Steps	**To be completed for each event evaluated.**
1	Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order: Column A: Date and Time in this format, mm/dd/yy HH:MM:SS Column B: Frequency Hz Column C: Total Lost Generation: enter the MW data of the units that tripped as a single generator where the value typically goes to zero at t(0). Column D: not applicable Column E: Non Conforming Load Column F: Pumped Hydro Column G: not applicable Column H: not applicable Column I: not applicable Column J: BA Bias Setting Column K: BA Load
2	Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign (+/-) convention defined in FRS Form 1.
3	Data compression must be turned off for each data point. Quality data will give you quality results in the evaluation.
4	Data must be at 2 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event. The spreadsheet will work with larger sample size data. If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data.
5	Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list. Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency. This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 469 of the data.
6	Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A469"
7	Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 633.
8	Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data!A633"
9	In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if you're interested. It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
10	Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

Steps	**To be completed once at the initial setup of the evaluation spreadsheet for your BA.**
A	Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".
B	Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: -80 MW/0.1 Hz (This value could change annually)

Note: For ease of use, only the necessary worksheets are displayed. If you are interested in viewing graphs and other hidden worksheets, select the "tab" at the bottom, right click, select unhide and select the worksheet you wish to unhide.

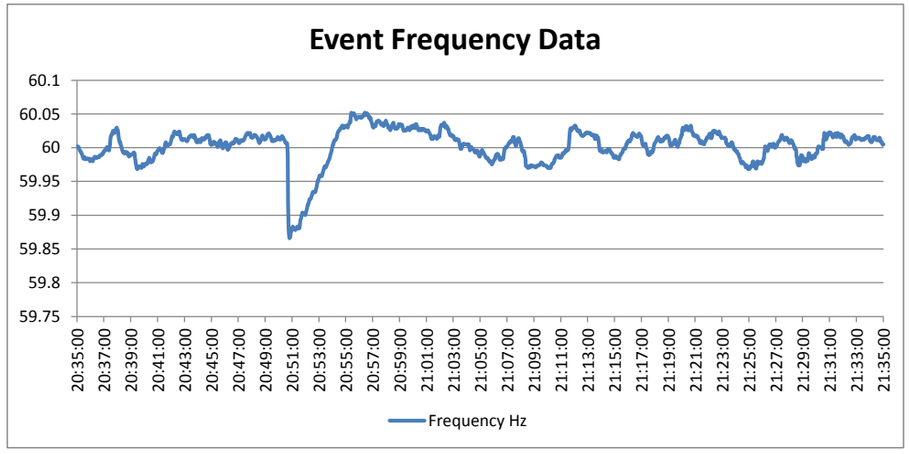
Balancing Authority Name:	ERCOT
Balancing Authority Frequency Response Obligation (FRO from FRS Form 1)	-286

Note: See "Instruction" tab for more detailed instructions.

Step 1.	Copy and Paste Event Data into the appropriate cells of the "Data" worksheet. Maintain date and time format of mm/dd/yy hh:mm:ss.	
Step 2.	Determine Time of T(0) and edit formula in cell "C8" to reference the correct row of the "Data" worksheet. T(0) is the first change in frequency of about 0.010 Hz (10 mHz) which should be the first scan of frequency data of the event.	20:50:40
Step 3.	Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz	20:54:00
Step 4.	Hit the big blue button to copy your data for pasting into FRS Form 1 "BA Event Data" worksheet.	

Copy Data for Pasting into Form 1



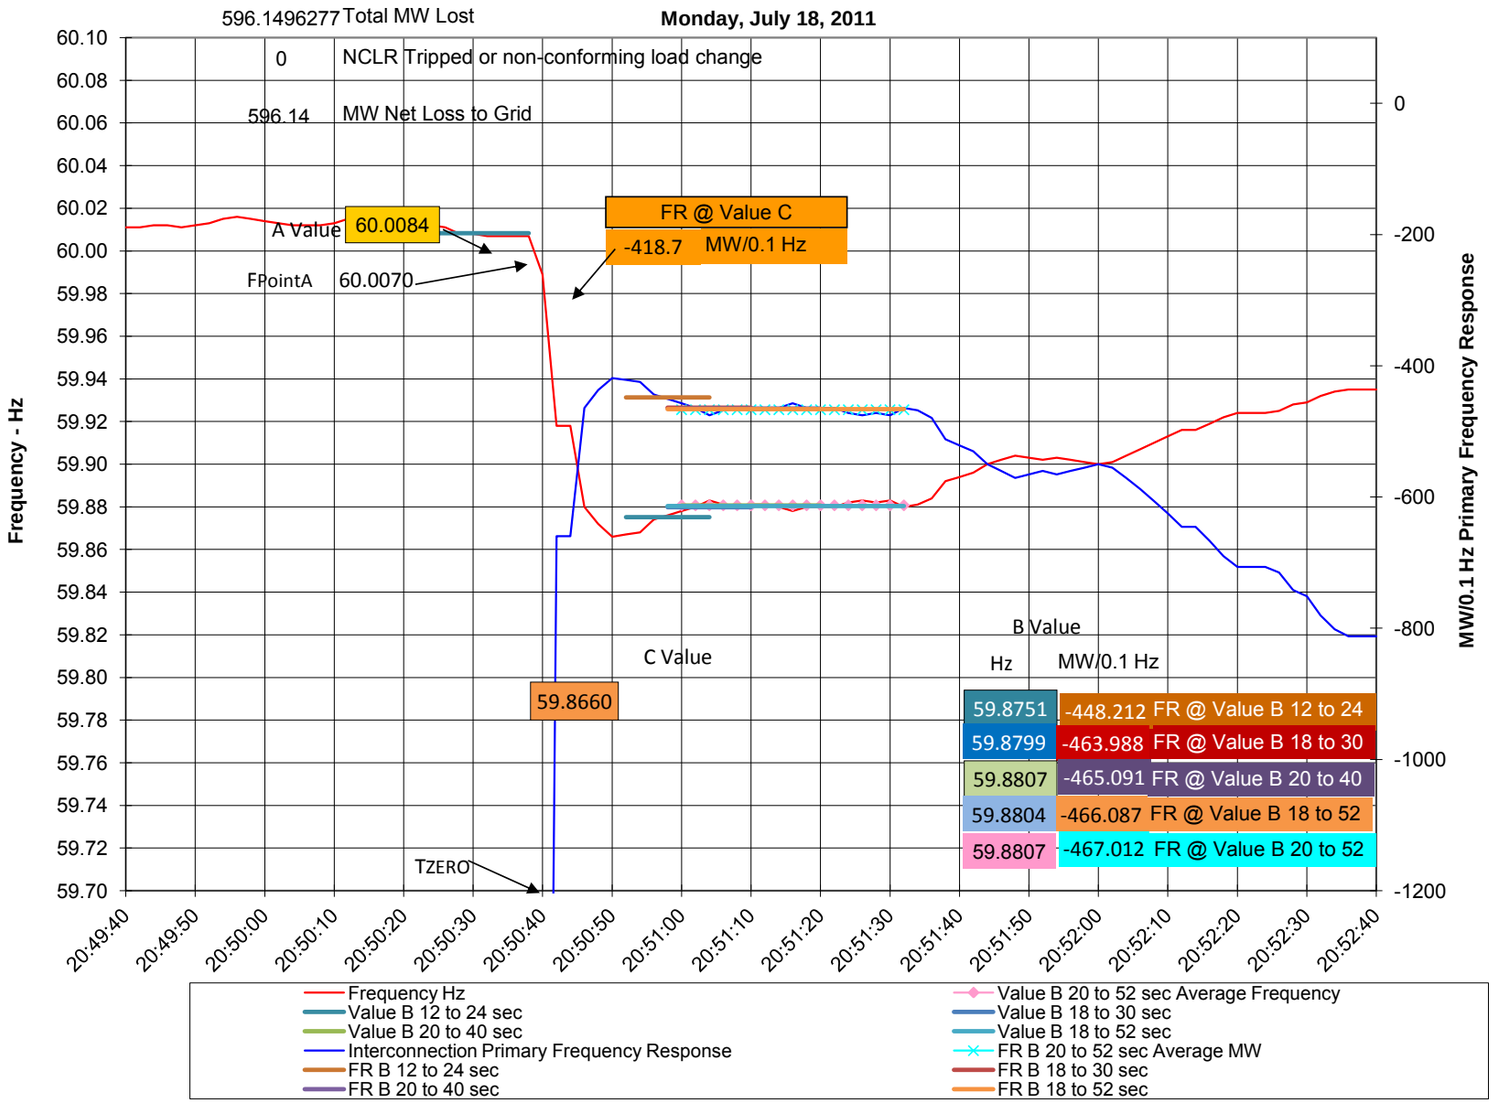
Step 5. Paste data into FRS Form 1 in the appropriate row on the "BA Event Data" worksheet.

Step 6. Save this workbook using the following file name format:MyBA_yymmdd_hhmm_FRS_Form2.xlsm

11/07/18 Date yymmdd

20:50 Time hh:ss of T(0)

Where "MyBA" = your BA mnemonic



IPFR = Interconnection Primary Frequency Response

scan rate	2 seconds	Date:	Monday, July 18, 2011		
		Time of T(0)	20:50:40		
		Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz	20:54:00		
		Value A Pre-Perturbation Average Frequency [T(-2) to T(-16)]	60.0084	Hz	
		Value B Post-Perturbation Average Frequency [T(+20 to T(+52)]	59.8807	Hz	
		Pre to Post Perturbation Delta Frequency Actual	-0.128	Hz	
		Value A Pre-Perturbation Average Interchange MW [T(-2) to T(-16)]	596.15	MW	
		Value B Post-Perturbation Average Interchange MW [T(+20 to T(+52)]	0.00	MW	
		Pre to Post Perturbation Interchange Delta MW Actual	-596.15	MW	
		Initial Performance Ramp Magnitude Adjustment	5.55	MW	
		EPFR Pre-Perturbation Average	-23.95	MW	
		EPFR Post-Perturbation Average	341.18	MW	
		EPFR Delta	365.13	MW	
EPFR = Expected Primary Frequency Response		EPFR(Final)	370.68	MW	

Balancing Authority	ERCOT		
Grid Nominal Frequency	60.000	Hz	
Capacity @ Droop for Minimum Performance	8580.0	MW	
Droop Setting	5.00%	3.00000	Hz
Deadband Setting	0.000	Hz	
Hz Span	3.00000	Hz	
Frequency Response Obligation (FRO)	-286	MW/0.1 Hz	
TC (frequency response filter constant)	1	Time Constant for delayed delivery of PFR during Sustained Measure	

Low Hz	Delta Hz Event
0.00	Actual Interchange MW Average during frequency recovery period
521.77	Target Interchange MW Average during frequency recovery period
312.99	Interchange Average Ramp MW during frequency recovery period
602.70	Actual MW @ T(-4)
-625.58	Starting and Ending Difference in Interchange MW during frequency recovery pe
0:03:20	Event Duration (h:mm:ss)
Yes	Target MW Average minus MW @ T(-4) less than zero
544.65	Interchange Target Relative Average Change - MW (Low Frequency Event)
22.88	Interchange Actual Relative Average Change - MW (Low Frequency Event)
Yes	Interchange Actual Average minus MW @ T(-4) less than zero
No	Interchange Average MW minus MW @ T(-4) greater than zero
No	Interchange Target MW Average minus MW @ T(-4) greater than zero
-80.93	Interchange Target Relative Average Change - MW (High Frequency Event)
-602.70	Interchange Actual Relative Average Change - MW (High Frequency Event)
Down	Ramp Direction during frequency recovery period

Steps **To be completed for each event evaluated.**

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, mm/dd/yy HH:MM:SS
Column B: Frequency Hz
Column C: Total Lost Generation: enter the MW data of the units that tripped as a single generator where the value typically goes to zero at t(0).
Column D: not applicable
Column E: Non Conforming Load
Column F: Pumped Hydro
Column G: not applicable
Column H: not applicable
Column I: not applicable
Column J: BA Bias Setting
Column K: BA Load

2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign (+/-) convention defined in FRS Form 1.

3 Data compression must be turned off for each data point. Quality data will give you quality results in the evaluation.

4 Data must be at 3 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event.
The spreadsheet will work with larger sample size data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data. The data must be numbers not text.

5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list.
Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency.
This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 313 of the data.

6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A313"

7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 424.

8 Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data!A424"

9 Skip for single BA Interconnections.

10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook.
Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

Steps **To be completed once at the initial setup of the evaluation spreadsheet for your BA.**

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".

B Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: -80 MW/0.1 Hz (This value could change annually)

Note: For ease of use, only the necessary worksheets are displayed. If you are interested in viewing graphs and other hidden worksheets, select the "tab" at the bottom, right click, select unhide and select the worksheet you wish to unhide.

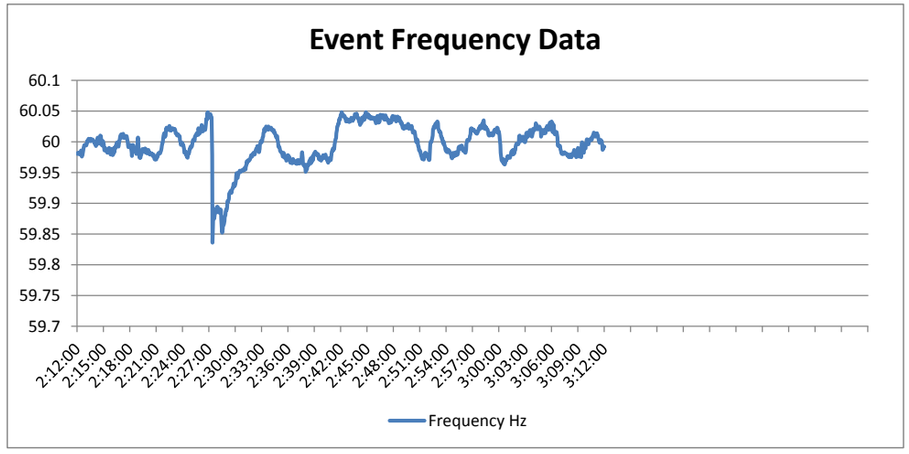
Balancing Authority Name:	HQ
Balancing Authority Frequency Response Obligation (FRO from FRS Form 1)	-141

Note: See "Instruction" tab for more detailed instructions.

Step 1.	Copy and Paste Event Data into the appropriate cells of the "Data" worksheet. Maintain date and time format of mm/dd/yy hh:mm:ss.	
Step 2.	Determine Time of T(0) and edit formula in cell "C8" to reference the correct row of the "Data" worksheet. T(0) is the first change in frequency of about 0.010 Hz (10 mHz) which should be the first scan of frequency data of the event.	2:27:21
Step 3.	Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz	2:32:54
Step 4.	Hit the big blue button to copy your data for pasting into FRS Form 1 "BA Event Data" worksheet.	

Copy Data for Pasting into Form 1



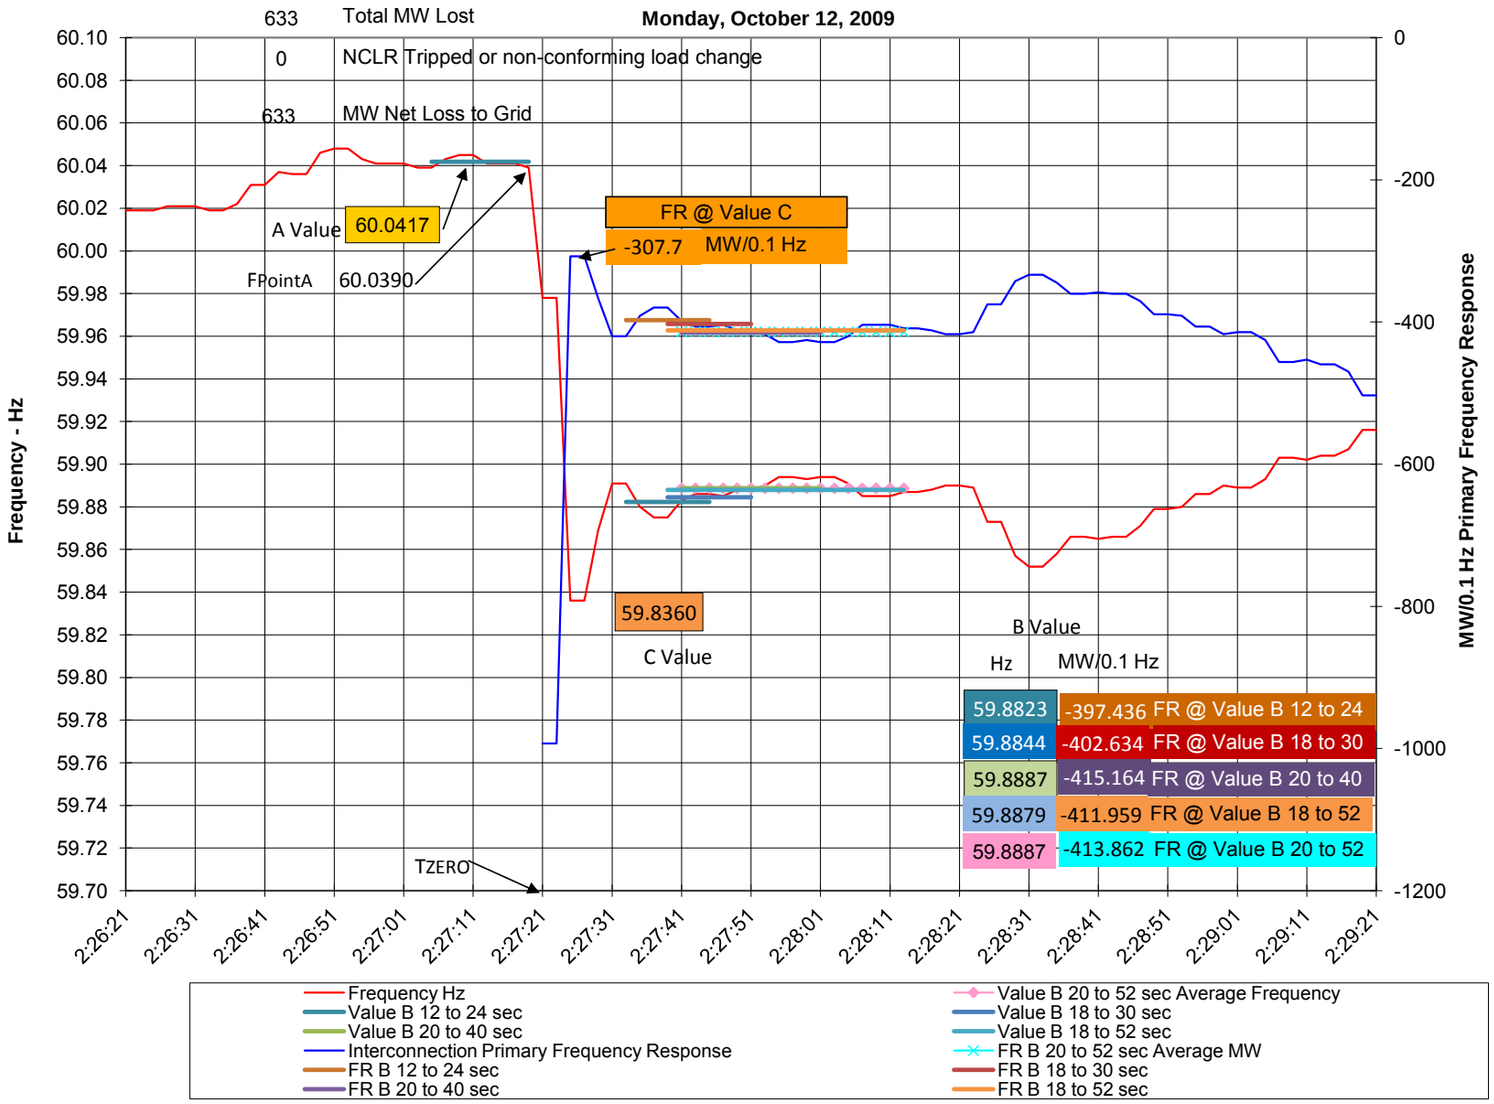
Step 5. Paste data into FRS Form 1 in the appropriate row on the "BA Event Data" worksheet.

Step 6. Save this workbook using the following file name format:MyBA_yymmdd_hhmm_FRS_Form2.xlsm

09/10/12 Date yymmdd

2:27 Time hh:ss of T(0)

Where "MyBA" = your BA mnemonic



IPFR = Interconnection Primary Frequency Response

scan rate	2 seconds	Date:	Monday, October 12, 2009		
		Time of T(0)	2:27:21		
		Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz	2:32:54		
		Value A Pre-Perturbation Average Frequency [T(-2) to T(-16)]	60.0417	Hz	
		Value B Post-Perturbation Average Frequency [T(+20 to T(+52)]	59.8887	Hz	
		Pre to Post Perturbation Delta Frequency Actual	-0.153	Hz	
		Value A Pre-Perturbation Average Interchange MW [T(-2) to T(-16)]	633.00	MW	
		Value B Post-Perturbation Average Interchange MW [T(+20 to T(+52)]	0.00	MW	
		Pre to Post Perturbation Interchange Delta MW Actual	-633.00	MW	
		Initial Performance Ramp Magnitude Adjustment	0.00	MW	
		EPFR Pre-Perturbation Average	-58.87	MW	
		EPFR Post-Perturbation Average	156.92	MW	
		EPFR Delta	215.79	MW	
EPFR = Expected Primary Frequency Response		EPFR(Final)	215.79	MW	

Balancing Authority	HQ	
Grid Nominal Frequency	60.000	Hz
Capacity @ Droop for Minimum Performance	4230.0	MW
Droop Setting	5.00% 3.00000	Hz
Deadband Setting	0.000	Hz
Hz Span	3.00000	Hz
Frequency Response Obligation (FRO)	-141	MW/0.1 Hz
TC (frequency response filter constant)	1	Time Constant for delayed delivery of PFR during Sustained Measure

Low Hz	Delta Hz Event
0.00	Actual Interchange MW Average during frequency recovery period
437.58	Target Interchange MW Average during frequency recovery period
348.10	Interchange Average Ramp MW during frequency recovery period
633.00	Actual MW @ T(-4)
-693.63	Starting and Ending Difference in Interchange MW during frequency recovery pe
0:05:33	Event Duration (h:mm:ss)
Yes	Target MW Average minus MW @ T(-4) less than zero
498.21	Interchange Target Relative Average Change - MW (Low Frequency Event)
60.63	Interchange Actual Relative Average Change - MW (Low Frequency Event)
Yes	Interchange Actual Average minus MW @ T(-4) less than zero
No	Interchange Average MW minus MW @ T(-4) greater than zero
No	Interchange Target MW Average minus MW @ T(-4) greater than zero
-195.42	Interchange Target Relative Average Change - MW (High Frequency Event)
-633.00	Interchange Actual Relative Average Change - MW (High Frequency Event)
Down	Ramp Direction during frequency recovery period

Initial Response P.U. Performance 2.933 P.U.

No Evaluation P.U. Sustianed Response P.U. Performance

Standards Announcement

Project 2007-12 Frequency Response
Initial Ballot Window and Non-Binding Poll
Now Open: Nov. 30 – Dec. 9, 2011

Available Now

An initial ballot of BAL-003-1 – Frequency Response and Frequency Bias Setting and its associated implementation plan, and a non-binding poll of the associated VRFs and VSLs, are open through 8 p.m. Eastern on Friday, December 9, 2011.

In addition to the standard and implementation plan, the following documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document – Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A – ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B – ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions – two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second, five second and six second intervals) – Both Form 1 and Form 2 are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.

- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically.

Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard and opinion for the non-binding poll from the following page: https://standards.nerc.net/CurrentBallots.aspx

Instructions for Commenting

A formal comment period is open through 8 p.m. Eastern on Friday, December 9, 2011. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments with a Ballot

Please note that comments submitted during the formal comment period, the ballot for the standard, and the non-binding poll of VRFs and VSLs all use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments (one through the electronic form, one with the ballot, and one with the non-binding poll). **The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.**

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will consider all comments and determine what changes to make in response to stakeholder input from the comments.

Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the reasons for the decline in Frequency Response

can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

Additional information is available on the project webpage.

A stakeholder interested in following the Frequency Response Standard Drafting Team's development of BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" email list, send a note to sarcomm@nerc.net and include the project's name in the subject line.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Project 2007-12 Frequency Response

Ballot Pool Windows Now Open: Oct. 25 – Nov. 23, 2011
Formal Comment Period Open: Oct. 25 – Dec. 8, 2011
Initial Ballot and Non-Binding Poll Window: Nov. 29 – Dec. 8, 2011

Available Now

BAL-003-1 – Frequency Response and Frequency Bias Setting, an implementation plan and several additional associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Thursday, December 8, 2011. Ballot pools are being formed and the ballot pool windows are open through 8 a.m. Eastern on Wednesday, November 23.

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document – Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A – ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B – ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions – two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second and five second intervals) – Both forms are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.

- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically

Instructions for Joining Ballot Pools for BAL-003-1 and Associated VRFs/VSLs

Two separate ballot pools are being formed – one ballot pool for Registered Ballot Body (RBB) members interested in balloting of BAL-003-1, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with BAL-003-1. RBB members who join the ballot pool for the standard **will not** be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)
The list server for the initial ballot is: bp-2007-12_Freq_Resp_in@nerc.com
Non-Binding Poll list server: bp-2007-12_NB_OCT2011_in@nerc.com

Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team is planning a webinar in November to explain changes to the most recent draft of BAL-003-1. The date and registration information will be announced as soon as the details are finalized. An initial ballot of BAL-003-1 will be conducted beginning on Tuesday, November 29, 2011 through 8 p.m. Eastern on Thursday, December 8, 2011.

Background

Project 2007-12 Frequency Response

Initial Ballot and Non-Binding Poll Results

Now Available

An initial ballot and non-binding poll of BAL and its implementation plan concluded on December 9, 2011. Voting statistics are listed below, and the Ballot Results webpage provides a link to the detailed initial ballot results.

Initial Ballot Results

Quorum: 93.92%

Approval: 30.82%

Non-Binding Poll Results

89.49% of those who registered to participate provided an opinion or abstention; 37% of those who provided an opinion indicated support for the VRFs and VSLs that were proposed.

Next Steps

The drafting team will consider all comments received during the comment period and ballot.

Measures are more specific and measurable than seen in the past. This is a positive improvement.
Yes
Hard to follow the language for the VSL for R1. Suggest using formulas for ease of interpretation or provide an example in the Supporting Documentation.
Yes
Yes
Yes
Need to clarify that 2012 Bias setting will be based on 1% of peak load or generation until approval of BAL-003-1 by FERC establishing the .08% of peak load or generation minimum threshold.
Yes
Bonneville Power Administration
Chris Higgins
Yes

No
Regarding R1, BPA believes that adding additional requirements in R1 by referencing Attachment A does not add clarity. FRO should be a calculation that the BA's can do themselves and included within the standard. Can Form 1 be changed outside of the standard drafting process? BPA doesn't believe that Form 1 should be allowed to be changed outside of the standard drafting process. As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. BPA recommends clarifying this concept and possibly including an example in the background document to help explain how this would work. Regarding R2, BPA believes each BA should be able to calculate its own frequency bias setting without ERO validation. The standard can require the BA to use Form 1, if the BA doesn't use Form 1 correctly, then the BA would be in violation of the standard. BPA believes that R3 should include a minimal amount of time (suggesting a couple of hours per year) to allow for testing other modes. Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode… unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. BPA recommends including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. BPA seeks clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 – Automatic Time Error Correction. BPA agrees with the concept of R4, however, BPA again disagrees with the ERO validation of the frequency bias setting. BPA believes that reducing frequency bias obligation is detrimental to reliability. It seems that lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. BPA believes that over time, it would seem that this pattern would lead to poorer response. BPA believes that R5 should read "greater than or equal to one of the following" not " at least equal to". The requirement should be a part of Form 1 or included in R2. For variable bias, the minimum percentage should be based on the forecasted month peak.
Yes
No
BPA believes that historian data should be able to be used for evidence.
No
BPA believes that R1 needs to be more clear and concise as to what is being conveyed in the requirement. It is difficult to understand. The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO. BPA believes that conforming changes to the VSLs would need to be made for any changes to the Requirements as suggested in the comments to the standard.
No
BPA believes that Attachment A adds additional requirements to the standard. Confusion exists between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but the Background Document states it will use "historical" Peak Load and Generation. 3a: it may take longer than 8 seconds in some disturbances. This should be 10 seconds. .05 Hz Delta F is not low enough for the Western Interconnection, it should be .075Hz to ensure there is measurable frequency response for the interconnection. Also, under frequency should be set at 59.95 Hz. BPA does not believe there is a reliability need to include over frequency events. 3b: It is unclear if the 18 seconds is setting the B point. If this is the B point, BPA believes it should be changed to 25 seconds for the Western Interconnection. 4. Please define relatively steady and near 60 Hz. 6: For the Western Interconnection, BPA believes this needs to be 10 minutes at the top of the hour. As mid hour scheduling becomes more prevalent, the ramping at

the bottom of the hour will have to be taken into account. FRO for the interconnection: Starting frequency should be the FTL limit. With RBC in place, the frequency is seldom at 60 Hz. BPA understands the theory behind setting the base obligation to the values listed in table 2. BPA would like to know if there were any studies performed to validate setting the FRO for the interconnection to such a low level? BA FRO and frequency bias setting: BPA does not agree with ERO assigning a Frequency Bias setting to each BA. This calculation is indicated as the initial FRO allocation, what is the process for changing it? BPA believes this should go through the standard drafting process for any changes. The calculation should use Peak online capacity, not the installed capacity. This would lead to the denominator being 2 X Peak projected load for the interconnection. BPA has approximately 35,000 MW of installed generation, and has never seen the actual coincidental generation go over 21,000 MW. Again, BPA doesn't believe the ERO should be validating the frequency bias setting. It is unclear to BPA how variable bias is being addressed in the standard.
No
BPA understands the concept and we disagree with it. As the ERO continues to lower the required minimum frequency bias setting for an interconnection, the BA's that have frequency response higher than the 1% will have a higher percentage of the frequency response of the interconnection. Also, this standard is primarily measuring AGC response, not natural frequency response; therefore not lowering the limit is appropriate.
No
BPA believes the form is not easily understood and is overly complicated for what it is trying to accomplish. BPA believes the form might work for an internal evaluation, just not for an external audit. Compliance is based on this form. BPA believes the standard needs to be simplified and possibly returned to a data gathering standard.
BPA believes that an entity is not measuring frequency response from 20 – 52 seconds; rather, that the entity is measuring AGC response which is based on the frequency bias term. This leads to a circular argument, because that entity would be using frequency bias setting in AGC to calculate frequency bias setting for the next year. Also, because an entity is measuring AGC response and net interchange and not taking pre-disturbance ACE into account, a BA frequency response may not be reflected in the spreadsheet. Example: If the BA has a positive ACE of 300 MW and the frequency component of ACE during an event is 200MW. Immediately following the disturbance, natural frequency response will drive net interchange up by 200MW. During the time frame being measured (20-52sec), AGC response will drive the on control generation down by the original 300 MW ACE, which will look like the BA had an opposite response at the interconnections in the amount of 100MW. Form 1: It is unclear in Form 1 how variable bias BA's would implement this standard. There is a note identifying a tab to use, but it is unclear if that is the only requirement for variable bias BA's. In the comment responses to BPA, it was indicated that "the SDT will provide additional and sufficient direction related to variable bias after review of this issue during the field trial." BPA finds this response unacceptable and believes that it needs to be addressed in the standard prior to approval. BPA believes the standard should be easy to understand and implement and should not rely on the judgment of the ERO. BPA believes this standard needs to be simplified. BPA believes this standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz, or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. Lastly, BPA asks, why are there no requirements on governor installation, settings, and operation for a frequency response standard?
Howard F. Illian
Energy Mark, Inc.

Yes
No
Comment 1: The timing requirements for implementing the Frequency Bias Setting are not specified for BAs participating in Overlap Regulation Service. The requirements indicate the value that should be used for the Frequency Bias Setting, but they do not indicate when those settings should be implemented. Comment 2: The term "Tie Line Bias mode" in Requirement R3 is not sufficiently defined to make this requirement enforceable. Any operating mode labeled as "Tie Line Bias mode" on an EMS that uses interchange scheduled and frequency error as inputs will meet the standard requirement as stated. This loop-hole exists because the NERC definition of "Tie Line Bias" fails to define the term in enough detail to actually limit AGC operation to the specified mode of operation. One way to improve this requirement would be to redefine Tie Line Bias in the NERC Glossary as a mode that uses the NERC ACE Equation as defined in BAL-001 as the basis for AGC action when the EMS is in Tie Line Bias mode. Comment 3: The standard is silent on how a BA receiving Overlap Regulation Service should set its Frequency Bias Setting. Unless this is explicitly stated, it will be up to the auditors to determine the value of the Frequency Bias Setting for BAs receiving Overlap Regulation Service. Comment 4: In general, the requirements indicate what the responsible BAs should do and when. The requirements do not indicate what the BAs that are not responsible should do and when, ie. how they are relieved from responsibility. This may create problems when the auditors are required to interpret the standards for BAs that have appropriately shifted responsibilites to others.
No
Comment 5: See comments in the non-binding poll.
Yes
Yes
No
Comment 6: "If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria will be included with the data set by the ERO for determining FRS compliance." I believe that the better alternative in this case would be to use the lesser number of events. This is partly based on the consideration that if there are fewer events, the risk to the interconnection for that year was less that expected, and as a result, evaluation of fewer events will not compromise interconnection reliability. If fewer than 25 events are available in any year, the selection criteria should be adjusted to select more events. Comment 7: There are a number of problems with the use of "median" Frequency Response of the measured events. These problems make a choice other than median preferable. The following comments list some of those problems. Comment 8: The current standard uses average Frequency Response of selected events. This makes the current standard incompatible with the use of median. Comment 9: If a BA reconfigures during a measurement year, that reconfiguration will create a bi-modal distribution of the Frequency Response events. Median is incapable of representing a bi-modal distribution. The use of median will result in a standard that is incapable of measuring compliance effectively for an BA that is reconfigured during a measurement year (Dec 1 thru Nov 30). Comment 10: Any attempt to purchase additional Frequency Response from another BA for a portion of a measurement year will also cause a bi-modal distribution making the purchase of Frequency Response only effective for entire measurement years. Comment 11: Median is a non-linear measurement method. Because it is a non-linear measurement method, there is no valid way to manage partial year measurements. Comment 12: I will offer an alternative to median to the SDT before the end of the development of responses to these comments. Comment 13: The Minimum Frequency Bias Setting and the Frequency Response Obligation are both based on a method that assigns responsibility based on a Peak Load / Peak Generation share of the interconnection. However, the method used to set the Minimum Frequency Bias Setting is different than the method used to determine the Frequency Response Obligation. Using these two different methods could result in the Minimum Frequency Bias Setting being less that the FRO for a BA. The best way to correct this problem is to use that same allocation methodology for determining the FRO and the Minimum Frequency Bias Setting. This can be easily accomplished by modifying R5 to use the

FRO allocation method to determine the Minimum Frequency Bias Setting. This calculation would divide the numerator from the FRO allocation equation, divide it by two and multiply it by the percentage specified in Attachment B. In fact, the current FRS Form 1 uses this equation with projected rather than historic data. The best alternative would be to modify the R5 in the standard to match the FRO allocation method and modify FRS Form 1 to use historic data instead of projected data. This would result in only one set of Peak Load and Peak Generation data throughout the standard, rather than three different sets of data as currently written. When multiple sets of the same or similar data are used within a single standard, it only creates confusion and errors in the result.
No
Comment 14: Some of the information in this document concerning the Frequency Bias Setting for BAs participating in Overlap Regulation should be moved to the Supporting Document. This change would help in addressing Comments 3 & 4 under Question 2.
Yes
Comment 15: This Yes answer assumes that the SDT addresses Comment 13 under Question 6 in these comments.
Yes
Comment 16: In the Consideration of Comments document, the SDT stated that the regression calculation in FRS Form 1 had been corrected. The regression calculation is still incorrect. Comment 17: Attachment A contains the following statement; "**In the Base Obligation measure for Texas, 1150 MW (Load Resources triggered by Under Frequency Relays at 59.70 Hz) was reduced from its Contingency Protection Criteria level of 2750 MW to get 229 MW/0.1 Hz. This was reduced to accurately account for designed response from Load Resources within 30 cycles." This load triggered by Under Frequency Relays is a unidirectional response. It responds as frequency drops but does not provide the alternative response as frequency recovers. The result is a continuous frequency response that may be insufficient for increasing frequency events. Additionally, it is only available once even for oscillatory frequency events. This type of response is very useful to supplement the continuous, bi-directional response provided by governors, load and other resources, but its overuse can lead to reliability issues when it is relied upon too much. This standard fails to put any limit on the use of this type of unidirectional, single use resource for meeting the Frequency Response requirements in this standard. Since this kind of Frequency Response is significantly less expensive than continuous, bidirectional response, its inclusion without limitations creates a significant reliability loop hole in this standard. Although, it is unlikely that this problem can be corrected within the current standard development timeline, NERC should initiate investigations that will result in the setting of appropriate limits and valuation of the use of these types of resources before there is significant penetration to comply with this standard. Illustrating this problem is easily done by evaluating an interconnection with 100% of its Frequency Response provided by unidirectional, step response resources. An interconnection configured in this manner in unstable and cannot survive even a small disturbance. Failure to close this loophole quickly could compromise interconnection reliability. Comment 18: The problem described in Comment 17 exists partially because the FRR SDT has failed to provide a comprehensive definition of Frequency Response as part of this standard. Without a good definition, the default definition becomes "any response that improves the measurement method" as implemented. As with the previous comment, NERC should address this weakness in a timely manner. Otherwise, it may face the undesirable task of disallowing response that improves the measure or modifying the measure to prevent inappropriate abuse. For example, a step load response that occurs 15 seconds after a frequency event will improve the Frequency Response as measured by this standard, but will not contribute to limiting the Arrested Frequency Response and will have little positive affect on reliability.
Don McInnis
Florida Power & Light Company
Yes
Yes
No

Could not find the Risk Severity Levels in the documents.
No
What is meant by documented formulae for M5? Is a one time snapshoot of the AGC formual sufficien? The concept is ok but this needs clarification of proof.
No
For R1 the low and high level descriptions appear to be identical and the high level is less than the medium risk level. For R3 there should be low, medium, and high levels. One BA not operating to TLB does not jepordize the Interconnection. Additionally, computer failures, database loads etc may require some period where TLB is not in service. Suggestion would be Lower VSL operation off of TLB for more than 5 but < 8 continuous hours or accumlative during the year of more than 8 < 16 hours. Medium VSL would be operation off of TLB for more than 8 but <16 continuous hours or accumlative during the year of more than 16 <24 hours. High VSL would be operation off of TLB for more than 16 <24 continuous hours or accumlative during the year of more than 36 <48 hours. Severe VLS would be >24 continuous hours off of TLB or accumlative of > 48.
No
In the table on page2 the asterick references a statement that the 59.7Hz used in Florida is a special protection scheme. This is incorrect. The special protection scheme setting was 59.82Hz and was done away with in 2005 or earlier. The 59.7Hz setting used within the FRCC is based on FRCC TWG studies that require this level of setting to protect the state in the event of a separation and to protect nuclear equipment. FPL supports the use of the C(N-2) critiera. Additionally, the reference to the FERC714 report that is currently in the background data should be made part of attachment A not separated. FPL fully agrees with Table 1 The formula used to derive the FRO is inconsistant with the definition used for requirement R5. R5 states that the load is " within the BA's metered boundary". The load used in the formulae is taken from FERC714. The yearly peak demand used in R5 should be the peak monthly load from June, July or August as reported on FERC714 to be compatible with the FRO formula.
Yes
No
There is no technical justification provided either in the attachment or background data for the initial starting value of 0.8%. This is acceptable but is arbitary. Additionally, the last sentense on page 1 of Attachment B should be changed to read " the ERO must reduce (in absolute value) the minimum Frequency Bias Settings for BA's within that Interconnection, by 0.1 percentage point from its previous annual value, to better match the Frequency Bias Setting to the natural Frequency Response or provide technical justification for not implementing the reduction
Yes
This standard is an excellent start on a very difficult topic and the technical explainations are very sound. Requirement R1 needs to be modificed somewhat as it currently implies that if a BA is a member of a RSG the frequency response obligation automatically assumed to be a RSG obligation. The RSG role may be strictly for reserves with the members of the BA meeting their own FRO. Perhaps a footnote stating that the FRO and reserve obligations can be separated out.

3. – How many seconds of observation for “Delta F”? Does “Point C” in a. refer to “Figure 1 – Classic Frequency Excursion and Recovery” from NERC’s Survey Instructions document dated September 1,

2010? If so it should be included in this document along with the added 8 and 18 second time lines being shown. What is a “narrow range” in item b.? 4. – Better define “relatively steady” (i.e. within a specific range and state it?) Also, “near 60.000 Hz” is not precise enough (i.e. if the event begins below 60.000 Hz, what range or time error correction is to be considered acceptable?) Is the “A” value also part of the figure cited in 3? 5. - Is the “B” value also part of the figure cited in 3? 6. – Change “should be excluded” to “will be excluded”. 7. – Better explain “the cleanest 2 or 3 frequency excursion events” or remove the word “cleanest”. Page 2 paragraph 5: Provide specific dates for the “quarterly postings” and where these will be posted (i.e. Internet address or other). Clarify the December 15 ERO annual post date with the dates stated for same posting on Page 3 paragraph 5 and the BA’s January 10 deadline. The BA posts 30 days from which date? This is confusing. Page 2 Table 2: What of starting event frequencies that are < 60 Hz? Why is the “Highest UFLS” 59.6 when the Florida setting for its load is 59.7? Page 3 FRO equation: Page 4 of the “Frequency Response Standard Background Document, October 2011” also shows this equation but uses different terms. Make the same on both documents. In the Background Document each component of the numerator is explained and reference is made to FERC Form 714 to obtain these values. There is no reference to this form for the denominator values. All of this needs to be made clear with reference to FERC Form 714 on Attachment A.
Yes
Yes
Last paragraph: As stated, would that make the Minimum Frequency Bias Setting 0.7% of peak load or generation? A numerical example shown would help clarify this paragraph.
No
FRS Form 2 – Two-second Sample Data Instructions tab/worksheet: What is referred to as or meant by the ‘master event list’? 4. – Regarding 2 second sample rate for 25 minutes starting 2 minutes before event begins and 15 minutes after it begins, does this add up to 25 minutes or are additional minutes being required for collection? Also, FPL can report frequency at this rate, but can only report load in MW every four seconds. Move to 4 second sample rate. 6-8. – Possible to add button to auto-populate cells C8 and C11 in ‘Entry Data’ tab from the new column C and cell identifying the desired frequency change time and simplify these steps? 10. – Clarify where the “Copy” button is. Is it the one in the ‘Data’ tab or worksheet? Entry Data tab/worksheet: Step 6 should also be or be moved to the “Instructions” worksheet. Are the values in column C in the “Data” worksheet labeled “Total Lost Generation” the same as those in column AQ in the “Evaluation” worksheet? If so, why are they not both labeled “Net Actual Interchange”? What is the definition of “Non Conforming Load” in column E?
FRS Form 1 – Eastern Interconnection Instructions tab/worksheet: Step 4 – Send to whom and to what address at NERC?

