Need:**

This SAR calls for the development of communications protocols for use by Real-time System Operators to improve situational awareness and shorten response time.

**Background:**

The purpose of the proposed COM-002-4 Reliability Standard is to improve communications for the issuance of Operating Instructions with predefined communications protocols to reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the Bulk Electric System (BES). The proposed Reliability Standard, similar to posting 7, combines COM-002-3 and former draft COM-003-1 into one standard that addresses communications protocols for operating personnel in Emergency, and non-emergency conditions. The Operating Personnel Communications Protocols Standard Drafting Draft (OPCP SDT) continues to believe that one communications protocols standard that addresses emergency and non-emergency situations will improve communications because operating personnel will not need to refer to a different set of protocols during the different operating conditions.

In preparing Posting 8, the OPCS SDT revised the first draft of COM-002-4 in Posting 7 to develop a single communications standard that addresses protocols for operating personnel in Emergency and non-emergency conditions. The OPCS SDT considered the comments provided on Posting 7 and also drew from a variety of other resources including:

- The NERC Board of Trustees' November 7<sup>th</sup>, 2013 Resolution for Operating Personnel Communication Protocols, discussed below.
- A survey distributed to a sample of industry experts by the Director of Standards Development and the Standards Committee Chair requesting feedback on the draft standard in Posting 8; and
- Consultation on the use of the term "Reliability Directive" in the COM-002-4 standard with the Project 2007-03 Real-time Transmission Operations Standard Drafting Team and the Project 2006-06 Reliability Coordination Standard Drafting Team.

On December 11, 2013, the NERC Standards Committee authorized a waiver of the standard process, in accordance with Section 16 of the Standard Processes Manual, to shorten this comment period from 45 days to 30 days with a ballot during the last 10 days of the comment period to meet the NERC Board of Trustees requested deadline. The standard drafting team is posting this standard for a shortened 30 day formal Comment and 10 day Ballot period per the Standards Committee waiver.

March 19, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement: Comment Periods Open for SAR for Reliability Coordination, SAR for Operating Personnel Communications Protocols, and Relay Loadability Standard**

**The Standards Committee (SC) announces the following standards actions:**

**SAR to Modify the Reliability Coordinator Standards (March 19–April 17, 2007)**

The Reliability Coordination SAR drafting team posted the second draft of its SAR for [Project 2006-06](#) for a 30-day comment period from March 19 through April 17, 2007.

The SAR proposes retiring, modifying or moving to other standards the Reliability Coordinator requirements contained within a set of ten already approved standards. The purpose of making these modifications is to ensure that the remaining requirements are clear, measurable, unique and enforceable; and to ensure that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. This project also involves addressing concerns raised by FERC and stakeholders and involves bringing the set of standards into conformance with the ERO Rules of Procedure and the latest version of the Reliability Standards Development Procedure. Please use the [comment form](#) to provide comments on this SAR.

**SAR for Project 2007-02 Operating Personnel Communications Protocols (March 19–April 17, 2007)**

The Operating Personnel Communications Protocols SAR for [Project 2007-02](#) is posted for a 30-day comment period from March 19 through April 17, 2007.

This SAR calls for the development of communications protocols for use by real-time system operators to improve situational awareness and shorten response time. The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Please use the [comment form](#) to provide comments on this SAR.

**Transmission Relay Loadability Standard (March 19–April 17, 2007)**

The [Transmission Relay Loadability](#) drafting team posted the third draft of its standard for a 30-day comment period from March 19 through April 17, 2007. The drafting team is seeking comments on a change in the requirements that assigns responsibility for identifying certain critical facilities to the planning coordinator, in support of the latest approved version of the [Functional Model](#).

The standard codifies the relay loadability criteria embodied in the NERC Recommendation 8a, *Improve System Protection to Slow or Limit the Spread of Future Cascading Outages*, and U.S.–Canada Power System Outage Task Force Recommendation 21A, *Make More Effective and*

*Wider Use of System Protection Measures.* Please use the [comment form](#) to provide comments on this standard.

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

## Standard Authorization Request Form

Title of Proposed Standard:	Operating Personnel Communications Protocols
Request Date:	March 1, 2007

### ***SAR Requester Information***

Name: <b><i>Harry Tom - to be replaced with SAR drafting team chair when SAR drafting team is appointed.</i></b>	<b><i>SAR Type (Check one box.)</i></b>
Company: NERC	<input checked="" type="checkbox"/> New Standard
Telephone: 609-452-8060	<input checked="" type="checkbox"/> Revision to Existing Standard
Fax: 609-452-9550	<input type="checkbox"/> Withdrawal of Existing Standard
E-mail: harry.tom@nerc.net	<input type="checkbox"/> Urgent Action

**Purpose** (Describe the purpose of the proposed standard – what the standard will achieve in support of reliability.)

Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The purpose of revising and expanding the existing requirements that address real-time system operator communications is to:

1. Provide an adequate level of reliability for the North American bulk power systems – by ensuring that the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure the standard or standards are enforceable as mandatory reliability standards with financial penalties – the applicability to bulk power system owners, operators, and users, are clearly defined; the purpose, requirements, and measures are results-focused and unambiguous; the consequences of violating the requirements are clear.
3. Consider other general improvements described in the standards development work plan.
4. Consider stakeholder comments received during the initial development of the standards and other comments received from Electric Reliability Organization (ERO) regulatory authorities, as noted in the attached review sheets.
5. Satisfy the standards procedure requirement for five-year review of the standards.

**Industry Need** (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

**Brief Description** (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers.

Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

The project may involve moving some requirements that address communications protocols from existing standards into this new standard and will involve adding new requirements that more fully address communications protocols under various operating scenarios.

## Reliability Functions

<b>The Standard will Apply to the Following Functions</b> (Check all applicable boxes.)		
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input checked="" type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input type="checkbox"/>	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
<input type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
<input type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input checked="" type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input checked="" type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input checked="" type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input type="checkbox"/>	Market Operator	Interface point for reliability functions with commercial functions.

## **Reliability and Market Interface Principles**

<b>Applicable Reliability Principles</b> (Check all boxes that apply.)	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
<input type="checkbox"/>	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
<input type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input type="checkbox"/>	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
<input type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
<b>Does the proposed Standard comply with all of the following Market Interface Principles?</b> (Select 'yes' or 'no' from the drop-down box.)	
Recognizing that reliability is an essential requirement of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes	

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

### **Scope**

The scope of the proposed standard or revised standards is to establish a common lexicon of communications protocols and communications paths such that all operators and users of the North American bulk electric system have the same understanding as to its meaning, usage and take pre-determined action in response. The August 2003 Blackout Recommendation Number 26 calls for a tightening of communications protocols. This standard is to ensure that effective communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities. References to communication protocols in other NERC Standards may be moved to this new standard.

### **Applicability**

Medical, law enforcement, air traffic control and other fields routinely use mutually defined and understood terminology or codes. Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.

Communications protocols shall precisely define terms, codes, phrases, words, etc. as to their connotation, conditions for use, context of use and expected responses in reply to these terms, codes, phrases, words, etc. Furthermore the protocols shall define a rigorous script for the Sender and Receiver of information. Effective communications with proper communications protocols among the operating entities are essential for maintaining reliable system operations.

The standard will include requirements for the following:

1. Real-time system operators will be required to use specific communications protocols under normal, abnormal and emergency conditions to quickly relay critical reliability-related information.
2. Reliability Coordinators, Balancing Authorities, Generation Operators, Transmission Operators and Distribution Providers will be required to adopt and employ directives that use pre-defined terms, and will require entities that receive those directives to respond to the reliability coordinator using pre-defined terms.
3. The standard will include requirements for entities that experience abnormal conditions to use pre-defined terms to communicate the operating situation to other entities that are in a position to either assist in resolving the operating situation or to entities that are impacted by the operating situation.
4. The standard may include other requirements that involve communications protocols for real-time system operators.

The standard should consider the FERC staff's Preliminary Assessment of NERC Standards (dated May 11, 2006) in which the FERC staff cited

various Blackout Report excerpts pertaining to ineffective communications as a factor common to the August 14 blackout and other previous major outages in North America. The Commission staff interprets Blackout Report recommendation #26 that urges "effective communications" with "tightened communications protocols" among operating entities to include two key components:

- (i) Effective communications that are delivered in clear language via pre-established communications paths among pre-identified operating entities, and
- (ii) Communications protocols which clearly identify that any operating actions with reliability impact beyond a local area or beyond a Reliability Coordinator's area must be communicated to the appropriate Reliability Coordinator for assessment and approval prior to their implementation to ensure reliability of the interconnected systems.

The communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

## ***Related Standards***

<b><i>Standard No.</i></b>	<b><i>Explanation – these requirement may need to be modified or moved to the new standard</i></b>
COM-001-1	R4 is a requirement for the Reliability Coordinator's, Transmission Operator's, and Balancing Authority's real-time operating personnel to use English when communicating between entities.
COM-002-2	R1.1 is a requirement for the Balancing Authority and Transmission Operator to make notifications when there is a threat to reliability. R2 is a requirement for the Reliability Coordinator, Transmission Operator and Balancing Authority relative to issuing and receiving operating directives.
EOP-001-9	R4.1 includes a requirement for the Transmission Operator and Balancing Authority to have communications protocols for use during emergencies
EOP-002-2	R6.5 and R7.2 require the Balancing Authority to ask the Reliability Coordinator to declare an Energy Emergency or an Energy Emergency Alert under certain conditions R8 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions R9.1 requires the Load-serving Entity to ask the Reliability Coordinator to declare an Energy Emergency Alert under certain conditions
EOP-006-1	R4 requires the Reliability Coordinator to disseminate information regarding restoration to neighboring Reliability Coordinators and Transmission Operators or Balancing Authorities R5 requires the Reliability Coordinator to approve, communicate, and coordinate the re-synchronizing of major system islands or synchronizing points
CIP-001-1	R1 and R2 require operating entities to have procedures for communicating information relative to sabotage of bulk power system facilities
CIP-008-1	R1.2 requires the responsible entity to have a communication plan for response to a cyber security incident
IRO-001-1	R3 requires the Reliability Coordinator to direct entities to act and R8 requires entities to respond to the Reliability Coordinator's directives
IRO-004-1	R6 requires the Reliability Coordinator to direct entities to act and R7 requires entities to respond to the Reliability Coordinator's directives
IRO-005-2	R4 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions R3, R5, R8, R11, F15, and R17 require the Reliability Coordinator to direct actions to alleviate various types of abnormal or emergency situations
IRO-014-1	R1.1 requires Reliability Coordinators to have procedures processes or plans that address communications and notifications made between Reliability Coordinators under various operating scenarios
PRC-001-1	R6 requires the Transmission Operator and Balancing Authority to make notifications when there is a change in the status of a special protection system
TOP-001-1	R3 requires some responsible entities to comply with the Reliability Coordinator's and Transmission Operator's directives R4 requires some responsible entities to comply with the Transmission Operator's directives R5 requires the Transmission Operator to notify its Reliability Coordinator of certain emergency situations

TOP-002-2	R14, R16 and R17 require responsible entities to notify their Reliability Coordinator of various changes to operating parameters R18 requires the use of uniform line identifiers when referring to transmission facilities of an interconnected network
TOP-007-0	R1 requires the Transmission Operator to notify its Reliability Coordinator when it exceeds an SOL or IROL R4 requires the Reliability Coordinator to direct entities to take actions to restore the system to within SOLs or IROLs
TOP-008-1	R3 requires the Transmission Operator to make notifications if it disconnects an overloaded facility
VAR-001-1	R8 and R12 require the Transmission Operator to direct actions to maintain voltage within limits and to prevent voltage collapse
VAR-002-1	R2.2 and R5.1 require the Generator Operator to comply with directives Rr3 requires the Generator Operator to notify the Transmission Operator of various status or capability changes

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement: Comment Periods Open for SAR for Reliability Coordination, SAR for Operating Personnel Communications Protocols, and Relay Loadability Standard**

**The Standards Committee (SC) announces the following standards actions:**

**SAR to Modify the Reliability Coordinator Standards (March 19–April 17, 2007)**

The Reliability Coordination SAR drafting team posted the second draft of its SAR for [Project 2006-06](#) for a 30-day comment period from March 19 through April 17, 2007.

The SAR proposes retiring, modifying or moving to other standards the Reliability Coordinator requirements contained within a set of ten already approved standards. The purpose of making these modifications is to ensure that the remaining requirements are clear, measurable, unique and enforceable; and to ensure that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. This project also involves addressing concerns raised by FERC and stakeholders and involves bringing the set of standards into conformance with the ERO Rules of Procedure and the latest version of the Reliability Standards Development Procedure. Please use the [comment form](#) to provide comments on this SAR.

**SAR for Project 2007-02 Operating Personnel Communications Protocols (March 19–April 17, 2007)**

The Operating Personnel Communications Protocols SAR for [Project 2007-02](#) is posted for a 30-day comment period from March 19 through April 17, 2007.

This SAR calls for the development of communications protocols for use by real-time system operators to improve situational awareness and shorten response time. The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Please use the [comment form](#) to provide comments on this SAR.

**Transmission Relay Loadability Standard (March 19–April 17, 2007)**

The [Transmission Relay Loadability](#) drafting team posted the third draft of its standard for a 30-day comment period from March 19 through April 17, 2007. The drafting team is seeking comments on a change in the requirements that assigns responsibility for identifying certain critical facilities to the planning coordinator, in support of the latest approved version of the [Functional Model](#).

The standard codifies the relay loadability criteria embodied in the NERC Recommendation 8a, *Improve System Protection to Slow or Limit the Spread of Future Cascading Outages*, and U.S.–Canada Power System Outage Task Force Recommendation 21A, *Make More Effective and*

*Wider Use of System Protection Measures.* Please use the [comment form](#) to provide comments on this standard.

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

## **Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols**

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The scope should be limited to communications between entities and should not prescribe communication protocols for communication within an organization. Intra-company communications are most appropriately addressed by interal policies and procedures tailored to an entity's specific needs and characteristics.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: Scope should be limited to communication among separate entities/organizations. For example, the standard should not address communication protocols between a Balancing Authority, Generaotr Operator and a Distribution Provider tha are the same corporate entity. The requirement to maintain situational awareness within a given entiy is addressed by other standards.

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: There is no doubt that during alerts and emergencies, both parties in communication require a common definition. To the extent the standard requires neighboring BAs, TOs and RCs to use the same word with the same meaning, then the scope of the proposed standard makes sense. However, as written the standard appears to indicate the kind of scripting that is better suited to selling magazines from a boiler room. No defined protocol can match every situation. And if in fact that was even a goal, the operators would have the time-consuming task of identifying which script currently was needed when their time would be better spent resolving the situation.

The SAR also proposes that any reliability impacts beyond a Reliability Coordinator's area must be coordinated and approved by the impacted Reliability Coordinator. Clearly, if time permits, this coordination is appropriate. However, in an emergency, the RC may have to use independent judgement.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The SAR needs further clarification before it is moved into the next stage. The SAR should identify at a minimum the words and procedures that the SDT is going to consider for a reliability standard.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The SAR should be expanded to include local control center's system operators.

See our comments to question 3.

The SAR should specify how each of the identified standards will be addressed through this process.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: Issue 1:

The recommendation from the blackout report is overly broad and vague. Tightening does not sound like a complete overhaul but rather tweaking the existing protocols and documenting them if they are informal. This may not even require a standard across all functional entities. TOPs and BAs in a given region have long history of communication and differing terms are already understood. However, for communications that occur between regional areas, there may be a need for common terms.

ATC does not agree with the concept of a rigorous script for communications. This may sound like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained operators to make decisions when new operational situations occur.

Issue 2:

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

The SAR needs to include local control center's system operators. The inclusion of this group of system operators will not be simple because local control centers are not an identified entity in NERC's functional model. Never the less if the SDT is going to create a common lexicon and procedures it's important that these system operators are required to follow the standard. ATC believes that the purpose behind this SAR would be better address through NERC's CEH program then through reliability standards.

SAR Scope:

"The scope of the proposed standard or reviewed standards is to establish a common lexicon of communications protocols and communications paths such that all operators and users of the North American bulk electric system have the same understanding as to its meaning, usage and take pre-determined action in response."

PER FERC Final Rule RM06-

"1343. Clearly, in a region where an RTO or ISO performs the transmission operator function, its personnel with primary responsibility for real-time operations must receive formal training pursuant to PER-002-0. IN addition, personnel who are responsible for implementing instructions at a local control center also affect the reliability of the Bulk Power System. These entities may take independent action under certain circumstances, for example, to protect assets, personnel safety and during system restorations. Whether the RTO or the local control center is ultimately responsible for compliance is a separate issue addressed above, but regardless of which entity registers for that responsibility, these local control center employees must receive formal training consistent with their roles, responsibilities and tasks. Thus, while we direct the ERO to develop modifications to PER-002-0 to include formal training for local control center personnel, that training should be tailored to the needs of the positions."

"1345. Another organization structure, typically representative of relative smaller entities, consists of a single control center that implements operating instructions from its transmission operator, e.g., an RTO, ISO or pooled resources. Similar to the discussion above, operators at these control centers also may take independent action to protect assets, safety and system restoration. Such control center personnel must also receive formal training pursuant to PER-002-0."

Because NERC has been order to create training plans for local control center's system operator any common lexicon and communications protocols could be dealt with for all entities most effectively in NERC's CEH program.

**4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments:

**5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments: Non identified

5. **Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments: No additional comments

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

Please use this form to submit comments on the proposed SAR for Operating Personnel Communications Protocols. Comments must be submitted by **April 17, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.net](mailto:sarcomm@nerc.net) with the abbreviation "Protocols" in the subject line. If you have questions please contact **Harry Tom** at [Harry.Tom@nerc.net](mailto:Harry.Tom@nerc.net) or by telephone at 609-452-8060.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: CECD believes there is a reliability reason for establishing a set of communication protocols.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: CECD agrees with the scope, however, CECD would caution that pre-defined action in response to grid operations would need to be broad enough to allow the flexibility that is required by a diverse system. The statement that raises this concern in the Scope is the first sentence which states, the scope of the proposed standard or revised standards is to establish a common lexicon of communications protocols and communication paths such that all operators and users of the North American bulk electric system have the same understanding as to its meaning, usage and take pre-determined action in response. The standard should focus on the communication paths, pre-determined contacts (regular communication/testing), the applicable language and the terminology but not necessarily a specific action.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments:

## **Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols**

---

We have the following suggestions concerning this SAR:

1. The use of the phrase “communications protocols” is not the best choice of labels for the purposes at hand because of the widespread and multi-faceted use of this phrase in the field of data communications. As an alternative we would recommend using the term “communication procedures”.
2. The scope of this standard should be constrained to inter-operator human communications vocabulary solely about the bulk electric system. A different SAR should be written for cyber communication standards.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: HQT supports establishing communication protocols to define consistent emergency determinations. However, the standard should not extend to establishing pre-defined scripts that operators must follow in their communications without the element of judgement and discussion that are needed in such situations.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: See response Question #1.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The scope of the SAR is too broad and too prescriptive. The Applicability section of the SAR where it states "... the protocol shall define a rigorous script for the Sender and Receiver of information..." is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: We are concerned that the scope of "... the protocol shall define a rigorous script for the Sender and Receiver of information" is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments:

5. **Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments:

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: ISO New England supports establishing communication protocols to define consistent emergency determinations. However, the standard should not extend to establishing pre-defined scripts that operators must follow in their communications without the element of judgement and discussion that are needed in such situations.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: See response Question #1.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments: No others.

5. **Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: Not to the extent this SAR is addressing itself. The Black Out Report is overly broad and vague regarding this issue. This SAR would make more sense if it were addressing itself to tightening existing protocols and documenting them between entities. The way this SAR has been presented, pre-defined terms would have to be developed. Who would be responsible to determine what these pre-defined terms would be and would the terms be applicable to all operating entities? Adjacent operating entities have a long history of communicating and differing terms are understood.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The SAR description suggests establishment of "protocols shall define a rigorous script" to be followed. It would be impracticable to presume to think through every operating condition that scripting would require. Although the notion of everyone using the same terms or phrases sounds good, the development of such an operating "dictionary" is not practicable. Who will be the final word on terminology the industry must adopt that changes the way in which operating entities have described their adopted practices and procedures for decades?

The scope of the SAR should limit itself to the principles of effective communication for operating entities to follow and not so prescriptive such as pre-definition of terms. Operating entities are smart enough to be able to use effective communication principles in a standard to determine and document communication protocols and terminology between them that provides effective communication. The same should apply between Reliability Coordinators. Follow the basic standards development: a standard should not say how something should be done, it should say what the required outcome should be.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

- 1. Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

- 2. Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The scope of this SAR is much to far reaching. It appears that the intention is for the this Standard to reach into the intra region operation. This could become a safety issue as Utility Safety Rule Books could be in conflict with terminology being proposed by the standard writer. Getting this standard accepted by the industry at large will be a major hurdle to jump.

- 3. The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

- 4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments: If it is the intention of the standard writer to re write these requirements into scripts than we see problems, especially if it is intended to push these scripts into the entities' intra region operating procedures.

- 5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

## **Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols**

---

Comments: We believe that there is a need to clean up the communication protocol in as far as full name identification of all parties for all communications between entities and three part communication: the sender giving the information or direction, the receiver repeating the information or direction back as to his understanding, and the receiver confirming or correcting the repeated statement. If there is a correction than the process is repeated.

A glossary of terms for industry standard operating terms is essential. This glossary with input from the entities should be an integral part of this SAR.

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

- 1. Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

- 2. Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The recommendation from the blackout report is overly broad and vague. Tightening does not sound like a complete overhaul but rather tweaking the existing protocols and documenting them if they are informal. This may not even require a standard across all functional entities. For instance, establishing a common lexicon makes sense at face value; however, it may not be needed for communications between neighboring BAs. BAs and TOPs in a given region have long history of communication and differing terms are already understood. However, for communications that occur between regional areas, there may be a need for common terms.

We do not agree with the concept of a rigorous script for communications. This sounds like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained (yes there is a training standard) operators to make decisions when new operational situations occur.

The SAR also proposes that any reliability impacts beyond a Reliability Coordinator's area must be coordinated and approved by the impacted Reliability Coordinator. This is certainly a laudable goal but is not reasonable in all cases. If there is an IROL violation in RC A's area and the action the RC would take would impact the area of RC B, RC A could not take action until RC B approved the action. Let's assume the impact on RC B is that a small load would be radialized when RC A opens a circuit to correct the IROL. This seems like a small risk to subject to RC B since the action will immediately correct the IROL. After the IROL is corrected, then RC A and RC B could begin determining other options. With the proposed language in the SAR, RC A would have violated this standard even though they eliminated that risk of more widespread outages.

- 3. The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

Comments: We agree that these functional entities should be considered for applicability; however, it is possible that the final standard should not apply to all of them. Further examination of the reason for the recommendation of the from the blackout report would help determine this.

- 4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: .

The scope need not be so expansive , it should start at a high level with no scripted message.

We do not agree with the concept of a rigorous script for communications. This sounds like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained (yes there is a training standard) operators to make decisions when new operational situations occur.

The Communication Training can be made part of Operator Training Procedures.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: We agree that these functional entities should be considered for applicability; and in addition it should apply to Interchange Coordinator Function.

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications: EOP-001-0 Attachment 1

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

Comments:

**5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments: Proof of the pudding is in tightly defining the Requirements and stipulating the Severity Levels and VRFs accurately so that the penalties are commensurate with the severity level and the VRF.

Is there a consistent methodology between IRO-014-1 R1.1 footnote 1 and CIP-008-1 R1.2?

Is IRO-001-1 R3 a repeat of IRO-005-2 R3?

There is an overlapping request for requirements for communication facilities for use during emergencies. These requests are made in this SAR (Operating Personnel Communications Protocols Project 2007-02) and in the SAR for Project 2006-06 Reliability Coordination-Attachment 1. Perhaps both the associated drafting teams could work together so that there are no overlapping requirements among developed standards. We do not see the purpose behind not including the recommendation regarding the upgrade to communication system hardware in this SAR. This SAR should include , if need be, the recommendations to upgrade communication system hardware.

### Background Information

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: NPCC participating members agree with the need to establish communication protocols to define consistent emergency determinations. However, the standard should not extend to establishing pre-defined scripts that operators must follow in their communications without the element of judgement and discussion that are needed in such situations.

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: See our comments to question 1

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments:

4. **The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

Comments: No others.

5. **Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments: NPCC participating members agree with the concepts in the SAR.

1. **Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: see comment in #2

2. **Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The NYISO is concerned that the scope of "... the protocol shall define a rigorous script for the Sender and Receiver of information" is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

Comments: The PSCSC believes the SAR should specifically acknowledge the power and effectiveness of three-part communications in ensuring common understanding of verbal exchanges. Three-part communications include the sender giving the information, the receiver repeating the information back, and the sender acknowledging the correctness of the repeated information. This form of communication is used in nuclear plant

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

### **Background Information**

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

This SAR proposes developing a set of standardized communication protocols for system operators to use during normal and emergency operations to improve situational awareness and shorten response time.

The requirements for communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards.

Please review the SAR and then answer the questions on the following page.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

- 1. Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: If all Owners, Operators, and Users of the Bulk Electric system adhered to the current NERC standards (and previous Operating Policies), we do not believe this standard would be necessary. However, we understand that this SAR is an attempt to make it very clear what is expected of a RC, TOP, BA, GO, and DP in way of communications during emergency situations.

We feel that this communication protocol should be only applicable under the current EEA Level 1 and above state or with the new Transmission Emergency state currently being developed.

- 2. Do you agree with the scope of the proposed standard?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: As mentioned in the answer to question #1, we feel it should be applicable for EEA Level 1 and above or with the new Transmission Emergency state currently being developed.

- 3. The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: However, there is only one "real time" requirement that is applicable to the DP. It is contained in TOP-001-1, R4.

- 4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications: IRO-016-1, R1

Comments: We do not recommend bringing the requirement over to this SAR. It is better to leave in the IRO standards.

## Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

---

**5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments:

\*Under FERC staff's Preliminary Assessment contained on page 7 of the SAR (items i and ii), item ii should not be addressed in this SAR. There are numerous requirements in the IRO standards already that adequately cover communications to other RCs for situations in which a reliability impact may go beyond a RC's area of view. In particular, the following standard requirements address the 2<sup>nd</sup> part (ii): IRO-001-1, Req. 7; IRO-003-2, Req.1; IRO-004-1, Req.2; IRO-014-1, Req.1,2,3; IRO-015-1, Req.1,2; IRO-016-1, Req.1;

\*If the SAR drafting team removes the requirements of the standards referenced in the "Related Standards" section of this SAR and move them to this SAR, it will become difficult for a Reliability Coordinator to know where to go for standards applicable to them. For example, currently most of the requirements related to real time actions taken by a RC are contained in the IRO standards. If the 4 IRO standard requirements are removed from the IRO standards and placed into this SAR, the RC system operators will now have to refer to more standards to find requirements related to their responsibilities. This same scenario also applies to the other standard drafting teams who are considering the same actions.

It would be helpful if NERC were to provide on the Standards Homepage a listing of standards by Function: RC, BA, TOP, etc. Then the RC could review the RC function and know all standards that are applicable to them in a quick and easy fashion.

## **Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols**

---

Comments: The SAR is a proposal for protocols to be used over "pre-established communications paths". This is good as far as it goes. When Operations sits down to write up these protocols with their peers, I recommend that they have a Communications person from at least one of the utilities on the panel to initially clearly delineate what the recommended path(s) are between the subject utilities. This will be based on use of private systems first with the possibility of widespread unavailability of commercial services, etc.

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: While the WECC RCCWG agrees in general with the scope of the proposed standard, the work group has some questions and comments regarding terms used in the scope. The scope of the SAR may be widened to "establish and implement a lexicon of communications protocols and communications paths." Please define "communication path" as used in the scope - is this the expected communications between entities as opposed to the actual physical paths of those communications? Additionally, there is a general comment that establishment of a lexicon does not, in itself ensure pre-determined action as noted in the scope. What type of pre-determined actions are expected, operating or communications?

3. **The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability?**

Yes

No

**If "No," please explain why in the comment area below and provide supporting information.**

Comments: The WECC RCCWG generally agrees, but some questions remain. The standard will apply to TO, BA, GO, DP; however, the SAR (Applicability Section #2) states that all those entities "will be required to adopt and employ directives that use pre-defined terms, and will require entities that receive those directives to respond to the reliability coordinator using pre-defined terms." Entities that receive those directives should respond to the entity issuing the directives using pre-defined terms. Additionally, the WECC RCCWG believes that the SAR drafting committee should consider adopting the term "directive" for reliability coordinator issue only and adopt another term, such as "operating instructions" for those actions directed by other than the reliability coordinator to distinguish between the two terms.

## **Comment Form — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols**

---

- 4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.**

The following list of requirements involves the issuing or receipt of real-time communications:

- 5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.**

Comments:

## **Consideration of Comments on First Draft of SAR for Operating Personnel Communications Protocols**

The Operating Personnel Communications Protocols SAR requesters thank all commenters who submitted comments on Draft 1 of the Communications Protocols SAR. This SAR was posted for a 30-day public comment period from March 15 through April 17, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 23 sets of comments, including comments from 69 different people from more than 45 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received, the drafting team is recommending the SAR be submitted to the Standards Committee for authorization to proceed to the standard drafting step. The SAR was not materially changed. The description of the SAR scope was re-written to convey the intent of the standard more clearly.

In this “Consideration of Comments” document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

[http://www.nerc.com/~filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/~filez/standards/Op_Comm_Protocol_Project_2007-02.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at 609-452-8060 or at [gerry.adamski@nerc.net](mailto:gerry.adamski@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedure manual: <http://www.nerc.com/standards/newstandardsprocess.html>.

## Consideration of Comments — 1<sup>st</sup> Draft of SAR for Operating Personnel Communications Protocols

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

1. Do you believe that there is a reliability-related need to establish a set of communications protocols to improve situational awareness and shorten response time? If "No," please explain why.

**Summary Consideration:** The majority of comments indicate that there is a reliability need for this SAR. Many comments took issue with the phrase "pre-defined scripts" and the SAR DT has re-written the SAR scope description to clarify that it is not the intent of the standard to require an extensive list of scripts to be used for all operating conditions. The SAR DT intent is for the Standard DT to develop requirements for communications protocols that include essential elements such that when applied, information is efficiently conveyed and mutually understood.

Commenter	Yes	No	Comment
			communicating and differing terms are understood.
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

2. Do you agree with the scope of the proposed standard? If “No,” please explain why

**Summary Consideration:** Many commenters expressed concern with “pre-defined scripts”. The SAR DT did not intend to prescribe scripts for all possible conditions, and the SAR DT has re-written the SAR’s description to clarify that it is not the intent of the standard to require an extensive list of scripts to be used for all operating conditions but rather for the Standard DT to develop requirements for communications protocols that include essential elements such that when applied, information is efficiently conveyed and mutually understood.

There was a comment that the standard should apply to “local control centers”. The SAR DT noted that although the system operators who work in local control centers operate under the direction of a TOP or RC, the local control center is typically owned and operated by the Transmission Owner. The SAR DT has added the functional entity of Transmission Owner as an applicable entity to give the standard DT maximum flexibility to do their work.

Question #2			
Commenter	Yes	No	Comment
BPA	<input checked="" type="checkbox"/>		
Entergy Services	<input checked="" type="checkbox"/>		
FirstEnergy	<input checked="" type="checkbox"/>		
PSC of South Carolina	<input checked="" type="checkbox"/>		
<p><b>Response:</b> The SAR DT acknowledges the commenters’ affirmative response to this question and appreciates their submission.</p>			
Southern Company Transmission	<input checked="" type="checkbox"/>		As mentioned in the answer to question #1, we feel it should be applicable for EEA Level 1 and above or with the new Transmission Emergency state currently being developed.
<p><b>Response:</b> The SAR DT believes that communications protocols that enable information to be efficiently conveyed and mutually understood are necessary under all operating conditions and not only during emergency or abnormal operating conditions.</p>			
Constellation	<input checked="" type="checkbox"/>		CECD agrees with the scope, however, CECD would caution that pre-defined action in response to grid operations would need to be broad enough to allow the flexibility that is required by a diverse system. The statement that raises this concern in the Scope is the first sentence which states, the scope of the proposed standard or revised standards is to establish a common lexicon of communications protocols and communication paths

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

<b>Question #2</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			such that all operators and users of the North American bulk electric system have the same understanding as to its meaning, usage and take pre-determined action in response. The standard should focus on the communication paths, per-determined contacts (regular communication/testing), the applicable language and the terminology but not necessarily a specific action.
<b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.			
WECC RCCWG	<input checked="" type="checkbox"/>		While the WECC RCCWG agrees in general with the scope of the proposed standard, the work group has some questions and comments regarding terms used in the scope. The scope of the SAR may be widened to "establish and implement a lexicon of communications protocols and communications paths." Please define "communication path" as used in the scope - is this the expected communications between entities as opposed to the actual physical paths of those communications? Additionally, there is a general comment that establishment of a lexicon does not, in itself ensure pre-determined action as noted in the scope. What type of pre-determined actions are expected, operating or communications?
<b>Response:</b> The SAR DT defines communications path as the means/method used to communicate. The SAR DT does not intend to prescribe which means/method to use but that one is in place. Pre-determined actions are previously agreed upon communication actions taken in response to specific operating conditions.			
Hydro-Québec TransÉnergie	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	See response to Question #1.
IESO	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	The scope of the SAR is too broad and too prescriptive. The Applicability section of the SAR where it states "... the protocol shall define a rigorous script for the Sender and Receiver of information..." is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.
ISO-NE	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	See response to Question #1.
NPCC CP9	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	See our comments to Question #1.

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

Question #2			
Commenter	Yes	No	Comment
<p><b>Response:</b> The SAR’s detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT’s intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			
Ameren Services		<input checked="" type="checkbox"/>	<p>There is no doubt that during alerts and emergencies, both parties in communication require a common definition. To the extent the standard requires neighboring BAs, TOs and RCs to use the same word with the same meaning, then the scope of the proposed standard makes sense. However, as written the standard appears to indicate the kind of scripting that is better suited to selling magazines from a boiler room. No defined protocol can match every situation. And if in fact that was even a goal, the operators would have the time-consuming task of identifying which script currently was needed when their time would be better spent resolving the situation.</p> <p>The SAR also proposes that any reliability impacts beyond a Reliability Coordinator's area must be coordinated and approved by the impacted Reliability Coordinator. Clearly, if time permits, this coordination is appropriate. However, in an emergency, the RC may have to use independent judgment.</p>
<p><b>Response:</b> The SAR’s detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT’s intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p> <p>The coordination between RC and TOP/BA is addressed in a separate project 2006-6 Reliability Coordination and is not part of this SAR.</p>			
ATC LLC		<input checked="" type="checkbox"/>	<p>The SAR should be expanded to include local control center’s system operators.</p> <p>See our comments to question 3.</p> <p>The SAR should specify how each of the identified standards will be addressed through this process.</p>
<p><b>Response:</b> The SAR DT believes that while “local control centers” are under the purview of either a Transmission Operator/Balancing Authority or Distribution Service Provider the SAR DT have added the functional entity of Transmission Owner as an applicable entity to give the standard DT maximum flexibility to do their work.</p>			
ERCOT		<input checked="" type="checkbox"/>	<p>There may be a need for pre-defined terms, however we do not agree with the concept of a rigorous script for communications. It would not be possible to identify every operational situation.</p>
<p><b>Response:</b> The SAR’s detailed description was revised to delete the sentence that indicated the standard would require</p>			

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #2			
Commenter	Yes	No	Comment
<p>scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			
IRC SRC		<input checked="" type="checkbox"/>	<p>We are concerned that the scope of "... the protocol shall define a rigorous script for the Sender and Receiver of information" is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.</p>
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			
ITC Transco		<input checked="" type="checkbox"/>	<p>The SAR scope needs to be clear in that it refers to specific protocols for communication, and not to "scripted" responses for every situation. Although the SAR discusses the use of protocols, other context of the remaining passages in the SAR lead one to believe otherwise.</p>
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			
KCPL		<input checked="" type="checkbox"/>	<p>The SAR description suggests establishment of "protocols shall define a rigorous script" to be followed. It would be impracticable to presume to think through every operating condition that scripting would require. Although the notion of everyone using the same terms or phrases sounds good, the development of such an operating "dictionary" is not practicable. Who will be the final word on terminology the industry must adopt that changes the way in which operating entities have described their adopted practices and procedures for decades?</p> <p>The scope of the SAR should limit itself to the principles of effective communication for operating entities to follow and not so prescriptive such as pre-definition of terms. Operating entities are smart enough to be able to use effective communication principles in a standard to determine and document communication protocols and terminology between them that provides effective communication. The same should apply between Reliability Coordinators. Follow the basic standards development: a standard should not say how something should be done, it should say what the required outcome should be.</p>
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

Question #2			
Commenter	Yes	No	Comment
Manitoba Hydro		<input checked="" type="checkbox"/>	<p>The scope of this SAR is much to far reaching. It appears that the intention is for the this Standard to reach into the intra region operation. This could become a safety issue as Utility Safety Rule Books could be in conflict with terminology being proposed by the standard writer. Getting this standard accepted by the industry at large will be a major hurdle to jump.</p> <p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p> <p>The coordination between RC and TOP/BA is addressed in a separate NERC Project 2006-6 entitled Reliability Coordination and is not part of this SAR.</p> <p>It is not the intent of the standard to define terms that may conflict with other programs but rather to prescribe essential elements (not necessarily specific terms) in communications protocols such that information is efficiently conveyed and mutually understood.</p>
Midwest SCG		<input checked="" type="checkbox"/>	<p>The recommendation from the blackout report is overly broad and vague. Tightening does not sound like a complete overhaul but rather tweaking the existing protocols and documenting them if they are informal. This may not even require a standard across all functional entities. For instance, establishing a common lexicon makes sense at face value; however, it may not be needed for communications between neighboring BAs. BAs and TOPs in a given region have long history of communication and differing terms are already understood. However, for communications that occur between regional areas, there may be a need for common terms.</p> <p>We do not agree with the concept of a rigorous script for communications. This sounds like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained (yes there is a training standard) operators to make decisions when new operational situations occur.</p> <p>The SAR also proposes that any reliability impacts beyond a Reliability Coordinator's area must be coordinated and approved by the impacted Reliability Coordinator. This is certainly a laudable goal but is not reasonable in all cases. If there is an IROL violation in RC A's area and the action the RC would take would impact the area of RC B, RC A could not take action until RC B approved the action. Let's assume the impact on RC B is</p>

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #2			
Commenter	Yes	No	Comment
			that a small load would be radialized when RC A opens a circuit to correct the IROL. This seems like a small risk to subject to RC B since the action will immediately correct the IROL. After the IROL is corrected, then RC A and RC B could begin determining other options. With the proposed language in the SAR, RC A would have violated this standard even though they eliminated that risk of more widespread outages.
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p> <p>The coordination between RC and TOP/BA is addressed in a separate NERC Project 2006-6 entitled Reliability Coordination and is not part of this SAR.</p>			
MRO Members		<input checked="" type="checkbox"/>	<p>The scope need not be so expansive , it should start at a high level with no scripted message.</p> <p>We do not agree with the concept of a rigorous script for communications. This sounds like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained (yes there is a training standard) operators to make decisions when new operational situations occur.</p> <p>The Communication Training can be made part of Operator Training Procedures.</p>
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p> <p>The SAR DT agrees that training is essential.</p>			
NYISO		<input checked="" type="checkbox"/>	<p>The NYISO is concerned that the scope of "... the protocol shall define a rigorous script for the Sender and Receiver of information" is too prescriptive yet not exhaustive enough to cover all situations. We support the notion of defining standard terms to be used in operation personnel communication, but do not believe predetermined script is required in every communication situation, nor do we think it is possible to have a set of scripts that covers all possible cases.</p>
<p><b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			

## Consideration of Comments — SAR for Operating Personnel Communications Protocols

---

Question #2			
Commenter	Yes	No	Comment
We Energies		<input checked="" type="checkbox"/>	The scope should be limited to communications between entities and should not prescribe communication protocols for communication within an organization. Intra-company communications are most appropriately addressed by internal policies and procedures tailored to an entity's specific needs and characteristics.
<b>Response:</b> The SAR DT agrees — that the scope of this standard does not apply to internal non-reliability related company communications; however it does apply to separate functional entities within a single company.			

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

3. The proposed standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators and Distribution Providers. Do you agree with the proposed applicability? If “No,” please explain why

**Summary Consideration:** The majority of the commenters agreed that the proposed requirements should be applicable to the RC, BA, TOP, GO and DP functional entities.

Question #3			
Commenter	Yes	No	Comment
Ameren Services	<input checked="" type="checkbox"/>		
BPA	<input checked="" type="checkbox"/>		
Constellation	<input checked="" type="checkbox"/>		
Entergy Services	<input checked="" type="checkbox"/>

PSC of South Carolina	<input checked="" type="checkbox"/>		
<p><b>Response:</b> The SAR DT acknowledges the commenters’ affirmative response to this question and appreciates their submission.</p>			

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #3			
Commenter	Yes	No	Comment
Southern Company Transmission	<input checked="" type="checkbox"/>		However, there is only one "real time" requirement that is applicable to the DP. It is contained in TOP-001-1, R4.  <b>Response:</b> The SAR DT agrees that the DP comply with direction from TOP. This standard does not conflict with that requirement but is intended to ensure quick, clear and mutual understanding of any directives from the TOP to the DP.
WECC RCCWG	<input checked="" type="checkbox"/>		The WECC RCCWG generally agrees, but some questions remain. The standard will apply to TO, BA, GO, DP; however, the SAR (Applicability Section #2) states that all those entities "will be required to adopt and employ directives that use pre-defined terms, and will require entities that receive those directives to respond to the reliability coordinator using pre-defined terms." Entities that receive those directives should respond to the entity issuing the directives using pre-defined terms. Additionally, the WECC RCCWG believes that the SAR drafting committee should consider adopting the term "directive" for reliability coordinator issue only and adopt another term, such as "operating instructions" for those actions directed by other than the reliability coordinator to distinguish between the two terms.  <b>Response:</b> The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.  The SAR DT believes that limiting the use of the word directive by RC's only is not within the scope of this standard. The use of the word "directive" occurs throughout several NERC standards.
ATC LLC		<input checked="" type="checkbox"/>	<b>Issue 1:</b> The recommendation from the blackout report is overly broad and vague. Tightening does not sound like a complete overhaul but rather tweaking the existing protocols and documenting them if they are informal. This may not even require a standard across all functional entities. TOPs and BAs in a given region have long history of communication and differing terms are already understood. However, for communications that occur between regional areas, there may be a need for common terms.  ATC does not agree with the concept of a rigorous script for communications. This may sound like it would require the team to identify any operational situation that could ever occur and then establish a script. If this were possible, it would be great. However, it is not possible. This is why we have trained operators to make decisions when new operational situations occur.

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #3			
Commenter	Yes	No	Comment
			<p><b>Issue 2:</b>                      The SAR needs to include local control center’s system operators. The inclusion of this group of system operators will not be simple because local control centers are not an identified entity in NERC’s functional model. Never the less if the SDT is going to create a common lexicon and procedures it’s important that these system operators are required to follow the standard. ATC believes that the purpose behind this SAR would be better address through NERC’s CEH program then through reliability standards.</p> <p>SAR Scope:</p> <p>“The scope of the proposed standard or reviewed standards is to establish a common lexicon of communications protocols and communications paths such that all operators and users of the North American bulk electric system have the same understanding as to its meaning, usage and take pre-determined action in response.”</p> <p><b>PER FERC Final Rule RM06-</b>                      “1343. Clearly, in a region where an RTO or ISO performs the transmission operator function, its personnel with primary responsibility for real-time operations must receive formal training pursuant to PER-002-0. IN addition, personnel who are responsible for implementing instructions at a local control center also affect the reliability of the Bulk Power System. These entities may take independent action under certain circumstances, for example, to protect assets, personnel safety and during system restorations. Whether the RTO or the local control center is ultimately responsible for compliance is a separate issue addressed above, but regardless of which entity registers for that responsibility, these local control center employees must receive formal training consistent with their roles, responsibilities and tasks. Thus, while we direct the ERO to develop modifications to PER-002-0 to include formal training for local control center personnel, that training should be tailored to the needs of the positions.”</p> <p>“1345. Another organization structure, typically representative of relative smaller entities, consists of a single control center that implements operating instructions from its transmission operator, e.g., an RTO, ISO or pooled resources. Similar to the discussion above, operators at these control centers also may take independent action to protect assets, safety and system restoration. Such control center personnel must also receive formal training pursuant to PER-002-0.”</p>

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #3			
Commenter	Yes	No	Comment
			Because NERC has been order to create training plans for local control center’s system operator any common lexicon and communications protocols could be dealt with for all entities most effectively in NERC’s CEH program.
<b>Response:</b> See previous responses to Questions 1 and 2.			
Midwest SCG		<input checked="" type="checkbox"/>	We agree that these functional entities should be considered for applicability; however, it is possible that the final standard should not apply to all of them. Further examination of the reason for the recommendation of the from the blackout report would help determine this.
<b>Response:</b> The SAR DT view is all of the applicable entities, RC, BA, TOP, GO, DP should be guided by communication protocols to ensure quick, clear and mutual understanding of information between them in real time. The specific reasons identified in the Blackout report are addressed by this SAR but is not limited by them.			
MRO Members		<input checked="" type="checkbox"/>	We agree that these functional entities should be considered for applicability; and in addition it should apply to Interchange Coordinator Function.
<b>Response:</b> The SAR DT believes the Interchange Authority function is under the BA function. The IA does ‘receive’ info from other entities and may, under some circumstances relay that info to others – see FM V3 P32, Real-time #7.			
We Energies		<input checked="" type="checkbox"/>	Scope should be limited to communication among separate entities/organizations. For example, the standard should not address communication protocols between a Balancing Authority, Generaotr Operator and a Distribution Provider tha are the same corporate entity. The requirement to maintain situational awareness within a given entiy is addressed by other standards.
<b>Response:</b> The SAR DT agrees that the scope of this standard does not apply to internal non-reliability related company communications protocols, however it does apply to separate functional entities within a single company.			

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

4. The SAR includes a list of standards that include requirements that involve the issuing or receipt of real-time communications. If you are aware of additional requirements, beyond those listed on pages 8-9, please identify them here.

**Summary Consideration:** Based on stakeholder comments, the SAR DT modified the SAR to clarify that EOP-001-0 Attachment 1 should be addressed by the standard drafting team.

Question #4				
Commenter	Yes	No	Requirement	Comment
Southern Company Transmission	<input checked="" type="checkbox"/>		IRO-016-1, R1	We do not recommend bringing the requirement over to this SAR. It is better to leave in the IRO standards.
<b>Response:</b> The SAR DT would like the Standard DT to consider communication-related requirements in other standards for duplication, conflicts and consolidation.				
BPA				None identified.
Hydro-Québec TransÉnergie				No others.
ISO-NE				No others.
Manitoba Hydro				If it is the intention of the standard writer to re write these requirements into scripts than we see problems, especially if it is intended to push these scripts into the entities' intra region operating procedures.
<b>Response:</b> The SAR DT does not intend to re-write any requirements into scripts.				
MRO Members	<input checked="" type="checkbox"/>			EOP-001-0 Attachment 1
<b>Response:</b> The SAR DT agrees with the commenter.				
NPCC CP9				No others.

**Consideration of Comments — SAR for Operating Personnel Communications Protocols**

5. Please provide any other comments (that you have not already provided in response to the first four questions on this form) that you have on the revised SAR.

**Summary Consideration:** Based on stakeholder comments, the SAR DT modified the SAR to clarify that three-part communications will be included in the proposed requirements.

Question #5			
Commenter	Yes	No	Comment
PSC of South Carolina			The PSCSC believes the SAR should specifically acknowledge the power and effectiveness of three-part communications in ensuring common understanding of verbal exchanges. Three-part communications include the sender giving the information, the receiver repeating the information back, and the sender acknowledging the correctness of the repeated information. This form of communication is used in nuclear plant communications and in other industries where it is critical that everyone involved has a common understanding of the intended message.
<b>Response:</b> The SAR DT thanks the commenter for this item and has incorporated the use of three-part communications into the scope of the SAR.			
Southern Company Transmission			<p>*Under FERC staff's Preliminary Assessment contained on page 7 of the SAR (items i and ii), item ii should not be addressed in this SAR. There are numerous requirements in the IRO standards already that adequately cover communications to other RCs for situations in which a reliability impact may go beyond a RC's area of view. In particular, the following standard requirements address the 2<sup>nd</sup> part (ii): IRO-001-1, Req. 7; IRO-003-2, Req.1; IRO-004-1, Req.2; IRO-014-1, Req.1,2,3; IRO-015-1, Req.1,2; IRO-016-1, Req.1;</p> <p>*If the SAR drafting team removes the requirements of the standards referenced in the "Related Standards" section of this SAR and move them to this SAR, it will become difficult for a Reliability Coordinator to know where to go for standards applicable to them. For example, currently most of the requirements related to real time actions taken by a RC are contained in the IRO standards. If the 4 IRO standard requirements are removed from the IRO standards and placed into this SAR, the RC system operators will now have to refer to more standards to find requirements related to their responsibilities. This same scenario also applies to the other standard drafting teams who are considering the same actions.</p> <p>It would be helpful if NERC were to provide on the Standards Homepage a listing of</p>

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #5			
Commenter	Yes	No	Comment
			standards by Function: RC, BA, TOP, etc. Then the RC could review the RC function and know all standards that are applicable to them in a quick and easy fashion.
<p><b>Response:</b> The SAR DT would like the Standard DT to consider communication-related requirements in other standards for duplication, conflicts and consolidation.</p> <p>There is a link to a document "Version 0 and Version 1 Matrix of Requirements by Function" on the NERC Standards website. The link may be found on the "BOT Approved Standards" webpage in the center of the page. Many standards include requirements that are applicable to more than one functional entity.</p>			
FirstEnergy			No additional comments.
Manitoba Hydro			<p>We believe that there is a need to clean up the communication protocol in as far as full name identification of all parties for all communications between entities and three part communication: the sender giving the information or direction, the receiver repeating the information or direction back as to his understanding, and the receiver confirming or correcting the repeated statement. If there is a correction than the process is repeated.</p> <p>A glossary of terms for industry standard operating terms is essential. This glossary with input from the entities should be an integral part of this SAR.</p>
<p><b>Response:</b> The SAR DT thanks the commenter for the item regarding three part communications and have incorporated it into the scope of the SAR.</p> <p>The SAR's detailed description was revised to delete the sentence that indicated the standard would require scripts to be used. The SAR DT's intent is for the standard to require that communications include essential elements or protocols such that information is efficiently conveyed and mutually understood.</p>			
MRO Members			<p>Proof of the pudding is in tightly defining the Requirements and stipulating the Severity Levels and VRFs accurately so that the penalties are commensurate with the severity level and the VRF.</p> <p>Is there a consistent methodology between IRO-014-1 R1.1 footnote 1 and CIP-008-1 R1.2?</p> <p>Is IRO-001-1 R3 a repeat of IRO-005-2 R3?</p> <p>There is an overlapping request for requirements for communication facilities for use during emergencies. These requests are made in this SAR (Operating Personnel Communications Protocols Project 2007-02) and in the SAR for Project 2006-06 Reliability Coordination-Attachment 1. Perhaps both the associated drafting teams could</p>

Consideration of Comments — SAR for Operating Personnel Communications Protocols

Question #5			
Commenter	Yes	No	Comment
			work together so that there are no overlapping requirements among developed standards. We do not see the purpose behind not including the recommendation regarding the upgrade to communication system hardware in this SAR. This SAR should include , if need be, the recommendations to upgrade communication system hardware.
<p><b>Response:</b> The Standard DT and Compliance Elements DT will work together to ensure the VRF and VSL assignments are appropriate.</p> <p>The SAR DT will endeavor to eliminate any duplication and/or contradictions with other reliability standards.</p> <p>COM-001 addresses hardware requirements and continue to be in effect until it is formally retired. The retirement can occur all at once or can occur on a requirement by requirement basis.</p>			
NPCC CP9			NPCC participating members agree with the concepts in the SAR.
SRP			The SAR is a proposal for protocols to be used over "pre-established communications paths". This is good as far as it goes. When Operations sits down to write up these protocols with their peers, I recommend that they have a Communications person from at least one of the utilities on the panel to initially clearly delineate what the recommended path(s) are between the subject utilities. This will be based on use of private systems first with the possibility of widespread unavailability of commercial services, etc.
<p><b>Response:</b> Thank you for your comment, the scope of this SAR concerns itself with communication protocols (verbal, written and visual) and not with telecommunications systems. (See COM-001-1)</p>			

## Standard Authorization Request Form

Title of Proposed Standard:	Operating Personnel Communications Protocols
Request Date:	March 1, 2007
Revised Date:	June 8, 2007

### ***SAR Requester Information***

Name: Lloyd Snyder	SAR Type (Check one box.)
Company: Georgia System Operations Corp.	<input checked="" type="checkbox"/> New Standard
Telephone: 770-270-7418	<input checked="" type="checkbox"/> Revision to Existing Standard
Fax: 770-270-7672	<input type="checkbox"/> Withdrawal of Existing Standard
E-mail: Lloyd.snyder@gasoc.com	<input type="checkbox"/> Urgent Action

## Standards Authorization Request Form

Purpose (Describe the purpose of the proposed standard - what the standard will achieve in support of reliability.)

Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The purpose of this standard is to:

1. Provide an adequate level of reliability for the North American bulk power systems - by ensuring that the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure the standard or standards are enforceable as mandatory reliability standards with financial penalties - the applicability to bulk power system owners, operators, and users, are clearly defined; the purpose, requirements, and measures are results-focused and unambiguous; the consequences of violating the requirements are clear.
3. Consider other general improvements described in the standards development work plan.
4. Consider stakeholder comments received during the initial development of the standards and other comments received from Electric Reliability Organization (ERO) regulatory authorities, as noted in the attached review sheets.
5. Satisfy the standards procedure requirement for five-year review of the standards.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

## Standards Authorization Request Form

---

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

This standard will require the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions. The standard will be applicable to transmission operators, transmission owners balancing authorities, reliability coordinators, generator operators and distribution providers.

Requirements will ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to operating directives.

The project may involve moving some requirements that address communications protocols from existing standards into this new standard and will involve adding new requirements that more fully address communications protocols under various operating conditions.

**Standards Authorization Request Form**

***Reliability Functions***

<b>The Standard will Apply to the Following Functions</b> <i>(Check all applicable boxes.)</i>		
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input checked="" type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input type="checkbox"/>	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
<input type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
<input type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input checked="" type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input checked="" type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input checked="" type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input checked="" type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input type="checkbox"/>	Market Operator	Interface point for reliability functions with commercial functions.

**Reliability and Market Interface Principles**

Applicable Reliability Principles ( <i>Check all boxes that apply.</i> )	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
<input type="checkbox"/>	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
<input type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input type="checkbox"/>	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
<input type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
<b>Does the proposed Standard comply with all of the following Market Interface Principles?</b> ( <i>Select 'yes' or 'no' from the drop-down box.</i> )	
Recognizing that reliability is an essential requirement of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes	

## Standards Authorization Request Form

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

### Scope

The scope of the proposed standard is to establish essential elements of communications protocols and communications paths such that operators and users of the North American bulk electric system will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Recommendation Number 26 calls for a tightening of communications protocols. This standard is to ensure that effective communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities. References to communication protocols in other NERC Standards may be moved to this new standard. The standard drafting team shall consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions.

### Applicability

Medical, law enforcement, air traffic control and other fields routinely use mutually defined and understood terminology or codes. Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.

Communications protocols shall precisely define terms, codes, phrases, words, etc. as to their connotation, conditions for use, context of use and expected responses in reply to these terms, codes, phrases, words, etc. Effective communications with proper communications protocols among the operating entities are essential for maintaining reliable system operations.

The standard will include requirements for the following:

1. Real-time system operators will be required to use specific communications protocols under normal, abnormal and emergency conditions to relay critical reliability-related information in a timely and effective manner.
2. Reliability Coordinators, Balancing Authorities, Generation Operators, Transmission Operators, Transmission Owners and Distribution Providers will be required to comply with this standard.
3. The standard will include requirements for entities that experience abnormal conditions to use pre-defined terms such as proposed in the "Alert Level Guideline" (attached) to communicate the operating condition to other entities that are in a position to either assist in resolving the operating condition or to entities that are impacted by the operating condition.

## Standards Authorization Request Form

---

4. The standard may include other requirements that involve communications protocols for real-time system operators.

The standard should address directives 1 and 3 of the FERC Order 693 Mandatory Reliability Standards, paragraph 540 which contains (directive 1 will also be addressed in Project 2006-06; directive 2 will be addressed in Project 2006-06):

“...the Commission identified concerns regarding COM-002-2, the proposed Reliability Standard serves an important purpose by requiring users, owners and operators to implement the necessary communications and coordination among entities. Accordingly, the Commission approves Reliability Standard COM-002-2 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. Finally, we direct the ERO to include APPA’s suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process.”

## Standards Authorization Request Form

### ***Related Standards***

Standard No.	Explanation – these requirements may need to be modified or moved to the new standard
COM-001-1	R4 is a requirement for the Reliability Coordinator's, Transmission Operator's, and Balancing Authority's real-time operating personnel to use English when communicating between entities.
COM-002-2	R1.1 is a requirement for the Balancing Authority and Transmission Operator to make notifications when there is a threat to reliability.  R2 is a requirement for the Reliability Coordinator, Transmission Operator and Balancing Authority relative to issuing and receiving operating directives.
EOP-001-0	R4.1 includes a requirement for the Transmission Operator and Balancing Authority to have communications protocols for use during emergencies (and Attachment 1-EOP-001-0)
EOP-002-2	R6.5 and R7.2 require the Balancing Authority to ask the Reliability Coordinator to declare an Energy Emergency or an Energy Emergency Alert under certain conditions  R8 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions  R9.1 requires the Load-serving Entity to ask the Reliability Coordinator to declare an Energy Emergency Alert under certain conditions
EOP-006-1	R4 requires the Reliability Coordinator to disseminate information regarding restoration to neighboring Reliability Coordinators and Transmission Operators or Balancing Authorities  R5 requires the Reliability Coordinator to approve, communicate, and coordinate the re-synchronizing of major system islands or synchronizing points
CIP-001-1	R1 and R2 require operating entities to have procedures for communicating information relative to sabotage of bulk power system facilities
CIP-008-1	R1.2 requires the responsible entity to have a communication plan for response to a cyber security incident
IRO-001-1	R3 requires the Reliability Coordinator to direct entities to act and R8 requires entities to respond to the Reliability Coordinator's directives
IRO-004-1	R6 requires the Reliability Coordinator to direct entities to act and R7 requires entities to respond to the Reliability Coordinator's directives
IRO-005-2	R4 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions  R3, R5, R8, R11, R15, and R17 require the Reliability Coordinator to direct actions to alleviate various types of abnormal or emergency situations
IRO-014-1	R1.1 requires Reliability Coordinators to have procedures processes or plans that address communications and notifications made between Reliability Coordinators under various operating scenarios
PRC-001-1	R6 requires the Transmission Operator and Balancing Authority to make notifications when there is a change in the status of a special protection system
TOP-001-1	R3 requires some responsible entities to comply with the Reliability Coordinator's and Transmission Operator's directives  R4 requires some responsible entities to comply with the Transmission Operator's directives  R5 requires the Transmission Operator to notify its Reliability Coordinator of certain emergency situations

**Standards Authorization Request Form**

TOP-002-2	R14, R16 and R17 require responsible entities to notify their Reliability Coordinator of various changes to operating parameters R18 requires the use of uniform line identifiers when referring to transmission facilities of an interconnected network
TOP-007-0	R1 requires the Transmission Operator to notify its Reliability Coordinator when it exceeds an SOL or IROL R4 requires the Reliability Coordinator to direct entities to take actions to restore the system to within SOLs or IROLs
TOP-008-1	R3 requires the Transmission Operator to make notifications if it disconnects an overloaded facility
VAR-001-1	R8 and R12 require the Transmission Operator to direct actions to maintain voltage within limits and to prevent voltage collapse
VAR-002-1	R2.2 and R5.1 require the Generator Operator to comply with directives R3 requires the Generator Operator to notify the Transmission Operator of various status or capability changes

## Guideline for Operating State Alert Levels

### Background

System operators need common definitions for normal, alert, and emergency conditions to enable them to act appropriately and predictably as system conditions change. On August 14, 2003, the principal entities involved in the blackout did not have a shared understanding of whether the grid was in an emergency condition, nor did they have a common understanding of the functions, responsibilities, capabilities, and authorities of reliability coordinators and control areas under emergency or near-emergency conditions.