Los Angeles Department of Water and Power
No
LADWP recommends the following change to the definition of Frequency Bias Setting (replace the word "discourage" with the word "prevent"). LADWP believes that this change increases the clarity of the definition: Original A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority’s Area Control Error equation to account for the Balancing Authority’s Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems. Proposed Change A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority’s Area Control Error equation to account for the Balancing Authority’s Frequency Response contribution to the Interconnection, and prevent response withdrawal through secondary control systems
No
LADWP has a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority’s Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances: - Telemetry problems that lead the operator to believe ACE is significantly in error. - The frequency input to AGC is not reflective of the BA’s true

frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). - During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). - For training purposes. - Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. LADWP believes that the language in Requirement 4 needs to be clarified and recommends the following change: - R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] LADWP believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. LADWP recommends the addition of “natural frequency response” as a third bullet item to Requirement 5. The revised requirement would read: - R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] • The minimum percentage of the Balancing Authority Area’s estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area’s estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The natural frequency response
Yes
LADWP agrees with the following VRFs: - R1 - Medium - R2 - Medium - R3 - Medium - R4 - Medium - R5 - Medium
No
LADWP recommends that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
No
LADWP recommends that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
No
LADWP considers the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. LADWP suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.
Yes
LADWP notes that the document “BAL-003-1 Background Document” seems to be reasonable.
Yes
LADWP notes that Attachment B seems to be reasonable
No
LADWP notes that Form 2 is not compatible with prior versions of Excel—it won’t even open in Excel 2003 (which is still widely used)—and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
LADWP supports project 2007-12’s general approach to frequency response, and is prepared to support the ballot once several problematic details are corrected. LADWP notes that the time allowed to analyze the final “official” set of 25 events for each year, from Dec 15 to Jan 10, is relatively short and coincides with the holiday vacation season. Could this time either be extended by 2-4 weeks or shifted to another part of the year (in addition to reducing the number of events to be analyzed)? LADWP would like to see addressed in the Standard how the case is to be addressed where a BA simply has no frequency response information to provide, as could happen for a small 1-2 generator BA which has its generators out of service for an extended period for maintenance or upgrades. Assuming the BA purchases frequency response services from another entity during this period, is the BA out of compliance with the proposed Standard simply because it has no data report? And how is its next-year obligation to be computed? These issues should be addressed in the Measures or Additional

Compliance information. If these are issues for “lawyers” as the Standards Drafting Team indicated during the November 14, 2011, webinar then the team should engage a NERC lawyer to resolve them prior to releasing the Standard for ballot.
Thomas Washburn

Yes
No
• R1. Each Balancing Authority (BA) or Reserve Sharing Group (RSG) shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection. [Risk Factor: Medium][Time Horizon: Operations Assessment] The BA does not have control over the frequency responsive generation. There needs to be a requirement that the GOP shall set frequency response for the generators as directed by the BA. • R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is {greater than or (<= add these words)} {at least (<= delete these words)} equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] • The minimum percentage of the Balancing Authority Area’s estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area’s estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.
Yes
Yes
Yes
No
• Item 2 should be changed as follows: The ERO will identify at least 25 frequency excursion events in each Interconnection for calculating the Frequency Bias Setting and the FRM. If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria will be included with the data set by the ERO for determining FRS compliance. (as written this item could cause double jeopardy for event from the previous period) • Under FRO for the Interconnection the first sentence should be changed as follows: “The ERO {Each Interconnection (delete these words)} will establish target contingency protection criteria for each Interconnection.” (each Interconnection is not a governing entity) • The footnote under Table 2 of Attachment A should be changed as follows: The Eastern Interconnection set point listed is a compromise value for the highest UFLS step setting of 59.5Hz used in the east and the {special protection scheme’s (delete these words)} highest UFLS step setting of 59.7Hz used in Florida. It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS {special protection scheme (delete these words)} to “false trip”. (this is not a special protection system; it is just an UFLS)

No
R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - recommend modifying the language to permit AGC out of TLB mode if the RC is notified; also remove the "to ensure coordinated control" as this is not essential for the requirement. Our reasoning behind the suggested change to notification of the RC is that there are occassions where an entity would need to perform testing, etc and it could be argued that testing would not be sufficient justification for meeting the Adverse Reliability Impact definition. Here is proposed revised language: Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless the Balancing Authority's Reliability Coordinator has been informed and the duration is [insert time constraint language here].
No
Based on our suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language.
Yes
No
Confusion exists around the “peak load” in that the Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where does that value come from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity?
No
Same comment here as the one in question 6.
No
There could be some confusion caused by the Attachment B due to the use of the word “initially” when the reference is made to the current standard. The drafting team should change the word “initially” to “currently” or strike it to avoid the potential confusion.
Yes
It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form.
It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities’ response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities can not know what is expected of them and therefore can not plan appropriately.
Kathleen Goodman

ISO New England Inc
No
The FRM definition should not refer to FORM 1. Also, we offer the following alternative wording for frequency bias setting; “A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority’s Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority’s area.”
No
We do not agree with placing a requirement on Balancing Authorities, as generators are the main supplier of “discretionary” frequency response. Also, the requirement refers to an attached form, which is not part of the standard and therefore not enforceable.
Yes
No
The sampling interval needs to be tuned on a per Interconnection basis to support HQTE’s characteristics
No
The violation severity levels for R1 seem to be reasonable. However, the technical writing needs to be enhanced for clarity
No
We suggest the SDT to first determine if the materials in the revised Attachment A & B are “Guideline” or Technical Background”, or are they “requirements”. If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO’s process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA’s obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, BAL-003-1- Attachment A 1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to the “cleanest events”. Perhaps a statement of what constitutes a “clean event” is needed to avoid possible controversy in the future. 3. The use of 59.6 Hz as the highest UFLS setting seems flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or, it should be 59.5 Hz without concern for Florida’s unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer “alternate FRO protection criteria”. It seems that the Interconnection should have been an integral part of establishing its obligation. Also, it states that the “ERO will confirm” the “alternate FRO protection criteria”. Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority’s FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. Also, the background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Very recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A sampling interval.
No
See first comment in 6 above. Also, Frequency Response Standard Background Document – 1. Cite Attachment B in addition to Attachment A in the discussion of requirement 1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6, drop the inappropriate recommendation of getting

frequency response through supplemental regulation. It is inappropriate to try to substitute a “minute plus” product that is deployed centrally by the Balancing Authority for a “sub-minute” product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it! This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the requirement. The requirement says that any time within the designated date is acceptable. 6. On page 8, the inclusion of “for training purposes” as a reason to not operate in tie line bias control should be dropped. This sort of training can be done in a training simulator. Alternatively, if it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: “This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations” is difficult to understand. The paragraph would read better by simply dropping it.
No
We suggest the SDT to first determine if the materials in the revised Attachment A & B are “Guideline” or Technical Background”, or are they “requirements”. If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO’s process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA’s obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement.
Yes
ISO New England will not vote to approve the standard because it fails to place requirements on generators to provide frequency response. There are four substantive problems: • Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz • Using installed capacity in determining the Frequency Response Obligation • The sampling interval needs to be tuned on a per Interconnection basis to support HQTE’s characteristics • Do not advocate the use of supplemental regulation as a method of procuring frequency response Additionally, the SDT must decide on what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the point of defining how often to run Frequency Response Surveys; it does not crisply define the “Interconnection” obligations. If the SDT does want to focus on performance then the issue of who is the default provider must be addressed. As the IRC has noted previously, all BAs do not own the service providers. To create standards that apply to entities that are dependent on other function entities to comply with a standard requirement is of great concern.

R1: TEP feels that the FRO should be able to be calculated by the BA and that Form 1 changes should be treated via the Standard drafting process. R2: TEP feels that use Form 1 should be required by the Standard. Further, BAs should calculate its own frequency bias setting without ERO intervention. R3: Operating outside Tie Line Bias mode should be allowed during a year to allow for the testing of other modes. R4: Agree with the concept, but without ERO intervention. R5: Should read "greater than or equal to".
Yes
No
It should be clear that historical data may be used to show compliance.
No
VSL's could be clearer and simpler. Allowance for the testing of other AGC modes should be considered.
No

Attachment A creates additional requirements to the BAL-003-1 Standard. The arrested value of frequency observed within 8 seconds may not be long enough in some instances. The delta F in the West should be greater than 0.05 Hz to ensure a measurable frequency response. West Under Frequency should be set at 59.95 Hz. There is no reliability concern for Over Frequency. Does 18 seconds after the start of the disturbance set point B? Pre-disturbance frequency should be relatively steady and near 60.000 Hz is vague. TEP feels that the ERO should not need to validate a BAs frequency bias setting.
Yes
No
Reducing a BAs frequency bias setting may have an adverse impact on recovering from a frequency event once you get past the first 8-10 seconds. A larger bias will allow for actual and sustained AGC generator responses. Industry focus should be on generator governor response within the first 8-10 seconds.
No
TEP feels that Form 2 is a useful tool for internal BA use and should not be used for compliance purposes.
The BAL-003-1 Standard should be simplified and should not rely on the judgement of the ERO. Thanks to the drafting team for their efforts and for taking on this important aspect of Interconnection reliability.
Dennis Sismaet
Seattle City Light
No
LADWP and SCL recommend the following change (in red) to the definition of Frequency Bias Setting. LADWP believes that this change increases the clarity of the definition: Original A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems. Proposed Change A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage prevent response withdrawal through secondary control systems
No
• LADWP and SCL have a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances: - Telemetry problems that lead the operator to believe ACE is significantly in error. - The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). - During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). - For training purposes. - Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. • LADWP and SCL believe that the language in Requirement 4 needs to be clarified and recommends the following change (in red): R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) calculate the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] • LADWP and SCL believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. SCL recommends the addition of "natural frequency response" as a third bullet item to Requirement 5 (in red). The revised requirement would read: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium][Time

Horizon: Operations Planning] • The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The natural frequency response
Yes
LADWP and SCL agree with the following VRFs: - R1 - Medium - R2 - Medium - R3 - Medium - R4 - Medium - R5 - Medium
No
LADWP and SCL recommend that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
No
LADWP and SCL recommend that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
No
• LADWP and SCL consider the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. SCL suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.
Yes
• LADWP and SCL note that the document "BAL-003-1 Background Document" seems to be reasonable.
Yes
• LADWP and SCL note that Attachment B seems to be reasonable.
No
• LADWP and SCL note that Form 2 is not compatible with prior versions of Excel—it won't even open in Excel 2003 (which is still widely used)—and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
• LADWP and SCL support project 2007-12's general approach to frequency response, and is prepared to support the ballot once several problematic details are corrected. • LADWP and SCL note that the time allowed to analyze the final "official" set of 25 events for each year, from Dec 15 to Jan 10, is relatively short and coincides with the holiday vacation season. Could this time either be extended by 2-4 weeks or shifted to another part of the year (in addition to reducing the number of events to be analyzed)? • LADWP and SCL would like to see addressed in the Standard how the case is to be addressed where a BA simply has no frequency response information to provide, as could happen for a small 1-2 generator BA which has its generators out of service for an extended period for maintenance or upgrades. Assuming the BA purchases frequency response services from another entity during this period, is the BA out of compliance with the proposed Standard simply because it has no data report? And how is its next-year obligation to be computed? These issues should be addressed in the Measures or Additional Compliance information. If these are issues for "lawyers" as the Standards Drafting Team indicated during the November 14, 2011, webinar then the team should engage a NERC lawyer to resolve them prior to releasing the Standard for ballot. • Finally, SCL points out that the proposed Standard introduces a new obligation on applicable entities to maintain frequency responsive reserves. Although this obligation does not appear to be unreasonable or problematic in general, compliance may prove difficult for some entities and in some localized areas.

No
PGN supports the collective comments of SERC members.We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA,

similar to the definition for Frequency Response Obligation (FRO)?
No
PGN supports the collective comments of SERC members.We feel that the utilization of the term, “Reserve Sharing Group”, is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as “Frequency Response Sharing”. R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in “Tie Line Bias” mode
Yes
No
See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”.
No
See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”.
Yes
Yes
No
PGN supports the collective comments of SERC members. We suggest the SDT consider a term other than “Initial’ in the title for Table 1. We suggest “Proposed Frequency Bias Setting” for Table 1
Yes
PGN Supports the collective comments of SERC members. We feel that frequency response is a function of a contingency event and the Purpose Statement should recognize this relationship. We suggest the following Purpose Statement. Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations due to a contingency event and supporting frequency until the frequency is restored. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.
Michael Falvo
Independent Electricity System Operator
No
In our previous comments, we suggested to drop the definitions for the terms FRM and FRO in favor of providing the needed wording in the standard itself to take care of the specific details. The SDT did not adopt our suggestion with the reason that these definitions will be used by other standards in the future. That’s fair enough. However, the FRM definition: “The median of all the Frequency Response observations reported annually on FRS Form 1” is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/maintenance problem without any appreciable value. Once again, we strongly urge the SDT to consider dropping these definitions, and have the details fully specified in the standard body. This will eliminate the cross reference issues. After all, the definition for FRM is a simple sentence and does not provide any clarity or specific details that cannot be addressed by providing the appropriate wording in a requirement. With this cross-reference issue, combined with the issues associated with Attachments A and B (see our comments under Q6, below), we are unable to support this standard at this time.
Yes
Yes

No
M4: This measure does not read quite right. Something seems to be missing in the part that says: "…showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: "…showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."
Yes
We do not have any issues with the VSLs, but wonder if the wording for R1 should have been "…Reserve Sharing Group's…". Alternatively, the wording after "interconnection's FRO" could be revised to: "…and the Balancing Authority's or the Reserve Sharing Group's FRM was…"
No
Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on page 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest the SDT to first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS) (in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM), and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. Further, there are no measures developed for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance? We suggest the SDT to move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Finally, the two Attachments are listed in Section F – Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where appropriate).
We do not have an opinion on whether or not the Background Document provides sufficient clarity to the development of the standard. We do, however, suggest that the SDT consider our comments in Q6 above, and move some of the information from Attachments A and B to or combine with the Background Document, to provide all the technical basis and background behind the elements stipulated in the requirements.
No
Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement.
No
If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question on the additional information requested. We have a concern over this omission of attention or oversight. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not

see how adding a Form 2 can help in that regard. We suggest the SDT to look at the basic need for data submission that would suffice to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection.
The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after “applicable regulatory approval” in Section 1.3 and 1.4 of the draft standard, and in the two bullets in the draft implementation plan, to the following effect: “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.”
Northeast Power Coordinating Council
Guy Zito
No
The FRM definition should not refer to FORM 1. Also, suggest the following wording for frequency bias setting: “A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority’s Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority’s area.”
No
The requirements should not be directed at Balancing Authorities, as generators are the main supplier of “discretionary” frequency response. Requirement R1 refers to an attached form, which is not part of the standard and therefore not enforceable.
Yes
No
The sampling interval needs to be tuned on a per Interconnection basis to support HQTE’s characteristics.
No
The violation severity levels for R1 are reasonable. The technical writing needs to be enhanced for clarity.
No
The SDT has to first determine if the materials in the revised Attachment A & B are “Guideline” or Technical Background”, or are they “requirements”. If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as written Attachment A is confusing as it describes the ERO’s process for supporting the Frequency Response Standard (FRS) (the method and criteria it uses to calculate the frequency bias settings and the FRM), and at the same time the BA’s obligations to support this process. The latter requirements should not be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, regarding BAL-003-1- Attachment A 1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to “cleanest events”. A statement of what constitutes a “clean event” is needed to avoid possible controversy in the future. 3. The use of 59.6 Hz as the highest UFLS setting is flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or it should be 59.5 Hz without concern for Florida’s unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer “alternate FRO protection criteria”. The Interconnection should have been an integral part of establishing its obligation. It is stated that the “ERO will confirm” the “alternate FRO protection criteria”. Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority’s FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. The background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A

sampling interval.
No
Refer to the first comment in Question 6. For the Frequency Response Standard Background Document – 1. Cite Attachment B in addition to Attachment A in the discussion of requirement R1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6, drop the inappropriate recommendation of getting frequency response through supplemental regulation. It is inappropriate to try to substitute a “minute plus” product that is deployed centrally by the Balancing Authority for a “sub-minute” product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it. This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the standard. The standard states that any time within the designated date is acceptable. 6. On page 8, the inclusion of “for training purposes” as a reason to not operate in tie line bias control should be dropped. This training can be done in a training simulator. If it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: “This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations” is difficult to understand. The paragraph would read better by simply deleting the sentence.
No
Refer to the first comment in Question 6.
Yes
This standard as written does not place requirements on generators to provide frequency response. There are four substantive problems: • Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz. • Using installed capacity in determining the Frequency Response Obligation. • The sampling interval needs to be tuned on a per Interconnection basis to support HQTE’s characteristics. • Do not advocate the use of supplemental regulation as a method of procuring frequency response. It must be decided as to what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the target of defining how often to run Frequency Response Surveys; it does not crisply define the “Interconnection” obligations. If performance is the focus, then the issue of who is the default provider must be addressed. All BAs do not own the service providers. To create standards that apply to entities that are dependent on other functional entities to comply with a standard requirement is of great concern. FRS Form 1 is listed as being an Associated Document. Will it be attached to the standard? The acronym FRS is used in the standard. FRS should be spelled out before its acronym is used. If FRS Form 1 will not be an appendix or an attachment to the document, then a link should be provided to it, or instructions given on how to find it.
John Bussman
Associated Electric Cooperative Inc
Yes
The FRO definition incorrectly applies the historically narrow Balancing Authority scope of responsibility, while the FRM definition does not address applicability at all. But the BAL-003-1 Standard itself identifies RSGs (where applicable) and BAs as the Responsible Entities within scope of this standard. For consistency, AECI recommends using “Responsible Entities (e.g. Reserve Sharing Groups - where applicable, and Balancing Authorities)” in both the FRO and FRM definitions. Rationale: This change should help future-proof the definition, should more specific “frequency response” or “spinning reserve” sharing groups later surface within our industry. AECI agrees with the Frequency Bias Setting definition’s inclusion of a bit more functionality than typical. We however recommend replacing “to account for the Balancing Authority’s Frequency Response contribution to

the Interconnection, and discourage response withdrawal through secondary control systems", with "to support their Frequency Response contribution to the Interconnection". Rationale: Readability, and clarity on the "discouraging withdrawal…" phrase, which should reside in the Background document.
Yes
Yes
Yes
Yes
The VSLs appear reasonable for the risk and particularly where they assess higher severity when the BA or RSG Interconnection's performance was sub-standard as well.
Yes
Yes
Yes
This is a very important document, providing bounds and rationale for and future changes, as well as initial settings going into ballot. As such, it is AECI's understanding that, upon going into effect, this BAL-003-1 will utilize these initial settings.
No
AECI believes the SDT could spare our industry both confusion and inconsistency, by specifying that identified Interconnection Disturbances include both Point A and Point B to the hour, minute, and second. While this introduces some risk of Entities over-automating their data-reports, the benefits for Eastern Interconnection respondents would be tremendous. Cautions and disclaimers should be placed on both Form 1 and Form 2, to assure respondents manually inspect their frequency data and pinpoint the specific inflection-point samples.
SDT Webinar responses, this standard still needs to address: 1) anticipated shifts in an Entity's FRO, due to large changes in base generation or load, and 2) likely non-compliance for single-unit generation-only BAs (R5.2?) Please address prior to second ballot.

NV Energy
Yes
No
Requirement 1 seems to be the only one that has any applicability to an RSG; however, it is unclear under what circumstances this requirement applies to an RSG. Suggest changing the R1 to be addressed solely to BA's or alternatively, explain under Applicability section 1.2 what "where applicable" means.
Yes
Medium appears to be reasonable and appropriate.
Yes
No
For R1, suggest that the VSL's not be dependent upon the aggregate performance of the BA's within an interconnection.
No
It is not clear whether the calculation of FRO is to utilize projections of BA load as in Att A, or past data reported in FERC Form 1 as per the Background Document.
Yes
This is a good reference; however see response to Question 6 in that there appears to be a

discprepancy between Att A and the Background Document with regard to FRO calculation.
No
In Attachment B, it seems unclear whether the initial FB setting is supposed to be 1% of BA peak load or 0.8% as shown in the table. In general, I was extremely confused about what the required FB setting should be. R5 indicates a percentage of load found in Att B, but Att B indicates the greater of Natural Frequency Response or 1% of peak, and then the table that follows indicates 0.8%. At this point, I have no idea what is being stated for the requirement.
Yes
Thad Ness
American Electric Power
No
R1: Clarification is needed regarding the responsibility of a BA that is a member of a Reserve Sharing Group. R2 and R3: What does “coordinated control” mean? There no leverage for the BA to require the generator to carry their burden of addressing governor settings or droop settings, yet the BA is obligated to meet some performance measures. This revision adds new performance measure responsibilities on the BA who likely has no direct control over every resource affecting their performance within their footprint. We are not necessarily challenging the performance measures themselves, nor their underlying objectives, however AEP views this as a gap in responsibilities which potentially effects reliability.
Yes
No
It is not clear for R1 what the exact delineations are among Lower, Medium, High, and Severe VSL’s.
Yes
A frequency response observation should not be used spanning multiple years, or if there does, there should at least be a reset period.
Yes
Yes
Arizona Public Service Company
Janet Smith, Regulatory Affairs Supervisor
1. The specified time interval from 20 seconds to 52 seconds for SEFRD measurement ignores the primary frequency response which happens in first 20 seconds and is responsible for arresting the frequency dip. We suggest using the average over the complete interval of 0 to 52 seconds. 2. The difference between Low and High VSL for R1 is not clear. Similarly the difference between Medium

and Severe is not clear.
RoLynda Shumpert
South Carolina Electric and Gas
No
The last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. Therefore, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word “Interconnection”. Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
No
The utilization of the term, “Reserve Sharing Group”, is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as “Frequency Response Sharing”. R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in “Tie Line Bias” mode.
Yes
No
See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”.
No
See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”.
Yes
Yes
No
We suggest the SDT consider a term other than “Initial’ in the title for Table 1. We suggest “Proposed Frequency Bias Setting” for Table 1
Yes
We feel that frequency response is a function of a contingency event and the Purpose Statement should recognize this relationship. We suggest the following insertion in the Purpose Statement. Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations (due to a contingency event) and supporting frequency until the frequency is restored. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.
Louis C. Guidry
Cleco Corporation
Yes
Yes
No
Please note Cleco does not use the VRFs therefore we feel too much energy and time is spent on the VRFs. The SDT needs to concentrate on the requirements and measurements.
Yes
No
The VSLs for R2 are based on 5, 15 and 25 days. What was the justification for these values? Could we just as well use 10, 20 and 30 or some other set of values? In R3, we understand that brief periods of operation outside of TLB control are allowable providing 1) continued operation in TLB control would create ARI on the Interconnection or 2) that justification is provided for the periods

when TLB is not used. For example, if something happens within our EMS that disables TLB control we are compliant if we document the period as an EMS malfunction?
Yes
We appreciate the effort of the SDT in developing Attachment A. It was very helpful in weeding through BAL-003.
Yes
We appreciate the effort of the SDT in developing the Background Document. It provided insight on how the SDT got the proposed standard to where it is with this posting.
Yes
Yes
Requirement 5, bullet 2 does not make any allowance for a single generator generator-only BAs. If that BAs generator is out-of-service, the BA cannot satisfy this requirement. This could also apply to other generation-only BAs which have a very limited number of generating units. Also, RSGs/BAs which experience resource changes throughout the year have no mechanism for adjusting their FRO.
MRO NSRF
Will Smith
No
The FRM definition: “The median of all the Frequency Response observations reported annually on FRS Form 1” is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Additionally, the definition of Frequency Bias Setting should focus on what it is. Balancing Authorities do not supply energy. Suggest revising it to: Frequency Bias Setting A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority’s Area Control Error equation to approximate the expected natural response provided by the assets within the respective Balancing Authority’s area.
No
R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R2 - Please add the word “range” in-between the words “date” and “specified”. The background document specifies that there is a 72-hour period to implement the FBS setting (See Background document Page 7). R2, as written, does not reflect the period for which an entity may implement the ERO validated Bias into ACE. Also see our comment on #7 as to the length of the comment period. Question 7 comment is provided to assist the SDT; Note from question 7: (Page 7 (3rd paragraph) of the Background document states “Given the fact that BA’s can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1. The Standard itself does not state this provision (24 hour window on each side of target date) as indicated. 2. The SDT accurately addresses the fact that BA’s could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We suggest that a seven day window be used for implementation of the FBS.) R3 – Recommend the term “Adverse Reliability Impact” be removed from Requirement 3. Based on the NERC definition of the term, a smaller entity could never operate its AGC outside of TLB mode due to their impact on the BES not likely to result in “instability or Cascading”. To ensure a more consistent and equitable approach when applying this Requirement, recommend the drafting team incorporate the reliability reasons listed within the Background Document into the actual Requirement. Additionally, the phrase “effectively coordinated control” should be removed as this is not essential to the Requirement and introduces ambiguity in its application. To this end, the following revisions are proposed: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority’s Area

meets one or more of the following conditions. • Telemetry problems that lead the operator to believe ACE is significantly in error. • The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). • During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). • For training purposes. • Many AGC systems will automatically switch to an alternative mode if the EMS determines Tie Line Bias control could lead to problems. • For single BA Interconnections, Flat Frequency and Tie Line Bias are equivalent. • The Reliability Coordinator has been informed and the duration is [insert time constraint language here]. R5 – Recommend to delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate? Please clarify.
Yes
No
Based on suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language. Additionally, M1 should be revised to not reference a specific Form. The Form may be the format of choice but it should not be an implied requirement. Measures 3 and 4 identify the use of "operating logs" as evidence. Measure 2 identifies hard copy and electronic evidence, "or other evidence". We suggest calling out specifically "operator logs" for M2 also, in case there are system problems in capturing hard copy or electronic evidence during the short time window for implementation.
No
The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet the FRO.
No
Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify. We suggest the SDT clarify if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or "requirements
No
the MRO NSRF has restated the same answer as in question 6 on purpose. Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify. Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1) The Standard itself does not state this provision (24 hour window on each side of target date) as indicated. 2) The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We

suggest that a seven day window be used for implementation of the FBS.
No
: There could be some confusion caused by the Attachment B due to the use of the word “initially” when the reference is made to the current standard. The drafting team should change the word “initially” to “currently” or strike it to avoid the potential confusion. The second paragraph of Attachment B (which contains the two bullets): The words “initially 1%” in the second bullet contradict with the Table 1 on Attachment B, which states “Initial” and “0.8%”. Suggest deleting the parenthetical in the second bullet as when BAL-003-1 is effective it would be referencing an old Standard version. If the initial minimum is intended to be 1% say so in the Table 1.
Yes
: It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form
It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities’ response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities cannot know what is expected of them and therefore cannot plan appropriately. In the first paragraph of R5 delete “at least” and replace with “greater than or”. This phrase would now read “…absolute value is greater than or equal to one of the following:” “Equal to or greater than” accurately identifies the expectation, the current phrasing will lead to confusion and mis-interpretation. Bullet #1 of R5: The minimum % is based upon the “estimated yearly Peak Demand”. During the NERC webinar it was mentioned that this minimum would move to being based on historical reporting of Peak Demand. Where does the SDT stand on this item? Please provide clarification.
SERC OC Standards Review Group
Gerald Beckerle
No
We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word “Interconnection”. Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
No
We feel that the utilization of the term, “Reserve Sharing Group”, is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as “Frequency Response Sharing”. R2 exempts BAs participating in Overlap Regulation Service from implementing the Frequency Bias Setting on the date specified by the ERO, and R4 states how the BA performing Overlap Regulation Service will modify its Frequency Bias Setting but does not state when the setting will be implemented. The exemption for BAs participating in Overlap Regulation Service should either be deleted from R2 or language stating the implementation date of the frequency bias setting needs to be included in R4. R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in “Tie Line Bias” mode.
Yes
No
See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”.
No

See comments in Question 2 regarding utilization of the term “Reserve Sharing Group”. VSL for R1: The draft VSLs for R1 uses the summation of FRM for all BAs within an Interconnection as a factor in determining the applicable VSL. This does not seem consistent with R1. R1 is about a single BA and the individual BA’s frequency response performance as measured by the FRM for that specific BA. Including the FRM summation of the Interconnection expands R1. It appears that a BA that is non-compliant with R1 could end up with either a Low/Medium or High/Severe VSL based upon the FRO performance of the Interconnection. The FRM performance of the Interconnection is beyond the knowledge and control of a single BA and should not be a determinate of the applicable VSL. Is there a technical basis for selection of the 1%, 30% and 15MW/.1 Hz VSL breakpoints? Does the Lower VSL give a 1% dead band to a BA’s FRO? If so, will this be acceptable to NERC/FERC? VSL for R2: The VSL should reflect the language used in the requirement. R2 says a BA “not participating in Overlap Regulation service shall ….”, while the VSL says a BA “not receiving Overlap Regulation Service…..” The VSL language is not consistent with the requirement. VSLs for R5: Since Frequency Bias Setting is expressed as a negative value, the terms “absolute value” and “less than” must be used carefully. Wouldn’t the “absolute value” of a BA’s Frequency Bias Setting always be positive and thus it could never be less than the minimum specified by the ERO (a negative value)?
No
The definition of Single Event Frequency Response Data (SEFRD) was struck from the draft standard but still appears in Attachment A. Since R1 of the standard references Attachment A, would the definition of SEFRD still be applicable? If the definition is to be totally struck, we don’t think the term should be used in Attachment A.
No
Portions of the Background Document do not appear to be complete or finished. The Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. elimination of the definition of SEFRD and any revisions to the draft BAL-003-1).
No
We suggest the SDT consider a term other than “Initial’ in the title for Table 1. We suggest “Proposed Frequency Bias Setting” for Table 1
Yes
We feel that frequency response is a function of a contingency event and the Purpose Statement should recognize this relationship. We suggest the following insertion (in quotation marks) in the Purpose Statement: Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations “due to a contingency event” and supporting frequency until the frequency is restored. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.
Southern Company
Antonio Grayson

We suggest adding BA to the definition of Frequency Response Measure (FRM), similar to the definition for Frequency Response Obligation (FRO).
Yes
No
VSL for R2: We suggest the language in the VSL be consistent with the language used in the Requirement. The VSL for R2 says a BA ‘not receiving Overlap Regulation Service…….’ R2 says a BA ‘not participating in Overlap Regulation service shall …….’ VSLs for R5: Since Frequency Bias Setting is expressed as a negative value, the terms “absolute value” and “less than” must be used carefully. This VSL uses “absolute value” when referring to the BA’s Frequency Bias Setting, but does not use “absolute value” when referring to the Frequency Response Obligation, or minimum value specified by the ERO. Consider revising this VSL so that a true comparison can be made.
No

We suggest increasing the delta f for the East to be the same value as the West or larger. The reason for this is that the 0.04Hz suggested is too close to the governor deadbands of .036Hz. This would potentially omit frequency response that some units may provide for a larger excursion but not for those close to the deadband.
No
We suggest the Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. Any revisions to draft BAL-003-1 and removal of the definition of SEFRD).
No
We suggest using the words, 'Proposed Frequency Bias Setting' in the Title of Table 1 instead of the word, 'Initial'.
Yes
We suggest adding the words, 'due to a contigency event', after the word, 'deviations', in the Purpose statement because we feel that frequency response occurs due to a contigency event.

The VSLs for R2 are based on 5, 15 and 25 days. What was the justification for these values? Could we just as well use 10, 20 and 30 or some other set of values? In R3, we understand that brief periods of operation outside of TLB control are allowable providing 1) continued operation in TLB control would create ARI on the Interconnection or 2) that justification is provided for the periods when TLB is not used. For example, if something happens within our EMS that disables TLB control are we compliant if we document the period as an EMS malfunction?
Yes
We appreciate the effort of the SDT in developing Attachment A. It was very helpful in weeding through BAL-003.
Yes
We also appreciate the effort of the SDT in developing the Background Document. It provided insight on how the SDT got the proposed standard to where it is with this posting.
Yes
Yes
Requirement 5, bullet 2 does not make any allowance for a single generator, generator-only BA. If that BA's generator is out-of-service, the BA cannot satisfy this requirement. This could also apply to other generation-only BAs which have a very limited number of generating units. Also, RSGs/BAs which experience resource changes (permanently removing generation from service) throughout the year have no mechanism for adjusting their FRO during the year.
H. Steven Myers
ERCOT
No
RE: Frequency Response Obligation (FRO) definition: ERCOT suggests changing "Balancing

Authority's" to "Balancing Authority Area's" as follows: The Balancing Authority Area's share of the required Frequency Response needed for the reliable operation of an Interconnection. A BA that does not own generation resources cannot provide Frequency Response, it can only schedule and dispatch available resources capable of such; . The BA should be responsible for taking action to schedule resources that are capable of frequency response, and monitoring to assure frequency response performance. The GOP (possibly the LSE when demand side performance is involved) must be accountable for performing. However, there is nothing in this requirement to encourage the owner of a resource who chooses not to provide frequency response to come to the table. There is nothing in this standard that uniformly requires all frequency response providers to perform. This is likely to be detrimental to the performance of a BAA and unfairly sanctions those willing to perform to to assure reliability while others are not required to perform.
No
Measure should be modified to align with revised Requirements per ERCOT's comments on #1.
No
Refer to comments in #1.
No
While there is no problem with the calculation involved, it is unclear why the SDT elected to assign a grid performance element in this standard to the ERO, who has no functional (registered) role in grid performance. Since this is a cook-book calculation and transfer of data on frequency performance, why not assign it to the BA?
Kasia Mihalchuk
Manitoba Hydro
No
It is not clear why the term "Single Event Frequency Response Data (SEFRD)" has been removed from the standard but is still used and defined in the Background Document and Attachment A.
No
Regarding R1: 1. Neither R1 nor the referenced Attachment A clarifies the FRM requirements for an RSG to comply versus a BA. In particular (i) At p.3, Attachment A states that the ERO is responsible for "annually assigning an FRO and Frequency Bias Setting to each BA." No mention is made of RSGs. (ii) Attachment A only references RSGs in the context of reporting obligations for Form 1 (at p.4) and (iii) Compared to BAL-002-0 R1.1, which clearly states that the BA may elect to fulfill its obligation through an RSG and that in such cases the RSG has the same responsibilities as each BA (that is a participant in the RSG). 2. It should be clarified that this requirement applies to a BA, where the BA doesn't belong to an RSG, OR to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation. 3. R1 does not specify where or how the FRO is determined. Presumably this would be determined by the ERO pursuant to Attachment A. 4. The phrase "to ensure that sufficient Frequency Response …" should be separated from the requirement as it is (i) not descriptive of the required actions; (ii) redundant with the stated purpose at the beginning of the standard. In general, such a drafting technique should be avoided as it may allow Responsible Entities to argue that a violation has not occurred where the specific action that is described has not been taken, but the purpose referenced in the requirement has been met. Regarding R2: 1. It is not clear from R2 who determines the Frequency Bias Setting for "validation" by the ERO and how the FBS is determined. (Presumably done by the BA in accordance with

Attachment B). Based on Background document, should refer to those “published” by ERO. The BA’s FBS may not be validated, and may be modified before posting. 2. Attachment B does not refer to the ERO “validating” FBS. 3. Attachment B refers to an RSG calculating FBS, but the standard does not.
Yes
No
It should be clarified that R1 requirement applies to a BA, where the BA doesn’t belong to an RSG, or to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation.
No
The Violation Severity Levels for R1 penalize entities more severely depending on how the interconnection as a whole has performed. MH believes that BAs should only be held accountable for issues within their control and that the VSLs for R1 should be revised accordingly.
No
1. p.2 refers to each “Interconnection” establishing target contingency protection criteria. However, an “Interconnection” as defined in the NERC Glossary is an electrical system, not a Responsible Entity. This should be revised to clarify which Responsible Entities must establish the protection criteria. 2. Table 2, although entitled “Interconnection Frequency Response Obligations” does not use the term FRO in the Table itself. This terminology should be consistent. 3. There is no clear statement in Attachment A identifying the significance of Table 2. The previous paragraph identifies Table 2 as listing “default targets”, but how does this relate to the FRO referenced in R1? 4. The “Note” on p.2 regarding the ERO being able to use additional events that don’t satisfy the criteria is unreasonable as drafted. Since these events are used to calculate the Frequency Bias Setting and FRM (as per p.1, s.2), the selection of events should not be at the unfettered discretion of the ERO. As drafted, no grounds or criteria must be satisfied.
Yes
Please see MH’s response to Question 1 regarding the term Single Event Frequency Response Data. Additionally, the discussion in this document is useful in clarifying the intent of the drafting team, but some of this clarification would best be incorporated into the Standard itself. Ex. RSG requirement on page 6. Also on page 7 Attachment A does not specify what validation is and how it is done. Attachment A refers to BA providing FBS data to ERO which then validates and publishes. This should be reflected in R2.
Yes
Yes
The Applicability of BAL-003-1 should be clarified. Specifically, Section 1.2 should be changed from “Reserve Sharing Groups (where applicable)” to “Reserve Sharing Group whose intent includes meeting Frequency Response Obligations”. Regarding Data Retention: 1. As the standard is currently drafted, both the BA and the RSG would be required to retain data or evidence to show compliance with requirements R1 and M1. It is unclear whether this is the intention, or whether it would be acceptable that just one or the other would maintain such records. 2. In the first and second paragraph, the reference to ‘three calendar years’ should be specified to be the ‘previous three calendar years’. 3. In the third paragraph, it should be clarified who is required to keep information related to non compliance if the BA belongs to an RSG – the BA or the RSG or both. 4. In the fourth paragraph, it should be clarified for what length of time the last audit records must be retained.
Western Electricity Coordinating Council
Steve Rueckert
Yes

No
Agree with the changes made to this latest version of BAL-003-1. However, additional clarity could be added by addressing the following: R1- It is not clear what is intended by "Reserve Sharing Group". As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - There may be occasions in which an entity has a legitimate reason or a need to operate in a mode other than Tie Line Bias but that does not qualify as an Adverse Reliability Impact. Recommend including language that would permit limited operation in a mode other than Tie Line Bias mode provided the Reliability Coordinator was notified. R3 – Has the drafting team considered whether or not the language of Requirement R3 will have any conflict or coordination issue with the FERC-approved regional reliability standards BAL-004-WECC-1 – Automatic Time Error Correction? R5 – Suggest changing the language “at least equal to” to “greater than or equal to” for clarity.
No
The proposed VSLs for Requirement R1 treat a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO.
No
There is disagreement between Attachment A and the Background Document. Attachment A states peak load allocation is based on “Projected” Peak Loads and Generation, but the Background Document states it will use “historical” Peak Load and Generation. The allocation methodology of FRO among the BAs in the equation on page 3 of Attachment A favors BAs with more load than more installed capacity. Peak load is served but not all installed capacity is always dispatched.
No
See response to question 6.
Reducing frequency bias obligation is detrimental to reliability. Lowering the Minimum Frequency Bias Setting from 1% to .8% (as identified in Table 1, Attachment B) will result in a lower value being used by those Balancing Authorities with a natural frequency response below the current required 1%, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response. Is there an upper limit to the amount of frequency response expected of the Balancing Authorities? How many tenths of a hertz is a Balancing Authority or Reserve Sharing Group expected to respond to. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide. It is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz. Will that event be excluded from the list used to calculate the Balancing Authorities’ response? Will it be included with an expectation that it counts the same as any other event? Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. As Drafted, is there the possibility that a Balancing Authority may fail to meet their FRO if surrounding BAs provide significantly more than required. Can over performers cause average performers to fail when they would have otherwise met their requirement. The documents do not provide guidance on how intermittent or variable generation is to be treated Referencing Attachment A may be adding requirements. You may wish to consider adding language in Requirement R1 that specifically requires the completion of the Attachments or Forms. There are no requirements on governor installation, settings, or operation. Addition of governor operation requirements seems essential for a frequency response standard. Without some sort of governor response to require the individual generators to perform, a Balancing Authority with significant amounts of generation for which it has no control over is at a disadvantage.
Curtis Crews

Texas Reliability Entity
Yes
We suggest that the Severe VSL for R3 is confusing and should be clarified as follows: “A Balancing Authority not receiving Overlap Regulation service failed to operate AGC in Tie Line Bias mode, when operation in Tie Line Bias mode would not have had an Adverse Reliability Impact on the Balancing Authority’s Area.”
No
We have a number of concerns regarding Attachment A which are set forth below: 1. Regarding the formula for “Initial FRO Allocation” on page 3 of Attachment A, the terms for “BA installed capacity” and “Interconnection installed capacity” are undefined and could be subject to manipulation and dispute. We suggest that this formula be revised to mirror the calculation based on well-established FERC Form 714 data that is discussed in the Background document, which is based on actual generation output. 2. In Attachment A, all references to “Texas” should be changed to “ERCOT” as a reference to the Interconnection or the Region (including tables). 3. Regarding the Event Selection Criteria in Attachment A: in item 2, consider whether certain events, such as DCS events, should be required to be included in the FRM analysis. 4. Regarding the Event Selection Criteria in Attachment A: item 7 provides that the selected frequency excursion events are to be selected so that they are evenly distributed seasonally. Consider adding the seasonal distribution concept to item 2, particularly if it becomes necessary to include events from the previous evaluation period. 5. In Attachment A, page 1 says the ERO is to post the final list of frequency excursion events by December 15, but on page 3 it suggests that the list will be posted by December 10. These references should be made consistent. 6. Attachment A states, on page 3, “the ERO will use FRS Form 1 data to post the following information for each Balancing Authority for the upcoming year: Frequency Bias Setting and Frequency Response Obligation (FRO).” What is meant by “the upcoming year”? Is the BA supposed to implement the new FBS immediately, or wait until the beginning of the next evaluation period on December 1? Note that if the new FRO and FBS are implemented immediately (e.g. in March), then the FRO will change in the middle of an evaluation period. This will complicate the comparison of FRM and FRO as required by R1.
No
There is an inconsistency between the Background Document and Attachment A. Attachment A only proposes event criteria based on “the largest category C (N-2) event identified,” but the Background Document says: “Attachment A proposes the following Interconnection event criteria as a basis to determine an Interconnection’s Frequency Response Obligation: - Largest category C loss-of-resource (N-2) event; - Largest total generating plant with common voltage switchyard; - Largest loss of generation in the interconnection in the last 10 years.”
No
1. In Attachment B, we suggest removing the paragraph beginning “The BA calculates . . .” because it appears to be background information that conflicts with the methods provided in this version of the standard for determining minimum bias settings. 2. Attachment B, Table 1, refers to “0.8% of peak load or generation.” If a BA has both load and generation, will its minimum Frequency Bias Setting be based on its load, its generation, or can it pick the value that it prefers to use?
Mark B Thompson
Alberta Electric System Operator
No
The FRO definition is specific to BAs. The Appendix 1, which is incorporated in the standard, uses this definition in relation to requirements of the Interconnection. The SDT should consider a revision of this definition that accounts for the requirements of the Interconnection versus the BA obligation to the Interconnection.

No
The language used in the requirements is superfluous. This could result in confusion and incorrect assumptions being made. In R1, the comment within brackets “(as detailed in Attachment A and calculated on FRS Form 1)”, is not necessary as it is already part of the FRM definition. We suggest removing this bracketed text from the requirement. Also in R1, the phrase “to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency response in the Interconnection” is a high level objective that does not add clarity to this requirement. We suggest removing this from the requirement. R2, R3 and R5 use similar language e.g. “to ensure effectively coordinated Tie Line Bias control”, “to ensure adequate control response” etc. Although it provides background information, this does not add clarity to the requirement. We suggest removing these from the requirements.
No
These documents not only provide additional clarity but also specify additional requirements, such as FRS Form 1 annual reporting by January 10. All the enforceable requirements should be included in the body of the standard. 1. Attachment A uses the terms "delta F (change in frequency)", "arresting frequency (Point C)", "B Value", "A Value". These terms are not properly defined or described in this document as drafted. The AESO suggests adding a description or definitions for clarity in this document. 2. The standard gives 2 sets of values for Interconnection Frequency Response Obligation in Table 2, (1) Base Obligation and (2) the obligation including 25% Safety Margin (which seems to be implied by the "contingency protection criterion"). The Attachment A does not specifiy whether the Base Obligation or the 25% Safety Margin value will be used to allocate the Interconnection FRO to the BAs. Please clarify which value will be used to calculate the BA Frequency Response Obligation (FRO) in the Interconnection FRO allocation formula in Attachment A. 3. The "initial FRO allocation" formula in Attachment A uses Peak Load. The term Peak Load is not used in the standard nor is it a defined term in the NERC Glossary. The standard uses Peak Demand, which is defined in the Glossary Is "Peak Load" synonymous with "Peak Demand"? If so, Peak Demand should be used in the formula instead. Otherwise Peak Load should be clearly defined in this document. 4. Is "Projected" in the FRO allocation formula synonymous with "Forecasted"? If so, Forecasted should be used for consistency. Otherwise "Projected" or the context in which it appears must be defined.
No
The Background Document uses BA Peak Generation in the BA FRO allocation formula. Attachment A uses BA Installed Capacity. The AESO suggests making the two formulae consistent.
Besides the standard, the posting has two attachments, supporting material and two forms. It is not clear how enforcement will be applied given the array of explicit and implicit requirements throughout this package, and the use of undefined terminology, which will be subject to interpretations. In the SDT response to our comments to the first draft of this standard it was stated that “The expectation is events will be selected by the Balancing Authorities. The Balancing Authority may exclude events from consideration for specific conditions such as data quality issues. “ Based on the SDT’s response, it is our understanding that, for the purpose of the FRM calculation, BAs could exclude or include events based on specific conditions consideration, such as data quality or event suitability (e.g. BA separation from the Interconnection). However, the standard as currently drafted, does not have any provisions to this effect. Please include such provisions in the body of the standard.
Anthony Jablonski
ReliabilityFirst
No

ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft BAL-003-1 VSLs which include the following: 1. General VSL Comment – For consistency with other standards, each VSL should begin with the phrase “The Responsible Entity…” or “The Balancing Authority”. This is consistent with the language of the requirement and correctly pinpoints the appropriate responsible entity. 2. VSL R1 Comment – Based on the FERC Guideline #3 “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”. ReliabilityFirst suggests the following modification: a. Lower VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection’s FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO b. Medium VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection’s FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO c. High VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity’s, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO d. Severe VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO 3. VSL R4 Comment – Based on the FERC Guideline #3 “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”. ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority incorrectly modified the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting-error less than 5% of the validated or calculated value 4. VSL R5 Comment – Based on the FERC Guideline #3 “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”. ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority used a monthly average Frequency Bias Setting whose absolute value was less than or equal to 5% below the minimum specified by the ERO.
ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft BAL-003-1 standard which include the following: 1. General Comment – ReliabilityFirst is unsure how a Reserve Sharing Group (RSG) would be capable of establishing a correct Frequency Response Measure (FRM) and Frequency Response Obligation (FRO) as a RSG. Frequency Response and Frequency Bias are unique values established for each Balancing Authority (BA), is the intent to require a RSG response to establish and maintain a certain frequency response based upon the members and size of the RSG? From a monitoring perspective and without more guidance it is unclear what or how these values will be determined. 2. General Comment – ReliabilityFirst believes the proposed definitions for Frequency Response Measure (FRM) and Frequency Response Obligation (FRO) are unclear. For example, ReliabilityFirst is unclear what is meant by the term “observations” in the FRM definition. ReliabilityFirst also believes the terms “reliable operation of an Interconnection” is ambiguous and seeks further clarification to its meaning. 3. General Comment – ReliabilityFirst recommends including Attachment A, Attachment B, FRS Form 1 and FRS Form 2 into the standard itself. These attachments and forms are referenced in the requirements (and definitions) and therefore should be appropriately embodied within the standard. 4. General Comment – ReliabilityFirst believes the last fragment of words in Requirement R1 through R4 (and first fragment of words in Requirement R5) is more of a justification for the requirement rather than a requirement itself. ReliabilityFirst believes this justification should be moved to a “Rationale Text Box”. For example, the first set of words in Requirement R5 states: “In order to ensure adequate control response”. This language is really explaining why this requirement is needed. ReliabilityFirst believes this should be removed, further expanded upon and placed in a “Rationale Text Box”.
Florida Municipal Power Agency

We thank the SDT for their hard work and diligence in moving this Project forward. However, we have some concerns that cause us to not support the standard in its current form. In general, we believe that there has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. We also believe that the proposed standard does not meet all of the conditions of the Final SAR and Supplemental SAR. The "Final SAR" was to develop methods by which a performance based standard would eventually be developed. The Final SAR states: "The proposed standard's intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once the reasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters." BAL-003-1 does not seem to complete the scope of this "Final SAR". For instance, "the reasons for the decline in Frequency Response" were not confirmed to our knowledge; and the field trial is not completed to our knowledge. The Supplemental SAR adds to the scope of the Final SAR: "To provide a minimum Frequency Response Obligation for the Balancing Authority to achieve, methods to obtain Frequency Response and provide a consistent method for calculating the Frequency Bias Setting for a Balancing Authority. In addition, the standard will specify the optimal periodicity of Frequency Response surveys." The Supplemental SAR does not eliminate the pre-requisite contained in the Final SAR to determine the reasons for the decline in frequency response and confirm them before establishing "defined reliability parameters". In addition, the standard does not complete the requirement of the Supplemental SAR to identify "methods to obtain Frequency Response". For instance, neither the BA nor the RSG have authority over governor and other generator settings. There should be a requirement for GOPs to incorporate setting changes directed by the BA, otherwise the standard establishes requirements that BAs and RSGs may not have the authority to achieve. There is no consideration of "footprint" changes of the BA resulting in different allocation from the ERO during a year. The standard and Attachments seem to specify an annual process with due dates in December and January with no allowance for mid-year changes and associated allocation changes. If a standard has a requirement for the ERO, who will audit the ERO for compliance? If the ERO does not meet its obligations, can an entity still be found non-compliant, especially on a schedule basis? Wasn't there an issue of assigning standards to RROs, e.g., the fill-in-the-blank standards? Are there similar issues with assigning requirements to the ERO? Is the ERO a "user, owner or operator" of the BPS under Section 215, e.g., at (b)(1)"… All users, owners and operators of the bulk-power system shall comply with the reliability standards that take effect under this section." We question how this would work from a compliance perspective.
No
On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.
No
The document does not discuss how the new reliability parameter will affect BAs

On R5, the wording should be changed from “absolute value is at least equal to” to “absolute value is greater than or equal to”
Brenda Powell
Constellation Energy Commodities Group
No
The Frequency Response Obligation has two components based on Attachment 1 - an Interconnection FRO and a BA FRO. The proposed definition captures only the BA FRO.
No
R1 should accommodate agreements between multiple BAs and RSGs in achieving the annual Frequency Response Measure. See proposed modification below: R1. Each Balancing Authority shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligations (FRO) to ensure that sufficient Frequency Response is provided by each BA. Either the Balancing Authority individual FRM, multiple Balancing Authority’s FRM per written agreement, or the FRM of the Reserve Sharing Group must be equal to or more negative than the applicable Frequency Response Obligations (FRO) for a single Balancing Authority or the aggregate of multiple Balancing Authorities or RSGs. -In R2, “Each Balancing Authority not participating in Overlap Regulation Service” should state “Each Balancing Authority, not receiving Overlap Regulation, shall implement the appropriate Frequency Bias Setting (fixed or variable,) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control”. -In R3, the explanatory language about why to operate in Tie Line Bias mode should be deleted. See proposed modification below: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless such operation would have an Adverse Reliability Impact on the Balancing Authority’s Area. -R5 should be modified to state only that the FBS is specified by the ERO in accordance with Attachment B. As drafted the Requirement is in conflict with Attachment B because the Requirement mandates a minimum and does not allow for a reduction to the minimum but it references Attachment B which is titled “Process for Adjusting Minimum Frequency Bias Setting”. See proposed modification below: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is as specified by the ERO in accordance with Attachment B. -There should be a Requirement specifically stating there is an obligation to complete and submit FRS Form 1 by January 10th each year for clarity. -The requirements should be re-ordered to reflect the chronology of the process for frequency calculation, implementation and performance measurement. The recommended order is as follows: R5 which defines the minimum Frequency Bias Setting (FBS) for a Balancing Authority R4 which describes how the minimum FBS may be altered through Overlap Regulation Service R2 which identifies the coordination required around implementation R3 which requires operation in Tie Line Bias mode R1 which establishes the performance obligation
Yes
No
Based on language modifications proposed to the Requirements, the measures should be revisited.
No
The language in the VSLs for R1 should be revisited based on the proposed language modifications above and should also clearly look to the FRM of a BA, group of BAs or RSG against the BA FRO not an Interconnection FRO.
Yes
Additional information relating to defining the FRO for the Interconnection would be helpful as would an example for calculating the BA FRO.
Yes
Should be revisited based on the propposed modifications to the requirements.
No
Should be revisited based on the proposed modifications to the requirements.

Yes

We thank the SDT for their hard work and diligence in moving this Project forward. However, we have some concerns that cause us to not support the standard in its current form. In general, we believe that there has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. We also believe that the proposed standard does not meet all of the conditions of the Final SAR and Supplemental SAR. The “Final SAR” was to develop methods by which a performance based standard would eventually be developed. The Final SAR states: “The proposed standard’s intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once the reasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters.” BAL-003-1 does not seem to complete the scope of this “Final SAR”. For instance, “the reasons for the decline in Frequency Response” were not confirmed to our knowledge; and the field trial is not completed to our knowledge. The Supplemental SAR adds to the scope of the Final SAR: “To provide a minimum Frequency Response Obligation for the Balancing Authority to achieve, methods to obtain Frequency Response and provide a consistent method for calculating the Frequency Bias Setting for a Balancing Authority. In addition, the standard will specify the optimal periodicity of Frequency Response surveys.” The Supplemental SAR does not eliminate the pre-requisite contained in the Final SAR to determine the reasons for the decline in frequency response and confirm them before establishing “defined reliability parameters”. In addition, the standard does not complete the requirement of the Supplemental SAR to identify “methods to obtain Frequency Response”. For instance, neither the BA nor the RSG have authority over governor and other generator settings. There should be a requirement for GOPs to incorporate setting changes directed by the BA, otherwise the standard establishes requirements that BAs and RSGs may not have the authority to achieve. There is no consideration of "footprint" changes of the BA resulting in different allocation from the ERO during a year. The standard and Attachments seem to specify an annual process with due dates in December and January with no allowance for mid-year changes and associated allocation changes. If a standard has a requirement for the ERO, who will audit the ERO for compliance? If the ERO does not meet its obligations, can an entity still be found non-compliant, especially on a schedule basis? Wasn’t there an issue of assigning standards to RROs, e.g., the fill-in-the-blank standards? Are there similar issues with assigning requirements to the ERO? Is the ERO a “user, owner or operator” of the BPS under Section 215, e.g., at (b)(1)”… All users, owners and operators of the bulk-power system shall comply with the reliability standards that take effect under this section.” We question how this would work from a compliance perspective.
No
The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO.
No
On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned

by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to “false trip”.", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.
No
The document does not discuss how the new reliability parameter will affect BAs
On R5, the wording should be changed from “absolute value is at least equal to” to “absolute value is greater than or equal to”

Ameren
No
The Frequency Response Measure (FRM) definition should include which Entity(ies) it applies to, similar to the definition of the FRO.
No
R1.While we agree with the concept of the entire requirement and the determination of the Interconnection Frequency Response Obligation, we believe that the accurate measurement of individual BA's FRM has not yet been demonstrated. This requirement should not be part of the standard (even with the additional 12 months in the effective date) until the field trial demonstrates that each BA's FRM can be consistently calculated to a level that will not create false non-compliance to this requirement. While the calculation methodology in FRS Form 1 looks promising, with the A-value and B-value average periods, we believe successful completion of the field trial is prudent. R5. We were not sure if it was intended for this comment question to include Requirement R5, but have decided to include our comments here. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
No
This is problematic since for a single BA interconnection these could be argued to be appropriate VRFs, but is different for a multiple BA interconnection, where the risk that a single BA would pose to the interconnection would be Lower.
Yes
With the understanding that any suggested changes to the proposed requirements would come with corresponding changes to their measure.
No
It is not clear how the VSL for R1 uses the "Summation of the BA's FRM", when the requirement is BA or RSG specific.
Yes
Yes
Yes
Considering the comments made regarding R5, in question 2, above, which are: R5. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
Yes
We agree that the spreadsheet is meaningful, but still needs to be vetted through the field trial

process, with improvements made based on experience in its use.
While we are in general support of this standard and its requirements we have concerns regarding the following: •The FRM methodology has not been fully vetted through the field trial process. •Adjusting the minimum of the Frequency Bias Setting, while an appropriate adjustment for AGC control in the ACE equation, should not be at the expense of L10 as used in BAL-001, R2. •The absence of any resource specific frequency response requirement in NERC standards is an issue that must be addressed somewhere. As the resource portfolio of our industry changes(expedited by recent EPA rulemaking), the resources used for traditional primary frequency response are becoming a lower percentage of the mix. New resources and existing resources that have not provided primary frequency response need to be incorporated into the available frequency response discussion
Michael Brytowski
Great River Energy
Yes
No
R1: Including the Reserve Sharing Group (RSG) in the Frequency Response Obligation is outside of the boundaries of a RSG. Where or how would a Frequency Bias be determined for an RSG to determine their Frequency Response Obligation? Although it is apparent that frequency responds during the implementation of reserves, the intention of a RSG is not to share frequency response, but rather to share Reserves. Additionally, if the Frequency Response Obligation is not met by the RSG how are penalties assessed? Should they be assessed to the group as a whole or strictly to the generators that did not meet their individual obligation? R3: Needs to include verbiage for those circumstances when it would be necessary to run AGC out of TLB such as during necessary testing. The BA should have the option to operate out of TLB for a predetermined amount of time if needed when notification and coordination with the RC has been established.
Yes
Yes
No
The VSLs on for Requirement R1 set a previously un-established precedent of relying on the performance of other registered entities to establish the severity level of the violation. This is not appropriate. The VSLs should be rewritten to provide further gradations of the violation severity based on the BA's own performance
No
Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an N-2 event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does but then the table lists out a separate 25% "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin.
No

We can find no document titled “BAL-003-1 Background Document”. We assume this question is referring to the “Frequency Response Standard Background Document” dated October 2011. We do not believe the document provides sufficient clarity. No explanation is provided for why RSG was added to Requirement R1. There are typos contained in the document. On page 6 in NIA, the A should be in subscript. On page 7 in bullet 4 in the first sentence, “The” should be in lowercase
Yes
Yes
The Data Retention section requires the BA to retain data or evidence for up to four years. No data that exceeds the audit cycle should be required to be retained. The audit cycle is three years.
Si Truc PHAN
Hydro-Quebec TransEnergie
No
The FRM and FRO definitions should precise that it is expressed in MW/0.1Hz. As for the Frequency Bias Setting definition, as written, would apply only to a multiple BA Interconnection. In a single BA Interconnection, the Frequency Bias translates the frequency error into a MW value that must be dispatched to bring back Frequency to desired value. Since Tie Lines are not controlled through AGC, there is no response withdrawal issue
No
The objective of R2 is that all BA’s implement their new Bias Setting at the same time, based on the previous year’s data, so that control stays the most effective throughout the Interconnection (Tie-Line Bias). In addition, the new Bias will be in effect all year long. The process is quite simple and straightforward for a fixed Bias Setting. As for Variable Bias Setting, this process is not applicable before the fact since the Bias equation can depend on real-time values that are not known in advance. In addition, the simultaneous Bias implementation is not an issue for a single BA Interconnection. Therefore, we suggest that Requirement 2 applies only to Fixed Bias Setting.
Yes
Yes
Yes
No
The Event Selection Criteria should be modified for the Quebec Interconnection. In Table 1, the change in frequency (Delta f) used for Quebec’s Event Selection Criteria should be 0,3Hz (from point “A” to point “C”) and must last for at least 7 seconds so that we don’t measure AGC action. In addition, a criterion should be added by saying that events that recovered within the 20-52 second average period for point “B” should be excluded from analysis.
Yes
No
The methodology proposed to compute the Minimum Frequency Bias Setting (in MW/0,1Hz) could be adverse for the Quebec Interconnection. Hydro-Quebec uses a variable Bias that is calculated based upon which generator is online and it’s droop setting. Under light load condition, we might have a Bias setting that would be under (in absolute value) than the FRM which is the median value, even though the Bias setting would reflect the grid’s frequency response. This method, as proposed, would mandate us to have a larger Bias that what is really needed. Unlike Eastern Interconnection, we are not over biased. By implementing this new methodology, it would make us over biased. Having a too large Bias could lead to system instability, based on the results of studies from our control specialists. The Minimum Frequency Bias Setting should take into account the wide load span that we can face. For the variable bias, we could express the Minimum Frequency Bias Setting as a function of monthly peak loads, and remove the Natural Frequency Response term. In addition, there is a gap between

Attachment B and the text in R5. See comment 10 for explanation.
Yes
There is a gap between R5, Attachment B and Form 1 next year's Bias Setting equation. Requirement 5 states that the average Frequency Bias shall be at least equal to the minimum percentage of BA's peak load or generation. In Attachment B and Form 1, the required Frequency Bias is the maximum (absolute value) between FRM, FRO and peak load+peak gen /2. As stated in comment 8, Hydro-Quebec is not in favor of adding the FRM into the minimum Frequency Bias requirement, at least for Variable Bias Setting. Due to a good frequency response, this would lead us to have a too high AGC Bias and causing potential reliability problems. In other words, this would lead us to be over-biased, which would not be a good thing for a single BA Interconnection. For a Single BA Interconnection, performance measure CPS1 tracks the performance of the variable Bias, which is enough to ensure reliability through the Interconnection. Hydro-Quebec therefore recommends the drafting team that Requirement 5 only applies to Multiple BA Interconnection. Another option is that Minimum Frequency Bias Setting could be expressed as a function of monthly peak loads, and remove the Natural Frequency Response term in the minimum Bias setting equation.
Greg Rowland
Duke Energy
No
Duke Energy would suggest removing "usually" from the Frequency Bias Setting definition, as the value in the ACE equation must be in terms of MW/0.1Hz in order for ACE to be correctly calculated. We apologize for missing this point in the last round of comments. Though some would argue that the last phrase of the definition is more of an explanation of a function rather than a definition, we support keeping the phrase inserted, as it should be recognized that the intent is to account for the frequency response contribution AND keep the FBS slightly larger (in magnitude) than the average estimated response, to better discourage withdrawal, which was also recognized by Nathan Cohn. Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
No
Duke Energy supports the concept of a group of BAs forming a group to share in Frequency Response however it should be clear that it is an option. We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms which is specific to sharing of contingency reserves, and should be replaced with a new term, such as "Frequency Response Sharing Group". R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode. Though comments are provided below on the Attachments, Duke Energy believes that all NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval), and not within Attachments that may be revised without Industry review and approval. As noted below and in prior comments, given the secondary control implications of changing the minimum Frequency Bias Setting (FBS), Duke Energy believes that subsequent revisions to the minimum FBS should be vetted through the Standards process. Duke Energy would suggest moving the details of the minimum FBS for each Interconnection into the Standard, and having the implementation plan include annual submittal of a revised minimum FBS based upon the methodology presented in Attachment B for ballot approval by the Industry.
Yes
No
See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
No
See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
No
On page 3 of the document it states "For a multiple Balancing Authority Interconnection, the Interconnection Frequency Response Obligation is allocated based upon either the Balancing Authority Peak Demand or peak generation", however, the initial FRO allocation equation shows that the BA

allocation is based upon the sum of the Projected BA Peak Load plus installed capacity, times the Interconnection FRO, and divided by the sum of the Projected Interconnection Peak Load plus Interconnection installed capacity. Is the statement in quotes correct, or is the allocation equation correct? In addition, the equation in Attachment A referencing "installed capacity" conflicts with the equation in the BAL-003-1 Background Document entitled "Frequency Response Standard Background Document" where "Peak Gen" is used. In summary, is the FRO allocation based upon an equation which a) sums the Projected BA Peak Load plus peak generation, b) sums the Projected BA Peak Load plus installed capacity, or c) uses either Projected BA Peak Load OR peak generation? All three options are currently represented in the documentation. Calculation of the FRO for the Eastern Interconnection: Duke Energy agrees with the criteria suggested for the event to be protected (4500 MW), and at this time also agrees with the "compromise" low limit of 59.6 Hz. However, knowing that another Standard is under development which may require hourly assessment of available "frequency responsive reserves", we are trying to determine what impact the choice of this methodology will have on the amount of frequency responsive reserves the industry will have to maintain – enough to cover frequency swings that only occasionally reach down to perhaps 59.9 Hz as we see on the Interconnection today (essentially the allocated FRO for a 0.1Hz deviation), enough to cover a 4500 MW loss, or whatever we deem appropriate as long as we are compliant to the FRM? We recognize that the Standard Drafting Team cannot answer this question, as the Standard under development is not within the scope of this team, however our comment is meant to illustrate the point that similar to our response to question 8, it should be recognized that elements of this Standard are tightly coupled to other current and potential Standards, and the impacts must be considered by the Industry.

No

Please see our comments to Question 6. In addition, Duke Energy disagrees with the statement on page 9 that Attachment B will "ensure there is no negative impact on other Standards" – please see our response to Question 8 for additional information.

No

Duke Energy suggests that the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1. Notwithstanding our suggestion that the criteria/requirements of the minimum FBS in the Attachment be incorporated into the Standard, Duke Energy has the following concerns with what is proposed: As cited in our comments to Question 8 in the last posting (extensive, so not repeated here), the secondary control measures of CPS1, CPS2 and the draft Balancing Authority ACE Limit (BAAL) are tightly coupled to the Frequency Bias Setting (FBS), and a reduction of the FBS will impact the secondary control requirements placed upon the BA. Noted in our response to Question 7 above, the statement on page 9 in the "BAL-003-1 Background Document"is not correct in stating that Attachment B will "ensure there is no negative impact on other Standards". The gradual reduction of the FBS will proportionally tighten the secondary control limits for each Balancing Authority. Even if the "natural" Frequency Response in the Eastern Interconnection remains unchanged for the next several years, under the process described allowing the ERO to annually adjust the minimum FBS for the Interconnection, the FBS will eventually be reduced to a value approximately 10% above the calculated response in magnitude, cutting the current CPS1, CPS2 and BAAL limits in the Eastern Interconnection on average by more than half. The current FBS for the Eastern Interconnection is approximately minus 6500 MW/0.1Hz, estimated "natural" Frequency Response is perhaps around minus 2400 MW/0.1Hz. Unlike CPS1 and BAAL where the measures are based upon the FBS of the BA only, CPS2 (dependent upon the FBS of the BA and the Interconnection) will be significantly limiting to the degree that no change in a BA's own Frequency Response could significantly change its CPS2 limit if the Interconnection FBS drops over time as indicated. At least under CPS1 and the draft BAAL, the BA would have an option of improving its Frequency Response, allowing it to increase its FBS and proportionally the CPS1 and BAAL bounds using the FBS. Conclusion from our last comments submitted: Duke Energy does not believe there is a reliability need pushing the industry to tighten secondary control to the degree discussed above simply as a result of reducing the Frequency Bias Setting. If the calculated Frequency Response of the Interconnection stayed at its current level, what would be the justification for tightening the secondary control requirements of CPS1, CPS2 and the proposed BAAL? Duke Energy supports taking more of the error out of the ACE equation by having the FBS closer to the estimated Frequency Response of the Balancing Authority, however, Duke Energy does not believe the result should be a significant increase in secondary control costs to meet the CPS1, CPS2, or draft BAAL requirements. Duke Energy understands the position placed upon this Standard Drafting Team- the secondary

control and reserve requirements are not under the scope of the team, however, proper consideration has not been given in Attachment B to the impact lowering the FBS will have on the industry in terms of the requirements placed upon the BA for secondary control and reserve requirements – especially for meeting CPS2. The research discussed in our comments to the last posting support that reducing the FBS while under CPS1 and the draft BAAL may be achievable, however a CPS2 bound cut potentially in half or lower will place unreasonable bounds on a BA, requiring control actions even when the BA may be operating in support of the Interconnection frequency. Given the significant impacts discussed, Duke Energy believes that additional provisions must be in place for the Industry to approve each subsequent revision to the calculation of the minimum Frequency Bias Setting, rather than leave it as a decision made only by the ERO.

Yes

Duke Energy appreciates the significant work of the Standard Drafting Team in putting together the draft Standard and extensive supporting documentation. Upon further consideration of the comments above, Duke Energy has concluded that the work of this Standard Drafting Team and that of the Balancing Authority Reliability-Based Control Standard Drafting Team under Project 2010-14 developing the Balancing Authority ACE Limit to replace CPS2, need to presented to the Industry as a package – there is too much at stake to have one Standard impact other Standards to this degree. Done in a vacuum the Industry is faced with the possibility of secondary control bounds being cut in half or more, though there is no reliability need driving such performance requirements. Thank you.

ISO/RTO Council Standards Review Committee

Al DiCaprio

No

(1) In our previous comments, we suggested to drop the definitions for the terms FRM and FRO in favor of providing the needed wording in the standard itself to take care of the specific details. The SDT did not adopt our suggestion with the reason that these definitions will be used by other standards in the future. That's fair enough. However, the FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an Attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/approval process without any appreciable value. Once again, we strongly urge the SDT to consider dropping these definitions, and have the details fully specified in the standard body itself. This will eliminate that cross reference issue. After all, the definition for FRM is a simple sentence and does not provide any clarity or specific details that cannot be presented by using appropriate wording in a requirement. (2) The definition of Frequency Bias Setting, if retained, should focus on what it is. Balancing Authorities do not supply energy. We suggest to revise it to: Frequency Bias Setting A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's (BA's) Area Control Error (ACE) equation to approximate the expected natural response provided by the assets within the respective Balancing Authority's area.

No

General Comments The SRC offers the following general comment with regard to the SDT's proposed revisions: Gerry Cauley's Results based initiative calls for requirements that focus on performance (i.e. WHAT must be accomplished NOT on WHY it is required or HOW it should be accomplished). The SRC has found that such explanatory statements as the SDT is proposing lead to ambiguities and confusion in the compliance application. Compliance Enforcement agents must consider not just the results but must decide if the action was taken for the given reason. To avoid such confusion, the Results based approach uses reference documents to address such background material while leaving the requirement as a direct mandate. The SRC notes: • All NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval). • Data requirements are better handled through NERC's Rules of Procedure Section 1600 than by mandating that ad hoc Forms be submitted. • Definitions should be generic, and should be self-contained (i.e. should not reference an external document). • The decisions regarding alternative

methodologies should be decided by the Industry not by the SDT. The SDT should make its case and ask the Industry for its approval. Regarding Order 693 directives, the SRC notes that there are three directives as follows: (1) To include Levels of Non-Compliance; (2) To determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and (3) To define the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved. The SRC suggests that Directive 2 be handled directly as a mandate that the ERO conduct a fixed number of Frequency Response Surveys for randomly selected events. Discussion of the number and the methodology can be explained in a reference document and leave the specifics to the requirement. Directive 3 is critical to the Industry as it relates to who is the Applicable Entity. The SDT addresses Directive 3 by mandating Balancing Authorities meet an objective. The directive is to define that Objective, but there is no requirement associated with that Objective. There is an attachment and there are discussions of what "may" be done, but there is no requirement in the Standard itself. The reference to the BA as the provider of Frequency Response (i.e. Primary Control response) runs counter to other FERC directives that mandate obligated entities be able to self-serve or to interchange provision of services. In this case the BA per se has no assets and cannot self-serve, moreover the primary response service providers have no obligations to provide the service, thus the BA potentially could face a situation where there is no physical service to be purchased but there is a federally mandated standard to comply with. The idea of creating a Primary Response Market as some have proposed does not work without an obligation on some entity to physically provide that service. One final note, the SRC points out that the ACE is an error signal used to drive secondary response; it is not a signal to drive primary response. Thus the use of the Frequency Bias setting is not for control, it is for "adjusting" the error measure that is analyzed after the fact. This standard needs: • a requirement on the ERO to compute the Obligation on each Interconnection • a requirement on the ERO to conduct Frequency Response surveys (note the SRC does not support this requirement but believes that it is needed to meet the FERC directive) • a requirement on energy supply assets (both generation and load) to provide primary response (as a function of the Interconnection obligation in the first bullet) The above will allow NERC to comply with the FERC directives in a fashion consistent with the processes and procedures approved by FERC. Specific recommendations: The SRC proposes that R1 be deleted based on the facts that: • It imposes an obligation on an entity that has no capability to comply • There is an internal conflict with imposing penalties on a deterministic basis (compliance with a fixed set of events) for a statistical service (primary response is a function of the assets operating state and not a fixed service of the asset). In any case, all of the words after FRO should be deleted. The words are not needed for the requirement and if left in can become a source of contention between auditors and registered entities. R3 – delete the added phrase "mode to effectively coordinate control". The phrase "would have an Adverse Impact on the BA's area" needs further discussion. Who makes the decision that operating on AGC will have adverse impact must be defined. R5 – delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate?
Yes
No
M1: The measure should not be tied to a specific Form. If a BA has the evidence but does not provide it on a given Form, how is the reliability of the Power System impacted? The Form may be the format of choice but it should not be an implied requirement. M4: This measure does not read quite right. Something seems to be missing in the part that says: "…showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: "…showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."
Yes
We do not have any issues with the VSLs, but wonder if the wording for R1 should have been "…Reserve Sharing Group's…". Alternatively, the wording after "interconnection's FRO" could be revised to: "…and the Balancing Authority's or the Reserve Sharing Group's FRM was…"

No
Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on P. 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest that the SDT first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. Further, there are no measures provided for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance? We suggest the SDT move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Moreover, if the Attachments are to be integral to the standards, the terminology "may" must be replaced with "shall". Finally, the two Attachments are listed in Section F – Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where appropriate).
We do not have an opinion on whether or not the Background Document provides sufficient clarity to the development of the standard. We do, however, suggest that the SDT consider our comments in Q6, above, and move some of the information from Attachments A and B to or combine with the Background Document, to the Background Document to provide all the technical basis and background behind the elements stipulated in the requirements.
No
Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement. Process description should be regarded guideline document and not a part of the standard requirement.
No
If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question in the Comment Form asking whether the additional information should be requested. We believe this is a significant change to the standard and many commenters may have missed the opportunity to comment on it. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not see how adding a Form 2 can help in that regard. We suggest the SDT to keep data requirements to only what is minimally needed to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection. Where the SDT deems the additional data sheet or information not necessary to support FRS reporting, then we suggest the SDT to hide those pages not required for the standard so as to avoid confusion, and/or to remove those analytical pages not directly used in the standard.
Finally, we ask the SDT to clarify what the primary purpose of this standard is. If it is to respond to Order 693 then the standard misses the point of defining how often to run Frequency Response

Surveys; it does not crisply define the “Interconnection” obligations. If the SDT wants to focus on AGC (which it seems to try to do) then the focus should be on the equations and variables and not on the response performance. If the SDT does want to focus on performance then the issue of who is the default provider must be addressed. As the SRC has noted previously, BAs do not own any generating facilities or service providers. To create standards that apply to entities that are completely dependent on other functional entities (facility owners or service providers) to comply with a requirement is simply improper. The Industry structure has changed but these requirements have not and still assume old industry relationships between BAs and GOs. This issue of who needs to be held responsible for performing the required reliability tasks and services/products must be explicitly cited in the standards and posted for the industry to debate and decide.
ACES Power Marketing Standards Collaborators
Jason L. Marshall
Yes
No
Requirement 1 should not apply to a Reserve Sharing Group. Reserve Sharing Groups (RSG) are designed to share Contingency Reserves and/or Operating Reserves not Frequency Response. While these reserves may be frequency responsive, they are not being shared for the purpose of expanding frequency response. Furthermore, while reserve sharing groups may calculate a joint ACE by summing its individual BA ACE values, RSGs do not have a Frequency Bias Setting which is necessary to assess a Frequency Response Obligation.
Yes
Yes
No
The VSLs on for Requirement R1 set a previously un-established precedent of relying on the performance of other registered entities to establish the severity level of the violation. This is not appropriate. The VSLs should be rewritten to provide further gradations of the violation severity based on the BA’s own performance.
No
Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the “Frequency Response Standard Background Document”. While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an N-2 event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the “safety margin”. There is a statement in the paragraph before the table that states it does but then the table lists out a separate 25% “Safety Margin”. Thus, it is not clear if the “Safety Margin” is included in the Contingency Protection Criteria value listed in the table or not. “Safety margin” should be changed to “reliability margin”. Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin.
No
We can find no document titled “BAL-003-1 Background Document”. We assume this question is referring to the “Frequency Response Standard Background Document” dated October 2011. We do not believe the document provides sufficient clarity. No explanation is provided for why RSG was added to Requirement R1. There are typos contained in the document. On page 6 in NIA, the A should be in subscript. On page 7 in bullet 4 in the first sentence, “The” should be in lowercase.
Yes

The Data Retention section requires the BA to retain data or evidence for up to four years. No data that exceeds the audit cycle should be required to be retained. The audit cycle is three years.

No
In the Standard, the definition of Frequency Response Measure (FRM) is statistically wrong. The median is an improper statistical measure of Frequency Response because --it truncates large excursions which are the specific subject of Frequency Response control, not normal operating frequency errors which are self-correcting and are the subject of CPM control; --it is non-linear; and therefore --it is non-summable over the interconnection; in other words, the individual BA medians don't add up to the interconnection median, in complete incompatibility with CPM control which requires summability of BA performances into the interconnection's performance. Moreover, it is mathematically impossible to sum the medians of the BAs in a Reserve Sharing Group (RSG) into the RSG's median: in other words, the RSG's median cannot represent the sum of the medians of its members. The last paragraph on page 5 of the Background Document is patently wrong, invented, and supported in no probability & statistics literature whatsoever. As a practicing statistician, I hereby give testimony to the utter falsehood of the statement that "In general, statisticians use the median as the best measure of central tendency when a population has outliers." (See http://www.robertblohm.com/BestStatistic.doc for an explanation of "best statistic" which is a highly technical and central topic in modern probability theory and statistics.) Also, "outliers" are falsely and rhetorically claimed to be "noise" when in fact they are the "events" that are the specific subject of Frequency Response. It is well known that they do not "fit" a normal distribution. They are distinct from the normal operating errors that are the subject of CPM control. The paragraph does correctly conclude that the linear regression more accurately incorporates outliers than the median does, although the paragraph uses rhetoric by calling this improvement "skew" as if it is distortionary when, in fact, the median distorts the reality.
Yes
Yes
Yes
Yes
No
The sample pre-selection described in Attachment A, Event Selection, Criteria 2 & 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria 2 & 7 to pre-select only certain events, and not others, in such a way that the selected events occur evenly throughout the year, is papently wrong because it is trying to "fit" events into a process (even distribution over time) that does not govern events, but that instead governs normal operating errors that are the subject of CPM control, not of this Frequency Response standard. In other words, criteria 2 & 7 confuse Frequency Response with CPM, and events with normal operating errors. The result is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on page 5 of the Background Document, on the other hand, provides a statistically correct description of event selection without sample pre-selection and should followed instead of the erroneous criteria 2 & 7 in Attachment A.
Yes
Paragraph 4 on page 5 of the Background Document provides a statistically correct description of

event selection without sample pre-selection and should followed instead of the erroneous criteria 2 & 7 in Attachment A. The risk-based approach to determining FRM, that the Background Document mentions in paragraph 4 of page 4 is being evaluated by the drafting team for application in this standard, should be considered for deployment as soon as possible to replace the administered method currently proposed in this standard, because the administered method lacks any technical justification. No such justification was ever attempted in the development of this standard. The administrative method of determining FRM is therefore but a highly dubious "quick fix" until the risk-based method is evaluated and implemented. The administrative method is in fact perverse because it discourages BAs from reducing their contribution to frequency error by refusing to reduce the BA's FRO accordingly, and because it encourages BAs to contribute to frequency error without increasing their FRO.

Yes

Yes

As a qualified professional statistician I attest that this standard commits two violations of fundamental statistical best practices: use of a median, and biased sample-preselection, as detailed in my answers to questions 1 and 6.

Sacramento Municipal Utility District (SMUD)

Joe Tarantino

No

As drafted, requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifying this concept and possibly including an example in the background document to help explain how this would work. As drafted, in requirement R3, each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode… unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. We seek clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 – Automatic Time Error Correction.

No

The standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz, or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities.

No
In addition to the requirements, reducing frequency bias obligation results in generation tripping closer to the set point. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response.
As a final comment we believe there needs to have consideration for a coordinated response rather than a setting threshold. Coordinated response thresholds values will provide for a desired and anticipated frequency response.

Consideration of Comments

Project 2007-12 Frequency Response

The Frequency Response Drafting Team thanks all commenters who submitted comments on the first formal posting for Project 2007-12 Frequency Response. This standard was posted for a 45-day public comment period from October 25, 2011 through December 9, 2011. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 43 sets of comments, including comments from approximately 133 different people from approximately 86 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

Based on the comments received and the drafting team's discussion of those comments, the drafting team made the following changes to the proposed Standard, definitions, and associated documents:

- Modified the definition for Frequency Response Measure (FRM)
- Modified the definition of Frequency Bias Setting
- Removed the references to Reserve Sharing Groups (RSGs) and replaced them with Frequency Response Sharing Group
- Created a definition for Frequency Response Sharing Group (FRSG)
- Modified Requirement R2 to provide clarity and incorporate Requirement R5
- Created a new Requirement R3 for entities using variable Frequency Bias
- Removed the requirement for operating in Tie Line Bias mode as duplicative of other requirements in other standards
- Removed Requirement R5 and combined it into revised Requirement R2 and new Requirement R3
- Modified Attachment A to provide additional clarity
- Created a Procedure to provide instructions for the ERO to follow in supporting the standard
- Made conforming changes to Measures, Evidence Retention, and VSLs to align with language in the revised requirements
- Re-wrote the Background Document to incorporate additional language for justification of requirements and provide additional clarity
- The SDT is now using the method detailed in the Frequency Response Initiative Report dated September 30, 2012 to calculate the Interconnection Frequency Response Obligation.

There were some minority issues that the team was unable to resolve, including the following:

- A few stakeholders questioned a Requirement for the BA to provide Frequency Response when they typically do not own generation. The SDT explained that the NERC Functional Model and FERC cited the BA as the responsible party for providing Frequency Response and that this was outside the scope of the industry approved SAR. The SDT also stated that there were several different methods available to the BA to provide Frequency Response and that the SDT had included these in the Background Document. The SDT further stated that any entity could submit a SAR addressing this issue to the SC for consideration and that the SDT supported this option.
- A couple of the commenters felt that the median was not the proper method to use for the calculation of the FRM and that the RSG was not fully explained. The SDT stated that the statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. The SDT also noted that while the median was not perfect, the median approaches a BA's typical performance after 15-20 observations and that more observations give a higher confidence in the estimate of the BA's performance.
- Some commenters disagreed with proceeding through development of the standard before the proposed measures have been thoroughly field tested. The SDT stated that it was responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Frequency_Response.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

1. **The SDT has made minor modifications to the proposed definitions to provide additional clarity. Do you agree that these modifications provide sufficient clarity? If not, please explain in the comment area.**

Summary Consideration: The majority of the commenters felt that the SDT should use the term "prevent" instead of "discourage" in the definition of FRM. The SDT explained that it did not want to use the word "prevent" since the SDT believes that the word would imply that you could stop withdrawal. The SDT does not believe that you can totally stop the withdrawal but you can discourage it.

Many of the commenters did not agree with requiring the BA to provide Frequency Response. The NERC Functional Model and FERC cite the BA as the responsible party for providing Frequency Response. There are several different methods available to the BA to provide Frequency Response and these are included in the Background Document.

A couple of the commenters felt that the median was not the proper method to use for the calculation of the FRM and that the RSG was not fully explained. Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. While the median is not perfect, the median approaches a BA's typical performance after 15-20 observations and more observations give a higher confidence in the estimate of the BA's performance.

Some commenters had concerns about the use of the RSG as a means to provide Frequency Response, and in response the SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Organization	Yes or No	Question 1 Comment
Seattle City Light	Negative	Answer: No. Comments: LADWP and SCL recommend the following change to the definition of Frequency Bias Setting. LADWP believes that this change increases the clarity of the definition: Original A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the

Organization	Yes or No	Question 1 Comment
		Interconnection, and discourage response withdrawal through secondary control systems. Proposed Change A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and prevent response withdrawal through secondary control systems
Response: The SDT disagrees with your definition. The SDT considered using the term "prevent" but decided to use the term "discourage" instead. The SDT believes that the word "prevent" would imply that you could stop withdrawal. The SDT does not believe that you can totally stop the withdrawal but you can discourage withdrawal.		
Alliant Energy Corp. Services, Inc.	Negative	The definition of Frequency Bias Setting should focus on what it is. balancing Authorities do not supply energy. seggest rivising it to "A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the expected natural response provided by the assets within the respective Balancing Authority's area."
Response: The SDT agrees that the Balancing Authority does not directly supply energy. However, the NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not**		

Organization	Yes or No	Question 1 Comment
outweigh the effort and cost. **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **The SDT also believes that the definition you have suggested is basically saying the same thing as the definition the SDT has chosen to use.**		
Potomac Electric Power Co.	Negative	The proposed new Definitions do not stand alone and are also linked to Attachments.
Response: The SDT has modified the definitions to no longer reference any other documents.		
ISO/RTO Council Standards Review Committee	No	(1) In our previous comments, we suggested to drop the definitions for the terms FRM and FRO in favor of providing the needed wording in the standard itself to take care of the specific details. The SDT did not adopt our suggestion with the reason that these definitions will be used by other standards in the future. That's fair enough. However, the FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an Attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/approval process without any appreciable value.Once again, we strongly urge the SDT to consider dropping these definitions, and have the details fully specified in the standard body itself. This will eliminate that cross reference issue. After all, the definition for FRM is a simple

Organization	Yes or No	Question 1 Comment
		sentence and does not provide any clarity or specific details that cannot be presented by using appropriate wording in a requirement. (2) The definition of Frequency Bias Setting, if retained, should focus on what it is. Balancing Authorities do not supply energy. We suggest to revise it to: Frequency Bias Setting A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's (BA's) Area Control Error (ACE) equation to approximate the expected natural response provided by the assets within the respective Balancing Authority's area.

Response: The SDT believes that these terms will be used in later version of the BAL Standards. The term FRO is presently being used in the development of a new standard (BAL-012-1 Planning Reserves). The SDT has modified the definitions to no longer reference any other documents.

The SDT agrees that the Balancing Authority does not directly supply energy. However, the NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.

There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.

Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.

The SDT also believes that the definition you have suggested is basically saying the same thing as the definition the SDT has

Organization	Yes or No	Question 1 Comment
chosen to use.		
Duke Energy	No	Duke Energy would suggest removing "usually" from the Frequency Bias Setting definition, as the value in the ACE equation must be in terms of MW/0.1Hz in order for ACE to be correctly calculated. We apologize for missing this point in the last round of comments. Though some would argue that the last phrase of the definition is more of an explanation of a function rather than a definition, we support keeping the phrase inserted, as it should be recognized that the intent is to account for the frequency response contribution AND keep the FBS slightly larger (in magnitude) than the average estimated response, to better discourage withdrawal, which was also recognized by Nathan Cohn. Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
Response: It is the understanding of the SDT that EMS systems could use different methods implementing the ACE calculation. The SDT therefore believes that the term "usually" is more appropriate. **The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."**		
Independent Electricity System Operator	No	In our previous comments, we suggested to drop the definitions for the terms FRM and FRO in favor of providing the needed wording in the standard itself to take care of the specific details. The SDT did not adopt our suggestion with the reason that these definitions will be used by other standards in the future. That's fair enough. However, the FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a

Organization	Yes or No	Question 1 Comment
		definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/maintenance problem without any appreciable value. Once again, we strongly urge the SDT to consider dropping these definitions, and have the details fully specified in the standard body. This will eliminate the cross reference issues. After all, the definition for FRM is a simple sentence and does not provide any clarity or specific details that cannot be addressed by providing the appropriate wording in a requirement. With this cross-reference issue, combined with the issues associated with Attachments A and B (see our comments under Q6, below), we are unable to support this standard at this time.
Response: The SDT believes that these terms will be used in later version of the BAL Standards. The term FRO is presently being used in the development of a new standard (BAL-012-1 Planning Reserves). The SDT has modified the definitions to no longer reference any other documents.		
Keen Resources Asia Ltd.	No	In the Standard, the definition of Frequency Response Measure (FRM) is statistically wrong. The median is an improper statistical measure of Frequency Response because--it truncates large excursions which are the specific subject of Frequency Response control, not normal operating frequency errors which are self-correcting and are the subject of CPM control;--it is non-linear; and therefore--it is non-summable over the interconnection; in other words, the individual BA medians don't add up to the interconnection median, in complete incompatibility with CPM control which requires summability of BA performances into the interconnection's performance. Moreover, it is mathematically impossible to sum the medians of the BAs in a Reserve Sharing Group (RSG) into the RSG's median:

Organization	Yes or No	Question 1 Comment
		in other words, the RSG's median cannot represent the sum of the medians of its members.The last paragraph on page 5 of the Background Document is patently wrong, invented, and supported in no probability & statistics literature whatsoever. As a practicing statistician, I hereby give testimony to the utter falsehood of the statement that "In general, statisticians use the median as the best measure of central tendency when a population has outliers." (See http://www.robertblohm.com/BestStatistic.doc for an explanation of "best statistic" which is a highly technical and central topic in modern probability theory and statistics.) Also, "outliers" are falsely and rhetorically claimed to be "noise" when in fact they are the "events" that are the specific subject of Frequency Response. It is well known that they do not "fit" a normal distribution. They are distinct from the normal operating errors that are the subject of CPM control. The paragraph does correctly conclude that the linear regression more accurately incorporates outliers than the median does, although the paragraph uses rhetoric by calling this improvement "skew" as if it is distortionary when, in fact, the median distorts the reality.

Response: The word "average" is a generic term to represent central tendency. The term is often used synonymously with the arithmetic "mean".
The issue with measuring frequency response is that a BA's calculated performance (as opposed to actual performance) is highly variable event to event. This is particularly true for a single BA in a multi-BA Interconnection.

Calculated Frequency Response has a very large noise to signal ratio. A 5,000 MW BA in the East typically is only called to contribute about 10-15 MW for the loss of a large unit. Its minute to minute load changes can easily wash this contribution out. An arithmetic mean or regression analysis will be influenced by noise-induced outliers.

Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response.

A regression would be appropriate if you were trying to forecast "calculated" frequency response for a BA in a multi-BA

Organization	Yes or No	Question 1 Comment
interconnection. **While not perfect, the median approaches a BA's typical performance after 15-20 observations. More observations give a higher confidence in the estimate of the BA's performance.**		
Manitoba Hydro	No	It is not clear why the term "Single Event Frequency Response Data (SEFRD)" has been removed from the standard but is still used and defined in the Background Document and Attachment A.
Response: The SDT removed the term because it was not being used within the standard itself. It was only being used in the calculation of the FRM. There is no need to create a NERC Glossary defined term if it is not being used in the standard.		
Seattle City Light	No	LADWP and SCL recommend the following change (in red) to the definition of Frequency Bias Setting. LADWP believes that this change increases the clarity of the definition:OriginalA number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems.Proposed ChangeA number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage prevent response withdrawal through secondary control systems
Response: The SDT disagrees with your definition The SDT considered using the term "prevent" but decided to use the term "discourage" instead. The SDT believes that the word "prevent" would imply that you could stop withdrawal. The SDT does not believe that you can totally stop the withdrawal but you can discourage withdrawal.		
Los Angeles Department of Water and Power	No	LADWP recommends the following change to the definition of Frequency Bias Setting (replace the word "discourage" with the word "prevent"). LADWP believes that this change increases the clarity of the definition:OriginalA number, either fixed or variable, usually expressed in

Organization	Yes or No	Question 1 Comment
		MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems.Proposed ChangeA number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and prevent response withdrawal through secondary control systems
Response: The SDT disagrees with your definition. The SDT considered using the term "prevent" but decided to use the term "discourage" instead. The SDT believes that the word "prevent" would imply that you could stop withdrawal. The SDT does not believe that you can totally stop the withdrawal but you can discourage withdrawal.		
Progress Energy	No	PGN supports the collective comments of SERC members.We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. **The SDT has modified the definition for FRM to state that it is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."**		
ERCOT	No	RE: Frequency Response Obligation (FRO) definition: ERCOT suggests changing "Balancing Authority's" to "Balancing Authority Area's" as follows:

Organization	Yes or No	Question 1 Comment
		The Balancing Authority Area's share of the required Frequency Response needed for the reliable operation of an Interconnection. A BA that does not own generation resources cannot provide Frequency Response, it can only schedule and dispatch available resources capable of such; . The BA should be responsible for taking action to schedule resources that are capable of frequency response, and monitoring to assure frequency response performance. The GOP (possibly the LSE when demand side performance is involved) must be accountable for performing.However, there is nothing in this requirement to encourage the owner of a resource who chooses not to provide frequency response to come to the table. There is nothing in this standard that uniformly requires all frequency response providers to perform. This is likely to be detrimental to the performance of a BAA and unfairly sanctions those willing to perform to to assure reliability while others are not required to perform.

Response: The SDT believes that the BA is the responsible entity not the BA Area.

The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.

There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.

Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a

Organization	Yes or No	Question 1 Comment
need for a generator performance obligation, they are encouraged to submit a SAR to that effect.		
Ameren	No	The Frequency Response Measure (FRM) definition should include which Entity(ies) it applies to, similar to the definition of the FRO.
Response: The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."		
Constellation Energy Commodities Group	No	The Frequency Response Obligation has two components based on Attachment 1 - an Interconnection FRO and a BA FRO. The proposed definition captures only the BA FRO.
Response: The definition is referencing the responsible entity, the BA. The interconnection's FRO is only calculated as the beginning point for the determination of the BA's FRO.		
Hydro-Quebec TransEnergie	No	The FRM and FRO definitions should precise that it is expressed in MW/0.1Hz. As for the Frequency Bias Setting definition, as written, would apply only to a multiple BA Interconnection. In a single BA Interconnection, the Frequency Bias translates the frequency error into a MW value that must be dispatched to bring back Frequency to desired value. Since Tie Lines are not controlled through AGC, there is no response withdrawal issue
Response: The FRM and FRO definitions have been modified to state MW/0.1Hz. **The SDT disagrees. There can be withdrawal on any interconnection that uses a Frequency Bias estimate if that estimate is lower than Frequency Response and other factors are used to determine dispatch, i.e., future load estimate.**		
Northeast Power Coordinating Council/ISO New England Inc.	No	The FRM definition should not refer to FORM 1. Also, suggest the following wording for frequency bias setting: "A number,

Organization	Yes or No	Question 1 Comment
		either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority's area."
Response: The SDT has modified the definitions to no longer reference any other documents. **The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."** **The SDT agrees that the Balancing Authority does not directly supply energy. However, the NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. The SDT also believes that the definition you have suggested is basically saying the same thing as the definition the SDT has

Organization	Yes or No	Question 1 Comment
chosen to use.		
Alberta Electric System Operator	No	The FRO definition is specific to BAs. The Appendix 1, which is incorporated in the standard, uses this definition in relation to requirements of the Interconnection. The SDT should consider a revision of this definition that accounts for the requirements of the Interconnection versus the BA obligation to the Interconnection.
Response: The definition is referencing the responsible entity, the BA. The Interconnection's FRO is only calculated as the beginning point for the determination of the BA's FRO.		
South Carolina Electric and Gas	No	The last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. Therefore, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. **The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."**		
SERC OC Standards Review Group	No	We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the

Organization	Yes or No	Question 1 Comment
		definition for Frequency Response Obligation (FRO)?
Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. **The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."**		
Southern Company	No	We suggest adding BA to the definition of Frequency Response Measure (FRM), similar to the definition for Frequency Response Obligation (FRO).
Response: The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."		
Associated Electric Cooperative Inc	Yes	The FRO definition incorrectly applies the historically narrow Balancing Authority scope of responsibility, while the FRM definition does not address applicability at all. But the BAL-003-1 Standard itself identifies RSGs (where applicable) and BAs as the Responsible Entities within scope of this standard. For consistency, AECI recommends using "Responsible Entities (e.g. Reserve Sharing Groups - where applicable, and Balancing Authorities)" in both the FRO and FRM definitions. Rationale: This change should help future-proof the definition, should more specific "frequency response" or "spinning reserve" sharing groups later surface within our industry. AECI agrees with the Frequency Bias Setting definition's inclusion of a bit more functionality than typical. We however recommend replacing "to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems", with "to support their Frequency Response contribution to the Interconnection". Rationale: Readability, and clarity on

Organization	Yes or No	Question 1 Comment
		the "discouraging withdrawal..." phrase, which should reside in the Background document.
Response: The SDT believes that using the term "Responsible Entities" would cause confusion since different standards could define a Responsible Entity differently. However, the SDT has defined a new term "Frequency Response Sharing Group" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." The SDT has decided not to add the term FRSG to the definition for Frequency Response Obligation (FRO). The SDT believes that the FRO is assigned to a BA not the FRSG. The FRSG FRO is a summation of the BA FRO's. **The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments.**		
SCE&G	Affirmative	The last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. Therefore, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)? o The utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing
Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. **The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."**		

Organization	Yes or No	Question 1 Comment
The SDT agrees that using the phrase Reserve Sharing Group could cause confusion. The SDT has defined a new term "Frequency Response Sharing Group". The definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." The SDT has decided not to add the term FRSG to the definition for Frequency Response Obligation (FRO). The SDT believes that the FRO is assigned to a BA not the FRSG. The FRSG FRO is a summation of the BA FRO's.

2. The SDT has made minor modifications to the Requirements R1 through R4 to provide additional clarity. Do you agree that these modifications provide sufficient clarity to comply with the standard? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters felt that the use of an RSG as a method for supplying Frequency Response was not fully explained. The SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Many of the commenters were concerned with the language in Requirement R3 stating that an entity had to be operating in Tie Line Bias mode unless there were adverse affects on the BES. The SDT removed this requirement from the proposed standard since it is duplicative of Requirement R6 and R7 in BAL-005-0.1b.

Many of the commenters did not agree with assigning the BA to provide Frequency Response. The NERC Functional Model and FERC cited the BA as the responsible party for providing Frequency Response. There are several different methods available to the BA to provide Frequency Response included in the Background Document.

A few of the commenters did not agree with lowering the minimum Frequency Bias Setting. Early research by Nathan Cohn on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased. The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

A couple of commenters were concerned that the BA could be responsible to supply an infinite amount of Frequency Response. They felt that a BA could not prepare for this in its planning process. The proposed standard was not clear on this subject and the SDT has added language in the "Event Selection Criteria" section of Attachment A to limit the amount of Frequency Response a BA would be required to provide to be compliant with the standard.

Organization	Yes or No	Question 2 Comment
Seattle City Light	Negative	The language in Requirement 4 needs to be clarified and recommends the following change: R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning]
Response: The SDT has modified Requirement R4 to use bullets in support of your suggestion.		
Public Utility District No. 1 of Douglas County	Negative	1. Recommend clarifying the language in R1 to include background information as to how RSGs fit into the FRM performance. 2. Recommend R3 language be modified to permit operation in other than tie-line bias mode with the requirement to notify the RC. 3. We have concern about the affect R3 will have on the WECC time error correction standard (BAL-004-WECC-1). 4. Clarification is needed between Attachment A and the Background Document for projected peak and historical peak. 5. We have a concern about the affect of lowering the minimum frequency bias obligation from 1% to .8% and its probable affect on reliability. 6. We have a concern about he upper limit to the amount of frequency response expected from BAs.
Response: Comment 1 – The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes		

Organization	Yes or No	Question 2 Comment
that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Comment 2 & 3– The SDT has removed the Requirement R3 from the next version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.** **Comment 4 – The SDT has corrected the error between Attachment A and the Background Document.** **Comment 5 – Early research by Nathan Cohn[2] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.** **The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The SDT has modified Attachment A to include language which puts an upper limit on the amount of Frequency Response required from an entity.**		
Potomac Electric Power Co.	Negative	1)The proposed Requirements do not meet all the FERC directives. 2)The proposed Requirements fail to recognize the fact that not all BAs can provide primary frequency response. 3)The proposed Requirements are not all in the standard. Some are in the Attachments.

[2] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 2 Comment
Response: Comment 1 – The SDT disagrees with you about their meeting all of the FERC directives. Unfortunately your comment does not provide specific information as to what you believe is not being addressed. The SDT has included a section within the Background Document which details how this standard is meeting the FERC directives. **Comment 2 – The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.** **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **Comment 3 – Unfortunately your comment does not provide enough information as to what parts of the attachments you believe should be in the requirements. However, the SDT has made significant modifications to both Attachment A and Attachment B now a Procedure for the ERO to follow in support of the proposed standard. The SDT believes that the requirements should be succinct and the methodologies to be used should be part of an attachment.**		
Seattle City Light	No	o LADWP and SCL have a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances:- Telemetry problems that lead the operator to believe ACE is significantly in error.-

Organization	Yes or No	Question 2 Comment
		The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection).- During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them).- For training purposes.- Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. o LADWP and SCL believe that the language in Requirement 4 needs to be clarified and recommends the following change (in red):R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) calculate the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] o LADWP and SCL believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. SCL recommends the addition of "natural frequency response" as a third bullet item to Requirement 5 (in red). The revised requirement would read: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] o The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. o The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment

Organization	Yes or No	Question 2 Comment
		B. o The natural frequency response
Response: The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b. **The SDT has modified Requirement R4 which now uses bullets in support of your suggestion.** **The SDT disagrees with your suggested modification. The SDT believes that your suggested modification could allow an entity to circumvent the minimum percentage process. However, the SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.**		
FMPP	No	o R1. Each Balancing Authority (BA) or Reserve Sharing Group (RSG) shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection. [Risk Factor: Medium][Time Horizon: Operations Assessment] The BA does not have control over the frequency responsive generation. There needs to be a requirement that the GOP shall set frequency response for the generators as directed by the BA. o R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is {greater than or (<= add these words)} {at least (<= delete these words)} equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] o The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. o The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.

Organization	Yes or No	Question 2 Comment
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **With regards to your comment concerning Requirement R5, you have not provided enough information for the SDT to respond. However, the SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.**		
Western Electricity Coordinating Council	No	Agree with the changes made to this latest version of BAL-003-1. However, additional clarity could be added by addressing the following: R1- It is not clear what is intended by "Reserve Sharing Group". As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - There may be occasions in which an entity has a legitimate reason or a need to operate in a mode other than Tie Line Bias but that does not qualify as an Adverse Reliability Impact. Recommend including language that would permit limited operation in a mode other than Tie Line Bias mode provided the Reliability Coordinator was notified. R3 - Has the drafting team considered whether or not the

Organization	Yes or No	Question 2 Comment
		language of Requirement R3 will have any conflict or coordination issue with the FERC-approved regional reliability standards BAL-004-WECC-1 - Automatic Time Error Correction? R5 - Suggest changing the language “at least equal to” to “greater than or equal to” for clarity.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term “Frequency Response Sharing Group (FRSG)” because it believes that using the presently defined term “Reserve Sharing Group” could cause confusion. The new definition reads “A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members.” **The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.** **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT has modified the requirement and believes we have implemented the intent of your suggestion.**		
Seattle City Light	Negative	Answer: No Comments: o LADWP and SCL have a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority’s Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances: - Telemetry problems that lead the operator to believe ACE is significantly in error. - The frequency input to AGC is not reflective of the BA’s true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). - During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). - For training purposes. - Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems.

Organization	Yes or No	Question 2 Comment
		o LADWP and SCL believe that the language in Requirement 4 needs to be clarified and recommends the following change: R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] o LADWP and SCL believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. SCL recommends the addition of "natural frequency response" as a third bullet item to Requirement 5. The revised requirement would read: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] o The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. o The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B. o The natural frequency response
Response: The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b. **The SDT has modified Requirement R4 which now uses bullets in support of your suggestion.** **The SDT disagrees with your suggested modification. The SDT believes that your suggested modification could allow an entity to circumvent the minimum percentage process. However, the SDT has removed Requirement R5 and combined it into Requirement**		

Organization	Yes or No	Question 2 Comment
R2 and a new Requirement R3.		
Avista Corp.	Negative	As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly including an example in the background document to help explain how this would work. Reducing frequency bias obligation is detrimental to reliability. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Early research by Nathan Cohn[3] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.** **The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting**		

[3] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 2 Comment
0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.		
City of Redding, Oregon Public Utility Commission, BrightSource Energy, Inc., Clark Public Utilities, Avista, Tri-State G & T Association, Inc.; Deseret Power	Negative	As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifying this concept and possibly including an example in the background document to help explain how this would work.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."		
Sacramento Municipal Utility District (SMUD)	No	As drafted, requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifying this concept and possibly including an example in the background document to help explain how this would work. As drafted, in requirement R3, each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or

Organization	Yes or No	Question 2 Comment
		desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified.We seek clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **The SDT has removed the Requirement R3 from the next version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.**		
Energy Mark, Inc.	No	Comment 1: The timing requirements for implementing the Frequency Bias Setting are not specified for BAs participating in Overlap Regulation Service. The requirements indicate the value that should be used for the Frequency Bias Setting, but they do not indicate when those settings should be implemented. Comment 2: The term "Tie Line Bias mode" in Requirement R3 is not sufficiently defined to make this requirement enforceable. Any operating mode labeled as "Tie Line Bias mode" on an EMS that uses interchange scheduled and frequency error as inputs will meet the standard requirement as stated. This loop-hole exists because the NERC definition of "Tie Line Bias" fails to define the term in enough detail to actually limit AGC operation to the specified mode of operation. One way to improve this requirement would be to redefine Tie Line Bias in the NERC Glossary as a mode that uses the NERC ACE Equation as defined in BAL-001 as the basis for AGC action when the EMS is in Tie Line Bias mode. Comment 3: The standard is silent on how a BA receiving Overlap Regulation Service should set its Frequency Bias Setting. Unless this is explicitly stated, it will be up to

Organization	Yes or No	Question 2 Comment
		the auditors to determine the value of the Frequency Bias Setting for BAs receiving Overlap Regulation Service. Comment 4: In general, the requirements indicate what the responsible BAs should do and when. The requirements do not indicate what the BAs that are not responsible should do and when, ie. how they are relieved from responsibility. This may create problems when the auditors are required to interpret the standards for BAs that have appropriately shifted responsibilites to others.
Response: Comment 1 – The SDT believes that Requirement R2 states the timing for implementation of the Frequency Bias Setting. The Requirement R4 is simply to provide the BA with the method for combining the Frequency Bias Settings for providers of Overlap Regulation Service. The Background Document and Attachment A have also been modified to provide further clarity. **Comment 2 – The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.** **Comment 3 & 4 – The SDT does not believe that there is an issue for entities receiving Overlap Regulation Service. However, the SDT has modified the Background document to further clarify this issue.**		
Duke Energy	No	Duke Energy supports the concept of a group of BAs forming a group to share in Frequency Response however it should be clear that it is an option. We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms which is specific to sharing of contingency reserves, and should be replaced with a new term, such as "Frequency Response Sharing Group". R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode. Though comments are provided below on the Attachments, Duke Energy believes that all NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval), and not within Attachments that may be revised without Industry review and approval. As noted below and in prior comments, given the secondary control implications of changing

Organization	Yes or No	Question 2 Comment
		the minimum Frequency Bias Setting (FBS), Duke Energy believes that subsequent revisions to the minimum FBS should be vetted through the Standards process. Duke Energy would suggest moving the details of the minimum FBS for each Interconnection into the Standard, and having the implementation plan include annual submittal of a revised minimum FBS based upon the methodology presented in Attachment B for ballot approval by the Industry.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it also believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.** **Attachments that are referenced within a Requirement are mandatory and enforceable.** **Early research by Nathan Cohn[4] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.** **The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.**		
ISO/RTO Council Standards Review Committee	No	General CommentsThe SRC offers the following general comment with regard to the SDT's proposed revisions: Gerry Cauley's Results based initiative calls for

[4] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 2 Comment
		requirements that focus on performance (i.e. WHAT must be accomplished NOT on WHY it is required or HOW it should be accomplished). The SRC has found that such explanatory statements as the SDT is proposing lead to ambiguities and confusion in the compliance application. Compliance Enforcement agents must consider not just the results but must decide if the action was taken for the given reason. To avoid such confusion, the Results based approach uses reference documents to address such background material while leaving the requirement as a direct mandate.The SRC notes: o All NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval). o Data requirements are better handled through NERC's Rules of Procedure Section 1600 than by mandating that ad hoc Forms be submitted. o Definitions should be generic, and should be self-contained (i.e. should not reference an external document). o The decisions regarding alternative methodologies should be decided by the Industry not by the SDT. The SDT should make its case and ask the Industry for its approval. Regarding Order 693 directives, the SRC notes that there are three directives as follows: (1) To include Levels of Non-Compliance; (2) To determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and (3) To define the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved.

Organization	Yes or No	Question 2 Comment
		The SRC suggests that Directive 2 be handled directly as a mandate that the ERO conduct a fixed number of Frequency Response Surveys for randomly selected events. Discussion of the number and the methodology can be explained in a reference document and leave the specifics to the requirement. Directive 3 is critical to the Industry as it relates to who is the Applicable Entity. The SDT addresses Directive 3 by mandating Balancing Authorities meet an objective. The directive is to define that Objective, but there is no requirement associated with that Objective. There is an attachment and there are discussions of what "may" be done, but there is no requirement in the Standard itself. The reference to the BA as the provider of Frequency Response (i.e. Primary Control response) runs counter to other FERC directives that mandate obligated entities be able to self-serve or to interchange provision of services. In this case the BA per se has no assets and cannot self-serve, moreover the primary response service providers have no obligations to provide the service, thus the BA potentially could face a situation where there is no physical service to be purchased but there is a federally mandated standard to comply with. The idea of creating a Primary Response Market as some have proposed does not work without an obligation on some entity to physically provide that service. One final note, the SRC points out that the ACE is an error signal used to drive secondary response; it is not a signal to drive primary response. Thus the use of the Frequency Bias setting is not for control, it is for "adjusting" the error measure that is analyzed after the fact.This standard needs: o a requirement on the ERO to compute the Obligation on each Interconnection o a requirement on the ERO to conduct Frequency Response surveys (note the SRC does not support this requirement but believes that it is needed to meet the FERC directive) o a requirement on energy supply assets (both generation and load) to provide primary response (as a function of the Interconnection obligation in the first bullet)

Organization	Yes or No	Question 2 Comment
		The above will allow NERC to comply with the FERC directives in a fashion consistent with the processes and procedures approved by FERC. Specific recommendations: The SRC proposes that R1 be deleted based on the facts that: o It imposes an obligation on an entity that has no capability to comply o There is an internal conflict with imposing penalties on a deterministic basis (compliance with a fixed set of events) for a statistical service (primary response is a function of the assets operating state and not a fixed service of the asset).In any case, all of the words after FRO should be deleted. The words are not needed for the requirement and if left in can become a source of contention between auditors and registered entities. R3 - delete the added phrase "mode to effectively coordinate control".The phrase "would have an Adverse Impact on the BA's area" needs further discussion. Who makes the decision that operating on AGC will have adverse impact must be defined. R5 - delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate?
Response: Unfortunately your comment does not provide enough information as to what parts of the attachments you believe should be in the requirements. However, the SDT has made significant modifications to both Attachment A and Attachment B, now a Procedure for the ERO to follow in supporting the standard. The SDT believes that the requirements should be succinct and the methodologies to be used should be part of an attachment. **The SDT is using defined forms to ensure that everyone calculates their Frequency Bias Setting and Frequency Response Measure in a consistent manner. The SDT also believes that this provides entities a relatively non-time consuming method to provide the necessary information to evaluate compliance.**		

Organization	Yes or No	Question 2 Comment
		The SDT has modified the definitions to no longer reference any other documents. **The SDT is recommending a certain approach to calculating the FRM. The reference to other methods being evaluated is simply a statement that the SDT believes that further analysis would be beneficial. Any modification to the calculation methodology would require industry approval.** **The SDT believes that it is meeting Directive #2 by requiring at least 20 events to be analyzed each year.** **The SDT believes that it is meeting the directive to define the "objective" by creating the BA Frequency Response Obligation (FRO). With regards to the BA being the responsible entity to provide Frequency Response the NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.** **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.** **The ERO is not defined as an applicable entity in the industry approved SAR and therefore it would be inappropriate to include them as an applicable entity.**
Los Angeles Department of Water and Power	No	LADWP has a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias

Organization	Yes or No	Question 2 Comment
		mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances:- Telemetry problems that lead the operator to believe ACE is significantly in error.- The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection).- During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them).- For training purposes.- Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. LADWP believes that the language in Requirement 4 needs to be clarified and recommends the following change:- R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] LADWP believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. LADWP recommends the addition of "natural frequency response" as a third bullet item to Requirement 5. The revised requirement would read:- R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium][Time Horizon: Operations Planning] o The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. o The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as

Organization	Yes or No	Question 2 Comment
		specified by the ERO in accordance with Attachment B. o The natural frequency response
Response: The SDT has removed the Requirement R3 from the next version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b. **The SDT has modified Requirement R4 which now uses bullets in support of your suggestion.** **The SDT disagrees with your suggested modification. The SDT believes that your suggested modification could allow for an entity to circumvent the minimum percentage process. However, the SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.**		
MidAmerican Energy Co.	Negative	MidAmerican supports the comments provided by the NSRF. It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. It is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.5). Without a statement that the BA is expected to keep its allocated portion of generation reserves only up to the largest event identified in Table 2, a BA could be expected to provide limitless amounts of frequency response. Balancing Authorities cannot know what is expected of them and therefore cannot plan appropriately.
Response: The SDT understands your concern and has added language in Attachment A that caps the amount of Frequency Response that a BA will be required to provide.		
East Kentucky Power Coop.; ACES Power Marketing; Hoosier Energy Rural Electric Cooperative, Inc.; Southwest Transmission Cooperative, Inc.	Negative	Overall, [we] believes the drafting team has done an excellent job to address the FERC directives from Order 693. However, we believe there is still room for improving the standard and that there is a significant technical error. The technical error was introduced by applying Requirement 1 to the RSG and is discussed below. Requirement 1 should not apply to a Reserve Sharing Group. Reserve Sharing Groups (RSG) are designed to share Contingency Reserves and/or Operating Reserves not

Organization	Yes or No	Question 2 Comment
		Frequency Response. While these reserves may be frequency responsive, they are not being shared for the purpose of expanding frequency response. Furthermore, while reserve sharing groups may calculate a joint ACE by summing its individual BA ACE values, RSGs do not have a Frequency Bias Setting which is necessary to assess a Frequency Response Obligation. Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an N-2 event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does, but then the table lists out a separate 25% "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin. The Data Retention section requires the BA to retain data or evidence for up to four years. No data that exceeds the audit cycle should be required to be retained. The audit cycle is three years for BAs.
Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency		

Organization	Yes or No	Question 2 Comment
Response Obligations of its members." **The SDT agrees with your comment concerning further clarification on certain terms and has made significant modifications to the Background Document and Attachments A and B.** **The Data Retention is stated as "the current year plus three calendar years" since it is highly unlikely that an entity will be audited exactly three years after its previous audit. The SDT recognizes that most audits will occur within the year following the third year.**		
PPL Electric Utilities Corp.; PPL Generation LLC	Negative	The PPL Companies do not support proposed Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting) primarily because PPL believes it inappropriately subjects Reserve Sharing Groups (RSGs) to the proposed requirements. The proposed Applicability provision states that the mandatory reliability requirements would be applicable to (1) Balancing Authorities and (2) Reserve Sharing Groups (where applicable). However, it is unclear how the proposed requirements would be applicable to an RSG. RSGs typically do not provide a mechanism for sharing automatic Frequency Response. The BA Frequency Response Obligation (FRO) is a formula based on BAs and the Interconnection and has nothing to do with RSGs. Rather, RSGs collectively respond to requests for activation of contingency reserves generally after the request is made by a member Balancing Authority. The Standard Drafting Team should therefore remove RSGs from the Applicability section and should remove all other references to RSGs in the proposed standard.
Response: The SDT disagrees that an RSG is not an appropriate mechanism for providing Frequency Response. However the SDT does believe that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a**		

Organization	Yes or No	Question 2 Comment
means to meet one of the FERC's Order No. 693 directives. **FRSG performance may be calculated on one of two ways:** • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or** • **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**		
Progress Energy	No	PGN supports the collective comments of SERC members.We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing". R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode
Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **The SDT has removed the requirement to operate AGC in Tie Line Bias mode as this requirement was duplicative of the Requirements R6 and R7 in BAL-005-0.1b.**		
MRO NSRF	No	R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R2 - Please add the word "range" in-between the words "date" and "specified". The background document specifies that there is a 72-hour period to implement the FBS setting (See Background document Page 7). R2, as written, does not reflect the

Organization	Yes or No	Question 2 Comment
		period for which an entity may implement the ERO validated Bias into ACE. Also see our comment on #7 as to the length of the comment period. Question 7 comment is provided to assist the SDT; Note from question 7: (Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1. The Standard itself does not state this provision (24 hour window on each side of target date) as indicated. 2. The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We suggest that a seven day window be used for implementation of the FBS.) R3 - Recommend the term "Adverse Reliability Impact" be removed from Requirement 3. Based on the NERC definition of the term, a smaller entity could never operate its AGC outside of TLB mode due to their impact on the BES not likely to result in "instability or Cascading". To ensure a more consistent and equitable approach when applying this Requirement, recommend the drafting team incorporate the reliability reasons listed within the Background Document into the actual Requirement. Additionally, the phrase "effectively coordinated control" should be removed as this is not essential to the Requirement and introduces ambiguity in its application. To this end, the following revisions are proposed: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area meets one or more of the following conditions.

Organization	Yes or No	Question 2 Comment
		o Telemetry problems that lead the operator to believe ACE is significantly in error. o The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). o During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). o For training purposes. o Many AGC systems will automatically switch to an alternative mode if the EMS determines Tie Line Bias control could lead to problems. o For single BA Interconnections, Flat Frequency and Tie Line Bias are equivalent. o The Reliability Coordinator has been informed and the duration is [insert time constraint language here]. R5 - Recommend to delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate? Please clarify.

Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG). The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**

Organization	Yes or No	Question 2 Comment
• **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.** **The SDT has modified Requirement R2 to provide better clarity. The requirement now reads "**Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period specified by the ERO and shall use this Frequency Bias Setting until directed to change by the ERO to ensure effectively coordinated Tie Line Bias control.**".** **The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.** **The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.**		
Xcel Energy	No	R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - recommend modifying the language to permit AGC out of TLB mode if the RC is notified; also remove the "to ensure coordinated control" as this is not essential for the requirement. Our reasoning behind the suggested change to notification of the RC is that there are occassions where an entity would need to perform testing, etc and it could be argued that testing would not be sufficient justification for meeting the Adverse Reliability Impact definition. Here is proposed revised language:Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless the Balancing Authority's Reliability Coordinator has been informed and the duration is [insert time constraint language here].
Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or more		

Organization	Yes or No	Question 2 Comment
Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.**		
Constellation Energy Commodities Group	No	R1 should accommodate agreements between multiple BAs and RSGs in achieving the annual Frequency Response Measure. See proposed modification below: R1. Each Balancing Authority shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligations (FRO) to ensure that sufficient Frequency Response is provided by each BA. Either the Balancing Authority individual FRM, multiple Balancing Authority's FRM per written agreement, or the FRM of the Reserve Sharing Group must be equal to or more negative than the applicable Frequency Response Obligations (FRO) for a single Balancing Authority or the aggregate of multiple Balancing Authorities or RSGs.- In R2, "Each Balancing Authority not participating in Overlap Regulation Service" should state "Each Balancing Authority, not receiving Overlap Regulation, shall implement the appropriate Frequency Bias Setting (fixed or variable,) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control". – In R3, the explanatory language about why to operate in Tie Line Bias mode should be deleted. See proposed modification below: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area.- R5 should be modified to state only that the FBS is specified by the ERO in accordance with Attachment B. As drafted the Requirement is in conflict with Attachment B because the Requirement mandates a minimum and does not allow for a reduction to the minimum but it references Attachment B which is titled

Organization	Yes or No	Question 2 Comment
		"Process for Adjusting Minimum Frequency Bias Setting". See proposed modification below: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is as specified by the ERO in accordance with Attachment B.- There should be a Requirement specifically stating there is an obligation to complete and submit FRS Form 1 by January 10th each year for clarity.- The requirements should be re-ordered to reflect the chronology of the process for frequency calculation, implementation and performance measurement. The recommended order is as follows: R5 which defines the minimum Frequency Bias Setting (FBS) for a Balancing Authority R4 which describes how the minimum FBS may be altered through Overlap Regulation Service R2 which identifies the coordination required around implementationR3 which requires operation in Tie Line Bias mode R1 which establishes the performance obligation
Response: The SDT does not see anything within the Requirement that would restrict any agreements between multiple BAs and RSGs. However, the SDT has modified the language in Requirement R1 to provide additional clarity. The requirement now reads "Each Balancing Authority or Frequency Response Sharing Group (FRSG) shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported in accordance with Attachment A) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each Balancing Authority or FRSG to maintain Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation." The SDT has also defined a new term "Frequency Response Sharing Group (FRSG)" because it also believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to		

Organization	Yes or No	Question 2 Comment
jointly meet the Frequency Response Obligations of its members." **The SDT has modified Requirement R2 to provide better clarity. The requirement now reads "**Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period specified by the ERO and shall use this Frequency Bias Setting until directed to change by the ERO to ensure effectively coordinated Tie Line Bias control.**".** **The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.** **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT also believes that Attachment B, now a Procedure for the ERO to follow in supporting the standard, only details the process the ERO is to use when evaluating and making modifications to the minimum Frequency Bias Setting.** **The SDT disagrees with your comment concerning an additional requirement for timing of reporting. The SDT believes that this is an administrative issue and is better handled within an attachment. The SDT would also like to note that an attachment when referenced in a requirement becomes mandatory and enforceable.** **The SDT thanks you for your suggested ordering for the requirements but believes that the revised proposed standard reflects the proper order in that it sets the goal at beginning of year, calculates performance, reports performance and calculates bias at the end of the year.**		
Constellation Energy	Negative	-R1 should accommodate agreements between multiple BAs and RSGs in achieving the annual Frequency Response Measure. See proposed modification below: R1. Each Balancing Authority shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligations (FRO) to ensure that sufficient Frequency Response is provided by each BA. Either the Balancing Authority individual FRM, multiple Balancing Authority's FRM per written agreement, or the FRM of the Reserve Sharing Group must be equal to or more negative than the applicable Frequency Response Obligations (FRO) for a single Balancing Authority or the aggregate of multiple Balancing Authorities or RSGs. -In R2, "Each Balancing Authority not participating in Overlap Regulation Service"

Organization	Yes or No	Question 2 Comment
		should state “Each Balancing Authority, not receiving Overlap Regulation, shall implement the appropriate Frequency Bias Setting (fixed or variable,) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control”. -In R3, the explanatory language about why to operate in Tie Line Bias mode should be deleted. See proposed modification below: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless such operation would have an Adverse Reliability Impact on the Balancing Authority’s Area. -R5 should be modified to state only that the FBS is specified by the ERO in accordance with Attachment B. As drafted the Requirement is in conflict with Attachment B because the Requirement mandates a minimum and does not allow for a reduction to the minimum but it references Attachment B which is titled “Process for Adjusting Minimum Frequency Bias Setting”. See proposed modification below: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is as specified by the ERO in accordance with Attachment B. -There should be a Requirement specifically stating there is an obligation to complete and submit FRS Form 1 by January 10th each year for clarity. -The requirements should be re-ordered to reflect the chronology of the process for frequency calculation, implementation and performance measurement. The recommended order is as follows: R5 which defines the minimum Frequency Bias Setting (FBS) for a Balancing Authority R4 which describes how the minimum FBS may be altered through Overlap Regulation Service R2 which identifies the coordination required around implementation R3 which requires operation in Tie Line Bias mode R1 which establishes the performance obligation
Response: The SDT does not see anything within the Requirement that would restrict any agreements between multiple BAs and RSGs. However, the SDT has modified the language in Requirement R1 to provide additional clarity. The requirement now reads		

Organization	Yes or No	Question 2 Comment
		"Each Balancing Authority or Frequency Response Sharing Group (FRSG) shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported in accordance with Attachment A) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each Balancing Authority or FRSG to maintain Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation." The SDT has also defined a new term "Frequency Response Sharing Group (FRSG)" because they also believed that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **The SDT has modified Requirement R2 to provide better clarity. The requirement now reads "**Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period specified by the ERO and shall use this Frequency Bias Setting until directed to change by the ERO to ensure effectively coordinated Tie Line Bias control.**".** **The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.** **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT also believes that Attachment A only details the process the ERO is to use when evaluating and making modifications to the minimum Frequency Bias Setting.** **The SDT disagrees with your comment concerning an additional requirement for timing of reporting. The SDT believes that this is an administrative issue and is better handled within an attachment. The SDT would also like to note that an attachment when referenced in a requirement becomes mandatory and enforceable.** **The SDT thanks you for your suggested ordering for the requirements but believes that the revised proposed standard reflects the proper order in that it sets the goal at beginning of year, calculates performance, reports performance and calculates bias at the end of the year.**
Ameren	No	R1.While we agree with the concept of the entire requirement and the determination of the Interconnection Frequency Response Obligation, we believe that the accurate measurement of individual BA's FRM has not yet been demonstrated. This requirement should not be part of the standard (even with the additional 12 months in the effective date) until the field trial demonstrates that

Organization	Yes or No	Question 2 Comment
		each BA's FRM can be consistently calculated to a level that will not create false non-compliance to this requirement. While the calculation methodology in FRS Form 1 looks promising, with the A-value and B-value average periods, we believe successful completion of the field trial is prudent. R5. We were not sure if it was intended for this comment question to include Requirement R5, but have decided to include our comments here. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
Response: The SDT agrees that validation of the methodology needs to occur. However, the SDT is working under a FERC approved deadline for completion of this project. The SDT is recommending that continued analysis should occur during the filing period and implementation period of the standard. The STD has also added considerable language to the Background Document on why it has chosen the methodology it is recommending for this standard. **The SDT understands your concern with the reduction of the minimum Frequency Bias Setting affecting other performance standards. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.**		
American Electric Power	No	R1: Clarification is needed regarding the responsibility of a BA that is a member of a Reserve Sharing Group. R2 and R3: What does "coordinated control" mean? There no leverage for the BA to require the generator to carry their burden of addressing governor settings or droop settings, yet the BA is obligated to meet some performance measures.

Organization	Yes or No	Question 2 Comment
		This revision adds new performance measure responsibilities on the BA who likely has no direct control over every resource affecting their performance within their footprint. We are not necessarily challenging the performance measures themselves, nor their underlying objectives, however AEP views this as a gap in responsibilities which potentially effects reliability.

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" to eliminate any confusion with the present d3efined term "Reserve Sharing Group". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**
- **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**

The SDT has been instructed to include a "reliability outcome" within the requirements and therefore included the language "…coordinated control…". The SDT understands that this does not provide any additional clarity for complying with the requirement and could be removed. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.

The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.

The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

Organization	Yes or No	Question 2 Comment
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.**		
Great River Energy	No	R1: Including the Reserve Sharing Group (RSG) in the Frequency Response Obligation is outside of the boundaries of a RSG. Where or how would a Frequency Bias be determined for an RSG to determine their Frequency Response Obligation? Although it is apparent that frequency responds during the implementation of reserves, the intention of a RSG is not to share frequency response, but rather to share Reserves. Additionally, if the Frequency Response Obligation is not met by the RSG how are penalties assessed? Should they be assessed to the group as a whole or strictly to the generators that did not meet their individual obligation? R3: Needs to include verbiage for those circumstances when it would be necessary to run AGC out of TLB such as during necessary testing. The BA should have the option to operate out of TLB for a predetermined amount of time if needed when notification and coordination with the RC has been established.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine**		

Organization	Yes or No	Question 2 Comment
how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives. **FRSG performance may be calculated on one of two ways:** • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or** • **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.** **The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.** **The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.**		
Tucson Electric Power	No	R1: TEP feels that the FRO should be able to be calculated by the BA and that Form 1 changes should be treated via the Standard drafting process. R2: TEP feels that use Form 1 should be required by the Standard. Further, BAs should calculate its own frequency bias setting without ERO intervention. R3: Operating outside Tie Line Bias mode should be allowed during a year to allow for the testing of other modes. R4: Agree with the concept, but without ERO intervention. R5: Should read "greater than or equal to".
Response: The FRO can be estimated by the BA but the actual BA FRO for compliance is based on the BA's footprint and is a function of the Interconnection FRO. Modifications to the FRS Form 1 would go through the Standard Drafting Process. **R3 - The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.** **R2 and R4 - The Frequency Bias Setting is calculated on FRS Form 1. The ERO is only validating the data used in the calculation. This is a practice that exists today. History has shown that there typically are errors in the data.** **R5 - The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT has**		

Organization	Yes or No	Question 2 Comment
modified the requirement and believes we have implemented the intent of your suggestion.		
SCE&G	Affirmative	R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode. o We suggest the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1 o
Response: The requirement to operate AGC in Tie Line Bias mode has been removed from the standard since it was duplicative of Requirements R6 and R7 in BAL-005-0.1b. **The SDT has modified Attachment B, now a Procedure for the ERO to follow in supporting the standard, to address your concern. The new title is, "Frequency Bias Setting Minimums".**		
Bonneville Power Administration	No	Regarding R1, BPA believes that adding additional requirements in R1 by referencing Attachment A does not add clarity. FRO should be a calculation that the BA's can do themselves and included within the standard. Can Form 1 be changed outside of the standard drafting process? BPA doesn't believe that Form 1 should be allowed to be changed outside of the standard drafting process. As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. BPA recommends clarifying this concept and possibly including an example in the background document to help explain how this would work. Regarding R2, BPA believes each BA should be able to calculate its own frequency bias setting without ERO validation. The standard can require the BA to use Form 1, if the BA doesn't use Form 1 correctly, then the BA would be in violation of the

Organization	Yes or No	Question 2 Comment
		standard. BPA believes that R3 should include a minimal amount of time (suggesting a couple of hours per year) to allow for testing other modes. Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. BPA recommends including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified.BPA seeks clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction. BPA agrees with the concept of R4, however, BPA again disagrees with the ERO validation of the frequency bias setting. BPA believes that reducing frequency bias obligation is detrimental to reliability. It seems that lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. BPA believes that over time, it would seem that this pattern would lead to poorer response. BPA believes that R5 should read "greater than or equal to one of the following" not " at least equal to". The requirement should be a part of Form 1 or included in R2. For variable bias, the minimum percentage should be based on the forecasted month peak.
Response: R1 – The FRO can be estimated by the BA but the actual BA FRO for compliance is based on the BA's footprint and is a function of the Interconnection FRO.		

Organization	Yes or No	Question 2 Comment
		Modifications the FRS Form 1 would go through the Standard Drafting Process. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives. FRSG performance may be calculated on one of two ways: • Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or • Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance. The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. R2 – The SDT is interested in the use of good data for the calculations but does not believe that a BA should be penalized for minor data errors. This is why the SDT proposes that the ERO validate the data. In addition, this process is used today. R3 - The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b. R4 – Again, this is a process that is in use today. The SDT is not proposing that the ERO modify anything, just proposing that the ERO validate the data being supplied. R5 - The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. However, the SDT understands your concern with the reduction of the minimum Frequency Bias Setting affecting other performance requirements. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change

Organization	Yes or No	Question 2 Comment
in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.		
Manitoba Hydro	No	Regarding R1: 1. Neither R1 nor the referenced Attachment A clarifies the FRM requirements for an RSG to comply versus a BA. In particular (i) At p.3, Attachment A states that the ERO is responsible for "annually assigning an FRO and Frequency Bias Setting to each BA." No mention is made of RSGs. (ii) Attachment A only references RSGs in the context of reporting obligations for Form 1 (at p.4) and (iii) Compared to BAL-002-0 R1.1, which clearly states that the BA may elect to fulfill its obligation through an RSG and that in such cases the RSG has the same responsibilities as each BA (that is a participant in the RSG). 2. It should be clarified that this requirement applies to a BA, where the BA doesn't belong to an RSG, OR to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation. 3. R1 does not specify where or how the FRO is determined. Presumably this would be determined by the ERO pursuant to Attachment A. 4. The phrase "to ensure that sufficient Frequency Response ..." should be separated from the requirement as it is

Organization	Yes or No	Question 2 Comment
		(i) not descriptive of the required actions; (ii) redundant with the stated purpose at the beginning of the standard. In general, such a drafting technique should be avoided as it may allow Responsible Entities to argue that a violation has not occurred where the specific action that is described has not been taken, but the purpose referenced in the requirement has been met. Regarding R2: 1. It is not clear from R2 who determines the Frequency Bias Setting for "validation" by the ERO and how the FBS is determined. (Presumably done by the BA in accordance with Attachment B). Based on Background document, should refer to those "published" by ERO. The BA's FBS may not be validated, and may be modified before posting. 2. Attachment B does not refer to the ERO "validating" FBS. 3. Attachment B refers to an RSG calculating FBS, but the standard does not.

Response: R1 – Comment 1 & 2 – The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**
- **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual**

Organization	Yes or No	Question 2 Comment
performance. The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. Comment 3 – The process for determining the FRO is detailed in Attachment A. Comment 4 – The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration. R2 – Comment 1 – The Frequency Bias Setting is calculated on FRS Form 1. The ERO is only validating the data not calculating the setting. The ERO will be working with the BA to correct any data errors discovered during the validation process. This is a process that is in use today Comment 2 & 3 – The SDT has made significant modifications to the Background Document and Attachment A to provide additional clarity. The SDT has added language to Attachment A regarding validation of the BA data. The SDT has removed all references to a FRSG for Frequency Bias Setting. Attachment B has been removed and the information from Attachment B has been incorporated in a Procedure developed by the SDT for the ERO to follow to support this standard.		
NV Energy	No	Requirement 1 seems to be the only one that has any applicability to an RSG; however, it is unclear under what circumstances this requirement applies to an RSG. Suggest changing the R1 to be addressed solely to BA's or alternatively, explain under Applicability section 1.2 what "where applicable" means.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.		

Organization	Yes or No	Question 2 Comment
FRSG performance may be calculated on one of two ways: • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or** • **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.** **The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.**		
ACES Power Marketing Standards Collaborators	No	Requirement 1 should not apply to a Reserve Sharing Group. Reserve Sharing Groups (RSG) are designed to share Contingency Reserves and/or Operating Reserves not Frequency Response. While these reserves may be frequency responsive, they are not being shared for the purpose of expanding frequency response. Furthermore, while reserve sharing groups may calculate a joint ACE by summing its individual BA ACE values, RSGs do not have a Frequency Bias Setting which is necessary to assess a Frequency Response Obligation.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. Organization	Yes or No	Question 2 Comment
The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.		
City of Redding, Oregon Public Utility Commission, BrightSource Energy, Inc., Clark Public Utilities, Avista, Tri-State G & T Association, Inc.; Deseret Power	Negative	Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified.
Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.		
Alberta Electric System Operator	No	The language used in the requirements is superfluous. This could result in confusion and incorrect assumptions being made. In R1, the comment within brackets "(as detailed in Attachment A and calculated on FRS Form 1)", is not necessary as it is already part of the FRM definition. We suggest removing this bracketed text from the requirement. Also in R1, the phrase "to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency response in the Interconnection" is a high level objective that does not add clarity to this requirement. We suggest removing this from the requirement. R2, R3 and R5 use similar language e.g. "to ensure effectively coordinated Tie Line Bias control", "to ensure adequate control response" etc. Although it provides background information, this does not add clarity to the requirement. We suggest removing these from the requirements.
Response: Based on industry comments the SDT has modified the definition for FRM such that it no longer references any other documents. Therefore, the SDT believes that leaving the reference to Attachment in the standard is prudent, based on advice		

Organization	Yes or No	Question 2 Comment
from the standards staff – without a reference to the specific Attachment, the responsible entity can't be held to compliance with the performance identified in that attachment. **The SDT has been instructed to include a "reliability outcome" within the requirements and therefore included the language you are referencing. The SDT understands that this does not provide any additional clarity for complying with the requirement and could be removed. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.**		
Hydro-Quebec TransEnergie	No	The objective of R2 is that all BA's implement their new Bias Setting at the same time, based on the previous year's data, so that control stays the most effective throughout the Interconnection (Tie-Line Bias). In addition, the new Bias will be in effect all year long. The process is quite simple and straightforward for a fixed Bias Setting. As for Variable Bias Setting, this process is not applicable before the fact since the Bias equation can depend on real-time values that are not known in advance. In addition, the simultaneous Bias implementation is not an issue for a single BA Interconnection. Therefore, we suggest that Requirement 2 applies only to Fixed Bias Setting.
Response: The SDT agrees with your comment and has modified Requirement R2 to reflect your concern. The SDT has also added an addition Requirement R3 to address entities using a variable Frequency Bias Setting.		
Northeast Power Coordinating Council	No	The requirements should not be directed at Balancing Authorities, as generators are the main supplier of "discretionary" frequency response. Requirement R1 refers to an attached form, which is not part of the standard and therefore not enforceable.
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.**		

Organization	Yes or No	Question 2 Comment
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost. **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **If an attachment is referenced in a requirement that attachment becomes part of the requirement. The requirement has been modified to no longer reference an attached form.**		
Beaches Energy Services; City of Bartow, Florida; Tampa Electric Co.	Negative	The standard is silent on the "methods to obtain Frequency Response". For instance, the BA does not have authority over governor and other generator settings. There should be a requirement for GOPs to incorporate setting changes directed by the BA, otherwise the standard establishes requirements that BAs may not have the authority to achieve. R1 includes the Reserve Sharing Group in its applicability, but none of the other requirements do. There is no consideration of "footprint" changes of the BA resulting in different allocation from the ERO during a year. The standard and Attachments seem to specify an annual process with due dates in December and January with no allowance for mid-year changes and associated allocation changes. If a standard has a requirement for the ERO, who will audit the ERO for compliance? If the ERO does not meet its obligations, can an entity still be found non-compliant, especially on a schedule basis? Wasn't there an issue of assigning standards to RROs, e.g., the fill-in-the-blank standards? Are there similar issues with assigning requirements to the ERO? Is the ERO a "user, owner or operator" of the BPS under Section 215, e.g., at (b)(1)"... All users, owners and operators of the bulk-power system shall comply with the reliability standards that take effect under this section." I question how this would work from a compliance perspective. On R5, the wording should be changed from "absolute value is at least equal to" to

Organization	Yes or No	Question 2 Comment
		"absolute value is greater than or equal to"
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **The SDT has also included other methods that a BA can use to provide Frequency Response in the Background Document.** **The SDT has added language to Attachment A to address changes in a BAs footprint.** **The proposed standard is not putting a requirement on the ERO. There is language in the Attachments to provide additional time for a BA to become compliant if the ERO is late in providing the necessary information. If the ERO does not provide the necessary information then the BA would not be required to modify anything and therefore the last information provided would be that which would be used for compliance purposes.** **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT has modified the requirement and believes we have implemented the intent of your suggestion.**		
South Carolina Electric and Gas	No	The utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing".

Organization	Yes or No	Question 2 Comment
		R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." **Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.** **FRSG performance may be calculated on one of two ways:** • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or** • **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.** **The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.** **The SDT has removed the requirement to operate AGC in Tie Line Bias mode as this requirement was duplicative of the Requirements R6 and R7 in BAL-005-0.1b.**		
Tri-State G & T Association, Inc.; Tucson Electric Power Co.; U.S. Army Corps of Engineers; South California Edison ; Platte River Power Authority; Pacific Gas and Electric Company; Colorado Springs Utilities; Idaho Power	Negative	We believe that there are several modifications that, if implemented to the existing requirements, would result in an improved, clarified standard. As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly including an example in the background

Organization	Yes or No	Question 2 Comment
Company; California Energy Commission; California ISO; Deseret Power		document to help explain how this would work. Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. We seek clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction.

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**
- **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**

The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.

Organization	Yes or No	Question 2 Comment
The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.		
ISO New England Inc	No	We do not agree with placing a requirement on Balancing Authorities, as generators are the main supplier of "discretionary" frequency response. Also, the requirement refers to an attached form, which is not part of the standard and therefore not enforceable.
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **If an attachment is referenced in a requirement that attachment becomes part of the requirement. However the requirement has been modified to no longer reference an attached form.**		
SERC OC Standards Review Group	No	We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing". R2 exempts BAs participating in Overlap Regulation Service from implementing the Frequency Bias Setting on the date specified by the ERO, and R4 states how the BA

Organization	Yes or No	Question 2 Comment
		performing Overlap Regulation Service will modify its Frequency Bias Setting but does not state when the setting will be implemented. The exemption for BAs participating in Overlap Regulation Service should either be deleted from R2 or language stating the implementation date of the frequency bias setting needs to be included in R4. R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode.