*The U.S./Canada Task Force Recommendation 20 recommends the establishment of clear definitions of normal, alert, and emergency operational system conditions, and to clarify the roles, responsibilities, and authorities of reliability coordinators and control areas under each condition.*

At its May 2006 meeting, the NERC Reliability Coordinator WG approved a motion to implement a pilot program that defined normal, alert, and emergency operating conditions as they relate to Transmission Loading and Security. The intent is to align the definitions for Transmission Loading and Security with the conditions identified in the Emergency Energy Alert states. In an effort to clarify the application of the definitions being used in the pilot program this guideline has been created. ***In the event of a conflict between the pilot program and applicable NERC Standards the Standards should always be applied first.***

Condition Level >>>>	Normal	Alert Level 1	Alert Level 2	Alert Level 3
Threat Level>>>>	Low	Elevated	High	Severe
Condition/Threat Color >>>>	Green	Yellow	Orange	Red
Generating/capacity	EEA 0 No Energy Deficiencies	EEA 1 all available resources in use	EEA 2 Load management procedures in effect	EEA 3 Firm load interruption imminent or in progress
Transmission	TEA 0 Respecting all IROLs	TEA 1 All available resources committed to respecting IROLs	TEA 2 Load Mgmt procedures in effect to respect IROLs	TEA 3 Firm Load Curtailments in effect to respect IROLs
Security	SEA 0 No cyber threat identified; No known threats on control center or grid assets (lines, substations, generators)	SEA 1 Cyber threat identified or is imminent, OR verified physical threat against control center or grid assets	SEA 2 Cyber event is affecting control center EMS capability, OR physical attack at <i>single</i> site (control center or grid assets- lines, substations, generators)	SEA 3 Cyber event has shut down control center EMS capability, OR physical attack at <i>multiple</i> sites (control center or grid assets- lines, substations, generators)

## Transmission Emergency Alert (TEA) Levels

### Introduction

This Attachment provides the procedures by which a Transmission Operator or Reliability Coordinator can advise of actions taken to manage potential or actual Interconnected Reliability Operating Limit (IROL) violations.

All three operating alert states (EEAs, TEAs and SEAs) are independent of each other and should be declared independently but they may also be declared concurrently.

### A. General Requirements

**1. Initiation by Reliability Coordinator.** A Transmission Emergency Alert (TEA) may be initiated only by a Reliability Coordinator at:

- 1) the Reliability Coordinator's own request, or
- 2) upon the request of a Transmission Operator

**1.1. Situations for initiating alert.** A Transmission Emergency Alert may be initiated for the following reasons:

- When all the available resources have been committed to respect an IROL in the pre-contingency state.
- When load curtailment procedures have been implemented to respect an IROL.

**2. Notification.** A Reliability Coordinator who declares a Transmission Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the "System Emergency" category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and Reliability Coordinators when the alert has ended.

### B. Transmission Emergency Alert Levels

#### Introduction

To ensure that all Reliability Coordinators clearly understand potential and actual actions taken to manage IROLs on the Interconnection, NERC has established three levels of Transmission Alerts. The Reliability Coordinators will use these terms when explaining actions taken to manage IROLs to each other. A Transmission Emergency Alert is an emergency procedure, not a daily operating practice, and is not intended as an alternative to compliance with NERC reliability standards.. The Reliability Coordinator may declare whatever alert level is appropriate, and need not proceed through the alerts sequentially.

## 1. Transmission Emergency Alert 1 (TEA 1) – All available resources committed to respecting IROLs.

### Circumstances:

- The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available resources are committed to respect the IROL and is concerned about its ability to respect the IROL.

## 2. Transmission Emergency Alert 2 (TEA 2) — Load management procedures in effect to respect IROLs.

### Circumstances:

- The Reliability Coordinator or Transmission Operator foresees or has implemented procedures up to, but excluding, interruption of firm load commitments. When time permits, these procedures may include, but are not limited to:
  - Public appeals to reduce demand.
  - Voltage reduction.
  - Interruption of non-firm end use loads in accordance with applicable contracts (for emergency purposes, not economic reasons).
  - Demand-side management.
  - Utility load conservation measures
  - TLR 6

Note: TLR 5 would normally be implemented in advance of this alert state. Under some circumstances TLRs may not be available or effective and would not be called prior to this alert state.

During TEA 2, Reliability Coordinators and Transmission Operators have the following responsibilities:

**2.1 Declaration period.** The declaring Reliability Coordinator shall update the RCIS (under “System Emergency”) at a minimum of every hour until the TEA 2 is terminated.

**2.4 Evaluating and mitigating transmission limitations.** The Reliability Coordinators shall review all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs) and transmission loading relief procedures in effect that may be contributing to the alert level. *Where appropriate*, the Reliability Coordinators shall inform the Transmission Operators under their purview of the pending Transmission Emergency Alert and request that they increase their ATC by actions such as restoring transmission elements that are out of service, reconfiguring their transmission system, adjusting phase angle regulator tap positions, implementing emergency operating procedures and redispatching generation.

**2.4.1 Notification of ATC adjustments.** Resulting increases in ATCs shall be communicated to the market via posting on the appropriate OASIS websites by the Transmission Providers.

**2.4.2 Availability of generation redispatch options.** Available generation redispatch options shall be immediately communicated to the declaring Reliability Coordinator.

**2.4.3 Evaluating impact of current transmission loading relief events.** The Reliability Coordinators shall evaluate the impact of any current transmission loading relief events on the ability to supply emergency assistance to the declaring entity. This

evaluation shall include analysis of system reliability and involve close communication among Reliability Coordinators.

**2.4.4 Initiating inquiries on re-evaluating SOLs and IROLs.** The Reliability Coordinators shall consult with the Balancing Authorities and Transmission Providers in their Reliability Areas about the possibility of re-evaluating and revising SOLs or IROLs.

**2.5 Coordination of emergency responses.** The Reliability Coordinator shall communicate and coordinate the implementation of emergency operating responses.

**2.6 Actions Prior to Declaration of TEA 3.** Before declaring a TEA 3, all available resources must be committed. This includes but is not limited to:

**2.6.1 All available generation units are on-line.** All generation capable of being on-line in the time frame of the emergency is on-line including quick-start and peaking units, regardless of cost.

**2.6.2 Purchases made regardless of cost.** All firm and non-firm purchases have been made, regardless of cost.

**2.6.3 Non-firm sales recalled and contractually interruptible loads and demand-side management curtailed.** All non-firm sales have been recalled, contractually interruptible retail loads curtailed, and demand-side management activated within provisions of the agreements.

**2.6.4 Operating Reserves.** Operating reserves are being utilized such that the declaring entity may be carrying reserves below the required minimum or has initiated emergency assistance through its operating reserve sharing program.

### **3. Transmission Emergency Alert 3 (TEA 3) — Firm load curtailment in effect to respect IROLs.**

#### **Circumstances:**

The Reliability Coordinator or Transmission Operator foresees or has implemented firm load obligation interruption to respect an IROL.

**3.1 Continue actions from TEA 2.** The Reliability Coordinators and the declaring entity shall continue to take all actions initiated during TEA 2.

**3.2 Declaration Period.** The declaring Reliability Coordinator shall update the RCIS under “System Emergency” at a minimum of every hour until the TEA 3 is terminated.

**3.3 Use of Transmission short-time limits.** The Reliability Coordinators shall request the appropriate Transmission Providers within their Reliability Area to utilize available short-time transmission limits or other emergency operating procedures in order to increase transfer capabilities.

**3.4 Re-evaluating and revising SOLs and IROLs.** The Reliability Coordinator of the declaring entity shall evaluate the risks of revising SOLs and IROLs on the reliability of the overall transmission system. Re-evaluation of SOLs and IROLs shall be coordinated with other Reliability Coordinators and only with the agreement of the Transmission Operator whose equipment would be affected. The resulting increases in transfer capabilities shall only be made

available to the declaring entity who has requested a TEA 3 condition. SOLs and IROLs shall only be revised as long as a TEA 3 condition exists or as allowed by the Transmission Operator whose equipment is at risk. The following are minimum requirements that must be met before SOLs or IROLs are revised:

**3.4.2 Mitigation of cascading failures.** The Reliability Coordinator shall use its best efforts to ensure that revising SOLs or IROLs would not result in any cascading failures within the Interconnection.

**3.5 Returning to pre-emergency SOLs and IROLs.** Whenever the transmission systems can be returned to their pre-emergency SOLs or IROLs, the declaring Entity shall notify its respective Reliability Coordinator.

**3.5.1 Notification of other parties.** Upon notification from the declaring entity that an alert has been downgraded, the Reliability Coordinator shall notify the affected Reliability Coordinators (via the RCIS), Transmission Operators and Balancing Authorities that their systems can be returned to their normal limits.

#### **4. Transmission Emergency Alert 0 (TEA 0) - Termination.**

When the declaring Entity is able to respect IROL requirements and is no longer concerned with its ability to respect IROLs, it shall request its Reliability Coordinator to terminate the alert.

**4.1. Notification.** The Reliability Coordinator shall notify Reliability Coordinators via the RCIS of the termination. The Reliability Coordinator shall also notify the affected Transmission Operators and Balancing Authorities. The TEA 0 shall also be posted on the NERC website if the original alert was so posted.

## Security Emergency Alerts (SEA)

### Introduction

This Attachment provides the procedures by which a Reliability Coordinator, Transmission Operator or Balancing Authority can communicate the physical and cyber security status of their facilities.

All three operating alert states (EEAs, TEAs and SEAs) are independent of each other and should be declared independently but they may also be declared concurrently.

### A. General Requirements

**1. Initiation by Reliability Coordinator.** A Security Emergency Alert may be initiated only by a Reliability Coordinator at

- 1) The Reliability Coordinator's own request, or
- 2) Upon the request of a Transmission Operator, or
- 3) Upon the request of a Balancing Authority

**1.1. Situations for initiating alert.** A Security Emergency Alert may be initiated for the following reasons:

- A Cyber threat affecting a control center, grid or generator assets has been identified or is imminent.
- A physical threat affecting a control center, grid or generator assets has been identified or is imminent.

### 2. Notification.

A Reliability Coordinator who initiates a Security Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the "CIP" category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has ended

### B. Security Emergency Alert (SEA) Levels

To ensure that all Reliability Coordinators clearly understand potential and actual Security Emergency Alerts, NERC has established three levels of Security Emergency Alerts. The Reliability Coordinators will use these terms when explaining security alerts to each other. A Security Emergency Alert is an emergency procedure, not a daily operating practice, and is not intended as an alternative to compliance with NERC reliability standards. The Reliability Coordinator may declare whatever alert level is necessary, and need not proceed through the alerts sequentially.

#### 1. Security Emergency Alert 1 (SEA 1) – Cyber or Physical threat is identified or imminent

**Circumstances:**

- The Reliability Co-ordinator, Transmission Operator or Balancing Authority has identified an actual or imminent cyber or physical threat to one of its facilities including but not limited to:

- Control Centers
- Generating facilities
- Substations
- Transmission Lines

## 2. Security Emergency Alert 2 (SEA 2) – Cyber event *impacts* control center EMS or physical attack at a *single site*

### Circumstances:

- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified an actual cyber threat event that is affecting control center EMS capability.
- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified a physical attack at a single site.

During Security Emergency Alert 2, Reliability Coordinators, Transmission Operators and Balancing Authorities have the following responsibilities:

### 2.1 Notifying other Reliability Coordinators, Transmission Operators and Balancing Authorities

The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP”.

### 2.2 Declaration period.

The declaring Entity shall update its Reliability Coordinator of the situation at a minimum of every hour until the SEA 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur and pass this information on to the affected Reliability Coordinators, Transmission Operators and Balancing Authorities.

## 3. Security Emergency Alert 3 (SEA 3) – Cyber event *shuts down* control center EMS or physical attack at *multiple sites*

### Circumstances:

- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified an actual cyber threat event that has shutdown a control center EMS capability.
- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified a physical attack at a multiple sites

### **3.1. Notifying other Reliability Coordinators, Balancing Authorities and Transmission Operators**

The Reliability Coordinator shall post the declaration of the alert level along with the locations of the affect facilities on the RCIS under “CIP”.

### **3.2. Declaration period**

The declaring Entity shall update its Reliability Coordinator of the situation at a minimum of every hour until the SEA 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur and pass this information on to the affected Reliability Coordinators, Transmission Operators and Balancing Authorities.

## **4. Security Emergency Alert 0 (SEA 0) – Termination of alert level**

When the declaring entity believes it is no longer under threat, it shall request its Reliability Coordinator to terminate the SEA.

### **4.1. Notification**

The Reliability Coordinator shall notify all other Reliability Coordinators via the RCIS of the termination. The Reliability Coordinator shall also notify the affected Transmission Operators and Balancing Authorities

**Example #1**

**IROL violation on "X"  
No Global Adequacy Concerns**

**IROL "X"  
500 MW - A to B  
300 MW - B to A**

- EEA** 1 No  
2 No  
3 No
- TEA** 1 Yes  
2 Yes  
3 Yes

In this example the available generation in A is in excess of its load requirements. The available generation in B is less than its load requirements. Area B will be relying on the full transfer capability of the interface "X" plus an additional import of 100 MW to the maximum limit on the intertie in Area B. With the implementation of the interruptible load and V/R the firm load requirements in B cannot be met without the use of Firm load shedding.

- In this scenario an EEA is not required as the BA is able to meet its global load/generation requirements.
- When this situation is forecast a TEA 1 should be issued to indicate the potential concerns with the ability to respect the IROL limit "X" without the use of load management procedures.
- When load management procedures are implemented in Real Time to respect the IROL "X", a TEA 2 should be issued.
- When Firm load is curtailed to respect the limit a TEA 3 should be issued.

**Example #2**

**Global Adequacy Deficiency  
No IROL Violation**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

- EEA** 1 Yes  
 2 Yes  
 3 No
- TEA** 1 No  
 2 No  
 3 No

In this example the available generation in A is less than its load requirements. The available generation in B is less than its load requirements. There is a Global Adequacy deficiency after considering full import capability and utilization of interruptible load and V/R.

- EEA procedures should be followed
- There is no need for a TEA to be issued

**Example #3**

**Global Adequacy Deficiency  
IROL Violation**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

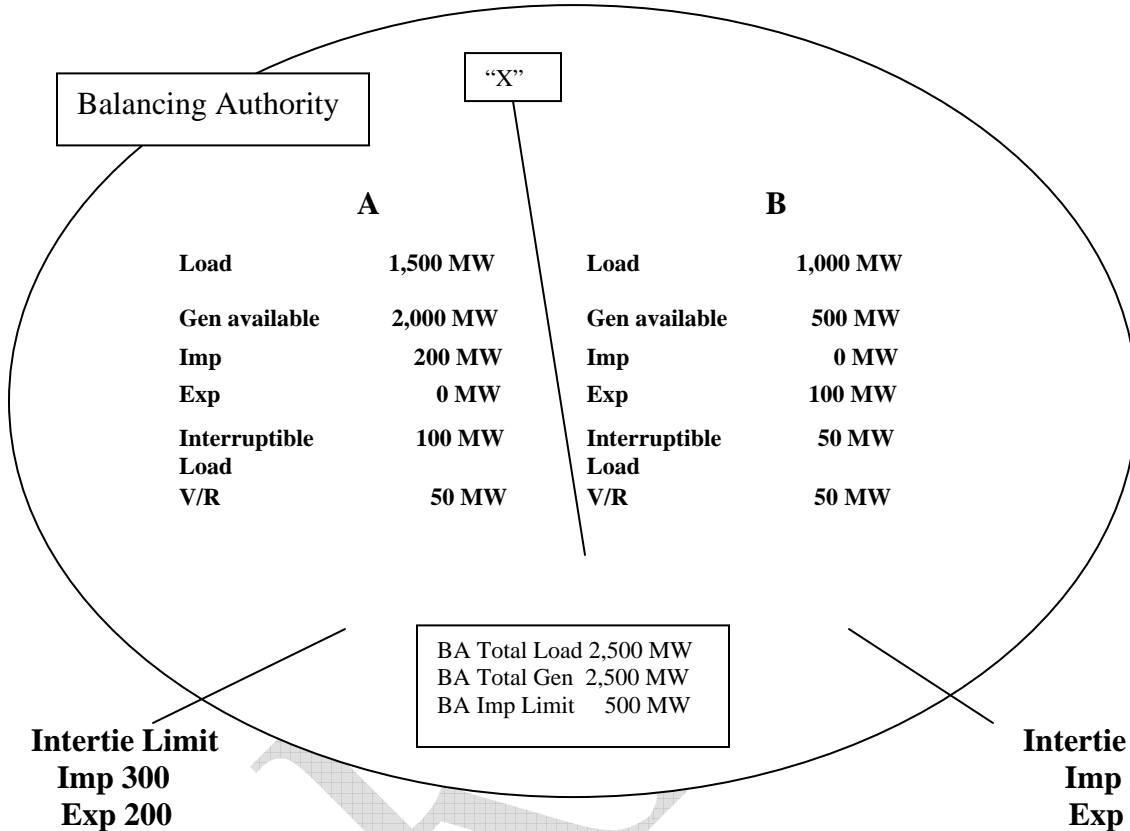

<b>EEA</b>	1	<b>Yes</b>	In this example the available generation in A meets its load requirements. The available generation in B is less than its load requirements. There is a Global Adequacy deficiency after considering full import capability. There is also an IROL violation at "X" in the direction of A to B to meet the load requirements in B depending on where load management procedures are implemented.
	2	<b>Yes</b>	
	3	<b>No</b>	
<b>TEA</b>	1	<b>Yes</b>	
	2	<b>Yes</b>	
	3	<b>Yes</b>	

- An EEA 1 and a TEA 1 should be issued to identify the potential issues
- When load management procedures are implemented to manage the transfer from A to B a TEA 2 should be issued (assumes B will be deficient before the global deficiency occurs).
- An EEA 2 should be issued when load management procedures are being implemented in A to manage global requirements.
- TEA 3 should also be issued when Firm load is shed in B to meet the load requirements in B while respecting the IROL.

**Example #4**

**Transaction Curtailments**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

- EEA** 1 No
- 2 No
- 3 No
- TEA** 1 No
- 2 No
- 3 No

In this example there are no global adequacy concerns. There is an export transaction in B that is causing a limit concern on "X" in the A to B direction. With the available generation in B plus the transfer capability there is no concern for violating the IROL limit. The transaction is creating a situation where it will be required curtailed at some point to prevent the IROL violation. Assuming the TLR procedure would be effective at relieving this constraint regardless of the TLR level (at either the TLR 3 or 5 level) no TEA

would be required as there is no concern that the IROL can't be respected with control actions that don't involve load management procedures.

NORTH AMERICAN ELECTRIC  
RELIABILITY CORPORATION

## Standard Authorization Request Form

Title of Proposed Standard:	Operating Personnel Communications Protocols
Request Date:	March 1, 2007
Revised Date:	<u>June 8, 2007</u>

## Standards Authorization Request Form

Purpose (Describe the purpose of the proposed standard - what the standard will achieve in support of reliability.)

Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The purpose of ~~revising and expanding the existing requirements that address real-time system operator communication~~this standard is to:

1. Provide an adequate level of reliability for the North American bulk power systems - by ensuring that the standards are complete and the requirements are set at an appropriate level to ensure reliability.
2. Ensure the standard or standards are enforceable as mandatory reliability standards with financial penalties - the applicability to bulk power system owners, operators, and users, are clearly defined; the purpose, requirements, and measures are results-focused and unambiguous; the consequences of violating the requirements are clear.
3. Consider other general improvements described in the standards development work plan.
4. Consider stakeholder comments received during the initial development of the standards and other comments received from Electric Reliability Organization (ERO) regulatory authorities, as noted in the attached review sheets.
5. Satisfy the standards procedure requirement for five-year review of the standards.

Industry Need (Provide a detailed statement justifying the need for the proposed standard, along with any supporting documentation.)

The need for improved real-time communications protocols was identified during the investigation of the August 2003 Blackout. Blackout Recommendation #26 is: "Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate." (Note that this SAR does not include the second part of this recommendation regarding the upgrade to communication system hardware.)

## Standards Authorization Request Form

Brief Description (Describe the proposed standard in sufficient detail to clearly define the scope in a manner that can be easily understood by others.)

This standard will require the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions~~especially for communications during alerts and emergencies~~. The standard will be applicable to transmission operators, transmission owners balancing authorities, reliability coordinators, generator operators and distribution providers.

Requirements will ensure that communications include essential elements such that information is efficiently conveyed and mutually understood ~~include protocols~~ for communicating changes to real-time operating ~~states~~conditions and ~~protocols for issuing and~~ responding to operating directives.

The project may involve moving some requirements that address communications protocols from existing standards into this new standard and will involve adding new requirements that more fully address communications protocols under various operating ~~scenarios~~conditions.

**Standards Authorization Request Form**

***Reliability Functions***

The Standard will Apply to the Following Functions ( <i>Check all applicable boxes.</i> )		
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input checked="" type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input type="checkbox"/>	Interchange Coordinator	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
<input type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
<input type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input checked="" type="checkbox"/> <input type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input checked="" type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input checked="" type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input checked="" type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input type="checkbox"/>	Market Operator	Interface point for reliability functions with commercial functions.

**Reliability and Market Interface Principles**

Applicable Reliability Principles ( <i>Check all boxes that apply.</i> )	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.
<input type="checkbox"/>	5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.
<input type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input type="checkbox"/>	7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.
<input type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
<b>Does the proposed Standard comply with all of the following Market Interface Principles?</b> ( <i>Select 'yes' or 'no' from the drop-down box.</i> )	
Recognizing that reliability is an essential requirement of a robust North American economy:	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes	

## Standards Authorization Request Form

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft a standard based on this description.)

### **Scope**

The scope of the proposed standard ~~or revised standards~~ is to establish ~~a common lexicon~~ essential elements of communications protocols and communications paths such that ~~all~~ operators and users of the North American bulk electric system ~~will have the same understanding as to its meaning, usage and take pre-determined action in response~~ efficiently convey information and ensure mutual understanding. The August 2003 Blackout Recommendation Number 26 calls for a tightening of communications protocols. This standard is to ensure that effective communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities. References to communication protocols in other NERC Standards may be moved to this new standard. The standard drafting team shall consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions.

### **Applicability**

Medical, law enforcement, air traffic control and other fields routinely use mutually defined and understood terminology or codes. Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.

Communications protocols shall precisely define terms, codes, phrases, words, etc. as to their connotation, conditions for use, context of use and expected responses in reply to these terms, codes, phrases, words, etc. ~~Furthermore the protocols shall define a rigorous script for the Sender and Receiver of information.~~ Effective communications with proper communications protocols among the operating entities are essential for maintaining reliable system operations.

The standard will include requirements for the following:

1. Real-time system operators will be required to use specific communications protocols under normal, abnormal and emergency conditions to ~~quickly~~ relay critical reliability-related information in a timely and effective manner.
2. Reliability Coordinators, Balancing Authorities, Generation Operators, Transmission Operators, Transmission Owners and Distribution Providers will be required to ~~adopt and employ~~ comply with this standard ~~directives that use pre-defined terms, and will require entities that receive those directives to respond to the reliability coordinator using pre-defined terms.~~
3. The standard will include requirements for entities that experience abnormal conditions to use pre-defined terms such as

## Standards Authorization Request Form

proposed in the "Alert Level Guideline" (attached) to communicate the operating ~~conditions~~situation to other entities that are in a position to either assist in resolving the operating ~~situation~~ ~~condition~~ or to entities that are impacted by the operating ~~condi~~situation.

4. The standard may include other requirements that involve communications protocols for real-time system operators.

~~The standard should consider address directives 1 and 3 of the FERC staff's Preliminary Assessment of NERC Standards (dated May 11, 2006) in which the FERC staff cited various Blackout Report excerpts pertaining to ineffective communications as a factor common to the August 14 blackout and other previous major outages in North America. The Commission staff interprets Blackout Report recommendation #26 that urges "effective communications" with "tightened communications protocols" among operating entities to include two key components:~~

- ~~(i) Effective communications that are delivered in clear language via pre-established communications paths among pre-identified operating entities, and~~
- ~~(ii) Communications protocols which clearly identify that any operating actions with reliability impact beyond a local area or beyond a Reliability Coordinator's area must be communicated to the appropriate Reliability Coordinator for assessment and approval prior to their implementation to ensure reliability of the interconnected systems.~~

~~The communications protocols may be developed and then distributed to relevant standards and/or may be developed and retained in one or more specialized standards. Order 693 Mandatory Reliability Standards, paragraph 540 which contains (directive 1 will also be addressed in Project 2006-06; directive 2 will be addressed in Project 2006-06):~~

"...the Commission identified concerns regarding COM-002-2, the proposed Reliability Standard serves an important purpose by requiring users, owners and operators to implement the necessary communications and coordination among entities. Accordingly, the Commission approves Reliability Standard COM-002-2 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to COM-002-2 through the Reliability Standards development process that: (1) expands the applicability to include distribution providers as applicable entities; (2) includes a new Requirement for the reliability coordinator to assess and approve actions that have impacts beyond the area view of a transmission operator or balancing authority and (3) requires tightened communications protocols, especially for communications during alerts and emergencies. Alternatively, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. Finally, we direct the ERO to include APPA's suggestions to complete the Measures and Levels of Non-Compliance in its modification of COM-002-2 through the Reliability Standards development process."

**Standards Authorization Request Form**

**Standards Authorization Request Form**

***Related Standards***

Standard No.	Explanation - these requirements may need to be modified or moved to the new standard
COM-001-1	R4 is a requirement for the Reliability Coordinator's, Transmission Operator's, and Balancing Authority's real-time operating personnel to use English when communicating between entities.
COM-002-2	R1.1 is a requirement for the Balancing Authority and Transmission Operator to make notifications when there is a threat to reliability.  R2 is a requirement for the Reliability Coordinator, Transmission Operator and Balancing Authority relative to issuing and receiving operating directives.
EOP-001-90	R4.1 includes a requirement for the Transmission Operator and Balancing Authority to have communications protocols for use during emergencies <u>(and Attachment 1-EOP-001-0)</u>
EOP-002-2	R6.5 and R7.2 require the Balancing Authority to ask the Reliability Coordinator to declare an Energy Emergency or an Energy Emergency Alert under certain conditions  R8 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions  R9.1 requires the Load-serving Entity to ask the Reliability Coordinator to declare an Energy Emergency Alert under certain conditions
EOP-006-1	R4 requires the Reliability Coordinator to disseminate information regarding restoration to neighboring Reliability Coordinators and Transmission Operators or Balancing Authorities  R5 requires the Reliability Coordinator to approve, communicate, and coordinate the re-synchronizing of major system islands or synchronizing points
CIP-001-1	R1 and R2 require operating entities to have procedures for communicating information relative to sabotage of bulk power system facilities
CIP-008-1	R1.2 requires the responsible entity to have a communication plan for response to a cyber security incident
IRO-001-1	R3 requires the Reliability Coordinator to direct entities to act and R8 requires entities to respond to the Reliability Coordinator's directives
IRO-004-1	R6 requires the Reliability Coordinator to direct entities to act and R7 requires entities to respond to the Reliability Coordinator's directives
IRO-005-2	R4 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions  R3, R5, R8, R11, R15, and R17 require the Reliability Coordinator to direct actions to alleviate various types of abnormal or emergency situations
IRO-014-1	R1.1 requires Reliability Coordinators to have procedures processes or plans that address communications and notifications made between Reliability Coordinators under various operating scenarios
PRC-001-1	R6 requires the Transmission Operator and Balancing Authority to make notifications when there is a change in the status of a special protection system
TOP-001-1	R3 requires some responsible entities to comply with the Reliability Coordinator's and Transmission Operator's directives  R4 requires some responsible entities to comply with the Transmission Operator's directives  R5 requires the Transmission Operator to notify its Reliability Coordinator of certain emergency situations

**Standards Authorization Request Form**

TOP-002-2	R14, R16 and R17 require responsible entities to notify their Reliability Coordinator of various changes to operating parameters R18 requires the use of uniform line identifiers when referring to transmission facilities of an interconnected network
TOP-007-0	R1 requires the Transmission Operator to notify its Reliability Coordinator when it exceeds an SOL or IROL R4 requires the Reliability Coordinator to direct entities to take actions to restore the system to within SOLs or IROLs
TOP-008-1	R3 requires the Transmission Operator to make notifications if it disconnects an overloaded facility
VAR-001-1	R8 and R12 require the Transmission Operator to direct actions to maintain voltage within limits and to prevent voltage collapse
VAR-002-1	R2.2 and R5.1 require the Generator Operator to comply with directives R3 requires the Generator Operator to notify the Transmission Operator of various status or capability changes

## Guideline for Operating State Alert Levels

### Background

System operators need common definitions for normal, alert, and emergency conditions to enable them to act appropriately and predictably as system conditions change. On August 14, 2003, the principal entities involved in the blackout did not have a shared understanding of whether the grid was in an emergency condition, nor did they have a common understanding of the functions, responsibilities, capabilities, and authorities of reliability coordinators and control areas under emergency or near-emergency conditions.

*The U.S./Canada Task Force Recommendation 20 recommends the establishment of clear definitions of normal, alert, and emergency operational system conditions, and to clarify the roles, responsibilities, and authorities of reliability coordinators and control areas under each condition.*

At its May 2006 meeting, the NERC Reliability Coordinator WG approved a motion to implement a pilot program that defined normal, alert, and emergency operating conditions as they relate to Transmission Loading and Security. The intent is to align the definitions for Transmission Loading and Security with the conditions identified in the Emergency Energy Alert states. In an effort to clarify the application of the definitions being used in the pilot program this guideline has been created. ***In the event of a conflict between the pilot program and applicable NERC Standards the Standards should always be applied first.***

Condition Level >>>>	Normal	Alert Level 1	Alert Level 2	Alert Level 3
Threat Level>>>>	Low	Elevated	High	Severe
Condition/Threat Color >>>>	Green	Yellow	Orange	Red
Generating/capacity	EEA 0 No Energy Deficiencies	EEA 1 all available resources in use	EEA 2 Load management procedures in effect	EEA 3 Firm load interruption imminent or in progress
Transmission	TEA 0 Respecting all IROLs	TEA 1 All available resources committed to respecting IROLs	TEA 2 Load Mgmt procedures in effect to respect IROLs	TEA 3 Firm Load Curtailments in effect to respect IROLs
Security	SEA 0 No cyber threat identified; No known threats on control center or grid assets (lines, substations, generators)	SEA 1 Cyber threat identified or is imminent, OR verified physical threat against control center or grid assets	SEA 2 Cyber event is affecting control center EMS capability, OR physical attack at <b>single</b> site (control center or grid assets- lines, substations, generators)	SEA 3 Cyber event has shut down control center EMS capability, OR physical attack at <b>multiple</b> sites (control center or grid assets- lines, substations, generators)

## Transmission Emergency Alert (TEA) Levels

### Introduction

This Attachment provides the procedures by which a Transmission Operator or Reliability Coordinator can advise of actions taken to manage potential or actual Interconnected Reliability Operating Limit (IROL) violations.

All three operating alert states (EEAs, TEAs and SEAs) are independent of each other and should be declared independently but they may also be declared concurrently.

### A. General Requirements

**1. Initiation by Reliability Coordinator.** A Transmission Emergency Alert (TEA) may be initiated only by a Reliability Coordinator at:

- 1) the Reliability Coordinator's own request, or
- 2) upon the request of a Transmission Operator

**1.1. Situations for initiating alert.** A Transmission Emergency Alert may be initiated for the following reasons:

- When all the available resources have been committed to respect an IROL in the pre-contingency state.
- When load curtailment procedures have been implemented to respect an IROL.

**2. Notification.** A Reliability Coordinator who declares a Transmission Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the "System Emergency" category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and Reliability Coordinators when the alert has ended.

### B. Transmission Emergency Alert Levels

#### Introduction

To ensure that all Reliability Coordinators clearly understand potential and actual actions taken to manage IROLs on the Interconnection, NERC has established three levels of Transmission Alerts. The Reliability Coordinators will use these terms when explaining actions taken to manage IROLs to each other. A Transmission Emergency Alert is an emergency procedure, not a daily operating practice, and is not intended as an alternative to compliance with NERC reliability standards.. The Reliability Coordinator may declare whatever alert level is appropriate, and need not proceed through the alerts sequentially.

## 1. Transmission Emergency Alert 1 (TEA 1) – All available resources committed to respecting IROLs.

### Circumstances:

- The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available resources are committed to respect the IROL and is concerned about its ability to respect the IROL.

## 2. Transmission Emergency Alert 2 (TEA 2) — Load management procedures in effect to respect IROLs.

### Circumstances:

- The Reliability Coordinator or Transmission Operator foresees or has implemented procedures up to, but excluding, interruption of firm load commitments. When time permits, these procedures may include, but are not limited to:
  - Public appeals to reduce demand.
  - Voltage reduction.
  - Interruption of non-firm end use loads in accordance with applicable contracts (for emergency purposes, not economic reasons).
  - Demand-side management.
  - Utility load conservation measures
  - TLR 6

Note: TLR 5 would normally be implemented in advance of this alert state. Under some circumstances TLRs may not be available or effective and would not be called prior to this alert state.

During TEA 2, Reliability Coordinators and Transmission Operators have the following responsibilities:

**2.1 Declaration period.** The declaring Reliability Coordinator shall update the RCIS (under “System Emergency”) at a minimum of every hour until the TEA 2 is terminated.

**2.4 Evaluating and mitigating transmission limitations.** The Reliability Coordinators shall review all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs) and transmission loading relief procedures in effect that may be contributing to the alert level. *Where appropriate*, the Reliability Coordinators shall inform the Transmission Operators under their purview of the pending Transmission Emergency Alert and request that they increase their ATC by actions such as restoring transmission elements that are out of service, reconfiguring their transmission system, adjusting phase angle regulator tap positions, implementing emergency operating procedures and redispatching generation.

**2.4.1 Notification of ATC adjustments.** Resulting increases in ATCs shall be communicated to the market via posting on the appropriate OASIS websites by the Transmission Providers.

**2.4.2 Availability of generation redispatch options.** Available generation redispatch options shall be immediately communicated to the declaring Reliability Coordinator.

**2.4.3 Evaluating impact of current transmission loading relief events.** The Reliability Coordinators shall evaluate the impact of any current transmission loading relief events on the ability to supply emergency assistance to the declaring entity. This

evaluation shall include analysis of system reliability and involve close communication among Reliability Coordinators.

**2.4.4 Initiating inquiries on re-evaluating SOLs and IROLs.** The Reliability Coordinators shall consult with the Balancing Authorities and Transmission Providers in their Reliability Areas about the possibility of re-evaluating and revising SOLs or IROLs.

**2.5 Coordination of emergency responses.** The Reliability Coordinator shall communicate and coordinate the implementation of emergency operating responses.

**2.6 Actions Prior to Declaration of TEA 3.** Before declaring a TEA 3, all available resources must be committed. This includes but is not limited to:

**2.6.1 All available generation units are on-line.** All generation capable of being on-line in the time frame of the emergency is on-line including quick-start and peaking units, regardless of cost.

**2.6.2 Purchases made regardless of cost.** All firm and non-firm purchases have been made, regardless of cost.

**2.6.3 Non-firm sales recalled and contractually interruptible loads and demand-side management curtailed.** All non-firm sales have been recalled, contractually interruptible retail loads curtailed, and demand-side management activated within provisions of the agreements.

**2.6.4 Operating Reserves.** Operating reserves are being utilized such that the declaring entity may be carrying reserves below the required minimum or has initiated emergency assistance through its operating reserve sharing program.

### **3. Transmission Emergency Alert 3 (TEA 3) — Firm load curtailment in effect to respect IROLs.**

#### **Circumstances:**

The Reliability Coordinator or Transmission Operator foresees or has implemented firm load obligation interruption to respect an IROL.

**3.1 Continue actions from TEA 2.** The Reliability Coordinators and the declaring entity shall continue to take all actions initiated during TEA 2.

**3.2 Declaration Period.** The declaring Reliability Coordinator shall update the RCIS under “System Emergency” at a minimum of every hour until the TEA 3 is terminated.

**3.3 Use of Transmission short-time limits.** The Reliability Coordinators shall request the appropriate Transmission Providers within their Reliability Area to utilize available short-time transmission limits or other emergency operating procedures in order to increase transfer capabilities.

**3.4 Re-evaluating and revising SOLs and IROLs.** The Reliability Coordinator of the declaring entity shall evaluate the risks of revising SOLs and IROLs on the reliability of the overall transmission system. Re-evaluation of SOLs and IROLs shall be coordinated with other Reliability Coordinators and only with the agreement of the Transmission Operator whose equipment would be affected. The resulting increases in transfer capabilities shall only be made

available to the declaring entity who has requested a TEA 3 condition. SOLs and IROLs shall only be revised as long as a TEA 3 condition exists or as allowed by the Transmission Operator whose equipment is at risk. The following are minimum requirements that must be met before SOLs or IROLs are revised:

**3.4.2 Mitigation of cascading failures.** The Reliability Coordinator shall use its best efforts to ensure that revising SOLs or IROLs would not result in any cascading failures within the Interconnection.

**3.5 Returning to pre-emergency SOLs and IROLs.** Whenever the transmission systems can be returned to their pre-emergency SOLs or IROLs, the declaring Entity shall notify its respective Reliability Coordinator.

**3.5.1 Notification of other parties.** Upon notification from the declaring entity that an alert has been downgraded, the Reliability Coordinator shall notify the affected Reliability Coordinators (via the RCIS), Transmission Operators and Balancing Authorities that their systems can be returned to their normal limits.

#### **4. Transmission Emergency Alert 0 (TEA 0) - Termination.**

When the declaring Entity is able to respect IROL requirements and is no longer concerned with its ability to respect IROLs, it shall request its Reliability Coordinator to terminate the alert.

**4.1. Notification.** The Reliability Coordinator shall notify Reliability Coordinators via the RCIS of the termination. The Reliability Coordinator shall also notify the affected Transmission Operators and Balancing Authorities. The TEA 0 shall also be posted on the NERC website if the original alert was so posted.

## Security Emergency Alerts (SEA)

### Introduction

This Attachment provides the procedures by which a Reliability Coordinator, Transmission Operator or Balancing Authority can communicate the physical and cyber security status of their facilities.

All three operating alert states (EEAs, TEAs and SEAs) are independent of each other and should be declared independently but they may also be declared concurrently.

### A. General Requirements

**1. Initiation by Reliability Coordinator.** A Security Emergency Alert may be initiated only by a Reliability Coordinator at

- 1) The Reliability Coordinator's own request, or
- 2) Upon the request of a Transmission Operator, or
- 3) Upon the request of a Balancing Authority

**1.1. Situations for initiating alert.** A Security Emergency Alert may be initiated for the following reasons:

- A Cyber threat affecting a control center, grid or generator assets has been identified or is imminent.
- A physical threat affecting a control center, grid or generator assets has been identified or is imminent.

### 2. Notification.

A Reliability Coordinator who initiates a Security Emergency Alert shall notify all Transmission Operators and Balancing Authorities in its Reliability Area. The Reliability Coordinator shall also notify Reliability Coordinators of the situation via the Reliability Coordinator Information System (RCIS) using the "CIP" category. Additionally, conference calls between Reliability Coordinators shall be held as necessary to communicate system conditions. The Reliability Coordinator shall also notify all Transmission Operators and Balancing Authorities in its Reliability Area and other Reliability Coordinators when the alert has ended

### B. Security Emergency Alert (SEA) Levels

To ensure that all Reliability Coordinators clearly understand potential and actual Security Emergency Alerts, NERC has established three levels of Security Emergency Alerts. The Reliability Coordinators will use these terms when explaining security alerts to each other. A Security Emergency Alert is an emergency procedure, not a daily operating practice, and is not intended as an alternative to compliance with NERC reliability standards. The Reliability Coordinator may declare whatever alert level is necessary, and need not proceed through the alerts sequentially.

#### 1. Security Emergency Alert 1 (SEA 1) – Cyber or Physical threat is identified or imminent

**Circumstances:**

- The Reliability Co-ordinator, Transmission Operator or Balancing Authority has identified an actual or imminent cyber or physical threat to one of its facilities including but not limited to:

- Control Centers
- Generating facilities
- Substations
- Transmission Lines

**2. Security Emergency Alert 2 (SEA 2) – Cyber event *impacts* control center EMS or physical attack at a *single site***

**Circumstances:**

- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified an actual cyber threat event that is affecting control center EMS capability.
- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified a physical attack at a single site.

During Security Emergency Alert 2, Reliability Coordinators, Transmission Operators and Balancing Authorities have the following responsibilities:

**2.1 Notifying other Reliability Coordinators, Transmission Operators and Balancing Authorities**

The Reliability Coordinator shall post the declaration of the alert level along with the location of the affected facility on the RCIS under “CIP”.

**2.2 Declaration period.**

The declaring Entity shall update its Reliability Coordinator of the situation at a minimum of every hour until the SEA 2 is terminated. The Reliability Coordinator shall update the RCIS as changes occur and pass this information on to the affected Reliability Coordinators, Transmission Operators and Balancing Authorities.

**3. Security Emergency Alert 3 (SEA 3) – Cyber event *shuts down* control center EMS or physical attack at *multiple sites***

**Circumstances:**

- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified an actual cyber threat event that has shutdown a control center EMS capability.
- The Reliability Coordinator, Transmission Operator or Balancing Authority has identified a physical attack at a multiple sites

### **3.1. Notifying other Reliability Coordinators, Balancing Authorities and Transmission Operators**

The Reliability Coordinator shall post the declaration of the alert level along with the locations of the affect facilities on the RCIS under “CIP”.

### **3.2. Declaration period**

The declaring Entity shall update its Reliability Coordinator of the situation at a minimum of every hour until the SEA 3 is terminated. The Reliability Coordinator shall update the RCIS as changes occur and pass this information on to the affected Reliability Coordinators, Transmission Operators and Balancing Authorities.

## **4. Security Emergency Alert 0 (SEA 0) – Termination of alert level**

When the declaring entity believes it is no longer under threat, it shall request its Reliability Coordinator to terminate the SEA.

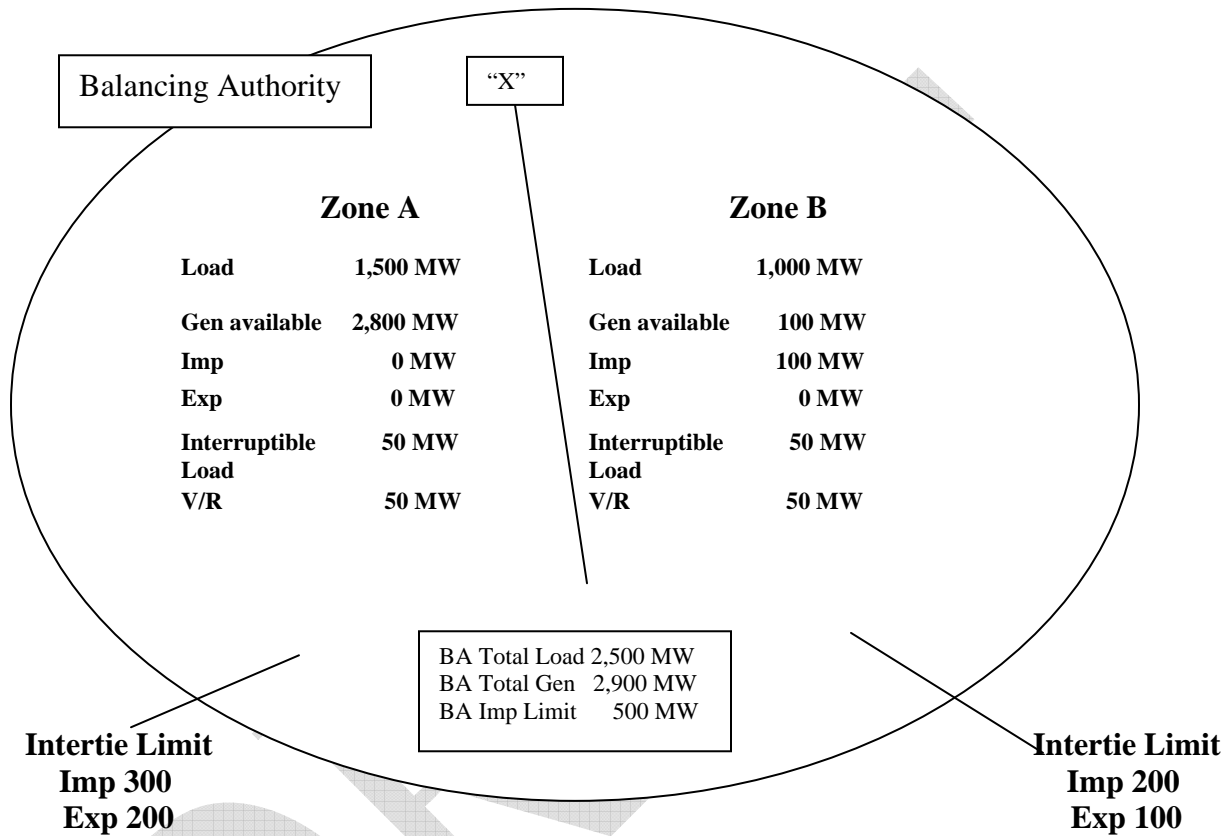

### **4.1. Notification**

The Reliability Coordinator shall notify all other Reliability Coordinators via the RCIS of the termination. The Reliability Coordinator shall also notify the affected Transmission Operators and Balancing Authorities

**Example #1**

**IROL violation on “X”  
No Global Adequacy Concerns**

**IROL “X”  
500 MW - A to B  
300 MW - B to A**

- EEA** 1 No
- 2 No
- 3 No
- TEA** 1 Yes
- 2 Yes
- 3 Yes

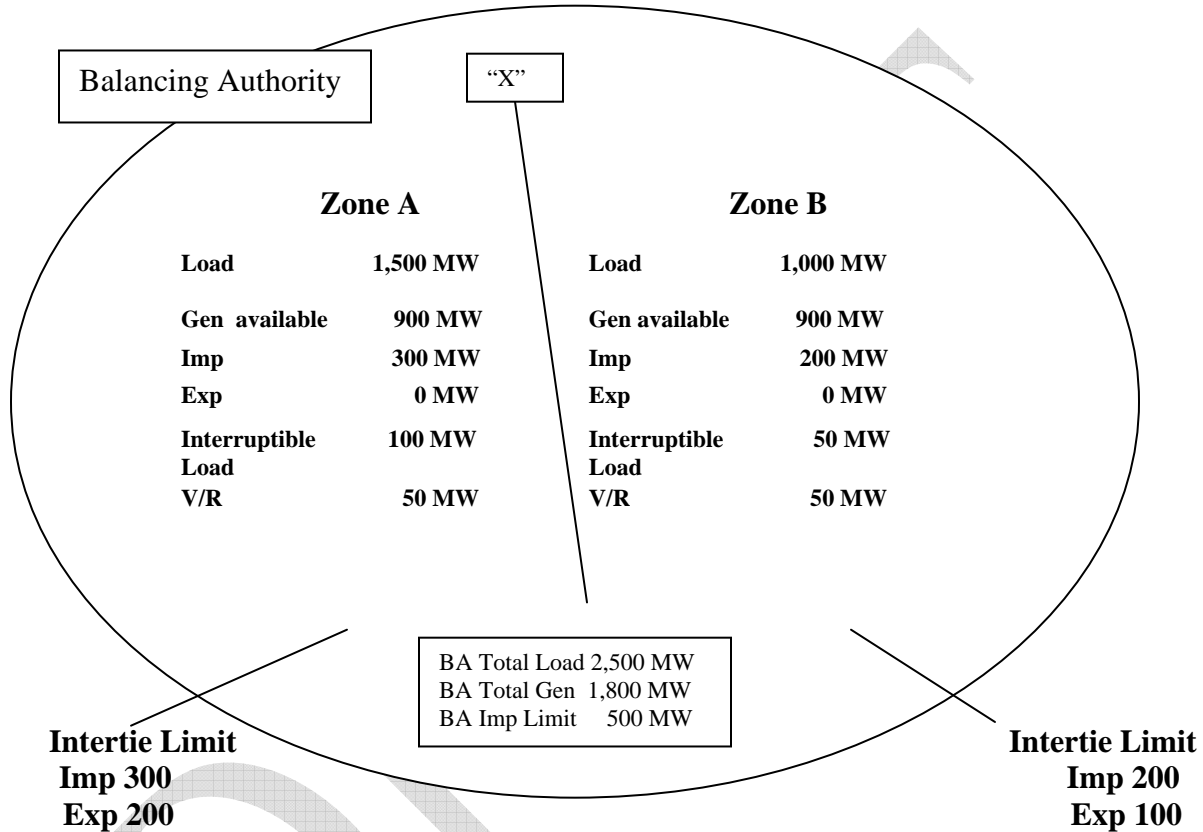

In this example the available generation in A is in excess of its load requirements. The available generation in B is less than its load requirements. Area B will be relying on the full transfer capability of the interface “X” plus an additional import of 100 MW to the maximum limit on the intertie in Area B. With the implementation of the interruptible load and V/R the firm load requirements in B cannot be met without the use of Firm load shedding.

- In this scenario an EEA is not required as the BA is able to meet its global load/generation requirements.
- When this situation is forecast a TEA 1 should be issued to indicate the potential concerns with the ability to respect the IROL limit “X” without the use of load management procedures.
- When load management procedures are implemented in Real Time to respect the IROL “X”, a TEA 2 should be issued.
- When Firm load is curtailed to respect the limit a TEA 3 should be issued.

**Example #2**

**Global Adequacy Deficiency  
No IROL Violation**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

- EEA** 1 Yes  
 2 Yes  
 3 No
- TEA** 1 No  
 2 No  
 3 No

In this example the available generation in A is less than its load requirements. The available generation in B is less than its load requirements. There is a Global Adequacy deficiency after considering full import capability and utilization of interruptible load and V/R.

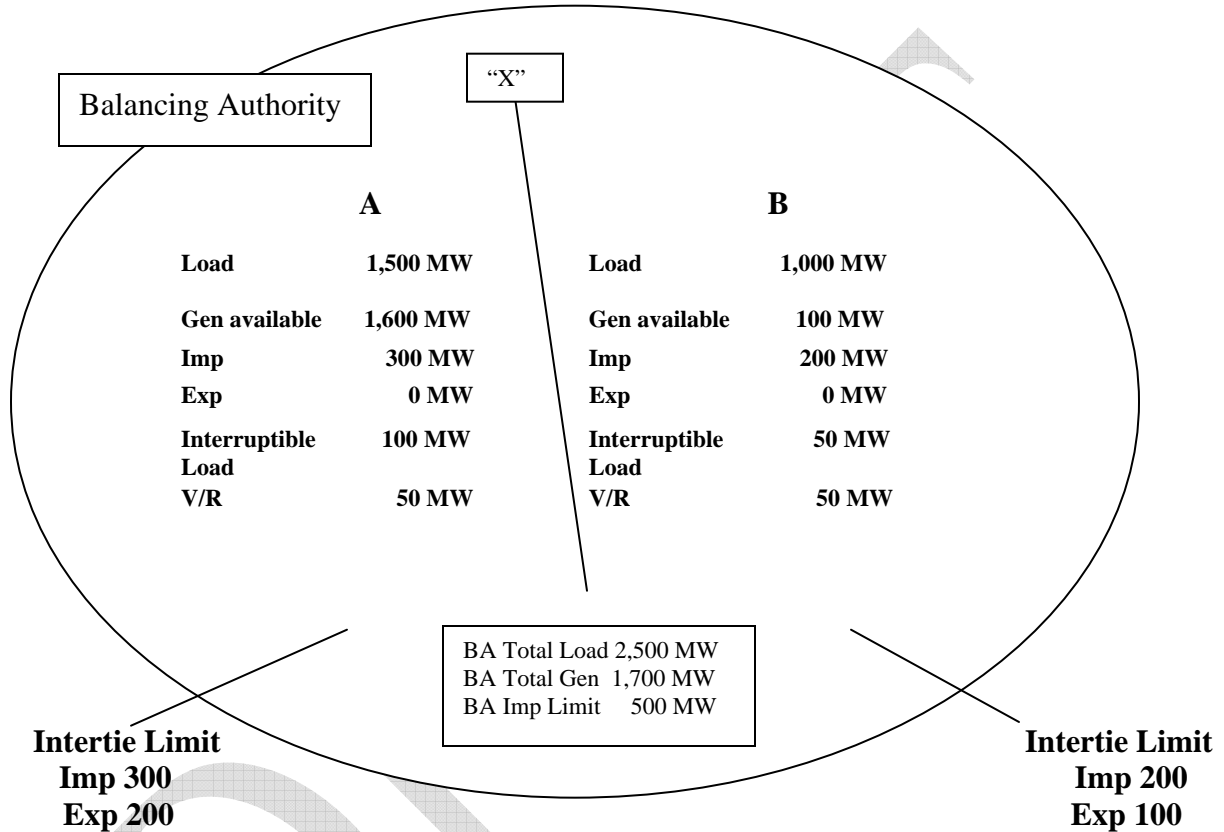

- EEA procedures should be followed
- There is no need for a TEA to be issued

**Example #3**

**Global Adequacy Deficiency  
IROL Violation**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

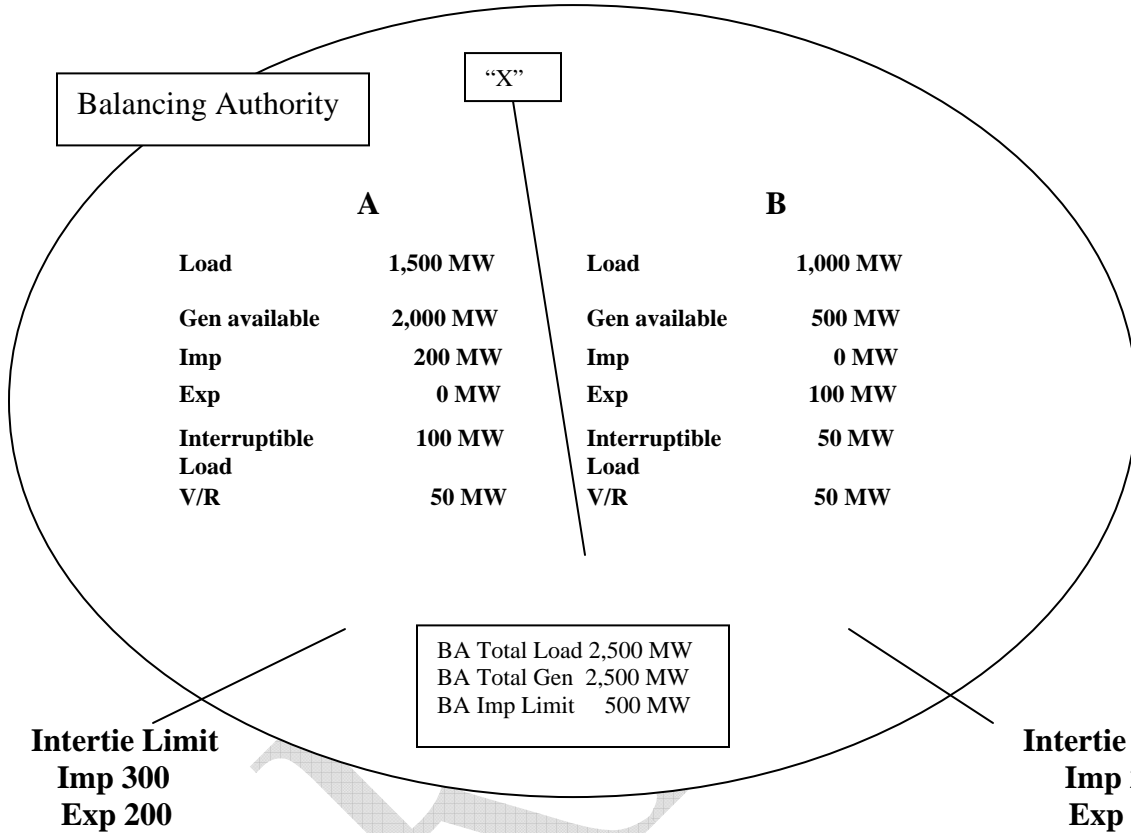

<b>EEA</b>	1	<b>Yes</b>	In this example the available generation in A meets its load requirements. The available generation in B is less than its load requirements. There is a Global Adequacy deficiency after considering full import capability. There is also an IROL violation at "X" in the direction of A to B to meet the load requirements in B depending on where load management procedures are implemented.
	2	<b>Yes</b>	
	3	<b>No</b>	
<b>TEA</b>	1	<b>Yes</b>	
	2	<b>Yes</b>	
	3	<b>Yes</b>	

- An EEA 1 and a TEA 1 should be issued to identify the potential issues
- When load management procedures are implemented to manage the transfer from A to B a TEA 2 should be issued (assumes B will be deficient before the global deficiency occurs).
- An EEA 2 should be issued when load management procedures are being implemented in A to manage global requirements.
- TEA 3 should also be issued when Firm load is shed in B to meet the load requirements in B while respecting the IROL.

**Example #4**

**Transaction Curtailments**

**IROL "X"**  
**500 MW - A to B**  
**300 MW - B to A**

- EEA** 1 No
- 2 No
- 3 No
- TEA** 1 No
- 2 No
- 3 No

In this example there are no global adequacy concerns. There is an export transaction in B that is causing a limit concern on "X" in the A to B direction. With the available generation in B plus the transfer capability there is no concern for violating the IROL limit. The transaction is creating a situation where it will be required curtailed at some point to prevent the IROL violation. Assuming the TLR procedure would be effective at relieving this constraint regardless of the TLR level (at either the TLR 3 or 5 level) no TEA

would be required as there is no concern that the IROL can't be respected with control actions that don't involve load management procedures.

April 18, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement**  
**Nomination Periods Open for Three Drafting Teams**

**The Standards Committee (SC) announces the following standards actions:**

**Nominations for Project 2007-09 Generator Verifications SAR Drafting Team (April 18–May 2, 2007)**

The Standards Committee is seeking industry experts to serve on the [Generator Verification](#) SAR Drafting Team. This project calls for completing the final four Phase III & IV standards (PRC-019, PRC-024, MOD-026, and MOD-027) and for refinement of two standards that were approved in 2005 (MOD-024 and MOD-025).

- PRC-019 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024 — Generator Performance During Frequency and Voltage Excursions
- MOD-024 — Verification of Generator Gross and Net Real Power Capability
- MOD-025 — Verification of Generator Gross and Net Reactive Power Capability
- MOD-026 — Verification of Models and Data for Generator Excitation System Functions
- MOD-027 — Verification of Generator Unit Frequency Response

The set of six standards all require generator verifications — either to ensure that generators will not trip off line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions or to ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

If you are interested in serving on this team, please complete this [nomination form](#) and return it to [sarcomm@nerc.net](mailto:sarcomm@nerc.net) with “GEN VER SARDT Nomination” in the subject line, no later than **May 2, 2007**.

**Nominations for Project 2006-03 System Restoration and Blackstart Standard Drafting Team (April 18–May 2, 2007)**

The Standards Committee is seeking additional industry experts to serve on the [System Restoration and Blackstart](#) Standard Drafting Team. This project calls for the modification of the following standards:

- EOP-005 — System Restoration Plans
- EOP-006 — Reliability Coordination — System Restoration
- EOP-007 — Establish, Maintain, and Document a Regional Blackstart Capability Plan
- EOP-009 — Documentation of Blackstart Generating Unit Test Results

REGISTERED BALLOT BODY

April 18, 2007

Page Two

This project involves upgrading the overall quality of the four standards; eliminating some gaps in the requirements; eliminating some ambiguity; and eliminating some “fill-in-the-blank” components. The Standards Committee has appointed the initial standard drafting team, but is seeking additional members, particularly from within the SPP and WECC regions.

If you are interested in serving on this team, please complete this [nomination form](#) and return it to [sarcomm@nerc.net](mailto:sarcomm@nerc.net) with “SRBS SDT Nomination” in the subject line, no later than **May 2, 2007**.

**Nominations for Project 2007-02 Operating Personnel Communications Protocols SAR Drafting Team (April 18–May 2, 2007)**

The Standards Committee is seeking additional industry experts to serve on the [Operating Personnel Communications Protocols](#) SAR Drafting Team. This SAR calls for the development of communications protocols for use by real-time system operators to improve situational awareness and shorten response time. The Standards Committee has appointed an initial SAR Drafting Team but is seeking additional nominations, particularly from the FRCC, NPCC, and SPP regions, from Canada, and from the generation and load-serving entity segments that will be affected by the proposed standard.

If you are interested in serving on this team, please complete this [nomination form](#) and return it to [sarcomm@nerc.net](mailto:sarcomm@nerc.net) with “OPS COM SARDT Nomination” in the subject line, no later than **May 2, 2007**.

**Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007

### Description of Current Draft:

This is the first draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 45-day comment period.

### Future Development Plan:

Anticipated Actions	Anticipated Date
1. Drafting team considers comments, makes conforming changes, posts for 30-day comment period.	March 16 to April 15, 2010
2. Drafting team considers comments, makes conforming changes, requests SC approval to proceed to pre-ballot comment period.	May 15, 2010
3. First ballot of standards.	June 2010
4. Recirculation ballot of standards.	July 2010
5. Board adopts standards.	August or November 2010

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

**Communications Protocol** — A framework of rules that govern how verbal and written information is exchanged.

**Three-part Communication** — A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct by the party who initiated the communication.

**Interoperability Communication** — Communication between two or more entities to exchange reliability-related information to be used by the entities to change the state or status of an element or facility of the Bulk Electric System.

## Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To timely convey reliability-related information effectively, accurately, and consistently in order to ensure mutual understanding by all key parties, especially during alerts and emergencies.
4. **Applicability:**
  - 4.1. Transmission Operator
  - 4.2. Transmission Owner
  - 4.3. Balancing Authority
  - 4.4. Reliability Coordinator
  - 4.5. Generator Operator
  - 4.6. Distribution Provider
  - 4.7. Transmission Service Provider
  - 4.8. Load Serving Entity
5. **(Proposed) Effective Date:**

First day of first calendar quarter, one calendar year following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

## Requirements

- R1.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall develop a written Communications Protocol Operating Procedure (CPOP) for Interoperability Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The CPOP shall include but is not limited to all elements described in Requirements R2 through R7 to ensure effective Interoperability Communications.  
*[Violation Risk Factor: Low][Time Horizon: Long Term Planning]*
- R2.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for verbal and written Interoperability Communications.  
*[Violation Risk Factor: High][Time Horizon: Real Time]*
- R3.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use the English language for verbal and written Interoperability Communications. Responsible Entities may use an alternate language for internal communications. *[Violation Risk Factor: High][Time Horizon: Real time]*
- R4.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use Central Standard Time (24 hour format) as the common

time zone for verbal and written Interoperability Communications. *[Violation Risk Factor: High][Time Horizon: Real time]*

- R5.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use Three-part Communications when issuing a directive during verbal Interoperability Communications. *[Violation Risk Factor: High][Time Horizon: Real time]*
- R6.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use the North American Treaty Organization (NATO) phonetic alphabet as identified in Attachment 2-COM-003-1 when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications. *[Violation Risk Factor: High][Time Horizon: Real time]*
- R7.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. *[Violation Risk Factor: High][Time Horizon: Real time]*

## **Measures**

- M1.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall have and provide for review, its written CPOP that includes all elements described in Requirements R2 through R7.
- M2.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall have and provide evidence that pre-defined system condition terminology contained in Attachment 1-COM-003-1 was used for verbal and written Interoperability Communications. Evidence may include but is not limited to voice recordings, transcripts, operating logs, or on site observations.
- M3.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall have and provide evidence that the English language was used for verbal and written Interoperability Communications. Responsible Entities may use an alternate language for internal operations. Evidence may include but is not limited to voice recordings, transcripts, operating logs, or on site observations.
- M4.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall provide evidence that the Central Time Zone was used for verbal and written Interoperability Communications. Evidence may include but is not limited to voice recordings, transcripts, operating logs, or on site observation.
- M5.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall provide evidence that Three-part Communications was used

when issuing directives during verbal Interoperability Communications. Evidence may include but is not limited to voice recordings, transcripts, operating logs, or on site observations.

- M6.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider provides evidence that the NATO phonetic alphabet was used when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information or for clarification during verbal Interoperability Communications. Evidence may include but is not limited to voice recordings, transcripts, operating logs, or on site observations.
- M7.** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider provides documented evidence such as a list or a one-line diagram acknowledged and used by the affected parties that confirms there is mutual agreement on the names/identifiers of lines and equipment. Evidence of use may include but is not limited to voice recordings, transcripts, operating logs, or on site observations.

## **Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

Regional Entity

#### **1.2. Compliance Monitoring Period and Reset**

Not Applicable

#### **1.3. Compliance Monitoring and Enforcement Processes:**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

Each Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall retain its current, in force

document and any documents in force for Requirement 1, Measure 1 since the last compliance audit.

- Each Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall retain for Requirement 2 through 7, Measure 2 through 7, dated operator logs for the most recent 12 months and voice recordings or transcripts of voice recordings for the most recent 3 months.

If a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

R #	VRF	Lower	Moderate	High	Severe
R1	Low		The responsible entity developed a CPOP but failed to incorporate one of the elements contained in R2 through R7.	The responsible entity developed a CPOP but failed to incorporate two or more elements contained in R2 through R7.	The responsible entity failed to develop a written CPOP.
R2	High				The responsible entity failed to use pre-defined system condition terminology (Attachment 1-COM-003-1) for verbal and written Interoperability Communications.
R3	High				The responsible entity failed to use the English language for verbal and written Interoperability Communications.
R4	High				The responsible entity failed to use Central Standard Time (24 hour format) as the common time zone for verbal and written Interoperability Communications.
R5	High				The responsible entity failed to use Three-part Communications when issuing a directive during verbal Interoperability Communications.
R6	High				The responsible entity failed to use the North American Treaty Organization (NATO) phonetic alphabet when issuing notifications, directions, instructions, orders and other reliability related operating information that involves alpha-numeric information or for clarification during verbal Interoperability Communications.
R7	High				The responsible entity failed to use pre-determined, mutually understood line and equipment identifiers for verbal and written Interoperability Communications.

Attachment 1 — COM-003-1 — Operating State Alert Levels

This Attachment 1-COM-003-1 defines normal, alert, and emergency operating conditions as they relate to Transmission Loading, Physical and Cyber Security. These definitions for Transmission Loading, Physical and Cyber Security Alert states align with the Emergency Energy Alert (EEA) states (as already described in NERC Reliability Standard EOP-002-2.1). The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions.

Reliability Coordinator Notifications for Physical Security Emergency Alerts		
<p><b>Condition YELLOW:</b> The Reliability Coordinator is notified of a verified actual or imminent physical threat affecting any ONE site within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>	<p><b>Condition ORANGE:</b> The Reliability Coordinator is notified of a physical attack at any ONE site within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>	<p><b>Condition RED:</b> The Reliability Coordinator is notified of a physical attack at multiple sites within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>
<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Physical Security Emergency Alert – PSEA Level One within (identify RC, TOP or BA area)”</p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Physical Security Emergency Alert – PSEA Level Two within (identify RC, TOP, or BA area)”</p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Physical Security Emergency Alert – PSEA Level Three within (identify RC, TOP, or BA area)”</p>
<p><b>Notify all the following functional entities within the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ Balancing Authorities</li> <li>▪ Distribution Service Providers</li> <li>▪ Generator Operators</li> <li>▪ Transmission Operators</li> <li>▪ Transmission Owners</li> </ul>		
<p><b>Notify the following functional entities outside the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ All Reliability Coordinators using “CIP Free Form” category of RCIS</li> </ul>		
<p><b>Notify the following entities:</b></p> <ul style="list-style-type: none"> <li>▪ NERC (ES-ISAC) via the RCIS. Under “External Links” use “ES-ISAC Site”.</li> </ul>		
<p><b>Additional Communications:</b></p> <ul style="list-style-type: none"> <li>▪ Post the declaration of the alert level along with the location of the affected facility to other parties as required by internal communication procedure, OE-417 Form, law enforcement, etc.</li> </ul>

<p><b>Notify the following outside the Reliability Coordinator Area:</b>                  All Reliability Coordinators using “CIP Free Form” category of RCIS. Notify ES-ISAC of end of Alert and any other entities initially notified.</p>		
<p><b>Additional Communications:</b></p> <ul style="list-style-type: none"> <li>▪ Remove the declaration of the alert level from the RCIS and other entities initially notified.</li> </ul>		

Attachment 1 — COM-003-1 — Operating State Alert Levels (continued)

Reliability Coordinator Notifications for Cyber Security Emergency Alerts		
<p><b>Condition YELLOW:</b> The Reliability Coordinator is notified of a identified actual or imminent cyber threat affecting any ONE site within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>	<p><b>Condition ORANGE:</b> The Reliability Coordinator is notified of a cyber attack at any ONE site within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>	<p><b>Condition RED:</b> The Reliability Coordinator is notified of a cyber attack at multiple sites within the RC Area:</p> <ul style="list-style-type: none"> <li>▪ Control center</li> <li>▪ Generating facility</li> <li>▪ Substation</li> <li>▪ Transmission line</li> </ul>
<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Cyber Security Emergency Alert – CEA <b>Level One</b> within (<b>identify RC, TOP or BA area</b>)”</p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Cyber Security Emergency Alert – CEA <b>Level Two</b> within (<b>identify RC, TOP, or BA area</b>)”</p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Cyber Security Emergency Alert – CEA <b>Level Three</b> within (<b>identify RC, TOP, or BA area</b>)”</p>
<p><b>Notify all the following functional entities within the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ Balancing Authorities</li> <li>▪ Distribution Service Providers</li> <li>▪ Generator Operators</li> <li>▪ Transmission Operators</li> <li>▪ Transmission Owners</li> </ul>		
<p><b>Notify the following functional entities outside the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ All Reliability Coordinators and CIP Participants using “CIP Free Form” category of RCIS.</li> </ul>		
<p><b>Notify the following entities:</b></p> <ul style="list-style-type: none"> <li>▪ NERC (ES-ISAC) via the RCIS. Under “External Links” use “ES-ISAC Site”.</li> </ul>		
<p><b>Additional Communications:</b></p> <ul style="list-style-type: none"> <li>▪ Post the declaration of the alert level along with the location of the affected facility to other parties as required by internal communication procedure, OE-417 Form, law enforcement, etc.</li> </ul>		
<p><b>Make Final Notifications:</b> “At (insert time) the Cyber Security Emergency Alert – CEA <b>Level One (identify RC, BA or TOP Area)</b> has been curtailed”</p>	<p><b>Make Final Notifications:</b> “At (insert time) the Cyber Security Emergency Alert – CEA <b>Level Two</b> within (<b>identify RC, TOP or BA Area</b>) has been curtailed”</p>	<p><b>Make Final Notifications:</b> “At (insert time) the Cyber Security Emergency Alert – CEA <b>Level Three</b> within (<b>identify RC, TOP, or BA Area</b>)” has been curtailed</p>
<p><b>Notify all the following within the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ Balancing Authorities</li> </ul>		

- Distribution Service Providers
- Generator Operators
- Transmission Operators
- Transmission Owners

**Notify the following outside the Reliability Coordinator Area:**

All Reliability Coordinators and CIP Participants using “CIP Free Form” category of RCIS. Notify ES-ISAC of end of Alert and any other entities initially notified

**Additional Communications:**

- Remove the declaration of the alert level from the RCIS and any other entities initially notified.

Attachment 1 — COM-003-1 — Operating State Alert Levels (continued)

Reliability Coordinator Notifications for Transmission Emergency Alerts		
<p><b>Condition YELLOW:</b> The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL.</p>	<p><b>Condition ORANGE:</b> The Reliability Coordinator or Transmission Operator foresees or has implemented procedures up to, but excluding, interruption of firm load commitments.</p>	<p><b>Condition RED:</b> The Reliability Coordinator or Transmission Operator foresees or has implemented firm load obligation interruption to respect an IROL.</p>
<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Transmission Emergency Alert – TEA <b>Level One</b> affecting the <i>(name of the interface; monitored and contingency element)</i>”</p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Transmission Emergency Alert – TEA <b>Level Two</b> affecting the <i>(name of the interface; monitored and contingency elements; amount of MW relief; type of load management procedures that have been or expected to be implemented i.e., voltage reduction, curtailable load reductions; relief that has been (or is expected) to be implemented to respect the limit; any actions that are expected to last the next (length of time – hours/days).</i></p>	<p><b>Make Initial Notifications:</b> “This is the Reliability Coordinator. At (insert time) there is a Transmission Emergency Alert – TEA <b>Level Three</b> affecting the <i>(name of the interface; monitored and contingency elements; amount of MW relief; amount of Firm Load curtailments that have been (or is expected) implemented to respect the limit; any actions that are expected to last the next (length of time – hours/days).</i>”</p>
<p><b>Notify all the following functional entities within the Reliability Coordinator Area:</b></p> <ul style="list-style-type: none"> <li>▪ Balancing Authorities</li> <li>▪ Distribution Service Providers</li> <li>▪ Generator Operators</li> <li>▪ Transmission Operators</li> <li>▪ Transmission Owners</li> </ul>

## Implementation Plan for COM-003-1 — Operating Personnel Communications Protocols

### Prerequisite Approvals

None

### Conforming Changes to Requirements in Already Approved Standards

- Remove R4 from COM-001-1
- Move R2 (or subsequent replacements) from COM-002-3 into COM-003-1 and retire COM-002-3

### Standard Summary

The OPCP SDT developed this new standard and is proposing removing requirements R4 from COM-001-1 and R2 (or subsequent replacements) from COM-002-3 for inclusion in this standard. This standard addresses part of Blackout Recommendation #26 and issues in FERC Order 693.

### Compliance with Standards

Once these standards become effective, the responsible entities identified in the Applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinator
- Balancing Authority
- Transmission Owner
- Transmission Operator
- Generator Operator
- Distribution Provider
- Transmission Service Provider
- Load Serving Entity

### Effective Date

The proposed effective date for this standard is the first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

**Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement**

Standard No.	Requirement(s) identified in the SAR as possibly needing to be modified or moved to the new standard	SDT Disposition/Explanation
COM-001-1	R4 is a requirement for the Reliability Coordinator's, Transmission Operator's, and Balancing Authority's real-time operating personnel to use English when communicating between entities.	<i>Requirement R4 from COM-001 has been incorporated as Requirement R3 of draft COM-003-1.</i>
COM-002-2	<p><i>R1.1 is a requirement for the Balancing Authority and Transmission Operator to make notifications when there is a threat to reliability.</i></p> <p><i>R2 is a requirement for the Reliability Coordinator, Transmission Operator and Balancing Authority relative to issuing and receiving operating directives.</i></p>	<p><i>Regarding R1.1, the SDT decided to focus on requirements that specify protocols on "How to" communicate <u>rather than</u> specified scenarios of "to Whom" or "When to" communicate (albeit COM-003 communication protocols are expected to be used when conveying real-time, reliability-related information in a high level, generic sense).</i></p> <p><i>The SDT believes this requirement focuses on predetermined communication paths / communications hardware. It does not appear to be appropriate to relocate this requirement.</i></p> <p><i>Requirement R2 to use Three-part Communication is currently in the scope of work for Project 2006-06. This Project includes a new Glossary term Reliability Directive. Upon completion of the Project 2006-06 development, the revisions to COM-002-3 will be moved to COM-003-1 and COM-002-3 will be retired.</i></p>
EOP-001-0	R4.1 includes a requirement for the Transmission Operator and Balancing Authority to have communications protocols for use during emergencies (and Attachment 1-EOP-001-0)	<i>R4.1 and EOP-001 as a whole requires "plans" for mitigating emergencies. These communication protocols differ from COM-003 protocols in that R4.1 involves actions and tasks for mitigating operational emergencies and for coordinating activities; not how to communicate.</i>
EOP-002-2	<p>R6.5 and R7.2 require the Balancing Authority to ask the Reliability Coordinator to declare an Energy Emergency or an Energy Emergency Alert under certain conditions</p> <p>R8 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions</p> <p>R9.1 requires the Load-serving Entity to ask the Reliability Coordinator</p>	<p><i>R6.5 and R7.2 prescriptively provide detail in the standard for remedies to capacity emergencies. These requirements specify the "when", "who" and "what" to communicate not "how" to communicate. Relocating or modifying these requirements is not appropriate.</i></p> <p><i>R8 of EOP-002 likewise specifies the "when" for an RC to declare an emergency alert; not "how" to communicate.</i></p> <p><i>R9.1 of EOP-002 likewise specifies the "when" for an LSE to request its RC to declare an emergency alert; not "how" to communicate.</i></p>

**Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement**

Standard No.	Requirement(s) identified in the SAR as possibly needing to be modified or moved to the new standard	SDT Disposition/Explanation
	to declare an Energy Emergency Alert under certain conditions	
EOP-006-1	<p>R4 requires the Reliability Coordinator to disseminate information regarding restoration to neighboring Reliability Coordinators and Transmission Operators or Balancing Authorities</p> <p>R5 requires the Reliability Coordinator to approve, communicate, and coordinate the re-synchronizing of major system islands or synchronizing points</p>	<p><i>The SDT decided to focus on requirements that specify protocols on “How to” communicate rather than “to Whom” or “When to” communicate. The SDT believes these requirements involve information/content and/or timing of certain communications and therefore these requirements should not be duplicated or relocated to COM-003-1 Standard because it would reduce the effectiveness of the existing standard or requirement.</i></p> <p><i>COM-003-1 is complementary to EOP-006-1 and must be complied with in conjunction with each other during emergencies.</i></p>
CIP-001-1	R1 and R2 require operating entities to have procedures for communicating information relative to sabotage of bulk power system facilities	<p><i>These requirements require procedures to be followed during emergency situations such as sabotage/security events. COM-003-1 requires protocols for ensuring understanding and conveying information in a generic sense regardless of the specific information.</i></p> <p><i>COM-003-1 is complementary to CIP-001-1 and must be complied with in conjunction with each other during sabotage emergencies.</i></p>
CIP-008-1	R1.2 requires the responsible entity to have a communication plan for response to a cyber security incident	<p><i>This requirement requires a plan, not how to ensure understanding of reliability-related information.</i></p> <p><i>COM-003-1 is complementary to CIP-008-2 R1.2 and must be complied with in conjunction with each other during Cyber Security emergencies.</i></p>
IRO-001-1	R3 requires the Reliability Coordinator to direct entities to act and R8 requires entities to respond to the Reliability Coordinator’s directives	<p><i>The purpose of this standard and its requirements is to specifically ensure IROs are mitigated within 30 minutes to ensure reliability of the BES per the direction of the Reliability Coordinator.</i></p> <p><i>The generic communication protocols of COM-003-1 can be used but removing any of the words from IRO-001-1 would dilute that standard.</i></p> <p><i>The SDT decided to focus on requirements that specify protocols on “How to” communicate rather than “to Whom” or “When to” communicate. The SDT believes the requirements R3 and R8 of IRO-001-1 involve information/content and/or timing of certain communications and therefore these requirements should not be duplicated or relocated to COM-003-1 Standard because it would</i></p>

**Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement**

Standard No.	Requirement(s) identified in the SAR as possibly needing to be modified or moved to the new standard	SDT Disposition/Explanation
		<p><i>reduce the effectiveness of the existing standard or requirement.</i></p> <p><i>COM-003-1 is complementary to IRO-001-1 R3 and R8; and must be complied with in conjunction with each other to preserve the integrity and reliability of the Bulk Electric System.</i></p>
IRO-004-1	R6 requires the Reliability Coordinator to direct entities to act and R7 requires entities to respond to the Reliability Coordinator's directives	<p><i>These requirements provide direction as to actions that should be taken when the results of next-day system studies reveal potential IROL and SOL violations within the system and not how to communicate.</i></p>
IRO-005-2	<p>R4 requires the Reliability Coordinator to issue an Energy Emergency Alert under certain conditions</p> <p>R3, R5, R8, R11, R15, and R17 require the Reliability Coordinator to direct actions to alleviate various types of abnormal or emergency situations</p>	<p><i>These requirements tell the RC "when" to take certain actions.</i></p> <p><i>R4 prescriptively provide detail in the standard for remedies to operating reserve in order to meet CPS and DCS requirements. Requirement R4 specify the "when", "who" and "what" to communicate not "how" to communicate. Relocating or modifying these requirements is not appropriate.</i></p> <p><i>R3, R5 R8, R11, R15 and R17 of IRO-005-2 specifies the "what" and "when" for RCs to mitigate potential IROL violations and CPS/DCS violations; not "how" to communicate.</i></p>
IRO-014-1	R1.1 requires Reliability Coordinators to have procedures processes or plans that address communications and notifications made between Reliability Coordinators under various operating scenarios	<p><i>This requirement specifies the contents of plans that are needed to be pre-established as well as the process to follow but not necessarily the "how" as prescribed in COM-003.</i></p> <p><i>COM-003-1 is complementary to IRO-0014-1 R1.1; and must be complied with in conjunction with each other to ensure that each Reliability Coordinator's operations are coordinated.</i></p>
PRC-001-1	R6 requires the Transmission Operator and Balancing Authority to make notifications when there is a change in the status of a special protection system	<p><i>R6 specifies that when a Special Protection System's status has changed the BA/TOP shall notify affected BA/TOPs of such a change. This is a "when" to communicate issue. COM-003-1 is complementary to PRC-001-1 R6.</i></p>
TOP-001-1	<p>R3 requires some responsible entities to comply with the Reliability Coordinator's and Transmission Operator's directives</p> <p>R4 requires some responsible entities to comply with the Transmission Operator's directives</p>	<p><i>These are "when" to communicate requirements and should not be relocated.</i></p> <p><i>COM-003-1 is complementary to TOP-001-1 and must be complied with in conjunction with each other to ensure that directives are</i></p>

**Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement**

Standard No.	Requirement(s) identified in the SAR as possibly needing to be modified or moved to the new standard	SDT Disposition/Explanation
	R5 requires the Transmission Operator to notify its Reliability Coordinator of certain emergency situations	<i>understood and coordinated.</i>
TOP-002-2	R14, R16 and R17 require responsible entities to notify their Reliability Coordinator of various changes to operating parameters  R18 requires the use of uniform line identifiers when referring to transmission facilities of an interconnected network	<i>These are “when” to communicate requirements and should not be relocated.  COM-003-1 is complementary to TOP-002-2 and must be complied with in conjunction with each other.  The SDT recommends that TOP-002-2 R18 be retired and to add applicability to LSE and TSP in the COM-003-1 Standard.</i>
TOP-007-0	R1 requires the Transmission Operator to notify its Reliability Coordinator when it exceeds an SOL or IROL  R4 requires the Reliability Coordinator to direct entities to take actions to restore the system to within SOLs or IROLs	<i>These are “when” to communicate requirements and should not be relocated.  COM-003-1 is complementary to TOP-007-0 and must be complied with in conjunction with each other.</i>
TOP-008-1	R3 requires the Transmission Operator to make notifications if it disconnects an overloaded facility	<i>This is a “when” and a “what” to communicate requirement and should not be relocated.  COM-003-1 is complementary to TOP-008-1 and must be complied with in conjunction with each other.</i>
VAR-001-1	R8 and R12 require the Transmission Operator to direct actions to maintain voltage within limits and to prevent voltage collapse	<i>This is a “when” and a “what” to communicate requirement and should not be relocated.  COM-003-1 is complementary to VAR-001-1 and must be complied with in conjunction with each other.</i>
VAR-002-1	R2.2 and R5.1 require the Generator Operator to comply with directives  R3 requires the Generator Operator to notify the Transmission Operator of various status or capability changes	<i>This is a “when” and a “what” to communicate requirement and should not be relocated.  COM-003-1 is complementary to VAR-002-1 and must be complied with in conjunction with each other.</i>

## Unofficial Comment Form for Project 2007-02 Operating Personnel Communications Protocols — Standard COM-003-1 —Operating Personnel Communications Protocols

Please **DO NOT** use this form. Please use the [electronic comment form](#) located at the link below to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by **January 15, 2010**. If you have questions please contact Harry Tom at [harry.tom@nerc.net](mailto:harry.tom@nerc.net) or by telephone at 609-452-8060.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### **Background Information:**

Effective communication is critical for real time operations. Failure to successfully communicate can lead to negative consequences.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP SDT). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Recommendation Number 26 calls for a tightening of communications protocols. This proposed standard is to ensure that effective communication is practiced and delivered in clear language via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions.

The upgrade of communication system hardware where appropriate is not included in this project (it is included in NERC Project 2007-08 Emergency Operations).

The standard will be applicable to Transmission Operators, Transmission Owners, Balancing Authorities, Reliability Coordinators, Generator Operators, Transmission Service Providers, Load Serving Entities and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The Purpose statement of this standard states: "To ensure that reliability-related information is conveyed effectively, accurately, consistently, and timely to ensure mutual understanding by all key parties, especially during alerts and emergencies."

The team developed a table to show each communications-related requirement identified in the SAR and the conclusion of the OPCS SDT with respect to whether each of these requirements should be modified or moved as part of this project. In summary, the OPCS SDT is recommending that three of the identified requirements be incorporated into the new

COM-003-1 Operating Personnel Communications Protocols standard and that the other requirements remain in their respective standards. Please review the table showing the disposition of related requirements identified in the SAR to see if you agree with the team. The OPCP SDT is seeking industry comment on a number a specific issues related to Project 2007-02 Operating Personnel Communications Protocols as identified in the questions below. The OPCP SDT is seeking industry input on:

- **New NERC Glossary terms:** Communications Protocol, Three-part Communication and Interoperability Communication. These terms are proposed for addition to the NERC Glossary to establish their meaning and usage within the electricity industry.
- **Addition of Transmission Service Provider and Load Serving Entity** as applicable under this new standard. The SDT believes incorporating Requirement R18 from TOP-002-2 as Requirement R7 of this draft COM-003-1 is appropriate. The applicability for R18 includes the Transmission Service Provider and Load Serving Entity; therefore the OPCP SDT proposes to add them to the Applicability section of COM-003-1.
- **Communication Protocol Operating Procedure (CPOP):** Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall develop a written CPOP in order to formally establish a set of Communication Protocols for use during real-time operations (R2 through R7). The SDT seeks feedback on whether this requirement is needed.
- **Pre-defined system condition terminology:** The Alert Level Guide document is work that was originally prepared by the Reliability Coordinator Working Group (RCWG) in accordance with a U.S./Canada Task Force Recommendation. Recommendation #20 called for the establishment of clear definitions of normal, alert, and emergency operational system conditions, and to clarify the roles, responsibilities, and authorities of Reliability Coordinators and other responsible entities under each condition.

The SDT recognizes the Alert Level Guide as an important tool for the clear and efficient communication of system condition levels regarding Physical Security, Cyber Security, Transmission Emergencies and Energy Emergencies. The SDT has incorporated the Alert Level Guide into Attachment 1-COM-003-1.

The SDT proposes four system condition alerts instead of the initial three in the RCWG version. The main criterion for splitting the Security Energy Alert (SEA) into two separate system condition alerts (Cyber and Physical) is based on feedback from Field Test participants that recommended separation.

Energy Emergency Alert requirements currently exist in NERC Standard EOP-002-2.1.

There is an ongoing Field Test of the Alert Level Guide among Reliability Coordinators, Balancing Authorities and Transmission Operators. The OPCP SDT is interested in receiving feedback from participants in the Field Test with respect to potential improvements to the Alert Level Guide.

- **Common time zone:** The SDT believes that Interoperability Communications would be enhanced with the use of a common time zone. Central Standard Time was chosen as it is already in use for NERC Time Error Corrections. The Blackout Report cited the need to tighten communication protocols and the SAR includes

consideration of a common time zone to minimize mis-matched time signature issues between control systems especially during an emergency.

- **Three-part Communication:** The SDT will move the existing Requirement R2 of COM-002-2 to this new standard when the RCSDT has completed their development and the industry has approved the revisions. The COM-003-1 Standard proposes to require the use of Three-part Communication whenever a directive is issued during verbal Interoperability Communications. The SDT seeks industry feedback on this proposal.
- **NATO Phonetic Alphabet:** The SDT proposes the standardized use of the NATO Phonetic Alphabet when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications. During spoken communications certain sounds become difficult to discern because they are audibly similar. The use of the NATO Phonetic Alphabet is not intended for all verbal communications but is required for Interoperability Communications.
- **Pre-determined Line and Equipment Identifiers:** COM-003-1 requires the use of predetermined line and equipment identifiers in Requirement R7 however the Requirement does not stipulate a single/unique identifier as long as all parties mutually agree on the identifier for the line or equipment. The mutual agreement shall be reached in advance of the use of the identifiers as described in the functional entity's CPOP.

The SDT is proposing to retire Requirement R4 from COM-001 and incorporate it into Requirement R2 of this draft COM-003-1. The SDT is proposing to retire COM-002-3 (requiring the use of Three-part Communication) upon the completion of Project 2006-06 Reliability Coordination and incorporate it into Requirement R4 of this draft of COM-003-1. Since Requirement R4 from COM-001-1 carries over unchanged there is no specific question related to it in this Comment Form.

The choice of VRFs was made on the basis of the impact on the Bulk Electric System of a miscommunication especially during an emergency situation. Requirements R2 through R7 are assigned a High Violation Risk Factor due to their potential direct impact on BES reliability. Requirement R1 is assigned a Low VRF due to its administrative nature.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R2 through R7 must be implemented in real time operations and therefore were assigned a Time Horizon of Real time. A violation of Requirement R1 can be addressed before it has a direct effect on the BES over a longer period and as such the SDT assigned R1 a Time Horizon of Long Term Planning.

The drafting team is posting the standard for industry comment for a 45-day comment period.

The Operating Personnel Communications Protocols Drafting Team would like to receive industry comments on this draft standard. Accordingly, we request that you include your comments on this form by **January 15, 2010**.

**\*Please use the [electronic comment form](#) to submit your final comments to NERC.**

1. Do you agree with the adoption of the following new terms for inclusion in the NERC Glossary and their proposed definitions: Communications Protocol, Three-part Communication, and Interoperability Communication? If not, please explain in the comment area.

Yes

No

Comments:

2. The SDT incorporated TOP-002-2 Requirement R18 into this new standard COM-003-1 as Requirement R7. In TOP-002-2, Requirement R18 applies to the Transmission Service Provider and Load Serving Entity. These entities are now added to COM-003-1. Do you agree with this proposal? If not, please explain in the comment area.

Yes

No

Comments:

3. Requirement R1 of the draft COM-003-1 states, "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall develop a written Communications Protocol Operating Procedure (CPOP) for Interoperability Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The CPOP shall include but is not limited to all elements described in Requirements R2 through R7 to ensure effective Interoperability Communications." Do you agree with this proposal? If not, please explain in the comment area.

Yes

No

Comments:

4. Requirement R2 of the draft COM-003-1 states, "Each Responsible Entity shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for all verbal and written Interoperability Communications." Do you agree with this proposal? If not, please explain in the comment area.

Yes

No

Comments:

5. Requirement R4 of the draft COM-003-1 states, "Each Responsible Entity shall use Central Standard Time (24 hour format) as the common time zone for all

verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.

Yes

No

Comments:

**6. Requirement R5 of the draft COM-003-1 states, “Each Responsible Entity shall use Three-part Communications when issuing a directive during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

Yes

No

Comments:

**7. Requirement R6 of the draft COM-003-1 states, “Each Responsible Entity shall use the North American Treaty Organization (NATO) phonetic alphabet as identified in Attachment 2-COM-003-1 when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

Yes

No

Comments:

**8. Requirement R7 of the draft COM-003-1 states, “Each Responsible Entity shall use pre-determined, mutually agreed upon line and equipment identifiers during for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

Yes

No

Comments:

**9. Attachment 1-COM-003-1 is based upon work performed by the Reliability Coordinator Working Group (RCWG). Do you have any concerns or suggestions for improvement of the attachment? If yes, please provide in the comment area. (If you are involved in the field testing of the Alert Level Guide please share any comments regarding the use of the guideline as it relates to the field test.)**

Yes

No

Comments:

**10. Are you aware of any regional variances that would be required as a result of this standard? If yes, please identify the regional variance.**

Yes

No

Comments:

**11. Are you aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement? If yes, please identify the conflict.**

## Standards Announcement

Comment Period Open

November 30, 2009–January 15, 2010

Now available at: [http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### Project 2007-02: Operating Personnel Communications Protocols

The Operating Personnel Communications Protocols Standard Drafting Team is seeking comments on the following documents **until 8 p.m. EDT on January 15, 2010**:

- Standard COM-003-1 — Operating Personnel Communications Protocols
- Implementation plan
- Disposition of Related Requirements Identified in Standard Authorization Request (SAR)

### Instructions

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at [Lauren.Koller@nerc.net](mailto:Lauren.Koller@nerc.net). An off-line, unofficial copy of the comment form is posted on the project page: [http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### Next Steps

The drafting team will draft and post responses to comments received during this period. The drafting team will also determine whether to post the standard for an additional comment period or seek approval from the Standards Committee to proceed to balloting.

### Project Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.

In the development of this proposed standard (as requested in the SAR), the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently, and timely to ensure mutual understanding by all key parties, especially during alerts and emergencies.

### Applicability of Standards in Project

Transmission Operator  
Transmission Owner  
Balancing Authority  
Reliability Coordinator  
Generator Operator  
Distribution Provider  
Transmission Service Provider  
Load Serving Entity

### Proposed Glossary of Terms Change (new definitions)

Communications Protocol  
Three-part Communication  
Interoperability Communication

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Disagree
For the Communication Protocol definition, please clarify if "written" includes electronic (email.) Change the definition of "Interoperability" to "Emergency" Entities should not be required to use 3 part communications on a routine basis, only on emergency issues.
Disagree
As the requirement already exists it is redundant to incorporate it into COM-003. The incorporation not only exposes a responsible entity to double jeopardy, it now exposes Transmission Service Providers and LSEs to COM-003 requirements that should not apply to these entities. TOP-002 addresses planning ahead of the operating hour whereas COM-003 addresses communication during real-time operations. In the absence of evidence that the lack of common identifiers is an imminent and continuing risk to BES reliability, it does not make sense to have operators addressing urgent, real-time situations bear significant penalty risk should they refer a BES element by something other than a newly established common identifier. Is it the intent of the requirement that the common identifiers be the same for all neighboring parties, all of whom must "agree" to the identification? If not, then an element might be referred to by one identifier with Party A, another with Party B etc. which might well defeat the purpose of the requirement. If it is required that there be a single identifier, then all neighbors would have to agree upon the identifier constrained as each may be by, for example, the formatting limitation of their respective SCADA/EMS systems. Cost to modify software to accommodate common identifiers could be significant and NERC should weigh these costs and the aforementioned operational risks against the perceived incremental improvements to the BES reliability.
Disagree
Requiring production of a document that merely repeats Requirement 2-7 of COM-003 does not further BES reliability. Requirements R2-R7 set forth all that such a document would contain. Stating

that the CPOP should include but not be limited to R2-R7 is nonsensical. What additional issues should the CPOP be required to address and why aren't those issues the subject of a COM-003 requirement?
Disagree
The attachment adds a whole new lexicon for BES operators. E.ON U.S. suggests integrating attachment 1 and the relative alert levels into the EOP standards. The purpose of COM-003 indicates this standard is to ensure understanding of information during emergency alerts and emergency situations and not to establish the conditions, required notification, or levels of emergency alerts. While the attachment has been identified as a product of the RCWG it is unclear whether it has been reviewed and approved through the normal NERC and industry vetting.
Disagree
If it is the intent that the requirements of this standard apply not only to control room operators but field personnel (line crews, substation crews, etc.) then E ON US is not in favor of using a common time zone nation-wide. The confusion that this change could create in real-time operations outweighs the BES reliability benefit E.ON US would also like clarification that this requirement does not apply to control systems or elements thereof that may log equipment operations. The background information above suggests this possible interpretation.
Disagree
E ON US believes more specificity is required as to what constitutes a "directive". Moreover, this requirement is redundant in light of COM-002 R2 for normal operations. If COM-003 is only applicable to emergencies, then this R5 would appear reasonable. E.ON U.S. suggests editing R5 and M5 as follows: Each Responsible Entity shall use Three-part Communications when issuing and/or receiving a directive during verbal Interoperability Communications
Disagree
The entire standard should only apply to emergency operations, not all communications. If it is the intent that the requirements of this standard apply not only to control room operators but also field personnel (line crews, substation crews, etc.) then E ON U.S. is not in favor of using the NATO phonetic alphabet. The confusion that this change could create in real-time operations outweighs the BES reliability benefit. E ON U.S. suggests that if the objective is to avoid confusion over similarly pronounced words, use of an ad-hoc phonetic alphabet would more easily address the concern. E ON U.S. is also concerned that the attention paid to "how" orders are given and acknowledged may well detract from "what" it is responsible entities are attempting to do. Are responsible entities supposed to spell out each number and word using the phonetic alphabet? The drafting team should be more specific as to what is meant by "alpha-numeric information."
Disagree
In the absence of evidence that the lack of common identifiers is an imminent and continuing risk to BES reliability, it does not make sense to have operators addressing urgent, real-time situations that bear significant penalty risk should they refer to a BES element by something other than the common identifier. The operator focus at such times should be on resolving the situation not avoiding penalties over nomenclature. Is it the intent of the requirement that the common identifiers be the same for all neighboring parties, all of whom must "agree" to the identification? If not, then an element might be referred to by one identifier with Party A, another with Party B, and so on, which might well defeat the purpose of the requirement. If it is required that there be a single identifier, then all neighbors would have to agree upon the identifier constrained as each may be by, for example, the formatting limitation of their respective SCADA/EMS systems. Cost to modify software to accommodate common identifiers could be significant and NERC should weigh these costs and the aforementioned operational risks against the perceived incremental improvements to the BES reliability.
Disagree
E.ON U.S. has many concerns with this proposed attachment. The use of color coding and multiple types of alerts adds unnecessary levels of complexity. Any proposed alert level should be consistent throughout the suite of reliability standards, e.g level 1,2,3. Also, as previously noted in our comment to question 4 above, E.ON U.S. suggests integrating attachment 1 and the relative alert levels into the EOP standards and focusing the COM standards on the requirements of communications protocol.
Disagree

Disagree
If the requisite protocols are intended to be followed by all field personnel, applicability of these requirements to Distribution Providers could run afoul of FPA Section 215(a) codified in 18CFR39.1.
Disagree
This standard should only apply to alerts and emergencies. E.ON U.S. suggests eliminating "especially" in the purpose statement of COM-003-1. During emergency situations, operational focus on the semantics of how communications are to occur does little to enhance the reliability of the system. High VRFs with Severe VSLs may add stress and distraction to operation personnel during times of emergency thus potentially harming, not improving reliability.

Agree
Agree
Agree
Agree
We agree with the proposal, however we feel that the color system should be evaluated to better distinguish the type of attack for example using P-YELLOW for physical vs. C-YELLOW for cyber instead of just "YELLOW" for both.
Disagree
We feel that time zones should be consistent throughout all standards and regulatory reporting requirements(eg. TADS)
Disagree
The term "directive" should be changed to "Reliability Directive" as defined in COM-002-3.
Disagree
We believe this should only be required when issuing Reliability Directives.
Agree
Agree
See question 4.
Disagree
Disagree
Agree
The SDT should consider vertically integrated utilities, where communication between functional entities is internal.
Group
Electric Market Policy
Mike Garton
Disagree
We do not agree with the adaptation of the proposed term "Interoperability Communication". As defined, it is limited to the communication of information to be used to change the state or status of a BES element or facility. That definition is too limiting in that there are many types of reliability-related information that need to be clearly communicated that do not lead to changing the state of a BES facility. For example; information related to ratings, information related to the results of studies, information related to data errors or loss of data, etc. If the term "Interoperability

Communication" is to be retained, we strongly suggest a name change. The word "interoperability" is widely used to refer to the ability of a system to work with or use the parts or equipment of another system. For example please see the current standards development efforts identified in the NIST Framework and Roadmap for Smart Grid Interoperability Standards available at [http://www.nist.gov/public\\_affairs/releases/smartgrid\\_interoperability.pdf](http://www.nist.gov/public_affairs/releases/smartgrid_interoperability.pdf). Using the term "interoperability" to refer to reliability-related human communications could be confusing to regulators, compliance personnel, auditors, and many others who have to deal with a variety of standards.

Disagree

In our experience, neither the TSP nor the LSE provide or receive information about specific lines or equipment in real-time. Therefore, requirement R7 should not apply to them absent clear evidence that a realistic (not hypothetical) threat to reliability would exist if they are omitted. We do not think that such a threat would exist. Applying R7 to TSPs and LSEs would only cause them grief and further burden the compliance staffs of the regional entities for no appreciable benefit.

Disagree

We agree that communications procedures are necessary, but we do not agree with several of the requirements proposed to be addressed in the elements of the CPOP. See our comments on specific requirements elsewhere in our responses. We do not see the need to create a CPOP that includes requirements R2 through R7 given that each requirement spells out how and what is to be communicated. We could agree that a CPOP may be needed for Interoperability Communications that are not addressed in R2-7.

Disagree

We object due to the following reasons; 1 - There are 3 versions of Attachment 1-COM-003-1 which is potentially confusing. We suggest separating into 3 attachments, one for each type of notification. 2 – The level(s) identified in the notification text are at odds with the condition (color vs numerical). It is suggested that the standard either use to Condition (color) or the level (numerical). 3 – None of the Operating State Alert Levels in Attachment 1 appears to address Energy Emergency Alerts (EEAs). The note in the "Attachment 1-COM-003-1 defines normal, alert, and emergency operating conditions as they relate to Transmission Loading, Physical and Cyber Security. These definitions for Transmission Loading, Physical and Cyber Security Alert states align with the Emergency Energy Alert (EEA) states (as already described in NERC Reliability Standard EOP-002-2.1). The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." This seems to limit use of Interoperability Communications to only events where there exists either a physical or cyber threat, or where an IROL can't be mitigated. This emphasizes the confusion as described in item 2 above where the EEA levels in EOP-002-2.1 uses numerical values (i.e. EEA Level 1) without the colored conditions. We recommend adding a new section to Attachment 1 'Operating State Alert Levels' as: 'Reliability Coordinator Notifications for Energy Emergency Alerts.' 4-Attachment 1 pertains specifically to Operating State Alert Levels and says nothing about the communication of information to be used to change the state or status of a BES element or facility (which is the SDT's proposed definition of Interoperability Communications). Therefore, it is not appropriate to require that all verbal and written Interoperability Communications use the pre-defined terminology in Attachment 1. Only those communications concerning Operating State Alert Levels should be required to use that terminology. By the proposed definition, such communications are not Interoperability Communications since the information is not used to change the state or status of a BES element or facility. The SDT needs to revise this requirement to clarify that it pertains only to communicating the Operating State Alert Levels and nothing more.

Disagree

Any confusion about what time is being verbally communicated should be cleared up by three-part communications. There should be no confusion about what time is being communicated in writing as long as the time zone and AM/PM designation are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion. Operators will continue to use local time in their communications with field personnel, support staff, and management, and we see no demonstrable reliability-related need to require every operator in North America to have to convert their local time to CST in their communications with other

operators. However, if the SDT feels a standard time must be adopted, it should be GMT as this is the time that used by all 'true time' devices.
Agree
As currently defined, Three-part Communications presumes the second party will repeat the information back "correctly." Failure to do so is assigned a High VRF and a Severe VSL. The practical application of Three-part Communication involves a sender communicating information, a receiver repeating back the information, and the sender verifying the repeat back is either correct or incorrect. If the repeat back is incorrect, the process repeats until both parties have the same understanding of what is being communicated. This iterative process needs to be addressed within the definition of Three-part Communications.
Disagree
Use of this adds a lot to verbal communication but has little value. Where either the issuing or receiving party is unsure as to which letter was used, their choice of word to associate with the alphabet need not be dictated by a specific phonetic alphabet. If I am unclear, whether I ask "did you say 'F' as in Frank or 'F' as in Foxtrot, it is my belief that we will both know that I heard the letter F not the letter S. Using Frank instead of Foxtrot will result in a violation of Requirement R6 which carries a High VRF and a Severe VSL; even though there would be no impact on effective communication. There is no compelling reason to require every operator in North America to learn and use the NATO phonetic alphabet. It would be overkill to do so, and it could create some really bizarre conversations. For example, consider a TOP in the eastern time zone who calls his RC (also in the eastern time zone) at 10:00 A.M. to confirm that a line that tripped earlier that morning will be ready to switch back in service at 10:35. Taken to the extreme, a strict interpretation of R6 and R4 (the CST requirement) would say that the TOP operator would have to state the estimated time of restoration as "niner tree fife, Alpha Mike, Charlie Sierra Tango". There is no need for that.
Agree
While we agree conceptually, it is our experience that Interoperability Communications concerning BES elements do not usually specifically identify the element or facility when the BA, RC or TOP is communicating with the TSP, LSE or GOP. This may have to do with concerns about Standards/Codes of Conduct or may be because specific identification of the element or facility isn't required in order to communicate action(s) that entity is required to take.
Agree
See response to question 4. In addition, there seems to be an inconsistency between the inclusion of Attachment 1 and what is stated in the document posted with the standard entitled Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement. The document states that the standard focuses on "how to" communicate rather than on specified scenarios of "to whom" or "when to" communicate; however, Attachment 1 does just the opposite.
Agree
Some ISO/RTOs have market rules which allow participants to elect NOT to follow instructions issued by their market operator (who may also perform BA, TOP and/or RC entity functions) unless an Emergency exists.
Agree
PJM members are only required to comply during an Emergency.
Agree
The VRFs for R2-R7 are all "High", and the VSLs are all "Severe". That is too harsh. Failing to comply with one of the requirements does not automatically mean that a miscommunication occurred that caused a reliability problem. There should be a "Moderate" VSL for failure to comply with a requirement but no miscommunication occurred. There should be a "High" VSL for failure to comply with a requirement that caused a miscommunication but resulted in no violation of another reliability standard. The "Severe" VSL should only apply to failures to comply with a requirement that caused a miscommunication that lead to a violation of another reliability standard. If approved, this standard will require a number of distracting things be added to each entity's control center with little value added. Clock – set to the 'standard time' Attachment 1 – COM-003 (all 3 versions) Attachment 2 – COM-003

Martin Bauer
Bureau of Reclamation
Agree
Agree
Agree
Disagree
Reclamation does not agree with the Attachment 1 condition color coding as it will conflict with the DHS system of notification of change in threat condition. The three color system is unique to the notifications issued by DHS. Use of that color system is reserved by the DHS. Federal agencies are required to perform specific tasks when DHS issues alerts or changes the threat condition. Only DHS can change the threat condition. The concept needs to be revised considerably to avoid the conflict or create a potential security issue.

Jason L. Marshall
Disagree
The definition of Three-part Communication applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: "A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it." These principles are included in Requirements R2 and R3 in the recently issued draft Standard COM-002-3 in Project 2006-06. We believe the term "Interoperability Communication" creates confusion within the industry and contradicts the work by RTO and RC SDT in Project 2006-06 that limits the requirement to use three-part communications when issuing Reliability Directives (defined in Project 2006-06) that address anticipated and actual emergency conditions. Additionally, it appears that this definition would encompass all verbal

communications and, as such, we question the need for such definition. While using three-part communications during routine operations may be a best operating practice, we do not believe that it is so critical to reliability that it becomes an enforceable requirement for routine operating instructions. Rather we believe the enforceable requirement should be limited to require three-part communications during actual emergency and anticipated emergency conditions only. Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? Then the terms need to be capitalized. In addition, the term "entities" is confusing and needs to be defined.

Disagree

The SDT actually expanded Requirement R18 of TOP-002-2 by adding the term "equipment". In any event, this Requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and comprehended.

Disagree

This proposed communication protocol is redundant to Requirements R2-R7 and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard.

Disagree

It is not clear what value there is in identifying these alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the listed entities such as Distribution Providers and Generator Operators cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 are not consistent with the definition of Interoperability Communications. By definition, Interoperability Communication pertains to all communications about how entities change the state of the BES (not just about physical or cyber attacks). Attachment 1 is only about notifying of what physical and cyber attacks and transmission emergencies have already happened to the BES.

Disagree

There is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no additional reliability need to use a common time zone. The time zone should be identified in the communication. Use of CST will actually cause confusion and significant, unnecessary costs with no foreseeable reliability benefit. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc.

Disagree

Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT in Project 2006-06 which would define a Reliability Directive based on the determination of the person giving such an order. We believe it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and

easily auditable and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives.

Disagree

While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications and is certainly not necessary to be included as an enforceable Requirement. Imagine the situation in which an operator says "A as in apple" instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. There is no reliability need for this Requirement.

Disagree

This may represent a good utility practice but it is not necessary to be included as a Requirement. The key question is: "Do the companies' personnel understand one another?" If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters. This is a "how" based Requirement that should be eliminated.

Disagree

It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage which is reported in CIP-001 R2 already. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Foresees is a forecast condition. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA's use terminated. We recommend using terminated. Distribution Service Providers should be Distribution Providers to be consistent with the Functional Model.

Disagree

Disagree

Disagree

Disagree

Agree

We believe that the existing standard COM-002 is better than this proposed Standard. This Standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT in Project 2006-06. The RC SDT is adding requirements. More coordination is certainly required between these two teams. In addition, as stated earlier, this Standard focuses on "how" certain tasks should be performed and conflicts with NERC's position of pursuing performance based and results based Standards. Based on these considerations, we suggest that work on this Standard be stopped until work on Project 2006-06 has been completed and approved. This approach is consistent with the August 2003 Blackout

Recommendation #26 which actually focused on communications during emergencies which is the scope of Project 2006-06. After Project 2006-06 is completed, a determination can be made if this Standard is even required.

Manitoba Hydro

Disagree

Comments: Agree to the adoption, but not the definitions as defined. 1. Communication Protocol - Remove "written" from this definition. Create a new standard that defines "written" protocol, i.e.: express "24 hour format", common date format, etc. a) Using "written" in this definition and which is also used in COM-003-1 R2, R3, R4 and R7 clouds both the Definition and the Standard. The majority of COM-003-1 requirements also focus on the spoken word, such as the use of English, Phonetics and Three-way Communication. b) "Communications" in the Definition infers verbal communication especially when examining the COM-003-1 Standard where its purpose is "timely information in alerts and emergencies". c) When COM-001-1 R4 "English" and COM-002-2 R2 "Three-way" requirements are amalgamated into COM-003-1, the COM-003-1 standard will now strengthen the focus on the process of verbal communications. d) COM-003-1 R2 "Uniform Line Identifiers" This requirement would be used in real time reliability situations, alerts and emergencies. The "written" communications would be used after the fact and therefore "written" does not belong in the definition. e) In COM-003-1 R3 "use English" The purpose of this standard is convey information effectively during alerts and emergencies. "Written" would be used after the fact and therefore does not belong here. f) In COM-003-1 R4 "24 hour format" "Written" could be reserved for a new standard, which could which define "24 hour format" along with a common date format which is also needed. g) In COM-003-1 R5 "Three-part Communication" Focuses entirely on the spoken word and appears appropriate that "written" is not used here. h) In COM-003-1 R6 "Phonetics" Focus on the spoken word and would never be used to empathize a written word and is appropriate that is not used here. i) COM-003-1 R7 states "Operating State Levels" All communications for broadcasting these alerts would typically be verbal. "Written" communications would be after the fact. 2. Three-part Communication - Use COM-002-2 R2 requirement as an improved basis for the "Three-part Communication" glossary term and define each part of the three parts separately. a) This new NERC Glossary term is better defined in the COM-002-2 R2 "Three-part communication" requirement. "Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall issue directives in a clear, concise, and definitive manner; shall ensure the recipient of the directive repeats the information back correctly; and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings." b) The current glossary term is overwhelming and confusing with the "back and forth" exchange of responsibilities. More thought process is consumed trying to break down the definition into usable portions, then comprehending the definition itself. c) The glossary term should be more clearly defined by specifying each of the three part communication protocol; i. An initiating party verbally issues directives in a clear, concise and definitive manner. ii. The receiving party shall replicate the intent of the directive and iii. The initiating party shall acknowledge to their satisfaction that the receiving party fully understands and is capable of caring out the directive. 3. Interoperability Communication - Define further and/or define entities. Expand "interoperability" and add and define "entity" a) Using "interoperability" and "entities" in same glossary term, clouds the definition especially when this glossary term is used to help clarify requirements in COM-003-1. There are at least three possible levels of "Interoperability" from a Control Center point of view; i. Internally, within a utility. -Communication between the Balancing Authority and Transmission for reliability purposes (within control center). -Between BA, TO, TOP, GO, TSP, LSE and DP, such as between the sending and receiving end of an HVDC terminal. ii. Externally, between neighbouring utilities. iii. Externally, between the Balancing Authority and their Reliability Coordinator. For a Reliability Coordinator two more levels of "Interoperability" could be added: iv. Communication between Reliability Organizations. v. Communication between the three major interconnections. b) Though the glossary definition surely includes all of the above, it does not clarify that and becomes immediately clouded when interpreting COM-003-1 R1 where "personnel" is used for real time control for effective Interoperability Communication. 1. Personnel – individual responsible for the operation of the interconnected bulk electrical system (real time, planning, etc) c) Adding and defining Entity in the glossary as per suggestions; i. "Entities" are used commonly in the Reliability Standards and

encompasses a lot of different contexts. ii. "Entity" defined by a dictionary includes a comprehensive range such as: -body -Unit -Group -Thing -Article iii. Entity in a interoperable power system: - BA, TO, GO, TSP, LSE, etc - Neighbouring BA, Control Area, Neighbour (Utility) - Reliability Coordinator, MISO, Reserve sharing Group, etc - NERC, MRO, WECC, NPCC, ERCOT, etc - Western Interconnection, Eastern Interconnection, ERCOT.

Disagree

Leave TOP-002-2 R18 in its original location. 1)"Mutual line and equipment identifiers" should not be moved from TOP-002-2 and placed in COM-003-1 R7. TOP-002-2 Standard's focus is "Planning, coordination and procedures" whereas: • R1 is "Maintain current Plans" • R2 is "Participate in planning and design" • R3 is "LSE coordinate with Host" • R4 is "BA coordinate with neighbours" • R5 is "plan to meet schedules" • R6 is "plan to meet N-1" • R7 is "plan to meet capacity and reserves" • R8 is "plan to meet VAR limits" • R9 is "plan to meet interchange" • R10 is "plan to meet IROL, SOL's" • R11 is "perform studies for SOL's" and "utilize identical SOL's for common facilities" • R12 is "include known SOLs or IROLs" • R13 is "GO shall verify generation capability" • R14 is "GO shall notify of changes" • R15 is "GO shall provide generation forecast" • R16 is "shall notify RC of changes" • R17 is "notify RC of R1 to R16" • R18 is "shall use uniform identifiers" • R19 is "maintain computer models for planning" 2)TOP-002-2 R18 "shall use uniform identifies" appears to be more strongly related to where it already exists and would have more impact to have it moved between R2 and R3. 3)Uniform identifiers are determined in the planning stages and are common knowledge to entities by the time they are in service and not a real time communication issue. a.Having TOP-002-2 R18 moved to COM-003-1 R7, takes the purpose of the COM-003 standard outside its context of "timely convey reliability information . . . especially during alerts and emergencies". b.COM-003-1's purpose and all its requirements directly relate to real time communication. 4)TOP-002-2 R11 "identical SOL's for common facilities" complements R18 "shall use uniform identifiers" and again are both planning requirements. 5)The unofficial comment for "Pre-determined Line and Equipment Identifiers" indicates that mutual agreement of these identifiers are to be reached in advance, thus agreeing with above. Leave R18 in TOP-002-2, but possibly move it between R2 and R3, thus R2 in COM-003-1 would be removed. Regarding adding TSP and LSE, no comment added.

Agree

Yes, with comments 1)In this requirement "Interoperability Communications between personnel responsible for real time" becomes clouded when compared to the "Interoperability Communications" definition that states "exchange information between entities". a.Improving the "Interoperability Communication" definition as per early suggestion should clarify this. 2)Changing the order of requirements would make the flow of the standard smoother. a.Since this standard is mostly designed for real time communication, the requirements should pyramid down. • R1 is fine. • R2 should be "English" • R3 should be "NATO" • R4 should be "Time" • R5 should be "Three-part communications" • R6 reserved for "Full name identification" (See below for clarification) Conclusion: This requirement is acceptable as long as the enclosed comments are considered.

Disagree

Move this new requirement R1.2 in COM-002-2. 1)COM-003-1 R2 "Pre-defined system condition terminology" are all planned definitions. a.COM-003-1 purpose is to "convey information effectively" meaning the use of English, NATO, three-part communication, 24 time format are all verbal aspects to accomplish this purpose and not suited to pre-defined or planned items. 2)COM-003-1 R2 appears more appropriate and relevant placed in COM-002-2. COM-002-2's Purpose is "capabilities for addressing real time emergencies and to ensure communications by personnel are effective". a.Placing "Pre-defined system condition terminology" in COM-002-2 after R1.1 as R1.2 appears to have more of a chronological approach. i.R1.1 states "conditions that could threaten" ii.R1.2 use "pre defined system conditions" Conclusion: Remove COM-003-1 R2 and replace in COM-002-2 as R1.2

Disagree

As per below. 1)The 24 hour format will certainly reduce the confusion of AM and PM and at present seems to be the current best practice for all entities so should not be a major change. 2)Examining the definition of "Interoperability Communications" means that there is and will be real time communications with entities in other times zones, thus it is assumed that this being an NERC standard is enforcing that all other time zones (PST, MST, EST) will be using CST when communicating with interoperability. a.If this is the case, it appears that the other time zones (PST, MST and EST) must make effort to modify their local time to synchronize with CST. b.This brings to

point that when interoperability communication is used, this fact must be mentioned, instead of 13:53, it should be 13:53 CST. 3)Adding CST to verbal time formats will be difficult to implement, so maybe a statement confirming the time zone should be appropriate each time interoperability communications is used when required. Conclusion: 24 hour format is fine, further clarify that all other time zones must use CST.