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**
- **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**

The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.

The SDT has modified the language in Requirement R2. The term "not participating in" has be replace with "not receiving". This now encompasses entities that are providing Overlap Regulation Service.

The SDT has removed the requirement to operate AGC in Tie Line Bias mode as this requirement was duplicative of the Requirements R6 and R7 in BAL-005-0.1b.

Organization	Yes or No	Question 2 Comment
Florida Municipal Power Agency/JEA Electric Compliance	No	We thank the SDT for their hard work and diligence in moving this Project forward. However, we have some concerns that cause us to not support the standard in its current form. In general, we believe that there has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. We also believe that the proposed standard does not meet all of the conditions of the Final SAR and Supplemental SAR.The “Final SAR” was to develop methods by which a performance based standard would eventually be developed. The Final SAR states:”The proposed standard’s intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once thereasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters.”BAL-003-1 does not seem to complete the scope of this “Final SAR”. For instance, “the reasons for the decline in Frequency Response” were not confirmed to our knowledge; and the field trial is not completed to our knowledge.The Supplemental SAR adds to the scope of the Final SAR:”To provide a minimum Frequency Response Obligation for the Balancing Authority to achieve, methods to obtain Frequency Response and provide a consistent method for calculating the Frequency Bias Setting for a Balancing Authority. In addition, the standard will specify the optimal periodicity of Frequency Response surveys.”The Supplemental SAR does not eliminate the pre-requisite contained in the Final SAR to determine the reasons for the decline in frequency response and confirm them before establishing “defined reliability parameters”. In addition, the standard does not complete the requirement of the Supplemental

Organization	Yes or No	Question 2 Comment
		SAR to identify “methods to obtain Frequency Response”. For instance, neither the BA nor the RSG have authority over governor and other generator settings. There should be a requirement for GOPs to incorporate setting changes directed by the BA, otherwise the standard establishes requirements that BAs and RSGs may not have the authority to achieve. There is no consideration of "footprint" changes of the BA resulting in different allocation from the ERO during a year. The standard and Attachments seem to specify an annual process with due dates in December and January with no allowance for mid-year changes and associated allocation changes. If a standard has a requirement for the ERO, who will audit the ERO for compliance? If the ERO does not meet its obligations, can an entity still be found non-compliant, especially on a schedule basis? Wasn’t there an issue of assigning standards to RROs, e.g., the fill-in-the-blank standards? Are there similar issues with assigning requirements to the ERO? Is the ERO a “user, owner or operator” of the BPS under Section 215, e.g., at (b)(1)”... All users, owners and operators of the bulk-power system shall comply with the reliability standards that take effect under this section.” We question how this would work from a compliance perspective.
Response: The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012. **The SDT agrees that the original SAR was strictly for data collection. However, a supplemental SAR was developed to address the FERC March 18, 2010 Order and was subsequently approved by the industry. The Standards Committee has determined that a proposed standard must be within the scope of the approved SAR but the proposed standard is not required to address the full scope of the SAR if stakeholders support a reduced scope.** **The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.**		

Organization	Yes or No	Question 2 Comment
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. **There are two primary reasons the SAR did not apply a performance obligation on generators. 3. The SDT has developed VRFs for the proposed Requirements within this standard. Do you agree that these VRFs are appropriately set? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters agreed with the VRFs that the SDT has proposed for the requirements within the standard.

One commenter felt the VRFs were too high and that they should have a "lower" VRF. The SDT developed the VRFs using the NERC Violation Risk Factor guidelines approved by FERC. A lower VRF is an administrative type of requirement that, if violated would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Violation of any of the requirements in the proposed standard could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.

Another commenter stated that they could not fine the "Risk Severity Levels" in the standard. The SDT is not sure as to the meaning of this comment. The SDT believes that the commenter may have been mixing two different terms, Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). The question asked by the SDT was concerning the VRFs. These are located within the body of the Requirement. The VSLs are located towards the end of the proposed standard.

Organization	Yes or No	Question 3 Comment
Seattle City Light	Negative	Answer: Yes. Comments: LADWP and SCL agree with the following VRFs: - R1 - Medium - R2 - Medium - R3 - Medium - R4 - Medium - R5 - Medium
Response: The SDT thanks you for your clarifying comment.		
Energy Mark, Inc.	No	Comment 5: See comments in the non-binding poll.
Response: Please see our response to your comments from the non-binding poll.		
Florida Power & Light Company	No	Could not find the Risk Severity Levels in the documents.

Organization	Yes or No	Question 3 Comment
Response: The SDT is not sure as to the meaning of your comment. The SDT believes that you may be mixing two different terms, Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). The question asked by the SDT was concerning the VRFs. These are located within the body of the Requirement. The VSLs are located towards the end of the proposed standard.		
Cleco Corporation	No	Please note Cleco does not use the VRFs therefore we feel too much energy and time is spent on the VRFs. The SDT needs to concentrate on the requirements and measurements.
Response: The SDT thanks you for your clarifying comment.		
Ameren	No	This is problematic since for a single BA interconnection these could be argued to be appropriate VRFs, but is different for a multiple BA interconnection, where the risk that a single BA would pose to the interconnection would be Lower.
Response: The SDT developed the VRFs using the NERC Violation Risk Factor guidelines approved by FERC. This document can be found at http://www.nerc.com/files/Violation_Risk_Factors.pdf. IA lower VRF is an administrative type of requirement that, if violated not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Violation of any of the requirements in the proposed standard could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.		
Seattle City Light/Los Angeles Department of Water and Power	Yes	LADWP and SCL agree with the following VRFs:- R1 - Medium- R2 - Medium- R3 - Medium- R4 - Medium- R5 - Medium
Response: The SDT thanks you for your affirmative response and clarifying comment.		
NV Energy	Yes	Medium appears to be reasonable and appropriate.
Response: The SDT thanks you for your affirmative response and clarifying comment.

4. The SDT has developed Measures for the proposed Requirements within this standard. Do you agree with the proposed Measures in this standard? If not, please explain in the comment area.

Summary Consideration: Many of the commenters were concerned with the language in Requirement R3 stating that an entity had to be operating in Tie Line Bias mode unless there were adverse affects on the BES and that if the requirement was modified that the measure should be modified. The SDT explained that it had removed this requirement from the proposed standard since they felt it was duplicative of Requirement R6 and R7 in BAL-005-0.1b.

Some commenters objected to the definition for FRM and the Measure referencing another document (FRS Form 1). The SDT explained that it modified the definition for FRM to no longer reference another document. The revised definition reads "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."

A couple of the commenters had concerns with Requirement R5 in that it should reference "natural Frequency Response" as a third bullet. The SDT has explained that it removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT did not include the term "natural Frequency Response" within the standard itself but included it in the Background Document and Attachment A. The SDT felt that this provided additional clarity within the requirement and allowed for further explanation of the term in the Background Document and Attachment A.

Some commenters indicated that the use of an RSG as a method for supplying Frequency Response was not fully explained. The SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

A couple commenters wanted the sampling interval to be tuned on a per Interconnection basis to support HQTE's characteristics. The SDT agreed and explained that it adjusted the event selection criteria to address concerns related to response driving frequency back to pre-event level during the B value measurement period and this adjustment should address their concern.

Organization	Yes or No	Question 4 Comment

Organization	Yes or No	Question 4 Comment
Seattle City Light	Negative	Answer: No. Comments: LADWP and SCL recommend that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b. **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.**		
Constellation Energy Commodities Group	No	Based on language modifications proposed to the Requirements, the measures should be revisited.
Response: The SDT has revised the Measures to align with modifications made to the Requirements.		
Xcel Energy	No	Based on our suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language.
Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b.		
MRO NSRF	No	Based on suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language. Additionally, M1 should be revised to not reference a specific Form. The Form may be the format of choice but it should not be an implied requirement. Measures 3 and 4 identify the use of "operating logs" as evidence. Measure 2 identifies hard copy and electronic evidence, "or other evidence". We suggest calling out specifically "operator logs" for M2 also, in case there are system problems in capturing hard copy or electronic evidence during the short time window for implementation.
Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b. **The SDT has modified Measure M1 which no longer references a form but does reference Attachment A to align with the requirement.**		

Organization	Yes or No	Question 4 Comment
The SDT is only providing examples ("…such as…") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard.		
Bonneville Power Administration	No	BPA believes that historian data should be able to be used for evidence.
Response: The SDT is only providing examples ("…such as…") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard. The SDT believes that the data from the software program "Historian" could be used to demonstrate compliance..		
Manitoba Hydro	No	It should be clarified that R1 requirement applies to a BA, where the BA doesn't belong to an RSG, or to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has modified the Applicability Section to clarify when a BA or FRSG is accountable for compliance. **The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."**		
Tucson Electric Power	No	It should be clear that historical data may be used to show compliance.
Response: The SDT is only providing examples ("…such as…") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard. The SDT believes that the data used to reflect compliance would have to		

Organization	Yes or No	Question 4 Comment
be historical data.		
Seattle City Light/ Los Angeles Department of Water and Power	No	LADWP and SCL recommend that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 & R7 in BAL-005-0.1b. **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.**		
ISO/RTO Council Standards Review Committee	No	M1: The measure should not be tied to a specific Form. If a BA has the evidence but does not provide it on a given Form, how is the reliability of the Power System impacted? The Form may be the format of choice but it should not be an implied requirement. M4: This measure does not read quite right. Something seems to be missing in the part that says: "...showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: "...showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."
Response: The SDT has modified Measure M1 which no longer references a form, however it does reference Attachment A to align with the associated requirement. **The SDT is only providing examples ("…such as…") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard.** **The SDT has modified the Measure M4 to incorporate your suggested wording.**		
Independent Electricity	No	M4: This measure does not read quite right. Something seems to be missing in the

Organization	Yes or No	Question 4 Comment
System Operator		part that says: "...showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: "...showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."
Response: The SDT has modified the Measure M4 to incorporate your suggested wording.		
ERCOT	No	Measure should be modified to align with revised Requirements per ERCOT's comments on #1.
Response: The SDT has modified the Measures to align with the modifications to the Requirements.		
SERC OC Standards Review Group/ Progress Energy/ South Carolina Electric and Gas/ Duke Energy	No	See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
Response: Please see our response to your comments on Question 2 regarding "Reserve Sharing Group".		
Northeast Power Coordinating Council/ISO New England Inc.	No	The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics.
Response: The SDT adjusted the event selection criteria to address concerns related to response driving frequency back to pre-event level during the B value measurement period. We believe that this adjustment addresses your concern.		
Florida Power & Light Company	No	What is meant by documented formulae for M5? Is a one time snapshoot of the AGC formual sufficien? The concept is ok but this needs clarification of proof.
Response: The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3.		

Organization	Yes or No	Question 4 Comment
Southwest Power Pool Regional Entity	Yes	Measures are more specific and measurable than seen in the past. This is a positive improvement.
Response: The SDT thanks you for your affirmative response and clarifying comment.		
Ameren	Yes	With the understanding that any suggested changes to the proposed requirements would come with corresponding changes to their measure.
Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT agrees that any modification to a Requirement would necessitate a re-evaluation of the corresponding Measure.

Hydro-Quebec TransEnergie	Yes	
Keen Resources Asia Ltd.	Yes	

5. The SDT has developed VSLs for the proposed Requirements within this standard. Do you agree with these VSLs? If not, please explain in the comment area.

Summary Consideration: Most of the commenters indicated that VSLs for Requirement R1 should not include language tied to whether or not a BA is in a single BA Interconnection or a multi-BA Interconnection. Frequency Response is an Interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections. Consider a small BA whose performance is 70% of its' FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.

Several commenters did not agree with the VSLs for Requirement R3. The SDT removed Requirement R3 from the revised standard since the requirement was duplicative of Requirement R6 & R7 in BAL-005-0.1b.

With concerns about the use of the RSG as a means to provide Frequency Response, the SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Organization	Yes or No	Question 5 Comment
Seattle City Light	Negative	Answer: No. Comments: LADWP and SCL recommend that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
Response: Based on Industry comments and further review, the drafting team has deleted R3 as the requirement is duplicative		

Organization	Yes or No	Question 5 Comment
with R6 and R7 in BAL-005-0.1b.		
Public Utility District No. 1 of Douglas County	Negative	1. The BA and interconnection meet the FRO differently. Suggest removing the interconnection performance from the VSL and develop additional levels of BA failure to meet its FRO.
Response: The drafting team does not agree, but believes an explanation would be helpful. VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections. Consider a small BA that whose performance is 70% of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.		
BrightSource Energy, Inc.	Negative	The negative vote from BrightSource is related to the proposed VSL only. The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO. Conforming changes to the VSLs would need to be made for any changes to the Requirements as suggested in the comments to the standard.
Response: The drafting team does not agree, but believes an explanation would be helpful. VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's		

Organization	Yes or No	Question 5 Comment
impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections. **Consider a small BA that whose performance is 70% of its FRO. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.**		
Western Area Power Administration	Negative	Under compliance for R1, there is a difference between VSL levels whether the interconnection met is FRO or not. If the interconnection meets it's FRO but a single BA doesn't't meet its share of FRO the violation is considered low VSL, but, if the interconnection dosen't't meet it's FRO the same BA will have a High VSL. Obligation of the individual BA to meet its allocated FRO should always be applicable regardless of what other BAs are doing in the interconnection. This provision creates a disparity amongst BAs and creates a disparate treatment between the BAs who perform compared to those who don't.
Response: The drafting team does not agree, but believes an explanation would be helpful.		

Organization	Yes or No	Question 5 Comment
VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.**		
Ameren Services; Ameren Energy Marketing Co./Ameren	Negative/No	It is not clear how the VSL for R1 uses the "Summation of the BA's FRM", when the requirement is BA or RSG specific.
Response: Based on comments, the drafting team has created a new definition for an entity called a Frequency Response Sharing Group (FRSG). FRSG performance may be calculated on one of two ways: • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or** • **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**		
Manitoba Hydro	Negative/No	The Violation Severity Levels for R1 penalize entities more severely depending on how the interconnection as a whole has performed. MH believes that BAs should only be held accountable for issues within their control and that the VSLs for R1 should be revised accordingly.
Response: The drafting team does not agree, but believes an explanation would be helpful. **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.**		

Organization	Yes or No	Question 5 Comment
Consider a small BA that whose performance is 70% of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.		
Constellation Energy Commodities Group	No	The language in the VSLs for R1 should be revisited based on the proposed language modifications above and should also clearly look to the FRM of a BA, group of BAs or RSG against the BA FRO not an Interconnection FRO.
Response: The drafting team has made conforming changes to VSLs based on wording changes to the Requirements. **Regarding the evaluation of the Interconnection, the drafting team does not agree, but believes an explanation would be helpful.** **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.** **Consider a small BA that whose performance is 70% of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections.** **The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.** **Based on comments, the drafting team has created a new definition for an entity called a Frequency Response Sharing Group (FRSG). FRSG performance may be calculated on one of two ways:**		

Organization	Yes or No	Question 5 Comment
• Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or • Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.		
Bonneville Power Administration	No	BPA believes that R1 needs to be more clear and concise as to what is being conveyed in the requirement. It is difficult to understand. The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO.BPA believes that conforming changes to the VSLs would need to be made for any changes to the Requirements as suggested in the comments to the standard.
Response: The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. We would welcome suggested wording changes that relay this concept more clearly. **With regard to removing a view of Interconnection performance, the drafting team does not agree, but believes an explanation would be helpful.** **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.** **Consider a small BA that whose performance is 70% of it's FRO. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency**		

Organization	Yes or No	Question 5 Comment
Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.		
Florida Power & Light Company	No	For R1 the low and high level descriptions appear to be identical and the high level is less than the medium risk level. For R3 there should be low, medium, and high levels. One BA not operating to TLB does not jepordize the Interconnection. Additionally, computer failures, database loads etc may require some period where TLB is not in service. Suggestion would be Lower VSL operation off of TLB for more than 5 but < 8 continuous hours or accumlative during the year of more than 8 < 16 hours. Medium VSL would be operation off of TLB for more than 8 but <16 continuous hours or accumlative during the year of more than 16 <24 hours. High VSL would be operation off of TLB for more than 16 <24 continuous hours or accumlative during the year of more than 36 <48 hours. Severe VLS would be >24 continuous hours off of TLB or accumlative of > 48.
Response: The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation. **Based on Industry comments and further review, the drafting team has deleted R3 as the requirement is duplicative with R6 and R7 in BAL-005-0.1b.**		
NV Energy	No	For R1, suggest that the VSL's not be dependent upon the aggregate performance of the BA's within an interconnection.
Response: The drafting team does not agree, but believes an explanation would be helpful. **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.**		

Organization	Yes or No	Question 5 Comment
Consider a small BA that whose performance is 70% of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.		
American Electric Power	No	It is not clear for R1 what the exact delineations are among Lower, Medium, High, and Severe VSL's.
Response: The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.		
Seattle City Light	No	LADWP and SCL recommend that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
Response: Based on Industry comments and further review, the drafting team has deleted R3 as the requirement is duplicative with R6 andR7 in BAL-005-0.1b.		
Los Angeles Department of Water and Power	No	LADWP recommends that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
Response: Based on Industry comments and further review, the drafting team has deleted R3 as the requirement is duplicative with R6 and R7 in BAL-005-0.1b.		
ReliabilityFirst	No	ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft BAL-003-1 VSLs which include

Organization	Yes or No	Question 5 Comment
		the following: 1. General VSL Comment - For consistency with other standards, each VSL should begin with the phrase “The Responsible Entity...” or “The Balancing Authority”. This is consistent with the language of the requirement and correctly pinpoints the appropriate responsible entity. 2. VSL R1 Comment - Based on the FERC Guideline #3 “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”. ReliabilityFirst suggests the following modification:a. Lower VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection’s FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FROb. Medium VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection’s FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever one is the greater deviation from its FROc. High VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity’s, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FROd. Severe VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity’s FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO3. VSL R4 Comment - Based on the FERC Guideline #3 “Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement”. ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority incorrectly modified the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined

Organization	Yes or No	Question 5 Comment
		footprint setting-error less than 5% of the validated or calculated value4. VSL R5 Comment - Based on the FERC Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement". ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority used a monthly average Frequency Bias Setting whose absolute value was less than or equal to 5% below the minimum specified by the ERO.
Response: While there may be a better way to lay out the VSL, the VSL for R1 is consistent with R1 in that performance can be reported either as a single BA or as an RSG. The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation. **The drafting team has modified the VSLs for R4 based on your comments. The SDT removed Requirement R5 and combined it into revised Requirement R2 and new Requirement R3.**		
Progress Energy / South Carolina Electric and Gas/Duke Energy	No	See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
Response: Based on comments, the drafting team has created a new definition for an entity called a Frequency Response Sharing Group (FRSG). **Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRFSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.** **FRSG performance may be calculated on one of two ways:** • **Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or**		

Organization	Yes or No	Question 5 Comment
• **Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.**		
SERC OC Standards Review Group	No	See comments in Question 2 regarding utilization of the term "Reserve Sharing Group". VSL for R1:The draft VSLs for R1 uses the summation of FRM for all BAs within an Interconnection as a factor in determining the applicable VSL. This does not seem consistent with R1. R1 is about a single BA and the individual BA's frequency response performance as measured by the FRM for that specific BA. Including the FRM summation of the Interconnection expands R1. It appears that a BA that is non-compliant with R1 could end up with either a Low/Medium or High/Severe VSL based upon the FRO performance of the Interconnection. The FRM performance of the Interconnection is beyond the knowledge and control of a single BA and should not be a determinate of the applicable VSL.Is there a technical basis for selection of the 1%, 30% and 15MW/.1 Hz VSL breakpoints? Does the Lower VSL give a 1% dead band to a BA's FRO? If so, will this be acceptable to NERC/FERC? VSL for R2:The VSL should reflect the language used in the requirement. R2 says a BA "not participating in Overlap Regulation service shall ....", while the VSL says a BA "not receiving Overlap Regulation Service....." The VSL language is not consistent with the requirement. VSLs for R5:Since Frequency Bias Setting is expressed as a negative value, the terms "absolute value" and "less than" must be used carefully. Wouldn't the "absolute value" of a BA's Frequency Bias Setting always be positive and thus it could never be less than the minimum specified by the ERO (a negative value)?
Response: With regard to R1, VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.		

Organization	Yes or No	Question 5 Comment
The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation. **Regarding the 1%, 30% and 15MW breakpoints, the 1% value accommodates rounding error. The 30% or 15MW/0.1Hz is intended to comparably address both large and small BAs. The drafting team used its judgment in selecting these values and cannot predict what the FERC might accept.** **The SDT has modified the VSLs for Requirement R2 to correctly match the requirement.** **The SDT has removed Requirement R5 from the proposed standard and combined it into Requirements R2 and R3. Requirement R2 no longer references "absolute value" and Requirement R3 references "absolute value" only as a comparison to another "absolute value".**		
Western Electricity Coordinating Council	No	The proposed VSLs for Requirement R1 treat a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO.

Organization	Yes or No	Question 5 Comment
		Response: The drafting team does not agree, but believes an explanation would be helpful. **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.** **Consider a small BA that whose performance is 70% of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.**		
Northeast Power Coordinating Council	No	The violation severity levels for R1 are reasonable. The technical writing needs to be enhanced for clarity.
Response: Thank you for the comment. The drafting team will look at ways to clarify the wording or provide an explanation in the Background Document.		
ISO New England Inc	No	The violation severity levels for R1 seem to be reasonable. However, the technical writing needs to be enhanced for clarity
Response: Thank you for the comment. The drafting team will look at ways to clarify the wording or provide an explanation in the Background Document.		
SPP Standards Review Group/Cleco Corporation	No	The VSLs for R2 are based on 5, 15 and 25 days. What was the justification for these values? Could we just as well use 10, 20 and 30 or some other set of values? In R3, we understand that brief periods of operation outside of TLB control are allowable providing 1) continued operation in TLB control would create ARI on the Interconnection or 2) that justification is provided for the periods when TLB is not used. For example, if something happens within our EMS that disables TLB control

Organization	Yes or No	Question 5 Comment
		are we compliant if we document the period as an EMS malfunction?
Response: Regarding R2, the time windows were based on judgment of the drafting team. Similar to the commenters' question, the team could have chosen 1, 7, 14 and 28 days or 1, 2, 3 or 4 days to frame the four levels of VSLs. The SDT has modified Attachment A to allow an implementation window of 3 days for implementation of the Frequency Bias Setting. **With regard to R3, the drafting team has deleted R3 as the requirement is duplicative with R6 and R7 in BAL-005-0.1b.**		
ACES Power Marketing Standards Collaborators/Great River Energy	No	The VSLs on for Requirement R1 set a previously un-established precedent of relying on the performance of other registered entities to establish the severity level of the violation. This is not appropriate. The VSLs should be rewritten to provide further gradations of the violation severity based on the BA's own performance.
Response: The drafting team does not agree, but believes an explanation would be helpful. **VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.** **Consider a small BA that whose performance is 70% of it's FRO. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.**		
Southern Company	No	VSL for R2:We suggest the language in the VSL be consistent with the language

Organization	Yes or No	Question 5 Comment
		used in the Requirement. The VSL for R2 says a BA 'not receiving Overlap Regulation Service.....' R2 says a BA 'not participating in Overlap Regulation service shall .....' VSLs for R5:Since Frequency Bias Setting is expressed as a negative value, the terms "absolute value" and "less than" must be used carefully. This VSL uses "absolute value" when referring to the BA's Frequency Bias Setting, but does not use "absolute value" when referring to the Frequency Response Obligation, or minimum value specified by the ERO. Consider revising this VSL so that a true comparison can be made.
Response: We agree with your suggested change for the VSL for R2 and corrected the mismatch between the requirement and the VSLs. **The SDT has removed Requirement R5 from the proposed standard and combined it into Requirements R2 and R3. Requirement R2 no longer references "absolute value" and Requirement R3 references "absolute value" only as a comparison to another "absolute value".**		
Tucson Electric Power	No	VSL's could be clearer and simpler. Allowance for the testing of other AGC modes should be considered.
Response: The drafting team has made changes to VSLs based on specific suggestions. Regarding AGC operation, the drafting team has deleted R3 as the requirement is duplicative with R6 and R7 in BAL-005-0.1b.		
Southwest Power Pool Regional Entity	Yes	Hard to follow the language for the VSL for R1. Suggest using formulas for ease of interpretation or provide an example in the Supporting Documentation.
Response: The drafting team will provide an explanation in the Background Document.		
Associated Electric Cooperative Inc	Yes	The VSLs appear reasonable for the risk and particularly where they assess higher severity when the BA or RSG Interconnection's performance was sub-standard as well.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment.		
ISO/RTO Council Standards Review Committee	Yes	We do not have any issues with the VSLs, but wonder if the wording for R1 should have been "...Reserve Sharing Group's...". Alternatively, the wording after "interconnection's FRO" could be revised to: "...and the Balancing Authority's or the Reserve Sharing Group's FRM was..."
Response: The drafting team agrees and has made this change.		
Independent Electricity System Operator	Yes	We do not have any issues with the VSLs, but wonder if the wording for R1 should have been "...Reserve Sharing Group's...". Alternatively, the wording after "interconnection's FRO" could be revised to: "...and the Balancing Authority's or the Reserve Sharing Group's FRM was..."
Response: The drafting team agrees and has made this change.		
Texas Reliability Entity	Yes	We suggest that the Severe VSL for R3 is confusing and should be clarified as follows: "A Balancing Authority not receiving Overlap Regulation service failed to operate AGC in Tie Line Bias mode, when operation in Tie Line Bias mode would not have had an Adverse Reliability Impact on the Balancing Authority's Area."
Response: Regarding AGC operation, the drafting team has deleted R3 as the requirement is duplicative with R6 and R7 in BAL-005-0.1b.

6. The SDT divided the previously posted "Attachment A – Background Document" into two documents to provide additional clarity. The first document "Attachment A- Supporting Document" which details the methods used to develop the events to be analyzed, the FRO, FRM and Frequency Bias Setting. Do you agree that the revised Attachment A – Supporting Document provides sufficient clarity on the methodologies to be used? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters pointed out that there was a discrepancy between Attachment A and the Background Document concerning the methodology used to calculate FRO. The SDT addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that Interconnection.

Several of the commenters indicated that the proposed standard did not provide a limit on the amount of Frequency Response that a BA was supposed to provide. The SDT added Paragraph #8 in Attachment A under the Event Selection Criteria to clarify that events greater than the limit in the criteria would be capped at a certain limit. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.

Some commenters were confused about the intent of Attachment A. They indicated that Attachment A was describing both a methodology to select events and providing a background for the process (not a process/methodology). The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry.

As to the use of the term "may" in the attachment, at this time the drafting team is unable to further restrict the language due to the issues surrounding an individual event. As an example, frequency is scheduled at 60 Hz most of the time. However, when viewed on a graph or an EMS screen, it rarely sits at 60.000 for a long period of time, it fluctuates between 59.995 and 60.005. The drafting team is unable to say at this time that an event that starts with frequency at 60.005 is materially different than an event that starts at 59.995. Therefore, the drafting team has attempted to put guidance into the document as to what is pertinent without attempting to be overly restrictive in the selection criteria since there is no support for a restriction at this time. As more experience is gained, the process should be refined. If the refinement is significant enough to require a change to the Attachment A language, the process required to do so would be open to participation of industry and not done without public exposure.

A couple of commenters said that using older data for compliance could cause an entity to be in "double jeopardy". The SDT discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. The drafting team has, however, reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period.

A few o commenters indicated that the allocation of the FRO to the BAs was a "top down" approach. The SDT agrees with some of the comments made, but not in the conclusion drawn from the individual points. There is not currently an obligation to provide any amount of frequency response to a sudden change in interconnection frequency. The proposed standard addresses this shortcoming in the proposed standard.

The drafting team has also reduced the initial reduction in the minimum Frequency Bias Setting to ensure that the reduction can be studied closely to ensure no detrimental impact on the reliable operation of the Bulk Electric System.

Finally, there is ongoing disagreement in the industry as to whether it is desired to have a minimum Frequency Bias Setting that is significantly greater than the Frequency Response Characteristic.

A couple of commenters questioned whether point B was 18 seconds after the start of the disturbance. The SDT revised the language in the document to provide clarity on the 18 seconds. To the extent that the language is related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available.

Organization	Yes or No	Question 6 Comment
Western Area Power Administration, Western Area Power Administration - UGP Marketing	Negative	4. The allocation of FRO among BAs is a top-down approach instead of bottom up approach currently used. Currently, BAs calculate their FRC and set their Bias based on the greater of 1% peak load (1% generation for gen only BAs), or the average of frequency response characteristic of their BA over a year (FRC). These calculated individual biases get summed up and it becomes the Interconnection Bias value. The proposed standard has identified a set MW (for Western Interconnection 685 MW for

Organization	Yes or No	Question 6 Comment
		0.1 of HZ) and is allocating it among all BAs. The individual BA's allocated FRO is much lower than what BAs obligations' presently are since the proposed standard lowers the bar for the BAs. The current approach is definitely superior to what is proposed since it more closely matches with the characteristic of the system and it protect the interconnection by requiring larger contribution than proposed standard. 5. The allocation of FRO among the BAs in the interconnection favors the BAs with more load than more installed capacity
Response: 4. The drafting team agrees with some of the comments made here but not in the conclusion you draw from the individual points. There is not currently an obligation to provide any amount of frequency response to a sudden change in the interconnection frequency. The proposed standard addresses this shortcoming in the current standard. The drafting team has also reduced the initial reduction in the minimum Frequency Bias Setting to ensure that the reduction can be studied closely to ensure no detrimental impact on the reliable operation of the Bulk Electric System. Finally, there is ongoing disagreement in the industry as to whether it is desired to have a minimum Frequency Bias Setting that is significantly greater than the Frequency Response Characteristic. Please refer to Order 693 P371 for further information on this issue. **5) After further discussion, the drafting team believes that the proposed allocation methodology does not favor any specific type of entity. To the extent that the commenter believes that the allocation favors any specific type of entity, the commenter should provide detailed reasoning of its position, not just an unsupported statement. The drafting team was unable to find any basis for this position during our discussions of the proposed allocation methodology. The drafting team will also point out that installed capacity is not a part of the calculation. The proposed allocation methodology, which has been clarified in the revised documents, utilizes monthly average peak generation and average peak load.**		
Seattle City Light	Negative	Answer: No. Comments: o LADWP and SCL consider the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. SCL suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.

Organization	Yes or No	Question 6 Comment
Response: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally, the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly defined and therefore not be used consistently across the industry.		
Alliant Energy Corp. Services, Inc.	Negative	Confusion exists around the "peak load" in that Attachment A states the allocastion is based on Projected Peak Loads and Generation but the Background Document states it will use historical Peak and Generation to make the allocation. - There appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation in Attachment A, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity of something less - please clarify. – It is not clear if there is an upper limit to the amount of frequcncy response expected of the BA's under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. BA's need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet the requirements.
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.		
BrightSource Energy, Inc.; Clark Public Utilities; Tri-State	Negative	Confusion exists between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but

Organization	Yes or No	Question 6 Comment
G & T Association, Inc.; Tucson Electric Power Co.; U.S. Army Corps of Engineers; South California Edison ; Platte River Power Authority; Pacific Gas and Electric Company; Colorado Springs Utilities; Idaho Power Company; California Energy Commission; California ISO; Deseret Power		the Background Document states it will use “historical” Peak Load and Generation. Reducing frequency bias obligation is detrimental to reliability. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response. The standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz, or if that event is excluded from the list used to calculate the Balancing Authorities’ response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. Finally, why are there no requirements on governor installation, settings, and operation for a frequency response standard?
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. **A reduction in the Frequency Bias Setting (FBS) may reduce the amount of AGC responses to a change in frequency. However, the drafting team has ensured that the FBS does not dip below the actual frequency response to ensure that the Frequency Response**		

Organization	Yes or No	Question 6 Comment
is not withdrawn due to AGC action. With that said, there is currently not an obligation to provide any amount of frequency response to a sudden change in the interconnection's frequency. The proposed standard addresses this shortcoming in the current standard. The drafting team has modified the initial reduction in the minimum Frequency Bias Setting to ensure that the reduction can be studied closely to ensure no detrimental impact on the reliable operation of the Bulk Electric System. Finally, there is ongoing disagreement in the industry as to whether it is desired to have a minimum Frequency Bias Setting that is significantly greater than the Frequency Response Characteristic. Please refer to Order 693 P371 for further information on this issue. **The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.** **The drafting team is operating under the Standard Authorization Requests (SARs) as approved. This drafting team believes that proposing a generator requirement is beyond the scope of the SARs. To the extent that the commenter believes there is a need to have a reliability standard related to generators, the drafting team would suggest that the commenter submit a SAR to begin the development process.**		
Beaches Energy Services; City of Bartow, Florida; Tampa Electric Co.	Negative	On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.
Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy		

Organization	Yes or No	Question 6 Comment
concerns. After further discussions, the drafting team has reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period. **The drafting team modified the language to clarify that the ERO will set the IFRO.** **This modification was made.**		
Salmon River Electric Cooperative	Negative	We feel that the drafting team has done an excellent job of providing clarify and reasonable reporting requirements to the right functional entity. We support the modifications but would like to have two additional minor modification in order to provide additional clarification to the Attachment I Event Table. We suggest the following clarifications: For the Event: BES Emergency resulting in automatic firm load shedding Modify the Entity with Reporting Responsibility to: Each DP or TOP that experiences the automatic load shedding within their respective distribution serving or Transmission Operating area. For the Event: Loss of Firm load for = 15 Minutes Modify the Entity with Reporting Responsibility to: Each BA, TOP, DP that experiences the loss of firm load within their respective balancing, Transmission operating, or distribution serving area. With these modifications or similar modifications we fully support the proposed Standard.
Response: The drafting team understands that this comment was submitted under the wrong project.		
FMPP	No	o Item 2 should be changed as follows: The ERO will identify at least 25 frequency excursion events in each Interconnection for calculating the Frequency Bias Setting and the FRM. If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria will be included with the data set by the ERO for determining FRS compliance. (as written this item could cause double jeopardy for event from the previous period) o Under FRO for the Interconnection the first sentence should be changed as follows: "The ERO {Each Interconnection (delete these words)} will establish target

Organization	Yes or No	Question 6 Comment
		contingency protection criteria for each Interconnection." (each Interconnection is not a governing entity) o The footnote under Table 2 of Attachment A should be changed as follows: The Eastern Interconnection set point listed is a compromise value for the highest UFLS step setting of 59.5Hz used in the east and the {special protection scheme's (delete these words)} highest UFLS step setting of 59.7Hz used in Florida. It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS {special protection scheme (delete these words)} to "false trip". (this is not a special protection system; it is just an UFLS)
Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. After further discussions, the drafting team has reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period. **The drafting team modified the language to clarify that the ERO will set the IFRO.** **This modification was made.**		
Seattle City Light	No	o LADWP and SCL consider the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. SCL suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.
Response: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally,		

Organization	Yes or No	Question 6 Comment
the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly defined and therefore not used consistently across the industry.		
Manitoba Hydro	No	1. p.2 refers to each "Interconnection" establishing target contingency protection criteria. However, an "Interconnection" as defined in the NERC Glossary is an electrical system, not a Responsible Entity. This should be revised to clarify which Responsible Entities must establish the protection criteria. 2. Table 2, although entitled "Interconnection Frequency Response Obligations" does not use the term FRO in the Table itself. This terminology should be consistent. 3. There is no clear statement in Attachment A identifying the significance of Table 2. The previous paragraph identifies Table 2 as listing "default targets", but how does this relate to the FRO referenced in R1? 4. The "Note" on p.2 regarding the ERO being able to use additional events that don't satisfy the criteria is unreasonable as drafted. Since these events are used to calculate the Frequency Bias Setting and FRM (as per p.1, s.2), the selection of events should not be at the unfettered discretion of the ERO. As drafted, no grounds or criteria must be satisfied.
Response:1. The drafting team modified the language to clarify that the ERO will set the IFRO. **2. The drafting team modified the table to ensure consistent terminology is used.** **3. The drafting team modified Attachment A to clarify the importance and explain the calculations made to get to the Interconnection FRO.** **4. The drafting team revised the note to clarify that the ERO may use any event, regardless of size or other condition, in its evaluation of Interconnection Frequency Response. However, these additional events will not be used for evaluation of BA response compliance.**		
FPL	No	3. - How many seconds of observation for "Delta F"? Does "Point C" in a. refer to "Figure 1 - Classic Frequency Excursion and Recovery" from NERC's Survey

Organization	Yes or No	Question 6 Comment
		Instructions document dated September 1, 2010? If so it should be included in this document along with the added 8 and 18 second time lines being shown. What is a "narrow range" in item b.? 4. - Better define "relatively steady" (i.e. within a specific range and state it?) Also, "near 60.000 Hz" is not precise enough (i.e. if the event begins below 60.000 Hz, what range or time error correction is to be considered acceptable?) Is the "A" value also part of the figure cited in 3? 5. - Is the "B" value also part of the figure cited in 3? 6. - Change "should be excluded" to "will be excluded". 7. - Better explain "the cleanest 2 or 3 frequency excursion events" or remove the word "cleanest". Page 2 paragraph 5: Provide specific dates for the "quarterly postings" and where these will be posted (i.e. Internet address or other). Clarify the December 15 ERO annual post date with the dates stated for same posting on Page 3 paragraph 5 and the BA's January 10 deadline. The BA posts 30 days from which date? This is confusing. Page 2 Table 2: What of starting event frequencies that are < 60 Hz? Why is the "Highest UFLS" 59.6 when the Florida setting for its load is 59.7? Page 3 FRO equation: Page 4 of the "Frequency Response Standard Background Document, October 2011" also shows this equation but uses different terms. Make the same on both documents. In the Background Document each component of the numerator is explained and reference is made to FERC Form 714 to obtain these values. There is no reference to this form for the denominator values. All of this needs to be made clear with reference to FERC Form 714 on Attachment A.
Response: 3. The SDT has modified the titles of the columns in Table 1 of the Procedure document to clarify what was intended by the table. The Point C value is defined in section 3a.		

Organization	Yes or No	Question 6 Comment
4 - Due to the complicated nature of event evaluation and selection, the drafting team has retained the words "relatively steady" and "near 60" in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further. **5 – No, the B value is a calculated value not shown in the chart referenced in number 3 above. Additional language has been added in Attachment A to clarify both the A value and the B value. The A and B values are shown on Figure 2 of the Background document as green and red lines, respectively.** **6 – The drafting team modified this language.** **7 – Due to the complicated nature of event evaluation and selection, the drafting team has retained the word "cleanest" in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further.** **NERC is developing this part of the process and an area to post this information. The drafting team has put clear language in the attachment requiring at least quarterly posting of events. It is currently the drafting team's expectation that a list of potential events would be posted shortly after they actually occur and a refined list will be made available quarterly.** **Modifications to Table 2 have been made to clarify what is being used.** **Attachment A and the Background Document have been modified so that the FRO Allocation equation is the same and the terms are fully explained.**		
Tucson Electric Power	No	Attachment A creates additional requirements to the BAL-003-1 Standard. The arrested value of frequency observed within 8 seconds may not be long enough in some instances. The delta F in the West should be greater than 0.05 Hz to ensure a measurable frequency response. West Under Frequency should be set at 59.95 Hz. There is no reliability concern for Over Frequency. Does 18 seconds after the start of the disturbance set point B?

Organization	Yes or No	Question 6 Comment
		Pre-disturbance frequency should be relatively steady and near 60.000 Hz is vague. TEP feels that the ERO should not need to validate a BAs frequency bias setting.
Response: The drafting team has modified the standard to put the requirements there and use Attachment A to clarify the process. **After further discussion and review of the events in the Western Interconnection Form 1 for 2011, the drafting team has modified the Delta C and Under Frequency values in Table 1.** **Based on language in Order 693 P355, the drafting team believes that frequency response is needed in both directions, not just one.** **The drafting team has revised the language in the document to provide clarity on the 18 seconds. To the extent that the language related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available.** **Due to level of detail being used to determine the FBS and FRM as well as the interactions between this standard and others, the drafting team disagrees with the commenter and continues to recommend the ERO validate the FBS of each BA.**		
Bonneville Power Administration	No	BPA believes that Attachment A adds additional requirements to the standard. Confusion exists between Attachment A and the Background Document. Attachment A states peak load allocation is based on “Projected” Peak Loads and Generation, but the Background Document states it will use “historical” Peak Load and Generation. 3a: it may take longer than 8 seconds in some disturbances. This should be 10 seconds. .05 Hz Delta F is not low enough for the Western Interconnection, it should be .075Hz to ensure there is measurable frequency response for the interconnection. Also, under frequency should be set at 59.95 Hz. BPA does not believe there is a reliability need to include over frequency events.

Organization	Yes or No	Question 6 Comment
		3b: It is unclear if the 18 seconds is setting the B point. If this is the B point, BPA believes it should be changed to 25 seconds for the Western Interconnection. 4. Please define relatively steady and near 60 Hz. 6: For the Western Interconnection, BPA believes this needs to be 10 minutes at the top of the hour. As mid hour scheduling becomes more prevalent, the ramping at the bottom of the hour will have to be taken into account. FRO for the interconnection: Starting frequency should be the FTL limit. With RBC in place, the frequency is seldom at 60 Hz. BPA understands the theory behind setting the base obligation to the values listed in table 2. BPA would like to know if there were any studies performed to validate setting the FRO for the interconnection to such a low level? BA FRO and frequency bias setting: BPA does not agree with ERO assigning a Frequency Bias setting to each BA. This calculation is indicated as the initial FRO allocation, what is the process for changing it? BPA believes this should go through the standard drafting process for any changes. The calculation should use Peak online capacity, not the installed capacity. This would lead to the denominator being 2 X Peak projected load for the interconnection. BPA has approximately 35,000 MW of installed generation, and has never seen the actual coincidental generation go over 21,000 MW. Again, BPA doesn't believe the ERO should be validating the frequency bias setting. It is unclear to BPA how variable bias is being addressed in the standard.

Response: The drafting team has modified the requirements to address comments. The drafting team believes as modified the requirements are stated in the standard and the process to be used is in the Attachment.

The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection.

The drafting team has revised the language in the document to provide clarity on the 18 seconds. The drafting team has also

Organization	Yes or No	Question 6 Comment
		attempted to clarify that the B Value is the average of the scan rate data for the period from 20 to 52 seconds following the start of the event. The event selection criteria will use the frequency approximately 18 seconds (prior to the start of the B Value period) to as frequency level to determine if the change in frequency qualifies as an event for the purposes of this standard. Based on event information for the 12 month period beginning December 2010, the drafting team has modified the frequency levels used for event qualification but did not modify the 18 second frequency point. To the extent that the language related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available. Both the NERC Resources Subcommittee (RS) and the NERC Transmission Issues Subcommittee (TIS) evaluated the level of response needed. The drafting team decided to use the limits determined by the RS over that determined by the TIS after evaluation of both. The documents developed by both of these subcommittees are available on the NERC website under this project (http://www.nerc.com/filez/standards/Frequency_Response-RF.html). The drafting team clarifies that the ERO is not assigning the Frequency Bias Setting. The ERO will review the data to determine that the Frequency Response Measure is correctly determined by the BA and that the Frequency Bias Setting is therefore correct. The expected process is that a subcommittee under NERC will review the Form 1 and Form 2 for each entity to ensure that the BA correctly filled out the form. Assuming the BA has correctly filled out these forms, there is no ERO interaction with the number provided by the BA. The FRO calculation is being included in the Attachment A to ensure that the process to modify the calculation would need to be open to industry input. It is not appropriate to put it in a requirement since it would not make sense to make a requirement that the FRO be allocated in a certain manner. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. The drafting team revised the requirements to separate the variable bias requirement from the fixed bias setting requirement and provide clarity related to what is expected in a variable bias setting.
Energy Mark, Inc.	No	Comment 6: "If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria

Organization	Yes or No	Question 6 Comment
		will be included with the data set by the ERO for determining FRS compliance." I believe that the better alternative in this case would be to use the lesser number of events. This is partly based on the consideration that if there are fewer events, the risk to the interconnection for that year was less that expected, and as a result, evaluation of fewer events will not compromise interconnection reliability. If fewer than 25 events are available in any year, the selection criteria should be adjusted to select more events. Comment 7: There are a number of problems with the use of "median" Frequency Response of the measured events. These problems make a choice other than median preferable. The following comments list some of those problems. Comment 8: The current standard uses average Frequency Response of selected events. This makes the current standard incompatible with the use of median. Comment 9: If a BA reconfigures during a measurement year, that reconfiguration will create a bi-modal distribution of the Frequency Response events. Median is incapable of representing a bi-modal distribution. The use of median will result in a standard that is incapable of measuring compliance effectively for an BA that is reconfigured during a measurement year (Dec 1 thru Nov 30). Comment 10: Any attempt to purchase additional Frequency Response from another BA for a portion of a measurement year will also cause a bi-modal distribution making the purchase of Frequency Response only effective for entire measurement years. Comment 11: Median is a non-linear measurement method. Because it is a non-linear measurement method, there is no valid way to manage partial year measurements. Comment 12: I will offer an alternative to median to the SDT before the end of the development of responses to these comments. Comment 13: The Minimum Frequency Bias Setting and the Frequency Response Obligation are both based on a method that assigns responsibility based on a Peak

Organization	Yes or No	Question 6 Comment
		Load / Peak Generation share of the interconnection. However, the method used to set the Minimum Frequency Bias Setting is different than the method used to determine the Frequency Response Obligation. Using these two different methods could result in the Minimum Frequency Bias Setting being less that the FRO for a BA. The best way to correct this problem is to use that same allocation methodology for determining the FRO and the Minimum Frequency Bias Setting. This can be easily accomplished by modifying R5 to use the FRO allocation method to determine the Minimum Frequency Bias Setting. This calculation would divide the numerator from the FRO allocation equation, divide it by two and multiply it by the percentage specified in Attachment B. In fact, the current FRS Form 1 uses this equation with projected rather than historic data. The best alternative would be to modify the R5 in the standard to match the FRO allocation method and modify FRS Form 1 to use historic data instead of projected data. This would result in only one set of Peak Load and Peak Generation data throughout the standard, rather than three different sets of data as currently written. When multiple sets of the same or similar data are used within a single standard, it only creates confusion and errors in the result.