Move requirement as planned but keep Three-part Communication definition as stated originally in COM-002-2 R2. 1)Reading the "Disposition/Explanation" it appears that COM-002-2 R2 will eventually be moved into COM-003 R5. This appears logical as COM-002-2 ensures staffing and communication capabilities. a.The statement in COM-002 R2 is reasonably descriptive, but loses its depiction when replaced with statement found in COM-003-0 R5. 2)Regarding COM-002-2 R2, Manitoba Hydro interprets part 2 (repeat back correctly) of Three-part Communication to mean; that the party receiving the directive has clearly received it in its full form and understands completely what is expected of him and to convey this to the sender; i.We delineated "repeating back correctly" to mean any of the three protocols as acceptable: 1.Actually repeating back the directives correctly. 2.The recipient verifies the issued directive(s) are identical to a copy they have at hand. Example for clarification: "The steps you have read are identical to what I have here on Order Number 1234, Revision 5 and I understand I can proceed with steps 3,4 and 5". 3.The recipient summarizes the issued directive(s) to a copy they have at hand. Example for clarification: "I will do step 8, open all 115 kV disconnects as read to me and are identical to the order 1234 Revision 5 that I have at hand". 4.This all could be resolved by using the term "repeat back the intent of the directive". This statement could allow the operator to determine if the recipient fully understands and is capable of carrying out the directive, by the method of the recipient reply (any literate person can read back a written statement, but do they understand what they are doing and the consequences). ii.The purpose of protocols 2 and 3 are to alleviate potential of "lose of attention" due to the tedious receptiveness of long written directives. Summarizing or verifying these types of written orders will maintain the interest and attention to the detail. iii.Verbally detailing a directive at least once in any single conversation by either party should be sufficient to fulfill the first two parts of Three-part Communications (Clear and concise, repeat back). iv.Part 3 (acknowledge to satisfaction of the originator) could ensure that the person receiving the directive is capable and competent of carrying out the directive. v.None written (changes, revisions, real time emergency switching) and radio communication directives are a must for repeating back and are covered by other local policies. Part Two "Three Part Identification" 3)This new Standard COM-003-1 should contain a requirement for "Three Part Identification" or more commonly known as "Full Name Identification". This is not addressed fully anywhere in the NERC standards. 4)We have defined "Three Part Identification" based loosely on common industry best practice into three parts: 1.Location – Company Name, Control Room Name, etc. 2.Area of responsibility or authority (function) – The operator at the desk must identify his position such as Balancing Authority or Distribution Operate, etc. 3.Identification – Unique identifier such as first and last Name.

Disagree

To using NATO full time 1)Being trained or being familiar with NATO Phonetics is a great idea, but should only be implemented, in bad communication connections, or upon request due to accents, quiet voice, fast talk, too loud, unusual request, etc. 2)Communication technology for the most part is exceptionally clear, and the regular use of NATO Phonetics would be difficult to implement and time consuming to use. The RC and neighbouring entities are familiar with common terminology between each other.

Disagree

Move this new requirement R1.3 in COM-002-2. This is similar to Question 4 and should be treated in the same way: (This requirement is moved from TOP-002-2 R18) 1)COM-003-1 R7 "Pre-determined, mutually agreed upon line and equipment identifiers" are all planned definitions. 2)COM-003-1 purpose is to "convey information effectively" meaning the use of English, NATO, three-part communication, 24 time format are all verbal aspects to accomplish this purpose and not suited to pre-determined or planned items. a.COM-003-1 R7 appears more appropriate and relevant placed in COM-002-2. COM-002-2's Purpose is "capabilities for addressing real time emergencies and to ensure communications by personnel are effective". 3)Placing "Pre-determined, mutually agreed upon line and equipment identifiers" in COM-002-2 after R1.1 as R1.3 appears to have more of a chronological approach. i. R1.1 states "conditions that could threaten" ii. R1.2 use "pre defined

system conditions" iii. R1.3 use "pre determined equipment identifiers" Conclusion: Remove COM-003-1 R7 and replace in COM-002-2 as R1.3

Disagree

1)Attachment 1-COM-003-1 qualifies for all three requirements stated below and would be better suited in this Standard. a.CIP-001-1 Purpose: "sabotage to be reported to appropriate bodies" and includes the following requirements; R1. Procedure for recognition R2. Procedure for communication R3. Response guideline 2)OR COM-003-1 Attachment 1 could also be placed in COM-002-2. COM-002-2's Purpose is "capabilities for addressing real time emergencies and to ensure communications by personnel are effective". 3)COM-003-1 purpose is to "convey information effectively" meaning the use of English, NATO, three-part communication, 24 time format are all verbal aspects to accomplish this purpose and not suited to pre-defined or planned items. 4)COM-003-1 Attachment 1 also defines Physical Security threats and notifications which fulfills the purpose of COM-002-2 more thoroughly (then in COM-003-1) and could even be made as an requirement.

Silvia Parada-Mitchell

Agree

Disagree

This requirement is already covered by TOP-002. If the TOP-002 standard is deemed deficient because certain entities have been excluded or language appears to be missing, the changes need to occur to TOP-002 as opposed to copying and revising the existing requirement elsewhere. This would ensure that compliance oversight, understanding, and adherence goals are unencumbered by unnecessary redundancies. Moreover, this would ensure that the industry continues to re-enforce standards with changes that are within the scope of their original reliability purpose. The latter is in line with one of the core objectives of the Performance-based Reliability Standards Task Force's recommendations to focus on identifying and aggregating duplicated requirements.

Disagree

FPL agrees with the reliability goal of establishing a set of agreed upon communication standards to ensure consistent communications particularly for actual and anticipated emergency coordination needs. FPL also believes that existing coordination/communication standards already fulfill this objective and that it might be of "training" or "reference" value to aggregate those requirements to a single document or view. However, FPL is not convinced that this requirement, largely administrative in nature, will result in marked improvement in reliability. Organizations tend to take the path of least resistance and unless forced out of that path with extensive and granular guidance on what CPOPs should contain above and beyond existing standards or contract language, CPOPs would likely become a simple patchwork of requirements constructed out of existing NERC standard language and contract language. Standards need to be clearly implementable before they are approved yet important implementation questions do not appear to have been answered. (1) What if parties cannot reach agreement? (2) Is it enough to have attempted to coordinate? (3) What if parties already have agreed upon procedures such as NPIRs, or those stated in Interconnection Agreements – do they take precedent or must they be redesigned/relegated? (4) What if CPOPs differ greatly across interconnections because of differing parties? (One might conclude that by formalizing these different practices, as opposed to mandating standard practices, the goal of more reliable coordination may not have been achieved) (5) What level of evidence constitutes "agreement" especially in circumstances where entities may be remiss to agree? (6) What if CPOPs are simply a patchwork of requirements constructed out of existing NERC standard language and contract language – does that achieve the CPOP goal?

Disagree

FPL agrees that standard system condition terminology could be beneficial in communications but this requirement introduces alert level conventions with no clarity on what the corresponding associated actions for such levels are and as a result, aside from the value derived from have improvement in terminology during communications, it is unclear what reliability improvements this will achieve in carrying out instructions since details on what sort of tasks need to be carried out for each level have not been defined. Also, this requirement should clearly indicate that this alerting system and any communication conventions be required for emergency conditions.

Disagree

Existing market and reliability communication methods already ensure that time-zone adjustments occur. It is critical that the feasibility, impact, and logistical aspects of implementing this change be rigorously reviewing and understood to inform this standard's development. Any implementation or transition gaps between the time format and references used by reliability coordinators, their corresponding systems, and the interfaced systems of market participants would be extremely detrimental to system stability and ongoing market operations.

Disagree

The term "directive" as of yet has not been explicitly defined. Furthermore, FPL believes that by associating the "3-part communication" method with "directives" this standard drafting team could be at risk of unintentionally defining a directive as anything that takes the 3-part communication form. We would encourage the standard drafting team to continue to use the terms already employed in the draft standard: "... three-part communication be used when issue instructions related to "actual or expected emergency conditions."

Disagree

FPL believes that though aspiring to use a single strict phonetic alphabet is important, it is more important to ensure that ease of communication takes precedence especially under emergency conditions. As such, this requirement should be written more as a best practice or guideline. FPL believes this requirement could be improved by stating that under such emergency conditions, the NATO phonetic alphabet can be used as a base-line reference but that usage of ad-hoc phonetic alternatives that achieve the same real-time communication goal can also be used.

Disagree

FPL believes that R7 should be withdrawn as it repeats TOP-002 R18 requirements. Please refer to comments on Q3.

Disagree

Disagree

Disagree

Agree

In the case of nuclear plant operations, NRC communication requirements and the requirements of NERC NUC-001 for nuclear facilities more than adequately cover communication requirements. COM-003 should not be applicable to Nuclear Generator Operators since doing so will introduce an additional, unnecessary, and potentially conflicting level of requirements. Measures: FPL suggests that the SDT clarify the periodicity of providing evidence of compliance and on what constitutes sufficient evidence of CPOP acceptance. Violation Severity Levels: FPL encourages the SDT to revisit the violation severity levels. In the case of most of the requirements it is unreasonable to levy severe penalties in instances where the operator may have deviated from the requirements but the communication occurred in an unencumbered and successful manner as evidenced by the use/acknowledgement outcomes of three-part communication.

Tim Hattaway

PowerSouth Energy

Disagree

Inoperability definition is too broad and not clear.

Agree

Disagree
It's not clear as to who is being targeted as the "personnel responsible for real-time generation control and real-time operation of the BES". Is this just the system operator or is this the generator unit operator or the field switchman?
Disagree
This requirement is unnecessary.
Disagree
This requirement will be too confusing and could lead to compliance violations because someone stated the wrong time during the conversation.
Disagree
The term interoperability communications is not clear.
Disagree
Completely unnecessary to require each operator to learn and use the NATO alphabet for situations that may occur on a very limited basis.
Agree
Individual
Joylyn Stover
Consumers Energy
Disagree
Communications Protocol and Three Part Communications have been used in the industry and are acceptable. There seems to be a better way of stating "informational" communications since Directives are already discussed.
Disagree
There is no reason to move R18 from TOP-002 to COM-003. There is also no reason to utilize a shotgun blast method of coverage for this standard. Also, regardless of technical accuracy, TOP-002-2 R18 should not be moved to COM-003-1 without a simultaneous and corresponding change to TOP-002-2, lest an entity be found non-compliant with both standards for a compliance violation.
Disagree
I agree written Communication Protocols should be in place. Since we do not agree with all of the requirements mentioned we can not agree with this statement. Furthermore, since these protocols will have to be between Functional Entities and most likely multiple companies, a methodology needs to be in place to prevent duplication of efforts and double jeopardy in the audit process.
Disagree
The COM Standards should put forth the methodology of communication, not provide communication for each event. For example, CIP-001 describes the communication to take place for CIP attacks, be they physical or cyber, EOP-002 describes the process for Generation and Capacity Emergencies. Utilizing the similar sounding vernacular (EEA,CEA,PSEA,TEA) is not prudent.
Disagree
Common Time Zone has been discussed for decades. There was little or no evidence a common time zone standard would have prevented any of the system disturbances experienced since 1996 let alone the blackout of 2003.
Agree
Agree

Disagree
This requirement is better served under the TOP Standards. The TOP standards already require this (TOP-002-2 R18), and the requirement should not be duplicated.
None.
None.

The way the definition of "Three-part Communication" is worded applies only when the communication is understood by the listener the first time. The RC SDT requirement which includes

"and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings" is more complete. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. A suggested revision to the definition: A Real-Time Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. These principles are included in Requirements R2 and R3 in the recently issued draft Standard COM-002-3 in Project 2006-06. An alternative suggestion to the definition of Three-part Communication: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct by the party who initiated the communication. A suggestion to the definition of Communications Protocol: The term "Interoperability Communication" creates confusion within the industry, and contradicts the work by RTO and RC SDT in Project 2006-06 that limits the requirement to use three-part communications when issuing Reliability Directives (defined in Project 2006-06) that address anticipated and actual emergency conditions, and do not agree with its definition. What also must be considered is that the RC SDT has stated that when someone "says", it is a directive--operating conditions are not distinguished. This definition unnecessarily and counterproductively encompasses all verbal communications and, as such, is not needed. It is not so critical to reliability that it should become an enforceable requirement for routine operating instructions. The enforceable requirement should be limited to require three-part communications, and be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, and be auditable and measurable. Virtually all communications in a control room environment deal with changing the state or status of an element of facility, as such there is not a need to define this communication protocol. Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? If so, the terms need to be capitalized. The term "entities" is confusing and needs to be defined.

Disagree

The SDT expanded Requirement R18 of TOP-002-2 by adding the term "equipment". This Requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and understood. LSEs and TSPs do not own or operate equipment, and as such in a market environment should not fall under the mandates of this requirement. Neither the TSP nor the LSE provide or receive information about specific lines or equipment in real-time. Therefore, requirement R7 should not apply to them absent clear evidence that a realistic (not hypothetical) threat to reliability would exist if they are omitted. We do not think that such a threat would exist.

Disagree

This proposed communication protocol is redundant to Requirements R2-R7, and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Results-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard. There is no need to create a CPOP that includes requirements R2 through R7 given that

each requirement spells out how and what is to be communicated. A CPOP may be needed for Interoperability Communications that are not addressed in R2-7.

Disagree

It is not clear what value there is in identifying these alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Just stating the severity and details of the incident should suffice. Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. System operators will need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. The level(s) identified in the notification text are at odds with the condition (color versus numerical). Suggest that the standard either use Condition (color) or the level (numerical). Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the listed entities such as Distribution Provider and Generator Operator cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 are not consistent with the definition of Interoperability Communications. By definition, Interoperability Communication pertains to all communications about how entities change the state of the BES (not just physical or cyber attacks). Attachment 1 is about notifying of what physical and cyber attacks have already happened to the BES. It is not clear in the context of Interoperability Communications what the recipient of a specific notification is expected to do when there is a change of state or status of an element or facility of the Bulk Electric System. Attachment 1 pertains specifically to Operating State Alert Levels and says nothing about the communication of information to be used to change the state or status of a BES element or facility (which is the SDT's proposed definition of Interoperability Communications). Therefore, it is not appropriate to require that all verbal and written Interoperability Communications use the pre-defined terminology in Attachment 1. Only those communications concerning Operating State Alert Levels should be required to use that terminology. By the proposed definition, such communications are not Interoperability Communications since the information is not used to change the state or status of a BES element or facility. The SDT needs to revise this requirement to clarify that it pertains only to communicating the Operating State Alert Levels and nothing more. None of the examples in either of the attachments appear to address EEAs (EEA is mentioned in the top paragraph of page 9 that is included in EOP-002-2.1) or SOLs. This limits the use of Interoperability Communications to only events where there exists either a physical or cyber threat, or where an IROL can't be mitigated. The requirements should focus on what is required, not how. The RC and encompassed entities should be required to define terms that will be used in communications. This would allow for the use of terms that are well understood in an area, rather than having to add new terms. The Background Information in this Comment Form introductory section mentions "The SDT proposes four system condition alerts instead of initial three in the RCWG version." However, Attachment 1 only mentions 3 alerts – Physical Security, Cyber Security, and Transmission Emergency Alerts leading to confusion.

Disagree

There is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no additional reliability need to use a common time zone. The time zone should be identified in the communication. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. When operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for operating entities to reliably operate. The time zone adopted by the respective Reliability Coordinator (RC) and their area control center, e.g., NYISO Eastern Standard Time (EST), should be used. If each entity in the area and the RC are all using EST (or daylight savings), then why would a time zone be used that is foreign to all parties in the area? This can lead to considerable confusion. What cannot be ignored is how many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement. The requirement should be that those entities which need to communicate and are in different time zones define which time they will use for communications. Any confusion about what time is being verbally communicated should be cleared up through three-part communications. There should be no confusion about what time is being communicated as long as the time zone

(where applicable), and the 24 hour format designations are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion.

Disagree

Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions, or during operational strategic discussions as well as other "non-action" oriented communications. This Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. This Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. The work being done by the RC SDT and RTO SDT in Project 2006-06 defines a Reliability Directive based on the determination of the person giving such an order. The entity that needs the action to be taken should establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, auditable, and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives. Outside of allowing the individual who NEEDS the action to be taken, this is an auditable or measureable requirement whether it be for 3-part communications or for the receiving entity to actually take said action. By definition, Three-part Communications presumes the second party will repeat the information back "correctly." Failure to do so is assigned a High VRF and a Severe VSL. The practical application of Three-part Communication involves a sender communicating information, a receiver repeating back the information, and the sender verifying the repeat back is either correct or incorrect. If the repeat back is incorrect, the process repeats until both parties have the same understanding of what is being communicated.

Disagree

While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications, and is certainly not necessary to be included as an enforceable Requirement. For example, a situation in which an operator says "A as in apple" instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. The objective of good communications is to assure that the parties understand each other. The statement "... shall use the NATO phonetic alphabet" doesn't make sense for North America. If the Real-Time Operator states "breaker 6-North," under the NATO phonetic alphabet that would be unacceptable, because the operator did not use the appropriate NATO term "breaker 6-November," even though the "N" on the one line diagram refers to the "North" breaker and not the "South" breaker. Many organizations may have established communications protocols which are working well. Making a change may actually hinder reliable operations by introducing unnecessary confusion and questioning. Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word "Zebra" instead of "Zulu" to signify the letter "Z"? And, why would this be enforceable. Perhaps this should be a guideline document rather than an enforceable Requirement. There is no reliability need for this Requirement.

Agree

Agree

It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There do not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information, for example 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts, and will only generate phone calls

for more information. Furthermore, PSE and CSE is a type of sabotage already reported in CIP-001 R2. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Also it has been the experience of several entities during the field test of these Alert Levels that there are inconsistencies as to when to implement various stages of Alerts, and this introduces more confusion than exists today. Reliability has not been enhanced. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Foresees is a forecast condition. There is an inconsistency between the inclusion of Attachment 1 and what is stated in the document posted with the standard entitled Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement. The document states that the standard focuses on "how to" communicate rather than on specified scenarios of "to whom" or "when to" communicate; however, Attachment 1 does just the opposite. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA's use terminated. Terminated is the preferred term. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model. Refer to the response to Question #4.

Agree

Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in Attachment 1 creates a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list verbally and individually would create that unnecessary burden, and distract the RC from actual system operation. This is a detriment to reliability. Some ISO/RTOs have market rules which allow participants to elect NOT to follow instructions issued by their market operator (who may also perform BA, TOP and/or RC entity functions) unless an Emergency exists. In the Province of Québec, the use of French is mandatory, according to law, for communication within the Province. R3 should include: Within the Québec Interconnection, the French language shall be used for verbal and written interoperability communication between entities (RC, BA, TO, TOP, GOP, TSP, LSE and DP). For their interoperability communication with entities outside of the Québec Interconnection, they shall use the English language.

Agree

In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, and resources while not enhancing reliability in these areas. When operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate. Many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.

Agree

The existing standard COM-002 is better than this proposed Standard. This Standard actually causes more confusion and ambiguity, and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. All requirements with the exception of R1 have been determined to have a HIGH VRF, when many of them are dictating HOW communications should take place and not when, why, or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT in Project 2006-06. The RC SDT is adding requirements. More coordination is required between the Standard Drafting Teams. Again, we support the work being done by the RC SDT and RTO SDT and do not believe this adds more necessary requirements. Many of the requirement proposed in this posting either reiterate the drafts as posted (i.e. English language) or introduce

confusion when compared to the drafts as posted. The SDTs should limit their scope to R2 and R7, so as not to duplicate or contradict the on-going work of other SDTs. The SDT appears to have adopted severe violations for every infraction. There should be some gradations, using increasing severity based on the number of or severity of any infractions. Definitions: The standard should define other terms, as well, including the following: • reliability-related information, • "... state or status of an element or facility of the BES ..." The standard should also have provision to include the boundaries (components) of an "element," and the meaning of the terms "state or status" in the written communication protocol. For example, is the gas compressor of a 345kV breaker considered part of this element, and so would a change in its "state or status" be covered? Similarly, is the heat trace inside a 345kV breaker control cabinet part of this element or not? The VRFs for R2-R7 are all "High", and the VSLs are all "Severe" are too harsh. Failing to comply with one of the requirements does not automatically mean that a miscommunication occurred that caused a reliability problem. There should be a "Moderate" VSL for failure to comply with a requirement, but no miscommunication occurred. There should be a "High" VSL for failure to comply with a requirement that caused a miscommunication but resulted in no violation of another reliability standard. The "Severe" VSL should only apply to failures to comply with a requirement that caused a miscommunication that lead to a violation of another reliability standard, or caused a reliability problem. In addition, as stated earlier, this Standard focuses on "how" certain tasks should be performed and conflicts with NERC's position of pursuing performance based and results based Standards. Based on these considerations, work on this Standard should be stopped until work on Project 2006-06 has been completed and approved. This approach is consistent with the August 2003 Blackout Recommendation #26 "failure to identify emergency conditions and communicate that status to neighboring systems, and upgrade communication system hardware where appropriate" which actually focused on communications during emergencies, which is the scope of Project 2006-06. After Project 2006-06 is completed, a determination can be made on the disposition of this Standard. This Standard should be effective uniformly continent-wide.

SERC OC&SOS Standards Review Group

Margaret Stambach

Disagree

We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards. Adherence to such results-based standards would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability. The concern is that, since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties. This group does not feel the need for a definition of Interoperability Communication, since the term Reliability Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process. In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state – repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to "information" in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3.

Disagree

TSPs and LSEs are not typically included in real-time communications and should not be included in COM-003-1. The intent of requirement R18 in TOP-002-2 pertained to communications between neighboring BAs and TOPs. Adding LSEs and TSPs to the applicability of this standard doesn't make sense, and this change should not be made.

Disagree

This group feels that there should not be a requirement in the standard to have a “procedure”. It is our understanding that, to be auditably compliant with a standard, the responsible entity must develop a procedure, train on that procedure, and be able to demonstrate compliance via documents, data, logs, records, etc. If Requirements R2 – R7 are included in this standard, the entity will need to develop a procedure to be compliant. Therefore, we feel that requirement R1 is redundant and should not be included.

Disagree

The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Yet the Alert Level Guides were intended for announcement, not actions. Requiring system operators to use the color-coded system condition terminology during communication adds a layer of responsibility that will distract from the operator’s real-time reliability-related tasks. We do not feel that these Alert Level Guides apply to all the responsible entities identified under Applicability in the draft standard – for example, TSPs and LSEs are not included in the list of notifications. There is also some redundancy in the Alert Level Guides – for example, the CIP-001 standard requires notification of sabotage events – it should not be repeated in this standard.

Disagree

We feel that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities that routinely operate in different time zones already have an effective system for dealing with time differences. There seems to be no incentive to change a system that already works quite well, and the cost of updating computer systems could prove prohibitive. For instance, the requirement to use the central time zone for logging the time of an alert is problematic in that all communication tools, such as the RCIS, will need to be re-vamped. We question whether there will be a measurable reliability benefit by so doing. This group feels that mandating a common time zone across all of North America can only lead to confusion and increased reliability issues.

Disagree

As suggested in Question 1 above, the term Reliability Directive (as defined in COM-002-3) should be used in place of Interoperability Communication, since the directive is specific to emergency operations. The requirement should read: “Each responsible entity shall use Three-part Communication when issuing a Reliability Directive”. In addition, this requirement should apply only to BAs, TOPs & RCs. The other entities listed in the draft standard under Applicability do not issue Reliability Directives.

Disagree

First, please note that “NATO” does not stand for North American Treaty Organization; it stands for North Atlantic Treaty Organization. Use of the NATO phonetic alphabet should be considered a “best practice” and should not be included as a requirement in a reliability standard. One failure, such as saying “Baker” instead of “Bravo”, results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system.

Disagree

Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined “equipment” identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability, yet will expose entities to large fines.

Agree

Our concern is that the Alert Level Guides of Attachment 1 were written for Reliability Coordinators, not the industry as a whole, and now they are being incorporated into an industry-wide standard. This attachment is very prescriptive as to how the notifications take place, such as through the RCIS. If the RCIS is not functioning and the hotline is used instead, is the entity vulnerable to a violation by virtue of the fact that these alert guides are included in the standard? We believe that

the color-coded system condition terminology should be defined/required externally to the COM standards. The use of clear & consistent alert level terminology, while important, does not fit in well with the reliability-related communication standards, especially at these high violation severity levels. It is our suggestion that the Alert Level Guides be balloted separately, and include the Energy Emergency Alerts (EEA) as well. EEA requirements currently exist in NERC Standard EOP-002-2.1

Disagree

No, we are not aware of any regional variances.

Agree

We do see a potential conflict with the Energy Policy Act of 2005, which set the framework for the Electric Reliability Organization (ERO). The ERO's mission is to oversee and protect the reliability of the Bulk Electric System. This standard seems to cross the line between reliability-related activities and other types of operating actions. The concern here is that system operators will focus on the letter of the standard rather than on good operating practice. The fear of a violation among operators may have a greater impact on reliability than the violation itself.

Agree

This review group has identified several problems with this standard, as noted above. Other observations include: The effective dates in the draft standard and in the implementation plan do not seem to match. In the standard, the effective date mentions one calendar year following regulatory approval, while the implementation plan refers to the third calendar quarter after regulatory approval. Furthermore, we do not feel that any of the requirements in this standard warrant Violation Risk Factors or Violation Severity Levels in the high or severe category. In summary, this review group feels that COM-003-1 is not yet ready to be acted upon and may have been posted too soon. There does not seem to be sufficient coordination between the drafting teams of all the COM standards, or any attempt to integrate these standards. One example is the inconsistency between COM-003-1 and COM-002-3 regarding the meaning of three-part communication (mentioned in our response to Question 1 above). As noted above, we feel that many of the requirements prescribe specific "how to" methods for compliance rather than focusing on the "what" of the requirement. Overall, COM-003-1 is much too prescriptive to be tied to million dollar-level fines. "The comments expressed herein represent a consensus of the views of the named members of the SERC OC&SOS Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

Individual

Jonathan Appelbaum

Long Island Power Authority

Disagree

LIPA disagrees with the definition for Three-Part Communication. LIPA prefers the process offered in COM-002-03 (draft). In COM-003 the listener must understand the communication the first time. Failure to understand and repeat back correctly could be a violation of the requirement. The intent three part communication is to have an iterative process whereby the person issuing the message is ultimately satisfied that the recipient understands the information and will perform the required action. It should not be defined as three steps and only three steps. LIPA offers the following definition: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. LIPA disagrees with the definition of Interoperability Communication. LIPA believes the Standard is addressing the communication of the Operating State of BES equipment and facilities. The proposed definition utilizes the phrase "change the state ... of a BES facility" which can be interpreted as the position, e.g. open, close, tap position, etc... thereby extending this Standard into routine switching and operation of the BES. The SAR stated this Standard was "to use specific communications protocols under normal, abnormal and emergency conditions to relay critical reliability-related information in a timely and effective manner". The proposed definition can be interpreted in a manner that extends this to all reliability related information for every BES operation. The drafting team should also consider adding a definition for Directive or acknowledge the definition in draft Com-002-03.

Agree
Disagree
LIPA agrees with the need for CPOP but does not agree that R4 can or should apply to all interoperability communications between entities. Since the examples in Attachment 1 specifically state RC and TOP, this standard should not apply to any other entity except for the RC and TOP. COM-002-03(draft) could require the other entities to utilize three part communication for reliability-related Interoperability communication.
Disagree
LIPA believes the use of "shall" and "all" coupled with the broad applicability of this Standard and the broad definition of Interoperability Communication will result in entities either not complying with R2 or making statements regarding the Operating Alert State when unnecessary. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels, and what to report on. There is no benefit to specifying the specific terminology. This requirement should require the RC to define the terms/levels/alert states to include within the CPOP that sufficiently communicate the increased levels of Alert or Response encountered/required. Many entities have invested time and training in the existing processes that meet the intent of this requirement. Read strictly, the only predefined alert conditions are Physical security, Cyber security and Transmission Security as it applies to the RC and TOP only. LIPA notes that R2 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.
Disagree
This requirement will burden those entities whose operations and communication needs are with other entities in the same time zone, which represents the overwhelming majority of all communications performed. It will increase the likelihood of errors for such entities. Further, some entities are operating both NERC BES elements and non-BES elements from the same control room. This requirement will significantly impact the efficiency and the safety of workers within those entities. LIPA notes that R4 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.
Disagree
The SDT should define Directive. Draft Com-002 -3 has a similar requirement to identify a directive and then utilize three-part communication. Also Com-002-3 Three part communication differs from the description of Three-part communication in this Standard. LIPA prefers Com-002-3 usage of the word "intent" in the repeat back. Also see comments to Question 1.
Disagree
While LIPA understands the benefit of utilizing a phonetic alphabet, we question the designation of a specific phonetic alphabet. This prescriptive requirement may result in absurd non-compliance reports, such as, using "Dog" for "D" instead of "Delta". R6 requires the use of the alphabet when issuing information, but not in the repeat back step. This may be an oversight. Also Does the RC in its communication utilize the abbreviation for the threat type, e.g PSEA, or does the RC use the NATO-Alphabet? If NATO, then the example in Attachment 1 should state this need.
Agree
LIPA notes that R7 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.
Agree
In addition to the response to Question 4, LIPA does not understand why there are Levels and color designations since only the threat level numeral is being communicated. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels. There is no benefit to specifying the specific terminology. Requiring system Operators to state Colors and Levels would seem to result in slower and more confused communication.
Disagree
Agree

R1 requires each entity to create a CPOP. There is not a requirement to coordinate CPOP's amongst entities beyond the requirements in the Standard. There is no requirement to exchange CPOP's between entities with an operating relationship. The SDT should consider adding a requirement either that allows entities with operating relationships to request and be provided a copy of the other's CPOP, or a requirement requiring the exchange of CPOP between entities with operating relationships. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures. LIPA does not believe that any requirement in this Standard if violated would have the results specified in the definition of a High VRF, especially since these requirements are addressing the HOW of communication.

Group

Pacific Northwest Small Utilities Comment Group

Margaret Ryan

Disagree

Communication protocols extend beyond the verbal and written versions. How does the "non-routable (communication) protocol" of CIP-006 fit into or not fit into these definitions?

Our utilities agree with the move in principle, but are concerned about the transition. How will NERC ensure that registered entities are not doubly jeopardized during the time when the same requirement exists in two active standards? The addition of LSE to COM-003 goes way beyond the obligations in TOP-002-2 R18; LSE's are now in every requirement of COM-003.

Disagree

DPs and LSEs are in general users, not owners or operators of interconnected BES equipment per the registry criteria. DPs and LSEs should be removed from this requirement since LSEs typically do not own or operate the interconnected BES equipment

Disagree

The referenced attachment appears to list alert levels for RCs to use in communicating threats to BAs, DPs, GOs, TOPs and TOs. This requirement should apply only to RCs.

Disagree

While our utilities agree that understanding the actual time is important, stating the time zone and summer offset (13:34 PDT) should suffice. As an alternative, UTC might be used since it is clearly distinguishable from local time in all of NERC. As in R1, LSEs and DPs should be removed from this Requirement.

Disagree

Per TOP-001 and IRO-001, only TOs and RCs have the authority to issue reliability directives (per the proposed definition of interoperability communications, such directives would qualify as reliability directives). All other entity types should be removed from this requirement. As in Q2, the transition is a concern. Unless the effective date of COM-003-1 is the same as the date of retirement of COM-002; there will either be a reliability gap where neither active standard requires three-part communication, or there will be a situation where an entity could be doubly jeopardized for a single event. Three-part communication is worthless unless the recipient understands what he/she is parroting and is authorized to take action. For example, many DPs/LSEs do not maintain 24/7 dispatch desks and an afterhours call may go to an answering service. Three-part communication with the answering service operator will only delay the requested action. The entity issuing the directive should be required to ensure their employee reaches someone authorized to take action before delivering the directive via Three-part communication.

Agree

No Comment

Disagree

DPs and LSEs are typically users, not owners or operators of interconnected BES equipment per the registry criteria. DPs and LSEs should be removed from this requirement.

Disagree

Agree
(This is a yes or no questions) Yes, The RC in the WECC region has no communication with any entity other than the sixteen listed in <a href="http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf">http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf</a> . Although the linked document is on PNSC letterhead, WECC as RC continues this policy. Communication paths involving the RC and any other entity in the west other than the sixteen should be exempt from all the requirements in this standard. If DPs and LSEs must be included in this standard, then there should be an agreement in force beforehand between them and their RC, BA and TOP that they may receive directives, or require the RC, BA and TOP to list those DPs and LSEs that would not receive directives.
Agree
(This is a Yes or No Questions) Yes, see our comments to Q2.
Agree
(This is a Yes or No Questions) The proposed standard seems to have just thrown everyone into the pot, and not considered how registered entities interact with the BES or what other standard requirements apply to them. We can not lose sight of the original objective of, not only ERO Compliance, but the "purpose" described in regards to the development of this standard (Posted as background information on Project 2007-02). The stated purpose is, "To ensure that reliability-related information is conveyed effectively, accurately, consistently, and timely to ensure mutual understanding by all key parties, especially during alerts and emergencies." With this said, The BA's, TOP's and RC's are the key registered entities that have the power to take action, they are the key players in the communication of information which "impacts" the BES. We fail to see the value added by including DP's and LSE in most of the requirements of this standard. If anything, we see the opposite affect taking place by adding DP & LSE's. This may be an extra tier of unnecessary communication that would not only slow down this process, but just may contribute to greater inefficiencies. Please note that many DP & LSE in the WECC region are very small utilities that do not have 24 by 7 coverage.

Please define "directive" as a term.
Agree
Disagree
A written CPOP will place an unnecessary burden on smaller entities without an increase in reliable communications. I feel that the other requirements are somewhat self-explanatory and that an annual review of the phonetics and three-part communications would improve reliability more than having a written CPOP requirement.
Agree
Eliminating lax communications and improving identifiers is one of the cheapest and easiest ways to improve reliability.
Disagree
In other large industries one time zone is usually picked, and the time zone that is usually picked is the EST zone (JP Morgan Chase is an example). I feel that picking a standard time zone is very important, but I have not seen significantly good arguments to use CST. EST, on the other hand, is where the majority of the load for the electric industry resides. I suggest changing the standard to EST but with the 24 hour format.
Agree
I feel that there needs to be a way to verify what has been said. Three-part Communications accomplish the verification that may be required as a result of the communication medium. If a better method is developed I propose that it be used.
Agree
The NATO Phonetic alphabet is easy to learn and use. Most people can learn it on their own much faster than it will take the SDT to read all of the comments for COM-003.
Agree
How many substations have the same name? Unique identifiers easily and inexpensively eliminate confusion and errors.

While recording telephone conversations may be routine for utility companies, many industrial facilities that fall under the jurisdiction of this standard do not currently have the facilities necessary to record the conversations and store them for an extended length of time. If a company does not currently possess the capability to record telephone conversations, is it the intent of this standard to require them to install such facilities? If so, what is the time frame surrounding the installation of the facilities necessary to record and store telephone conversations? Currently, we maintain a log of our communications which includes the question or instruction and our (or in the case of a question the third party's) response. Does this satisfy the requirements for evidence as defined in measures M2 through M7?

Compliance paragraph 1.4 bullet 2 implies that all entities retain 3 months worth of telephone voice recordings through its use of the word 'and' in the statement "Distribution Provider shall retain for Requirement 2 through 7, Measure 2 through 7, dated operator logs for the most recent 12 months and voice recordings or transcripts of voice recordings for the most recent 3 months". While many utility companies employ the use of voice recorders, many industrial facilities do not. When a facility does not currently employ the use of voice recorders, is it the intent of this document to require the facility to install the infrastructure necessary to record and store telephone conversations? If so, what is the time line for deploying the infrastructure necessary to record and store telephone conversations? Currently, we maintain a log of our communications which includes the question or instruction and our (or in the case of a question the third party's) response. Does this satisfy the evidence criteria as defined in measures M2 through M7 of the proposed standard?

Individual
Tracy Sliman - System Operations Compliance
Tri-State Generation & Transmission Assoc.
Disagree
The term directive is not defined therefore it is unclear what constitutes a directive.
Disagree
LSE and TSP are not responsible for the reliability of the Bulk Electric System. That responsibility resides with the TOP.
Disagree
DP, LSE and TSP are not responsible for the reliability of the Bulk Electric System. Also, attachment 1 explains Operating State Alert Levels that defines colors that are already in use by the Department of Homeland Security. Re-using these colors presents confusion to the operators of the BES. This places an unnecessary additional burden on Real Time day-to-day operations with a high risk of confusion in an emergency.
Disagree
Attachment 1 explains Operating State Alert Levels that defines colors that are already in use by the Department of Homeland Security. Re-using these colors presents confusion to the operators of the BES. This places an unnecessary additional burden on Real Time day-to-day operations with a high risk of confusion in an emergency. Additionally, this is too complicated and requires a complete retraining of operators in the English language.
Disagree
We have been operating within our individual time zones for many years without incident. Modifying the time zone to which we operate will pose additional confusion and add unnecessary risk in operating the BES.
Disagree
Directive is not defined. This would require issuing a directive for each and every verbal communication between entities, even those that pose no risk to the BES, which is not necessary.
Disagree
Directive is not defined. This poses an undue burden on the operators, which does not improve the reliability of the BES. NERC should only concern themselves with issues related to maintaining the reliability of the BES.
Disagree
This is not NERC's responsibility to define. There are too many lines and too much equipment to identify each as a NERC definition. Definitions are already agreed upon between operating entities.
Agree
The Operating State Alert Levels can be confused with DHS security levels. DSPs should not be included because they are not subject to BES standards because they do not operate the BES, that responsibility resides with the TOP. The title Distribution Service Providers should be changed to Distribution Provider to correlate with the NERC functional model. Under Additional Communication the posting of the alert level should be determined by each entities internal procedure and not included in this standard. This attachment is too invasive and restrictive.
Disagree
Disagree
Agree
This standard should not apply to DPs, LSEs or TSPs as they do not have control over the BES. That responsibility resides entirely with the TOP. Additionally, it is concerning that the term "directive" is not defined. The proposed definition for Interoperability Communication could be interpreted to include all communication between entities. This is too restrictive.

none
Disagree
none
Disagree
This standard is based on COM-002-3 however that standard has not been voted-in or NERC approved yet. I think this COM-003 effort should be put on hold until the 2006-06 project is complete. At that time the term "directive" should be replaced by "Operational Directive" and "Reliability Directive" based on context and all of these terms should be defined in the NERC Glossary of Terms.
Individual
Joe Knight
Great River Energy
Disagree
GRE believes the proposed definition for the term Interoperability Communication is too broad and ambiguous. We recommend the following instead: Communication between two or more Functional Entities to exchange reliability-related information to be used by the entities to change the state or status of Facilities of the Bulk Electric System. The inclusion of the terms Functional Entities and Facilities removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC's Glossary) The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct.

We suggest the definition be revised as follows: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. GRE believes there should be a definition added for Reliability Directive to ensure consistency across the defined projects for standards development. The Drafting Team working on Project 2006-06 has defined Reliability Directive as: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency. GRE recommends use of this definition and the term Reliability Directive as opposed to Directive.

Disagree

TOP-002\_R18 is fundamentally different from the new proposed requirement in COM-003-1\_R7. TOP-002 R18 states that the BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003-1\_R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use PRE-DETERMINED, MUTUALLY AGREED UPON line and equipment identifiers for verbal and written Interoperability Communications. GRE believes the TOP-002\_R18 could be included in COM-003-1 but included as stated verbatim in TOP-002.

Disagree

The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. GRE does not support such an approach. GRE suggests deleting this Requirement from the Standard.

Disagree

It is not clear what value there is in identifying these alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the listed entities such as Distribution Providers and Generator Operators cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 are not consistent with the definition of Interoperability Communications. By definition, Interoperability Communication pertains to all communications about how entities change the state of the BES (not just about physical or cyber attacks). Attachment 1 is only about notifying of what physical and cyber attacks and transmission emergencies have already happened to the BES.

Disagree

There is no reliability need to use a common time zone for communications. The prevailing time zone should be used to avoid confusion between operating staff and field personnel. Use of CST will actually cause confusion with no foreseeable reliability benefit.

Disagree

Without defining directive the SDT is leaving the industry in the same situation we are currently in. As discussed in the response to Question #1 above, it is GRE's opinion that the definition of Reliability Directive must be developed and included in the discussion of this standard. The term directive should be as defined in Project 2006-06: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency. GRE believes it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and easily auditable and measureable.

Disagree

While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through enforceable requirements. The NATO phonetic alphabet does not allow for the use of numbers ten and beyond. An entity WOULD be found non compliant for

saying OPEN SWITCH FOURTEEN BRAVO. GRE does not believe this is reasonable as it adds nothing to the reliability of the BES. It is too prescriptive and all encompassing and could potentially confuse or slow down the communication process especially in an emergency situation.
Disagree
See comments for Question 2
Disagree
Disagree
Agree
GRE believes that the existing standard COM-002 is actually better than this standard. This standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.
Individual
Fred Meyer
The Empire District Electric Company
Disagree
Replace the proposed COM-003-1 definition of "Three-part Communication with what is used here: Three Part Communication: A communications protocol to be used when a Reliability Directive is initiated verbally, whereby the action to be taken is identified as a Reliability Directive; the recipient repeat the details of the Reliability Directive back to the issuer of the Reliability Directive; and the issuer acknowledges the response from the recipient of the Reliability Directive as correct, or re-issues the Reliability Directive to resolve any misunderstanding.
Disagree
A more efficient method of designation common pre-determined line and equipment identifiers would be through the Reliability Coordinator. Having the Reliability Coordinator establish this would create a single methodology as opposed to several different methodologies that would have to be agreed upon between entities and a significant amount of work for all entities.
Disagree
What benefit to the BES would this provide? Rather I see more confusion by having entities develop different CPOPs. How will this benefit real time operations? This seems to be a requirement by NERC to assist NERC in analysis "after the fact" of an event, but in reality it can hinder daily operations.
Disagree
This attachment is not needed. It is a duplicate of the NERC Alert process that is already established as well as CIP-001 Sabotage reporting requirement R2 along with requirements of EOP-001 R5 and EOP-004 R2 dealing with disturbance reporting. The last thing the industry needs is more paperwork requirements that are redundant when an emergency event happens on the system.
Disagree
In dealing in real time, what possible benefit can be had by this requirement? I see this requirement benefitting NERC analysis after the fact and can lead to more operating mistakes in real time than it benefits. If a situation is occurring in real time and two entities are in communication with each other, the requirement of a common time zone holds no benefit.
Disagree
When and why would a GO, TSP or LSE ever issue a directive? Directives are given by RC's. Use the definition of Third Party Communications provided earlier in this comment form.
Disagree
The NATO phonetic alphabet is too descriptive as a requirement. A common phonetic alphabet where both parties understand the communication should be a better requirement and left up to the parties in communication with each other as common across the USA.
Disagree

I would suggest a more efficient method of designating common pre-determined line and equipment identifiers through the Reliability Coordinator. As similar to the response earlier. A definition of "Equipment" is needed as well.
Disagree
Again this attachment is redundant to the NERC Alert process.
Agree
NO
Disagree
Disagree
This proposed standard seems to be a redundant standard to many other already approved NERC standards such as CIP-001, EOP-001, EOP-004, as well as the NERC alert process. I see little to no benefit from this standard as proposed.
Individual
Ed Davis
Entergy Services
Disagree
The definition for Three-part communication is deficient when compared with the requirements of the recently posted COM-002-3 which describes an interactive process in which the communicating party corrects the recipient in the situation where the repeated message contains inconsistencies. The party receiving the message will not always get the message right the first time. Also, Entergy does not believe that the introduction of the term Interoperability Communications is necessary. In the questions below, we identify specific ways that the requirements could be improved by including the term Reliability Directive as included in the recently posted COM-002-3. The term Interoperability Communications is very broad, covering both normal and emergency communications, creates a new category of communications without providing any real benefit to the industry.
Disagree
TSP and LSE are not typically included in real-time communications and should not be included in this requirement. The intent this requirement in TOP-002-2 pertained to communications between neighboring BAs and TOPs. Adding LSE and TSP to this requirement doesn't make sense, and this change should not be made.
Disagree
Interoperability communications should be removed as recommended in our response to question 1. Creating requirements for the communications protocol will by necessity require entities to document how they meet the requirements. A requirement for an operating procedure is redundant. The requirement to have an operating procedure in effect makes this a "how" requirement. An entity could choose to have more than one procedure that described their communications protocol. This requirement as written could force an entity to put all of their communications procedures into one CPOP, which doesn't improve reliability. Therefore the requirement is not needed and should not be included in the standard.
Disagree
Term Interoperability Communications should be removed from the standard. As written, the actions that fall into interoperability communications are much broader than the set of conditions described in the table in attachment 1. To the extent that the communications are outside of the ones in the table, entities will be non-compliant because their communications are not pre-defined. Recommend that this requirement be changed to indicate that "Any Reliability Coordinator or Transmission Operator experiencing a physical security emergency, cyber security emergency, or transmission emergency will communicate their status using the conditions and processes in Attachment 1."
Disagree
This is also a "how" requirement and not a "what" requirement. If the industry believes that confusion exists pertaining to what time zone different entities are referring to in written and verbal communications, the requirement should be focused on ensuring clear communication of time zone information is included in verbal and written communication. Forcing entities to change to any one

time zone will impose significant effort and expense without a measurable improvement in reliability. However, Entergy is not aware that reliability issues have occurred as a result of entities communicating in written or verbal format in different time zones. Entergy proposes that this requirement be removed from the standard.

Disagree

Should be rewritten to say that "Each Responsible Entity shall use Three-part Communications when issuing a Reliability Directive." This should use the definition of Reliability Directive as proposed in project 2006-06. Entergy recommends not including the definition of Interoperability Communications in this standard or in the R5 Requirement. Also, the list of responsible entities listed in the requirement R5 are not all able to issue Reliability Directives. So this requirement should be limited to Reliability Coordinators, Balancing Authorities and Transmission Operators, who can issue Reliability Directives.

Disagree

Entergy has 2 concerns with this requirement as written. First, the use of the NATO phonetic alphabet is overly prescriptive to convey alpha-numeric information. For instance, if I use the word "baker" instead of "bravo" in my communications, I would have still successfully communicated the letter "B" to the person receiving my communication. My communication may have supported reliable interconnected operations. However, according to this requirement, I would still have violated the standard. Second, the requirement as written is very broad, applying not just to directives, but also to "notifications, directions, instructions, orders and other reliability related operating information". These terms are not defined, so I would assume that this covers Reliability Directives, and everything else. If the industry supports using a phonetic alphabet, it should be limited just to directives containing alpha-numeric information. Again, the requirement to use the NATO phonetic alphabet imposes a significant operational burden, creates a human error trap for operating personnel, and does not improve reliability. It should not be included in the new standard.

Disagree

The requirement as it was written in TOP-002-2 pertained to communication between neighbors for shared lines and facilities. That intent has been lost in this version of the requirement. Also a term "equipment identifiers" has been added, but it is not clear what additional equipment is covered by this requirement, or what reliability concern is being addressed by these changes. Entergy recommends that this requirement be changed to be similar to the language that exists in TOP-002-2 R18 "Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use pre-determined mutually agreed upon line identifiers when referring to transmission facilities of an interconnected network."

Agree

As written, the actions that fall into interoperability communications in requirement 2 are much broader than the set of conditions described in the table in attachment 1. To the extent that the communications are outside of the ones in the table, entities will be non-compliant because their communications are not pre-defined. Recommend that requirement 2 be changed to indicate that "Any Reliability Coordinator or Transmission Operator experiencing a physical security emergency, cyber security emergency, or transmission emergency will communicate their status using the conditions and processes in Attachment 1."

Disagree

Comments: We agree with the new terms for inclusion in the NERC Glossary. We are somewhat concerned that in this version of the draft standard there was no definition for "directive" included. We do understand that the term "directive" is no longer capitalized in this version of the standard,

therefore, not required to be included in the NERC Glossary. Since several requirements of this draft standard require certain actions when a "directive" is issued, the term should be defined. It is necessary to define the term "directive" to ensure that just normal conversations between entities are not later "interpreted" to be a "directive".

Agree

Yes, we believe that the use of pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications enhances the reliable operation of the BES.

Disagree

We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is applicable. We suggest the drafting team consider modifying the applicability of this standard as follows similar to the format used in PRC-005: 4. Applicability: 4.1. Transmission Operator 4.2. Transmission Owner 4.3. Balancing Authority 4.4. Reliability Coordinator 4.5. Generator Operator 4.6. Distribution Provider that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System 4.7. Transmission Service Provider 4.8. Load Serving Entity that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System

Agree

We believe there is a need to use pre-defined system condition terminology and the ones provided in the attachment are easy to understand.

Disagree

We believe that adding the Central Time zone requirement for all verbal and written Interoperability Communications is unnecessary. For these type of activities there should already be accurate time stamps from equipment such as RTUs, EMS systems etc... for record keeping and documentation activities. In the future, with the implementation of Smart Grid technologies, time stamping will be included in the developed platforms for such technology, therefore, reducing the much of the time stamping errors. Because many of the actions required for Interoperability Communications, are completed by field personnel this requirement is onerous. It could potentially impact reliability since the field personnel might be more focused on documenting the correct time zone, for compliance to the requirement and the potential impact for non-compliance, than completing the required task safely and accurately. If time-stamping is an issue in event analysis, it might be more appropriate that Central Standard Time be utilized by recording devices such as RTUs, EMS systems etc... not for the actual verbal and written communications. In addition, how will daylight savings time be addressed in the proposed requirement of this standard?

Disagree

We agree that Three-part communication is a more accurate form of communication for issuing and responding to a Directive during verbal Interoperability Communications and should remain as a requirement of this standard. However since the term "directive" has not been defined it is unclear when Three-part communication is required.

Disagree

We agree that using the NATO phonetic alphabet is a more accurate form of communication for issuing and responding to a directive during verbal Interoperability Communications. However, other forms of phonetic alphabet communications could be utilized to achieve the same results and entities should not be forced to use only the NATO phonetic alphabet. As stated in question 6 we are concerned about the undefined term "directive". In addition to the NATO alphabet, did the drafting team consider including the 10-Code system many utilities use for verbal communication (ex: 10-4)? If not, why not and if so, why not included?

Agree

We agree using pre-determined, mutually agreed upon line and equipment identifiers during for all verbal and written Interoperability Communications is a more accurate form of communication and should remain as a requirement of this standard.

Agree

POSSIBLE FRCC VARIENCE - FRCC appears to have developed a communication protocol in which "any or all conversations on the phone is considered a directive. If this case, we suggest that the drafting team review the FRCC approach and determine if a regional variance should be included in this standard or consider utilizing the FRCC approach for clearly defining the term "directive" for inclusion in the NERC Glossary.

We recommend replacing the term "Distribution Service Providers" in Attachment 1 with the term "Distribution Provider" as stated in the Applicability of this standard. In addition, please see our response to Question 3 regarding a modification to the Applicability portion of the standard to address concerns about the inclusion of Distribution Providers and Load Serving Entities. We are concerned with the onerous communication requirements for Load Serving Entities and Distribution Providers with field personnel that have rare or possibly no opportunities to communicate with personnel working at an entity registered as a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator or Transmission Service Provider.

Disagree
<p>We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards which would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability. Since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties. This group does not feel the need for a definition of Interoperability Communication, since the term Reliability Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process. In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state – repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3. The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: “A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.” Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? Then the terms need to be capitalized.</p>
Disagree
<p>Requirement R7, regarding the use of pre-determined line &amp; equipment identifiers, applies to TSPs &amp; LSEs. However, the other requirements of this standard do not seem to apply to these entities. For instance, most of the reliability-related alerts are communicated through the Reliability Coordinator Information System (RCIS). TSPs do not have access to this real-time communication tool, so the TSP should not be included in the applicability for the entire standard. Furthermore, Requirement R18 in TOP-002-2 mandated that neighboring Balancing Authorities use the uniform line identifiers. In COM-003-1, this requirement is lost, since Requirement R7 makes no mention of neighboring BAs. This requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and comprehended.</p>
Disagree
<p>It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during</p>

actual and anticipated emergency conditions. We feel that there should not be a requirement in the standard to have a "procedure". It is our understanding that, to be auditably compliant with a standard, the responsible entity must develop a procedure, train on that procedure, and be able to demonstrate compliance via documents, data, logs, records, etc. If Requirements R2 – R7 are included in this standard, the entity will need to develop a procedure to be compliant. In other words, the procedure itself will become the focus rather than the actual communications protocol. Therefore, we feel that requirement R1 is redundant and should not be included. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard. Furthermore, the establishment of R2-R7 as elements of the CPOP required in R1 appears to contradict the recent shift in direction that NERC has taken regarding defining criteria as bullets under a requirement. See NERC's August 10th informational filing regarding assignment of violation risk factors and violation severity levels in regards to dockets RM08-11-000, RR08-4-000, RR07-9-000, and RR07-10-000 Furthermore, R2 appears to define Interoperability Communications for attachment 1 communications only. Is this the intent of the drafting team?

Disagree

The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Yet the Alert Level Guides were intended for announcement, not actions. Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. We also do not feel that these Alert Level Guides apply to all the responsible entities identified under Applicability in the draft standard – for example, TSPs and LSEs are not included in the list of notifications. The requirement to use the central time zone for logging the time of an alert is problematic in that all communication tools, such as the RCIS, will need to be re-vamped. We question whether there will be a measurable reliability benefit by doing so. There is also some redundancy in the Alert Level Guides – for example, the CIP-001 standard requires notification of sabotage events – it should not be repeated in this standard. This also needs to be reconciled with EOP-004 and CIP-001 and the SAR formed to address those redundancies. It is not clear what value there is in identifying alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Attachment 1 and R2 do not appear to be in synch primarily due to the definition of Interoperability Communications. By definition, Interoperability Communication is about how entities change the state of the BES and Attachment 1 is about notifying of what already happened to the BES.

Disagree

We feel that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities that routinely operate in different time zones already have an effective system for dealing with time differences. There seems to be no incentive to change a system that already works quite well, and the cost of updating computer systems could prove prohibitive. This group feels that mandating a common time zone across all of North America can only lead to confusion and increased reliability issues.

Disagree

As suggested in Question 1 above, the term Reliability Directive (as defined in COM-002-3) should be used in place of Interoperability Communication, since the directive is specific to emergency operations. The requirement should read: "Each responsible entity shall use Three-part Communication when issuing a Reliability Directive". In addition, this requirement should apply only to entities which issue reliability directives - BAs, TOPs & RCs. The other entities listed in the draft standard under Applicability do not issue Reliability Directives.

Disagree

Use of the NATO phonetic alphabet should be considered a "best practice" and should not be included as a requirement in a reliability standard. One failure, such as saying "Baker" instead of "Bravo", results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system. Also, many organizations may have established communications protocols which are functioning properly and making a change may actually hinder reliable operations by introducing unnecessary confusion.

Disagree

Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined "equipment" identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability, yet will expose entities to large fines. The key question is: "Do the companies' personnel understand one another?"

Agree

Our concern is that the Alert Level Guides of Attachment 1 were written for Reliability Coordinators, not the industry as a whole, and now they are being incorporated into an industry-wide standard. This attachment is very prescriptive as to how the notifications take place, such as through the RCIS. If the RCIS is not functioning and the hotline is used instead, is the entity vulnerable to a violation by virtue of the fact that these alert guides are included in the standard? We believe that the color-coded system condition terminology should be defined/required externally to the COM standards. The use of clear & consistent alert level terminology, while important, does not fit in well with the reliability-related communication standards, especially at these high violation severity levels. It is our suggestion that the Alert Level Guides be balloted separately, and include the Energy Emergency Alerts (EEA) as well. EEA requirements currently exist in NERC Standard EOP-002-2.1 It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage which is reported in CIP-001 R2 already. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Forsees is a forecast condition. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEAs use terminated. We recommend using terminated. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model.

Disagree

Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list

verbally and individually would create an unnecessary burden that distracts the RC from actual system operation and represents a detriment to reliability.

Agree

We do see a potential conflict with the Energy Policy Act 2005, which set the framework for the Electric Reliability Organization (ERO). The ERO’s mission is to oversee and protect the reliability of the Bulk Electric System. This standard seems to cross the line between reliability-related activities and other types of operating actions which may be better suited for NAESB action. The concern here is that system operators will focus on the letter of the standard rather than on good operating practice. The fear of a violation among operators may have a greater impact on reliability than the violation itself. In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing “Central Standard Time” or “Eastern Standard Time” is sufficient for other operating entities to reliably operate; also, let’s not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.

Agree

We have identified several problems with this standard, as noted above. Other observations include: The effective dates in the draft standard and in the implementation plan do not seem to match. In the standard, the effective date mentions one calendar year following regulatory approval, while the implementation plan refers to the third calendar quarter after regulatory approval. Furthermore, we do not feel that any of the requirements in this standard warrant Violation Risk Factors or Violation Severity Levels in the high or severe category. In summary, this review group feels that COM-003-1 is not yet ready to be acted upon and may have been posted too soon. There does not seem to be sufficient coordination between the drafting teams of all the COM standards, or any attempt to integrate these standards. One example is the inconsistency between COM-003-1 and COM-002-3 regarding the meaning of three-part communication (mentioned in our response to Question 1 above). Recommendation 26 of the August 14, 2003 blackout report is cited as a driver for extending three-part communications. We believe the title of Recommendation 26 is misleading and when reviewed separately from the supporting text of the recommendation and direct and contributing factors in the report results in an incorrect interpretation. “Failure to identify emergency conditions and communicate that status to neighboring systems” is one of the contributing factors and the supporting text of the recommendation clearly refer to shoring up communications during emergency and anticipated emergency conditions and establishing an emergency broadcast communication system to alert regulatory, state and local officials. The supporting text of Recommendation 26 only mentions addressing alerts, emergencies or other critical situations. Some have incorrectly inferred the initial clause of Recommendation 26, “Tighten communication protocols”, means the recommendation applies to all routine communications. As noted above, we feel that many of the requirements prescribe specific “how to” methods for compliance rather than focusing on the “what” of the requirement. Overall, COM-003-1 is much too prescriptive to be tied to million dollar-level fines.

Disagree

We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards which would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability. Since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties. This group does not feel the need for a definition of Interoperability Communication, since the term Reliability

Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process. In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state – repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3. The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: “A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.” Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? Then the terms need to be capitalized.

Disagree

Requirement R7, regarding the use of pre-determined line & equipment identifiers, applies to TSPs & LSEs. However, the other requirements of this standard do not seem to apply to these entities. For instance, most of the reliability-related alerts are communicated through the Reliability Coordinator Information System (RCIS). TSPs do not have access to this real-time communication tool, so the TSP should not be included in the applicability for the entire standard. Furthermore, Requirement R18 in TOP-002-2 mandated that neighboring Balancing Authorities use the uniform line identifiers. In COM-003-1, this requirement is lost, since Requirement R7 makes no mention of neighboring BAs. This requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and comprehended.

Disagree

It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. We feel that there should not be a requirement in the standard to have a “procedure”. It is our understanding that, to be auditably compliant with a standard, the responsible entity must develop a procedure, train on that procedure, and be able to demonstrate compliance via documents, data, logs, records, etc. If Requirements R2 – R7 are included in this standard, the entity will need to develop a procedure to be compliant. In other words, the procedure itself will become the focus rather than the actual communications protocol. Therefore, we feel that requirement R1 is redundant and should not be included. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard. Furthermore, the establishment of R2-R7 as elements of the CPOP required in R1 appears to contradict the recent shift in direction that NERC has taken regarding defining criteria as bullets under a requirement. See NERC’s August 10th informational filing regarding assignment of violation risk factors and violation severity levels in regards to dockets RM08-11-000, RR08-4-000, RR07-9-000, and RR07-10-000 Furthermore, R2 appears to define Interoperability Communications for attachment 1 communications only. Is this the intent of the drafting team?