Response: Comment 6: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally, the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly defined and therefore not used consistently across the industry.

Comment 7-12: The drafting team is recommending use of the median for the purposes of determining a BA FRM over multiple events. This decision is based on the determination that, while it may not be perfect, it is better than the other alternatives available at this time. The drafting team recognizes that in the future a better methodology might be found; based on the data available at this time the median allows us to move forward to implement a response requirement.

Comment 13: The drafting team understands your concern of using the historical numbers for the FRO allocation and the projected number as the basis for the minimum Frequency Bias Setting. However, after discussions, the drafting team believes

Organization	Yes or No	Question 6 Comment
that at this time, minimizing the changes to the current Frequency Bias Setting process provides better comparability for the purpose of evaluating the impacts of reducing the minimum setting requirement. In the alternative, the drafting team feels that allocating the FRM based on historical data provides less room to game the process since the numbers used for allocation can be verified independently.		
MRO NSRF	No	Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach.If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify.We suggest the SDT clarify if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or "requirements
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.		
Xcel Energy	No	Confusion exists around the "peak load" in that the Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where does that value come from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same

Organization	Yes or No	Question 6 Comment
		approach.If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity?
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and monthly peak generation (monthly peak) and does not use installed capacity.		
ISO/RTO Council Standards Review Committee	No	Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on P. 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest that the SDT first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. Further, there are no measures provided for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance?We

Organization	Yes or No	Question 6 Comment
		suggest the SDT move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Moreover, if the Attachments are to be integral to the standards, the terminology "may" must be replaced with "shall". Finally, the two Attachments are listed in Section F - Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where appropriate).
Response: The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. As to the use of the term "may" in the attachment, at this time the drafting team is unable to further restrict the language due to the issues surrounding an individual event. As an example, frequency is scheduled at 60 Hz most of the time. However, when viewed on a graph or an EMS screen, it rarely sits at 60.000 for a long period of time, it fluctuates between 59.995 and 60.005. The drafting team is unable to say at this time that an event that starts with frequency at 60.005 is materially different that an event that starts at 59.995. Therefore, the drafting team has attempted to put guidance into the document as to what is pertinent without attempting to be overly restrictive in the selection criteria since there is no support for a restriction at this time. As more experience is gained, the process should be refined. It the refinement is significant enough to require a change to the Attachment A language, the process required to do so would be open to participation of industry and not done without public exposure. **The SDT agrees with your comment about removing the documents from Section F of the proposed standard has made this modification to the standard.**		
Independent Electricity	No	Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is

Organization	Yes or No	Question 6 Comment
System Operator		problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on page 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest the SDT to first determine if the materials in the revised Attachment A (and Attachment B) are “Guideline” or “Technical Background”, or are they “requirements”. If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO’s process for supporting the Frequency Response Standard (FRS) (in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM), and on the other hand the BA’s obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. Further, there are no measures developed for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance? We suggest the SDT to move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Finally, the two Attachments are listed in Section F - Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where

Organization	Yes or No	Question 6 Comment
		appropriate).
Response: The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments and modified them to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. As to the use of the term "may" in the attachment, at this time the drafting team is unable to further restrict the language due to the issues surrounding an individual event. However, when viewed on a graph or an EMS screen, it rarely sits at 60.000 for a long period of time, it fluctuates between 59.995 and 60.005. The drafting team is unable to say at this time that an event that starts with frequency at 60.005 is materially different that an event that starts at 59.995. Therefore, the drafting team has attempted to put guidance into the document as to what is pertinent without attempting to be overly restrictive in the selection criteria since there is no support for a restriction at this time. As more experience is gained, the process should be refined. It the refinement is significant enough to require a change to the Attachment A language, the process required to do so would be open to participation of industry and not done without public exposure. **The SDT agrees with your comment about removing the documents from Section F of the proposed standard has made this modification to the standard.**		
Florida Power & Light Company	No	In the table on page2 the asterick references a statement that the 59.7Hz used in Florida is a special protection scheme. This is incorrect. The special protection scheme setting was 59.82Hz and was done away with in 2005 or earlier. The 59.7Hz setting used within the FRCC is based on FRCC TWG studies that require this level of setting to protect the state in the event of a separation and to protect nuclear equipment. FPL supports the use of the C(N-2) critiera. Additionally, the reference to the FERC714 report that is currently in the background data should be made part of attachment A not separated. FPL fully agrees with Table 1The formula used to derive the FRO is inconsistant with the definition used for requirement R5. R5 states that the load is " within the BA's metered boundary". The load used in the formulae is taken from FERC714. The yearly peak demand used in R5 should be the peak

Organization	Yes or No	Question 6 Comment
		monthly load from June, July or August as reported on FERC714 to be compatible with the FRO formula.
Response: The drafting team has removed the reference to the special protection scheme. The drafting team has modified the FRO allocation formula to better explain what is desired. However, the drafting team did not adjust the formula to what is suggested by the commenter.		
NV Energy	No	It is not clear whether the calculation of FRO is to utilize projections of BA load as in Att A, or past data reported in FERC Form 1 as per the Background Document.
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.		
Los Angeles Department of Water and Power	No	LADWP considers the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. LADWP suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.
Response: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally, the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly defined and therefore not used consistently across the industry.		
JEA Electric	No	On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO

Organization	Yes or No	Question 6 Comment
Compliance/Florida Municipal Power Agency		can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to “false trip”.", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.
Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. After further discussions, the drafting team has reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period. **The drafting team modified the language to clarify that the ERO will set the IFRO.** **This modification was made.**		
Duke Energy	No	On page 3 of the document it states “For a multiple Balancing Authority Interconnection, the Interconnection Frequency Response Obligation is allocated based upon either the Balancing Authority Peak Demand or peak generation”, however, the initial FRO allocation equation shows that the BA allocation is based upon the sum of the Projected BA Peak Load plus installed capacity, times the Interconnection FRO, and divided by the sum of the Projected Interconnection Peak Load plus Interconnection installed capacity. Is the statement in quotes correct, or is the allocation equation correct? In addition, the equation in Attachment A referencing “installed capacity” conflicts with the equation in the BAL-003-1

Organization	Yes or No	Question 6 Comment
		Background Document entitled "Frequency Response Standard Background Document" where "Peak Gen" is used. In summary, is the FRO allocation based upon an equation which a) sums the Projected BA Peak Load plus peak generation, b) sums the Projected BA Peak Load plus installed capacity, or c) uses either Projected BA Peak Load OR peak generation? All three options are currently represented in the documentation. Calculation of the FRO for the Eastern Interconnection: Duke Energy agrees with the criteria suggested for the event to be protected (4500 MW), and at this time also agrees with the "compromise" low limit of 59.6 Hz. However, knowing that another Standard is under development which may require hourly assessment of available "frequency responsive reserves", we are trying to determine what impact the choice of this methodology will have on the amount of frequency responsive reserves the industry will have to maintain - enough to cover frequency swings that only occasionally reach down to perhaps 59.9 Hz as we see on the Interconnection today (essentially the allocated FRO for a 0.1Hz deviation), enough to cover a 4500 MW loss, or whatever we deem appropriate as long as we are compliant to the FRM? We recognize that the Standard Drafting Team cannot answer this question, as the Standard under development is not within the scope of this team, however our comment is meant to illustrate the point that similar to our response to question 8, it should be recognized that elements of this Standard are tightly coupled to other current and potential Standards, and the impacts must be considered by the Industry.
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. **The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.**		

Organization	Yes or No	Question 6 Comment
SERC OC Standards Review Group	No	The definition of Single Event Frequency Response Data (SEFRD) was struck from the draft standard but still appears in Attachment A. Since R1 of the standard references Attachment A, would the definition of SEFRD still be applicable? If the definition is to be totally struck, we don't think the term should be used in Attachment A.
Response: The SEFRD definition was moved to Attachment A. The SEFRD is used on individual events. The median of a BA's SEFRDs will be used to determine its FRM. Therefore, the drafting team believes it is appropriate to use the definition in the Attachment. Since it is not likely to be used outside of the context of this standard, the drafting team is not proposing to place the definition in the NERC Glossary.		
Hydro-Quebec TransEnergie	No	The Event Selection Criteria should be modified for the Quebec Interconnection. In Table 1, the change in frequency (Delta f) used for Quebec's Event Selection Criteria should be 0,3Hz (from point "A" to point "C") and must last for at least 7 seconds so that we don't measure AGC action. In addition, a criterion should be added by saying that events that recovered within the 20-52 second average period for point "B" should be excluded from analysis.
Response: The drafting team has modified Attachment A to address these comments.		
Keen Resources Asia Ltd.	No	The sample pre-selection described in Attachment A, Event Selection, Criteria 2 & 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria 2 & 7 to pre-select only certain events, and not others, in such a way that the selected events

Organization	Yes or No	Question 6 Comment
		occur evenly throughout the year, is papently wrong because it is trying to "fit" events into a process (even distribution over time) that does not govern events, but that instead governs normal operating errors that are the subject of CPM control, not of this Frequency Response standard. In other words, criteria 2 & 7 confuse Frequency Response with CPM, and events with normal operating errors. The result is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on page 5 of the Background Document, on the other hand, provides a statistically correct description of event selection without sample pre-selection and should followed instead of the erroneous criteria 2 & 7 in Attachment A.
Response: The drafting team has discussed this issue several times and believes that issues related to measurement caused by noise in individual events and the need to ensure adequate representation of events throughout the year outweigh the concern to have a "pure" statistical sample. For these reasons the drafting team has not modified the event selection criteria.		
Northeast Power Coordinating Council	No	The SDT has to first determine if the materials in the revised Attachment A & B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as written Attachment A is confusing as it describes the ERO's process for supporting the Frequency Response Standard (FRS) (the method and criteria it uses to calculate the frequency bias settings and the FRM), and at the same time the BA's obligations to support this process. The latter requirements should not be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, regarding BAL-003-1- Attachment A 1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to "cleanest events". A statement of what constitutes a "clean event" is needed to avoid possible controversy in the future.

Organization	Yes or No	Question 6 Comment
		3. The use of 59.6 Hz as the highest UFLS setting is flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or it should be 59.5 Hz without concern for Florida's unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". The Interconnection should have been an integral part of establishing its obligation. It is stated that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. The background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A sampling interval.
Response: The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. **1. The drafting team believes that Criterion 5 is clear as written. The comment does not provide any guidance as to what needs**		

Organization	Yes or No	Question 6 Comment
		clarification so no change was made. **2. Due to the complicated nature of event evaluation and selection, the drafting team has retained the word "cleanest" in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further.** **3. The drafting team has revised the terminology used to explain the frequency levels proposed. There was not a change to the Eastern Interconnection numbers.** **4. An interconnection can recommend a change to the table. As the standards process currently works, that interconnection would need to support its alternative level with data. If the interconnection has a single Regional Reliability Organization, the ERO would typically agree to the alternative assuming it would be more restrictive (in this case a larger response requirement) than the ERO has recommended.** **5. The drafting team has addressed the concerns raised by clarifying that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.** **6. The drafting team has modified Attachment A to address concerns with selection of an event where frequency returns to the A Value level during the measurement period. These events will be excluded from the measurement process for all interconnections.** **7. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets.**
Sacramento Municipal Utility District (SMUD)	No	The standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the

Organization	Yes or No	Question 6 Comment
		frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz, or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities.
Response: The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.		
Western Electricity Coordinating Council	No	There is disagreement between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but the Background Document states it will use "historical" Peak Load and Generation. The allocation methodology of FRO among the BAs in the equation on page 3 of Attachment A favors BAs with more load than more installed capacity. Peak load is served but not all installed capacity is always dispatched.
Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.		
Alberta Electric System Operator	No	These documents not only provide additional clarity but also specify additional requirements, such as FRS Form 1 annual reporting by January 10. All the enforceable requirements should be included in the body of the standard. 1. Attachment A uses the terms "delta F (change in frequency)", "arresting frequency (Point C)", "B Value", "A Value". These terms are not properly defined or described in this document as drafted. The AESO suggests adding a description or definitions for

Organization	Yes or No	Question 6 Comment
		clarity in this document. 2. The standard gives 2 sets of values for Interconnection Frequency Response Obligation in Table 2, (1) Base Obligation and (2) the obligation including 25% Safety Margin (which seems to be implied by the "contingency protection criterion"). The Attachment A does not specifiy whether the Base Obligation or the 25% Safety Margin value will be used to allocate the Interconnection FRO to the BAs. Please clarify which value will be used to calculate the BA Frequency Response Obligation (FRO) in the Interconnection FRO allocation formula in Attachment A. 3. The "initial FRO allocation" formula in Attachment A uses Peak Load. The term Peak Load is not used in the standard nor is it a defined term in the NERC Glossary. The standard uses Peak Demand, which is defined in the Glossary Is "Peak Load" synonymous with "Peak Demand"? If so, Peak Demand should be used in the formula instead. Otherwise Peak Load should be clearly defined in this document. 4. Is "Projected" in the FRO allocation formula synonymous with "Forecasted"? If so, Forecasted should be used for consistency. Otherwise "Projected" or the context in which it appears must be defined.
Response: The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. **1. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets.** **2. The drafting team has modified Table 2 to clarify that the bottom number in each column is the Interconnection FRO. The Interconnection FRO will be allocated to the BAs within that interconnection.** **3 and 4. The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. The proposed**		

Organization	Yes or No	Question 6 Comment
methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.		
Great River Energy/ACES Power Marketing Standards Collaborators	No	Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an N-2 event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does but then the table lists out a separate 25% "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin.
Response: 1. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets. The drafting team has clarified Table 2 by modifying the titles for each line.		
Texas Reliability Entity	No	We have a number of concerns regarding Attachment A which are set forth below: 1. Regarding the formula for "Initial FRO Allocation" on page 3 of Attachment A, the terms for "BA installed capacity" and "Interconnection installed capacity" are undefined and could be subject to manipulation and dispute. We suggest that this formula be revised to mirror the calculation based on well-established FERC Form 714 data that is discussed in the Background document, which is based on actual

Organization	Yes or No	Question 6 Comment
		generation output. 2. In Attachment A, all references to "Texas" should be changed to "ERCOT" as a reference to the Interconnection or the Region (including tables). 3. Regarding the Event Selection Criteria in Attachment A: in item 2, consider whether certain events, such as DCS events, should be required to be included in the FRM analysis. 4. Regarding the Event Selection Criteria in Attachment A: item 7 provides that the selected frequency excursion events are to be selected so that they are evenly distributed seasonally. Consider adding the seasonal distribution concept to item 2, particularly if it becomes necessary to include events from the previous evaluation period. 5. In Attachment A, page 1 says the ERO is to post the final list of frequency excursion events by December 15, but on page 3 it suggests that the list will be posted by December 10. These references should be made consistent. 6. Attachment A states, on page 3, "the ERO will use FRS Form 1 data to post the following information for each Balancing Authority for the upcoming year: Frequency Bias Setting and Frequency Response Obligation (FRO)." What is meant by "the upcoming year"? Is the BA supposed to implement the new FBS immediately, or wait until the beginning of the next evaluation period on December 1? Note that if the new FRO and FBS are implemented immediately (e.g. in March), then the FRO will change in the middle of an evaluation period. This will complicate the comparison of FRM and FRO as required by R1.
Response: 1. The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. **2. This change was made.**		

Organization	Yes or No	Question 6 Comment
3. The drafting team recommends all events with a frequency deviation that meets the selection criteria should be evaluated. For the entity that lost generation (or load) to initiate the event, the calculation methodology proposed allows adjustments to be made for that event. **4. This modification was made to the Attachment B (now a Procedure). The suggested modifications are shown in Criteria 2 and 7.** **5. These two documents have been conformed.** **6. The ERO will notify the BAs as to the date the Frequency Bias Setting is to be implemented if they are utilizing a fixed Frequency Bias Setting.**		
Southern Company	No	We suggest increasing the delta f for the East to be the same value as the West or larger. The reason for this is that the 0.04Hz suggested is too close to the governor deadbands of .036Hz. This would potentially omit frequency response that some units may provide for a larger excursion but not for those close to the deadband.
Response: The delta f values have been selected to balance the need to have a sufficient number of events for evaluation and the need to have sufficient frequency movement to actually measure response. At this time the drafting team is not modifying the eastern interconnection values based on the event selection process for the period December 2010 through November 2011.		
ISO New England Inc	No	We suggest the SDT to first determine if the materials in the revised Attachment A & B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, BAL-003-1- Attachment A

Organization	Yes or No	Question 6 Comment
		1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to the "cleanest events". Perhaps a statement of what constitutes a "clean event" is needed to avoid possible controversy in the future. 3. The use of 59.6 Hz as the highest UFLS setting seems flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or, it should be 59.5 Hz without concern for Florida's unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". It seems that the Interconnection should have been an integral part of establishing its obligation. Also, it states that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. Also, the background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Very recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A sampling interval.
Response: The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the

process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. 1. The drafting team believes that Criterion 5 is clear as written. The comment does not provide any guidance as to what needs clarification so no change was made. 2. Due to the complicated nature of event evaluation and selection, the drafting team has retained the word cleanest in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further. 3. The drafting team has revised the terminology used to explain the frequency levels proposed. There was not a change to the Eastern Interconnection numbers. 4. An interconnection can recommend a change to the table. As the standards process currently works, that interconnection would need to support its alternative level with data. If the interconnection has a single Regional Reliability Organization, the ERO would typically agree to the alternative assuming it would be more restrictive (in this case a larger response requirement) than the ERO has recommended. 5. The drafting team has addressed the concerns raised by clarifying that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. 6. The drafting team has modified Attachment A to address concerns with selection of an event where frequency returns to the A Value level during the measurement period. These events will be excluded from the measurement process for all interconnections. 7. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets.		
Constellation Energy Commodities Group	Yes	Additional information relating to defining the FRO for the Interconnection would be helpful as would an example for calculating the BA FRO.
Response: The drafting team has revised Attachment A to provide better explanation and to clarify the allocation methodology to		

Organization	Yes or No	Question 6 Comment
the BA.		
American Electric Power	Yes	A frequency response observation should not be used spanning multiple years, or if there does, there should at least be a reset period.
Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. After further discussions, the drafting team has reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period.		
Cleco Corporation/ SPP Standards Review Group	Yes	We appreciate the effort of the SDT in developing Attachment A. It was very helpful in weeding through BAL-003.
Response: Thank you for your comments.

Ameren	Yes	

7. The second document "BAL-003-1 Background Document" provides information behind the development of the standard. Do you agree that this new document provides sufficient clarity as to the development of the standard? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters referenced other questions in the comments. The SDT asked them to review the response to those earlier questions.

Several of the commenters pointed out that there was a discrepancy between the Background Document and Attachment A regarding the calculation of the BA FRO. The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.

Some commenters indicated that Supplemental Regulation Service is not an appropriate method to provide Frequency Response. It is inappropriate to expect supplementary regulation to transfer frequency response successfully. However the SDT does not want to prevent any innovative solution that will transfer frequency response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging supplementary regulation via a pseudo-tie have to be consistent in the removal or inclusion of it in their actual net interchange measurement as well as in all events across the measurement period.

Organization	Yes or No	Question 7 Comment
Seattle City Light	Negative	Answer: Yes Comments: o LADWP and SCL note that the document "BAL-003-1 Background Document" seems to be reasonable.
Response: Thank you for your comment.		
Energy Mark, Inc.	No	Comment 14: Some of the information in this document concerning the Frequency Bias Setting for BAs participating in Overlap Regulation should be moved to the Supporting Document. This change would help in addressing Comments 3 & 4 under Question 2.
Response: The SDT has added language to Attachment A to address your concern.		

Organization	Yes or No	Question 7 Comment
Duke Energy	No	Please see our comments to Question 6. In addition, Duke Energy disagrees with the statement on page 9 that Attachment B will "ensure there is no negative impact on other Standards" - please see our response to Question 8 for additional information.
Response: Thank you for your comments. Please see the responses to Questions #6 and #8.		
SERC OC Standards Review Group	No	Portions of the Background Document do not appear to be complete or finished. The Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. elimination of the definition of SEFRD and any revisions to the draft BAL-003-1).
Response: The SDT has made significant modifications to the Background Document to support the proposed standard. The SDT is proposing that this document be posted on the NERC web site in order for it to be easily obtained by stakeholders once the standard is approved.		
ERCOT	No	Refer to comments in #1.
Response: Refer to the response in Question #1.		
Northeast Power Coordinating Council	No	Refer to the first comment in Question 6.For the Frequency Response Standard Background Document – 1. Cite Attachment B in addition to Attachment A in the discussion of requirement R1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6, drop the inappropriate recommendation of getting frequency response

Organization	Yes or No	Question 7 Comment
		through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it. This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the standard. The standard states that any time within the designated date is acceptable. 6. On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This training can be done in a training simulator. If it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: "This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations" is difficult to understand. The paragraph would read better by simply deleting the sentence.
Response: Please refer to our response to Question #6. **Comment 1 – The SDT has modified the Background Document to incorporate your suggested change.** **Comment 2 – The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.** **Comment 3 – The SDT has removed the speculative language and replaced it with more appropriate language.** **Comment 4 - While the SDT agrees that it is inappropriate to expect supplementary regulation to transfer frequency response**		

Organization	Yes or No	Question 7 Comment
successfully, we do not want to prevent any innovative solution that will transfer frequency response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging supplementary regulation via a pseudo-tie have to be consistent in the removal or inclusion of it in their actual net interchange measurement as well as all events across the measurement period. **Comment 5 – The SDT has corrected the background document to accurately reflect the language proposed in the standard.** **Comment 6 – The SDT has modified the background document to remove the training language.** **Comment 7 – The SDT has revised the paragraph to provide additional clarity.**		
Xcel Energy	No	Same comment here as the one in question 6.
Response: Please refer to our response to Question #6.		
ISO New England Inc	No	See first comment in 6 above. Also, Frequency Response Standard Background Document – 1. Cite Attachment B in addition to Attachment A in the discussion of requirement 1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6, drop the inappropriate recommendation of getting frequency response through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should

Organization	Yes or No	Question 7 Comment
		actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it! This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the requirement. The requirement says that any time within the designated date is acceptable. 6. On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This sort of training can be done in a training simulator. Alternatively, if it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: "This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations" is difficult to understand. The paragraph would read better by simply dropping it.

Response: Please refer to our response to Question #6.

Comment 1 – The SDT has modified the Background Document to incorporate your suggested change.

Comment 2 – The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.

Comment 3 – The SDT has removed the speculative language and replaced it with more appropriate language.

Comment 4 - While the SDT agrees that it is inappropriate to expect supplementary regulation to transfer frequency response successfully, we do not want to prevent any innovative solution that will transfer frequency response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging supplementary regulation via a pseudo-tie have to be consistent in the removal or inclusion of it in their actual net interchange measurement as well as all events across the measurement period.

Comment 5 – The SDT has corrected the background document to accurately reflect the language proposed in the standard.

Organization	Yes or No	Question 7 Comment
Comment 6 – The SDT has modified the background document to remove the training language. **Comment 7 – The SDT has revised the paragraph to provide additional clarity.**		
Western Electricity Coordinating Council	No	See response to question 6.
Response: Please refer to our response to Question #6.		
Alberta Electric System Operator	No	The Background Document uses BA Peak Generation in the BA FRO allocation formula. Attachment A uses BA Installed Capacity. The AESO suggests making the two formulae consistent.
Response: The drafting team has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.		
Florida Municipal Power Agency	No	The document does not discuss how the new reliability parameter will affect BAs
Response: The new standard will require that Balancing Authorities meet a level of response to frequency events equal to or more negative than their Frequency Response Obligation. The SDT has made significant modifications to the Background Document which should address your concern.		
JEA Electric Compliance	No	The document does not discuss how the new reliability parameter will affect BAs
Response: The new standard will require that Balancing Authorities meet a level of response to frequency events equal to or more negative than their Frequency Response Obligation. The SDT has made significant modifications to the Background Document which should address your concern.		
MRO NSRF	No	The MRO NSRF has restated the same answer as in question 6 on purpose. Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use

Organization	Yes or No	Question 7 Comment
		a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify. Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1) The Standard itself does not state this provision (24 hour window on each side of target date) as indicated. 2) The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We suggest that a seven day window be used for implementation of the FBS.
Response: The drafting team has corrected the proposed standard to accurately reflect the language in the Background Document.		
Texas Reliability Entity	No	There is an inconsistency between the Background Document and Attachment A. Attachment A only proposes event criteria based on "the largest category C (N-2) event identified," but the Background Document says: "Attachment A proposes the following Interconnection event criteria as a basis to determine an Interconnection's Frequency Response Obligation: - Largest category C loss-of-resource (N-2) event; - Largest total generating plant with common voltage switchyard; - Largest loss of generation in the interconnection in the last 10 years."

Organization	Yes or No	Question 7 Comment
Response: The drafting team has corrected the reference so both documents agree.		
Great River Energy/ACES Power Marketing Standards Collaborators	No	We can find no document titled "BAL-003-1 Background Document". We assume this question is referring to the "Frequency Response Standard Background Document" dated October 2011. We do not believe the document provides sufficient clarity. No explanation is provided for why RSG was added to Requirement R1.There are typos contained in the document. On page 6 in NIA, the A should be in subscript. On page 7 in bullet 4 in the first sentence, "The" should be in lowercase
Response: Your assumption was correct. The drafting team has corrected these typos.		
Southern Company	No	We suggest the Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. Any revisions to draft BAL-003-1 and removal of the definition of SEFRD).
Response: Thank you for your comments. The drafting team revised the background document based upon modifications to the standard as well as modifications to other documents related to the standard.		
Seattle City Light	Yes	o LADWP and SCL note that the document "BAL-003-1 Background Document" seems to be reasonable.
Response: Thank you for your comments.		
Constellation Energy Commodities Group	Yes	Should be revisited based on the propposed modifications to the requirements.
Response: Thank you for your comments. The drafting team revised the background document based upon modifications to the standard as well as modifications to other documents related to the standard.		
Los Angeles Department of Water and Power	Yes	LADWP notes that the document "BAL-003-1 Background Document" seems to be reasonable.

Organization	Yes or No	Question 7 Comment
Response: Thank you for your comments.		
Keen Resources Asia Ltd.	Yes	Paragraph 4 on page 5 of the Background Document provides a statistically correct description of event selection without sample pre-selection and should followed instead of the erroneous criteria 2 & 7 in Attachment A. The risk-based approach to determining FRM, that the Background Document mentions in paragraph 4 of page 4 is being evaluated by the drafting team for application in this standard, should be considered for deployment as soon as possible to replace the administered method currently proposed in this standard, because the administered method lacks any technical justification. No such justification was ever attempted in the development of this standard. The administrative method of determining FRM is therefore but a highly dubious "quick fix" until the risk-based method is evaluated and implemented. The administrative method is in fact perverse because it discourages BAs from reducing their contribution to frequency error by refusing to reduce the BA's FRO accordingly, and because it encourages BAs to contribute to frequency error without increasing their FRO.
Response: The standard has to be written with what will be used day one. Due to the timeline that NERC has filed with FERC, there is not enough time to adequately evaluate a second methodology.		
Manitoba Hydro	Yes	Please see MH's response to Question 1 regarding the term Single Event Frequency Response Data. Additionally, the discussion in this document is useful in clarifying the intent of the drafting team, but some of this clarification would best be incorporated into the Standard itself. Ex. RSG requirement on page 6. Also on page 7 Attachment A does not specify what validation is and how it is done. Attachment A refers to BA providing FBS data to ERO which then validates and publishes. This should be reflected in R2.
Response: Please refer to our response to Question 1. **The "validation" process is nothing new. The ERO presently validates the information sent in by BAs today. The ERO will not be**		

Organization	Yes or No	Question 7 Comment
performing this process in a vacuum, but will be working with the BAs in the same manner as they presently do.		
NV Energy	Yes	This is a good reference; however see response to Question 6 in that there appears to be a discprepancy between Att A and the Background Document with regard to FRO calculation.
Response: The drafting team has corrected the discrepancy so both documents now agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.		
Cleco Corporation/SPP Standards Review Group	Yes	We appreciate the effort of the SDT in developing the Background Document. It provided insight on how the SDT got the proposed standard to where it is with this posting.
Response: Thank you for your comment.

ISO/RTO Council Standards Review Committee/ Independent Electricity System Operator		We do not have an opinion on whether or not the Background Document provides sufficient clarity to the development of the standard. We do, however, suggest that the SDT consider our comments in Q6, above, and move some of the information from Attachments A and B to or combine with the Background Document, to the Background Document to provide all the technical basis and background behind the elements stipulated in the requirements.
Response: Please refer to our response to Question #6.		

8. The SDT has developed a new document titled Attachment B – Process for Adjusting Bias Setting Floor. This document is intended to provide the methodology the ERO will use to reduce the minimum Frequency Bias Setting to become closer to natural Frequency Response. Do you agree that this document provides clear and concise instructions for the ERO to follow? If not, please explain in the comment area.

Summary Consideration: The majority of commenters did not like the word "initially" that was used in the proposed standard. They felt that it caused confusion. The SDT modified the attachment to remove the reference to the word "initially" and added other clarifying language to the document.

Some commenters were concerned with how the calculation of FRO for BAs that have load and generation. The intent was that generation-only BAs would base their settings on generation. Traditional BAs would use load. The SDT revised the table to agree with the proposed standard.

One commenter indicated that the standard was measuring AGC. The SDT disagrees.. There may be some AGC influence in the measurement however the SDT believes that this impact is minor. Based on the data received from the Field Trial, the SDT did not see this phenomenon.

A couple of commenters indicated that the methodology used for calculation of the minimum Frequency Bias Setting could be adverse for a single BA interconnection. The SDT explained that to ensure comparable treatment between BAs with fixed Bias Settings, BAs with a variable Bias Setting report their monthly average Bias for the reporting year. This average will be calculated when frequency is greater than 60.036 Hz or less than 59.964 Hz. The average of the 12 months' Bias values must be equal to or more negative than the Interconnection's minimum Bias Setting.

Organization	Yes or No	Question 8 Comment
Seattle City Light	Negative	Answer: Yes Comments: o LADWP and SCL note that Attachment B seems to be reasonable.
Response: Thank you for your comment.		
Constellation Energy Commodities Group	No	Should be revisited based on the proposed modifications to the requirements.

Organization	Yes or No	Question 8 Comment
Response: The SDT has modified Attachment B, now a Procedure for the ERO to follow in supporting the standard, to reflect modifications to the requirements and suggested changes from the industry.		
MRO NSRF	No	: There could be some confusion caused by the Attachment B due to the use of the word "initially" when the reference is made to the current standard. The drafting team should change the word "initially" to "currently" or strike it to avoid the potential confusion. The second paragraph of Attachment B (which contains the two bullets):The words "initially 1%" in the second bullet contradict with the Table 1 on Attachment B, which states "Initial" and "0.8%". Suggest deleting the parenthetical in the second bullet as when BAL-003-1 is effective it would be referencing an old Standard version. If the initial minimum is intended to be 1% say so in the Table 1.
Response: The SDT has modified Attachment B, now a Procedure for the ERO to follow in supporting the standard, to reflect your suggested changes.		
Texas Reliability Entity	No	1. In Attachment B, we suggest removing the paragraph beginning "The BA calculates . . ." because it appears to be background information that conflicts with the methods provided in this version of the standard for determining minimum bias settings.2. 2. Attachment B, Table 1, refers to "0.8% of peak load or generation." If a BA has both load and generation, will its minimum Frequency Bias Setting be based on its load, its generation, or can it pick the value that it prefers to use?
Response: The SDT agrees and has removed it from the Attachment B, now a Procedure. **The SDT intended that generation-only BAs would base their settings on generation. Traditional BAs would use load. We have revised the table to agree with the proposed standard.**		
Bonneville Power	No	BPA understands the concept and we disagree with it. As the ERO continues to lower the required minimum frequency bias setting for an interconnection, the BA's that

Organization	Yes or No	Question 8 Comment
Administration		have frequency response higher than the 1% will have a higher percentage of the frequency response of the interconnection. Also, this standard is primarily measuring AGC response, not natural frequency response; therefore not lowering the limit is appropriate.
Response: The SDT believes that you may be mixing the Frequency Bias Setting and Frequency Response Measure. As proposed the FRO will be assigned based upon load and generation as defined in Attachment A. Therefore actual Frequency Response will be required to come from the interconnection on that basis. To the extent an entity has a FRM greater than its Interconnection's minimum Frequency Bias Setting, its Frequency Bias Setting may grow as a percent of the Interconnections total Frequency Bias Setting. However, that is not Frequency Response. **The SDT disagrees with your comment concerning AGC. There may be some AGC influence in the measurement however the SDT believes that this impact is minor. Based on the data received from the Field Trial, the SDT did not see this phenomenon.**		
Duke Energy	No	Duke Energy suggests that the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1. Notwithstanding our suggestion that the criteria/requirements of the minimum FBS in the Attachment be incorporated into the Standard, Duke Energy has the following concerns with what is proposed: As cited in our comments to Question 8 in the last posting (extensive, so not repeated here), the secondary control measures of CPS1, CPS2 and the draft Balancing Authority ACE Limit (BAAL) are tightly coupled to the Frequency Bias Setting (FBS), and a reduction of the FBS will impact the secondary control requirements placed upon the BA. Noted in our response to Question 7 above, the statement on page 9 in the "BAL-003-1 Background Document"is not correct in stating that Attachment B will "ensure there is no negative impact on other Standards".The gradual reduction of the FBS will proportionally tighten the secondary control limits for each Balancing Authority. Even if the "natural" Frequency Response in the Eastern Interconnection remains unchanged for the next several years, under the process described allowing the ERO to annually adjust the minimum FBS for the Interconnection, the FBS will

Organization	Yes or No	Question 8 Comment
		eventually be reduced to a value approximately 10% above the calculated response in magnitude, cutting the current CPS1, CPS2 and BAAL limits in the Eastern Interconnection on average by more than half. The current FBS for the Eastern Interconnection is approximately minus 6500 MW/0.1Hz, estimated "natural" Frequency Response is perhaps around minus 2400 MW/0.1Hz. Unlike CPS1 and BAAL where the measures are based upon the FBS of the BA only, CPS2 (dependent upon the FBS of the BA and the Interconnection) will be significantly limiting to the degree that no change in a BA's own Frequency Response could significantly change its CPS2 limit if the Interconnection FBS drops over time as indicated. At least under CPS1 and the draft BAAL, the BA would have an option of improving its Frequency Response, allowing it to increase its FBS and proportionally the CPS1 and BAAL bounds using the FBS. Conclusion from our last comments submitted: Duke Energy does not believe there is a reliability need pushing the industry to tighten secondary control to the degree discussed above simply as a result of reducing the Frequency Bias Setting. If the calculated Frequency Response of the Interconnection stayed at its current level, what would be the justification for tightening the secondary control requirements of CPS1, CPS2 and the proposed BAAL? Duke Energy supports taking more of the error out of the ACE equation by having the FBS closer to the estimated Frequency Response of the Balancing Authority, however, Duke Energy does not believe the result should be a significant increase in secondary control costs to meet the CPS1, CPS2, or draft BAAL requirements. Duke Energy understands the position placed upon this Standard Drafting Team- the secondary control and reserve requirements are not under the scope of the team, however, proper consideration has not been given in Attachment B to the impact lowering the FBS will have on the industry in terms of the requirements placed upon the BA for secondary control and reserve requirements - especially for meeting CPS2. The research discussed in our comments to the last posting support that reducing the FBS while under CPS1 and the draft BAAL may be achievable, however a CPS2 bound cut potentially in half or lower will place unreasonable bounds on a BA, requiring control actions even when the BA may

Organization	Yes or No	Question 8 Comment
		be operating in support of the Interconnection frequency. Given the significant impacts discussed, Duke Energy believes that additional provisions must be in place for the Industry to approve each subsequent revision to the calculation of the minimum Frequency Bias Setting, rather than leave it as a decision made only by the ERO.

Response: We agree with your comment about the word "initial" in Attachment B, now a Procedure for the ERO to follow in supporting the standard, and have removed the word "initial" from the title to remove the confusion.

We believe that your assessments about the effects on CPS2, BAAL and CPS1 are uncertain because there are complex interactions between the Frequency Bias Setting and the ACE values in these measures that use a Frequency Bias Setting.

We agree that the words in Attachment B, now a Procedure for the ERO to follow in supporting the standard, stating "ensure there is no negative impact on other standards" is an overstatement at this point. We have added language to allow for analysis prior to implementing changes to the minimum Frequency Bias Setting. This is also why we have chosen to go slow with the concept of allowing the frequency bias setting to be reduced below 1% of Peak Load.

We agree with your support of taking more of the error out of the ACE equation by making the FBS closer to the estimated Frequency Response of the Balancing Authority; however, we do not agree that the effects of secondary control can be ignored when we make these changes. Therefore we are proposing a "go slow approach" to making this happen and included checks to confirm there are not unexpected influences injected into the CPS-related calculations.

Based on concerns raised by the industry, the drafting team has modified the Attachment B, now a Procedure for the ERO to follow in supporting the standard, to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

We support your comment related to the ERO working with the Industry to approve each subsequent revision to the minimum FBS. However, it is this drafting team's understanding that the language in the standard is limited to referencing the ERO and the ERO will develop a process to address the needs of the standard. Therefore, no modification has been made to require any specific coordination between the ERO and the Industry.

Organization	Yes or No	Question 8 Comment
Sacramento Municipal Utility District (SMUD)	No	In addition to the requirements, reducing frequency bias obligation results in generation tripping closer to the set point. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response.
Response: The SDT is unsure of what your first comment is attempting to say. Therefore the SDT cannot provide a response to your comment without further clarification. **The SDT believes that you may be mixing the Frequency Bias Setting and Frequency Response Measure. As proposed the FRO will be assigned based upon load and generation as defined in Attachment A. Therefore actual Frequency Response will be required to come from the Interconnection on that basis. To the extent an entity has an FRM greater than its Interconnection's minimum Frequency Bias Setting, its Frequency Bias Setting may grow as a percent of the Interconnection's total Frequency Bias Setting. However, that is not Frequency Response.**		
NV Energy	No	In Attachment B, it seems unclear whether the initial FB setting is supposed to be 1% of BA peak load or 0.8% as shown in the table. In general, I was extremely confused about what the required FB setting should be. R5 indicates a percentage of load found in Att B, but Att B indicates the greater of Natural Frequency Response or 1% of peak, and then the table that follows indicates 0.8%. At this point, I have no idea what is being stated for the requirement.
Response: The SDT agrees and has modified the attachment. **The SDT intended that generation-only BAs would base their settings on generation. Traditional BAs would use load. We have revised the table to agree with the proposed standard.**		
Progress Energy	No	PGN supports the collective comments of SERC members. We suggest the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1

Organization	Yes or No	Question 8 Comment
Response: The SDT agrees with your comments and has made corresponding modifications to the attachment by removing the word, "initial".		
Independent Electricity System Operator	No	Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement.
Response: Please refer to our response to Question #6.		
ISO/RTO Council Standards Review Committee	No	Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement. Process description should be regarded guideline document and not a part of the standard requirement.
Response: Please refer to our response to Question #6.		
Tucson Electric Power	No	Reducing a BAs frequency bias setting may have an adverse impact on recovering from a frequency event once you get past the first 8-10 seconds. A larger bias will allow for actual and sustained AGC generator responses. Industry focus should be on generator governor response within the first 8-10 seconds.
Response: The Standard Drafting Team disagrees with your comment. Full recovery is dependent upon the contingent BA recovering from its loss. However, we do agree that secondary frequency support from the non-contingent BAs may not be as robust.		
Northeast Power Coordinating Council	No	Refer to the first comment in Question 6.
Response: Please refer to our response to Question #6.		
Hydro-Quebec TransEnergie	No	The methodology proposed to compute the Minimum Frequency Bias Setting (in MW/0,1Hz) could be adverse for the Quebec Interconnection. Hydro-Quebec uses a

Organization	Yes or No	Question 8 Comment
		variable Bias that is calculated based upon which generator is online and it's droop setting. Under light load condition, we might have a Bias setting that would be under (in absolute value) than the FRM which is the median value, even though the Bias setting would reflect the grid's frequency response. This method, as proposed, would mandate us to have a larger Bias that what is really needed. Unlike Eastern Interconnection, we are not over biased. By implementing this new methodology, it would make us over biased. Having a too large Bias could lead to system instability, based on the results of studies from our control specialists. The Minimum Frequency Bias Setting should take into account the wide load span that we can face. For the variable bias, we could express the Minimum Frequency Bias Setting as a function of monthly peak loads, and remove the Natural Frequency Response term. In addition, there is a gap between Attachment B and the text in R5. See comment 10 for explanation.
Response: To ensure comparable treatment between BAs with fixed Bias Settings, BAs with a variable Bias Setting report their monthly average Bias for the reporting year. This average will be calculated when frequency is greater than 60.036 Hz or less than 59.964 Hz. The average of the 12 months' Bias values must be equal to or more negative than the Interconnection's minimum Bias Setting.		
Xcel Energy	No	There could be some confusion caused by the Attachment B due to the use of the word "initially" when the reference is made to the current standard. The drafting team should change the word "initially" to "currently" or strike it to avoid the potential confusion.
Response: The SDT agrees with your comment and has modified the attachment to remove the word, "initially".		
Florida Power & Light Company	No	There is no technical justification provided either in the attachment or background data for the initial starting value of 0.8%. This is acceptable but is arbitary. Additionally, the last sentense on page 1 of Attachment B should be changed to read " the ERO must reduce (in absolute value) the minimum Frequency Bias Settings for BA's within that Interconnection, by 0.1 percentage point from its previous annual

Organization	Yes or No	Question 8 Comment
		value, to better match the Frequency Bias Setting to the natural Frequency Response or provide technical justification for not implementing the reduction
Response: You are correct, the starting value is arbitrary. The SDT did not want to make a one step change to immediately reduce the minimum Frequency Bias Setting to natural Frequency Response. The SDT believes that a multi-year multi-step process would be better and allows for monitoring the effects on other performance standards. **The SDT believes that the end result would be the same. The present wording allows for collaboration between the ERO and other entities/groups. The SDT is also concerned with putting a requirement on the ERO within an Attachment when there is not a reliability problem if it were not to happen.**		
SERC OC Standards Review Group	No	We suggest the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1
Response: The SDT agrees with your comment and has modified the attachment by removing the word, "initial".		
South Carolina Electric and Gas	No	We suggest the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1
Response: The SDT agrees with your comment and has modified the attachment by removing the word, "initial".		
ISO New England Inc	No	We suggest the SDT to first determine if the materials in the revised Attachment A & B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the

Organization	Yes or No	Question 8 Comment
		proposed method. An appendix is not regarded as a mandatory requirement.
Response: The process is still being developed at NERC but an Attachment would document processes to be utilized without a measurement saying that you failed the standard.		
Southern Company	No	We suggest using the words, 'Proposed Frequency Bias Setting' in the Title of Table 1 instead of the word, 'Initial'.
Response: The SDT agrees with your comment and has modified the attachment by removing the word, "initial".		
ERCOT	No	While there is no problem with the calculation involved, it is unclear why the SDT elected to assign a grid performance element in this standard to the ERO, who has no functional (registered) role in grid performance. Since this is a cook-book calculation and transfer of data on frequency performance, why not assign it to the BA?
Response: The Attachment B, now a Procedure for the ERO to follow in supporting the standard, only outlines a process that the ERO is to use when adjusting the minimum Frequency Bias Setting. The Procedure does not place any grid performance requirement on the ERO. The SDT also believes that some authority should have oversight over the minimum setting to prevent abuses and assure fairness.		
Seattle City Light	Yes	o LADWP and SCL note that Attachment B seems to be reasonable.
Response: The SDT thanks you for your affirmative response and clarifying comment.		
Energy Mark, Inc.	Yes	Comment 15: This Yes answer assumes that the SDT addresses Comment 13 under Question 6 in these comments.
Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT addressed your Comment #13 under Question #6.		
Ameren	Yes	Considering the comments made regarding R5, in question 2, above, which are:

Organization	Yes or No	Question 8 Comment
		R5. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
Response: The SDT thanks you for your affirmative response and clarifying comment. However, the SDT disagrees with your comment. Since L_{10} is the function of individual Frequency Bias Settings to the sum of all BA Frequency Bias Settings within an Interconnection and establishes operating boundaries, it would be inappropriate to leave L_{10} as is when a Frequency Bias Setting changes.		
Los Angeles Department of Water and Power	Yes	LADWP notes that Attachment B seems to be reasonable
Response: The SDT thanks you for your affirmative response and clarifying comment.		
FPL	Yes	Last paragraph: As stated, would that make the Minimum Frequency Bias Setting 0.7% of peak load or generation? A numerical example shown would help clarify this paragraph.
Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT has added an example to the Background Document.		
Southwest Power Pool Regional Entity	Yes	Need to clarify that 2012 Bias setting will be based on 1% of peak load or generation until approval of BAL-003-1 by FERC establishing the .08% of peak load or generation minimum threshold.
Response: We agree and we have endeavored to do so. The SDT does point out that the proposed minimum for the first year once approved by FERC is 0.9% not 0.08%.		
Associated Electric	Yes	This is a very important document, providing bounds and rationale for and future

Organization	Yes or No	Question 8 Comment
Cooperative Inc		changes, as well as initial settings going into ballot. As such, it is AECI's understanding that, upon going into effect, this BAL-003-1 will utilize these initial settings.
Response: The SDT thanks you for your affirmative response and clarifying comment.		
Imperial Irrigation District	Yes

FMPP	Yes	
American Electric Power	Yes	
Cleco Corporation	Yes	
Manitoba Hydro	Yes	
Great River Energy	Yes	
Keen Resources Asia Ltd.	Yes	

9. The SDT has provided an additional spreadsheet, FRS Form 2, to assist the Balancing Authority in providing the data needed to comply with the proposed standard. Do you agree that this spreadsheet is useful and the instructions are meaningful? If not, please explain in the comment area.

Summary Consideration: Many of the commenters expressed concern with the fact that the Excel Spreadsheets that were required to be used were in a newer version of Excel than their company was presently using. In response, the SDT developed Excel Spreadsheets that are compatible with earlier versions of Excel.

A couple of commenters expressed concern that the Excel Spreadsheets did not contain all of the information necessary to comply with the analysis required (timing of the event (hour, minute, second). Form 1 contains the time of the event including the hour, minute and second for t(0) and a graph of frequency data for each event in the list. The time for each BA's t(0) may vary from this time due to different sample rates of data and physical proximity to the contingency. Since this standard does not identify an "A Point" or "B Point" but calculates an "A Value" and "B Value", providing an exact time for these provides little value. T(0) is the focus of the measurement process and is the first observed change in frequency of the event. Also added to Form 1, the BA can enter the time zone of its data and the time of t(0) will be converted to the correct time in that zone. We agree that the proper selection of t(0) is important. This can be viewed on the "Graph 20 to 52s" worksheet. When set correctly, the first change in frequency of the event will be exactly in the center of the graph on the vertical grid line.

Some commenters felt that it would be useful if the SDT could develop a completed form as an example to help entities better understand the methodologies used in the form. Form 2 contains actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis.

A couple of commenters question the meaning of "master event list" in FRS Form 2. The "Master event list" refers to the event list contained in each Interconnection's Form 1.

Organization	Yes or No	Question 9 Comment
Seattle City Light	Negative	Answer: No Comments: o LADWP and SCL note that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)- and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.

Organization	Yes or No	Question 9 Comment
Response: Excel 2003 versions of all forms have been developed.		
Seattle City Light	No	o LADWP and SCL note that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)-and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
Response: Excel 2003 versions of all forms have been developed.		
Associated Electric Cooperative Inc	No	AECI believes the SDT could spare our industry both confusion and inconsistency, by specifying that identified Interconnection Disturbances include both Point A and Point B to the hour, minute, and second. While this introduces some risk of Entities over-automating their data-reports, the benefits for Eastern Interconnection respondents would be tremendous. Cautions and disclaimers should be placed on both Form 1 and Form 2, to assure respondents manually inspect their frequency data and pinpoint the specific inflection-point samples.
Response: Form 1 contains the time of the event including the hour, minute and second for t(0) and a graph of frequency data for each event in the list. The time for each BA's t(0) may vary from this time due to different sample rates of data and physical proximity to the contingency. Since this standard does not identify an "A Point" or "B Point" but calculates an "A Value" and "B Value", providing an exact time for these provides little value. T(0) is the focus of the measurement process and is the first observed change in frequency of the event. Also added to Form 1, the BA can enter the time zone of its data and the time of t(0) will be converted to the correct time in that zone. We agree that the proper selection of t(0) is important. This can be viewed on the "Graph 20 to 52s" worksheet. When set correctly, the first change in frequency of the event will be exactly in the center of the graph on the vertical grid line.		
Bonneville Power Administration	No	BPA believes the form is not easily understood and is overly complicated for what it is trying to accomplish. BPA believes the form might work for an internal evaluation, just not for an external audit. Compliance is based on this form. BPA believes the standard needs to be simplified and possibly returned to a data gathering standard.

Organization	Yes or No	Question 9 Comment
Response: The addition of "Adjustments" to the analysis did add complexity to the Form. These were added based on comments received from the industry on previous postings. Some of these "Adjustments" may be removed as the field trial progresses if they are not utilized. In the latest Form 2, version 6, the multiple time period averages were removed since the final average period was selected based on the results of the first round of the field trial evaluated last fall. However, Form 2 is important to the standard in that it achieves the requirement of measuring frequency response in the same manner for all Interconnections. Returning Form 2 with Form 1 allows validation of the selection of t(0) which is critical for this requirement. **The SDT does not believe that it can revert back to a "data gathering" standard. The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012.**		
FPL	No	FRS Form 2 - Two-second Sample DataInstructions tab/worksheet: What is referred to as or meant by the 'master event list'? 4. - Regarding 2 second sample rate for 25 minutes starting 2 minutes before event begins and 15 minutes after it begins, does this add up to 25 minutes or are additional minutes being required for collection? Also, FPL can report frequency at this rate, but can only report load in MW every four seconds. Move to 4 second sample rate.6-8. - Possible to add button to auto-populate cells C8 and C11 in 'Entry Data' tab from the new column C and cell identifying the desired frequency change time and simplify these steps? 10. - Clarify where the "Copy" button is. Is it the one in the 'Data' tab or worksheet? Entry Data tab/worksheet:Step 6 should also be or be moved to the "Instructions" worksheet.Are the values in column C in the "Data" worksheet labeled "Total Lost Generation" the same as those in column AQ in the "Evaluation" worksheet? If so, why are they not both labeled "Net Actual Interchange"? What is the definition of "Non Conforming Load" in column E?
Response: "Master event list" refers to the event list contained in each Interconnection's Form 1.		

Organization	Yes or No	Question 9 Comment
		The inconsistency in the data sample totals has been corrected. The absolute minimum amount of data required for the full analysis is two minutes before the beginning of the event to 15 minutes after the beginning of the event. The calculation rate of "Load" can be at a different rate than the AGC scan rate. The Load data is not used in measuring performance. The variability of Load can impact measured performance and can be observed on the "BA Load Dampening" worksheet graph. On some Interconnections, load dampening can be observed in the data. Using the historian "data sample" collection option, it will fill the spreadsheet with the same value of Load, changing at the calculation rate. **The "auto populate" of cells C8 and C11 is a good idea. A couple BAs did this during the first phase of the field trail. The problem is that the event time of t(0) in column C was set using 2 second scan data in one part of the Interconnection and the beginning of the event may be shifted one or two scans when frequency is scanned less often. This would make this automation difficult for the value in C8. It is critical for the measure for t(0) be set correctly. The value of C11 is less critical and is not used in the initial primary Frequency Response Measure. It is only used to demonstrate delivery of primary frequency response during the frequency recovery period.** **The location of the "Copy" button has been clarified.** **Step 6 on the "Data Entry" worksheet was added to the "Instructions" worksheet. The value in column C in the "Data" worksheet labeled "Total Lost Generation" is for single BA Interconnections only. It takes the place of "Net Actual Interchange" for multiple BA Interconnections. Column "AO" on the "Evaluation" worksheet is not the same as the "Contingent BA Lost Generation" data on the "Evaluation" worksheet. The "Contingent BA Lost Generation" data is only used by multiple BA Interconnection BAs not Single BA Interconnections. The "Data" worksheet for the "Single BA Interconnection" Forms has an n/a in columns G, H and I and should not be used by BAs in these Interconnections. This is noted on their "Instructions" worksheet. This should explain why they are not labeled the same.** **Non-conforming Load is Load that changes abnormally different than the conventional diurnal load pattern of a Balancing Authority Area. Non-conforming Load becomes significant when the net change within a few minutes is greater than a BA's L_{10} limit. The importance here is that this Load change can be ten times larger than some BAs' FRO and makes measuring the SEFRD inaccurate. An example of non-conforming load would be an arc furnace of a significant size.** **Thank you for your comments and the effort to find each of these items.**
ISO/RTO Council Standards Review Committee	No	If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question in

Organization	Yes or No	Question 9 Comment
		the Comment Form asking whether the additional information should be requested. We believe this is a significant change to the standard and many commenters may have missed the opportunity to comment on it. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not see how adding a Form 2 can help in that regard. We suggest the SDT to keep data requirements to only what is minimally needed to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection. Where the SDT deems the additional data sheet or information not necessary to support FRS reporting, then we suggest the SDT to hide those pages not required for the standard so as to avoid confusion, and/or to remove those analytical pages not directly used in the standard.
Response: The SDT points out that there are no additional data requirements. It is possible that you are seeing more spreadsheets due to them being unhidden. **Form 2 is a separate stand-alone workbook. Form 1 does have a worksheet labeled "BA Form 2 Event Data" that will contain the single event data from each of the BA's Form 2s. Two additional worksheets were added to Form 1 and several worksheets were deleted. The "Time Zone Ref" worksheet was added to allow the ability of the BA to enter the time zone of its data and the spreadsheet will calculate the local time of the event from the UTC time. This was added for the convenience of the BA in collecting the correct data for each event and does not require additional data from the BA. The second worksheet added was a worksheet that displays graphs of frequency for each event and the t(0) selected correctly. This was added to aid the BA with data collection and the selection of t(0) since this seemed to be one of the biggest problems during the first phase of the field trial. This graph worksheet does not require the BA to do anything. It is not used in the analysis and can be deleted. Deleting this worksheet will greatly reduce the size of Form 1. None of the data requirements on Form 1 or Form 2 have changed from previous**		

Organization	Yes or No	Question 9 Comment
versions. The absolute minimum data needed for this standard is the date/time, frequency and NAI in columns A, B and C of the "Data" worksheet in Form 2. Columns D through I have been totally optional and can be left blank. Column J is the Bias setting in the ACE equation and is important to BAs that utilize variable Bias. Column K, BA Load, was added by the drafting team in the beginning to see if Load Dampening could be measured as this has been done for several years on one Interconnection. Column I of the "Data" worksheet is the only optional data that the BA should use when it is the contingent BA during any of the events evaluated. Utilizing this data will allow the BA's SEFRD to be calculated correctly and give the BA a full sample set for the annual median calculation. Form 2 is necessary to standardize the measurement process on all Interconnections. You are free to hide any analytical worksheets on Form 1 and Form 2. You can do this on your "master" Form 2 and then build each Form 2 for each event using this master. These additional worksheets are available for BAs to utilize if they find that their performance is below the FRO and will aid the analysis of the contributing causes.		
Independent Electricity System Operator	No	If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question on the additional information requested. We have a concern over this omission of attention or oversight. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not see how adding a Form 2 can help in that regard. We suggest the SDT to look at the basic need for data submission that would suffice to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection.
Response: The SDT points out that there are no additional data requirements. It is possible that you are seeing more spreadsheets due to them being unhidden.		

Organization	Yes or No	Question 9 Comment
Form 2 is a separate stand-alone workbook. Form 1 does have a worksheet labeled "BA Form 2 Event Data" that will contain the single event data from each of the BA's Form 2s. Two additional worksheets were added to Form 1 and several worksheets were deleted. The "Time Zone Ref" worksheet was added to allow the ability of the BA to enter the time zone of its data and the spreadsheet will calculate the local time of the event from the UTC time. This was added for the convenience of the BA in collecting the correct data for each event and does not require additional data from the BA. The second worksheet added was a worksheet that displays graphs of frequency for each event and the t(0) selected correctly. This was added to aid the BA with data collection and the selection of t(0) since this seemed to be one of the biggest problems during the first phase of the field trial. This graph worksheet does not require the BA to do anything. It is not used in the analysis and can be deleted. Deleting this worksheet will greatly reduce the size of Form 1. None of the data requirements on Form 1 or Form 2 have changed from previous versions. Los Angeles Department of Water and Power	No	LADWP notes that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)-and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
Response: Excel 2003 versions of all forms have been developed.		
Tucson Electric Power	No	TEP feels that Form 2 is a useful tool for internal BA use and should not be used for compliance purposes.
Response: Form 2 is not intended to be used to reflect compliance but rather for consistency in reporting.		

Organization	Yes or No	Question 9 Comment
Form 2 was developed so consistent analysis of each event could be validated. During the first round of the field trial, many BAs selected the incorrect t(0), some provided data that was filtered or utilized data compression techniques that caused the analysis to be incorrect. With Form 2, the selection of t(0) can be quickly evaluated and data quality reviewed. The proper selection of t(0) can be made and Form 1 corrected providing validated consistent results.		
MRO NSRF	Yes	: It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form
Response: All versions of Form 2 contain actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis.		
Xcel Energy	Yes	It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form.
Response: All versions of Form 2 contain actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis.		
Ameren	Yes	We agree that the spreadsheet is meaningful, but still needs to be vetted through the field trial process, with improvements made based on experience in its use.
Response: We completely agree.

10. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard BAL-003-1.

Summary Consideration: Many of the commenters referenced other questions in the comments. The SDT asked them to review the response to those earlier questions rather than repeating the responses here.

Several commenters pointed out that there was a discrepancy between the Background Document and Attachment A regarding the calculation of the BA FRO. The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.

Several other commenters indicated that Supplemental Regulation Service was not an appropriate method to provide Frequency Response. The SDT agrees that it is inappropriate to expect supplementary regulation to transfer Frequency Response successfully, however the SDT did not want to prevent any innovative solution that will transfer Frequency Response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging Supplementary Regulation via a pseudo-tie have to be consistent in the removal or inclusion of Supplementary Regulation in their actual net interchange measurement as well as in all events across the measurement period.

Many commenters were concerned that the BA could be responsible for supplying an infinite amount of Frequency Response. They indicated that a BA could not prepare for this in its planning process. The SDT agrees that the proposed standard was not clear on this subject and added language in the "Criteria for Selection of Events" section of the revised Attachment A to limit the amount of Frequency Response a BA would be required to provide in order to be compliant with the standard.

Some commenters were concerned with the wording in Requirement R5. They indicated that the wording needed to say "greater than or" instead of "at least". The SDT removed the requirement and combined it with the revised Requirement R2 and the new Requirement R3. The SDT has modified the requirement and believes we have implemented the intent of your suggestion.

Many commenters did not agree with requiring the BA to provide Frequency Response. The NERC Functional Model and FERC both cited the BA as the responsible entity for providing Frequency Response. T There are several different methods available to the BA to provide Frequency Response and the SDT has included these in the Background Document.

Some commenters were concerned with the threshold that the SDT recommended for the Eastern Interconnection. Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere **in** the East. This is the reason for the higher first step of UFLS in Florida. Having all Eastern Interconnection Balancing Authorities carry extra frequency responsive reserves to protect against a target minimum frequency of 59.7 Hz would not protect Florida against a contingency inside Florida, but would require the other BAs in the Eastern Interconnection to continuously carry about 4,000 MW of frequency

responsive reserves to protect against a false trip in Florida if frequency fell below 59.7 Hz but over 59.5 Hz. This is a contingency on the order of 7,000 MW or more. The drafting team compromised and gave the entire Interconnection an obligation based on 59.96Hz.

A few commented did not agree with lowering the minimum Frequency Bias Setting. Early research by Nathan Cohn on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased. The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

Some commenters had concerns about the use of the RSG as a means to provide Frequency Response, and the SDT modified the Background Document to further explain how an RSG (now FRSG) could supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

A couple of commenters indicated that the median was not the proper method to use for the calculation of the FRM. Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. While the median is not perfect, the median approaches a BA's typical performance after 15-20 observations and more observations give a higher confidence in the estimate of the BA's performance.

Organization	Yes or No	Question 10 Comment
MRO NSRF	Negative	It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they

Organization	Yes or No	Question 10 Comment
		can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities cannot know what is expected of them and therefore cannot plan appropriately. In the first paragraph of R5 delete "at least" and replace with "greater than or". This phrase would now read "…absolute value is greater than or equal to one of the following:" "Equal to or greater than" accurately identifies the expectation, the current phrasing will lead to confusion and mis-interpretation. Bullet #1 of R5: The minimum % is based upon the "estimated yearly Peak Demand". During the NERC webinar it was mentioned that this minimum would move to being based on historical reporting of Peak Demand. Where does the SDT stand on this item? Please provide clarification.
Response: The SDT agrees with you that there was not a clear statement as to the maximum amount of Frequency Response that a BA would have to provide. The SDT has added language in Attachment A that caps the amount of Frequency Response that a BA will be required to provide. **The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT has modified the requirement and believes we have implemented the intent of your suggestion.** **The SDT has corrected the reference so that both Attachment A and the Background Document agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.**

FirstEnergy Corp.; FirstEnergy Energy Delivery; FirstEnergy Solutions;Ohio Edison Company	Abstain	FirstEnergy appreciates the hard work of the drafting team but needs more time to review the standard with internal business units and with our RTO. Therefore at this time we must abstain.
Response: The SDT thanks you for your clarifying comment.		
	Abstain	As a qualified professional statistician I abstain from voting "affirmative" or "negative" on this standard because it violates two fundamental statistical best practices. 1. In the Standard, the definition of Frequency Response Measure (FRM) is statistically wrong. The median is an improper statistical measure of Frequency Response because --it truncates large excursions which are the specific subject of Frequency Response control, not normal operating frequency errors which are self-correcting and are the subject of CPM control; --it is non-linear; --it is non-summable over the interconnection; in other words, the individual BA medians don't add up to the interconnection median, in complete incompatibility with CPM control which requires summability of BA performances into the interconnection's performance. Moreover, it is mathematically impossible to sum the medians of the BAs in a Reserve Sharing Group (RSG) into the RSG's median: in other words, the RSG's median cannot represent the sum of the medians of its members. The last paragraph on page 5 of the Background Document is patently wrong, invented, and supported in no probability & statistics literature whatsoever. As a practicing statistician, I hereby give testimony to the utter falsehood of the statement that "In general, statisticisns use the median as the best measure of central tendency when a

Organization	Yes or No	Question 10 Comment
		population has outliers." (See http://www.robertblohm.com/BestStatistic.doc for an explanation of "best statistic" which is a highly technical and central topic in modern probability theory and statistics.) Also, "outliers" are falsely and rhetorically claimed to be "noise" when in fact they are the "events" that are the specific subject of Frequency Response. It is well known that they do not "fit" a normal distribution. They are distinct from the normal operating errors that are the subject of CPM control. The paragraph does correctly conclude that the linear regression more accurately incorporates outliers than the median does, although the paragraph uses rhetoric by calling this improvement "skew" as if it is distortionary when, in fact, the median distorts the reality. 2. The sample pre-selection described in Attachment A, Event Selection, Criteria 2 & 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria 2 & 7 to pre-select only certain events, and not others, in such a way that the selected events occur evenly throughout the year, is papently wrong because it is trying to "fit" events into a process (even distribution over time) that does not govern events, but that instead governs normal operating errors that are the subject of CPM control, not of this Frequency Response standard. In other words, criteria 2 & 7 confuse Frequency Response with CPM, and events with normal operating errors. The result is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on page 5 of the Background Document, on the other hand, provides a statistically correct description of event selection without sample pre-selection and should

Organization	Yes or No	Question 10 Comment
		followed instead of the erroneous criteria 2 & 7 in Attachment A. The reason I do not vote "negative": the risk-based approach to determining FRM, that the Background Document mentions in paragraph 4 of page 4 is being evaluated by the drafting team for application in this standard, should be considered for deployment as soon as possible to replace the administered method currently proposed in this standard, because the administered method lacks any technical justification. No such justification was ever attempted in the development of this standard. The administrative method of determining FRM is therefore but a highly dubious "quick fix" until the risk-based method is evaluated and implemented. The administrative method is in fact perverse because it discourages BAs from reducing their contribution to frequency error by refusing to reduce the BA's FRO accordingly, and because it encourages BAs to contribute to frequency error without increasing their FRO.

Response: The word “average” is a generic term to represent central tendency. The term is often used synonymously with the arithmetic “mean”.
The issue with measuring Frequency Response is that a BA’s calculated performance (as opposed to actual performance) is highly variable event to event. This is particularly true for a single BA in a multi-BA Interconnection.

Calculated Frequency Response has a very large noise to signal ratio. A 5,000 MW BA in the East typically is only called to contribute about 10-15 MW for the loss of a large unit. Its minute to minute Load changes can easily wash this contribution out. An arithmetic mean or regression analysis will be influenced by noise-induced outliers.

Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA’s Frequency Response.

A regression would be appropriate if you were trying to forecast “calculated” frequency response for a BA in a multi-BA Interconnection.

While not perfect, the median approaches a BA’s typical performance after 15-20 observations. More observations give a higher

Organization	Yes or No	Question 10 Comment
confidence in the estimate of the BA's performance.		
Associated Electric Cooperative, Inc.	Affirmative	Please see comments submitted by John Bussman of AECI. Thanks, Chris Bolick
Response: Please refer to our earlier question responses to Mr. Bussman's comments.		
Southwest Power Pool, Inc.	Negative	Please refer to the IRC Standards Review Committee comments which SPP is a party to for our concerns and recommendations for this standard.
Response: The SDT cannot find any comments submitted by the IRC Standards Review Committee.		
City Utilities of Springfield, Missouri	Affirmative	SPRM supports the comments from SPP.
Response: The SDT cannot find any comments submitted by the IRC Standards Review Committee.		
Oklahoma Gas and Electric Co.	Affirmative	See comments submitted by the Southwest Power Pool
Response: The SDT cannot find any comments submitted by the IRC Standards Review Committee.		
Electric Reliability Council of Texas, Inc.	Affirmative	The Applicability of BAL-003-1 should be clarified. Specifically, Section 1.2 should be changed from "Reserve Sharing Groups (where applicable)" to "Reserve Sharing Group whose intent includes meeting Frequency Response Obligations". Regarding Data Retention: 1. As the standard is currently drafted, both the BA and the RSG would be required to retain data or evidence to show compliance with requirements R1 and M1. It is unclear whether this is the intention, or whether it would be acceptable that just one or the other would maintain such records. 2. In the first and second paragraph, the reference to 'three calendar years' should be specified to be the 'previous three calendar years'. 3. In the third paragraph, it should be clarified who is required to keep

Organization	Yes or No	Question 10 Comment
		information related to non compliance if the BA belongs to an RSG – the BA or the RSG or both. 4. In the fourth paragraph, it should be clarified for what length of time the last audit records must be retained.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. **1 & 3 - The SDT believes that the reporting entity would be the responsible entity to maintain records. The SDT also believes that once a BA has declared itself as part of an FRSG then the FRSG would be the responsible entity with the obligation to maintain records.** **2 - The SDT agrees with your second comment and has made this modification.** **4 – The last audit record should be kept until the next audit.**		
Midwest ISO, Inc.	Affirmative	We would like to thank the drafting team for developing a standard responsive to the FERC Orders.
Response: The SDT thanks you for your affirmative response and clarifying comment.		
SCE&G	Affirmative	We feel that frequency response is a function of a contingency event and the Purpose Statement should recognize this relationship. We suggest the following insertion in the Purpose Statement. Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations (due to a contingency event) and supporting frequency until the frequency is restored. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Organization	Yes or No	Question 10 Comment
Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT believes that the Purpose Statement you are recommending is basically the same as what the SDT is proposing. For this reason the SDT has decided to propose their Purpose Statement for use in the proposed standard.		
SERC Reliability Corporation	Affirmative	Please see comments submitted by the SERC Operating Committee standards subgroup for technical suggestions to improve the standard.
Response: Please refer to the earlier question for the SDTs responses.		
Tennessee Valley Authority	Affirmative	Comments submitted by SERC OC Standards Review Group. TVA votes affirmative with comments previously submitted by SERC.
Response: Please refer to the earlier questions for the SDTs responses.		
Louisville Gas and Electric Co.	Negative	We support the comments in the SERC OC Standards Review Group Comments.
Response: Please refer to the earlier questions for the SDTs responses.		
AEP, AEP Marketing, AEP Service Corp.	Negative	AEP's negative ballot is primarily due to our concerns regarding R1. Comments are being submitted via electronic form by Thad Ness on behalf of American Electric Power.
Response: Please refer to our response for Question #1.		
Alberta Electric System Operator	Negative	Besides the standard, the posting has two attachments, supporting material and two forms. It is not clear how enforcement will be applied given the array of explicit and implicit requirements throughout this package, and the use of undefined terminology, which will be subject to interpretations. In the SDT response to our comments to the first draft of this standard it was stated that "The expectation is events will be selected by the Balancing Authorities. The Balancing Authority may exclude events from consideration for specific conditions

Organization	Yes or No	Question 10 Comment
		such as data quality issues. " Based on the SDT's response, it is our understanding that, for the purpose of the FRM calculation, BAs could exclude or include events based on specific conditions consideration, such as data quality or event suitability (e.g. BA separation from the Interconnection). However, the standard as currently drafted, does not have any provisions to this effect. Please include such provisions in the body of the standard.
Response: The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. **The SDT recognizes that data may not be available for specific events and therefore has provided in FRS Form 1 a means to exclude an event. Additionally if an entity has separated from an Interconnection this could be reason for excluding that event from its FRM calculation since the frequency it would be responding to would not be the Interconnection wide frequency. The risk caused by excluding events is that the measurement process has shown that a limited number of events does not provide suitable calculation.**		
Ameren Energy Marketing Co.; Ameren Services	Negative	We believe that this is good start to a worthwhile standard, but the following issues need to be addressed in this standard: (1) The FRM methodology has not been fully vetted through the field trial process. (2)Adjusting the minimum of the Frequency Bias Setting, while an appropriate adjustment for AGC control in the ACE equation, should not be at the expense of L10 as used in BAL-001, R2. (3) The absence of any resource specific frequency response requirement in NERC standards is an issue that must be address somewhere. As the resource portfolio of our industry changes(expedited by recent EPA rulemaking), the resources used for traditional primary frequency response are becoming a lower percentage of the mix. New resources and existing resources that have not provided primary frequency response need to be incorporated into the available frequency response discussion. (4) BAL-003 is only applicable for an interconnected system, conditions that are

Organization	Yes or No	Question 10 Comment
		created by islanding and other emergences are not address here(nor should they), but need to be address within the EOP family of standards, so that adequate primary frequency response is available during emergency situations.

Response: (1) – The issue with measuring Frequency Response is that a BA's calculated performance (as opposed to actual performance) is highly variable event to event. This is particularly true for a single BA in a multi-BA Interconnection.

Calculated Frequency Response has a very large noise to signal ratio. A 5,000 MW BA in the Eastern Interconnection typically is only called to contribute about 10-15 MW for the loss of a large unit. Its minute to minute Load changes can easily wash this contribution out. An arithmetic mean or regression analysis will be influenced by noise-induced outliers.

Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response.

A regression would be appropriate if you were trying to forecast "calculated" frequency response for a BA in a multi-BA Interconnection.

While not perfect, the median approaches a BA's typical performance after 15-20 observations. More observations give a higher confidence in the estimate of the BA's performance.

- The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

(2) - The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

Organization	Yes or No	Question 10 Comment
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient Frequency Response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **(3) – The SDT agrees that the issue you cite should not be covered in this standard. The SDT will forward this comment on to the appropriate entity at NERC.**		
PJM Interconnection, L.L.C.	Negative	PJM does not believe that the BA should be the entity responsible for the frequency response obligation, moreover the SDT has not sufficiently vetted the issue of applying the response requirements on an entity that cannot provide that service. PJM is concerned that the proposed draft does not explicitly cover the FERC Order 693 directives in the proposed requirements and rather addresses the directives indirectly in the attachments. This matter of mandatory vs. informational attachments must be formally clarified before approval can be given for this approach. PJM does not agree with the additional clarifying phrases being incorporated into the requirements. Explanatory phases should be included as text boxes as proposed in NERC's Risk Based Methodology.
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

Avista Corp.	Negative	This standard should be designed for each interconnection explicitly rather than one size fits all. Frequency is an interconnection issue and response is driven by the interconnection's topology. One size does not fit all for interconnections. This

Organization	Yes or No	Question 10 Comment
		standard should be designed around the explicit needs of each interconnection. Reducing frequency bias obligation is detrimental to reliability. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response.
Response: The SDT believes that an Interconnection has the capability to request a variance (especially one that is more restrictive), however the SDT has tried to prevent the need for variances by respecting the individuality of each of the Interconnections in setting Interconnection Frequency Excursion Threshold Values, Interconnection Frequency Response Obligations and the Frequency Bias Setting Minimums as noted in Attachment A. **Early research by Nathan Cohn[5] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.** **The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. Beaches Energy Services; City of Bartow, Florida; Tampa Electric Co.	Negative	We thank the SDT for their hard work and diligence in moving this Project forward. However, I have some concerns that cause me to not support the standard in its current form. In general, I believe that there has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. I also believe that the proposed standard does not meet the intent of the Final SAR

[5] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 10 Comment
		or Supplemental SAR. The "Final SAR" was to develop methods by which a performance based standard would eventually be developed. The Final SAR states: "The proposed standard's intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once the reasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters." BAL-003-1 is beyond the scope of this "Final SAR". For instance, "the reasons for the decline in Frequency Response" were not confirmed to our knowledge; and the field trial is not completed to our knowledge. The Supplemental SAR adds to the scope of the Final SAR: "To provide a minimum Frequency Response Obligation for the Balancing Authority to achieve, methods to obtain Frequency Response and provide a consistent method for calculating the Frequency Bias Setting for a Balancing Authority. In addition, the standard will specify the optimal periodicity of Frequency Response surveys." Please note that the Standards Development Roadmap does not confirm whether this Supplemental SAR was ever approved; hence, I question whether this is actually part of the scope of the SDT. Be that as it may, the Supplemental SAR does not eliminate the pre-requisite contained in the Final SAR to determine the reasons for the decline in frequency response and confirm them before establishing "defined reliability parameters". In addition, the standard does not meet the scope requirements of the Supplemental SAR.
Response: The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012. **The SDT agrees that the original SAR was strictly for data collection. However, a supplemental SAR was developed to address the FERC March 18, 2010 Order and was subsequently approved by the industry.**		

Organization	Yes or No	Question 10 Comment
Constellation Energy Commodities Group	Negative	Please see submitted comments for additional detail behind the negative vote.
Response: Please see the SDT responses to your comments to the earlier questions.		
Energy Mark, Inc.	Negative	The issue of Median, Mean, Regression needs to be resolved using Field Trial data. This should be able to be completed before the end of January 2012. The FRO and Minimum Bias Setting allocations should be determined using a single allocation method and a single data set. Wording changes are needed in the Requirements to indicate compliance in all cases for all BAs. In general, although this standard has many weaknesses, its implementation with small modifications will be better than failure to implement it.
Response: The drafting team is recommending use of the median for the purposes of determining a BA FRM over multiple events. This decision is based on the determination that, while it may not be perfect, it is better than the other alternatives available at this time. The drafting team recognizes that in the future a better methodology might be found; based on the data available at this time the median allows us to move forward to implement a response requirement. **The drafting team understands your concern of using the historical numbers for the FRO allocation and the projected number as the basis for the minimum Frequency Bias Setting. However, after discussions, the drafting team believes that at this time, minimizing the changes to the current Frequency Bias Setting process provides better comparability for the purpose of evaluating the impacts of reducing the minimum setting requirement. In the alternative, the drafting team feels that allocating the FRM based on historical data provides less room to game the process since the numbers used for allocation can be verified independently.** **The SDT has modified the requirements and believes that your concern has now been addressed.** **The SDT thanks you for your comment.**		
Energy Mark, Inc.	Negative	The Time Horizon for R1 is Operations Assesment. It should be Real Time. Frequency

Organization	Yes or No	Question 10 Comment
		Response is a service that is automatic. It does not require operator action to activate the service. It requires that the operator set-up the system to provide the automatic response before an event requiring Frequency Response occurs. Unlike other Real Time services, if the operator fails to set-up the system to provide this service before Real Time, there is no action that the operator can take to provide the service in response to an event. Many other actions in the standards required by the system operator are considered to be Real Time because the operator can take action after an event occurs. It does not make sense to consider an action that must be taken before Real Time as Operations Assessment.
Response: The requirement does not fall into a single category. The operator is constantly taking actions some of which were set in a "longer term" horizon, some in a "real-time" horizon and this is an after-the-fact measure.		
Fort Pierce Utilities Authority	Negative	FPUA supports the comments submitted by Florida Municpal Power Agency (FMPA) through the formal comment process.
Response: Please refer to the SDT response to the comments received from FMPA in the earlier questions.		
Hydro One Networks, Inc.	Negative	Hydro One is casting a negative vote for this project. We support and subscribe to the comments submitted by NPCC on behalf of its members. In summary, the comments are: 1 o Use of 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz. 2 o Use of installed capacity in determining the Frequency Response Obligation. 3 o The sampling interval should be tuned on a per Interconnection basis to support HQTE's characteristics. 4 o NPCC does not advocate the use of supplemental regulation as a method of procuring frequency response. 5 o BAL-003-1 is applicable only to Balancing Authorities and Reserve Sharing

Organization	Yes or No	Question 10 Comment
		Groups. A common concern that has been expressed in the industry is that the burden of compliance is being placed solely on Balancing Authorities while the main sources of discretional frequency response are generators. 6 o Balancing Authorities must be able to provide sufficient frequency response and be able to and the proper frequency bias settings applied in their AGC systems are necessary. 7 o In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Is there a clear and consistent definition for installed capacity? Considering the growth of wind energy development, the delivered energy from wind generation over longer time horizons will be substantially less than the machine nameplate ratings. 8 o The background document refers to the use of peak generation instead of installed capacity. Which shall be used? o Additional minor issues for the SDT consideration that should be addressed: ? A link should be provided in the standard to FRS Form 1, or instructions provided for how entities may find the form. ? In the definitions, FRS should be spelled out before using the acronym.
Response: 1 - Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere in the East. This is the reason for its higher first step of UFLS in Florida. Having all Eastern Interconnection Balancing Authorities carry extra frequency responsive reserves to protect against a target minimum frequency of 59.7 Hz would not protect Florida against a contingency inside Florida, but would require the other BAs in the Eastern Interconnection to continuously carry about 4,000 MW of frequency responsive reserves to protect against a false trip in Florida if frequency fell below 59.7 Hz but over 59.5 Hz. This is a contingency on the order of 7,000 MW or more. The drafting team compromised and gave the entire Interconnection an obligation based on 59.96Hz. **2, 7 & 8 – The SDT has modified both the Background Document and Attachment A to be consistent. The calculation uses "historical data" to circumvent the problem you have described.**		

Organization	Yes or No	Question 10 Comment
3 – The SDT adjusted the event selection Criteria to address concerns related to response driving frequency back to the pre-event level during the B value measurement period. We believe that this adjustment addresses your concern. 4 – The SDT has a section in the Background Document addressing methods of obtaining Frequency Response. The drafting team believes the following are valid methods of obtaining Frequency Response: • Regulation services. • Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration. • Through a tariff (e.g. Frequency Response and regulation service). • From generators through an interconnection agreement. • Contract with an internal resource or Loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response). Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation. 5 – The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not		

Organization	Yes or No	Question 10 Comment
outweigh the effort and cost. **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **6 – The SDT agrees with you comment.** **Additional minor issues** **The Forms will be put on a NERC website and announced once the standard is approved.** **The definition no longer reference FRS Form 1.**		
Independent Electricity System Operator	Negative	The complete IESO's comments on the revised standard are provided through the electronic comment form. The summary below highlights IESO's major concerns with the revised standard: 1)The definition for Frequency Response Measure (FRM): The proposed FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an attachment to the standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/maintenance problem without any appreciable value. (See complete comment in Section Q1 in the electronic comment form) 2)Attachment A: Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on page 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. (See complete comment in Section Q6 in the electronic

Organization	Yes or No	Question 10 Comment
		comment form) 3)The expanded FRS Form 1 and the addition of a Form 2 ask for data entry that is excessive and whose value has not been demonstrated. (See complete comment in Section Q9 in the electronic comment form)

Response: 1) The SDT has modified the definition to no longer reference FRS Form 1. The definition now reads "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz."

2) The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that indicated requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry.

3) The SDT points out that there are no additional data requirements. It is possible that you are seeing more spreadsheets due to them being unhidden.

Form 2 is a separate stand-alone workbook. Form 1 does have a worksheet labeled "BA Form 2 Event Data" that will contain the single event data from each of the BA's Form 2s. Two additional worksheets were added to Form 1 and several worksheets were deleted. The "Time Zone Ref" worksheet was added to allow the BA to enter the time zone of its data and have the spreadsheet calculate the local time of the event from the UTC time. This was added for the convenience of the BA in collecting the correct data for each event and does not require additional data from the BA. The second worksheet added was a worksheet that displays graphs of frequency for each event and the t(0) selected correctly. This was added to aid the BA with data collection and the selection of t(0) since this seemed to be one of the biggest problems during the first phase of the field trial. This graph worksheet does not require the BA to do anything. It is not used in the analysis and can be deleted. Deleting this worksheet will greatly reduce the size of Form 1. None of the data requirements on Form 1 or Form 2 have changed from previous versions. The absolute minimum data needed for this standard is the date/time, frequency and NAI in columns A, B and C of the "Data" worksheet in Form 2. Columns D through I have been totally optional and can be left blank. Column J is the Bias setting in the ACE equation and is important to BA's that utilize Variable Bias. Column K, BA Load, was added by the drafting team in the beginning to see if Load Dampening could be measured as this has been done for several years on one Interconnection. Column I of the

Organization	Yes or No	Question 10 Comment
"Data" worksheet is the only optional data that the BA should use when it is the contingent BA during any of the events evaluated. Utilizing this data will allow the BA's SEFRD to be calculated correctly and give the BA a full sample set for the annual median calculation. Form 2 is necessary to standardize the measurement process on all Interconnections. You are free to hide any analytical worksheets on Form 1 and Form 2. You can do this on your "master" Form 2 and then build each Form 2 for each event using this master. These additional worksheets are available for BAs to utilize if they find that their performance is below the FRO and will aid the analysis of the contributing causes.		
ISO New England, Inc.	Negative	ISO New England will not vote to approve the standard because it fails to place requirements on generators to provide frequency response. There are four substantive problems: 1 • Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz 2 • Using installed capacity in determining the Frequency Response Obligation 3 • The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics 4 • Do not advocate the use of supplemental regulation as a method of procuring frequency response Additionally, the SDT must decide on what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the point of defining how often to run Frequency Response Surveys; it does not crisply define the "Interconnection" obligations. If the SDT does want to focus on performance then the issue of who is the default provider must be addressed. As the IRC has noted previously, all BAs do not own the service providers. To create standards that apply to entities that are dependent on other function entities to comply with a standard requirement is of great concern.
Response: 1 - Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere in the East. This is the reason for their higher first step of UFLS in Florida. Having all Eastern Interconnection Balancing Authorities carry extra frequency responsive reserves to protect against a target minimum frequency of 59.7 Hz would not protect Florida against a

		contingency inside Florida, but would require the other BAs in the East to continuously carry about 4000 MW of frequency responsive reserves to protect against a false trip in Florida if frequency fell below 59.7 Hz but over 59.5 Hz. This is a contingency on the order of 7,000 MW or more. The drafting team compromised and gave the entire Interconnection an obligation based on 59.96Hz. 2 – The SDT has modified both the Background Document and Attachment A to be consistent. The calculation uses "historical data" to circumvent the problem you have described. 3 – The SDT adjusted the event selection Criteria to address concerns related to response driving frequency back to the pre-event level during the B value measurement period. We believe that this adjustment addresses your concern. 4 – The SDT has a section in the Background Document addressing methods of obtaining Frequency Response. The drafting team believes the following are valid methods of obtaining Frequency Response: • Regulation services. • Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration. • Through a tariff (e.g. Frequency Response and regulation service). • From generators through an interconnection agreement. • Contract with an internal resource or Loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response). Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation. The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

Organization	Yes or No	Question 10 Comment
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.** **6 – The SDT agrees with you comment.** **Additional minor issues** **The Forms will be put on a NERC website and announced once the standard is approved.** **The definition no longer reference FRS Form 1.**		
JEA	Negative	JEA is not comfortable with a performance based standard as written without more field testing to ensure that net interchange is not skewed by load and generation changes that are not a function of frequency. Since frequency response has components from load and generation resources, and load is not controllable for the most part, seems this standard should be directed at specific generator response methods from the GO/GOP's. This is a wide reaching standard. And, this is a performance standard (if it doesn't perform as designed, it is a violation). Because of this, more testing needs to be completed so we know the model is correct. We are not sure we know how to ensure compliance. Don't agree the standard needs to be performance based.
Response: Based on the studies performed by the SDT, the drafting team believes that a calculation of the median of multiple		

Organization	Yes or No	Question 10 Comment
events addresses the concerns raised by the noise being inside a single event. The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. **The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012.**		
Kansas City Power & Light Co.	Negative	The proposed Standard BAL-003-1 does not consider the real time operating conditions under which this standard should apply. There are no considerations for the complexities introduced by capacity energy agreements between BA's nor consideration of the differing level of Interconnection Frequency Response needed at times of minimum interconnection load conditions and interconnection peak load conditions.
Response: The method for determining the FRO is based upon the determination of the largest contingency that could occur at any time and does not vary based upon time of day or system conditions. Since the largest contingency could occur at any time, the minimum Frequency Response Obligation necessary to manage the contingency will not be dependent upon the differing conditions that can occur during different times of the day like those referred to in the question.		
Lakeland Electric	Negative	In general; here has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. Refer to comments submitted by FMPA on LAK behalf.
Response: The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012. **Please refer to the SDT response to the comments received from FMPA in the earlier questions.**		
Liberty Electric Power LLC	Negative	Voting no due to SDT addressing FERC directives with attachments instead of in the standard requirements.
Response: The SDT disagrees with your concern about addressing FERC directives within an attachment. If a requirement		

Organization	Yes or No	Question 10 Comment
references specific performance in an Attachment, then the performance described in the Attachment is mandatory and enforceable.		
Manitoba Hydro	Negative	The Applicability of BAL-003-1 should be clarified. Specifically, Section 1.2 should be changed from "Reserve Sharing Groups (where applicable)" to "Reserve Sharing Group whose intent includes meeting Frequency Response Obligations". Regarding Data Retention: 1. As the standard is currently drafted, both the BA and the RSG would be required to retain data or evidence to show compliance with requirements R1 and M1. It is unclear whether this is the intention, or whether it would be acceptable that just one or the other would maintain such records. 2. In the first and second paragraph, the reference to 'three calendar years' should be specified to be the 'previous three calendar years'. 3. In the third paragraph, it should be clarified who is required to keep information related to non compliance if the BA belongs to an RSG – the BA or the RSG or both. 4. In the fourth paragraph, it should be clarified for what length of time the last audit records must be retained.
Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. **1 & 3 - The SDT believes that the reporting entity would be the responsible entity to maintain records. The SDT also believes that once a BA has declared themselves as part of a FRSG then the FRSG would be the responsible entity to maintain records.** **2 - The SDT agrees with your second comment and has made this modification.** **4 – The last audit record should be kept until the next audit.**		

Organization	Yes or No	Question 10 Comment
New Brunswick Power Transmission Corporation	Negative	The compliance burden should not fall on the BA as the provider of Frequency Response (i.e. Primary Control response). In this case the BA per se has no assets, moreover the primary response service providers have no obligations to provide the service, thus the BA potentially could face a situation where there is no physical service to be purchased but there is a mandated standard to comply with. The idea of creating a Primary Response Market as some have proposed does not work without an obligation on some entity to physically provide that service.
Response: The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.**		
New York State Department of Public Service, National Association of Regulatory Utility Commissioners	Negative	After review of the standard and draft comments to be submitted by industry participants, it appears that there are many areas of the proposed standard that require clarification.
Response: The SDT thanks you for your participation. Please be more specific about what needs clarification so the SDT can address your specific concerns.		

Organization	Yes or No	Question 10 Comment
Northeast Power Coordinating Council	Negative	This standard as written does not place requirements on generators to provide frequency response. There are four substantive problems: 1 • Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz. 2 • Using installed capacity in determining the Frequency Response Obligation. 3 • The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics. 4 • Do not advocate the use of supplemental regulation as a method of procuring frequency response. It must be decided as to what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the target of defining how often to run Frequency Response Surveys; it does not crisply define the "Interconnection" obligations. If performance is the focus, then the issue of who is the default provider must be addressed. All BAs do not own the service providers. To create standards that apply to entities that are dependent on other functional entities to comply with a standard requirement is of great concern. FRS Form 1 is listed as being an Associated Document. Will it be attached to the standard? The acronym FRS is used in the standard. FRS should be spelled out before its acronym is used. If FRS Form 1 will not be an appendix or an attachment to the document, then a link should be provided to it, or instructions given on how to find it.
Response: 1 - Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere in the East. This is the reason for their higher first step of UFLS in Florida. The drafting team believes the following are valid methods of obtaining Frequency Response: • Regulation services. • Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration. • Through a tariff (e.g. Frequency Response and regulation service). • From generators through an interconnection agreement. • Contract with an internal resource or Loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response). Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation. The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for

Organization	Yes or No	Question 10 Comment
generators. The drafting team is obliged to stay within the bounds of its SAR. There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost. Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect. FRS Forms 1 and 2 will be Attached to the standard. The Forms will be put on a NERC website and announced once the standard is approved. The definition no longer reference FRS Form 1.		
Orlando Utilities Commission	Negative	Per LPPC comments
Response: The SDT is not sure of the entity you are referencing (LPPC). Therefore, the SDT cannot respond to your comment without further clarification.		
Portland General Electric Co.	Negative	PGE agrees with the WECC whitepaper including the comments and concerns.
Response: see WECC comments.		
PPL Electric Utilities Corp.; PPL Generation LLC	Negative	The PPL Companies do not support proposed Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting) primarily because PPL believes it inappropriately subjects Reserve Sharing Groups (RSGs) to the proposed requirements. The proposed Applicability provision states that the mandatory reliability requirements would be applicable to (1) Balancing Authorities and (2) Reserve Sharing Groups (where applicable). However, it is unclear how the proposed requirements would be applicable to an RSG. RSGs typically do not provide a mechanism for sharing automatic Frequency Response. The BA Frequency Response

Organization	Yes or No	Question 10 Comment
		Obligation (FRO) is a formula based on BAs and the Interconnection and has nothing to do with RSGs. Rather, RSGs collectively respond to requests for activation of contingency reserves generally after the request is made by a member Balancing Authority. The Standard Drafting Team should therefore remove RSGs from the Applicability section and should remove all other references to RSGs in the proposed standard.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."		
PPL EnergyPlus LLC	Negative	Please refer to PPL's corporate comments.
Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."		
Seattle City Light	Negative	LADWP and SCL support project 2007-12's general approach to frequency response, and is prepared to support the ballot once several problematic details are corrected. o LADWP and SCL note that the time allowed to analyze the final "official" set of 25 events for each year, from Dec 15 to Jan 10, is relatively short and coincides with the holiday vacation season
Response: The ERO will be posting preliminary events throughout the year. The criteria contained in Attachment A should allow an entity to evaluate events as they occur. This coupled with the Forms 1 & 2 should allow an entity to be looking forward throughout the year. In addition the standard allows 30-days for providing information.		