Disagree
The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Yet the Alert Level Guides were intended for announcement, not actions. Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. New York State Reliability Council

Robert Ganley

Disagree

Comments: NYSRC agrees with the definitions for Communication Protocol. NYSRC disagrees with the definition for Three-Part Communication. NYSRC prefers the process offered in COM-002-03 (draft). In COM-003 the listener must understand the communication the first time. Failure to understand and repeat back correctly could be a violation of the requirement. The intent three part communication is to have an iterative process whereby the person issuing the message is ultimately satisfied that the recipient understands the information and will perform the required action. It should not be defined as three steps and only three steps. NYSRC offers the following definition: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. NYSRC disagrees with the definition of Interoperability Communication. NYSRC believes the Standard is addressing the communication of the Operating State of BES equipment and facilities. The proposed definition utilizes the phrase "change the state ... of a BES facility" which can be interpreted as the position, e.g. open, close, tap position, etc... thereby extending this Standard into routine switching and operation of the BES. The SAR stated this Standard was "to use specific communications protocols under normal, abnormal and emergency conditions to relay critical reliability-related information in a timely and effective manner". The proposed definition can be interpreted in a manner that extends this to all reliability related information for every BES operation. The drafting team should also consider adding a definition for Directive or acknowledge the definition in draft Com-002-03.

Agree

Disagree

Comments: NYSRC agrees with the need for CPOP but does not agree that R4 can or should apply to all interoperability communications between entities. Since the examples in Attachment 1 specifically state RC and TOP, this standard should not apply to any other entity except for the RC and TOP.

COM-002-03(draft) could require the other entities to utilize three part communication for reliability-related Interoperability communication.

Disagree

Comments: NYSRC believes the use of "shall" and "all" coupled with the broad applicability of this Standard and the broad definition of Interoperability Communication will result in entities either not complying with R2 or making statements regarding the Operating Alert State when unnecessary. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels, and what to report on. There is no benefit to specifying the specific terminology. This requirement should require the RC to define the terms/levels/alert states to include within the CPOP that sufficiently communicate the increased levels of Alert or Response encountered/required. Many entities have invested time and training in the existing processes that meet the intent of this requirement. Read strictly, the only predefined alert conditions are Physical security, Cyber security and Transmission Security as it applies to the RC and TOP only. NYSRC notes that R2 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.

Disagree

Comments: This requirement will burden those entities whose operations and communication needs are with other entities in the same time zone, which represents the overwhelming majority of all communications performed. It will increase the likelihood of errors for such entities. Further, some entities are operating both NERC BES elements and non-BES elements from the same control room. This requirement will significantly impact the efficiency and the safety of workers within those entities. NYSRC notes that R4 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.

Disagree

Comments: The SDT should define Directive. Draft Com-002 -3 has a similar requirement to identify a directive and then utilize three-part communication. Also Com-002-3 Three part communication differs from the description of Three-part communication in this Standard. NYSRC prefers Com-002-3 usage of the word "intent" in the repeat back. Also see comments to Question 1.

Disagree

Comments: While NYSRC understands the benefit of utilizing a phonetic alphabet, we question the designation of a specific phonetic alphabet. This prescriptive requirement may result in absurd non-compliance reports, such as, using "Dog" for "D" instead of "Delta". R6 requires the use of the alphabet when issuing information, but not in the repeat back step. This may be an oversight. Also Does the RC in its communication utilize the abbreviation for the threat type, e.g PSEA, or does the RC use the NATO-Alphabet? If NATO, then the example in Attachment 1 should state this need.

Agree

Comments: NYSRC notes that R7 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.

Agree

Comments: In addition to the response to Question 4, NYSRC does not understand why there are Levels and color designations since only the threat level numeral is being communicated. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels. There is no benefit to specifying the specific terminology. Requiring system Operators to state Colors and Levels would seem to result in slower and more confused communication.

Disagree

Agree

Comments: R1 requires each entity to create a CPOP. There is not a requirement to coordinate CPOP's amongst entities beyond the requirements in the Standard. There is no requirement to exchange CPOP's between entities with an operating relationship. The SDT should consider adding a requirement either that allows entities with operating relationships to request and be provided a copy of the other's CPOP, or a requirement requiring the exchange of CPOP between entities with operating relationships. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. High Risk Factor requirement (a) is one that, if violated,

could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures. NYSRC does not believe that any requirement in this Standard if violated would have the results specified in the definition of a High VRF, especially since these requirements are addressing the HOW of communication.

Greg Rowland

Duke Energy

Disagree

When viewed in the context of its use in R5 and R6, the definition of Interoperability Communication is excessively broad and unclear. R5 refers to the issuing of a "directive" during verbal Interoperability Communications. The term "directive" is undefined. R6 requires the use of the NATO phonetic alphabet during verbal Interoperability communications such as directives, notifications, directions, instructions, orders or other reliability related operating information. This could conceivably encompass all communications. Also, the definition refers to communications between two or more "entities". Does "entities" refer to functional entities or registered entities?

Disagree

We disagree with moving R18 into COM-003-1 and broadening it to include every line and piece of equipment. This would create an enormous amount of effort to implement, and would substantially increase compliance risk, without any increase in reliability. Furthermore, if R18 is moved into COM-003-1, when would it be removed from TOP-002-2? Until R18 is actually removed from TOP-002-2, entities would be subject to compliance double jeopardy.

Disagree

There is no need to have a CPOP to describe how an entity will comply with R2 through R7. A CPOP would just be a restatement of the requirements. If an entity complies with R2 through R7, there's no reliability related benefit to having a CPOP.

Disagree

Attachment 1 is limited to notifications from the RC to other entities regarding Alerts for Physical Security Emergency, Cyber Security Emergency or Transmission Emergency. Also, these types of notifications wouldn't meet the definition of "Interoperability Communications", because they wouldn't necessarily be used to effect a change in the state or status of an element or facility of the Bulk Electric System.

Disagree

We don't agree with this requirement because it would introduce confusion into communications, especially in all communications other than RC to RC. RC's already have protocols in place to deal with time zone differences, and changing that and applying it to all entities would create reliability errors. We think that this is "a solution in search of a problem".

Disagree

We believe that the term "directive" should be defined. This SDT should work with the COM-002 SDT to come up with common phraseology and definition for the term "Directive". Work on COM-003-1 should have begun by defining "directive", and limiting the requirement to use 3-part communications to "directives", and not requiring it for general day-to-day communications. The entity issuing a "directive" should inform the receiving entity that it is a directive and therefore requires the use of 3-part communications.

Disagree

We believe that R6 should be deleted, because it is focused on the details of the "how" rather than the "what" in communications. The key is accurate 3-part communications for "directives", as required by R5. R6 is far too broad in the communications that would be included. Also, we believe that there is no reasonable way to implement, self-certify or audit compliance with this requirement.

Disagree

Delete this requirement. See our response to Question #2 above.

Agree

We support the development of this attachment, but question whether it belongs in this standard, especially since it is under field trial. We think it belongs in the EOP standards. We note the

Attachment 1 is only associated with notifications by the RC, so we question whether these are Interoperability Communications as that term is defined. Also, the introduction on Attachment 1 is very confusing. Attachment 1 states that definitions for Transmission Loading, Physical and Cyber Security Alert states align with the Emergency Energy Alert (EEA) states as already described in Standard EOP-002-2.1. EOP-002-2.1 and associated EEA Levels provides guidance on Energy and Capacity Emergencies rather than Transmission or Physical/Cyber Alerts. Energy Emergency is defined as a condition when a LSE has exhausted all other options and can no longer provide its customers' expected energy requirements. This is a totally different classification of Emergency Alert. We suggest deleting the 2nd and 3rd sentences of the introduction to Attachment 1. In addition, Attachment 1 does not contain four system condition alerts, as the SDT has proposed.

Disagree

Disagree

Agree

As a general comment, all the requirements other than R1 are High VRFS with only Severe VSLs. As this standard is written to apply broadly to routine as well as emergency communications between entities, we believe that failure to meet these requirements would rarely impact the reliability of the Bulk Electric System. For example if in routine switching an operator says "Baker" instead of "Bravo", the entity is subject to FERC's most severe penalty. Clearly the basis for this standard needs to be reassessed. If we use the test that if a requirement or a standard supports/encourages reliability and security, then entities should invest the time and effort to track performance to ensure auditable compliance. For example – Does DCS compliance support/encourage reliability/security? The industry would generally say yes – so the tracking and determination of auditable compliance is justified. But would auditable compliance to this draft of COM-003-1 support/encourage reliability/security? We don't think so, given the vague and general nature of this draft. It certainly would not justify the amount of work and effort it would take to ensure auditable compliance with this COM-003-1 draft, given the amount of effort it would take to monitor all recorded communications that fit within this vague draft standard. Bottom line is that we think COM-003 is not needed. As proposed, it is a "how" and not a "what" based standard that will create more distraction from reliability/security than any value it might add.

Transmission System Operations

Disagree

The definition of "Interoperability Communication" is not clear. What does the term "reliability-related" information entail? Does "Interoperability Communication" include instructions from a control room to a generator to adjust vars, from the control room to field personnel to direct the changing of transformer taps, from the control room to field personnel to implement switching instructions, etc? What is the definition of "entity"? Does this mean if switching instructions are given from a control room of one company to personnel in its own company (i.e., the same entity), that the interaction would not be classified as "Interoperability Communication"?

Agree

Disagree

We believe the phrase, "but is not limited to" should be deleted. The elements required to be in the CPOP should be well-defined.

Agree

Disagree

We believe that the use of Central Standard Time in non-CST areas would create confusion between the Reliability Coordinator, Transmission Operator, Transmission Owner, Generator Operators, and field personnel.

Disagree

As stated in Question #1, the definition of "Interoperability Communication" needs further clarification. Also, further clarification is needed as to when "Interoperability Communications" is required to be used.
Disagree
As stated in Question #1, the definition of "Interoperability Communication" needs further clarification. Directives, notifications, directions, instructions, orders, and other reliability operating information needs to be clearly defined, including what it consists of and when it is to be utilized.
Agree
Agree
It should be made clear that Attachment 1 applies to the RC's. It is not specifically stated in R2 that it is the RC's responsibility to make notifications. In Attachment 1, we believe the wording under "Initial Notifications" should be changed. For example, on the 2nd row and 1st column of the matrix, it states that the RC makes initial notification and states that "...there is a Physical Emergency Alert, PSEA Level One within...." Nowhere is it ever mentioned that there is a "Condition Yellow". Since it is never mentioned by the RC in the notification that the Condition is "Yellow", what is the use or benefit of having the conditions? It should also be made clear that when the RC states, for example, that "There is a Physical Security Emergency Alert-PSEA Level One within..." that this refers to specific definitions given in Attachment 1 of EOP-002-2.1. This fact is mentioned at the top of the matrix, but the wording of this explanation is not consistent with the wording used in the body of the matrix.
Agree
Refer to Question #5; we do not agree with using Central Standard Time.
Disagree
Agree
We think the SDT should coordinate their work closely with the team of the Reliability Coordination Project 2006-06, especially regarding new definitions related to communications and reliability directives.
Group
We Energies
Howard Rulf
Disagree
Communications Protocol: This defined term appears only in the Three-part Communication definition and in titles. Titles are expected to be capitalized and are not necessarily the defined term. The COM-003-1 Standard title is "Operating Personnel Communications Protocols", but the purpose is not restricted to verbal and written information, so "Communications Protocol" does not seem to refer to the defined term in this title. Similarly, it is not necessarily the defined term in CPOP. It is not clear where this definition is being utilized in the standard. Three-Part Communication: Should be required for "Reliability Directives" only. It seems that this is currently being addressed, and could remain, in an updated version of COM-002-003. This should be coordinated between standards and duplication should be avoided. Interoperability Communication: This definition is excessively broad, and the terminology "reliability related information" is ambiguous and vague. Communication is used elsewhere within the NERC Standards to include voice, data, email, memos, NERCnet, etc. Since communication of any type may be used to change the "state or status" of the Bulk Electric System, this definition seems to pertain to every communication in every form, which could be interpreted to include market information which is continuously used to drive changes to the "state or status". By extension, a CPOP would need to include every communication of any type (voice, data, email, memos, etc.), which is over-reaching and open to conflict with the CPOP's developed independently by other entities. Interoperability Communications should apply only to situations covered in Attachment 1, and definitions should better reflect applicability to communications between separate, distinct entities (not communications within the same organization).
Disagree
Because applicability to a TSP and LSE of this standard stems solely from TOP-002-2 R18, R7 should be the only requirement that applies to a TSP or LSE.

Disagree
It is not clear what the purpose of the CPOP is, or how having it would improve reliability of the Bulk Electric System. This standard, (or alternatively COM-002-003) should focus on requiring Three-Part Communication during Reliability Directives. In addition, the vague and broad nature of the existing definition of Interoperability Communication makes creating CPOP's problematic and open to conflict with the CPOP's developed independently by other entities. As noted in question 2, R1 should not apply to a TSP or LSE.
Disagree
Attempting to mold all possible circumstantial situations into the pre-defined terminologies is overly restrictive and may result in reduced accuracy, unnecessary confusion and misinterpretation. R2 should have the word "all" included (as is stated in this question) in order to restrict the applicability of Interoperability Communications to only those situations defined in Attachment 1. As noted in question 2, R2 should not apply to a TSP or LSE.
Disagree
If requiring one standard time zone, it would seem prudent to specify Greenwich Mean Time (GMT) as a universal standard. That being said, solely utilizing Central Standard Time (CST), or even GMT, as the common time zone may cause undue confusion given that MISO and PJM already operate with established processes and systems that are inconsistent with this, and are based on their own market timing. In addition, many plant personnel and procedures already have a long and engrained history of successful operation under existing timing directions, which are not aligned with market timing. Forcing every plant across multiple time zones to establish a new standard ignores the need for cases of special consideration and historical circumstances. The potential confusion due to the forced timing standard across many entities within a given area is too high a price to pay for the possible clarity by a limited few due to the switch to CST. A preferred alternative would include focusing the standard on requiring very clear communication of the time zone being specified for a given Reliability Directive. Thus, compliance enforcement would only pertain to Reliability Directives.
Disagree
The term "directive" should be replaced with the term "Reliability Directive" as defined by the Drafting Team working on Project 2006-06 which states it as: "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency". Three-part Communication should be required (with regard to compliance) during emergency situations in which Reliability Directives are being issued. This requirement should not apply to normal or non-emergency situations, and should be enforceable between Functional Entities (distinct entities, not within a given organization). As noted in question 2, R5 should not apply to a TSP or LSE.
Disagree
While R6 could be recommended as a good utility practice when communicating Reliability Directives, it is not appropriate to enforce it as a requirement for all communications. The focus of the standard should be on the achievement of clear communications, with individual organizations retaining some freedom to implement practices appropriate for their own unique situations. If Violation Severity Levels will be "high" as indicated in Attachment 1-COM-003-1, then the standard must be much more specific as to what constitutes "directives, notifications, directions, instructions, orders or other reliability operating information". Assigning a high Violation Severity Level to the failure to use a specific phonetic alphabet (NATO) instead of to a failure to use any phonetic alphabet seems unreasonable and is likely to cause as much confusion as failing to use any sort of phonetic pronunciation. If attachment 2 is utilized, it should only be required for situations where Attachment 1 applies. As noted in question 2, R6 should not apply to a TSP or LSE.
Disagree
TOP-002-2 R18 requires uniform line identifiers. The wording of R7 and the statement by the SDT that "the Requirement does not stipulate a single/unique identifier as long as all parties mutually agree" is in conflict with TOP-002-2 R18. Allowing multiple line and equipment identifiers to be used does not improve reliability or improve communications in an emergency. TOP-002-2 applies to Transmission Facilities of an Interconnected Network...R7 should do the same for clarity. Having the term "mutually agreed upon" in a standard is unworkable, since it allows a non-cooperative party to disrupt the genuine efforts of others and to exploit unfair leverage in discussions or negotiations. A better approach is having the Transmission Owners develop identifiers for transmission, and

Generation Operators develop identifiers for generation. The process should be defined such that comments are solicited and input within a pre-specified convention, and then a specific entity is given the ability to make the final determination. Again, R7 is more appropriate as a best practices recommendation, rather than a requirement.

Agree

Attachment 1 is written for an RC. Usage of Attachment 1 by entities other than an RC should be clarified.

Disagree

Agree

In general, establishing CST as a uniform time zone may conflict with individual Tariffs regarding references to wholesale electric market commercial activities and could cause additional confusion if commercial market time zone references are independent of reliability time zone references.

Agree

Remove "timely" from the Purpose section, since a time period is not part of any requirement. According to the NERC Reliability Standards Development Procedure, Compliance Monitoring Period and Reset are required elements, and should be included. M1 through M7 should indicate which requirement they pertain to. Compliance enforcement should be focused on Reliability Directives only. Rather than proving 100% compliance, it is more practical if each party is obligated to report instances of unclear communication to the other party/parties involved in the Reliability Directive(s). Defining a remediation plan could be part of the requirement, with a measure being whether or not the remediation was implemented. An overall observation is that the intended communication updates could be implemented through modification of existing COM-001 & COM-002 standards without the need for another overlapping standard. Additional industry focus regarding communication protocols could be further emphasized through NERC System Operation Certification Program requirements and training.

Individual

Greg Mason

Dynegy

Disagree

The way the definition of "Three-part Communication" is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: "A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it." It should also be noted that these principles are included in Requirements R2 and R3 in the recently issued draft Standard COM-002-3 in Project 2006-06. This definition in this Standard is not needed. We believe the term "Interoperability Communication" creates confusion within the industry and contradicts the work by RTO and RC SDT in Project 2006-06 that limits the requirement to use three-part communications when issuing Reliability Directives (defined in Project 2006-06) that address anticipated and actual emergency conditions. Additionally, it appears that this definition would encompass all verbal communications and, as such, would be a distraction to Operators. Therefore, there is no reliability need for this definition. While using three-part communications during routine operations may be a best operating practice, we do not believe that it is so critical to reliability that it needs to become an enforceable requirement for routine operating instructions. Rather we believe the enforceable requirement should be limited to require three-part communications during actual emergency and anticipated emergency conditions only. Both element and facility are used in the Interoperability Communication definition and are NERC defined terms.

Did the drafting team intend that the NERC definitions should apply? Then the terms need to be capitalized. In addition, the term “entities” is confusing and needs to be defined.
Disagree
The SDT actually expanded Requirement R18 of TOP-002-2 by adding the term “equipment”. In any event, this Requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of the three-part communication protocol until the message has been correctly spoken and comprehended.
Disagree
This proposed communication protocol is redundant to Requirements R2-R7 and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposed Requirement takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard.
Disagree
It is not clear what value there is in identifying these alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the listed entities such as Distribution Provider and Generator Operator cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 are not consistent with the definition of Interoperability Communications. By definition, Interoperability Communication pertains to all communications about how entities change the state of the BES (not just about physical or cyber attacks). Attachment 1 is only about notifying of what physical and cyber attacks have already happened to the BES .
Disagree
There is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. The time zone should be identified in the communication. Use of CST in all time zones will actually cause confusion and significant and unnecessary costs with no foreseeable reliability benefit. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc.
Disagree
Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT in Project 2006-06 which would define a Reliability Directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measurable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives.
Disagree
While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications and is certainly not necessary to be included as an enforceable Requirement. Imagine the situation in which an operator says “A as in apple” instead of using the NATO Alpha. Even though the listener should clearly be able to discern

the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. There is no reliability need for this Requirement.
Disagree
This may represent a good utility practice but it is not necessary to be included as a Requirement. The key question is: "Do the companies' personnel understand one another?" If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters. This is a "how" based Requirement that should be eliminated.
Disagree
It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage which is reported in CIP-001 R2 already. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model.
Disagree
Disagree
Disagree
Agree
We believe that the existing standard COM-002 is better than this proposed Standard. This Standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. The stated retirement of COM-002 does not appear to be consistent with the direction of the RC SDT in Project 2006-06. The RC SDT is adding requirements. More coordination is certainly required between these two teams. In addition, as stated earlier, this Standard focuses on "how" certain tasks should be performed and conflicts with NERC's position of pursuing performance based and results based Standards.

Disagree
We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is applicable.

Individual
Kirit Shah
Ameren
Disagree
The definition for three part implies the exact message must be repeated back. What should be said is the content must be repeated back in original or modified forms such that the originator is sure the recipient understands and can execute the action. As far as Interoperability, what is state or status? Is the dispatch instruction to change from 500 MW to 505 MW such a communication? (which changed, state or status?)
Agree
Disagree
This is a near fill-in-the-blank requirement. The mere inclusion, or recitation, of the R2-7 elements does not assure a meaningful plan. It is easy to say "Our plans includes R3". That does not assure reliable communications. This requirement should describe a functional CPOP.
Disagree
This is an ambiguous reference in all of NERC standards for all but the RC. How would an LSE interpret this in communication between them and a DP. Would there ever be a red condition for issues that affect them? And as it relates to operating, it looks like this is exclusive of EEA type events, i.e. BA type emergencies seem to not be represented. It would seem that the pre-defined conditions should be established for each interaction that each entity might have, e.g. a predefined set for a BA to a TOP, a BA to an LSE, et al. While each entity can certainly address the 3 scenarios in Attachment 1 (RC to entity) those are not the only conditions where communication affects BES reliability.
Disagree
We agree that all inter-entity operability communication should be on common time zone but if said communication includes routine dispatch instructions several RTOs use EST time for market operations, would they then need to change to CST? And while CST seems to have some value because it is used for time error, wouldn't it make more sense to use UTC? It is a world standard and has the benefit of not being associated with daylight savings times as Central time does (may be confusion at some times between CST and CDT)
Agree
Disagree
Requirement should be revised to say that Attachment 2 needs to be used when single alphabetic characters, or when needed for clarity, are needed in communications. If we have a Bee Hollow-51 circuit, that is alpha-numeric information. But we wouldn't support that Bee Hollow needs to be spelled out as Bravo-Echo-Echo-space-Hotel.....
Agree
But how does CMEP process check this "mutually agreed". Much more work needs to be done with this requirement and measures to address this.
Agree

As stated earlier, this is an excellent document for RC interactions. But it is wholly unclear how this impacts other entity-to-entity relationships in pre-defining states. And as mentioned having only Attachment 1 seems to ignore the energy balance alerts/emergencies

We understand the binary function of VSL that forces Severe for most requirements. However, the standard itself seems to offer some hope with the definition to address the VSL issue better. The definition has at the end, "especially during alerts and emergencies" Given that this implies stratification, couldn't Severe VSL be assigned to violations during emergencies, High be assigned to alerts, and moderate to all other system conditions. When emergency conditions exist, entities should have their "A" game on, and failure to communicate during these times is a more severe violation of the communication protocols than during the thousands of daily interactions that are note likely to affect BES, (alternatively, the VRF could be adjusted for the situation)

Disagree

The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. We believe the term "Interoperability Communication" contradicts the work by the RTO and RC SDT that limits the requirement to use three-part communications to only those communications that explicitly state that the communication is a Reliability Directive and creates confusion within the industry. Additionally, it appears that this definition would encompass all verbal communications and, as such, we question the need for such definition. While we support using three-part communications during routine operations as a best operating practice, we do not believe that it is so critical to reliability that it becomes an enforceable requirement for routine operating instructions. Rather we believe the enforceable requirement should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable.

Disagree

This requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the of use three-part communication protocol until the message has been correctly spoken and comprehended.

Disagree

It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard. Furthermore,

the establishment of R2-R7 as elements of the CPOP required in R1 appears to contradict the recent shift in direction that NERC has taken regarding defining criteria as bullets under a requirement. See NERC's August 10th informational filing regarding assignment of violation risk factors and violation severity levels in regards to dockets RM08-11-000, RR08-4-000, RR07-9-000, and RR07-10-000. COM-003 R2 states: "shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for verbal and written Interoperability Communications." Why does R1 establish the requirement for a procedure, when the procedure is essentially defined by R2-R7. If there is such a reliability need to establish these requirements, one could conclude nothing else is so important that it needs to be included because it is not identified in the standard. Furthermore, R2 appears to define Interoperability Communications for attachment 1 communications only. Is this the intent of the drafting team?

Disagree

It is not clear what value there is in identifying alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generator Operator cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 do not appear to be in synch primarily due to the definition of Interoperability Communications. By definition, Interoperability Communication is about how entities change the state of the BES and Attachment 1 is about notifying of what already happened to the BES.

Disagree

There is no need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no demonstrated benefit to reliability to use a common time zone. The time zone should be identified in the communication. Use of CST will cause significant and unnecessary costs and the resulting reliability benefit is not clear. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate; also, let's not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We, and our members, are strongly opposed to this requirement.

Disagree

Based on the definition of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT which would define a directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable.

Disagree

Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word "Zebra" instead of "Zulu" to signify the letter "Z"? And, why would this be enforceable? Perhaps this would be better served as a guideline document rather than and enforceable Requirement. Also, many organizations may have established communications protocols

which are functioning properly and making a change may actually hinder reliable operations by introducing unnecessary confusion.
Agree
We agree that the stipulation of a single/unique identifier is unnecessary as long as all parties mutually agree on the identifier for the line or equipment, and therefore, support this change to the existing Requirement in TOP-002.
Agree
It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage which is reported in CIP-001 R2 already. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Also, several entities have observed confusion during the field-test of these Alert Levels because there are inconsistencies in the implementation of various stages of Alerts. It certainly has not enhanced Reliability. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. "Foresees" is a forecast condition. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA's use terminated. We recommend using terminated. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model.
Agree
Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list verbally and individually would create an unnecessary burden that distracts the RC from actual system operation and represents a detriment to reliability.
Agree
In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate; also, let's not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.
Agree
We believe that the existing standard COM-002 is actually better than this standard. This standard causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. Additionally, we cannot understand how all requirements but

R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT. The RC SDT appears to be adding requirements. More coordination is requirement between these two teams. Recommendation 26 of the August 14, 2003 blackout report is cited as a driver for extending three-part communications. We believe the title of Recommendation 26 is misleading and when reviewed separately from the supporting text of the recommendation and direct and contributing factors in the report results in an incorrect interpretation. "Failure to identify emergency conditions and communicate that status to neighboring systems" is one of the contributing factors and the supporting text of the recommendation clearly refer to shoring up communications during emergency and anticipated emergency conditions and establishing an emergency broadcast communication system to alert regulatory, state and local officials. The supporting text of Recommendation 26 only mentions addressing alerts, emergencies or other critical situations. Some have incorrectly inferred the initial clause of Recommendation 26, "Tighten communication protocols", means the recommendation applies to all routine communications. Lastly, this on-line submittal asks many questions that are YES/NO in nature (i.e. "do you have any concerns with...", or "if, yes, please explain...") but the radial selections are "agree/disagree" which may be taken out of context. We suggest changing the on-line submittal back to YES/NO.

Group

ATC and ITC

Jason Shaver

Disagree

ATC believes that the proposed definition for the term "Interoperability Communication" is too broad and ambiguous. We recommend the following: "Communication between two or more Functional Entities (not within the same organization) to exchange reliability-related information to be used by the entities to change the state or status of Facilities of the Bulk Electric System." The inclusion of the terms "Functional Entities" and "Facilities" removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC's Glossary) In addition, the inclusion of the phrase "not within the same organization" clarifies that the focus of definition is to address communication between different Functional Entities. ATC understands that this Drafting Team is working closely with the Drafting Team working on Project 2006-06 and believes that this team needs to use the term "Reliability Directive" as a replacement for the term "directive" which is currently being used. The Drafting Team working on Project 2006-06 has defined Reliability Directive as: "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency."

Disagree

TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. ATC believes that the requirement should state that "mutual agreement" allows for multiple identifiers. We believe that this is needed in order to avoid the following issues. 1) This clarification will avoid any need for arbitration or formal dispute resolution steps. 2) If the standard does not allow for this provision entities will be forced to deviate from their own line naming convention and will result in entities to modify their drawings, field signs, and SCADA systems.

Disagree

: Based upon the concerns that we have with R2-R7 we would not support this requirement. We would support the requirement if it stopped after the first sentence and then merely listed the minimum requirements that should be included in the Procedure such as; (1) time zone, (2) language spoken, (3) when phonetic alphabet will be used, etc.. This will allow the Entities to draft their own CPOP per the intent of the requirement and avoid the concerns that we have documented for the remainder of the requirements.

Disagree

The Attachment pertains to requirements of the RC, not all entities. Either the attachment should be changed or the requirement should be changed for accurate accountabilities.
Disagree
ATC is in the Central Standard Time zone, and would not be directly impacted by this requirement. With that being said we are concerned that forcing an organization to refer to a time zone that is not local may result in an increase of errors and a decrease in reliability. See comments for question #3.
Disagree
ATC believes that the term "directive" should be replaced with the term "Reliability Directive" which is being developed under Project 2006-06. It is important for BES reliability that NERC use clearly defined term which will identify the circumstances under which this requirement is enforceable. We provide the definition for "Reliability Directive", as it appears in the latest posting for Project 2006-06, in our response to question 1. It is our understanding and interpretation that the intent of this requirement is to require entities to use Three-Part Communication during emergency situations in which "Reliability Directives" are being issued. In other words this requirement as proposed does not apply to normal (non-emergency) day-to-day switching. The replacement of the term "directive" with "Reliability Directive" provides the additional clarity around an entity's compliance obligation.
Disagree
The use of the phonetic alphabet should be documented in the Entities CPOP per our comments to question #3. We do not agree that it needs to be included in Requirement 5 because it is too prescriptive and all encompassing and could potentially confuse or slow down the communication process. As we recommended in question 6 the term "directive" should be replaced with "Reliability Directive".
Disagree
TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. ATC believes that the requirement should state that "mutual agreement" allows for multiple identifiers. We believe that this is needed in order to avoid the following issues. 1) This clarification will avoid any need for arbitration or formal dispute resolution steps. 2) If the standard does not allow for this provision entities will be forced to deviate from their own line naming convention and will result in entities to modify their drawings, field signs, and SCADA systems.

Disagree
Three-part Communication ♦ The phrase "the information is repeated back correctly" may pose compliance problems if the second party does not repeat the information back correctly the first time. We suggest the definition be revised as follows: "A Communications Protocol where information is verbally stated by one person to a second person whereby communication is initiated, the second person repeats the information back to the first person as means to verify the communication. The initiating party either confirms the response as correct or repeats the original statement and resolves any misunderstandings." Interoperability Communication ♦ We recommend

this definition be removed and be incorporated into the RCSDT's proposed definition of Reliability Directive. Please see our comments in Question 6 for a complete explanation.

Agree

Disagree

We feel that procedures are beneficial for entities to have as far as internal training of new personnel and as a reference guide for all personnel, but we do not agree that it should be a requirement of a reliability standard. It is not appropriate to subject an entity to monetary fines for not having a procedure even if that entity has fully complied with all the other requirements (R2 through R7) of this standard that the procedure is referencing. Although this requirement may fall into the category of best practices and administrative requirements, it certainly does not rise to the level of performance-based, risk-based, or competency-based requirements. The real evidence of an entity implementing R2 through R7 is by evaluating the measures of those requirements and a variety of information could be used by an entity such as training records, procedures, voice recordings etc. Having a procedure does not need to be a stand alone requirement.

Disagree

We do not support R2 and its referenced attachment and feel that they should be removed. The requirement and attachment are too convoluted, create confusion among system operators, and not necessary with regard to the goal of this standard. This standard mandates proper three-part communication in all reliability-related communication (including alert level situations). Other standards should define and mandate rules associated with the specifics surrounding urgent action situations (i.e. CIP, TOP, EOP standards). Together these standards will arrive at proper communication between entities during alerts.

Disagree

Using a specific time zone that is subject to adjustments for daylight savings introduces additional complexity for an operator and has potential to introduce additional reliability issues. A significant portion of the Eastern Interconnection transmission operators have dealings with entities that do not span multiple time zones and are solely within the Eastern Time Zone. We do not feel that it is appropriate for this standard to mandate how time is communicated during three-part communication. Operating communication can deal with several different subjects and data during a conversation, and it would be inappropriate to mandate all the possible subjects and data through standard requirements. As a best practice, and not as a mandated requirement, it would be appropriate for operators to state the time zone they are in if necessary for the situation or if requested by an entity.

Disagree

Although we agree that proper communication should be used during actions that affect the reliability of the BES, we do not agree with this requirement as written. The following contains our rationale and suggestions: 1. The lower case term "directive" is ambiguous, not defined, and confusing. This is especially true in light of the proposal of the RCSDT to modify COM-002-3 to include a definition of "Reliability Directive" and their plan to use this defined term to invoke 3-part communication. Since the plan of this OPCPSDT is to eventually incorporate the COM-002-3 requirements into this new COM-003-1 standard, we feel the definition of Reliability Directive should be moved to this standard now (instead of later) and the term should be broadened to include any actions that affect the BES reliability. Essentially then, the current proposed R1 of COM-002-3 can be moved to this COM-003-1 standard. 2. Our proposal for the term Reliability Directive in item 1 above incorporates the verbiage of the proposed Interoperability Communication definition. Therefore, the proposed term Interoperability Communication is no longer required and can be eliminated. 3. Once the term Reliability Directive and proposed R1 from COM-002-3 are moved to this COM-003-1 standard, the current R5 of COM-003-1 requiring the use of Three-Part Communication could then be revised to require three-part when a Reliability Directive is issued and continue until the operating condition that invoked the Reliability Directive is resolved, mitigated, or ended. 4. With respect to the proposed R2 and R3 of COM-002-3 which essentially discuss three-part communication, these requirements could be eliminated and would be covered by COM-003-1. As a result, the COM-002-3 requirements being proposed by the RCSDT can be eliminated in their entirety since we have now incorporated all of them into this new COM-003-1. 5. Since COM-002-3 included the Purchasing-Selling Entity as an applicable entity, since they could be the recipient of a

Reliability Related Directive and since, with our proposed changes, COM-002-3 can be retired; the Purchasing-Selling Entity can be added to the applicability section of and incorporated into this new COM-003-1 standard as recommended below. In conclusion, we suggest the following changes/additions to COM-003-1: A. Move a revised version of the term "Reliability Directive" from COM-002-3 to this new COM-003-1 standard and define it as follows: "A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where the recipient is directed to change the state or report the status of an Element or Facility of the Bulk Electric System." B. Delete proposed definition "Interoperability Communication". C. Delete R2 and R3 of COM-002-3 as suggested in item 4 above. D. Insert a New Requirement R4, renumbered as R2, into new standard COM-003-1 taken from COM-002-3 R1: "When a Reliability Coordinator, Transmission Operator or Balancing Authority issues a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time]" E. Revise Requirement R5 and renumber as R3: "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall use Three-part Communication for all communications concerning a Reliability Directive that was issued per Requirement R1 and continuing until the actions or status reporting identified in the Reliability Directive has been completed. [Violation Risk Factor: High][Time Horizon: Real time]" F. Add the Purchasing-Selling Entity as an applicable entity to COM-003-1.

Disagree

While we agree that using the NATO phonetic alphabet may be a best practice, we feel that it is not practical to regulate its use. This requirement is too prescriptive. The focus should be on the correct understanding of verbal communication which will be accomplished via Three-party Communication, whether an entity uses NATO or "A as in Apple, B as in Boy", this should not be codified within the standard. Substantiating compliance with this requirement is not reasonable to expect, practical to prove, nor does it produce an improvement in reliability.

Disagree

Although we agree with moving this current TOP-002 R18 requirement to this standard, we question the use of the phrase "mutually agreed upon". It is not clear how the line and equipment identifiers will be mutually agreed upon and how this will be measured. We suggest using similar wording from the current TOP-002 R18 and reword COM-003-1 R7 as follows: "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use uniform line and equipment identifiers for verbal and written communications."

Disagree

We do not support Att. 1 and feel that it should be removed. This attachment is too convoluted, creates confusion among system operators, and not necessary with regard to the goal of this standard. This standard mandates proper three-part communication in all reliability-related communication. Other standards should define and mandate rules associated with the specifics surrounding urgent action situations (i.e. CIP, TOP, EOP standards). Together these standards will arrive at proper communication between entities during alert level situations.

Not aware of any

Not aware of any

Agree

Coordination of SDT Efforts – We feel that the NERC Standards Committee should direct the Reliability Coordination SDT to hand over COM-002 to this OPCPSDT since those requirements will eventually be moved to COM-003-1. It is difficult to coordinate all these changes on a separate basis and moving the development to one SDT would help better coordinate these efforts. The current path forward is inefficient and causes confusion, not only for industry but also for the two drafting teams. Purpose Statement – We feel the phrase "especially during alerts and emergencies" implies that using proper communications protocol during normal operating situations is not as important as during emergencies. It is not appropriate to include this phrase in the purpose statement of a standard, and we suggest it be removed. Also, we suggest removing the word "timely" since this standard does not mandate time limits on communications. Compliance Section 1.4 Data Retention – We do not agree with the following statement for data retention "If a Transmission Operator,

<p>Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant." We feel that this is not appropriate in a reliability standard since it is already mandated through Compliance Violation Investigations (CVI). Also, we feel that it is more applicable to NERC's Rules of Procedure. Therefore, we suggest it be removed from the standard.</p>

Pepco Holdings, Inc. - Affiliates
Richard Kafka
Disagree
PHI believes the proposed definition for the term Interoperability Communication is too broad and ambiguous. It is inconsistent with the effort to develop results based standards which would have an effect in the reliability of bulk electric system. Additionally, PHI does not see the need of a definition of Interoperability Communication now that the term Reliability Directive has been defined in draft standard COM-002-3 which is currently posted for review.
Agree
Disagree
PHI agrees that communications procedures are necessary. We do not see the need to create a CPOP that includes requirements R2 through R7 given that each requirement defines how and what is to be communicated. This requirement as written could force entities to incorporate all of their communication procedures into a CPOP which will not improve reliability.
Disagree
Requiring system operators to use the color-coded system condition terminology during communication adds a layer of responsibility that will distract from the operator's real-time reliability-related tasks.
Disagree
PHI believes that mandating one time zone for all Interoperability Communications will create more confusion during an emergency that it will prevent and may contribute to increased reliability issues.
Disagree
: As mentioned in Question 1 above, the term Reliability Directive has been defined in the draft standard COM-002-3 and should be considered in place of Interoperability Communication since the directive is specific to emergency operations. PHI recommends that the requirement changed to read "Each responsible entity shall use Three Part Communication when issuing or receiving a Reliability Directive".
Disagree
Having system operators potentially struggle to remember the NATO phonetic alphabet during communications rather than focus on the communication and managing the bulk electric system itself is in contradiction with the purpose of the standard. Use of the NATO phonetic alphabet should be considered a "best practice" and should not be included as a requirement in a reliability standard. One failure, such as saying "Baker" instead of "Bravo", results in a severe violation without any impact on system reliability.
Disagree
This requirement came from TOP-002 R18 and is fundamentally different from the new proposed requirement in COM-003-1 R7. TOP-002 R18 states that the BA, TOP, GO, LSE and TSP shall use uniform line identifiers when referring to transmission facilities of an interconnected network. The requirement in COM-003-1 R7 introduces an additional requirement to use pre-determined "equipment" identifiers is another example of a prescriptive requirement that will not impact bulk electric system reliability and will expose entities to large fines. PHI believes the TOP-002 R18 could be included in COM-003-1 but included as defined in TOP-002 R18.
Agree
As noted in our comments to Question 4, Attachment 1 has examples for Reliability Coordinators only. It is not a good guide for other Interoperability Communications. Additionally, Attachment 1 identifies the Level 1, Level 2 and Level 3 communications by color codes that are not referenced in

the sample messages. PHI finds the addition of color codes to not be helpful and possibly confused with national security Alert Levels. The color coding should be eliminated and examples for entities in addition to the Reliability Coordinator should be included.

Agree

PHI asserts that WECC would say NO to Central Standard Time.

Disagree

Disagree

Individual

Henry Masti

NYSEG

Disagree

The definition for Interoperability Communication needs to be further explained. The current definition would appear to include not only communication between two control centers, but also between a control center and field personnel for all normal and routine switching, which we do not believe is the intent of the Standard. Communication Protocol as a separate definition does not appear to be necessary. The provided definition describes the term in a simple and generic way and is not specific enough to provide anymore guidance than is already provided in a general understanding of the word "communication" or "protocol". Three-part communication should be revised as follows: An iterative process where verbal communication from a sender to receiver is repeated back to the sender by the receiver to eventually ensure correct and accurate transmission of the entire message. We believe this definition is more consistent with COM-002 R2, which is proposed to be retired once COM-003-1 is approved and Three-part Communication is adopted.

Agree

Disagree

It is not clear when the Interoperability Communication is required to be used. Is it only for communications between registered entities (inter) or internal to a registered entity (intra)? And is it required for all communications or used only in certain circumstances (i.e. emergency (if emergency, it needs to be defined what constitutes an emergency))?

Disagree

R2 indicates the need to use pre-defined system condition terminology for all verbal and written Interoperability Communications yet Attachment 1 only defines transmission loading and physical and cyber security threats. Either need to rewrite the Requirement to include only these circumstances, or define every possible system condition used in Interoperability Communications. Additionally, there does not appear to be any benefit in attempting to pre-define transmission loading, and physical and cyber alert system conditions since the actions associated with each are similar, if not the same, for almost all conditions.

Disagree

Unless the communication is across time zones, there is no benefit to using Central Standard Time, nor is it sensible. Entire system infrastructures and business processes are driven by current, local standard time and it is far more safe, reliable, and practical to use the established current time for system operations. If there is a compelling need for definitive time notation across time zones then the requirement should dictate the addition of the time zone when referring to a specific clock time (i.e., 1400 CST, 1400 EST, 1400 ED[aylight]T, etc.).

Disagree

The definition of Three-part Communications and Interoperability Communications needs to be revised as explained above.

Disagree

While it is perhaps a good practice to include the use of phonetics to avoid miscommunications, it should be left up to each entity to determine the appropriateness of adopting such a practice (e.g., field switching, internal instructions, etc.) and should not be included in the Requirement, especially if Interoperability is not further clarified/defined.

Agree
COM-003-1 R7 is more clearly defined than TOP-002 R18 in that R7 and associated M7 speak only to written and verbal Interoperability Communication, where TOP-002 R18 and M10 dictate a more extensive use of the identifier. The adoption of a more narrow purpose is preferred.
Agree
There does not appear to be any compelling practical or reliability reason to adopt the Attachment.
Disagree
Disagree
Disagree
Individual
Jose Medina
NextEra Energy Resources, LLC
Agree
Disagree
This requirement is already covered by TOP-002. If the TOP-002 standard is deemed deficient because certain entities have been excluded or language appears to be missing, the changes need to occur to TOP-002 as opposed to copying and revising the existing requirement elsewhere. This would ensure that compliance oversight, understanding, and adherence goals are unencumbered by unnecessary redundancies. Moreover, this would ensure that the industry continues to re-enforce standards with changes that are within the scope of their original reliability purpose. The latter is in line with one of the core objectives of the Performance-based Reliability Standards Task Force's recommendations to focus on identifying and minimizing duplicated requirements.
Disagree
NextEra agrees with the reliability goal of establishing a set of agreed upon communication standards to ensure consistent communications particularly for actual and anticipated emergency coordination needs. NextEra believes that existing coordination/communication standards already fulfill this objective and that it might be of "training" or "reference" value to aggregate those requirements to a single document or view. However, NextEra is not convinced that this requirement, largely administrative in nature, will result in marked improvement in reliability. Organizations tend to take the path of least resistance and unless forced out of that path with extensive and granular guidance on what CPOPs should contain above and beyond existing standards or contract language, CPOPs would likely become a simple patchwork of requirements constructed out of existing NERC standard language and contract language. Standards need to be clearly implementable before they are approved yet important implementation questions do not appear to have been answered. (1) What if parties cannot reach agreement? (2) Is it enough to have attempted to coordinate? (3) What if parties already have agreed upon procedures such as NPIRs, or those stated in Interconnection Agreements – do they take precedent or must they be redesigned/relegated? (4) What if CPOPs differ greatly across interconnections because of differing parties? (One might conclude that by formalizing these different practices, as opposed to mandating standard practices, the goal of more reliable coordination may not have been achieved) (5) What level of evidence constitutes "agreement" especially in circumstances where entities may be remiss to agree? (6) What if CPOPs are simply a patchwork of requirements constructed out of existing NERC standard language and contract language – does that achieve the CPOP goal?
Disagree
NextEra agrees that standard system condition terminology could be beneficial in communications but this requirement introduces alert level conventions with no clarity on what the corresponding associated actions for such levels are and as a result, aside from the value derived from having improvement in terminology during communications, it is unclear what reliability improvements this will achieve in carrying out instructions.
Disagree

Existing market and reliability communication methods already ensure that time-zone adjustments occur. It is critical that the feasibility, impact, and logistical aspects of implementing this change be rigorously reviewed and understood to inform this standard's development. Conceivably, the result of that analysis could expose significant risks outweighing the purported benefits of implementing a single time-zone policy. Any implementation or transition gaps between the time format and references used by reliability coordinators, their corresponding systems, and the interfaced systems of market participants would be extremely detrimental to system stability and ongoing market operations.

Disagree

NextEra believes that by associating the "3-part communication" method with "directives" this standard drafting team could be at risk of unintentionally defining a directive as anything that takes the 3-part communication form. We would encourage the standard drafting team to continue to use the terms already employed in the draft standard: "... three-part communication be used when issuing instructions related to actual or expected emergency conditions."

Disagree

NextEra believes that though aspiring to use a single strict phonetic alphabet may be beneficial it is more important to ensure that ease of communication takes precedent especially under emergency conditions. The requirement for 3-part communication already ensures that understanding between two parties occurs. Moreover, it is overly burdensome to require that the phonetic alphabet be used in all communications which would include communications related to mundane interactions between interconnected parties and that might broadly fit the mold of the "interoperability" definition but not truly require the formality or rigor commanded by a phonetic approach.

Disagree

NextEra believes that R7 should be withdrawn as it repeats TOP-002 R18 requirements. Please refer to comments on Q3.

Disagree

None at this time.

Disagree

None at this time.

Disagree

Agree

In the case of nuclear plant operations, NRC communication requirements and the requirements of NERC NUC-001 for nuclear facilities more than adequately cover communication requirements. COM-003 should not be applicable to Nuclear Generator Operators since doing so will introduce an additional, unnecessary, and potentially conflicting level of requirements. Measures: NextEra suggests that the SDT clarify the periodicity of providing evidence of compliance and on what constitutes sufficient evidence of CPOP acceptance. Violation Severity Levels: NextEra encourages the SDT to revisit the violation severity levels. In the case of most of the requirements it is unreasonable to levy Severe penalties in instances where the operator may have deviated from the requirements but the communication occurred in an unencumbered and successful manner as evidenced by the use/acknowledgement outcomes of three-part communication.

Individual

Dan Rochester

Independent Electricity System Operator

Disagree

The way the definition of Three-part Communication is worded seems to only apply when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation. The definition should, rather, reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by a second party that received the communication, and the information is verbally confirmed to be correct or

corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.
Disagree
This requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also use three-part communication protocol until the message’s correct understanding is confirmed.
Disagree
It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions without inclusion of the elements to be communicated as they cover a wide range of conditions which can vary among the communicating parties.
Disagree
It is not clear what value there is in identifying alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Further, the “pre-defined” system conditions and alert levels are too detailed and overly prescriptive. System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task, in and of itself, does not ensure nor improve reliability and does not lend itself to promptly and effectively deal with the emergency situation.
Agree
Disagree
3-part communication should be used for communicating a directive that must be complied with. The “must be complied with” is needed to distinguish between an “instruction type” of directive and a “need to perform type” of directive. We believe it is the latter that should require 3-part communication.
Disagree
While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through sanctionable requirements. Similar to R2, having to use the NATO phonetic alphabet is overly prescriptive and forces system operators to learn and remember “languages” in addition to the power system language. System operators should not be penalized for using some means other than the NATO phonetic alphabet to communicate equally effectively. We see no short coming in operations that would require these additional requirements and that the added complexity and additional training requirements may deteriorate reliability.
Disagree
This may represent a good utility practice but it is not necessary to be a requirement. The key is whether or not operation personnel understand one another. Similar comments as in Q4 and Q7 also apply here.
Agree
It is not clear what value is realized by declaring an alert status particularly with cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as the number of substations that have been physically or cyber attacked, etc. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Also, please see our comments under Q4.
Disagree
Disagree
Agree
We believe that the existing standard COM-002 can be simply modified to cover the 3-part communication requirement. This COM-003 standard actually causes more confusion and ambiguity,

and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. This standard is not needed.

Listed as an LSE & DP, we are a small municipal utility that does not own nor operate any generation or transmission equipment. Therefore this standard is not applicable to our facility. Keep in mind, not all LSE's & DP's operate generation or transmission equipment. There are several small utilities that this standard would not be applicable to. LSE's & DP's should be put into class sizes depending on the size of the company or utility. Example: Class #1 LSE & DP : Companies that own & operate generation & transmission Class #2 LSE & DP : Companies that do not own or operate generation & transmission. (municipals, co-ops, etc)

Southern Company Transmission
JT Wood
Disagree
<p>Southern Company supports the SERC SOS comments. SERC SOS comments: We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards. Adherence to such results-based standards would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability. The concern is that, since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties. This group does not feel the need for a definition of Interoperability Communication, since the term Reliability Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process. In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state – repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3. Southern Company comments: Interoperability Communication — Communication between two or more entities to exchange reliability-related information regarding the Bulk Electric System. Why is a change in state or status required to make a communication between two entities an Interoperability Communication? What term should be used when a conference call is made to all of the RCs in an Interconnection to discuss low frequency?</p>
Disagree
<p>Southern Company supports SERC SOS comments. SERC SOS comments: Requirement R7, regarding the use of pre-determined line &amp; equipment identifiers, applies to TSPs &amp; LSEs. However, the other requirements of this standard do not seem to apply to these entities. For instance, most of the reliability-related alerts are communicated through the Reliability Coordinator Information System (RCIS). TSPs do not have access to this real-time communication tool, so the TSP should not be included in the applicability for the entire standard. Furthermore, Requirement R18 in TOP-002-2 mandated that neighboring Balancing Authorities use the uniform line identifiers. In COM-003-1, this requirement is lost, since Requirement R7 makes no mention of neighboring BAs. Southern Company comments: No proposed revision to remove R18 from TOP-002-2 has been provided in this SDT proposal. If this standard is adopted and TOP-002-2 is not revised at the same time the same requirement will be in two reliability standards.</p>
Disagree
<p>Southern Company supports the SERC SOS comments. SERC SOS comments: This group feels that there should not be a requirement in the standard to have a “procedure”. It is our understanding that, to be auditably compliant with a standard, the responsible entity must develop a procedure, train on that procedure, and be able to demonstrate compliance via documents, data, logs, records, etc. If Requirements R2 – R7 are included in this standard, the entity will need to develop a procedure to be compliant. Therefore, we feel that requirement R1 is redundant and should not be included. Southern company comments: The VSF for not having a written procedure is Severe. If an entity does not have a written procedure but complies with the other requirements in this standard has the reliability of the Bulk Electric System been affected? If the reliability of the Bulk Electric System is not affected by not having a written procedure why is this requirement in a Reliability Standard?</p>
Disagree

Southern Company supports the SERC SOS comments. SERC SOS comments: The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Yet the Alert Level Guides were intended for announcement, not actions. Requiring system operators to use the color-coded system condition terminology during communication adds a layer of responsibility that will distract from the operator's real-time reliability-related tasks. We also do not feel that these Alert Level Guides apply to all the responsible entities identified under Applicability in the draft standard – for example, TSPs and LSEs are not included in the list of notifications. The requirement to use the central time zone for logging the time of an alert is problematic in that all communication tools, such as the RCIS, will need to be re-vamped. We question whether there will be a measurable reliability benefit by so doing. There is also some redundancy in the Alert Level Guides – for example, the CIP-001 standard requires notification of sabotage events – it should not be repeated in this standard.

Disagree

Southern Company supports the SERC SOS comments. SERC SOS comments: We feel that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities that routinely operate in different time zones already have an effective system for dealing with time differences. There seems to be no incentive to change a system that already works quite well, and the cost of updating computer systems could prove prohibitive. This group feels that mandating a common time zone across all of North America can only lead to confusion and increased reliability issues.

Disagree

Southern Company supports the SERC SOS comments. SERC SOS comments: As suggested in Question 1 above, the term Reliability Directive (as defined in COM-002-3) should be used in place of Interoperability Communication, since the directive is specific to emergency operations. The requirement should read: "Each responsible entity shall use Three-part Communication when issuing a Reliability Directive". In addition, this requirement should apply only to BAs, TOPs & RCs. The other entities listed in the draft standard under Applicability do not issue Reliability Directives. Southern Company comments: conditional on if the definition of directive is not routine operational instruction.

Disagree

Southern Company supports the SERC SOS comments. SERC SOS comments: Use of the NATO phonetic alphabet should be considered a "best practice" and should not be included as a requirement in a reliability standard. One failure, such as saying "Baker" instead of "Bravo", results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system. Southern Company comments: This requirement should be removed from the standard. Requirement 5 requires understanding by both parties during communication. Requirement 6 requires common identifiers which will enhance the chances of both parties understanding communications. Although using the phonetic alphabet may be necessary some times in order to gain understanding between two parties it should not be required. If both parties understand A as well as they do Alpha the reliability of the system has not been affected. No entity should be found in non-compliance of a Reliability Standard if reliability was not affected.

Disagree

Southern Company supports the SERC SOS comments. SERC SOS comments: Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined "equipment" identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability, yet will expose entities to large fines.

Agree

Southern Company supports the SERC SOS comments. SERC SOS comments: Our concern is that the Alert Level Guides of Attachment 1 were written for Reliability Coordinators, not the industry as a whole, and now they are being incorporated into an industry-wide standard. This attachment is

very prescriptive as to how the notifications take place, such as through the RCIS. If the RCIS is not functioning and the hotline is used instead, is the entity vulnerable to a violation by virtue of the fact that these alert guides are included in the standard? We believe that the color-coded system condition terminology should be defined/required externally to the COM standards. The use of clear & consistent alert level terminology, while important, does not fit in well with the reliability-related communication standards, especially at these high violation severity levels. It is our suggestion that the Alert Level Guides be balloted separately, and include the Energy Emergency Alerts (EEA) as well. EEA requirements currently exist in NERC Standard EOP-002-2.1

Disagree

Agree

Southern Company supports the SERC SOS comments. SERC SOS comments: We do see a potential conflict with the Energy Policy Act 2005, which set the framework for the Electric Reliability Organization (ERO). The ERO’s mission is to oversee and protect the reliability of the Bulk Electric System. This standard seems to cross the line between reliability-related activities and other types of operating actions. The concern here is that system operators will focus on the letter of the standard rather than on good operating practice. The fear of a violation among operators may have a greater impact on reliability than the violation itself.

Agree

Southern Company supports SERC SOS comments. SERC SOS comments: This review group has identified several problems with this standard, as noted above. Other observations include: The effective dates in the draft standard and in the implementation plan do not seem to match. In the standard, the effective date mentions one calendar year following regulatory approval, while the implementation plan refers to the third calendar quarter after regulatory approval. Furthermore, we do not feel that any of the requirements in this standard warrant Violation Risk Factors or Violation Severity Levels in the high or severe category. In summary, this review group feels that COM-003-1 is not yet ready to be acted upon and may have been posted too soon. There does not seem to be sufficient coordination between the drafting teams of all the COM standards, or any attempt to integrate these standards. One example is the inconsistency between COM-003-1 and COM-002-3 regarding the meaning of three-part communication (mentioned in our response to Question 1 above). As noted above, we feel that many of the requirements prescribe specific “how to” methods for compliance rather than focusing on the “what” of the requirement. Overall, COM-003-1 is much too prescriptive to be tied to million dollar-level fines. Southern Company comments: There are possible inconsistencies with the references to the term “CIP Free Form” and a more generic term “Free Form” in the tables described in Attachment 1 – COM-003-1 – Operating State Alert Levels. Reference the fields where functional entities “outside” the Reliability Coordinator Area are identified for both the initial alert notification and the end of alert notification. For Physical Security, the field mentions only RC’s using the “CIP Free Form.” For Cyber Security, the field mentions RC’s and CIP Participants using the “CIP Free Form.” For Transmission Emergency Alerts, the field mentions only RC’s using the generic “Free Form.” Is there a distinction between the two forms? Is it consistent to reference CIP Participants only for Cyber Security alerts and not for Physical or Transmission? Although this standard is well intentioned it is not ready for presentation to the ballot body. When this standard is applicable is in question just by the way the Title and Purpose are written. The Purpose needs to make it absolutely clear to all parties, complying entities as well as compliance enforcement, when the standard is applicable. For example, the Purpose of the standard is subject to interpretation. Does this standard apply all of the time or just during Alerts and Emergencies? Or does the word especially mean that a non-compliance during an emergency is more severe? Is the phonetic alphabet required when an alert is declared or just after the alert is declared?

Individual
James H. Sorrels, Jr.
American Electric Power
Disagree
Given that Three-part Communications is required when using a directive, a "directive" must be clearly defined. Without this determination, the definitions are incomplete. There are undefined conditions, such as conference calls with multiple parties. Does each participant repeat back in three-part? Also, the definitions do not address communication of directives that are made in a non-oral format. This is an important area to address in this standard. Lastly, please expand "entities" in the Interoperability Communication definition to be "NERC registered functional entities." We are concerned that the definition is much too broad and may expand the scope of required communication beyond alerts and emergencies.
Disagree
Based on definitions provided in the functional model, the inclusion of the TSP and LSE in this standard is inappropriate. These entities manage the relationship with the end-use customer and are not responsible for the operation or maintenance of BES facilities.
Disagree
While having a procedure is important and the responsible entities should have a procedure to be compliant, there is not necessary to establish this requirement to have a procedure. We need to stay focused on what the purpose of the standard is to be and not dilute its effectiveness by focusing on documented procedures. Furthermore, if the extent of communication concerns warrants the extensive effort to establish pre-defined line and equipment identifiers, then this should be

established in a uniform manner and not left to result in multitudes of approaches. There will likely need to be system modifications to address character limitations with respect to line and equipment identifiers.

Disagree

AEP suggests that RCIS be expanded to include the additional parties necessary to support Interoperability Communications. Without such an expansion, the communication requirements for the RC are burdensome and the effectiveness may be compromised by the volume of parties that will need to be included. Is it practical for RFC to communicate across some 60 parties or should this be limited to only those that need to know? Attachment 1 does not seem consistent with the stated purpose of this standard as Attachment seems to focus on defining the operating condition, not communication during alerts and emergencies. The SDT should consider if the scope of the standard is appropriate to resolve this discrepancy. To the extent that it gets mandated, Attachment 1 could be administered through the addition of "check boxes" on the expanded RCIS.

Disagree

AEP believes that the significant efforts and significant system changes necessary to support a common time zone does not provide a significant enough reliability benefit. In fact, the focus on a common time may divert attention away from more pressing operational reliability needs.

Disagree

Is a "directive" from the RC a "directive" all the way through the communication process, including down to the plant orders? Again, based on definitions provided in the functional model, the inclusion of the TSP and LSE in this standard is inappropriate. These entities manage the relationship with the end-use customer and are not responsible for the operation or maintenance of BES facilities. Consequently, when would such entities be responsible for issuing "directives?"

Disagree

AEP does not believe that this should be a requirement. It is understood that three-part communications represent best practices, but it is not necessary to mandate the NATO phonetic alphabet. We are not aware of an instance where the use of "Ed" rather than "Echo" has resulted in a reliability compliance breakdown.

Disagree

AEP does not believe it is appropriate for the standard to have been edited to remove the clarification that neighboring BAs use uniform line identifiers when communicating information about their lines and to add the addition requirement of using pre-determined "equipment" identifiers.

Agree

"Transmission Loading" should be replaced with "IROLs." The attachment is very prescriptive as to the notifications are to take place, but not on conveyance of information to be communicated during alerts and emergencies. The attachment is not a good fit in this standard.

Disagree

Disagree

Agree

Unfortunately, the standard seems to be losing its value as the emphasis overly focusing on procedures while missing the intent. The SDT should reconsider the standard in the context of "what" rather than "how." Lastly, we do not believe that this standard is ready to advance and needs significant re-working before the revised draft is posted. The SDT should attempt to better coordinate with the necessary other drafting teams as these standards are integrated.

Individual

Xcel Energy

Agree

Agree

Disagree
We agree with the structure of the standard, however we have issues with several of the CPOP elements being proposed. (See detail comments in following questions.)
Disagree
The use of Yellow, Orange and Red, as related to the various alert levels, may conflict with existing color requirements that entities already have in use. We recommend instead only refer to the PSEA, CEA and TEA levels. Additionally, it is unclear how R2 applies to anyone other than the RC. Attachment 1 seems to only apply to the RC. If this is correct, then why would the other entities listed in R2 have to incorporate that terminology into their CPOP? If this is not correct, please clarify the requirement so that the other entities can clearly understand what is expected.
Disagree
Do not agree with the requirement to use CST. By requiring the use of CST it may actually introduce an element of error for those who do not routinely operate in that time zone and must make mental corrections for the time zone they are in. Additionally, some agreements already exist that stipulate what time zone is to be used.
Disagree
The way the standard is written, the term "directive" is still open to interpretation and could be inconsistently applied. The term "directive" should be defined.
Disagree
Use of the NATO phonetic alphabet should be a best practice not a reliability requirement. We are not convinced that there is any threat to reliability if someone were to use a different phonetic than what is indicated. Additionally, we do not feel that it is necessary to use the phonetic alphabet unless there is an indication that the initial communication has been misunderstood. If the drafting team feels this requirement should remain in the standard, we feel it should be modified to address: 1) there should be an exception for approved acronyms, such as NERC, FERC, etc., 2) it should only be required upon repeat-back, when the first communication was misunderstood, and 3) any phonetic alphabet should be acceptable for use, such as military or police, not just NATO's.
Disagree
We feel this requirement needs clarification, particularly regarding how granular an entity would have to go into the various pieces of equipment/lines. We would also recommend that R7 be modified to not require mutual agreement. We feel the owner (or majority owner) of the line or equipment should be the one setting the identifiers. For example, R7 could instead read like this: "Owner-determined line and equipment identifiers shall be used for all verbal and written Interoperability Communications."
Agree
Please see our response to question 4.
Disagree
Disagree
Agree
1) Recommend removal of the references to measures in the data retention section of the standard. It is only necessary to refer to the requirements, which is already included. 2) The data retention section should also be modified to refer generically to evidence, instead of "dated operator logs... and voice recordings or transcripts of voice recordings...". This is because the measures specifically allow for other types of evidence, as stated: "Evidence of use may include but is not limited to voice recordings, transcripts, operating logs, or on site observations."
Individual
Laura Zotter
ERCOT ISO
Disagree
The purpose of the standard is for timely communication of reliability-related information "especially during alerts and emergencies". The definition and use of Interoperability Communication in this standard expands the intended scope of the standard beyond alerts and emergencies. Guidance

should be provided for verbal communications with respect to hot-line calls (one party to many) and how three-part communication should be handled. This definition assumes a one on one communication.

Agree

Disagree

This approach of an administrative type requirement is in conflict with the NERC BOT approval of pursuing the development of standards to support reliability performance and eliminate administrative requirements. It is not necessary to have a separate CPOP document to insure operating personnel communicate effectively.

Disagree

This is an administrative task and prescribes how something should be done. Written Interoperability Communications are typically done through automated systems, in which time zone conversion should not be an issue. Verbal communication should be thorough enough to confirm the conversion. If the industry is in favor of this requirement, then perhaps consideration should be to use Central Prevailing Time to alleviate potential confusion with changes with Daylight Savings Time.

Disagree

The requirement, based on the definitions of the terms, introduces ambiguity or even conflict. Three part communication should be required for emergency situations and with the issuance of Reliability Directives (term not yet formally defined – in the works by the Reliability Coordination SDT). Interoperability communications refer to any communications in which a status of a facility or element is to be changed, which means not specifically related to emergencies.

Disagree

ERCOT ISO does not agree with this approach, which seems to be overly prescriptive (“directives, notifications, directions, instructions, orders, or other reliability related information”), which goes beyond the purpose of “during alerts and emergencies”. This is an administrative requirement that would increase communication timing and possibly negatively affect reliability. If using a common language and three part communication for directives is effective this is not required.

Disagree

Does the phrase ‘mutually agreed upon line and equipment identifiers’ mean that identifiers do not have to be identical, but that all parties understand the equipment discussed? If this is the general understanding, then no further comment, otherwise, please clarify. Although the related bullet item in the Background Information section describes that they do not have to be identical, many auditors many only look at the requirement language.

Agree

The intent is for a simple way to look and know the high-level status of an area. This goes way too far into HOW to do it instead of stating what must be done.

Disagree

Disagree

Agree

Individual

Leland McMillan

NorthWestern Energy

Agree

Disagree

COM-001 and COM-002 standards, along with Operator Training, adequately address this issue. Therefore there is no need for this additional requirement.

Disagree
Attachment 1 seems too overly complicated for emergency Operating circumstances and provides an additional burden for Real Time personnel who are stressed with difficult decisions already.
Disagree
NorthWestern appreciates the opportunity to comment. We believe the requirement to use Central Standard Time will cause unnecessary confusion (translating to a different time zone and possibly to a different time reckoning – standard or daylight) at a time when the need for clarity is critical. NorthWestern suggests that each entity use their local time zone when issuing switching orders. Each entity should state the time zone they are using when giving any time reference (e.g., 15:20 Mountain Daylight Time) if necessary.
Agree
Disagree
NorthWestern appreciates the opportunity to comment. The requirement, as drafted, appears to open the possibility of sanctions for incorrect use of the NATO phonetic alphabet during any verbal communication between entities. The use of the NATO phonetic alphabet would be difficult when performing local switching orders to field personnel. NorthWestern suggests that the requirement be reworded to state that entities “shall use a phonetic code (e.g., the NATO phonetic alphabet) when necessary, to verify accurate reception of alpha-numeric information.”
Disagree
Agree
NorthWestern feels that the current communication standards are sufficient for reliable BES Operations.
Individual
Saurabh Saksena
National Grid
Disagree
Interoperability Communication: Virtually all communications in a control room environment deal with changing the state or status of an element of facility, as such there is not a need to define this communication protocol. However, addition of “real time communication” in the definition will to an extent address the issue. The definition should be revised as follows: Real Time Communication between two or more entities to exchange reliability-related information to be used by the entities to change the state or status of an element or facility of the Bulk Electric System. Three-part Communication: The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.
National Grid has no specific stand either ways. However, please refer to response to Question 8 for issues pertaining to the language of the requirement.
Disagree

It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions.

Disagree

Defining specific wording per Attachment 1 is overly prescriptive. The requirements should focus on what is required not how. The RC and encompassing entities should be required to define terms that will be used in communications. This would allow for the use of terms that are well understood in an area rather than adding new terms. Also, System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. There is still plenty of grey area in Attachment 1 and there does not appear to be any differentiation in actions taken based on the alert levels. Finally, the section Background Information in the Comments form mentions "The SDT proposes four system condition alerts instead of initial three in the RCWG version." However, Attachment 1 only mentions 3 alerts – Physical Security, Cyber Security, and Transmission Emergency Alerts leading to confusion.

Disagree

The use of central time is unnecessary and may cause more confusion when converting times. The requirement should be that those entities which need to communicate and are in different time zones, define which time they will use for communications.

Disagree

Based on the definition of Interoperability Communications, this would require 3- part communication to be used during virtually all control room communications. The definition of Interoperability Communications should be revised as proposed in response to Question 1.

Disagree

Using the NATO phonetic alphabet is useful, but to what extent? Does it apply to facility identifications, key words, or every letter of every word? Is it upto the judgment of the operators? If so how will compliance be monitored? If during a communication, personnel used a term different than that in the NATO alphabet i.e. D as in Dog rather than Delta however, the listener understood the message and the correct action was taken would there still be the possibility of a compliance violation?

Disagree

The way this and TOP-002 R18 requirements are written they could be interpreted to mean that the line identifiers have to be unique. The requirement should be written similar to the bullet on page 7 of the comment form also listed below. "TOP-002 R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network." "Pre-determined Line and Equipment Identifiers: COM-003-1 requires the use of predetermined line and equipment identifiers in Requirement R7 however the Requirement does not stipulate a single/unique identifier as long as all parties mutually agree on the identifier for the line or equipment. The mutual agreement shall be reached in advance of the use of the identifiers as described in the functional entity's CPOP"

None

Agree

We believe that the existing standard COM-002 is actually better than this standard. This standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT. The RC SDT appears to be adding requirements. More coordination is required between these two teams.

Group
NERC Staff
Howard Gugel
Disagree
<p>NERC staff recommends that the term “Communications Protocol” be removed from the definition section because the term is only used in the title and in another definition. In addition, the definition adds no additional clarity than can be provided by a commonly used definition of the terms. Similarly, the term “Three-part Communication” can be removed since it is used in only one requirement, and the definition can be incorporated in the requirement. Furthermore, Three-part Communication refers to a process or procedure, not a term. NERC staff recommends that the term “Interoperability Communication” be modified to “Operating Communication” with the definition of “communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” This captures all communication that affects BES reliability, not just communication between function entities.</p>
Disagree
<p>NERC staff agrees with the proposal, but would offer the following modification in order to add clarity. We recommend that the phrase “when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications” be replaced with “when verbal Operating Communications with alpha-numeric information is involved.” This would utilize the definition of Operating Communications offered in the response to Question 1. This will hopefully eliminate the need to further define what communication is or is not included in the phrase “directives, notifications, directions, instructions, orders or other reliability related operating information.”</p>
Disagree
<p>NERC staff recommends that Requirement R1 be deleted because it is strictly an administrative requirement that is not necessary. It is not results-based, and is redundant given the imbedded reference to Requirements R2 to R7. If an entity can demonstrate compliance with the other requirements, Requirement R1 performs no additional reliability enhancement. A Requirement should state a performance outcome or a risk to be mitigated. If there is a need to document something, the appropriate location for that is in the Measures section of the standard. A distinction should be made here that producing a document containing specific content necessary for reliability, such as a system restoration procedure, can be an effective requirement used to minimize risk. However, documentation that does not stand on its own as a result necessary for reliability should not be made into a requirement. Such documentation requirements should either be eliminated or moved to an administrative, informational section of the standards. An example of a weak requirement is “the Responsible Entity shall document the implementation of security patches”. The requirement that directly contributes to a risk reduction outcome is to implement applicable cyber security patches. Documentation of the implementation is simply a vehicle for demonstrating compliance. The NERC staff does not find that the CPOP satisfies the criterion of reducing risk.</p>
Disagree
<p>NERC staff agrees with the principle behind Requirement R2. However, it appears that two separate communication actions are being performed, the action to notify the Reliability Coordinator, and the action by the Reliability Coordinator to communicate the alert level to affected functional entities. Therefore, we recommend that that Requirement R2 be split into two requirements and offer the following wording: A Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall notify its Reliability Coordinator when it becomes aware that there is a situation involving the facilities under its control that meets the criteria for an alert, as specified in Attachment 1 – Operating State Alert Levels, to keep the Reliability Coordinator informed on the initial and subsequent status of the situation. When a Reliability Coordinator is notified (or becomes aware) that there is a situation within its Reliability Coordinator Area that meets conditions specified in Attachment 1 – Operating State Alert Levels, the Reliability Coordinator shall use the phraseology when making the notifications specified in Attachment 1 to keep others informed on the initial and subsequent status of the situation. The NERC staff recommends that the SDT review the content of the Attachment for consistency, clarity and omissions (such as found in the table on page 14 of the draft – the cell, “Notify the following entities:” is blank).</p>

Disagree

In the "Background Information" section of this Comment Form, you state, "The SDT believes that Interoperability Communications would be enhanced with the use of a common time zone. Central Standard Time was chosen as it is already in use for NERC Time Error Corrections. The Blackout Report cited the need to tighten communication protocols and the SAR includes consideration of a common time zone to minimize mis-matched time signature issues between control systems especially during an emergency." NERC staff would like to see more detailed justification on how reliability would be enhanced with this requirement. This appears to solve issues for communications between time zones, but may add additional confusion for all additional communications that exist within a common time zone.

Disagree

NERC staff agrees with the principle behind Requirement R5. We recommended in Question 1 that the term "Three-part Communication" be removed since it is only used in this requirement. We feel that this requirement should be split into two requirements so that the sender and receiver each have responsibility in the communication. Therefore, we offer the following as suggested replacement language for Requirement R5: Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider that receives a verbal Operating Communication shall repeat the communication to the initiator. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider that initiates a verbal Operating Communication shall ensure that the receiving party has repeated the communication, and shall verbally confirm the communication to be correct or reinitiate the communication.

Disagree

As stated in response to Question 2, NERC staff agrees with the proposal, but would offer the following modification in order to add clarity. We recommend that the phrase "when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications" be replaced with "when verbal Operating Communications with alpha-numeric information is involved." This would require using the definition of Operating Communications offered in the response to Question 1. This will hopefully eliminate the need to further define what communication is or is not included in the phrase "directives, notifications, directions, instructions, orders or other reliability related operating information."

Disagree

NERC staff is unaware of any instance where not having a mutually agreed upon nomenclature has led to an adverse reliability event. Rather than requiring a national database for all line and equipment identifiers, it appears that restricting the list to jointly-owned facilities and tie-line would accomplish the team's goal. We recommend that the phrase "Interoperability Communications" be replaced with "Operating Communications involving jointly-owned Facilities and tie lines."

Agree

NERC staff recommends that a line be added to each table that provides the expectation for entities communicating events to the Reliability Coordinator. Using the existing tables, all expectations and requirements rest solely on the Reliability Coordinator. We also recommend eliminating the color designations of yellow, orange, red and the Alerts be changed to Level One, Two and Three for consistency. The use of colors does not appear to add anything to the clarity or effectiveness in conveying the content of an Alert and may be inconsistent with the Department of Homeland Security's threat level system. Additionally, the team should update Attachment 1 to include the criteria and notifications for Energy Emergency Alerts.

Agree

Although no questions were asked about Requirement R3, NERC staff is aware that some areas in North America require a language other than English for official communication. In addition, it may be hard to define what "internal communications" are. NERC staff recommends that the phrase "Interoperability Communications. Responsible Entities may use an alternate language for internal communications" be replaced with "Operating Communications between functional entities, unless prohibited by law." In addition, regions that exist solely in one time zone may ask for a variance from the requirement to use CST for communication.

Agree

Although no questions were asked about Requirement R3, NERC staff is aware that some areas in North America require a language other than English for official communication. In addition, it may be hard to define what "internal communications" are. NERC staff recommends that the phrase "Interoperability Communications. Responsible Entities may use an alternate language for internal communications" be replaced with "Operating Communications between functional entities, unless prohibited by law."

Agree

NERC staff questions whether this standard applies to the Transmission Service Provider and the Transmission Owner. It is unclear from the functional model where they would be involved in real-time operations communications. It is also unclear why the Violation Risk Factor for every requirement is High, and the Violation Severity Level for all but the first requirement is Severe. This automatically elevates any violation of any of these requirements to the highest penalty level that is imposed. The NERC staff recommends that the SDT review the latest guidelines for assignment of VSLs and consider alternatives that could expand/graduate the VSLs to account for varying severity of non-compliances.

Disagree

The way the definition of "Three-part Communication" is worded applies only when the communication is understood by the listener the first time. The RC SDT requirement which includes "and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings" is more complete. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. A suggested revision to the definition: A Real-Time Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. These principles are included in Requirements R2 and R3 in the recently issued draft Standard COM-002-3 in Project 2006-06. An alternative suggestion to the definition of Three-part Communication: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct by the party who initiated the communication. In the definition of Communications Protocol, the term "Interoperability Communication" creates confusion within the industry, and contradicts the work by RTO and RC SDT in Project 2006-06 that limits the requirement to use three-part communications when issuing Reliability Directives (defined in Project 2006-06) that address anticipated and actual emergency conditions, and do not agree with its definition. What also must be considered is that the RC SDT has stated that when someone "says", it is a directive--operating conditions are not distinguished. This definition unnecessarily and counterproductively encompasses all verbal communications and, as such, is not needed. It is not so critical to reliability that it should become an enforceable requirement for routine operating instructions. The enforceable requirement should be limited to require three-part communications, and be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, and be auditable and measurable. Virtually all communications in a control room environment deal with changing the state or status of an element of facility, as such there is not a need to define this communication protocol. Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? If so, the terms need to be capitalized. The term "entities" is confusing and needs to be defined.

Disagree

The SDT expanded Requirement R18 of TOP-002-2 by adding the term "equipment". This Requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and understood. LSEs and TSPs do not own or operate equipment, and as such should not fall under the mandates of this requirement. Neither the TSP nor the LSE provide or receive information about specific lines or equipment in real-time. Therefore, requirement R7 should not apply to them absent clear evidence that a realistic (not hypothetical) threat to reliability would exist if they are omitted. We do not think that such a threat would exist.

Disagree

This proposed communication protocol is redundant to Requirements R2-R7, and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions for all entities involved in real time operations. The NERC BOT has approved pursuing the Results-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard. There is no need to create a CPOP that includes requirements R2 through R7 given that each requirement spells out how and what is to be communicated. A CPOP may be needed for Interoperability Communications that are not addressed in R2-7.

Disagree

It is not clear what value there is in identifying these alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Just stating the severity and details of the incident should suffice. Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. System operators will need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. The level(s) identified in the notification text are at odds with the condition (color versus numerical). Suggest that the standard either use Condition (color) or the level (numerical). Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the listed entities such as Distribution Provider and Generator Operator cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 are not consistent with the definition of Interoperability Communications. By definition, Interoperability Communication pertains to all communications about how entities change the state of the BES (not just physical or cyber attacks). Attachment 1 is about notifying of what physical and cyber attacks have already happened to the BES. It is not clear in the context of Interoperability Communications what the recipient of a specific notification is expected to do when there is a change of state or status of an element or facility of the Bulk Electric System. Attachment 1 pertains specifically to Operating State Alert Levels and says nothing about the communication of information to be used to change the state or status of a BES element or facility (which is the SDT's proposed definition of Interoperability Communications). Therefore, it is not appropriate to require that all verbal and written Interoperability Communications use the pre-defined terminology in Attachment 1. Only those communications concerning Operating State Alert Levels should be required to use that terminology. By the proposed definition, such communications are not Interoperability Communications since the information is not used to change the state or status of a BES element or facility. The SDT needs to revise this requirement to clarify that it pertains only to communicating the Operating State Alert Levels and nothing more. None of the examples in either of the attachments appear to address EEAs (EEA is mentioned in the top paragraph of page 9 that is included in EOP-002-2.1) or SOLs. This limits the use of Interoperability Communications to only events where there exists either a physical or cyber threat, or where an IROL can't be mitigated. The requirements should focus on what is required, not how. The RC and encompassed entities should be required to define terms that will be used in communications. This would allow for the use of terms that are well understood in an area, rather than having to add new terms. The Background Information in this Comment Form introductory section mentions "The SDT proposes four system

condition alerts instead of initial three in the RCWG version." However, Attachment 1 only mentions 3 alerts – Physical Security, Cyber Security, and Transmission Emergency Alerts leading to confusion. Finally, Attachment should only be used as a guide.

Disagree

HQT agrees with using 24 hour format. However, there is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no additional reliability need to use a common time zone. The time zone should be identified in the communication. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. When operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for operating entities to reliably operate. The time zone adopted by the respective Reliability Coordinator (RC) and their area control center, e.g., NYISO Eastern Standard Time (EST), should be used. If each entity in the area and the RC are all using EST (or daylight savings), then why would a time zone be used that is foreign to all parties in the area? This can lead to considerable confusion. What cannot be ignored is how many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement. The requirement should be that those entities which need to communicate and are in different time zones define which time they will use for communications. Any confusion about what time is being verbally communicated should be cleared up through three-part communications. There should be no confusion about what time is being communicated as long as the time zone (where applicable), and the 24 hour format designations are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion.

Disagree

Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions, or during operational strategic discussions as well as other "non-action" oriented communications. This Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. This Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. The work being done by the RC SDT and RTO SDT in Project 2006-06 defines a Reliability Directive based on the determination of the person giving such an order. The entity that needs the action to be taken should establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, auditable, and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives. Outside of allowing the individual who NEEDS the action to be taken, this is an auditable or measureable requirement whether it be for 3-part communications or for the receiving entity to actually take said action. By definition, Three-part Communications presumes the second party will repeat the information back "correctly." Failure to do so is assigned a High VRF and a Severe VSL. The practical application of Three-part Communication involves a sender communicating information, a receiver repeating back the information, and the sender verifying the repeat back is either correct or incorrect. If the repeat back is incorrect, the process repeats until both parties have the same understanding of what is being communicated.

Disagree

While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications, and is certainly not necessary to be included as an enforceable Requirement. For example, a situation in which an operator says "A as in apple" instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. The objective of good communications is to assure that the parties understand each other. The statement "... shall use the NATO phonetic alphabet" doesn't make sense for North America. If the Real-Time Operator states "breaker 6-North," under

the NATO phonetic alphabet that would be unacceptable, because the operator did not use the appropriate NATO term "breaker 6-November," even though the "N" on the one line diagram refers to the "North" breaker and not the "South" breaker. Many organizations may have established communications protocols which are working well. Making a change may actually hinder reliable operations by introducing unnecessary confusion and questioning. Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word "Zebra" instead of "Zulu" to signify the letter "Z"? And, why would this be enforceable. Perhaps this should be a guideline document rather than an enforceable Requirement. There is no reliability need for this Requirement. Furthermore, the use of three part communication eliminates the need for a mandatory use of NATO phonetic alphabet.

Agree

Agree

It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There do not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information, for example 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts, and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage already reported in CIP-001 R2. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Also it has been the experience of several entities during the field test of these Alert Levels that there are inconsistencies as to when to implement various stages of Alerts, and this introduces more confusion than exists today. Reliability has not been enhanced. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Foresees is a forecast condition. There is an inconsistency between the inclusion of Attachment 1 and what is stated in the document posted with the standard entitled Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement. The document states that the standard focuses on "how to" communicate rather than on specified scenarios of "to whom" or "when to" communicate; however, Attachment 1 does just the opposite. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA's use terminated. Terminated is the preferred term. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model. Refer to the response to Question #4.

Agree

In the Province of Québec, the use of French is mandatory, according to law, for communication within the Province. R3 should include: Within the Québec Interconnection, the French language shall be used for verbal and written interoperability communication between entities (RC, BA, TO, TOP, GOP, TSP, LSE and DP). For their interoperability communication with entities outside of the Québec Interconnection, they shall use the English language.

Agree

In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, and resources while not enhancing reliability in these areas. When operating across time-

zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate. Many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.

Agree

The existing standard COM-002 is better than this proposed Standard. This Standard actually causes more confusion and ambiguity, and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. All requirements with the exception of R1 have been determined to have a HIGH VRF, when many of them are dictating HOW communications should take place and not when, why, or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT in Project 2006-06. The RC SDT is adding requirements. More coordination is required between the Standard Drafting Teams. Again, we support the work being done by the RC SDT and RTO SDT and do not believe this adds more necessary requirements. Many of the requirements proposed in this posting either reiterate the drafts as posted (i.e. English language) or introduce confusion when compared to the drafts as posted. The SDTs should limit their scope to R2 and R7, so as not to duplicate or contradict the on-going work of other SDTs. The SDT appears to have adopted severe violations for every infraction. There should be some gradations, using increasing severity based on the number of or severity of any infractions. Definitions: The standard should define other terms, as well, including the following: • reliability-related information, • "... state or status of an element or facility of the BES ..." The standard should also have provision to include the boundaries (components) of an "element," and the meaning of the terms "state or status" in the written communication protocol. For example, is the gas compressor of a 345kV breaker considered part of this element, and so would a change in its "state or status" be covered? The VRFs for R2-R7 are all "High", and the VSLs are all "Severe" are too harsh. Failing to comply with one of the requirements does not automatically mean that a miscommunication occurred that caused a reliability problem. There should be a "Moderate" VSL for failure to comply with a requirement, but no miscommunication occurred. There should be a "High" VSL for failure to comply with a requirement that caused a miscommunication but resulted in no violation of another reliability standard. The "Severe" VSL should only apply to failures to comply with a requirement that caused a miscommunication that lead to a violation of another reliability standard, or caused a reliability problem. In addition, as stated earlier, this Standard focuses on "how" certain tasks should be performed and conflicts with NERC's position of pursuing performance based and results based Standards. Based on these considerations, work on this Standard should be stopped until work on Project 2006-06 has been completed and approved. This approach is consistent with the August 2003 Blackout Recommendation #26 "failure to identify emergency conditions and communicate that status to neighboring systems, and upgrade communication system hardware where appropriate" which actually focused on communications during emergencies, which is the scope of Project 2006-06. After Project 2006-06 is completed, a determination can be made on the disposition of this Standard. This Standard should be effective uniformly continent-wide.

Group

Santee Cooper

Terry L. Blackwell

Disagree

The definition of Interoperability Communication needs to be clarified. What is the intent of the word "entities" in this definition? This definition may no longer be needed with the recent definition of a Reliability Directive. Three-part Communication should be required when issuing and receiving a Reliability Directive. This term has recently been defined by a SDT.

Disagree

A TSP and LSE should not be subjected to other requirements within the COM003 Standard such as Three-part Communications. In addition, R18 of TOP002-2 required the use of uniform line identifiers among neighboring BAs. As this requirement (R7) is now written in COM003 it is not clear that this is when the use of uniform line identifiers is required. As currently written, it could be interpreted that the use of uniform line identifiers is required for all communication which is more restricting.

Disagree

We believe that a company's documentation demonstrating compliance for R2 through R7 would eliminate the need for a CPOP document.
Disagree
Utilization of a color-coded system for all verbal and written Interoperability Communications adds a layer of complexity to the System Operator that is not necessary.
Disagree
A common time zone is not necessary and is overly prescriptive. Companies should not have to worry about self-reporting or receiving a compliance violation if someone states the wrong time during a conversation.
Disagree
The SDT should consider using the now defined term Reliability Directive in place of Interoperability Communications. Typically, only BAs, TOPs, or RCs issue Reliability Directives so this requirement should only be applicable to those entities.
Disagree
Use of the NATO phonetic alphabet should not be a requirement of this standard. This also adds a layer of complexity to the system operator position that is not necessary.
Disagree
See previous comment on Question 2. In addition the use of the words "equipment identifiers" could be interpreted to include all pieces of equipment within a line.
Disagree
Disagree
Agree
A lot of the requirements in this standard could be considered a "best practice" for the industry rather than reliability related.
Agree
The SDT has put a lot of work into this standard and we appreciate their effort. The SDT of COM-002 and COM-003 may need to integrate the reliability related requirements of these two standards into one standard that the industry can approve. This standard as written could lead to some extremely high dollar fines when in reality the reliability of the bulk electric system has not been affected at all.

Bonneville Power Administration
Denise Koehn
Disagree
BPA does not agree with the aspects of Interoperability Communications. We do not need a common time standard. Why use the NATO Standard. This could add a lot of time to a directive that needs to be given immediately. The 3 part communication is already used by BPA.
Disagree
BPA Would like further clarification about what is meant by "pre-determined, mutually agreed upon line and equipment identifiers". Is it a specified format no matter which part of the system is being used, or is it only for 115 kV and above as it applies to LSE's and TSP's. If it only refers to Transmission equipment above 115 kV, then BPA would likely agree.
Disagree
BPA does not agree with the one time zone or the NATO Standard. We believe the protocols are unnecessary and in fact will add more confusion to the process. We also do not agree, if this requires creating a brand new documented procedure just to address this standard, when elements are already covered in a different standard (common language in TOP).
Agree
In Attachment #1 - Operating State Alert Levels, for the Transmission Emergency Alert (TEA) Level 2 definition, a "why" needs to be incorporated into the definition. It appears that the reason we're going to TEA 2 is to avoid violation of an SOL but it needs to be called out.

Disagree
This creates a communication barrier between the utility and it's customers and the local population. Do not go ahead with this provision. The very last thing that we want to do is to create confusion and this approach, given that the country itself is using different time zones, will do just that. With 3-part communications with specified time zones in Interoperability Communications as required and a common English language, the matter is covered.
Agree
Suggest that each entity is also required to use the full station name in verbal communications.
Disagree
Disagree
BPA Would like further clarification about what is meant by "pre-determined, mutually agreed upon line and equipment identifiers". Is it a specified format no matter which part of the system is being used, or is it only for 115 kV and above as it applies to LSE's and TSP's. If it only refers to Transmission equipment above 115 kV, then BPA would likely agree.
Agree
In Attachment #1 - Operating State Alert Levels, for the Transmission Emergency Alert (TEA) Level 2 definition, a "why" needs to be incorporated into the definition. It appears that the reason we're going to TEA 2 is to avoid violation of an SOL but it needs to be called out. The color scheme may be confusing with (DHS) Homeland Security's terrorist alert levels. (The RC makes the notifications to all based upon the Operator's reported conditions per the scheme.). Suggest only using the Emergency Energy Alert numerical levels versus the color scheme, to avoid confusion with Homeland Security alerts. An example: A red alert is a breakup like 2003 and 1996, not shedding of load to prevent it, The color scheme does not work for this. Agree with Notifications for Physical Security and Cyber Security. Disagree with Notifications for Transmission Emergency Alerts. This appears to be only IROL related, but could progress to SOL. May have too many of these issued. Suggest the following: Yellow – approaching IROL limit; Orange – procedures implemented to correct IROL; RED – shedding firm to respect an IROL.
Disagree

Agree
R3 creates a special need for multi language operators. US and US-involved entities need to use English in all instances, not only for reliability purposes, but for internal communication purposes and to be able to hire replacements without competing for an artificially small set of operators and to be auditable by NERC.

Disagree
The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. We believe the term "Interoperability Communication" contradicts the work by the RTO and RC SDT that limits the

requirement to use three-part communications to only those communications that explicitly state that the communication is a Reliability Directive and creates confusion within the industry. Additionally, it appears that this definition would encompass all verbal communications and, as such, we question the need for such definition. While we support using three-part communications during routine operations as a best operating practice, we do not believe that it is so critical to reliability that it becomes an enforceable requirement for routine operating instructions. Rather we believe the enforceable requirement should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable. Both element and facility are used in the Interoperability Communication definition and are NERC defined terms. Did the drafting team intend that the NERC definitions should apply? Then the terms need to be capitalized.

Disagree

This requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and comprehended.

Disagree

It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard. Furthermore, the establishment of R2-R7 as elements of the CPOP required in R1 appears to contradict the recent shift in direction that NERC has taken regarding defining criteria as bullets under a requirement. See NERC's August 10th informational filing regarding assignment of violation risk factors and violation severity levels in regards to dockets RM08-11-000, RR08-4-000, RR07-9-000, and RR07-10-000. COM-003 R2 states: "shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for verbal and written Interoperability Communications." Why does R1 establish the requirement for a procedure, when the procedure is essentially defined by R2-R7. If there is such a reliability need to establish these requirements, one could conclude nothing else is so important that it needs to be included because it is not identified in the standard. Furthermore, R2 appears to define Interoperability Communications for attachment 1 communications only. Is this the intent of the drafting team?

Disagree

It is not clear what value there is in identifying alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Further, the "pre-defined" system conditions and alert levels are too detailed and overly prescriptive. System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation. Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generator Operator cannot have access to these systems due FERC standards of conduct requirements. Attachment 1 and R2 do not appear to be in synch primarily due to the definition of Interoperability Communications. By definition, Interoperability Communication is about how entities change the state of the BES and Attachment 1 is about notifying of what already happened to the BES.

Disagree

There is no need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no demonstrated benefit to reliability to use a common time zone. The time zone should be identified in the communication. Use of CST will cause significant and unnecessary costs

and the resulting reliability benefit is not clear. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate; also, let's not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.

Disagree

Based on the definition of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT which would define a directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP issue directives. Thus, the term "....when issuing a directive...." should be "....when communicating directives...." , so both the issuer and receiver are included in the requirement.

Disagree

While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through enforceable requirements. Imagine the situation in which an operator says "A as in apple" instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. Also, many organizations may have established communications protocols which are functioning properly and making a change may actually hinder reliable operations by introducing unnecessary confusion.

Disagree

Please confirm our understanding of this requirement. We believe that the SDT intends for the requirement to compel all companies to use the same name for all facilities. If this is the intention, we disagree with the requirement. This may represent a good utility practice but it is not necessary to be a requirement. The key question is: "Do the companies' personnel understand one another?" If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters.

Disagree

It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There does not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information such as 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked. Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators' parts and will only generate phone calls for more information. Furthermore, PSE and CSE is a type of sabotage which is reported in CIP-001 R2 already. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2. Also, several entities have observed confusion during the field-test of these Alert Levels because there are inconsistencies in the implementation of various stages of Alerts. It certainly has not enhanced Reliability. Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, "The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not

forecast conditions." In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. "Foresees" is a forecast condition. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2. Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA's use terminated. We recommend using terminated. Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model.

Agree

Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list verbally and individually would create an unnecessary burden that distracts the RC from actual system operation and represents a detriment to reliability.

Agree

In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing "Central Standard Time" or "Eastern Standard Time" is sufficient for other operating entities to reliably operate; also, let's not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.

Agree

We believe that the existing standard COM-002 is actually better than this standard. This standard causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. COM-002 retirement does not appear to be consistent with the direction of the RC SDT. The RC SDT appears to be adding requirements. More coordination is requirement between these two teams. Recommendation 26 of the August 14, 2003 blackout report is cited as a driver for extending three-part communications. We believe the title of Recommendation 26 is misleading and when reviewed separately from the supporting text of the recommendation and direct and contributing factors in the report results in an incorrect interpretation. "Failure to identify emergency conditions and communicate that status to neighboring systems" is one of the contributing factors and the supporting text of the recommendation clearly refer to shoring up communications during emergency and anticipated emergency conditions and establishing an emergency broadcast communication system to alert regulatory, state and local officials. The supporting text of Recommendation 26 only mentions addressing alerts, emergencies or other critical situations. Some have incorrectly inferred the initial clause of Recommendation 26, "Tighten communication protocols", means the recommendation applies to all routine communications. The first paragraph in Attachment 1 of COM-003-1 an EEA is stated as being an Emergency Energy Alert rather than an Energy Emergency Alert. This should be corrected for consistency with other standards and to avoid confusion. Also in this paragraph, the term "states" should be replaced with "levels" in order to maintain consistency with the tables in the Attachment as well as EOP-002-2.1 to which this Attachment refers.

Progress Energy Carolina, Inc

Disagree

The definition for Interoperability Communication needs more clarification/an interpretation since the type of communications is not defined, the term "reliability-related information" undefined, and it may be so diluting as to de-emphasize true reliability directives.
Disagree
The word "Neighboring" is used in TOP-002 R18. Excluding this word in the proposed COM-003-1 means that each entity would have to coordinate the uniform identifiers with an undefined number of entities in the entire Interconnection.
Disagree
A requirement to create a CPOP and mandating absolute adherence to that CPOP is overly prescriptive, may not improve reliability of BES operations, and may serve to delay communications and therefore delay actions necessary to respond to threats to the reliability of the BES.
Disagree
The link between COM-003-1 R2 and Attachment 1 for entities other than the Reliability Coordinator is unclear. R2 links with Attachment 1 and is applicable to a host of entities while Attachment 1 seems to only provide pre-defined system condition terminology for use during notifications by the RC to other entities.
Disagree
Mandating that all "Interoperability Communications" be based on Central Standard Time could generate an error precursor- (i.e. some entity communicating a reliability directive in a location using EST to a different entity in a location using EST having to convert the time stamp to CST introduces possibilities of errors and/or delays.) A better approach for those entities that communicate across time zones is for those entities to agree/coordinate on a time standard reference.
Disagree
PEC supports creating a definition of Reliability Directives. PEC may then agree that each entity shall use 3-part communications when issuing Reliability Directives during "Interoperability Communications." Alternatively, simplify and change to use Three Part Communications when using Interoperability Communications.
Disagree
NATO stands for North Atlantic Treaty Organization. This proposed requirement is a best practice and does not serve to increase the reliability of the BES.
Disagree
Agree
R2 which links with Attachment 1 is applicable to a host of entities while the Attachment seems to only provide pre-defined system condition terminology for use during notifications by the RC to other entities. PEC feels that unscripted specific language used by RCs now on RCIS and in verbal communications currently provides the necessary awareness and information to entities without personnel having to refer to a procedure or remember color codes to decipher the meaning. This attachment does not serve to increase the reliability of the BES.
no
Agree
This proposed revision, if implemented, may introduce unnecessary complications into communications between entities which may lead to delays and misunderstandings, potentially decreasing the reliability of the BES.
Group
PEF
Dania Colon
Disagree
PEF does not agree with the adoption of the proposed term "Interoperability Communication". The term "Reliability Communication" should be used instead. The proposed term "Interoperability Communication" is defined such that it applies to a state or status change of an element or facility of

the BES – but there are many reliability-related communications which do not necessarily apply to a state or status change.

Agree

Agree

Disagree

PEF recommends that the color coding and definitions that are used by Homeland Security also be used for the notification of physical and cyber emergency alerts reported to the RC. This would follow the ES-ISAC standard already adopted by the electric industry. If the attachment is adopted as is, PEF recommends adding the EEA levels to provide “pre-defined system condition terminology.”

Disagree

PEF feels that the use of CST will create too much confusion within the different entities, particularly during emergency communications. We recommend the use of GMT instead.

Agree

Agree

Agree

Agree

PEF recommends that the color coding and definitions that are used by Homeland Security also be used for the notification of physical and cyber emergency alerts reported to the RC. This would follow the ES-ISAC standard already adopted by the electric industry. If the attachment is adopted as is, PEF recommends adding the EEA levels to provide “pre-defined system condition terminology.”

Disagree

Agree

PEF recommends that the color coding and definitions that are used by Homeland Security also be used for the notification of physical and cyber emergency alerts reported to the RC. This would follow the ES-ISAC standard already adopted by the electric industry.

Agree

PEF believes additional NERC defined entities (such as Generators Owners) should be made applicable to this standard. Specifically, PEF believes that the Interchange Authority should be added due to the communications required between the Reliability Coordinator and the Interchange Authority. PEF also believes that the adoption of R4 would have major implications on the tagging process. PEF believes that all tagging would be required to be done using CST due to schedule check-out between BAs, TSPs, LSEs and RCs. Therefore, PSEs should be made applicable as well for R3 and R4.

Group

PPL

Annette Bannon

Disagree

Three-part Communication is too prescriptive. How will “all call/blast” communications be handled? Also, it is unclear what communications are included in Interoperability Communication.

Disagree

It is not clear what real time communications take place with a TSP and/or a LSE that would put the BES in jeopardy and thus necessitate them to be included as an applicable entity.

Disagree

Will the CPOPs be developed regionally, by RCs, by TOPs, by BAs? Will some entities have to adhere to various CPOPs since they may operate in various areas? Too many unanswered questions to support this concept.

Disagree
This requirement should be applicable to a RC only. Some registered entities may not even receive these types of communications. Since the responses are the same for all levels noted in attachment 1, there is questionable value to defining this level of additional administrative detail.
Disagree
This requirement is overly prescriptive and the benefit to reliability by switching everyone to CST is unclear.
Disagree
Only RCs, TOPs, & Bas issue directives. The other entities should be removed from this requirement.
Disagree
The way this could be interpreted is that every type of communication between every applicable entity would have to use the NATO phonetic alphabet. This would be impractical since many of the current communications do not require this level of specificity.
Disagree
Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined "equipment" identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability, yet will expose entities to large fines.
No comments either way since this applies specifically to RCs.
Disagree
Disagree
Agree
If this draft standard would be approved as it is currently proposed, the implementation plan is way too short considering all the process and system changes that are needed to comply with the numerous additional requirements.
Individual
Scott Berry
Indiana Municipal Power Agency
Disagree
It is not clear in the definition of Interoperability Communication if this is communication between two outside entities (two different companies) or could apply to communication between two entities within the same company. For example, communication between a company's generation plant and the same company's dispatcher.
Disagree
The OPCP SDT does not give a real justified reason on making this requirement move from TOP-002-2 to COM-003-1, except saying that the team believes it is appropriate. Unless there is a very sound or technical justification for moving it, the requirement should be left in the current standard (TOP-002-2) to reduce the extra work and confusion this may cause among the industry. In addition, since Inoperability Communication is not clearly defined, if two LSE entities are communicating, do they have to follow the cummunication protocal required in COM-003?
Disagree
What reliability purpose is served by restating requirements two through seven in a Communications Protocol Operating Procedure (CPOP)? Since these requirements are the only required items in the CPOP, entities will just be restating these requirements in their CPOP. In addition, this is an administrative requirement which does not fit into the new performance-based standard principle that should be used by SDT's.
Disagree

No. Does attachment 1 cover all possible communication scenarios and terminology? Using pre-defined condition terminology does not allow flexibility in communications and for near changes in communications that might be needed depending on the situation.

Disagree

There is no need to use a common time zone. The time zone should be identified in the communication, if needed. The reliability benefit is not clear for using one time zone, and the cost associated with using one time zone will be significant and unnecessary. The use of just CST will cause confusion, because one ISO has all its systems in EST and another ISO systems has its systems in EPT. If an entity is required to use CST when verbally communicating to one or both of these two ISOs, then many mistakes and confusion will result because their portals continue to be in their respective times.

Disagree

The definition of Interoperability Communications is not clear and this requirement could require Three-part Communications to communicate routine, internal instructions within an entity. In addition, the definition of a directive is being worked on by a NERC SDT, and this definition might help clear up any confusion in this requirement, along with a better definition of Interoperability Communications.

Disagree

An entity should not be required to use a specific phonetic alphabet. If a letter needs to be clarified, then boy, bob or beta should be allowed to convey the letter "B". In an emergency, an entity wants its coordinators to be concentrating on the situation and not worrying about using the proper phonetic alphabet word for the letter "B".

Agree

This standard is not needed because requirement two in COM-002 takes into account the use of Three-part Communication which is the main reliability requirement from COM-003. The use of a procedure (R1), the English language (R3), a standard time zone (R4), the NATO phonetic alphabet (R6), and a pre-defined system condition terminology (R2) are administrative requirements (not performance based requirements) and if not used, all of them definitely do not have a high VRF. If an entity does not use a procedure, but ensures they follow requirement 2 of COM-002 and both parties have a clear understanding of the directive what other reliability requirement is necessary. One recommendation might be for the COM-002 Standard Drafting Team or another SDT to come up with a definition for a directive.

Individual

Michael R. Lombardi

Northeast Utilities

Disagree

The term "Interoperability Communication" creates confusion within the industry and contradicts the work by RTO and RC SDT in Project 2006-06 that limits the requirement to use three-part communications when issuing Reliability Directives (defined in Project 2006-06) that address anticipated and actual emergency conditions. Additionally, it appears that this definition would encompass all verbal communications and, as such, we question the need for such definition. The definition of "three-part communication" may be viewed as accurate and consistent with the work that has been done and substantially progressed through two other SDTs, we believe the RC SDT requirement, which includes "and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings", is more complete. Again, we believe the term "Interoperability Communication" contradicts this work and creates confusion within the industry. It appears to mandate 3-part communication during operational strategic discussions, as well as other "non-action" oriented communications. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion.

Disagree
The SDT expanded Requirement R18 of TOP-002-2 by adding the term "equipment". This Requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the use of three-part communication protocol until the message has been correctly spoken and understood. LSEs and TSPs do not own or operate equipment, and as such in a market environment should not fall under the mandates of this requirement. Neither the TSP nor the LSE provide or receive information about specific lines or equipment in real-time. Therefore, requirement R7 should not apply to them absent clear evidence that a realistic (not hypothetical) threat to reliability would exist if they are omitted. We do not think that such a threat would exist.
Disagree
This proposed communication protocol is redundant to Requirements R2-R7, and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Results-based Reliability Standard Ad Hoc Working Group recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard.
Disagree
It is not clear what value there is in identifying alert levels since there does not appear to be any differentiation in actions taken based on the alert levels. Additionally, it has been our experience of during the field-test of these Alert Levels, that there are inconsistencies in when to implement various stages of Alerts and, we believe, this introduces more confusion than exists today.
Disagree
There is no reliability need to use Central Standard Time (CST) a common time zone for communications. Eastern Standard Time (EST) is used in New England and within the NPCC region. Converting to a different time zone will be confusing to the operators and the field personnel. The time zone that will be used should be agreed between each operating entity. This should only impact those entities that cross two time zones. If NERC or a Region were to perform an investigation that involves entities across the eastern interconnection, it would be appropriate for the investigation team to request data using a specific time zone.
Disagree
Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions, or during operational strategic discussions as well as other "non-action" oriented communications. This Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. This Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. The work being done by the RC SDT and RTO SDT in Project 2006-06 defines a Reliability Directive based on the determination of the person giving such an order. The entity that needs the action to be taken should establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, auditable, and measurable.
Disagree
Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word "Zebra" instead of "Zulu" to signify the letter "Z"? And, why would this be enforceable. Perhaps this should be a guideline document rather than an enforceable Requirement. There is no reliability need for this Requirement.
Agree

Disagree
If one of the goals is consistent communications, why would the standard require each Entity to develop a separate CPOP? For consistency, shouldn't the Reliability Coordinator develop the CPOP (with input from the other Entities) and all other Entities within the RC's area adopt it?
Agree
Disagree
We believe that any time zone can be used as long as the parties come to a common understanding of time through communication. Also, if an Entity mistakenly starts off a conversation using a time other than Central Standard Time, but corrects themselves during the 3-part communication process, is that a violation? We believe not, that as long as the communicating entities come to a common understanding of time, there is no violation. More clarity on this is desired. We assume such opportunity to correct mistakes is present throughout the standard and the language of the standard ought to reflect that. A high VRF is not appropriate, especially if the parties involved in the communication have a common understanding of the time, who cares what time zone?
Agree
The word "directive" is ambiguous. The standard should either require the Reliability Coordinator to define a "directive" or the standard should make this a defined term so that there is clarity between what is and what is not a directive. In fact, the "disposition" does state that "Reliability Directive" definition is in the scope of the SDT's effort. We do not think that this merits an increase from a "Medium" VRF in COM-002-2 R2 to a "High" VRF in this standard, especially if the actual action taken was in accordance with the direction given.
Disagree
How strict are the NATO pronunciations? E.g., "Uniform" is designated as pronouncing the "i" as a long "ee", most people I know do not do that. Similarly, there are multiple pronunciations of "Quebec", "Sierra", "Victor", "Three", "Four", "Five", and "Nine" to name a few, yet one pronunciation is specified. We presume that if the wrong pronunciation is used in the current draft of the standard, there would be a violation, currently at a high risk factor and high severity level, which seems rather severe. FMPA suggests that the SDT revisit this with an eye towards at least not penalizing someone for saying "five" instead of "fife", and possibly with an eye towards saying "'f" as in 'frank'" is OK, rather than being strict with NATO nomenclature.
Agree
For clarity, a NERC Glossary defined term is more appropriate than "line or equipment" identifiers, such as "Facility" or "Element" identifiers. A VRF of "High" is not appropriate. Note that TOP-002-2, R18, which this requirement retires, was "Medium".
Agree
(FMPA assumes that commenting "agree" means "yes, we have suggestions for improvement") It seems that the first two tables on Physical and Cyber Emergency Alerts are nearly identical. Why not combine them? On the third table on IROLs, are IROLs the only emergencies, e.g., how about a capacity / energy emergency? Shouldn't that be in a table as well?
Disagree
(FMPA assumes "disagree" means that we are not aware of any regional variances)
Disagree
(FMPA assumes that "Disagree" means that we are not aware of any conflicts)
Agree
(FMPA assumes that "Agree" means "Yes, we do have other comments) The Violation Risk Factor for R2 should be "Low", not "High". It is administrative in nature. The Measures make the types of evidence an "or" statement, e.g., "(e)vidence may include ... voice recording, transcripts, operating logs, OR on site observations" (emphasis added). The Data Retention section seems to make evidence an "and" statement, e.g., "Each ... (Responsible Entity) shall retain ... dated operator logs for the most recent 12 months AND voice recordings or transcripts ... for ... 3 months" (emphasis added). These statements are inconsistent with each other and both ought to be "or" statements. Due to the variability of the length of a month, data retention ought to be expressed in days rather than months, e.g., 90 days instead of 3 months. Why is the Transmission Owner included in the applicability of the standard? What "Interoperability Communications" are they involved with? If the

Transmission Owner is included, why isn't the Generation Owner? Explain the inconsistent treatment of Transmission Owners and Generator Owners. R3 – what if an entity starts to communicate in a language other than English, but, as part of the 3 part communication process changes to English and completes all steps of 3-part communication in English, is that entity non-compliant or compliant? How should EOP-001-0, R4.1 coordinate with COM-003-1? Should EOP-001-0, R4.1 focus on internal Entity communications?

Individual

Darcy O'Connell

California Independent System Operator

Disagree

Three-Part Communications: There is no leeway given if the "intent" of the information is repeated back correctly. If the initiating party mispronounces a word and the receiver does not, is it a violation? Also there is a possibility of delaying actions due to multiple repeat backs while attempting to repeat back verbatim. The air traffic control /pilot communications could be held up as the current best practice standard in critical communications, and utilizing three-part techniques... and they do NOT use verbatim word-for-word repeat. Rather the messages are often truncated, but still indicate an understanding of the message. Interoperability Communication: The proposed definition does not distinguish between internal and external entities. A more specific term than entity is needed here for clarity. With no more guidance than provided, a Generation Dispatcher may be considered a separate entity than the Transmission Dispatcher in the same room. As proposed the definition opens the doors for wildly different interpretations. We think this term, in this usage, applies to communication between companies, but we are not sure. Interoperability Communication is a bit of an unconventional use of the word interoperability. The standard strives to ensure communication protocols ensure interoperability. Communication Interoperability normally in usage, refers to the ability of dissimilar systems to exchange data. Its use here is unnecessarily confusing. It's a rather messy way of saying, inter-company communication.

Agree

Disagree

CAISO Comment; The requirement does not distinguish between intra and inter communications. Even though the proposed definition of "Interoperability Communications" is between two "entities", how will an auditor interpret it? Will this be taken to the extreme and be required to address communications between two different functions within one organization? For example, between the generation desk and the scheduling desk? How important is this plan? This requirement has a low Violation Risk Factor while the individual requirements that makeup the plan have High Violation Risk Factors. Furthermore, the Violation Security Levels do not address failure to follow the protocol in the plan. Based on the VFR and VSL, it is easy to conclude this plan does little in supporting an adequate level of reliability.

Disagree

CAISO Comments; Regarding CEA; CIP-002 requires responsible entities to identify their cyber assets and critical cyber assets. This requirement does not address any identification and requires responsible entities to declare emergency conditions for non-critical assets. How does this provide an adequate level of reliability? What technical justification did the SDT use in determining an actual or imminent cyber or physical threat to any BES generating facility, substation, or transmission line constitute an emergency declaration? Regarding PSEA and CEA; This requirement does not provide an adequate level of reliability. As a general statement, receiving notification from the RC stating XXXX BA has identified (actual or imminent) physical or cyber threats affecting 1 or 999 control center(s), generating facility(ies), substation(s), or transmission line(s) close to your jurisdiction would provide an adequate level of reliability compared to XXXX BA has declared a PSEA or CEA condition ORANGE. Why is the SDT promoting requirements that reduce reliability and dumb-down communications? Is this the correct standard to add a requirement such as this? Physical and Cyber threats are addressed in the CIP standards and emergencies are addressed in the EOP standards. Both require notification so why include it in a COM standard? Is there a possibility of double jeopardy between this requirement and CIP requirements? If this requirement must be included, Per attachment 1 – COM-003-1 (PSEA and CEA section) the Reliability Coordinator is the only responsible entity with any defined actions. It is suggested the SDT remove the BA, TO, TOP, GO,

TSP, LSE, and DP due to lack of applicability. The same entities should be removed from the measure (M2) also. Until "soft words" such as "threat" and "sabotage" are defined or clarity is provided the industry should not be proposing standards based upon them. Regarding TEA; What technical justification did the SDT use in determining that notifying all BA, DP, GOP, TOP, and TO in the RC area of a possible IROL violation provides an adequate level of reliability? There are no associated actions for the BA, DP, GOP, TO, and TOP to perform upon notification so what is the purpose of this requirement? The Alert Level Guide is still in the test phase; does not the Alert Level Guide need to be approved prior to any standard which references the guide be approved?  
Comments: Per attachment 1 – COM-003-1 the Reliability Coordinator is the only responsible entity with any actions. Suggest removing BA, TO, TOP, GO, TSP, LSE, and DP. Or assign them actions. The same entities should be removed from the measure (M2) also.

Disagree

CAISO Comments; Any standardization of time zones, in order to enhance reliability or reduce costs would use GMT as the reference zone in our opinion. The use of Central Standard Time is problematic because some months of the year other time zones would be at the same time as CST (Eastern Daylight Savings Time) and others not. Adopting systems that require system operators to sometimes operate in a time zone that is not their own local time and sometimes to operate in a time zone that is equivalent to their own local time is standardization that is not actually standard. How does using Central Standard Time for all verbal and written communication improve or support reliability? The SDT needs to explain how this requirement provides an adequate level of reliability for real-time operations for any entity operating outside the Central Standard Time Zone.

Disagree

CAISO Comments: Until "directive" is a defined term the industry should not accept requirements governing actions regarding directives. Directive is currently being defined in an interpretation. Subsequent interpretations may subvert the standards drafting process. Terms should be formally defined before inclusion in other standards to prevent future interpretation issues, including the changing of a standard outside of the accepted Standard Development process.

Disagree

This requirement is a best practice. Maybe the standardized alpha-numeric communication is something that companies should be required to train their personnel on, maybe it could even be a requirement of their CharliePapaOscarPapa. As this requirement is literally written a system operator who used the word 'cat' instead of the word 'charlie' when giving a directive would violate a sanctionable standard with a VRF of 'High' and a VSL of 'Severe'.

Disagree

CAISO Comments; This Requirement is problematic as it doesn't actually steer towards standardization. It mandates that companies have potentially scores of agreements agreeing on terms with each party it interacts with, all of which may be different. It ensures the system operator will spend more time ensuring terminology is correct for a given inter-company communication and once again, less time actually reliably operating the system. Standardization can only occur in a meaningful manner at very minimum, the interconnection level. Also the language in the VSL section uses "mutually understood", which the CAISO supports as opposed to the requirement and measure use "mutually agreed upon". Mutually agreed upon is overly prescriptive.

CAISO Comments; Information regarding the Alert Level Guide field test has not been widely circulated and unproductive as of late. Does not the Alert Level Guide need to be approved prior to any standard which references the guide be approved? What was the outcome of the field testing? Was reliability enhanced? Attachment 1 describes 'normal, alert, and emergency operating conditions', then goes on to never use those terms again in any meaningful manner. To further confuse it then mixes color coding of steps with levels. Which is it, Condition Red or Level 3? The attachment directs Reliability Coordinators to make vague notifications to the functional entities in its footprint. It directs Reliability Coordinators to make these vague notifications to entities that do not use, in our case the WECCNet. Is it really anticipated that the Reliability Coordinator calling on the telephone every DSP in its footprint with a vague notification will be an enhancement to reliability?

Agree

CAISO Comments; The proposed requirement R7 will cause regions operating in any time zone other than Central to draft regional standards to avoid this non-reliability supporting requirement.

Disagree
Agree
The Drafting team should take a hard look at the VRFs and VSLs established in this standard and contrast them against VRFs and VSLs for other adopted standards. We do not feel, as an example, that the use of Spanish in a normal communication between two companies, while improper, should carry a VRF of 'high' with a VSL of 'severe'. The draft standard focuses too much attention on prescriptive remedy than ensuring understanding.

Agree
Agree
Agree
Disagree
It's very confusing to refer to each condition using a color and/or a level number. In other areas, we are accustomed to using Alert Levels (ie. EEA states). The color designation seems to throw in an unnecessary element that doesn't add any value.
Disagree
This could be a potential problem since Operators will need to communicate with field personnel and local utilities in their local applicable time zone. It could be confusing to communicate by referring to a different time zone in other instances. It seems like it would make more sense to require that the time zone being used in a communication must be specifically and clearly referred to and identified. It doesn't matter so much WHICH time zone is used, it just matters that everyone understands which one is being used.
Agree
Disagree
Not everyone is familiar with the NATO phonetic alphabet, so it would be another thing for operators to have to memorize, or to always have in front of them to refer to.

PSE agrees in the consolidation of communication type activities into one standards, however the blanket addition of the TSP and LSE across all requirements doesn't seem appropriate. Additional

thought should be given in the potential for these two entities to participate in the communication activities contemplated by each requirement, rather than incorporating them wholesale. For example, a quick search on the term "directive" in the current set of standards indicated that neither Transmission Service Providers or Load Serving Entities (or even some of the other entities covered by the proposed standard) are likely to issue directives under the requirements of those standards, so is it appropriate to subject them to the requirements of Requirement 5?

Disagree

As discussed in Question 2, further consideration should be given to whether it is appropriate to include all the listed entities in this requirement. Additionally, the phrase "is not limited to" should be removed from the last sentence of the proposed requirement. The standard should specifically spell out what should be included in the CPOP. This phrase would lead to confusion about what an entity must include in the CPOP and is likely to result in inconsistent enforcement of the requirement. Also R1 appears to require a CPOP that will be used by personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. It is unclear if this specificity in who has to follow this extends to R2-R7 as well(while as noted the CPOP has to include elements of R2-R7). Without that clarity, the aspects of R2-R7 could seeming extend to communication between non-critical personnel regarding non-critical information. In addition, it appears that each of these entities must develop their own CPOP with clarity how the protocol gets vetted so that it is effectively employed across the entities. Finally, when reviewing the Functional Model document and it's discussion of tasks and relationships to other entities, it is unclear why the TO is included in the applicability as they perform no real-time functions and provide no real time information.

Disagree

This requirement, along with the associated M2, will be almost impossible to substantiate for audit purposes. For example, would an entity be required to present, and an auditor be required to listen to, voice recorder records for the data retention time? It is difficult to image another way to prove an entity complied with this requirement. Further the statement "as defined in Attachment 1" implies a set of definitions can be found and yet Attachment 1 is not structured in such that way. Is the system condition terminology just the terms "condition yellow", "condition orange", and "condition red". The procedural and time aspects described in this attachment creates confusion as to whether compliance is required under this standard or a different one. Suggest, more simplified presentation of definitions or glossary for clarity. Finally the inclusion of "written" communications creates a question relative to real-time information or whether this is extending beyond that timeframe. Most real time information sharing is verbal due to the urgency of it. Suggest removal of written.

Disagree

The requirement for common time zone should be at the descretion of the Reliability Coordinator in the respective region to determine. The conversion to CST has no apparent value. It would be much more reasonable to require communications related to time to include the time zone used in that communication. If common time zone across the nation is required it should only be imposed on the RCs as they would communicate with each other more readily than entities to other national entities. If an entity does not operate within the CST, the need to convert during periods of stress may increase the potential for error and reduce reliability.

Disagree

The requirement should use the NERC defined term "Reliability Directive," instead of the general term "directive."

Disagree

This requirement is too burdensome when compared to its benefits. The proposed requirement covers many different types of verbal communication and converts a useful communication protocol into mandatory requirement, which carries with it large potential penalties. Under this requirement, an operator's use of the phrase "M as in Mary" instead of "M as in Mike" would be violation of NERC reliability standards. The requirement for Three-Part Communications covers most of this ground in a much more useful fashion and ensures parties understand the information. The use of this protocol is a matter that should be left for entities to consider for inclusion in their CPOPs, but should not be a mandatory requirement to use the protocol. Further it is again assumed that based on R1, this information is related to real time. As well further examples of what a real time issuing of a

"notification" is and what "other realibilty related operation information would be needs to be specified.
Disagree
As discussed in Question 2, Requirement 18 should be removed from TOP-002-2 (or any successor standard) upon adoption of this standard if this requirement is included in this standard. Further the term mutually agreed implies that a discussion has occurred prior to the need to verbalize or write these types of communications. The additional specificity of "pre-determined" is duplicative or leads one to think there is formal guidance as to what the "identifier" should be. Remove "pre-determined". It also begs the question of timeframe which could bring interpretation issues during an audit.
Disagree
See discussion in Question 4. Also the attachment applies to Reliability Coordinators only, yet the requirement referencing the attachment applies to additional entities. Those entities should be removed from Requirement 2 or the attachment and Requirement 2 should be clarified to address what those additional entities' responsibilities are under the attachment.
I might suggest one for R4 by each region that is not in the Central Standard Time zone.

NERC Standards Review Subcommittee
Carol Gerou
Disagree
Concerning Three Part Communications: Please clarify by answering the following. Does the word "correctly" mean repeating back word for word or would paraphrasing the intent of the message received prove that the receiving party understands the intent and specific action of what they are required to accomplish? Please verify that Three Part Communications will be required when issuing directives related to emergency situations, and not every time communications is required between two parties. We believe the proposed definition for the term "Interoperability Communication" is too broad and ambiguous. We recommend the following instead: "Communication between two or more Functional Entities (not within the same organization) to exchange reliability-related information to be used by the entities to change the state or status of Facilities of the Bulk Electric System." The inclusion of the terms "Functional Entities" and "Facilities" removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC's Glossary) In addition, the inclusion of the phrase "not within the same organization" clarifies that the focus of definition is to address communication between different Functional Entities. The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it. We believe there should be a definition added for "Directive" as orders given in an emergency situation. Directive, as currently used in the industry, is understood to mean an emergency situation and the party issuing the "Directive" states as such, so everyone knows it is an emergency situation. In the "Disposition of Requirements identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement" document included with the proposed standard, it is stated that COM-002-2, R2 is being modified in Project 2006-06 to include a new definition for "Reliability Directive" and that it is to be included in the NERC Glossary. It also states that when it is completed, it will be moved into COM-003-1 and COM-002-3 will be deleted. It is our opinion that the definition of Reliability Directive must be included in the review and approval of COM-003-1, as it is central to many of the actions to be

taken. We understand that the SDT is working closely with the Drafting Team working on Project 2006-06 and believe that this team needs to use the term "Reliability Directive" as a replacement for the term "directive" which is in the current version of COM-003-1. The Drafting Team working on Project 2006-06 has defined Reliability Directive as: "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency." The NSRS recommends use of this definition and the term "Reliability Directive" as opposed to "directive".

Disagree

TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. We believe the requirement should require the exchange of line identifiers but not impose that they be mutually agreed upon. This requirement represents a "how" and not a "what". In general, standards should be focused on "what" not how.

Disagree

We request that R1 be rewritten for real time operation of elements and facilities connected to the BES. Based upon the concerns that we have with Requirements R2-R7 we would not support this requirement. We would support requirement R1 if it stopped after the first sentence and then merely listed the minimum requirements that should be included in the Procedure such as; (1) time zone, (2) language spoken, (3) when phonetic alphabet will be used, etc.. This will allow the Entities to draft their own CPOP per the intent of the requirement and avoid the concerns that we have documented for the remainder of the requirements. Reliability Standards are supposed to describe "What" is required, not "How" compliance would be achieved. We believe this proposed Reliability Standard describes more the the "How", and is contrary to the Results Based Standards Initiative being implemented by NERC. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force's recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We – and the industry as a whole based on the response to the Task Force – do not support such an approach. We suggest deleting this Requirement from the Standard. The CPOP should only apply to verbal communications. It could be implied that written communications (switching order affecting the BES) must have a CPOP, which would essentially be a writing guide procedure for how to write a procedure. The CPOP would need to be developed for each entity on how to write a CPOP and all the requirements contained in this draft standard. Every entity has unique switching instruction templates that have been developed over time in negotiations with unions, third-parties, etc, which have detailed procedures for their use. Requiring the use of a CPOP on top of that is adding additional complexity that adds nothing to the reliability of the BES.

Disagree

The attachment only applies to the RC. We recommend R2 state that the RC shall use pre-determined system condition terminology and the BA, DP, GOP, TOP, and TO shall follow orders and directives unless such acts violate safety, etc. Either the attachment should be changed or the requirement should be changed for accurate accountabilities.

Disagree

We believe that requiring the use of Central Standard Time (CST) in the Operating Arena (Real-Time) would reduce the level of reliability on a real-time basis. We understand that one of the primary reasons for going to one time zone is to aid in Event Analysis. It is our belief that during the analysis of an event, there is adequate time to make the necessary adjustments for time zones. The Group performing the analysis could require all data being submitted be in one time zone as the basis. Requiring the use of CST is an added burden to the Operations Staff in real-time that does not help them.

Disagree

Without defining "directive" the SDT is leaving the industry in the same situation we are currently in. As discussed in the response to Question #1 above, it is our opinion that the definition of Reliability Directive must be developed and included in the discussion of this standard (COM-003-1), and should be as defined in Project 2006-06: "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.". Based on the definition of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT which would define a directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable.

Disagree

The required use of the phonetic alphabet should be documented in the Entities CPOP per our comments to question #3. While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through enforceable requirements. All information passed by a NERC Certified System operator falls under the scope of Requirement 6: "directives, notifications, directions, instructions, orders or other reliability related operating information". Based on that definition, all communication would fall under this Requirement. The NATO phonetic alphabet does not allow for the use of numbers ten and beyond. An entity WOULD be found non compliant for saying "open switch fourteen bravo". We do not believe this is reasonable as it adds nothing to the reliability of the BES is too prescriptive and all encompassing and could potentially confuse or slow down the communication process. We recommend that use of the NATO phonetic alphabet be included in the NERC operator certification training program and removed from this standard. As we recommended above, the term "directive" should be replaced with "Reliability Directive".

Disagree

Field personnel may not have access to the predetermined agreed to line and equipment identifiers. Requiring universal use of these identifiers could lead to confusion with field personnel within and between companies. This could lead to a decrease in the reliability and safety of the BES. As written R7 is expanding the requirement for agreed upon identifiers. We believe it is not necessary or required to have agreed upon equipment identifiers between companies as long as the line identifiers have been agreed upon. TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003-1, R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. We believe the requirement should require the exchange of line identifiers but not impose that they be mutually agreed upon.

Agree

As Attachment 1 is written it only applies to the RC and is a one-way communications path. The BA, DP, GOP, TOP, and TO are to be notified by the RC but the attachment doesn't state what they are to do with the information. COM-003-1, R1 states that the RC, BA, TO, TOP, GOP, TSP, LSE and DP are to have a CPOP with the elements in R2 through R7, which refer to Attachment 1. If Attachment 1 is applicable only to the RC, as we recommend, there is no reason to have the other Functions listed for Attachment 1. Requirement R2 and Measure M2 need to be revised to be applicable to the RC only. Attachment 1 makes reference to "Distribution Service Providers". There is no definition of a Distribution Service Provider in the NERC Functional Model, and we believe this should either be revised to Distribution Provider, or deleted entirely from the list.

Agree

If the Central Standard time zone is required as noted in R4, we believe there should be a regional variance to allow the WECC to select the time zone to use as a standard.
Agree
Attachment 1, Physical Security is a basis for the SAR for Project 2009-02, Disturbance and Sabotage reporting SDT.
Agree
Without "Directive" being defined, this proposed standard still leaves a huge area that will cause problems and issues within the industry. We believe the SDT should replace "directive" with "Reliability Directive" and use the definition developed in Project 20006-06: "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency." We believe Reliability Standard COM-003-1 is entirely too prescriptive, and is in actuality a procedure and not a standard. The Standard needs to focus on the "What" and not the "How". If the industry is going to truly embrace the Results Based Standards Initiative, this standard must be significantly revised to reflect that philosophy. We believe that the existing standard COM-002 is actually better than this standard. This standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.
Individual
Michael Gammon
Kansas City Power & Light
Disagree
The definition of Three-part Communication applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows: "A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it." The definition for Interoperability Communication is too broad. Currently, this could mean any communication of information. This should be confined to emergency or unusual operating conditions.
Disagree
Including "equipment" is too broad. This could mean anything and should be limited to transmission devices that could affect the reliable operation of the bulk electric system.
Disagree
This proposed communication protocol is redundant to Requirements R2-R7 and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions and using agreed upon terminology for switching equipment for bulk electric system.
Disagree
Attachment 1 should be removed from this standard. This is a duplication of the alerts by the NERC Alerts system and the EISAC. In addition, these are reliability standards and should deal with real-time and expected future reliability issues. Alerts are an inappropriate for this standard.
Disagree
There is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no additional reliability need to use a common time zone. The time zone should be identified in the communication. Use of CST will actually cause confusion and significant, unnecessary costs with no foreseeable reliability benefit. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc.
Agree

Agree
Disagree
Including "equipment" is too broad. This could mean anything and should be limited to transmission devices that could affect the reliable operation of the bulk electric system.

## Consideration of Comments on Project 2007-02 Operating Personnel Communications Protocols — Standard COM-003-1

The Operating Personnel Communications Protocols Standard Drafting Team (OPCP SDT) thanks all commenters who submitted comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols Reliability Standard. This standard was posted for a 45-day public comment period from November 30, 2009 through January 15, 2010. Stakeholders were asked to provide feedback on the standard through a special electronic comment form. There were 71 sets of comments submitted, including comments from more than 280 different people from over 100 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404 446 2563 or at [Herb.Schrayshuen@nerc.net](mailto:Herb.Schrayshuen@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary Consideration:

The majority of commenters expressed disagreement with the standard.

### Definitions:

Most commenters found the proposed definitions confusing. The SDT has removed all three definitions (Communications Protocol, Three-part Communication and Interoperability Communication).

- The term “Three-Part Communications” was subsumed into Requirements R2 and R3 in the revised standard.
- The OPCP SDT changed “Interoperability Communications” to become “Operating Communications,” which is now defined as: “Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.”

The OPCP SDT also addressed complaints stating it was unclear if “Interoperability Communication” included internal communication (communication between functional entities of the same organization), external communication (communication between two or more Functional Entities not within the same organization), or both.

“Operating Communication”, the proposed definition to replace “Interoperability Communication,” addresses changes in state, status, output, or input of any Element or Facility, capturing all communication that affects BES reliability. The term “Operating Communication” includes any communication that is requesting a change to the BES, regardless of whether the communicators are internal or external.

---

<sup>1</sup> The appeals process is in the Standard Processes Manual:  
[http://www.nerc.com/files/Appendix\\_3A\\_Standard\\_Processes\\_Manual\\_Rev%201\\_20110825.pdf](http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_Rev%201_20110825.pdf).

**Requirements:**

*Requirement R1 (required entities to have a Communications Protocol Operating Procedure):*

- The majority of the comments stated a Communications Protocol Operating Procedure (CPOP) would be administrative in nature and would not satisfy the criterion of enhancing the reliable operation of the BES. The SDT has removed it from the revised standard.

*Requirement R2 (required entities to use pre-defined system condition terminology for verbal and written Interoperability Communications as defined in an Attachment)*

- Many commenters indicated Requirement R2 should not have been applicable to TSPs and LSEs. The SDT removed TSPs and LSEs from the standard to be consistent with the approved SAR.
- Many commenters indicated that the scope (involving all Interoperability Communications) of the requirement was too broad.
- Several commenters indicated that the focus of this requirement was confusing and mixed guidance with requirements.
- Several commenters proposed expanding the table of alerts to include the alerts from EOP-002 – Capacity and Energy Emergencies.
- Several commenters indicated that this requirement is calling for entities to make notifications, and take actions under specific conditions, and belongs in other standards.
- The SDT determined that the notifications in the proposed requirement are not “communications protocols” and do not belong in COM-003 and removed the requirement from the revised standard.

*Requirement R3 (required entities to use English language for all Interoperability Communications)*

- Some commenters indicated that there are some places where there are legal requirements to use a language other than English. The SDT modified the standard (now Requirement R1, Part 1.1.1) to clarify that this requirement is not applicable where another language is mandated by law or regulation:
  - 1.1.1 Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.

*Requirement R4 (required entities to use Central Standard Time (24 hour format) for all Interoperability Communications)*

- The majority of commenters stated Requirement R4 would add confusion for the operators and decrease reliability. Some recommend the use of another time in place of Central Standard Time. The SDT modified the standard to require use of the 24 hour format (new 1.1.2) in all Operating Communications and the inclusion of a time zone reference (new 1.1.3) only when Operating Communications occur between different time zones.

1.1.2. Use the 24-hour clock format when referring to clock times.

1.1.3. When the communication is between entities in different time zones, include the time, time zone and indicate whether time is daylight saving time or standard time.

*Requirement R5 (required entities to use Three-part Communications when issuing a directive during verbal Interoperability Communications)*

- Many commenters offered differing recommendations on R5 regarding the application and Definition of “Reliability Directive.” The proposed term “Reliability Directive” is being developed by the RC SDT for Project 2006-06. The SDT avoided use of the terms, “directive” and “Reliability Directive” in the second draft of COM-003.
- Many commenters recommended splitting proposed Requirement R5 to recognize the two distinct parties (sending and receiving) in the three part communication process. The OPCP SDT has done so by separating what had been Requirement R5 into R2 (for the sender) and Requirement R3 (for the receiver). Together these two requirements fully assign the responsibility to accomplish three-part communication.
- Some commenters expressed concerns regarding potential audit citations if a repeat-back was not word-for-word or verbatim. The OPCP SDT added the phrase “not necessarily verbatim” to address the concern. In other words as long as the communication is clear and accurately conveys the Operating Communication and its substantive components, it is acceptable.

**R2.** Each Reliability Coordinator, Transmission Operator and Balancing Authority that issues an oral, two party, person-to-person Operating Communication; excluding Reliability Directives shall: *[Violation Risk Factor: Medium][Time Horizon: Real-Time]*

**2.1.** Issue the Operating Communication and wait for a response from the receiver.

**2.2.** After a response is received , or if no response is received, do one of the following:

- Confirm the receiver’s response, if the repeated information is correct (not necessarily verbatim).
- Reissue the Operating Communication if the repeated information is incorrect, or the issuer does not receive a response.
- Reissue the Operating Communication if requested by the receiver.

**R3.** Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider that receives an oral two party, person-to-person Operating Communication excluding Reliability Directives , shall take one of the following actions:

- Repeat the Operating Communication, (not necessarily verbatim) and wait for confirmation from the issuer that the repetition was correct.
- Request that the issuer reissue the Operating Communication.

*Requirement R6 (required entities to use the NATO alphabet during verbal Interoperability Communications)*

- Many commenters indicated the use of a phonetic alphabet is not necessary and should not be required, as it will not improve reliability of the BES and that there are no instances where the absence of its use has resulting in reliability problems. The SDT disagrees with this comment and believes that enhanced clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.
- Commenters stated that requiring strict adherence to and precise pronunciation of the NATO phonetic alphabet is overly prescriptive, and the proposed standard should allow for other phonetic clarifiers where clarity on alpha-numeric information is necessary. The SDT agrees, and modified the Requirement to allow for use of the any correct alpha numeric clarifier. The revised language was moved into Requirement R1, as Part 1.2.

1.2 When participating in oral Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.<sup>2</sup>

*Requirement R7 (required entities to use pre-determined, mutually agreed upon line and equipment identifiers for all Interoperability Communications)*

- Many commenters indicated Requirement R7 should not have been applicable to TSPs and LSEs. The SDT agrees, and has removed TSPs and LSEs from the standard to be consistent with the approved SAR.
- Additional commenters indicated the word “equipment” as used in Requirement R7 was too broad. The SDT modified the standard to use the defined terms “Element” and “Facility” instead of “equipment”.
- Other commenters indicated Requirement R7 addressed a planning function already included in TOP-002, and should not be included in COM-003. The drafting team believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT retained the concept of R7 and transferred it into Requirement R1, Part 1.1.4.
- There were additional comments that uniform and mutually agreed line and equipment identifiers should not be mandated so long as the identifiers are pre-determined. The SDT agrees documentation of mutual agreement is not necessary, so long as the identifiers are pre-determined, understood and used during Operating Communications. The standard has been modified to reflect this change.

---

<sup>2</sup>The North Atlantic Treaty Organization (NATO) Phonetic Alphabet or International Radiotelephony Spelling Alphabet is one example of a widely utilized set of alpha- numeric clarifiers.

- Commenters indicated a general consensus for the mandatory use of line and equipment identifiers applying only to interface Elements, not Elements or Facilities internal to the footprint of the entity. The SDT modified the standard to apply only to interface Elements and Facilities.
  - 1.1.4 When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission Element or Transmission Facility.

### Outstanding Minority Issues

Several stakeholders identified potential conflicts between COM-003 and work underway in Project 2006-06 – Reliability Coordination where another drafting team is also addressing the use of three-part communications. In Project 2006-06 the proposed requirements focus on the use of three part communication when issuing and receiving “Reliability Directives.” As proposed, a Reliability Directive is a directive issued to address an Emergency or an Adverse Reliability Impact. The OPCP SDT proposes use of three-part communication for all Operating Communications, which would include Reliability Directives. To prevent double jeopardy, the second draft of the Implementation Plan for COM-003 proposes retiring COM-002 when COM-003 becomes effective.

Some additional comments were received indicating the previously posted standard was too prescriptive in specifying “how” to communicate, instead of “what.” The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.

Commenters also indicated the proposed standard was unnecessary and would distract operators from reliably controlling the system. The SDT disagreed based on Blackout Task Force Report recommendation 26, which calls for tightening communication to improve reliability.

**Addendum:** As a result of the April 2012 Quality Review, the SDT adopted many changes that would impact many of the responses in this document. The SDT believes the QR recommendations provide clarity for the requirements and add discernible reliability value.

- A significant QR change is the addition of language excluding “Reliability Directives” from the scope of Operating Communications addressed in R2 and R3. The purpose of the exclusion is to prevent a potential overlap by requiring the use of three part communications in two different standards (COM 003-1 and COM 002-3). Thus, several of the responses in this report indicate that the term, “Reliability Directive” is not used in COM-003-2 and that is no longer true. Based on the need to distinguish between Reliability Directives (Operating Communications issued relative to an Emergency) and Operating Communications (Operating Communications issued anytime there is a need to communicate about maintenance or a change to an Element or Facility on the BES), Requirements R2 and R3 now include phrases to indicate they **do not apply** to “Reliability Directives”. Retention of the requirements for three-part communication in COM-002-3, recognizes that failure to effectively communicate during an Emergency has greater potential risk to reliability than a similar failure during other operating conditions. Thus noncompliance with three-part communication in COM-002-3 has a High VRF while as proposed, noncompliance with three part communications for

Operating Communications during other than Emergencies as proposed in COM-003-1 has a Medium VRF.

- The SDT believes the proposed definition: *Reliability Directive* is a subset of Operating Communication when the Reliability Directive is an instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. While Reliability Directives are excluded from COM 003-01, Requirements R2 and R3, Reliability Directives are subject to the protocols in Requirement R1.
- The SDT modified the implementation plan to omit the reference to retirement of COM-002-3.

## Index to Questions, Comments, and Responses

1. Do you agree with the adoption of the following new terms for inclusion in the NERC Glossary and their proposed definitions: Communications Protocol, Three-part Communication, and Interoperability Communication? If not, please explain in the comment area..... 22
2. The SDT incorporated TOP-002-2 Requirement R18 into this new standard COM-003-1 as Requirement R7. In TOP-002-2, Requirement R18 applies to the Transmission Service Provider and Load Serving Entity. These entities are now added to COM-003-1. Do you agree with this proposal? If not, please explain in the comment area..... 74
3. Requirement R1 of the draft COM-003-1 states, “Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall develop a written Communications Protocol Operating Procedure (CPOP) for Interoperability Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The CPOP shall include but is not limited to all elements described in Requirements R2 through R7 to ensure effective Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area..... 97
4. Requirement R2 of the draft COM-003-1 states, “Each Responsible Entity shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area..... 121
5. Requirement R4 of the draft COM-003-1 states, “Each Responsible Entity shall use Central Standard Time (24 hour format) as the common time zone for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area..... 145
6. Requirement R5 of the draft COM-003-1 states, “Each Responsible Entity shall use Three-part Communications when issuing a directive during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area. .... 169
7. Requirement R6 of the draft COM-003-1 states, “Each Responsible Entity shall use the North American Treaty Organization (NATO) phonetic alphabet as identified in Attachment 2-COM-003-1 when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area..... 199
8. Requirement R7 of the draft COM-003-1 states, “Each Responsible Entity shall use pre-determined, mutually agreed upon line and equipment identifiers during for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area..... 226

9. Attachment 1-COM-003-1 is based upon work performed by the Reliability Coordinator Working Group (RCWG). Do you have any concerns or suggestions for improvement of the attachment? If yes, please provide in the comment area. (If you are involved in the field testing of the Alert Level Guide please share any comments regarding the use of the guideline as it relates to the field test.)..... 246
10. Are you aware of any regional variances that would be required as a result of this standard? If yes, please identify the regional variance. .... 269
11. Are you aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement? If yes, please identify the conflict. .... 279
12. Do you have any other comments to improve the draft standard? If yes, please elaborate in the comment area..... 292

**Consideration of Comments on OPCP SDT — Project 2007-02**

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the adoption of the following new terms for inclusion in the NERC Glossary and their proposed definitions: Communications Protocol, Three-part Communication, and Interoperability Communication? If not, please explain in the comment area.

**Summary Consideration:**

Most commenters who responded to this question indicated all three of the proposed definitions were confusing and had little bearing on improving communication clarity. The SDT has removed all 3 definitions.

Based on these comments, the SDT deleted the term “Three-Part Communications” but will be covered in the requirements (R2 and R3) of second draft of the standard.

The OPCP SDT deleted “Interoperability Communications” and replaced it with “Operating Communications,” which is defined as:

“Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.”

The OPCP SDT also responded to comments that the definition of “Interoperability Communication” did not clearly indicate if it included internal communication (communication between functional entities of the same organization), external communication (communication between two or more functional entities not within the same organization), or both. The proposed definition of the new term “Operating Communication” includes communications that change or maintain the state, status, output, or input of any Element or Facility. As such, the term “Operating Communication” includes any communication that is requesting a change to the BES, regardless of whether the communicators are internal or external and regardless of whether the communications are oral or written.

Some commenters indicated concerned that the terms “facilities” and “elements,” were not capitalized in the proposed definition of Interoperability Communications. The defined terms “Facility” and “Element” are capitalized in the new proposed definition of Operating Communication.

The term “Communication Protocol” was never specifically mentioned in the standard so the SDT has eliminated it from the second draft of the standard.

Organization	Yes or No	Question 1 Comment
British Columbia Transmission	Agree	

Consideration of Comments on OPCP SDT — Project 2007-02

Organization	Yes or No	Question 1 Comment
Corporation		
Bureau of Reclamation	Agree	
ExxonMobil Research and Engineering	Agree	
NextEra Energy Resources, LLC	Agree	
NorthWestern Energy	Agree	
Oncor Electric Delivery	Agree	
PacifiCorp	Agree	
Puget Sound Energy	Agree	
South Carolina Electric and Gas	Agree	
Sunflower Electric Power Corporation	Agree	
Transmission Owner	Agree	
Western Area Power Administration	Agree	
Xcel Energy	Agree	
Washington City Light & Power	Disagree	
ATC and ITC	Disagree	ATC believes that the proposed definition for the term “Interoperability Communication” is too broad and

Organization	Yes or No	Question 1 Comment
		<p>ambiguous. We recommend the following: “Communication between two or more Functional Entities (not within the same organization) to exchange reliability-related information to be used by the entities to change the state or status of Facilities of the Bulk Electric System.” The inclusion of the terms “Functional Entities” and “Facilities” removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC’s Glossary) In addition, the inclusion of the phrase “not within the same organization” clarifies that the focus of definition is to address communication between different Functional Entities.</p> <p><b>Response: We agree with most of your comments. The SDT is eliminating the term “Interoperability Communications” because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p> <p>ATC understands that this Drafting Team is working closely with the Drafting Team working on Project 2006-06 and believes that this team needs to use the term “Reliability Directive” as a replacement for the term “directive” which is currently being used. The Drafting Team working on Project 2006-06 has defined Reliability Directive as: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.”</p> <p><b>Response: The current draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Bonneville Power Administration	Disagree	<p>BPA does not agree with the aspects of Interoperability Communications.</p> <p>We do not need a common time standard.</p> <p>Why use the NATO Standard. This could add a lot of time to a directive that needs to be given immediately.</p> <p>The 3 part communication is already used by BPA.</p>

Organization	Yes or No	Question 1 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>1. The SDT has eliminated the term Interoperability Communications.</b></p> <p><b>2 The SDT is proposing an alternative to a single time zone that should address your concern. In the second draft of the standard references to time zones are only required when those involved in the communication are in different time zones.</b></p> <p><b>3. The SDT is proposing the use of a correct alpha-numeric clarifier instead of explicitly requiring the use of the NATO phonetic alphabet, and does not agree that it would add an inordinate amount of time to communications.</b></p> <p><b>4 The SDT acknowledges BPA’s use of three-part communications.</b></p>		
Orange and Rockland Utilities, Inc.	Disagree	Clarification must be made to the definition "Interoperability Communication" and to the specific applicability of the term as it translates into the actions and functions both internal and external to the local TO.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT is eliminating the term Interoperability Communications because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p>		
Manitoba Hydro	Disagree	<p>Comments:</p> <p>Agree to the adoption, but not the definitions as defined.</p> <p>1. Communication Protocol - Remove “written” from this definition. Create a new standard that defines “written” protocol, i.e.: express “24 hour format”, common date format, etc.</p> <p><b>Response: “Communication Protocol” has been removed as a defined term. The SDT believes references to written protocols in some elements of the requirements are justified and these have been retained in the revised standard.</b></p> <p>a) Using “written” in this definition and which is also used in COM-003-1 R2, R3, R4 and R7 clouds both the Definition and the Standard. The majority of COM-003-1 requirements also focus on the spoken word, such as the use of English, Phonetics and Three-way Communication.</p> <p><b>Response: The SDT believes “written” is appropriate in some cases, and has chosen to retain it. Operating Communications can be “written” in some cases, and use of these protocols in those cases will add clarity.</b></p>

Organization	Yes or No	Question 1 Comment
		<p>b) “Communications” in the Definition infers verbal communication especially when examining the COM-003-1 Standard where its purpose is “timely information in alerts and emergencies”.</p> <p><b>Response: The SDT respectfully disagrees that “Communications” in the definition applies <u>solely</u> to verbal communication. The SDT has removed the proposed definition “Interoperability Communications” and proposes a new definition, “Operating Communication.” The requirements in the draft standard specify when protocols are required for written, oral or both types of communication.</b></p> <p>c) When COM-001-1 R4 “English” and COM-002-2 R2 “Three-way” requirements are amalgamated into COM-003-1, the COM-003-1 standard will now strengthen the focus on the process of verbal communications.</p> <p><b>Response: The SDT agrees with your comments.</b></p> <p>d) COM-003-1 R2 “Uniform Line Identifiers” This requirement would be used in real time reliability situations, alerts and emergencies. The “written” communications would be used after the fact and therefore “written” does not belong in the definition.</p> <p><b>Response: The SDT questions if you meant R7 instead of R2 as written. Nonetheless, the SDT believes utilizing uniform line identifiers for interface Elements/Facilities for both oral and written communications adds clarity and contributes to the accuracy of operating instructions.</b></p> <p>e) In COM-003-1 R3 “use English” The purpose of this standard is convey information effectively during alerts and emergencies. “Written” would be used after the fact and therefore does not belong here.</p> <p><b>Response: The SDT does not agree the purpose of this standard is to <u>only</u> convey information effectively during alerts and emergencies, and also does not agree that written communication is necessarily “after the fact” communication“. The revised standard requires English in both written and oral “Operating Communications” when communicating between functional entities, unless another language is mandated by law or regulation.</b></p> <p>f) In COM-003-1 R4 “24 hour format” “Written” could be reserved for a new standard, which could which define “24 hour format” along with a common date format which is also needed.</p> <p><b>Response: The SDT believes the requirement for use of 24 hour format should apply to both oral and written communication, and sees no need to create a separate standard. The term 24 hour format is commonly understood and does not require definition. With real-time communications, the SDT does not believe it is necessary to include a common date format.</b></p> <p>g) In COM-003-1 R5 “Three-part Communication” Focuses entirely on the spoken word and appears</p>

Organization	Yes or No	Question 1 Comment
		<p>appropriate that “written” is not used here.  <b>Response: The SDT agrees with the comment, and the revised draft standard clarifies that three part communication is only required for oral communication.</b></p> <p>h) In COM-003-1 R6 “Phonetics” Focus on the spoken word and would never be used to empathize a written word and is appropriate that is not used here.  <b>Response: The SDT agrees with your comment and has modified the standard to clearly indicate phonetic clarifiers are only required for oral communications.</b></p> <p>i) COM-003-1 R7 states “Operating State Levels” All communications for broadcasting these alerts would typically be verbal. “Written” communications would be after the fact.  <b>Response: The SDT believes that Operating State levels could be written or oral. Note, however, that based on stakeholder comments, the SDT has removed Requirement R2 from the second draft of the standard. In addition, written communication is not always after the fact.</b></p> <p>2. Three-part Communication - Use COM-002-2 R2 requirement as an improved basis for the “Three-part Communication” glossary term and define each part of the three parts separately.</p> <p>a) This new NERC Glossary term is better defined in the COM-002-2 R2 “Three-part communication” requirement.” Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall issue directives in a clear, concise, and definitive manner; shall ensure the recipient of the directive repeats the information back correctly; and shall acknowledge the response as correct or repeat the original statement to resolve any misunderstandings.”</p> <p>b) The current glossary term is overwhelming and confusing with the “back and forth” exchange of responsibilities. More thought process is consumed trying to break down the definition into usable portions, then comprehending the definition itself.</p> <p>c) The glossary term should be more clearly defined by specifying each of the three part communication protocol;</p> <p>i. An initiating party verbally issues directives in a clear, concise and definitive manner.</p>

Organization	Yes or No	Question 1 Comment
		<p>ii. The receiving party shall replicate the intent of the directive and</p> <p>iii. The initiating party shall acknowledge to their satisfaction that the receiving party fully understands and is</p> <p><b>c.</b></p> <p>capable of carrying out the directive.</p> <p><b>Response: The SDT has removed the definition for “Three-part Communication” from the second draft of the standard and has instead included the details of implementing three-part communication in Requirements R2 and R3 in the second draft of COM-003-1.</b></p> <p>3. Interoperability Communication - Define further and/or define entities. Expand “interoperability” and add and define “entity”</p> <p>a) Using “interoperability” and “entities” in same glossary term, clouds the definition especially when this glossary term is used to help clarify requirements in COM-003-1. There are at least three possible levels of “Interoperability” from a Control Center point of view;</p> <p>i. Internally, within a utility.-Communication between the Balancing Authority and Transmission for reliability purposes (within control center).-Between BA, TO, TOP, GO, TSP, LSE and DP, such as between the sending and receiving end of an HVDC terminal.</p> <p>ii. Externally, between neighbouring utilities.</p> <p>iii. Externally, between the Balancing Authority and their Reliability Coordinator. For a Reliability Coordinator two more levels of “Interoperability” could be added:</p> <p>iv. Communication between Reliability Organizations.</p> <p>v. Communication between the three major interconnections.</p> <p>b) Though the glossary definition surely includes all of the above, it does not clarify that and becomes immediately clouded when interpreting COM-003-1 R1 where “personnel” is used for real time control for effective Interoperability Communication.1. Personnel - individual responsible for the operation of the interconnected bulk electrical system (real time, planning, etc)c Adding and defining Entity in the glossary as per suggestions;</p> <p>i. “Entities” are used commonly in the Reliability Standards and encompasses a lot of different contexts.</p> <p>ii. “Entity” defined by a dictionary includes a comprehensive range such as:-body-Unit-Group-Thing-Article</p>

Organization	Yes or No	Question 1 Comment
		<p>iii. Entity in a interoperable power system:- BA, TO, GO, TSP, LSE, etc- Neighbouring BA, Control Area, Neighbour (Utility)- Reliability Coordinator, MISO, Reserve sharing Group, etc- NERC, MRO, WECC, NPCC, ERCOT, etc- Western Interconnection, Eastern Interconnection, ERCOT.</p> <p><b>Response: The SDT has eliminated the term “Interoperability Communications” because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>New York State Reliability Council</p>	<p>Disagree</p>	<p>Comments:</p> <p>NYSRC agrees with the definitions for Communication Protocol.</p> <p><b>Response: “Communication Protocol” has been removed as a definition as it was not used except in the title of the standard.</b></p> <p>NYSRC disagrees with the definition for Three-Part Communication. NYSRC prefers the process offered in COM-002-03 (draft). In COM-003 the listener must understand the communication the first time. Failure to understand and repeat back correctly could be a violation of the requirement. The intent three part communication is to have an iterative process whereby the person issuing the message is ultimately satisfied that the recipient understands the information and will perform the required action. It should not be defined as three steps and only three steps.</p> <p>NYSRC offers the following definition: A Real-Time Operating Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.</p> <p><b>Response: The SDT has removed the definition for “Three-part communication” and has included revised language for the protocol in the second draft of COM-003-1 Requirements R2 and R3. Requirements R2</b></p>

Organization	Yes or No	Question 1 Comment
		<p><b>and R3 in the second draft of the standard addresses your concerns.</b></p> <p>NYSRC disagrees with the definition of Interoperability Communication. NYSRC believes the Standard is addressing the communication of the Operating State of BES equipment and facilities. The proposed definition utilizes the phrase “change the state ... of a BES facility” which can be interpreted as the position, e.g. open, close, tap position, etc., thereby extending this Standard into routine switching and operation of the BES. The SAR stated this Standard was “to use specific communications protocols under normal, abnormal and emergency conditions to relay critical reliability-related information in a timely and effective manner”. The proposed definition can be interpreted in a manner that extends this to all reliability related information for every BES operation</p> <p><b>Response: The SDT has addressed your concerns by eliminating the term “Interoperability Communications” and revised the draft standard to include the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. However, please note the SDT believes that even routine switching could affect reliability if proper communications protocols are not used.</b></p> <p>The drafting team should also consider adding a definition for Directive or acknowledge the definition in draft Com-002-03.</p> <p><b>Response: The second draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our comments above.</b></p>		
NRECA RTF Members	Disagree	<p>Comments:</p> <p>We agree with the new terms for inclusion in the NERC Glossary.</p> <p>We are somewhat concerned that in this version of the draft standard there was no definition for “directive” included. We do understand that the term “directive” is no longer capitalized in this version of the standard, therefore, not required to be included in the NERC Glossary. Since several requirements of this draft standard require certain actions when a “directive” is issued, the term should be defined. It is necessary to</p>

Organization	Yes or No	Question 1 Comment
		define the term “directive” to ensure that just normal conversations between entities are not later “interpreted” to be a “directive”.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>Response: The second draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p>		
Pacific Northwest Small Utilities Comment Group	Disagree	Communication protocols extend beyond the verbal and written versions. How does the “non-routable (communication) protocol” of CIP-006 fit into or not fit into these definitions?
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT feels “non-routable (communication) protocol” of CIP-006 falls outside of the scope of the COM-003-1 standard, which deals with oral and written Operating Communications. If you feel it is within the scope, please elaborate.</b></p>		
Consumers Energy	Disagree	Communications Protocol and Three Part Communications have been used in the industry and are acceptable. There seems to be a better way of stating “informational” communications since Directives are already discussed.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees with your statements, and has revised the draft of COM-003-1 to eliminate the previous definitions. The SDT is proposing a new term, “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p>		
We Energies	Disagree	<p>Communications Protocol: This defined term appears only in the Three-part Communication definition and in titles. Titles are expected to be capitalized and are not necessarily the defined term. The COM-003-1 Standard title is “Operating Personnel Communications Protocols”, but the purpose is not restricted to verbal and written information, so “Communications Protocol” does not seem to refer to the defined term in this title. Similarly, it is not necessarily the defined term in CPOP. It is not clear where this definition is being utilized in the standard.</p> <p><b>Response: The SDT agrees and has removed the definition of “Communications Protocol.”</b></p>

Organization	Yes or No	Question 1 Comment
		<p>Three-Part Communication: Should be required for “Reliability Directives” only. It seems that this is currently being addressed, and could remain, in an updated version of COM-002-003. This should be coordinated between standards and duplication should be avoided.</p> <p><b>Response: The SDT disagrees that three-part communication should be used only for Reliability Directives. Miscommunications occur during routine operations and the impact on reliability can be the same. The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p> <p>Interoperability Communication: This definition is excessively broad, and the terminology “reliability related information” is ambiguous and vague. Communication is used elsewhere within the NERC Standards to include voice, data, email, memos, NERCnet, etc. Since communication of any type may be used to change the “state or status” of the Bulk Electric System, this definition seems to pertain to every communication in every form, which could be interpreted to include market information which is continuously used to drive changes to the “state or status”.</p> <p><b>Response: The SDT has eliminated the term “Interoperability Communication,” and replaced it with the term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p> <p>By extension, a CPOP would need to include every communication of any type (voice, data, email, memos, etc.), which is over-reaching and open to conflict with the CPOP’s developed independently by other entities. Interoperability Communications should apply only to situations covered in Attachment 1, and definitions should better reflect applicability to communications between separate, distinct entities (not communications within the same organization).</p> <p><b>Response: The SDT has removed the CPOP requirement and Interoperability Communication from the second version of the draft COM-003-1 standard.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		

Organization	Yes or No	Question 1 Comment
<p>MRO NERC Standards Review Subcommittee</p>	<p>Disagree</p>	<p>Concerning Three Part Communications: Please clarify by answering the following. Does the word “correctly” mean repeating back word for word or would paraphrasing the intent of the message received prove that the receiving party understands the intent and specific action of what they are required to accomplish?</p> <p><b>Response: The second draft of the Standard has been modified to address this by adding the phrase “not necessarily verbatim”.</b></p> <p>Please verify that Three Part Communications will be required when issuing directives related to emergency situations, and not every time communications is required between two parties.</p> <p><b>Response: In the second draft, three-part communication is required any time that verbal communication is intended to change or maintain the state or status of the BES.</b></p> <p>We believe the proposed definition for the term “Interoperability Communication” is too broad and ambiguous. We recommend the following instead:</p> <p>“Communication between two or more Functional Entities (not within the same organization) to exchange reliability-related information to be used by the entities to change the state or status of Facilities of the Bulk Electric System.”</p> <p>The inclusion of the terms “Functional Entities” and “Facilities” removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC’s Glossary) In addition, the inclusion of the phrase “not within the same organization” clarifies that the focus of definition is to address communication between different Functional Entities.</p> <p><b>Response: Your definition approximates the proposed definition of “Operating Communication” — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT believes flawed operating communication within the same organization can impact the reliability of the BES during normal operations. With this new definition of “Operating Communications” including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p>

Organization	Yes or No	Question 1 Comment
		<p>The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows:</p> <p>A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The protocol should be followed until the party issuing the information is satisfied that a party receiving the information has understood the communication and confirmed it.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft of COM-003. Those modifications incorporate many of your recommendations.</b></p> <p>We believe there should be a definition added for “Directive” as orders given in an emergency situation. Directive, as currently used in the industry, is understood to mean an emergency situation and the party issuing the “Directive” states as such, so everyone knows it is an emergency situation. In the “Disposition of Requirements identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement” document included with the proposed standard, it is stated that COM-002-2, R2 is being modified in Project 2006-06 to include a new definition for “Reliability Directive” and that it is to be included in the NERC Glossary. It also states that when it is completed, it will be moved into COM-003-1 and COM-002-3 will be deleted. It is our opinion that the definition of Reliability Directive must be included in the review and approval of COM-003-1, as it is central to many of the actions to be taken. We understand that the SDT is working closely with the Drafting Team working on Project 2006-06 and believe that this team needs to use the term “Reliability Directive” as a replacement for the term “directive” which is in the current version of COM-003-1. The Drafting Team working on Project 2006-06 has defined Reliability Directive as: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.” The NSRS recommends use</p>

Organization	Yes or No	Question 1 Comment
		<p>of this definition and the term “Reliability Directive” as opposed to “directive”.</p> <p><b>The second draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
E.ON U.S. LLC	Disagree	<p>For the Communication Protocol definition, please clarify if “written” includes electronic (email.) Change the definition of “Interoperability” to “Emergency” Entities should not be required to use 3 part communications on a routine basis, only on emergency issues.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft of the standard removes the proposed definition “Communications Protocol” and proposes a new definition for the term “Operating Communications” which will apply to all communications to alter or maintain the state of the BES. An email message is one example of written Operating Communications.</b></p> <p><b>The OPCP SDT disagrees with the concept of only requiring three part communication solely in emergency conditions. Mistakes due to poor communication can also occur during routine operations. Blackout Report Recommendation #26 states communication protocols should be tightened especially those for alerts and emergency communications, but does not recommend they be tightened <i>only</i> for alert and emergency conditions. FERC Order 693 P531 directed communication protocols be tightened, and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies,” but did not rule out improving all communications as a way of meeting the objective of the SAR. Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.”</b></p>		
American Electric Power	Disagree	<p>Given that Three-part Communications is required when using a directive, a “directive” must be clearly defined. Without this determination, the definitions are incomplete.</p> <p><b>Response: The second draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p> <p>There are undefined conditions, such as conference calls with multiple parties. Does each participant repeat back in three-part?</p>

Organization	Yes or No	Question 1 Comment
		<p><b>Response: The SDT clarified that the use of three-part communication is limited to instances involving oral, person-to-person communication.</b></p> <p>Also, the definitions do not address communication of directives that are made in a non-oral format. This is an important area to address in this standard.</p> <p><b>Response: The second draft of the standard provides clarity on which protocols apply to both written and oral Operating Communications and which protocols apply only to oral Operating Communications.</b></p> <p>Lastly, please expand “entities” in the Interoperability Communication definition to be “NERC registered functional entities.” We are concerned that the definition is much too broad and may expand the scope of required communication beyond alerts and emergencies.</p> <p><b>Response: The SDT is eliminating the term “Interoperability Communications” because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p> <p>The SDT is addressing more than just alerts and emergencies. Blackout Report Recommendation #26 states communication protocols should be tightened, “especially” those for alerts and emergency communications, but does not recommend they be tightened <i>only</i> for alert and emergency conditions. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies,” but did not rule out improving all communications as a way of meeting the objective of the SAR. Mishaps due to miscommunication can and do occur during routine operations, and have the potential to negatively impact reliability.</p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Great River Energy	Disagree	<p>GRE believes the proposed definition for the term Interoperability Communication is too broad and ambiguous. We recommend the following instead:</p> <p>Communication between two or more Functional Entities to exchange reliability-related information to be</p>

Organization	Yes or No	Question 1 Comment
		<p>used by the entities to change the state or status of Facilities of the Bulk Electric System.</p> <p>The inclusion of the terms Functional Entities and Facilities removes the ambiguity which we believe is contained in the proposed definition. (Both of these terms are defined in NERC’s Glossary)</p> <p><b>Response: Your definition approximates the new proposed definition of “Operating Communication” — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT believes flawed operating communication within the same organization can impact the reliability of the BES.</b></p> <p>The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct. We suggest the definition be revised as follows:</p> <p>A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct or corrected by the party who initiated the communication. The proposed definition can be interpreted in a manner that extends this to all reliability related information for every BES operation.</p> <p><b>Response: The definition for “Interoperability Communication” has been removed. The SDT believes flawed operating communication within the same organization and during normal or routine operations can detrimentally impact the reliability of the BES.</b></p> <p>The drafting team should also consider adding a definition for Directive or acknowledge the definition in draft Com-002-03.</p> <p><b>Response: The term Reliability Directive is being developed under NERC Project 2006-06 Reliability</b></p>

Organization	Yes or No	Question 1 Comment
		<p>Coordination. The current draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
NERC Staff	Disagree	<p>NERC staff recommends that the term “Communications Protocol” be removed from the definition section because the term is only used in the title and in another definition. In addition, the definition adds no additional clarity than can be provided by a commonly used definition of the terms.</p> <p><b>Response: The term “Communication Protocol” has been eliminated from the standard.</b></p> <p>Similarly, the term “Three-part Communication” can be removed since it is used in only one requirement, and the definition can be incorporated in the requirement.</p> <p>Furthermore, Three-part Communication refers to a process or procedure, not a term. NERC staff recommends that the term “Interoperability Communication” be modified to “Operating Communication” with the definition of “communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” This captures all communication that affects BES reliability, not just communication between function entities.</p> <p><b>Response: The proposed definitions in the previous draft have been removed and the new term “Operating Communications” has been proposed.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
PEF	Disagree	<p>PEF does not agree with the adoption of the proposed term “Interoperability Communication”. The term “Reliability Communication” should be used instead. The proposed term “Interoperability Communication” is defined such that it applies to a state or status change of an element or facility of the BES - but there are many reliability-related communications which do not necessarily apply to a state or status change.</p>
<p><b>Response: The SDT thanks you for your comments and your recommendation.</b></p> <p><b>The proposed term “Interoperability Communication” has been removed from the previous draft of the standard. Instead the SDT is proposing the new term “Operating Communications” to focus on the communications that change or maintain the state of the BES.</b></p>		
Pepco Holdings, Inc. -	Disagree	<p>PHI believes the proposed definition for the term Interoperability Communication is too broad and</p>

Organization	Yes or No	Question 1 Comment
Affiliates		<p>ambiguous. It is inconsistent with the effort to develop results based standards which would have an effect in the reliability of bulk electric system.</p> <p>Additionally, PHI does not see the need of a definition of Interoperability Communication now that the term Reliability Directive has been defined in draft standard COM-002-3 which is currently posted for review.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications” to focus on the communications that change or maintain the state of the BES.</b></p> <p><b>The SDT does not believe its work to be inconsistent with results-based principles. The Need or Problem Statement for this standard is that miscommunication can lead to action or inaction harmful to the reliability of BES. This was identified by the NERC President in his January 2011 report to the industry as one of the eight top priority issues for BPS reliability, and there are a number of events that have occurred in the past where miscommunication was a contributing factor to the event or exacerbated the severity of the event. The Goal, therefore, is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication. The key Objective to accomplish this Goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this Objective, and are risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</b></p> <p><b>The SDT believes the term Reliability Directives as defined in COM 002-03 does not fully address the range of miscommunication risks that could seriously impact the reliability of the BES.</b></p>		
American Municipal Power	Agree	Please define "directive" as a term.
<p><b>Response: The SDT thanks you for your comments. The second draft version of COM-003-1 does not use the terms “directive” or “Reliability Directive,” instead using the new term “Operating Communications.” The SDT is working to coordinate with Project 2006-06 to eliminate any potential conflicts between the standards.</b></p>		
The Empire District Electric Company	Disagree	<p>Replace the proposed COM-003-1 definition of "Thee-part Communication with what is used here:</p> <p>Three Part Communication: A communications protocol to be used when a Reliability Directive is initiated verbally, whereby the action to be taken is identified as a Reliability Directive; the recipient repeat the details of the Reliability Directive back to the issuer of the Reliability Directive; and the issuer acknowledges the</p>

Organization	Yes or No	Question 1 Comment
		<p>response from the recipient of the Reliability Directive as correct, or re-issues the Reliability Directive to resolve any misunderstanding.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft of COM-003. The new language incorporates much of your suggestion.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Southern Company Transmission	Disagree	<p>Southern Company supports the SERC SOS comments.</p> <p>SERC SOS comments: We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards. Adherence to such results-based standards would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability.</p> <p>The concern is that, since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties.</p> <p><b>Response: The SDT is eliminating the term Interoperability Communications because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p> <p><b>The SDT does not believe its work to be inconsistent with results-based principles. The Need or Problem Statement for this standard is that miscommunication can lead to action or inaction harmful to the reliability of BES. This was identified by the NERC President in his January 2011 report to the industry as one of the eight top priority issues for BPS reliability, and there are a number of events that have occurred in the past where miscommunication was a contributing factor to the event or exacerbated the severity of the event. The Goal, therefore, is to specify clear, formal and universally applied communication protocols</b></p>

Organization	Yes or No	Question 1 Comment
		<p>that reduce the possibility of miscommunication. The key Objective to accomplish this Goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this Objective, and are risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</p> <p>This group does not feel the need for a definition of Interoperability Communication, since the term Reliability Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process.</p> <p><b>Response: The SDT believes the term Reliability Directive as defined in COM 002-03 does not fully address the range of miscommunication risks that could seriously impact the reliability of the BES.</b></p> <p><b>The Need for this standard is that miscommunication can lead to action or inaction harmful to the reliability of BES, not just that miscommunications associated with emergencies can lead to action or inaction harmful to the reliability of BES. As such this standard is consistent with results-based principles. To the extent that entities feel actions or inactions caused by miscommunication have no ability to impact the reliability of the BES, then those entities simply disagree with the Need, but that does not indicate the standard is inconsistent with the results-based principles.</b></p> <p>In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state - repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft of COM-003. The requirement now also applies only to “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System</b></p>

Organization	Yes or No	Question 1 Comment
		<p>If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3.</p> <p><b>Response: The SDT agrees with this recommendation for consistency, however as envisioned, the requirements of COM-002-3 will be retired when the requirements of COM-003-1 become effective.</b></p> <p>Southern Company comments:</p> <p>Interoperability Communication - Communication between two or more entities to exchange reliability-related information regarding the Bulk Electric System. Why is a change in state or status required to make a communication between two entities an Interoperability Communication? What term should be used when a conference call is made to all of the RCs in an Interconnection to discuss low frequency?</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications” to focus on the communications that change or maintain the state of the BES.</b></p> <p><b>Conference calls and discussions to determine actions and options would not constitute Operating Communications if they do not directly request a change to, or maintain, the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Progress Energy Carolina, Inc	Disagree	<p>The definition for Interoperability Communication needs more clarification/an interpretation since the type of communications is not defined, the term "reliability-related information" undefined, and it may be so diluting as to de-emphasize true reliability directives.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications” to focus on the communications that change or maintain the state of the BES.</b></p>		
NYSEG	Disagree	<p>The definition for Interoperability Communication needs to be further explained. The current definition would appear to include not only communication between two control centers, but also between a control center and field personnel for all normal and routine switching, which we do not believe is the intent of the</p>

Organization	Yes or No	Question 1 Comment
		<p>Standard.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications” to focus on the communications that change or maintain the state of the BES. That definition would also extend to communication between two control centers, and between a control center and field personnel for all normal and routine switching to the extent it meets the criteria of the Operating Communications definition. Miscommunication during routine operations can result in mistakes that could seriously impact reliability on the BES.</b></p> <p>Communication Protocol as a separate definition does not appear to be necessary. The provided definition describes the term in a simple and generic way and is not specific enough to provide anymore guidance than is already provided in a general understanding of the word “communication” or “protocol”.</p> <p><b>Response: The SDT agrees and has removed the term.</b></p> <p>Three-part communication should be revised as follows:</p> <p>An iterative process where verbal communication from a sender to receiver is repeated back to the sender by the receiver to eventually ensure correct and accurate transmission of the entire message.</p> <p>We believe this definition is more consistent with COM-002 R2, which is proposed to be retired once COM-003-1 is approved and Three-part Communication is adopted.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft of COM-003. The new language incorporates the intent of your recommendation.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Ameren	Disagree	<p>The definition for three part implies the exact message must be repeated back. What should be said is the content must be repeated back in original or modified forms such that the originator is sure the recipient understands and can execute the action.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second</b></p>

Organization	Yes or No	Question 1 Comment
		<p><b>draft of COM-003. We have incorporated the language to not require a verbatim repeat-back.</b></p> <p>As far as Interoperability, what is state or status? Is the dispatch instruction to change from 500 MW to 505 MW such a communication? (which changed, state or status?)</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p><b>A dispatch instruction to change from 500 MW to 505 MW would be such a communication. The input or output on the system was changed in your example.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Entergy Services</p>	<p>Disagree</p>	<p>The definition for Three-part communication is deficient when compared with the requirements of the recently posted COM-002-3 which describes an iterative process in which the communicating party corrects the recipient in the situation where the repeated message contains inconsistencies. The party receiving the message will not always get the message right the first time.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft of COM-003. The new language incorporates the concept of iteration, and also includes the phrase, “not necessarily verbatim.”</b></p> <p>Also, Entergy does not believe that the introduction of the term Interoperability Communications is necessary. In the questions below, we identify specific ways that the requirements could be improved by including the term Reliability Directive as included in the recently posted COM-002-3. The term Interoperability Communications is very broad, covering both normal and emergency communications, creates a new category of communications without providing any real benefit to the industry.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the</b></p>

		<p><b>Bulk Electric System.</b></p> <p>The SDT believes the term Reliability Directives as defined in COM 002-03 does not fully address the range of miscommunication risks that could seriously impact the reliability of the BES.</p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Transmission System Operations	Disagree	<p>The definition of “Interoperability Communication” is not clear. What does the term “reliability-related” information entail? Does “Interoperability Communication” include instructions from a control room to a generator to adjust vars, from the control room to field personnel to direct the changing of transformer taps, from the control room to field personnel to implement switching instructions, etc? What is the definition of “entity”? Does this mean if switching instructions are given from a control room of one company to personnel in its own company (i.e., the same entity), that the interaction would not be classified as “Interoperability Communication”?</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. Each of your examples, if they direct a change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, will be subject to the protocols in COM 003 including three part communication.</p>		
Florida Municipal Power Agency (FMPA) and some members	Disagree	<p>The definition of Communications Protocol can be improved as: Policies and procedures that govern how verbal and written communication is exchanged.</p> <p><b>Response: The SDT agreed with the numerous comments that the term was not useful and eliminated it from the Standard.</b></p> <p>The definition of Three-part Communication could be improved by simplifying the language as: A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly by the party receiving the communication to the initiating party, and the same information is verbally confirmed to be correct by the initiating party.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second</b></p>

Organization	Yes or No	Question 1 Comment
		<p><b>draft of COM-003. The new language incorporates much of your suggestion.</b></p> <p>The definition of Interoperability Communication can be improved by using NERC Glossary of Terms definitions, e.g., Element and Facility ought to be capitalized in the definition, and the use of both Element and Facility is redundant and only the term Facility needs to be used since a Facility is essentially defined as a BES Element.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT has capitalized the terms “Element” and “Facility” as suggested, but elected to keep both terms in the definition. The NERC Glossary term Facility is not defined as a BES Element, but as “A set of electrical equipment that operates as a single Bulk Electric System Element.”</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Georgia Transmission Corp	Disagree	<p>The definition of Interoperability Communication is very broad and has no real benefit.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT eliminated the term “Interoperability Communications.” Instead, the SDT has revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has improved the standard to be clearer and less ambiguous.</b></p>		
Santee Cooper	Disagree	<p>The definition of Interoperability Communication needs to be clarified. What is the intent of the word “entities” in this definition? This definition may no longer be needed with the recent definition of a Reliability Directive.</p> <p>Three-part Communication should be required when issuing and receiving a Reliability Directive. This term has recently been defined by a SDT.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The proposed term “Interoperability Communication” has been removed from the standard. 		<p>"Interoperability Communication</p> <p>We recommend this definition be removed and be incorporated into the RCSDT's proposed definition of Reliability Directive. Please see our comments in Question 6 for a complete explanation.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p><b>Please see response to comments in Question 6 as well.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above</b></p>		
PPL	Disagree	<p>Three-part Communication is too prescriptive. How will “all call/blast” communications be handled? Also, it is unclear what communications are included in Interoperability Communication.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has eliminated the definition of three-part communication and has incorporated it into the language of Requirements R2 and R3 in the new draft. The language has been modified to be more flexible and support different scenarios. The SDT considered adding a requirement to address “all call” or “blast” communications but determined that a requirement is not necessary. As revised, the need to perform a “repeat back” of an Operating Communication is limited to oral person-to-person communications.</b></p>		
California Independent System Operator	Disagree	<p>Three-Part Communications:</p> <p>There is no leeway given if the “intent” of the information is repeated back correctly. If the initiating party mispronounces a word and the receiver does not, is it a violation?</p> <p>Also there is a possibility of delaying actions due to multiple repeat backs while attempting to repeat back verbatim. The air traffic control /pilot communications could be held up as the current best practice standard in critical communications, and utilizing three-part techniques... and they do NOT use verbatim word-for-word repeat. Rather the messages are often truncated, but still indicate an understanding of the message.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft</b></p>

Organization	Yes or No	Question 1 Comment
		<p>of COM-003. The SDT has also added language to applicable requirements to specify repeat-backs are not required to be verbatim.</p> <p>Interoperability Communication:                      The proposed definition does not distinguish between internal and external entities. A more specific term than entity is needed here for clarity. With no more guidance than provided, a Generation Dispatcher may be considered a separate entity than the Transmission Dispatcher in the same room. As proposed the definition opens the doors for wildly different interpretations. We think this term, in this usage, applies to communication between companies, but we are not sure.</p> <p><b>Response: We agree with your comments. The SDT is eliminating the term “Interoperability Communications” because of comments citing ambiguity. We have revised the draft standard by defining the new term “Operating Communications.” With this new definition including all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, the SDT believes it has removed any ambiguity over the utilization of communication protocols between or among Functional Entities in the same or in other organizations.</b></p> <p>Interoperability Communication is a bit of an unconventional use of the word interoperability. The standard strives to ensure communication protocols ensure interoperability. Communication Interoperability normally in usage, refers to the ability of dissimilar systems to exchange data. Its use here is unnecessarily confusing. It’s a rather messy way of saying, inter-company communication.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Electric Market Policy	Disagree	<p>We do not agree with the adaptation of the proposed term “Interoperability Communication”. As defined, it is limited to the communication of information to be used to change the state or status of a BES element or facility. That definition is too limiting in that there are many types of reliability-related information that need</p>

Organization	Yes or No	Question 1 Comment
		<p>to be clearly communicated that do not lead to changing the state of a BES facility. For example; information related to ratings, information related to the results of studies, information related to data errors or loss of data, etc.</p> <p>If the term “Interoperability Communication” is to be retained, we strongly suggest a name change. The word “interoperability” is widely used to refer to the ability of a system to work with or use the parts or equipment of another system. For example please see the current standards development efforts identified in the NIST Framework and Roadmap for Smart Grid Interoperability Standards available at: <a href="http://www.nist.gov/public_affairs/releases/smartgrid_interoperability.pdf">http://www.nist.gov/public_affairs/releases/smartgrid_interoperability.pdf</a>. Using the term “interoperability” to refer to reliability-related human communications could be confusing to regulators, compliance personnel, auditors, and many others who have to deal with a variety of standards.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p>		
PJM	Disagree	<p>We feel that the definition of Interoperability Communication is much too broad and is inconsistent with the effort to develop results-based standards which would have a measurable and observable effect on the reliability of the bulk electric system. The definition of Interoperability Communication, as written, can include virtually any information exchange/instruction between entities, both routine and emergency. Such communication may or may not have a measurable and observable effect on bulk system reliability. Since the broad term Interoperability Communication is used in every requirement in COM-003-1, entities will be required to use the English language, the central time zone, and 3-part communication in even the most routine exchanges of information. This could create a burden on operating personnel and a distraction from their reliability duties. This group does not feel the need for a definition of Interoperability Communication, since the term Reliability Directive has been defined in draft standard COM-002-3, which is currently posted for review. The Reliability Directive term is emergency-focused and consistent with the results-based standards process</p> <p><b>Response: Response: The proposed term “Interoperability Communication” has been removed from the standard. 		<p>Bulk Electric System. Routine operations that would affect the BES as described would be subject to the use of the communication protocols in COM 003. The SDT believes the term Reliability Directives as defined in COM 002-03 does not fully address the range of miscommunication risks that could seriously impact the reliability of the BES.</p> <p>The SDT does not believe its work to be inconsistent with results-based principles. The Need or Problem Statement for this standard is that miscommunication can lead to action or inaction harmful to the reliability of BES. This was identified by the NERC President in his January 2011 report to the industry as one of the eight top priority issues for BPS reliability, and there are a number of events that have occurred in the past where miscommunication was a contributing factor to the event or exacerbated the severity of the event. The Goal, therefore, is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication. The key Objective to accomplish this Goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this Objective, and are risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</p> <p>In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state - repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3. The way the definition of Three-part Communication is worded applies only when the communication is understood by the listener the first time. Because the definition requires the listener to repeat the information back correctly, failure of the listener to understand the information the first time could be construed as a violation or at least not fitting the definition. The definition should rather reflect that three-part communication is an iterative process that should be followed until the listener is confirmed by the speaker to get the information correct.</p> <p>We suggest the definition be revised as follows:</p>

Organization	Yes or No	Question 1 Comment

The goal, therefore, is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication. The key objective to accomplish this goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this objective, and are and risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</b></p> <p>In addition, the definition of Three-part Communication in this standard does not match the three-part communication requirements stated in COM-002-3. In COM-002-3, the requirements for three-part communication (state - repeat - acknowledge) apply to Reliability Directives, while in COM-003-1 the definition of Three-part Communication refers to “information” in general. If, as stated in the Disposition of Requirements, the revisions to COM-002-3 will be moved to COM-003-1, the definition of Three-part Communication in this draft standard should be consistent with the requirements of COM-002-3.</p> <p><b>Response: The SDT has eliminated the definition of three-part communication and has incorporated the performance of three-part communication into the language of Requirements R2 and R3 in the second draft</b></p>

Organization	Yes or No	Question 1 Comment
		of COM-003. The SDT agrees with your comments on consistency between the 2 standards.
<b>Response: The SDT thanks you for your comments. Please see our responses above</b>		
NIPSCO	Agree	When COM-002-3 is fully incorporated, more definitions such as Reliability Directive will need to be added.
<b>Response: The SDT thanks you for your comments.</b>		
Duke Energy	Disagree	<p>When viewed in the context of its use in R5 and R6, the definition of Interoperability Communication is excessively broad and unclear. R5 refers to the issuing of a “directive” during verbal Interoperability Communications. The term “directive” is undefined.</p> <p>R6 requires the use of the NATO phonetic alphabet during verbal Interoperability communications such as directives, notifications, directions, instructions, orders or other reliability related operating information. This could conceivably encompass all communications.</p> <p><b>Response: The proposed term “Interoperability Communication” has been removed from the revised standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p>Also, the definition refers to communications between two or more “entities”. Does “entities” refer to functional entities or registered entities?</p> <p><b>Response: The new term “Operating Communications” does not contain the word “entities.”</b></p>
<b>Response: The SDT thanks you for your comments. Please see our responses above</b>		
Westar Energy	Disagree	Would like to see the Interoperability Communication definition be more specific.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The proposed term “Interoperability Communication” has been removed from the standard. Instead the SDT is proposing the new term “Operating Communications,” which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT believes this is more specific.</b></p>		

2. The SDT incorporated TOP-002-2 Requirement R18 into this new standard COM-003-1 as Requirement R7. In TOP-002-2, Requirement R18 applies to the Transmission Service Provider and Load Serving Entity. These entities are now added to COM-003-1. Do you agree with this proposal? If not, please explain in the comment area.

**Summary Consideration:** While many commenters did agree with the proposal, most commenters who responded to this question disagreed with the proposal.

The dissenting commenters addressed several key issues. Many indicated that Requirement R7 should not be applicable to TSPs and LSEs because these entities were not included in the SAR for this project. The SDT agrees and has removed TSPs and LSEs from the standard to be consistent with the approved SAR.

Additional commenters indicated the word “equipment” as used in Requirement R7 was too broad. The standard has been modified to use the defined terms “Element” and “Facility” instead in the revised standard Part 1.1.4.

Other commenters indicated Requirement R7 addressed a planning function already included in TOP-002, and should not be included in COM-003. While the SDT agrees that TOP-002-2a R18 is a planning function the drafting team working on TOP-002 revisions under Project 2007-03 has proposed retiring this requirement, and the OPCP SDT believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 be retained and transferred to Requirement R1, Part 1.1.4.

Commenters indicated a general consensus for the mandatory use of line and equipment identifiers applying only to interface Elements, not Elements or Facilities internal to the footprint of the entity. The SDT agreed, and modified the standard to apply only to interface Elements and Facilities.

Some additional comments were received indicating the previously posted standard was too prescriptive in specifying “how” to communicate, instead of “what.” They also indicated the proposed standard was unnecessary and would distract operators from reliably controlling the system. The SDT disagreed based on Blackout Task Force Report recommendation 26, which calls for tightening communication to improve reliability. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.

There were additional comments that uniform and mutually agreed line and equipment identifiers should not be mandated so long as the identifiers are pre-determined. The SDT agrees documentation of mutual agreement is not necessary, so long as the identifiers are pre-determined, understood and used during Operating Communications. The standard has been modified to reflect this change – Requirement R7 was absorbed into R1 as Part 1.1.4 as shown below:

**R1.** Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall use the following communications protocols:

1.1 When participating in oral or written Operating Communications:

1.1.4. When referring to a Transmission interface Element or Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission Facility.

Sunflower Electric Power Corp.	Agree	

Organization	Yes or No	Question 2 Comment
Sunflower Electric Power Corporation	Agree	
Transmission System Operations	Agree	
Westar Energy	Agree	
Western Area Power Administration	Agree	
Xcel Energy	Agree	
Washington City Light & Power	Disagree	
The Empire District Electric Company	Disagree	<p>A more efficient method of designation common pre-determined line and equipment identifiers would be through the Reliability Coordinator. Having the Reliability Coordinator establish this would create a single methodology as opposed to several different methodologies that would have to be agreed upon between entities and a significant amount of work for all entities.</p>
<p><b>The SDT thanks you for your comments. The second draft of the standard requires that, when referring to a Transmission interface Element/Facility, entities must use the name specified by the owner(s) of that Element /Facility. We believe that assignment to be the most appropriate since it will not require any entity to change its existing practice.</b></p>		
Santee Cooper	Disagree	<p>A TSP and LSE should not be subjected to other requirements within the COM 003 Standard such as Three-part Communications.</p> <p>In addition, R18 of TOP002-2 required the use of uniform line identifiers among neighboring BAs. As this requirement (R7) is now written in COM003 it is not clear that this is when the use of uniform line identifiers is required. As currently written, it could be interpreted that the use of uniform line identifiers is required for all communication which is more restricting.</p>

Organization	Yes or No	Question 2 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p> <p><b>The second draft of the standard requires that, when referring to a Transmission interface Element/Facility, entities must use the name specified by the owner(s) of that Element /Facility.</b></p>		
<p>E.ON U.S. LLC</p>	<p>Disagree</p>	<p>As the requirement already exists it is redundant to incorporate it into COM-003. The incorporation not only exposes a responsible entity to double jeopardy, it now exposes Transmission Service Providers and LSEs to COM-003 requirements that should not apply to these entities.</p> <p><b>Response: The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities consistent with your comments.</b></p> <p>TOP-002 addresses planning ahead of the operating hour whereas COM-003 addresses communication during real-time operations. In the absence of evidence that the lack of common identifiers is an imminent and continuing risk to BES reliability, it does not make sense to have operators addressing urgent, real-time situations bear significant penalty risk should they refer a BES element by something other than a newly established common identifier.</p> <p><b>Response: The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP SDT believes this requirement is necessary in COM-003-1 for reliable real-time operations. Not ensuring that operators are communicating about the same piece of equipment can lead to actions or inactions that could compromise reliability.</b></p> <p>Is it the intent of the requirement that the common identifiers be the same for all neighboring parties, all of whom must “agree” to the identification? If not, then an element might be referred to by one identifier with Party A, another with Party B etc. which might well defeat the purpose of the requirement. If it is required that there be a single identifier, then all neighbors would have to agree upon the identifier constrained as each may be by, for example, the formatting limitation of their respective SCADA/EMS systems.</p> <p><b>Response: The second draft of the standard no longer requires explicit agreement. The new Requirement R1 Part 1.1.4 calls for the owner of the transmission asset to specify the name for its interface Elements and Facilities.</b></p>

Organization	Yes or No	Question 2 Comment
		<p>Cost to modify software to accommodate common identifiers could be significant and NERC should weigh these costs and the aforementioned operational risks against the perceived incremental improvements to the BES reliability.</p> <p><b>Response: The standard does not require modifications to software. To the extent entities wish to modify their internal systems to facilitate this requirement, the SDT disagrees the cost to modify software would be significant, as it would be limited to <u>only</u> interface Elements/Facilities as stated in R1.1.4 of the second draft of the standard.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>American Electric Power</p>	<p>Disagree</p>	<p>Based on definitions provided in the functional model, the inclusion of the TSP and LSE in this standard is inappropriate. These entities manage the relationship with the end-use customer and are not responsible for the operation or maintenance of BES facilities.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
<p>We Energies</p>	<p>Disagree</p>	<p>Because applicability to a TSP and LSE of this standard stems solely from TOP-002-2 R18, R7 should be the only requirement that applies to a TSP or LSE.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
<p>Bonneville Power Administration</p>	<p>Disagree</p>	<p>BPA Would like further clarification about what is meant by “pre-determined, mutually agreed upon line and equipment identifiers”.</p> <p><b>Response: The second draft of the standard requires that, when referring to a Transmission interface Element/Facility, entities must use the name specified by the owner(s) of that Element /Facility.</b></p> <p>Is it a specified format no matter which part of the system is being used, or is it only for 115 kV and above as it applies to LSE’s and TSP’s. If it only refers to Transmission equipment above 115 kV, then BPA would likely agree.</p> <p><b>Response: The SDT has limited the standard to communication with the intent to change or maintain the state,</b></p>

Organization	Yes or No	Question 2 Comment
		<p>status, output, or input of an Element or Facility of the Bulk Electric System (see definition of “Operating Communications.” As such, the format would only apply in those situations. In addition, the SDT removed LSEs and TSPs as responsible entities in the second draft of the standard.</p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Old Dominion Electric Cooperative</p>	<p>Disagree</p>	<p>Comments: We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider , Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is applicable. We suggest the drafting team consider modifying the applicability of this standard as follows similar to the format used in PRC-OO5:4.</p> <p>Applicability:</p> <ul style="list-style-type: none"> <li>4.1. Transmission Operator</li> <li>4.2. Transmission Owner</li> <li>4.3. Balancing Authority</li> <li>4.4. Reliability Coordinator</li> <li>4.5. Generator Operator</li> <li>4.6. Distribution Provider that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</li> <li>4.7. Transmission Service Provider</li> <li>4.8. Load Serving Entity that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</li> </ul>
<p><b>Response: The SDT thanks you for your comments and suggestion.</b>  <b>The SDT has deleted the requirement for a Communications Protocol Operating Procedure.</b>  <b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been</b></p>		

Organization	Yes or No	Question 2 Comment
<p><b>retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity.</b></p>		
<p>Electric Market Policy</p>	<p>Disagree</p>	<p>In our experience, neither the TSP nor the LSE provide or receive information about specific lines or equipment in real-time. Therefore, requirement R7 should not apply to them absent clear evidence that a realistic (not hypothetical) threat to reliability would exist if they are omitted. We do not think that such a threat would exist. Applying R7 to TSPs and LSEs would only cause them grief and further burden the compliance staffs of the regional entities for no appreciable benefit.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
<p>Kansas City Power &amp; Light</p>	<p>Disagree</p>	<p>Including “equipment” is too broad. This could mean anything and should be limited to transmission devices that could affect the reliable operation of the bulk electric system.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>R7 (now R1.1.4) has been revised in the second draft of the standard, and refers to interface Elements and interface Facilities rather than “equipment”.</b></p>		
<p>PPL</p>	<p>Disagree</p>	<p>It is not clear what real time communications take place with a TSP and/or a LSE that would put the BES in jeopardy and thus necessitate them to be included as an applicable entity.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
<p>Manitoba Hydro</p>	<p>Disagree</p>	<p>Leave TOP-002-2 R18 in its original location.                      1) “Mutual line and equipment identifiers” should not be moved from TOP-002-2 and placed in COM-003-1 R7. TOP-002-2 Standard’s focus is “Planning, coordination and procedures” whereas:                      o R1 is “Maintain current Plans”                      o R2 is “Participate in planning and design”                      o R3 is “LSE coordinate with Host”                      o R4 is “BA coordinate with neighbours”                      o R5 is “plan to meet schedules”</p>

Organization	Yes or No	Question 2 Comment
		<p>o R6 is “plan to meet N-1”</p> <p>o R7 is “plan to meet capacity and reserves”</p> <p>o R8 is “plan to meet VAR limits”</p> <p>o R9 is “plan to meet interchange”</p> <p>o R10 is “plan to meet IROL, SOL’s”</p> <p>o R11 is “perform studies for SOL’s” and “utilize identical SOL’s for common facilities”</p> <p>o R12 is “include known SOLs or IROLs”</p> <p>o R13 is “GO shall verify generation capability”</p> <p>o R14 is “GO shall notify of changes”</p> <p>o R15 is “GO shall provide generation forecast”</p> <p>o R16 is “shall notify RC of changes”</p> <p>o R17 is “notify RC of R1 to R16”</p> <p>o R18 is “shall use uniform identifiers”</p> <p>o R19 is “maintain computer models for planning”</p> <p>2)TOP-002-2 R18 “shall use uniform identifies” appears to be more strongly related to where it already exists and would have more impact to have it moved between R2 and R3.</p> <p>3) Uniform identifiers are determined in the planning stages and are common knowledge to entities by the time they are in service and not a real time communication issue.</p> <p>a. Having TOP-002-2 R18 moved to COM-003-1 R7, takes the purpose of the COM-003 standard outside its context of “timely convey reliability information . . . especially during alerts and emergencies”.</p> <p>b.COM-003-1’s purpose and all its requirements directly relate to real time communication.</p> <p>4) TOP-002-2 R11 “identical SOL’s for common facilities” complements R18 “shall use uniform identifiers” and again are both planning requirements. 5)The unofficial comment for “Pre-determined Line and Equipment Identifiers” indicates that mutual agreement of these identifiers are to be reached in advance, thus agreeing with above.</p> <p>Leave R18 in TOP-002-2, but possibly move it between R2 and R3, thus R2 in COM-003-1 would be removed.</p> <p><b>Response: The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP SDT believes communications between entities would be improved when use of pre-determined identifiers is</b></p>

Organization	Yes or No	Question 2 Comment
		<p>required for interface Elements and Facilities. The SDT proposes the concept of R7 being retained and transferred to R1 Part 1.1.4. The SDT feels that this requirement is appropriate under COM-003, as the use of pre-determined names for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003.</p> <p>Regarding adding TSP and LSE, no comment added.</p> <p><b>Response: The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Tri-State Generation & Transmission Assoc.	Disagree	LSE and TSP are not responsible for the reliability of the Bulk Electric System. That responsibility resides with the TOP.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
National Grid		National Grid has no specific stand either ways. However, please refer to response to Question 8 for issues pertaining to the language of the requirement.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>Please refer to the SDT response to Question 8.</b></p>		
NERC Staff	Disagree	<p>NERC staff agrees with the proposal, but would offer the following modification in order to add clarity. We recommend that the phrase “when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications” be replaced with “when verbal Operating Communications with alpha-numeric information is involved.” This would utilize the definition of Operating Communications offered in the response to Question 1. This will hopefully eliminate the need to further define what communication is or is not included in the phrase “directives, notifications, directions, instructions, orders or other reliability related operating information.”</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 2 Comment
<p>The SDT agrees with your comments and has incorporated the Operating Communications revisions to R7 (now R1 Part 1.1.4) in the second draft of the standard.</p>		
<p>Pacific Northwest Small Utilities Comment Group</p>		<p>Our utilities agree with the move in principle, but are concerned about the transition. How will NERC ensure that registered entities are not doubly jeopardized during the time when the same requirement exists in two active standards? The addition of LSE to COM-003 goes way beyond the obligations in TOP-002-2 R18; LSE’s are now in every requirement of COM-003.</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP SDT believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 being retained and transferred to R1 Part 1.1.4.                      The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</p>		
<p>Puget Sound Energy</p>	<p>Disagree</p>	<p>PSE agrees in the consolidation of communication type activities into one standard; however the blanket addition of the TSP and LSE across all requirements doesn't seem appropriate. Additional thought should be given in the potential for these two entities to participate in the communication activities contemplated by each requirement, rather than incorporating them wholesale. For example, a quick search on the term “directive” in the current set of standards indicated that neither Transmission Service Providers or Load Serving Entities (or even some of the other entities covered by the proposed standard) are likely to issue directives under the requirements of those standards, so is it appropriate to subject them to the requirements of Requirement 5?</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT reviewed the SAR, agrees with your comments and has removed TSPs and LSEs as applicable entities.</p>		
<p>PJM</p>	<p>Disagree</p>	<p>Requirement R7, regarding the use of pre-determined line &amp; equipment identifiers, applies to TSPs &amp; LSEs. However, the other requirements of this standard do not seem to apply to these entities. For instance, most of the reliability-related alerts are communicated through the Reliability Coordinator Information System (RCIS). TSPs do not have access to this real-time communication tool, so the TSP should not be included in the applicability for the entire standard.  <b>Response: The SDT reviewed the SAR, agrees with your comments and has removed TSPs and LSEs as applicable entities.</b></p>

Organization	Yes or No	Question 2 Comment
		<p>Furthermore, Requirement R18 in TOP-002-2 mandated that neighboring Balancing Authorities use the uniform line identifiers. In COM-003-1, this requirement is lost, since Requirement R7 makes no mention of neighboring BAs.</p> <p><b>Response: The SDT understands the comment in regard to the use of the word “neighboring”. The SDT agrees and has modified Requirement R7 to only apply to interface Elements/Facilities.</b></p> <p>This requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how. The only real need for a requirement is to establish that each entity issuing a directive shall use three-part communications and the recipient of a directive shall also properly participate in the of use three-part communication protocol until the message has been correctly spoken and comprehended.</p> <p><b>Response: The OPCP SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations. In addition to three-part communication, the SDT believes the standard should consider other necessary protocols that prevent miscommunication.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>PJM SOS Comments</p>	<p>Disagree</p>	<p>Requirement R7, regarding the use of pre-determined line &amp; equipment identifiers, applies to TSPs &amp; LSEs. <p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Progress Energy Carolina, Inc	Disagree	<p>The word "Neighboring" is used in TOP-002 R18. Excluding this word in the proposed COM-003-1 means that each entity would have to coordinate the uniform identifiers with an undefined number of entities in the entire Interconnection.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees and has modified R7 to only apply only to interface Elements and interface Facilities.</b></p>		
Transmission Agency of Northern California	Disagree	<p>There is no additional reliability benefit to the proposed applicability of COM-003-1 Requirement R7 to Transmission Service Providers (TSP) and Load Serving Entities (LSE), since TSP and LSE must already comply with effectively the same terms in TOP-002-2 Requirement R18. Furthermore, TSP and LSE exposure to penalties and sanctions associated with non-compliance of TOP-002-2 Requirement R18 would effectively be doubled if they were required to also comply with COM-003-1 Requirement R7.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed the SAR, agrees and has removed TSPs and LSEs as applicable entities. Note that the drafting team working on proposed revisions to TOP-002 has recommended retiring Requirement R18.</b></p>		
Consumers Energy	Disagree	<p>There is no reason to move R18 from TOP-002 to COM-003. There is also no reason to utilize a shotgun blast method of coverage for this standard. Also, regardless of technical accuracy, TOP-002-2 R18 should not be moved to COM-003-1 without a simultaneous and corresponding change to TOP-002-2, lest an entity be found non-compliant with both standards for a compliance violation.</p>

Organization	Yes or No	Question 2 Comment
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP team believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 be retained and transferred to R1 Part 1.1.4.</b></p>		
<p>Next Era Energy Resources, LLC</p>	<p>Disagree</p>	<p>This requirement is already covered by TOP-002. If the TOP-002 standard is deemed deficient because certain entities have been excluded or language appears to be missing, the changes need to occur to TOP-002 as opposed to copying and revising the existing requirement elsewhere. This would ensure that compliance oversight, understanding, and adherence goals are unencumbered by unnecessary redundancies. Moreover, this would ensure that the industry continues to re-enforce standards with changes that are within the scope of their original reliability purpose. The latter is in line with one of the core objectives of the Performance-based Reliability Standards Task Force’s recommendations to focus on identifying and minimizing duplicated requirements.</p>
<p><b>Response: The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP team believes communications between entities would be improved when pre-determined names are used for referencing interface Elements and Facilities. Organization	Yes or No	Question 2 Comment
ATC and ITC	Disagree	<p>TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. ATC believes that the requirement should state that “mutual agreement” allows for multiple identifiers. We believe that this is needed in order to avoid the following issues.</p> <ol style="list-style-type: none"> <li>1) This clarification will avoid any need for arbitration or formal dispute resolution steps.</li> <li>2) If the standard does not allow for this provision entities will be forced to deviate from their own line naming convention and will result in entities to modify their drawings, field signs, and SCADA systems.</li> </ol>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees that mutual agreement is not necessary so long as the identifiers are pre-determined, unique and used during Operating Communications. The second draft of the standard requires that, when referring to a Transmission interface Element/Facility, entities must use the name specified by the owner(s) of that Element /Facility.</b></p>		
MRO NERC Standards Review Subcommittee	Disagree	<p>TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented.</p> <p>We believe the requirement should require the exchange of line identifies but not impose that they be mutually agreed upon. This requirement represents a “how” and not a “what”. In general, standards should be focused on “what” not how.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees that mutual agreement is not necessary so long as the identifiers are pre-determined, unique and used during Operating Communications. <p>standard is more focused on “what” protocols to use in specific situations.  <b>In addition to three-part communication, the SDT believes the Standard should address other protocols that prevent miscommunication.</b></p>		
Great River Energy	Disagree	<p>TOP-002_R18 is fundamentally different from the new proposed requirement in COM-003-1_R7. TOP-002 R18 states that the BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003-1_R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use PRE-DETERMINED, MUTUALLY AGREED UPON line and equipment identifiers for verbal and written Interoperability Communications. GRE believes the TOP-002_R18 could be included in COM-003-1 but included as stated verbatim in TOP-002.</p>
<p><b>Response: The SDT thanks you for your comments and recommendation.</b>  <b>The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP team believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 being retained and transferred to R1 Part 1.1.4.</b>  <b>The SDT agrees that mutual agreement is not necessary so long as the identifiers are pre-determined, unique and used during Operating Communications. The second draft of the standard requires that, when referring to a Transmission interface Element/Facility, entities must use the name specified by the owner(s) of that Element /Facility.</b></p>		
Entergy Services	Disagree	<p>TSP and LSE are not typically included in real-time communications and should not be included in this requirement. The intent this requirement in TOP-002-2 pertained to communications between neighboring BAs and TOPs. Adding LSE and TSP to this requirement doesn’t make sense, and this change should not be made.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed the SAR, agrees with your comment and has removed TSPs and LSEs as applicable entities.</b></p>		
SERC OC&SOS Standards Review Group	Disagree	<p>TSPs and LSEs are not typically included in real-time communications and should not be included in COM-003-1. The intent of requirement R18 in TOP-002-2 pertained to communications between neighboring BAs and TOPs. Adding LSEs and TSPs to the applicability of this standard doesn’t make sense, and this change should not be made.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed the SAR, agrees with your comment and has removed TSPs and LSEs as applicable entities.</b></p>		
Duke Energy	Disagree	<p>We disagree with moving R18 into COM-003-1 and broadening it to include every line and piece of equipment. This would create an enormous amount of effort to implement, and would substantially increase compliance risk,</p>

Organization	Yes or No	Question 2 Comment
		without any increase in reliability. Furthermore, if R18 is moved into COM-003-1, when would it be removed from TOP-002-2? Until R18 is actually removed from TOP-002-2, entities would be subject to compliance double jeopardy.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT appreciates the comment in regard to the use of the word “equipment”. The SDT agrees and has modified Requirement R7 to only apply to interface Elements/Facilities.</p> <p>The drafting team working on revisions to TOP-002-2a has recommended retiring R18. The OPCP team believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 being retained and transferred to R1 Part 1.1.4.</p>		
NRECA RTF Members	Agree	Yes, we believe that the use of pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications enhances the reliable operation of the BES.
<p><b>Response: The SDT thanks you for your comments.</b></p>		

3. Requirement R1 of the draft COM-003-1 states, “Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall develop a written Communications Protocol Operating Procedure (CPOP) for Interoperability Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The CPOP shall include but is not limited to all elements described in Requirements R2 through R7 to ensure effective Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.

**Summary Consideration:**

The majority of the commenters indicated a Communications Protocol Operating Procedure (CPOP) would be administrative in nature and would not satisfy the criterion of enhancing the reliable operation of the BES.

The SDT agrees that a CPOP is administrative in nature, and does not satisfy the criteria of enhancing the reliable operation of the BES. The SDT has removed it from the proposed standard.

The SDT also removed TSPs and LSEs from the list of applicable entities because they were not named in the SAR. DPs have been maintained as applicable entities in the standard, as they were named in the SAR and perform activities impacting the BES.

Organization	Yes or No	Question 3 Comment
Bureau of Reclamation	Agree	
NIPSCO	Agree	
Oncor Electric Delivery	Agree	
PacifiCorp	Agree	
PEF	Agree	
South Carolina Electric and Gas	Agree	
Sunflower Electric Power Corp.	Agree	

Organization	Yes or No	Question 3 Comment
Western Area Power Administration	Agree	
ATC and ITC	Disagree	: Based upon the concerns that we have with R2-R7 we would not support this requirement. We would support the requirement if it stopped after the first sentence and then merely listed the minimum requirements that should be included in the Procedure such as; (1) time zone, (2) language spoken, (3) when phonetic alphabet will be used, etc.. This will allow the Entities to draft their own CPOP per the intent of the requirement and avoid the concerns that we have documented for the remainder of the requirements.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Progress Energy Carolina, Inc	Disagree	A requirement to create a CPOP and mandating absolute adherence to that CPOP is overly prescriptive, may not improve reliability of BES operations, and may serve to delay communications and therefore delay actions necessary to respond to threats to the reliability of the BES.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
American Municipal Power	Disagree	A written CPOP will place an unnecessary burden on smaller entities without an increase in reliable communications. I feel that the other requirements are somewhat self-explanatory and that an annual review of the phonetics and three-part communications would improve reliability more than having a written CPOP requirement.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Puget Sound Energy	Disagree	<p>As discussed in Question 2, further consideration should be given to whether it is appropriate to include all the listed entities in this requirement.</p> <p>Additionally, the phrase “is not limited to” should be removed from the last sentence of the proposed requirement. The standard should specifically spell out what should be included in the CPOP. This phrase would lead to confusion about what an entity must include in the CPOP and is likely to result in inconsistent enforcement of the requirement.</p> <p>Also R1 appears to require a CPOP that will be used by personnel responsible for Real-time generation control</p>

Organization	Yes or No	Question 3 Comment
		<p>and Real-time operation of the interconnected Bulk Electric System. It is unclear if this specificity in who has to follow this extends to R2-R7 as well (while as noted the CPOP has to include elements of R2-R7). Without that clarity, the aspects of R2-R7 could seem to extend to communication between non-critical personnel regarding non-critical information.</p> <p>In addition, it appears that each of these entities must develop their own CPOP with clarity how the protocol gets vetted so that it is effectively employed across the entities. Finally, when reviewing the Functional Model document and its discussion of tasks and relationships to other entities, it is unclear why the TO is included in the applicability as they perform no real-time functions and provide no real time information.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT did remove the TSP and LSE from the second draft of the standard. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>British Columbia Transmission Corporation</p>	<p>Disagree</p>	<p>BCTC agrees with R1, R2, R3, R5 and R7 but strongly objects to R4 and R6.</p> <p>As a majority of the Interoperability Communications is within our time zone there is no advantage in using Central Standard Time as this will only make the communications more difficult as both parties are required to change time, R4 is unreasonable.</p> <p>R6 requiring the use of North American Treaty Organization (NATO) phonetic alphabet adds no value and will only cause confusion presently an instruction would be issued as: "At Kelly Lake open 5CB4" R6 it will now become "At Kelly Lake open Fife Charlie Bravo Fow-er"</p>
<p><b>Response: The SDT thanks you for your comments. Since the comments made by BCTC are directed specifically to requirements R4 and R6, the SDT responses to BCTC are covered in the responses to the relevant section for those requirements. You are correct, based on the requirement to use a phonetic alphabet, an operator that might normally say "At Kelly Lake open 5CB4" will now be required to say something similar to "At Kelly Lake open Fife Charlie Bravo Fow-er." This is intended to ensure that the recipient of the communication does not mistake the instruction for "At Kelly Lake open 5CP4." While "B" and "P" may sound similar, "Bravo" and "Papa" clearly do not.</b></p>		
<p>Bonneville Power Administration</p>	<p>Disagree</p>	<p>BPA does not agree with the one time zone or the NATO Standard. We believe the protocols are unnecessary and in fact will add more confusion to the process. We also do not agree, if this requires creating a brand new documented procedure just to address this standard, when elements are already covered in a different standard (common language in TOP).</p>
<p><b>Response: The SDT thanks you for your comments. Since the comments made by BPA are directed specifically to requirement R6, the SDT</b></p>		

Organization	Yes or No	Question 3 Comment
<p><b>responses to BPA are covered in the responses to the relevant requirements. Note that the SDT is proposing an alternative to R6.</b></p>		
<p>California Independent System Operator</p>	<p>Disagree</p>	<p>CAISO Comment; The requirement does not distinguish between intra and inter communications. Even though the proposed definition of “Interoperability Communications” is between two “entities”, how will an auditor interpret it? Will this be taken to the extreme and be required to address communications between two different functions within one organization? For example, between the generation desk and the scheduling desk? How important is this plan? This requirement has a low Violation Risk Factor while the individual requirements that makeup the plan have High Violation Risk Factors. Furthermore, the Violation Security Levels do not address failure to follow the protocol in the plan. Based on the VFR and VSL, it is easy to conclude this plan does little in supporting an adequate level of reliability.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP. Additionally, it should be noted that the SDT has removed the definition and any reference to “Interoperability Communications”.</b></p>		
<p>NorthWestern Energy</p>	<p>Disagree</p>	<p>COM-001 and COM-002 standards, along with Operator Training, adequately address this issue. Therefore there is no need for this additional requirement.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>New York State Reliability Council</p>	<p>Disagree</p>	<p>Comments: NYSRC agrees with the need for CPOP but does not agree that R4 can or should apply to all interoperability communications between entities. Since the examples in Attachment 1 specifically state RC and TOP, this standard should not apply to any other entity except for the RC and TOP. COM-002-03(draft) could require the other entities to utilize three part communication for reliability-related Interoperability communication.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP. The concern stated by NYSRC regarding R4 is addressed in the SDT responses to question #5.</b></p>		
<p>Old Dominion Electric Cooperative</p>	<p>Disagree</p>	<p>Comments: We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider , Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the</p>

Organization	Yes or No	Question 3 Comment
		<p>personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is applicable. We suggest the drafting team consider modifying the applicability of this standard as follows similar to the format used in PRC-005:4. Applicability:</p> <ul style="list-style-type: none"> <li>4.1. Transmission Operator</li> <li>4.2. Transmission Owner</li> <li>4.3. Balancing Authority</li> <li>4.4. Reliability Coordinator</li> <li>4.5. Generator Operator</li> <li>4.6. Distribution Provider that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</li> <li>4.7. Transmission Service Provider</li> <li>4.8. Load Serving Entity that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</li> </ul>
<p><b>Response:</b> The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP. We did not include the LSE or TSP because they were not listed in the SAR but did include DPs in the standard as DPs carry out actions related to the reliability of the Bulk Electric System such as voltage reduction and load shedding.</p>		
<p>Tri-State Generation &amp; Transmission Assoc.</p>	<p>Disagree</p>	<p>DP, LSE and TSP are not responsible for the reliability of the Bulk Electric System. Also, attachment 1 explains Operating State Alert Levels that defines colors that are already in use by the Department of Homeland Security. Re-using these colors presents confusion to the operators of the BES. This places an unnecessary additional burden on Real Time day-to-day operations with a high risk of confusion in an emergency.</p>
<p><b>Response:</b> The SDT thanks you for your comments. The SDT appreciates the comments with regards to concerns related to including TSPs, DPs and LSEs. The SDT has removed the LSE and TSP functions from the applicability of the current draft of the standard, which is consistent with the SAR. However, the SDT believes that DPs carry out actions related to the reliability of the Bulk Electric System such as voltage reduction and load shedding. Several existing standards contain requirements concerning operating communications that DPs must presently comply with that would be governed by the protocols of COM -003-1. It should be noted that the requirements of the second draft of COM-003-1 are only applicable to</p>		

Organization	Yes or No	Question 3 Comment
<p><b>Operating Communications.</b> To the extent that these entities do not take actions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, COM-003-1 would not apply.</p> <p>The SDT refers Tri-State Generation &amp; Transmission Assoc. to response to Question 9 to see responses showing changes proposed on Attachment 1 of COM-003.</p>		
<p>Pacific Northwest Small Utilities Comment Group</p>	<p>Disagree</p>	<p>DPs and LSEs are in general users, not owners or operators of interconnected BES equipment per the registry criteria. DPs and LSEs should be removed from this requirement since LSEs typically do not own or operate the interconnected BES equipment</p>
<p><b>Response:</b> The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</p> <p>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable entity.</p>		
<p>Transmission Owner</p>	<p>Disagree</p>	<p>FPL agrees with the reliability goal of establishing a set of agreed upon communication standards to ensure consistent communications particularly for actual and anticipated emergency coordination needs. FPL also believes that existing coordination/communication standards already fulfill this objective and that it might be of “training” or “reference” value to aggregate those requirements to a single document or view. However, FPL is not convinced that this requirement, largely administrative in nature, will result in marked improvement in reliability. Organizations tend to take the path of least resistance and unless forced out of that path with extensive and granular guidance on what CPOPs should contain above and beyond existing standards or contract language, CPOPs would likely become a simple patchwork of requirements constructed out of existing NERC standard language and contract language. Standards need to be clearly implementable before they are approved yet important implementation questions do not appear to have been answered.</p> <p>(1) What if parties cannot reach agreement?</p> <p>(2) Is it enough to have attempted to coordinate?</p> <p>(3) What if parties already have agreed upon procedures such as NPIRs, or those stated in Interconnection Agreements - do they take precedent or must they be redesigned/relegated?</p> <p>(4) What if CPOPs differ greatly across interconnections because of differing parties? (One might conclude that by formalizing these different practices, as opposed to mandating standard practices, the goal of more reliable coordination may not have been achieved)</p>

Organization	Yes or No	Question 3 Comment
		<p>(5) What level of evidence constitutes “agreement” especially in circumstances where entities may be remiss to agree?</p> <p>(6) What if CPOPs are simply a patchwork of requirements constructed out of existing NERC standard language and contract language - does that achieve the CPOP goal?</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Consumers Energy	Disagree	<p>I agree written Communication Protocols should be in place. Since we do not agree with all of the requirements mentioned we cannot agree with this statement. Furthermore, since these protocols will have to be between Functional Entities and most likely multiple companies, a methodology needs to be in place to prevent duplication of efforts and double jeopardy in the audit process.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Florida Municipal Power Agency (FMPA) and some members	Disagree	<p>If one of the goals is consistent communications, why would the standard require each Entity to develop a separate CPOP? For consistency, shouldn't the Reliability Coordinator develop the CPOP (with input from the other Entities) and all other Entities within the RC's area adopt it?</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Entergy Services	Disagree	<p>Interoperability communications should be removed as recommended in our response to question 1. Creating requirements for the communications protocol will by necessity require entities to document how they meet the requirements. A requirement for an operating procedure is redundant. The requirement to have an operating procedure in effect makes this a “how” requirement. An entity could choose to have more than one procedure that described their communications protocol. This requirement as written could force an entity to put all of their communications procedures into one CPOP, which doesn't improve reliability. Therefore the requirement is not needed and should not be included in the standard.</p>
<p><b>Response: The SDT thanks you for your comments. “Interoperability Communications” has been removed because it appeared to be ambiguous and unclear.</b></p>		

Organization	Yes or No	Question 3 Comment
<p>Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</p>		
We Energies	Disagree	<p>It is not clear what the purpose of the CPOP is, or how having it would improve reliability of the Bulk Electric System. This standard, (or alternatively COM-002-003) should focus on requiring Three-Part Communication during Reliability Directives. In addition, the vague and broad nature of the existing definition of Interoperability Communication makes creating CPOP’s problematic and open to conflict with the CPOP’s developed independently by other entities. As noted in question 2, R1 should not apply to a TSP or LSE.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP. The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities.</b></p>		
Independent Electricity System Operator	Disagree	<p>It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions without inclusion of the elements to be communicated as they cover a wide range of conditions which can vary among the communicating parties.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
IRC Standards Review Committee	Disagree	<p>It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements.</p> <p>This proposal takes the opposite approach and incorporates a new administrative requirement. We - and the industry as a whole based on the response to the Task Force - do not support such an approach. We suggest deleting this Requirement from the Standard.</p> <p>Furthermore, the establishment of R2-R7 as elements of the CPOP required in R1 appears to contradict the recent</p>

<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
National Grid	Disagree	<p>It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
PJM	Disagree	<p>It is not clear what the purpose of this communication protocol is or what should even be included in the protocol. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. We feel that there should not be a requirement in the standard to have a “procedure”. It is our understanding that, to be auditably compliant with a standard, the responsible entity must develop a procedure, train on that procedure, and be able to demonstrate compliance via documents, data, logs, records, etc. If Requirements R2 - R7 are included in this standard, the entity will need to develop a procedure to be compliant. In other words, the procedure itself will become the focus rather than the actual communications protocol. Therefore, we feel that requirement R1 is redundant and should not be included. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to delineate actionable reliability requirements from record/documentation requirements. <p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
NYSEG	Disagree	<p>It is not clear when the Interoperability Communication is required to be used. Is it only for communications between registered entities (inter) or internal to a registered entity (intra)? And is it required for all communications or used only in certain circumstances (i.e. emergency (if emergency, it needs to be defined what constitutes an emergency))?</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
PowerSouth Energy	Disagree	<p>It's not clear as to who is being targeted as the "personnel responsible for real-time generation control and real-</p>

Organization	Yes or No	Question 3 Comment
		time operation of the BES". Is this just the system operator or is this the generator unit operator or the field switchman?
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p> <p><b>The person responsible may be any individual from an Applicable Entity who sends or receives an operating communication changing the state or status of the BES. Note that in the second draft of this standard, the phrase, "personnel responsible for real-time generation control and real-time operation of the BES" is not used.</b></p>		
Long Island Power Authority	Disagree	LIPA agrees with the need for CPOP but does not agree that R4 can or should apply to all interoperability communications between entities. Since the examples in Attachment 1 specifically state RC and TOP, this standard should not apply to any other entity except for the RC and TOP. COM-002-03(draft) could require the other entities to utilize three part communication for reliability-related Interoperability communication.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
City Of Greenfield	Disagree	Listed as an LSE & DP, we are a small municipal utility that does not own nor operate any generation or transmission equipment. Therefore this standard is not applicable to our facility. Keep in mind, not all LSE's & DP's operate generation or transmission equipment. There are several small utilities that this standard would not be applicable to. LSE's & DP's should be put into class sizes depending on the size of the company or utility. Example: Class #1 LSE & DP : Companies that own & operate generation & transmission      Class #2 LSE & DP : Companies that do not own or operate generation & transmission.(municipals,co-ops,etc)
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity.</b></p>		
NERC Staff	Disagree	NERC staff recommends that Requirement R1 be deleted because it is strictly an administrative requirement that is not necessary. It is not results-based, and is redundant given the imbedded reference to Requirements R2 to R7. If an entity can demonstrate compliance with the other requirements, Requirement R1 performs no additional reliability enhancement. A Requirement should state a performance outcome or a risk to be mitigated. If there is a need to document something, the appropriate location for that is in the Measures section of the

Organization	Yes or No	Question 3 Comment
		<p>standard. A distinction should be made here that producing a document containing specific content necessary for reliability, such as a system restoration procedure, can be an effective requirement used to minimize risk. However, documentation that does not stand on its own as a result necessary for reliability should not be made into a requirement. Such documentation requirements should either be eliminated or moved to an administrative, informational section of the standards. An example of a weak requirement is “the Responsible Entity shall document the implementation of security patches”. The requirement that directly contributes to a risk reduction outcome is to implement applicable cyber security patches. Documentation of the implementation is simply a vehicle for demonstrating compliance. The NERC staff does not find that the CPOP satisfies the criterion of reducing risk.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>NextEra Energy Resources, LLC</p>	<p>Disagree</p>	<p>NextEra agrees with the reliability goal of establishing a set of agreed upon communication standards to ensure consistent communications particularly for actual and anticipated emergency coordination needs. NextEra believes that existing coordination/communication standards already fulfill this objective and that it might be of “training” or “reference” value to aggregate those requirements to a single document or view. However, NextEra is not convinced that this requirement, largely administrative in nature, will result in marked improvement in reliability. Organizations tend to take the path of least resistance and unless forced out of that path with extensive and granular guidance on what CPOPs should contain above and beyond existing standards or contract language, CPOPs would likely become a simple patchwork of requirements constructed out of existing NERC standard language and contract language. Standards need to be clearly implementable before they are approved yet important implementation questions do not appear to have been answered. (1) What if parties cannot reach agreement? (2) Is it enough to have attempted to coordinate? (3) What if parties already have agreed upon procedures such as NPIRs, or those stated in Interconnection Agreements - do they take precedent or must they be redesigned/relegated? (4) What if CPOPs differ greatly across interconnections because of differing parties? (One might conclude that by formalizing these different practices, as opposed to mandating standard practices, the goal of more reliable coordination may not have been achieved) (5) What level of evidence constitutes “agreement” especially in circumstances where entities may be remiss to agree? (6) What if CPOPs are simply a patchwork of requirements constructed out of existing NERC standard language and contract language - does that achieve the CPOP goal?</p>

TransEnergie		<p>Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions for all entities involved in real time operations. The NERC BOT has approved pursuing the Results-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard. There is no need to create a CPOP that includes requirements R2 through R7 given that each requirement spells out how and what is to be communicated. A CPOP may be needed for Interoperability Communications that are not addressed in R2-7.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Kansas City Power & Light	Disagree	<p>This proposed communication protocol is redundant to Requirements R2-R7 and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions and using agreed upon terminology for switching equipment for bulk electric system.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Midwest ISO Standards Collaborators	Disagree	<p>This proposed communication protocol is redundant to Requirements R2-R7 and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Performance-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We - and the industry as a whole based on the response to the Task Force - do not support such an approach. We suggest deleting this Requirement from the Standard.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute</b></p>		

Organization	Yes or No	Question 3 Comment
<p><b>to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>Northeast Power Coordinating Council</p>	<p>Disagree</p>	<p>This proposed communication protocol is redundant to Requirements R2-R7, and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Results-based Reliability Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard. There is no need to create a CPOP that includes requirements R2 through R7 given that each requirement spells out how and what is to be communicated. A CPOP may be needed for Interoperability Communications that are not addressed in R2-7.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>Northeast Utilities</p>	<p>Disagree</p>	<p>This proposed communication protocol is redundant to Requirements R2-R7, and should not be included in this Standard. This standard only needs to focus on requiring three-part communications during actual and anticipated emergency conditions. The NERC BOT has approved pursuing the Results-based Reliability Standard Ad Hoc Working Group recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. The industry as a whole, based on the response to the Task Force, does not support such an approach. This Requirement should be deleted from the Standard.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>Electric Market Policy</p>	<p>Disagree</p>	<p>We agree that communications procedures are necessary, but we do not agree with several of the requirements proposed to be addressed in the elements of the CPOP. See our comments on specific requirements elsewhere in our responses.</p>

Organization	Yes or No	Question 3 Comment
		We do not see the need to create a CPOP that includes requirements R2 through R7 given that each requirement spells out how and what is to be communicated. We could agree that a CPOP may be needed for Interoperability Communications that are not addressed in R2-7.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Xcel Energy	Disagree	We agree with the structure of the standard, however we have issues with several of the CPOP elements being proposed. (See detail comments in following questions.)
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Santee Cooper	Disagree	We believe that a company’s documentation demonstrating compliance for R2 through R7 would eliminate the need for a CPOP document.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Sunflower Electric Power Corporation	Disagree	We believe that distribution providers (electric cooperatives) should be removed from this standard unless they control a BES segment
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity subject to the DPs’ impact on Elements on the BES.</b></p>		
NRECA RTF Members	Disagree	We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider , Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is

Organization	Yes or No	Question 3 Comment
		<p>applicable. We suggest the drafting team consider modifying the applicability of this standard as follows similar to the format used in PRC-005:</p> <p>4. Applicability:</p> <p>4.1. Transmission Operator</p> <p>4.2. Transmission Owner</p> <p>4.3. Balancing Authority</p> <p>4.4. Reliability Coordinator</p> <p>4.5. Generator Operator</p> <p>4.6. Distribution Provider that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</p> <p>4.7. Transmission Service Provider</p> <p>4.8. Load Serving Entity that is responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. Washington City Light & Power	Disagree	<p>We believe that it may be important for entities registered as a Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider , Load Serving Entity and Distribution Provider to have a formalized Communications Protocol Operating Procedure (CPOP) for Interoperability Communications, but this requirement will place an unnecessary burden on the personnel at many of the smaller Load Serving Entities and Distribution Providers on the NERC Compliance Registry. In most real-time scenarios, the BES facilities are not operated nor maintained by the Load Serving Entity or Distribution Provider. As with many standards, entities will be required to demonstrate why the standard/requirement is applicable.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute</b></p>		

Organization	Yes or No	Question 3 Comment
<p>to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</p> <p>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity subject to the DPs’ impact on Elements on the BES.</p>		
Transmission System Operations	Disagree	We believe the phrase, “but is not limited to” should be deleted. The elements required to be in the CPOP should be well-defined.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
FirstEnergy	Disagree	We feel that procedures are beneficial for entities to have as far as internal training of new personnel and as a reference guide for all personnel, but we do not agree that it should be a requirement of a reliability standard. It is not appropriate to subject an entity to monetary fines for not having a procedure even if that entity has fully complied with all the other requirements (R2 through R7) of this standard that the procedure is referencing. Although this requirement may fall into the category of best practices and administrative requirements, it certainly does not rise to the level of performance-based, risk-based, or competency-based requirements. The real evidence of an entity implementing R2 through R7 is by evaluating the measures of those requirements and a variety of information could be used by an entity such as training records, procedures, voice recordings etc. Having a procedure does not need to be a standalone requirement.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
MRO NERC Standards Review Subcommittee	Disagree	We request that R1 be rewritten for real time operation of elements and facilities connected to the BES. Based upon the concerns that we have with Requirements R2-R7 we would not support this requirement. We would support requirement R1 if it stopped after the first sentence and then merely listed the minimum requirements that should be included in the Procedure such as; (1) time zone, (2) language spoken, (3) when phonetic alphabet will be used, etc.. This will allow the Entities to draft their own CPOP per the intent of the requirement and avoid the concerns that we have documented for the remainder of the requirements. Reliability Standards are supposed to describe “What” is required, not “How” compliance would be achieved. We believe this proposed Reliability Standard describes more the “How”, and is contrary to the Results Based Standards Initiative being implemented by NERC. The NERC BOT has approved pursuing the Performance-based Reliability

Organization	Yes or No	Question 3 Comment
		<p>Standard Task Force’s recommendations to assess the existing standards, modify and develop standards that support reliability performance and risk management, and work on an overall plan to transition existing standards to a new set of standards. One goal of this effort is to eliminate administrative requirements. This proposal takes the opposite approach and incorporates a new administrative requirement. We - and the industry as a whole based on the response to the Task Force - do not support such an approach. We suggest deleting this Requirement from the Standard. The CPOP should only apply to verbal communications. It could be implied that written communications (switching order affecting the BES) must have a CPOP, which would essentially be a writing guide procedure for how to write a procedure. The CPOP would need to be developed for each entity on how to write a CPOP and all the requirements contained in this draft standard. Every entity has unique switching instruction templates that have been developed over time in negotiations with unions, third-parties, etc, which have detailed procedures for their use. Requiring the use of a CPOP on top of that is adding additional complexity that adds nothing to the reliability of the BES.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>The Empire District Electric Company</p>	<p>Disagree</p>	<p>What benefit to the BES would this provide? Rather I see more confusion by having entities develop different CPOPs. How will this benefit real time operation? This seems to be a requirement by NERC to assist NERC in analysis "after the fact" of an event, but in reality it can hinder daily operations.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>Indiana Municipal Power Agency</p>	<p>Disagree</p>	<p>What reliability purpose is served by restating requirements two through seven in a Communications Protocol Operating Procedure (CPOP)? Since these requirements are the only required items in the CPOP, entities will just be restating these requirements in their CPOP. In addition, this is an administrative requirement which does not fit into the new performance-based standard principle that should be used by SDT's.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>American Electric Power</p>	<p>Disagree</p>	<p>While having a procedure is important and the responsible entities should have a procedure to be compliant, there is not necessary to establish this requirement to have a procedure. We need to stay focused on what the purpose of the standard is to be and not dilute its effectiveness by focusing on documented procedures.</p>

Organization	Yes or No	Question 3 Comment
		Furthermore, if the extent of communication concerns warrants the extensive effort to establish pre-defined line and equipment identifiers, then this should be established in a uniform manner and not left to result in multitudes of approaches. There will likely need to be system modifications to address character limitations with respect to line and equipment identifiers.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
Westar Energy	Disagree	While I agree that a CPOP is necessary and should include the elements of the requirements, I am not sold on all of the requirements yet as written.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP. Please comment on the revisions we made to the remaining requirements.</b></p>		
ExxonMobil Research and Engineering	Disagree	While recording telephone conversations may be routine for utility companies, many industrial facilities that fall under the jurisdiction of this standard do not currently have the facilities necessary to record the conversations and store them for an extended length of time. If a company does not currently possess the capability to record telephone conversations, is it the intent of this standard to require them to install such facilities? If so, what is the time frame surrounding the installation of the facilities necessary to record and store telephone conversations? Currently, we maintain a log of our communications which includes the question or instruction and our (or in the case of a question the third party's) response. Does this satisfy the requirements for evidence as defined in measures M2 through M7?
<p><b>Response: The SDT thanks you for your comments. The SDT respectfully refers to the measures, which identify types of evidence that may be used. The SDT recognizes that similar requirements already exist within the COM standards and that the same types of evidence have been included in the associated measures. Having voice recordings is an example of what could be used as evidence; not what is required or the only type of evidence. Time frames for implementation of the Requirements of COM-003-1 are identified under the Proposed Effective Date in the second draft of the standard.</b></p>		
PPL	Disagree	Will the CPOPs be developed regionally, by RCs, by TOPs, by BAs? Will some entities have to adhere to various CPOPs since they may operate in various areas? Too many unanswered questions to support this concept.
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute</b></p>		

Organization	Yes or No	Question 3 Comment
<p><b>to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p>		
<p>Manitoba Hydro</p>	<p>Agree</p>	<p>Yes, with comments</p> <p>1) In this requirement “Interoperability Communications between personnel responsible for real time” becomes clouded when compared to the “Interoperability Communications” definition that states “exchange information between entities”.</p> <p>a. Improving the “Interoperability Communication” definition as per early suggestion should clarify this.</p> <p>2) Changing the order of requirements would make the flow of the standard smoother.</p> <p>a. Since this standard is mostly designed for real time communication, the requirements should pyramid down.</p> <ul style="list-style-type: none"> <li>o R1 is fine.</li> <li>o R2 should be “English”</li> <li>o R3 should be “NATO”</li> <li>o R4 should be “Time”</li> <li>o R5 should be “Three-part communications”</li> <li>o R6 reserved for “Full name identification” (See below for clarification)</li> </ul> <p>Conclusion: This requirement is acceptable as long as the enclosed comments are considered.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that having a CPOP does not directly contribute to reliability. The SDT agrees, and has deleted the requirement for a CPOP.</b></p> <p><b>The SDT supports the ordering of the comments you suggested. After aggregating all of the industry comments and changes, the SDT reformatted the posted Standard. While it is not Identical, some groupings and concepts are similar. We would be interested in your comments on this next draft version.</b></p>		

4. Requirement R2 of the draft COM-003-1 states, “Each Responsible Entity shall use pre-defined system condition terminology as defined in Attachment 1-COM-003-1 for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.

**Summary Consideration:**

Most stakeholders who responded to this question disagreed with the proposal.

The major recommendation from the comments for question 4 was that the term “Interoperability Communications” should be removed from the standard. The OPCP SDT agreed and changed “Interoperability Communications” to “Operating Communications” which is now defined as – “Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.”

Several commenters pointed out that “Alert Levels” with defined colors are already in use by the Department of Homeland Security and may be misinterpreted.

Other commenters stated that attempting to mold all possible situations into the pre-defined terms is overly restrictive and may result in reduced accuracy, unnecessary confusion and misinterpretation.

The SDT proposes that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement (R2) to use Attachment 1 from the revised standard.

Organization	Yes or No	Question 4 Comment
British Columbia Transmission Corporation	Agree	
ExxonMobil Research and Engineering	Agree	
Florida Municipal Power Agency (FMPA) and some members	Agree	

Organization	Yes or No	Question 4 Comment
Old Dominion Electric Cooperative	Agree	
Oncor Electric Delivery	Agree	
Orange and Rockland Utilities, Inc.	Agree	
PacifiCorp	Agree	
Sunflower Electric Power Corp.	Agree	
Transmission System Operations	Agree	
Westar Energy	Agree	
American Electric Power	Disagree	<p>AEP suggests that RCIS be expanded to include the additional parties necessary to support Interoperability Communications. Without such an expansion, the communication requirements for the RC are burdensome and the effectiveness may be compromised by the volume of parties that will need to be included. Is it practical for RFC to communicate across some 60 parties or should this be limited to only those that need to know?</p> <p>Attachment 1 does not seem consistent with the stated purpose of this standard as Attachment seems to focus on defining the operating condition, not communication during alerts and emergencies. The SDT should consider if the scope of the standard is appropriate to resolve this discrepancy. To the extent that it gets mandated, Attachment 1 could be administered through the addition of “check boxes” on the expanded RCIS.</p>
<p><b>Response:</b> The SDT thanks you for your comments and recommendations regarding RCIS expansion. While the SDT believes that it has merit, such an initiative is beyond the scope of this standard’s development. The team will recommend your proposal to the proper authority for their consideration.</p> <p>The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to</p>		

Organization	Yes or No	Question 4 Comment
<p><b>use Attachment 1 from the revised standard.</b></p>		
Sunflower Electric Power Corporation	Agree	As defined in Attachment 1 - COM-003-1
<p><b>Response: The SDT thanks you for your comments. Note that the SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Tri-State Generation & Transmission Assoc.	Disagree	Attachment 1 explains Operating State Alert Levels that defines colors that are already in use by the Department of Homeland Security. Re-using these colors presents confusion to the operators of the BES. This places an unnecessary additional burden on Real Time day-to-day operations with a high risk of confusion in an emergency. Additionally, this is too complicated and requires a complete retraining of operators in the English language.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Duke Energy	Disagree	Attachment 1 is limited to notifications from the RC to other entities regarding Alerts for Physical Security Emergency, Cyber Security Emergency or Transmission Emergency. Also, these types of notifications wouldn’t meet the definition of “Interoperability Communications”, because they wouldn’t necessarily be used to effect a change in the state or status of an element or facility of the Bulk Electric System.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p> <p><b>The term Interoperability Communications has been removed from the second draft of the standard.</b></p>		
NorthWestern Energy	Disagree	Attachment 1 seems too overly complicated for emergency Operating circumstances and provides an additional burden for Real Time personnel who are stressed with difficult decisions already.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Kansas City Power & Light	Disagree	Attachment 1 should be removed from this standard. This is a duplication of the alerts by the NERC Alerts system and the EISAC. In addition, these are reliability standards and should deal with real-time and expected future reliability issues. Alerts are an inappropriate for this standard.

Organization	Yes or No	Question 4 Comment
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
We Energies	Disagree	<p>Attempting to mold all possible circumstantial situations into the pre-defined terminologies is overly restrictive and may result in reduced accuracy, unnecessary confusion and misinterpretation. R2 should have the word “all” included (as is stated in this question) in order to restrict the applicability of Interoperability Communications to only those situations defined in Attachment 1. As noted in question 2, R2 should not apply to a TSP or LSE.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p> <p><b>Note that the definition of “Interoperability Communications” has been deleted from the revised standard and replaced with the term, “Operating Communication” with a more narrow focus on communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p><b>The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR.</b></p>		
California Independent System Operator	Disagree	<p>CAISO Comments;</p> <p>Regarding CEA;</p> <p>CIP-002 requires responsible entities to identify their cyber assets and critical cyber assets. This requirement does not address any identification and requires responsible entities to declare emergency conditions for non-critical assets. How does this provide an adequate level of reliability? What technical justification did the SDT use in determining an actual or imminent cyber or physical threat to any BES generating facility, substation, or transmission line constitute an emergency declaration?</p> <p>Regarding PSEA and CEA;</p> <p>This requirement does not provide an adequate level of reliability. As a general statement, receiving notification from the RC stating XXXX BA has identified (actual or imminent) physical or cyber threats affecting 1 or 999 control center(s), generating facility(ies), substation(s), or transmission line(s) close to your jurisdiction would provide an adequate level of reliability compared to XXXX BA has declared a PSEA or CEA condition ORANGE. Why is the SDT promoting requirements that reduce reliability and dumb-down communications?</p> <p>Is this the correct standard to add a requirement such as this? Physical and Cyber threats are addressed in the</p>

Organization	Yes or No	Question 4 Comment
		<p>CIP standards and emergencies are addressed in the EOP standards. Both require notification so why include it in a COM standard?</p> <p>Is there a possibility of double jeopardy between this requirement and CIP requirements?</p> <p>If this requirement must be included, Per attachment 1 - COM-003-1 (PSEA and CEA section) the Reliability Coordinator is the only responsible entity with any defined actions. It is suggested the SDT remove the BA, TO, TOP, GO, TSP, LSE, and DP due to lack of applicability. The same entities should be removed from the measure (M2) also. Until “soft words” such as “threat” and “sabotage” are defined or clarity is provided the industry should not be proposing standards based upon them.</p> <p>Regarding TEA;</p> <p>What technical justification did the SDT use in determining that notifying all BA, DP, GOP, TOP, and TO in the RC area of a possible IROL violation provides an adequate level of reliability? There are no associated actions for the BA, DP, GOP, TO, and TOP to perform upon notification so what is the purpose of this requirement?</p> <p>The Alert Level Guide is still in the test phase; does not the Alert Level Guide need to be approved prior to any standard which references the guide be approved?</p> <p>Comments: Per attachment 1 - COM-003-1 the Reliability Coordinator is the only responsible entity with any actions. Suggest removing BA, TO, TOP, GO, TSP, LSE, and DP. Or assign them actions. The same entities should be removed from the measure (M2) also.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined, based on your comments and the comments of other stakeholders, that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>