Organization	Yes or No	Question 10 Comment
Seattle City Light	Negative	SCL would like to see addressed in the Standard how the case is to be addressed where a BA simply has no frequency response information to provide, as could happen for a small 1-2 generator BA which has its generators out of service for an extended period for maintenance or upgrades. Assuming the BA purchases frequency response services from another entity during this period, is the BA out of compliance with the proposed Standard simply because it has no data report? And how is its next-year obligation to be computed? These issues should be addressed in the Measures or Additional Compliance information. If these are issues for "lawyers" as the Standards Drafting Team indicated during the November 14, 2011, webinar then the team should engage a NERC lawyer to resolve them prior to releasing the Standard for ballot. o Finally, SCL points out that the proposed Standard introduces a new obligation on applicable entities to maintain frequency responsive reserves. Although this obligation does not appear to be unreasonable or problematic in general, compliance may prove difficult for some entities and in some localized areas.

Response: The SDT has a section in the Background Document addressing methods of obtaining Frequency Response.

The drafting team believes the following are valid methods of obtaining Frequency Response:

- **Regulation services.**
- **Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration.**
- **Through a tariff (e.g. Frequency Response and regulation service).**
- **From generators through an interconnection agreement.**
- **Contract with an internal resource or loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response).**

Organization	Yes or No	Question 10 Comment
Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation.		
Public Utility District No. 1 of Snohomish County/Snohomish County PUD No. 1	Negative	Public Utility District No. 1 of Snohomish County supports the comments filed by Seattle City Light.
Response: The ERO will be posting preliminary events throughout the year. The criteria contained in attachment A should allow an entity to evaluate events as they occur. This coupled with the Forms 1 & 2 should allow an entity to be looking forward throughout the year. In addition the standard allows 30-days for providing information. **The SDT has a section in the Background Document addressing methods of obtaining Frequency Response.** **The drafting team believes the following are valid methods of obtaining Frequency Response:** • **Regulation services.** • **Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration.** • **Through a tariff (e.g. Frequency Response and regulation service).** • **From generators through an interconnection agreement.** • **Contract with an internal resource or Loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response).** **Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation.**		
South California Edison	Negative	SCE's "No" vote, like the WECC position, regarding Project 2007-12 is based on the

Organization	Yes or No	Question 10 Comment
Company		following five points: 1) Clarification is needed whether there will/ will not be conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction 2) Confusion exists between Attachment A and the Background Document: 2a) Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, versus 2b) The Background Document which states it will use "historical" Peak Load and Generation. 3) Reducing frequency bias obligation is detrimental to reliability. It seems that Lowering the Minimum Frequency Bias Setting from 1% to .8% will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response. 4) There is no clear statement of what is expected from the Balancing Authorities and whether or not there is a limit on that expectation. 5) Why are there no requirements on governor installation, settings, and operation for a frequency response standard?
Response: 1) The SDT has removed Requirement R3. The SDT believes that this requirement is duplicative of BAL-005-0.1b Requirements R6 & R7. **2) The SDT has modified both the Background Document and Attachment A to be consistent. The calculation uses "historical data" to circumvent the problem you have described.** **3) Early research by Nathan Cohn[6] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.**		

[6] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 10 Comment
		The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations. **4) The SDT understands your concern and has added language in Attachment A that caps the amount of Frequency Response that a BA will be required to provide** **5) The NERC *Functional Model Technical Document* identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.** **The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.** **There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.** **Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.**
Western Area Power Administration	Negative	1. Reducing frequency bias obligation is a detriment to reliability of interconnection and the proposed standard aims to reduce the bias obligation from the current minimum level of 1% load to 0.8% and subsequently to a lower percentage. 2. The proposed standard is very confusing and complex in regard to data collection

Organization	Yes or No	Question 10 Comment
		and compliance. 3. The proposed standard is encompassing reserve sharing group (where applicable), why? What reserve sharing group operates AGC? It is not clear whether the compliance period is monthly or yearly for R1 & R5. The issue of non-binding standard and whether it serves a purpose to go through complicated data submission and found in compliance or out of compliance without any consequences.

Response: 1. Early research by Nathan Cohn[7] on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.

The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

3. The SDT has modified the Background Document to provide additional information and clarity.

4. The SDT modified R1 so that it no longer applies to an RSG _ the SDT defined new term, "Frequency Response Sharing Group" to address stakeholder concerns that the RSG is not the correct entity. The definition of Frequency Response Sharing Group is:

A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members.

3. Requirement R1 is calculated on an annual basis. The SDT has removed Requirement R5 and combined it into Requirement R2

[7] *Control of Generation and Power Flow on Interconnected Systems*, John Wiley & Sons, 1967

Organization	Yes or No	Question 10 Comment
and new Requirement R3. **The SDT made modifications to Attachment A to try to distinguish mandatory performance assigned to the BA from process steps performed by the ERO.**		
Xcel Energy, Inc.	Negative	It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities cannot know what is expected of them and therefore cannot plan appropriately.
Response: The SDT understands your concern and has added language in Attachment A that caps the amount of Frequency Response that a BA will be required to provide.		
	Negative	59.6 Hz should be used as the Eastern Interconnection URLS. Installed capacity should always be used determining an area's frequency response obligation. I question the use of supplemnetal regulation as a method of procuring frequency response. Is this an acceptable practice throughout all NERC Regions? Each Balancing Authority must be able to provide the required or calculated frequency response and be able to incorporate the proper frequency bias settings in

Organization	Yes or No	Question 10 Comment
		the Balancing Authority's AGC system. A link should be provided in the proposed standard to FRS Form 1.

Response: Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere in the East. This is the reason for their higher first step of UFLS in Florida. Having all Eastern Interconnection Balancing Authorities carry extra frequency responsive reserves to protect against a target minimum frequency of 59.7 Hz would not protect Florida against a contingency inside Florida, but would require the other BAs in the East to continuously carry about 4,000 MW of frequency responsive reserves to protect against a false trip in Florida if frequency fell below 59.7 Hz but over 59.5 Hz. This is a contingency on the order of 7,000 MW or more. The drafting team compromised and gave the entire Interconnection an obligation based on 59.96Hz.

The SDT has modified both the Background Document and Attachment A to be consistent. The calculation uses "historical data" to circumvent the problem you have described.

The SDT has a section in the Background Document addressing methods of obtaining Frequency Response.

The drafting team believes the following are valid methods of obtaining Frequency Response:

- **Regulation services.**
- **Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration.**
- **Through a tariff (e.g. Frequency Response and regulation service).**
- **From generators through an interconnection agreement.**
- **Contract with an internal resource or Loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response).**

Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation.

Frequency Response Technical Conferences

Please use the electronic comment form to submit comments on the Frequency Response Technical Conferences held on May 22, 2012 and May 24, 2012. These comments will be posted on the project webpage as part of the development record and considered by the FRSDT as it continues to develop BAL-003. Comments must be submitted by **June 15, 2012.** If you have questions please contact Darrel Richardson (email) or by telephone at (609) 613-1848.

Background Information:

NERC recently held two technical conferences on Frequency Response. The first conference was held on May 22, 2012 in Arlington, VA and the second was held in Denver, Colorado on May 24, 2012. The purpose of these conferences was to obtain industry input on the development of a Frequency Response standard. The information provided in the conferences primarily dealt with the following three areas.

1. The work that has been done on the standard to date
2. Which Functional Entity should be responsible for Frequency Response.
3. How to measure Frequency Response

A complete set of presentations from the conferences can be found at the following link.

http://www.nerc.com/filez/standards/Frequency_Response-RF.html

NERC is requesting industry comments pertaining to the information provided in the conferences or suggestions for further consideration in the development of a Frequency Response standard. Please share your thoughts on the Technical Conference and the associated subject matter below.

Enter All Comments in Simple Text Format.

1. **Please provide any comments on the Technical Conference and associated subject matter in the comment area below.**

Don Tench on Behalf of ENBALA
ENBALA Power Networks
I. INTRODUCTION ENBALA Power Networks (ENBALA) respectfully submits these comments in response to the North American Electric Reliability Corporation (NERC) Technical Conference on Frequency Response held in Arlington VA on May 22, 2012 and Denver CO on May 24, 2012. ENBALA rewards large electricity users for participation in the Smart Grid. The ENBALA Power Network enables industrial, commercial and municipal partners to be financially rewarded for the inherent flexibility of their electrical equipment. Resource partners incur no cost in connecting to this platform and receive payments for helping to bring continuous balance to the electricity system. The purpose of these conferences was to provide background on the development, and implementation of BAL-003-1 - Frequency Response Standard (FRS) and to explain the rationale and considerations for the Requirements and their associated compliance information as well as to solicit feedback from industry participants on the standard. ENBALA provides these comments in support of draft standard BAL-003-1 II. BACKGROUND The requirement to continuously balance load and generation to maintain stable frequency is a critically important aspect of interconnected power system operation. Frequency Response is the characteristic of load and generation within Balancing Authorities and Interconnections that reacts or responds to changes in load-resource balance and resulting changes in system frequency. Primary Frequency Control is defined by NERC as those actions provided by the Interconnection to arrest and stabilize frequency in response to frequency deviations, typically caused by a significant system loss. Primary Control comes from mechanical inertia, followed by automatic generator governor response, load response (typically from motors), and other devices that provide an immediate response based on local (device-level) control systems. Primary Frequency Response (PFR) is the first stage of overall frequency control and is the response, which begins immediately, of resources and load to a locally sensed change in frequency to arrest that change in frequency. This is distinct from Secondary Frequency Control, defined to be those actions provided by an individual BA or its Reserve Sharing Group to correct the resource – load unbalance that created the original frequency deviation, which will restore both Scheduled Frequency and Primary Frequency Response. Secondary Control comes from automated dispatch from a centralized control system. The original Standards Authorization Request (SAR) to establish mandatory standards with respect to this critical requirement were established in BAL-003-0, finalized on June 30, 2007. In Order No. 693, the Federal Energy Regulatory Commission (FERC) directed additional changes to this standard . We interpret the objective of the FERC direction to be to establish concrete measures and allocation of Interconnection Frequency Response to ensure continued reliable operation III. COMMENTS Presentations and discussion at the conference provided the following understanding; - The system currently has enough PFR to operate reliably. The concern is that continuing decline could result in unreliability at a future date. The immediate concern is to ensure that the decline on the Eastern Interconnection is halted. - Approximately 30% of generators provide governor response and hence primary frequency control at any time in the Eastern and Western Interconnections. - Primary Frequency Response (PFR) should not be viewed as event driven but rather as continuous control. - The draft standard has been written to give the Balancing Authority (BA) responsibility to meet the standard. The main issue with this is a concern that BA's are being given responsibility but do not have the requisite authority to impose requirements on participants (eg. generators) to provide the PFR. The discussion at the conference focused almost exclusively on the ability of generators to supply PFR through governor action. This is not surprising given the fact that the interconnected power system is based on rotating machines (for the most part) and that speed governors are a necessary part of generator control systems and have been providing PFR for many years. However, there is growing evidence that some generation operators prefer not to provide this service as only a fraction of generators actually

provide PFR to the interconnection at any time. Many reasons were discussed that generators do not provide response, ranging from regulatory restrictions, environmental restrictions, and operation at full output, economic choices to make the plant more efficient, and physical constraints, among others. But in our opinion, all of these reasons come down to a fundamental consideration – the generators must sacrifice some efficiency to provide PFR. This is not a surprising outcome. Prior to electricity deregulation many 'ancillary services ' provided by generators were considered to be delivered at low or no cost. However, organized electricity markets have shown that these services have considerable value. Primary Frequency Response is another example. This is not to say that generators may not be the most effective way to provide the majority of PFR. However, generation resources may not be the least cost supplier of PFR. It is important to recognize that this service has a cost and different technologies are able to provide the service at different costs. These costs vary even amongst generation technologies. In addition, there are alternatives to providing all PFR from generation. ENBALA's experience in providing Secondary Frequency Control (SFC) to organized markets has shown that aggregated mid-sized commercial and industrial facilities can provide very high quality SFC, demonstrably better performance than the majority of generation. This technology can be extended to provide localized PFR as well. It is our opinion that PFR from load can be of higher 'quality' than that provided by generation. The ability of individual aggregated loads to increase or decrease nearly instantaneously in response to frequency provides an immediate stabilizing influence on frequency that works together with generator inertia to arrest frequency deviations more quickly than generation alone. Recent studies by California ISO identify that this response can be several times more valuable than slower generation response. Given the facts that; PFR is a valuable reliability service, the cost of providing PFR varies with technology, decisions must be made with respect to who will provide PFR, and alternatives exist to continuing with the provision of generator only PFR, we respectfully make the following suggestions; - The standard should continue as drafted and not limit the technology to provide PFR (eg. generators only) - PFR should be recognized as a reliability service in the same manner as other ancillary services. - The standard should apply to an entity like the BA, as drafted, that has defined responsibility for balancing load and generation - Mechanisms should be developed to procure PFR sufficient to meet NERC standards, on an economic basis either through market or tariff provisions IV. CONCLUSION It is ENBALA's belief that unless the value of Primary Frequency Response can be made transparent to the marketplace, efficient alternatives will not be implemented and inefficient decisions with respect to existing technologies will be made leading to higher costs for consumers. Treatment of PFR as a market priced reliability service will allow the industry to determine the most efficient and effective way to provide necessary Frequency Response, independent of changes taking place in the supply mix of generation. Respectfully Submitted,

Individual

Robert Blohm

Keen Resources Asia Ltd.

17-year NERC veteran's, long-standing active FRS drafting team contributor's, ex NERC Standards Committee member's, and Columbia-University-postgraduated statistician's expert comments on "Avoiding a Trifecta of Statistics Errors in the NERC Frequency Response Standard". Please review my 6-slide powerpoint presentation downloadable at http://www.robertblohm.com/3FRSissues.pptx or http://www.robertblohm.com/3FRSissues.ppt and submitted but never posted for inclusion in the technical conference. The last 3 slides highlight the following 3 fundamental statistics errors in the FRS as drafted so far: (1) confusion of (the correct probabilistic measure of "largest contingency" consisting of) "largest event to occur at least as often as once in 10 years" with (the incorrect probabilistic measure of "largest contingency" consisting of) "largest event in the last 10 years" which may be the "largest event to occur at least as often as once in MUCH MORE THAN 10 years"; (2) sampling of frequency responses to events that is not true "random", "unbiased" or "stratified" sampling which requires samples that are distributed unevenly over time just like the population of responses to events is: every month or season of the year cannot be forced to have the same number of samples; otherwise what is being measured is not the population of responses to events, but something else (like responses to regular small operating errors that are the domain of CPS, not the FRS) with a probability density over time in the shape of a flat-top box; (3) use of a median measure of frequency-response performance, which is impossible for 3 reasons: because there is a practical infinity of possible Frequency Responsive Reserve Sharing Groups or overlap regulation arrangements, because use of the median incents the formation of those whose actual provision of

frequency response is over-represented by the median and would in that case deteriorate below the actual minimum amount required for system reliability, and because use of the median disincents the formation of those whose actual provision of of frequency response is under-represented by the median. The first 3 slides clarify the following 3 technical points: (1) the resistance of load to adjust to sudden change in generation output prompts frequency (but not generator output) to change and to thereby involuntarily change the load whose resistance to that adjustment prompts frequency to change even more and only until the sudden generation output change is reversed enough in order first to stop the frequency change and then begin to reverse the frequency change; [The involuntary load response/adjustment provides the energy used by generation inertia to immediately slow down frequency change until frequency response is deployed to stop and begin to reverse the frequency change as illustrated in this 4-slide powerpoint presentation of 4 errors in the Cummings presentation's slide of frequency response http://www.robertblohm.com/CummingsVsIllianLoadResponse.pptx or http://www.robertblohm.com/CummingsVsIllianLoadResponse.ppt . The 2 graphs depicted therein show that load response and inertia are inseparable and provide the entirety of frequency response during more than the initial half of the 5 or 6 second pre-arresting period, and this supports the next slide.] (2) the FRS is a standard for "system" frequency response (the 1st of NERC's 2 glossary definitions of "frequency response"), not for "equipment" frequency response (the 2nd of NERC's 2 glossary definitions of "frequency response"); the FRS is a BA-Response System Operation and Measurement Standard, not a Connection and Maintenance Standard for Individual Pieces of Equipment; in other words, all sharp large-enough tie-line and frequency changes of whatever kind for whatever reason are counted (“summed”) and managed (and included in the probability density curve of frequency events and responses thereto), not just measurements of a construed pure machine response to one single imagined un-overlapped change (shorn of supposed "contaminants" of an idealized "equipment" reality non-existent at actual "system" level); (3) the probability density function of frequency events that are un-uniformly distributed over time governs the FRS and is different from the standard normal distribution of operating errors (that governs CPS) that are evenly distributed over time in a uniform distribution.
Group
Dominion
Connie Lowe
Dominion
Dominion agrees that resources other than generators could supply some limited frequency response, but believe that all resources providing reliability-related services should be subject to applicable NERC reliability standards. We also agree that relationships can exist between reliability and compensation, especially in organized markets. In order for generators to be able to respond to a low frequency event, they would need to operate slightly below their maximum output. The Balancing Authority is the entity best suited to make the determination of how to balance efficiency and reliability. There may be financial consequences for resources that do not meet their assigned schedule and we encourage further discussion of this with NAESB to determine whether this issue might be ripe for discussions and possible solutions from NERC (reliability) and NAESB (commercial/financial). As noted in the Duke presentation, alignment is also needed in the new NERC standards and Glossary of terms (clarification is needed on specific terms used by engineering vs. the Generator Operator) as it pertains to frequency response.
Individual
Terry Bilke
MISO
The standard sets a rational backstop for reliability without forcing undue costs for undefined improvements in reliability. My primary concern is the reliability gap created for variable bias BAs. There is no discernible reason why a variable bias BA should ever have a bias less negative than say 30% of its FRO. The variable bias BA should also have an average annual bias at least 90% of its FRO. This can be managed through the year and still will be well less than the current obligation under BAL-003-0. Since there is no firm technical guidance on how variable bias is to be set, to leave this gap will cause a mass movement of BAs to report as variable bias entities. It will also leave the door open to gaming to artificially improve CPS and DCS and BAAL performance.

Robert Rhodes
Southwest Power Pool
Requirement 3 of the standard covers the use of variable bias. However, the requirement does not establish a minimum limit for variable bias. In order to prevent what could be perceived as a way to 'game' the requirement, we would suggest incorporating a minimum limit on variable bias that does not allow the value to be positive.

PSEG Comments on Project 2007-12 – Frequency Response A. SUMMARY OF COMMENTS 1. The standard drafting team (SDT) for Project 2007-12 has not explained how compliance with draft standard BAL-003-1 is achievable; therefore, a key goal of Order 693 has not been met. a. BAL-003-1's objectives (from the project's web page) states "There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline." If one does not know why Frequency Response is declining, how can a BA ensure itself that it has sufficient Frequency Response in its area to meet its obligation? b. BAL-003-1 assigns Balancing Authorities (BAs) the requirement to meet a Frequency Response Obligation for their respective areas. However, BAs have no the authority to set requirements for suppliers of Frequency Response service: Generator Owners (GOs) as well as demand response resources. 2. Two existing standards (BAL-001-0.1a and BAL-002-0) also address Frequency Response. However, the pro forma Open Access Transmission Tariff (OATT) contained ancillary services associated with these standards prior to the standards being approved. a. The SDT needs to explain the relationship between BAL-001-0.1a, BAL-002-0, and draft standard BAL-003-1 since they all address an aspect of Frequency Response. b. BAL-003-1's objectives (from the project's web page) do not include a statement that having sufficient Frequency Response is necessary to arrest the frequency decline within the first seconds of a disturbance so that underfrequency load shedding (UFLS) is minimized. 3. There is no OATT ancillary service for the service in draft standard BAL-003-1. Unless commercial terms are established which define the relationship between BAs and Frequency Response providers, BAL-003-1 will not be implementable. Because commercial terms need to be defined in the OATT, we encourage NERC to work with FERC's Office of Energy Market Regulation and/or its Office of Energy Policy and Innovation to initiate proceeding with the goal of developing a new ancillary service – Primary Frequency Response Service. 4. A plot of frequency versus time after the sudden loss of generation is only contained in presentations for the technical conferences, but a plot is not in any of BAL-003-1's documents. Such a plot is needed in the standard (or in an attachment to it) so that the familiar reference points – A, B, and C – can be used in the standard's documents. 5. With regard to setting the Frequency Response Obligation by Interconnections in BAL-003-1: a. How can two Interconnections (Eastern and Quebec), which are not Registered Entities, comply with the requirement in Attachment A to set a Frequency Response Obligation? b. The SDT should explain its rationale for choosing "the largest category C (N-2) event identified" as the basis for setting an Interconnection's Frequency Response Obligation. 6. Project 2010-14-1 is related to Project 2007-10, and the two project teams should coordinate on these items: a. Both SDTs should put themselves in the position of a BA that must comply with R3 and all its subparts in draft standard BAL-012-1 and develop a hypothetical implementation plan for a BA to meet its Frequency Response Obligation. b. Both SDTs should work together to explain the relationship between Regulating Reserve, Contingency Reserve, and Frequency Response Reserve contained in BAL-012-1. B. REGULATORY BACKGROUND When FERC approved BAL-003-0 – Frequency Response and Bias – in Order 693, it issued NERC a directive in P. 375: …the Commission directs the ERO to develop a modification to BAL-003-0 through the Reliability Standards development process that: … (3) defines the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved." The standard drafting team for Project 2007-12 is currently addressing all but one of the items in the Order 693 directive. See below: Order 693, P. 375 (3) Directive Addressed by SDT? 1. Define the necessary amount of Frequency Response for each BA Yes 2. Define methods of obtaining Frequency Response No 3. Define methods of measuring that Frequency Response is achieved Yes This second item is critical. "Methods" can describe technical options, but it can also describe process options. While the project's "Frequency Response Background Document" dated October 2011 has a section on "methods of obtaining Frequency

Response" on p. 11, that section has six bullet points on the topic. The points are not integrated into a coherent approach that explains how compliance is achievable. Draft standard BAL-003-1 assigns BAs the requirement to meet a Frequency Response Obligation for their respective areas. However, BAs have no the authority to set requirements for suppliers of Frequency Response service: GOs as well as demand response resources. In addition, there are no OATT provisions that will compensate suppliers for the service BAs will ask them to provide. C. TECHNICAL COMMENTS 1. BAL-001-0.1a and BAL-002-0 NERC's Glossary defines of Frequency Response and Frequency Bias as follows: Frequency Response: (Equipment) The ability of a system or elements of the system to react or respond to a change in system frequency. (System) The sum of the change in demand, plus the change in generation, divided by the change in frequency, expressed in megawatts per 0.1 Hertz (MW/0.1 Hz). Frequency Bias: A value, usually expressed in MW/0.1 Hz, set into a Balancing Authority [Area Control Area] ACE algorithm that allows the Balancing Authority to contribute its frequency response to the Interconnection. Two existing standards are related to draft standard BAL-003-1. a. BAL-001-0.1a – Real Power Control Performance – addresses maintenance of frequency, within limits, by a BA in a steady-state (no disturbance) environment by measuring ACE. This requires BAs to have sufficient Regulating Reserve. The ACE equation includes a component for Frequency Bias. This component adjusts ACE when frequency deviates from 60 Hz, allowing a BA to contribute its Frequency Response to the Interconnection. In the OATT, this service is Schedule 3 – Regulation and Frequency Response. b. BAL-002-1– Disturbance Control Performance – requires BAs to provide sufficient Contingency Reserve so that ACE can be returned to its pre-disturbance level within 15 minutes. In the OATT, this service is incorporated into two schedules: Schedule 5 – Operating Reserve – Spinning Reserve Service and Schedule 6 – Operating Reserve – Supplemental Reserve Service. In both standards, the needed ancillary services were in the OATT PRIOR to the standards being approved. The reliability standards set performance requirements while the OATT sets the commercial structure for compensating providers. To meet the requirements of BAL-001-0.1a and BAL-002-1, BAs need Frequency Response (equipment) so that they have the "ability… to react or respond to a change in system frequency." Maintaining ACE is a Frequency Response service, but it is different from the type of service in draft standard BAL-003-1 and as described in the technical conference. The SDT should explain the relationship of all three standards since they all address an aspect of Frequency Response. 2. Draft BAL-003-1 Objectives The objectives of Project 2007-12 are excerpted below from its web page: Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. Failure to maintain frequency can disrupt the operation of equipment and initiate disconnection of power plant equipment to prevent them from being damaged, which could lead to wide-spread blackouts. THERE IS EVIDENCE OF CONTINUING DECLINE IN FREQUENCY RESPONSE IN THE THREE INTERCONNECTIONS OVER THE PAST 10 YEARS, BUT NO CONFIRMED REASON FOR THE APPARENT DECLINE (emphasis added). The proposed standard would set a minimum Frequency Response obligation for each Balancing Authority, provide a uniform calculation of Frequency Response and Frequency Bias Settings that transition to values closer to natural Frequency Response, and encourage coordinated AGC operation. This statement has two shortcomings. First, the emphasized sentence above is discouraging because if one does not know why Frequency Response is declining, how can a BA ensure itself that it has sufficient Frequency Response in its area to meet its obligation? The standard should describe how a BA might comply with its Frequency Response Obligation in an appendix. (See the comments in Section D below.) Second, it makes no mention that having sufficient Frequency Response is necessary TO ARREST FREQUENCY DECLINE WITHING THE FIRST SECONDS OF A DISTURBANCE SO THAT UNDERFREQUENCY LOAD SHEDDING (UFLS) IS MINIMIZED. 3. Graphics A plot of frequency versus time after the sudden loss of generation is only contained in the presentations for the technical conferences, not in any of BAL-003-1's documents. Such a plot is needed in the standard (or in an attachment to it) so that the familiar reference points – A, B, and C – can be used in the standard's documents. 4. Physical response to loss of generation The workshop did a good job in explaining what occurs physically within an Interconnection after generation is lost. Those are summarized below for the SDT to review for any misunderstanding. a. At point A (pre-disturbance), an unspecified amount of generation is lost. b. Between point A and point C (the frequency nadir), several changes occur: i. Due to the loss of generation, load is greater than generation, and in response to this imbalance, generators "slow down" and frequency drops. Each generator's loss of speed releases power to serve the load, albeit at a reduced frequency. Generators with greater mass are preferred since they have more stored rotating power to release. Frequency

Bias setting in each BA's ACE equation allows this power to flow into the Interconnection. ii. Load is also reduced when frequency is reduced because loads such as motors slow down also and consume less power. Load reduction aids in arresting frequency decline. However, unless the frequency decline triggers the first UFLS step, no connected is lost. iii. Generator governors begin to respond. A generator's governor that can increase output when frequency declines provided certain characteristics are met. 1) The generator must be operating below its maximum capacity that can be achieved under automatic (i.e. non-operator intervention) operation. A generator with a 100 MW capacity and operating at 80 MW has "head room" to respond while the same generator operating at 100 MW cannot. 2) The governor's "dead band," which defines a range (+/-) of frequency changes that do not activate the governor, must not be so wide so as to effectively disable the governor from responding to frequency changes during a disturbance. 3) The governor cannot be overridden by "outer loop controls" on the generator. These controls countermand the governor's response, keeping the generator's output level unchanged. Governor response is the last to occur – it begins within seconds after the disturbance and continues until the generators with active governors reach their maximum capacity or until frequency is restored. In addition, properly devised demand response resources can substitute for governor-responsive generators. c. At point B, frequency is stabilized. All of items above occur automatically, without operator intervention. Collectively, these actions are referred to the "primary response" of the Interconnection to loss of generation. Subsequent responses involve operator actions that eventually return system frequency and ACE to a pre-disturbance ACE target. These subsequent responses are not the objective of draft BAL-003-1, but they are the objective of BAL-002-1. 5. Frequency Response Obligation Determination Regarding the Frequency Response Obligation for an Interconnection, Attachment A in draft BAL-003-1 states "Each Interconnection will establish target contingency protection criteria," with the default target "based on the largest category C (N-2) event identified." We have several questions: a. How can two Interconnections (Eastern and Quebec), which are not Registered Entities, comply with the requirement in Attachment A to set a Frequency Response Obligation? In fact, no Interconnection is listed in the Applicability section of BAL-003-1. b. We assume that "category C" in the Attachment A language above references Table 1 in the current TPL standards, but that should be clarified by the SDT. Does the SDT intend to restrict the category C events to those that only result in the loss of two Elements? This question is asked because category C in Table 1 is described as "Event(s) resulting in the loss of two or more (multiple) elements." c. The default target contingency in Attachment A is greater than minimum Contingency Reserve requirement in BAL-002-1 (R3.1), which is based on "the most severe single contingency." Why was the minimum requirement in BAL-002-1 not used? The SDT should explain its rationale for choosing "the largest category C (N-2) event identified" as the basis for setting an Interconnection's Frequency Response Obligation. 6. Frequency Response Obligation Measurement We summarized Frequency Response Obligation measurement below for the SDT to review for any misunderstanding. a. Frequency Response will be measured at point B due to technical limitations in measuring each BA's point C. However, point C can be measured for an Interconnection. Because the C to B ratio is highly consistent within an Interconnection, measuring the response at B also measures the decline at C is achieved. b. For compliance purposes, each BA's performance in meeting its Frequency Response Obligation will be based upon its median Frequency Response of at least 25 events, expressed in megawatts per 0.1 Hertz (MW/0.1 Hz). D. FREQUENCY RESPONSE OPTIONS The discussion below is not inclusive, and the SDT is encouraged to provide guidance on compliance as recommended in Section C.2 above. 1. Value high inertia generators. Generators that are on line and spinning, even if loaded to their maximum capacity, provide MW by slowing down, and generators with greater mass are preferred. In engineering parlance, this is termed the inertia constant, H, which, for a given generator is: H = (Stored kinetic energy in megajoules at synchronous speed)/(Generator rating in MVA) Generators with a greater H constant have more value in arresting frequency decline than similarly rated generators with a lower H constant. 2. Value interruptible load on underfrequency relays. Many utilities have interruptible loads, and some of these could be configured to be shed load based upon frequency steps that are above the first UFLS step. As an example, direct load control programs for cycling residential air conditioners and water heaters could be configured to interrupt all appliances on the program for several minutes after a disturbance, with the appliances gradually restored after the frequency decline is arrested. 3. For generators that provide primary Frequency Response through governor action, value rapid response. The rate of increase in generator output due to governor response is both governor and prime-mover specific. The governor's droop determines how much it will increase signal generator power to increase when frequency declines. Also, generators with rapid power increase capability,

such as simple cycle gas turbines, can deliver the governor's signal to increase power more quickly. The more rapid a generator's response capability, the more it should be valued. a. Generators providing primary Frequency Response through governor action or automatically curtailed interruptible load also provide "Operating Reserve – Spinning," which is a component of Operating Reserve. It is defined in the NERC Glossary as follows: Operating Reserve – Spinning The portion of Operating Reserve consisting of: i. Generation synchronized to the system and fully available to serve load within the Disturbance Recovery Period following the contingency event; or ii. Load fully removable from the system within the Disturbance Recovery Period following the contingency event. The term "Disturbance Recovery Period" is used in BAL-002-1, and its default value is 15 minutes. To minimize UFLS activation, which can occur within seconds after a disturbance, primary Frequency Response is the key requirement, and the 15 minute time frame in Operating Reserve – Spinning is not relevant. However, a GO that provides primary Frequency Response via an active governor or a demand response provider that provides automatically curtailed interruptible load is also providing Operating Reserves – Spinning. E. OATT PROVISIONS Unless commercial terms are established which define the relationship between BAs and Frequency Response providers (GOs and demand response resources), BAL-003-1 will not be implementable. Because commercial terms need to be defined in the OATT, we encourage NERC to work with FERC's Office of Energy Market Regulation and/or its Office of Energy Policy and Innovation to initiate proceeding with the goal of developing a new ancillary service – Primary Frequency Response Service. This service would address automatic Frequency Response within a short time frame (up to about 30 seconds) after a disturbance. Overlap between Spinning Reserve Service and Primary Frequency Response Service would need to be addressed. F. COORDINATION WITH PROJECT 2010-14.1 After preparing the majority of our comments, a first-time request for comments on a related project, Project 2010-14.1 – Phase 1 of Balancing Authority Reliability-based Controls Reserves – was posted on June 4. This project includes a new draft standard BAL-012-1 that has a proposed definition for Frequency Response Reserve – "An amount of reserve automatically responsive to locally sensed frequency deviation during the primary control time frame." That definition is similar to the ancillary service proposed above. Both SDTs should put themselves in the position of a BA that must comply with R3 and all its subparts in draft standard BAL-012-1 and develop a hypothetical implementation plan for a BA to meet its Frequency Response Obligation. If they did, they would understand why BAs have little understanding of what they must do to comply with draft BAL-003-1. Both SDTs work together to explain the relationship between Regulating Reserve, Contingency Reserve, and Frequency Response Reserve contained in BAL-012-1.

The conference was very informative. Of particular interest was who should be responsible for providing frequency response. The assignment to the BA was well supported and logically presented. The details presented in the conference were different than those in the original version of the standard i.e. the frequency selected to protect for was modified from 59.7 to " prevailing". The prevailing frequency if prevailing is interpreted as dominant is 59.3Hz yet the standards team choose 59.5Hz without explanation or justification. There was also a lack of technical justification in increasing the frequency bias minimum from the original 0.8% to 0.9%. While a minimum should be established there should be no link to frequency response as the two are no longer related.
Individual

Bob Frost
Portland General Electric
1. BAL-003-1, Attachment A, states that the ERO will provide quarterly posting of candidate frequency events. It then states it will post the final list of frequency excursion events used for standard compliance by December 15 each year. Because the quarterly postings are only candidates and the median frequency response is the measure, Balancing Authorities cannot always be certain they will be compliant with the Standard until December 15. 2. FRS Form 1, sheet “Data Entry”, requests entry by the Balancing Authority of next year’s FRO (cell O31). However, per Attachment A, this information is provided by the ERO only after Form 1 is submitted by the Balancing Authority. A Balancing Authority is only able to estimate their FRO. 3. FRS Form 2, sheet “Entry Data”, has the Balancing Authority modify formulas for cells C8 and C11 in order to identify the beginning and recovery from the event. This is tedious as Form 2 must be completed a minimum of 25 times each year. The spreadsheet should be authored so that the user does not need to modify formulas. The sheet “Data” on Form 2 could have cells adjacent to the data that are marked to identify these points.

We have a strong concern related to the handling of variable bias. The drafting team is fully removing the floor for the minimum amount of bias for these BAs and only asks bias to be equal to natural frequency response when frequency is off normal. There should always be some bias (perhaps 40% of FRO) provided to the Interconnection and there should be some minimum annual average. This can be managed through the year and still will be well less than the current obligation under BAL-003-0. Since there is no firm technical guidance on how variable bias is to be set, to leave this gap will cause a mass movement of BAs to report as variable bias entities. It will also leave the door open to gaming to artificially improve CPS, DCS and BAAL performance. For example, an algorithm that takes bias to a small positive number once each 15 minutes would assure the BA will never fail DCS or BAAL.

LG&E and KU Services
Brent Ingebrigtson
LG&E and KU Services
LG&E and KU Services have two comments/questions related to the material presented at the FR Technical Conference: 1. Data was presented that illustrates a decline in the Frequency Response of the Eastern Interconnect for the period 1994 through 2010. Since FR is partially related to the amount of on-line generation available at the time of the contingency, has the SDT investigated the amount of spinning reserves typically available on the Eastern Interconnect during the same 1994 to 2010 period? If so, was there a correlation between the decline of Frequency Response and available spinning reserve? 2. During the conference, mention was made that there is a cost for obtaining Frequency Response – mainly the cost of unused spinning generator capacity. However, no data, analysis or estimates were presented as to what these costs might be. Cost estimates for attaining the desired amount of Frequency Response would be useful to the industry and FERC in evaluating the proposed Frequency Response standard.

American Wind Energy Association
AWEA appreciates the opportunity to comment on NERC’s ongoing work on frequency response standards. Based on the presentations at NERC’s May 2012 technical conferences on frequency response issues, it appears that consensus exists around three important points, which we would like to highlight in our comments. We are pleased that these points appear to be embodied in the ongoing work of the standards drafting team on frequency response (BAL-003-1). 1. The balancing authority (BA) should be the entity responsible for meeting a frequency response standard. This responsibility would fit in well with a BA’s existing responsibilities for maintaining system frequency within acceptable bounds, such as CPS 1&2 and DCS requirements. Just as a BA currently obtains the reserves and other services required to meet these frequency standards and operates according to these standards, the BA is the logical entity for taking on those responsibilities for frequency

response. The BA is the only entity that has a real-time awareness of overall power system needs and capabilities, and is thus ideally suited for meeting a frequency response standard. 2. A BA's selection of resources to provide frequency response service should be market-based. As was explained at the technical conferences, different resources have widely divergent costs for providing frequency response. Many resources are likely to be able to provide significant frequency response at very low cost, while other resources are likely to face significantly higher costs for providing this service. For example, maintaining the capability to provide sustained frequency response from a wind plant would require holding the wind plant below its operating capability at all times, foregoing significant production of near-zero-marginal cost, zero emissions wind energy. As a result, under normal operating conditions, the wind plant's opportunity cost for providing frequency response capability is likely to be significantly higher than the cost for many other generating resources, which would be able to save on fuel costs by operating below their maximum output. Innovative technologies, including some forms of demand response and energy storage, are also likely to be able to provide frequency response at relatively low cost. The BA is well-positioned to use a market-based mechanism to select the least-cost frequency response resources from the available resources, as conditions change in real-time. This market-based incentive should also provide sufficient incentive for most potential resources to install any equipment necessary to provide frequency response. The market mechanism should be designed to pay for performance, so that frequency response resources are incentivized to provide services with the maximum value for the power system. 3. The decline in frequency response on the Eastern U.S. power system pre-dates the introduction of wind energy and appears to have been caused by changes in how conventional power plants are operated, and not in any way tied to the increased use of wind energy. As NERC noted in comments submitted to FERC on October 14, 2010: "Frequency response of the interconnected North American electric systems has shown a significant decline for several years. The reasons for the decline are numerous, including: • A trend toward larger governor deadband settings, exceeding the historical typical setting of ±36 millihertz (mHz); • Use of steam turbine sliding pressure controls; • Loading units to 100 percent of capacity leaving no "headroom" for response to losses of generation; • Blocked governor response; • Once-through boilers; • Gas Turbine inverse response; • Withdrawal of primary frequency response of generators by MW setpoints, resulting in limited time of response; and • Changes in the frequency response characteristics of the load. These changes have been evolving for some time and are not the direct result of the emergence of renewable resources such as wind and solar." Data presented at the technical conference indicated that only around 30% of generators are currently providing frequency response. Much of the decline in frequency response provision appears to result from generator owners maximizing efficiency and minimizing costs under current market structures. Implementing a market-based mechanism to select the least-cost frequency response resources from the available resource pool would allow conventional generators to be appropriately compensated for any costs they incur for providing frequency response while simultaneously selecting the least-cost resources for the power system. The technical conference also discussed the fact that only 1/3 of the 30% of generators that are providing frequency response (so 10% of the total generation fleet) sustain that frequency response for more than a short period of time. Part of the problem appears to be that some current energy imbalance tariff provisions may penalize generators that increase their output beyond the scheduled amount, and therefore generators are limiting the duration of frequency response following a system disturbance to avoid imbalance penalties. At the technical conference, there appeared to be widespread support for reforming those energy imbalance tariff provisions to remove that perverse incentive, which is commendable.

ISO/RTO Standards Review Committee

Albert DiCaprio

PJM

Introduction The undersigned members of the ISO/RTO Standards Review Committee (SRC) appreciate that NERC provided the opportunity to comment upon NERC's Frequency Response Technical Conference. The Conference addressed an important topic in which the SRC is deeply interested – primary control. The SRC notes that the Conference's presentation of the various and diverse perspectives of this topic highlighted the continued need to resolve and address several issues: • The need for a common language for discussion • The need for an objective analysis of a reliability need • Given the proof of such an objective reliability need, there is a need to define the quantitative parameters involved in measuring the objective • The need to justify the creation of a

mandatory standard that is relevant to the current and future BES. That includes: o Reviewing relevancy of old standards o Clarifying discussions o Objectively assigning responsibilities Discussion Terminology/Common Language The SRC noted that the presenters did not share a common set of terms. The term Frequency Response was used to address issues that are separated by time frames and that deserve separate discussions. Frequency Response was used generically to mean any activity related to controlling frequency. Frequency Response was also used to mean undirected control (such as the change in generator output caused by a governor). Frequency Response was used to mean directed control (aka secondary control). It was also used to mean the Area Control Error equation. Rather than relying on the broad and ill-defined term Frequency Response, the SRC suggests that either newly minted terms be created or that more traditional terms such as Primary Control Response and Secondary Control Response be used. All too often the presenters crossed the traditional boundaries thereby decreasing the clarity (and the value) of the discussion. There was also a tendency to use the term “Service” for both the traditional Ancillary Services (Load Following (aka Economic Dispatch); Spinning reserves; Supplemental reserves; Regulation service (aka AGC); Reactive and voltage control service; Black start) and for conditions that exist (i.e. the reaction from generators to changes in frequency). There is a tendency to equate Frequency Control through tie-line bias (typically this is AGC or secondary control) with Primary control (Dave Lemmons); Bias vs. Beta (is also a secondary control issue but it is linked because the parameters themselves are related to the primary response experienced; but they drive secondary control problems and solutions). In short the Bias is a 1st order approximation of what the magnitude of primary response that goes into the ACE equation to drive secondary control. Unless care is taken with the terms, it is easy to envision differences in discussions. Good resolutions of problems caused on the secondary control system were presented (Terry Bilke) but that need is relatively independent of this SDT. For our comments the SRC will focus on Primary Control response and use the terms primary, primary response, or primary frequency response rather than Frequency Response. Need The SRC notes that the presenters offered a variety of reasons for a “Frequency Response” standard: • Because the governor response in the Eastern Interconnection changed (or appears to be changing) • To avoid Under-Frequency Load Shedding relay operation • To avoid problems for Secondary control (valid need but not a valid justification for Primary Frequency control standard) (Howard Illian) • FERC Order 693 o Determine the appropriate periodicity of frequency response surveys o Define necessary amount of Frequency Response for reliable operations with methods of obtaining response and measuring that the frequency response is achieved • FERC Technical Conference The SRC observes that the presenters are attempting to address the goal of operating at a reasonable margin away from both UFLS (under-frequency) and OFR (over-frequency) settings, and to avoid any single event (contingency) causing those relays to activate. The SRC fully supports that objective. Several presenters mentioned the above objective and addressed the amount of post-event governor response, i.e. response that was activated after the frequency was arrested. Presenters recognized that not all suppliers are generators, and not all generators have governors, and not all of those generators respond in the same way. They also note that BAs do not all own generators. One presenter documented that the Eastern Interconnection has the worst post event response but also has the highest frequency arrest level (i.e. are farthest from a relay trip point) Most presenters expressed preference to impose Frequency response production requirements on BAs. Most presenters want to focus on the Eastern Interconnection. The SRC believes the requirement addressing primary frequency response must: • Relate to the frequency nadir point not the post event response • Apply to and be assigned to “ALL” Functional Entities registered for that applicable group • Reflect the capabilities of the functional entity to provide the mandated service. • Address both supply capabilities as well as appropriateness of relay settings If the objective is to avoid tripping relays and to minimize the risk of tripping those relays then the requirement must focus on that objective. Some presenters stated that it is traditional and simply easier to focus a Frequency Response requirement on BAs. Others stated that there were too many suppliers to impose a frequency response mandate on the suppliers. The SRC as well as NERC have stated the intention to have performance based standards and to move away from procedural requirements. The majority of the Technical Conference presenters focused on procedural solutions (i.e. governor response) and tried to indicate that both generation and demand response could serve as response providers. Bob Cummings of NERC showed that the typical worst response of the EI was equal to or higher than the best responses in ERCOT or WECC. In effect the concern about lack of post event response does not reflect the margin of reliability experienced even with the “hockey stick” response. Given the fact that none of the presenters proposed increasing the ERCOT and WECC responses to be as effective as the EI response, the observed decrease in the Eastern

interconnection could be seen as a type of “right-sizing” of response – i.e. the east is now coming closer to the rest of North America. Supply The SRC does recognize the change in frequency response in the EI, but is concerned that mandating ill-advised requirements on the wrong applicable entities will foster the loss of the provision of primary response service and not help it. If the “supply” requirement is placed on a coordinator, then the energy producing assets have no incentive to provide a service that takes away from other more lucrative products. If the requirement is placed on a subset of suppliers then those suppliers will likely mimic the suppliers in the other subset and not offer any service at all. The idea of focusing on one given solution – governor response – creates disincentives for new technologies. The Industry is now adopting those innovations without a mandate and should be allowed to continue that expansion without the threat of a standard that would impede such expansion. Suggestions The SRC believes there is a need for more open presentations including people not as focused on governors. The majority of presenters were experts in a given area. Their expertise seemed to preclude exploration of other options than the current option/approach. It should be noted that a Governor-centric requirement violates Order 693’s mandate to be resource neutral. It is time to have a discussion of the role of coordinators (like RCs, TOPs and BAs) who can and do use a palette of tools and services to address a given system condition without being obligated to answer for non-production. An alternative could be that such entities are required to provide assessment and analysis but not production; or they are required to arrange for, purchase, or otherwise provide capacity (not energy) capable of providing the primary frequency response. Many of the presenters seemed to be in a vertically integrated industry where the coordinator is the owner and operator. That is no longer universally true. A primary frequency response service for an interconnection may be calculated as discussed by the presenters, but the mandate must be developed so that the default entity will be obligated to provide or purchase the obligation (thus opening the opportunity to all new innovations). Should that be the LSEs who use the service; the suppliers who provide the service; the coordinators who integrate all of the services; or to allow a combination without specifying “how” it must be done? Other SRC Considerations raised by presenters’ comments It is invalid to avoid imposing a requirement on the appropriate applicable entity simply because there are many of them; if other standards apply to the same applicable entities then this one can also. Speed should not be a driver contrary to what one presenter stated. As presenters said we are fine today without any mandatory standard for primary control. This prompts the question “why the need for speed?” Because we can correct problems with the requirements later, via SARs, is NOT a justification for creating an inaccurate standard. Why should TOPs be permitted to set relays anywhere, but GOPs be obligated to set governors to avoid those relays? Focusing on improving details of what we have today does not make today’s paradigm better!!!! A standard should not serve as a field test for an idea!!!!

Laura Lee

Duke Energy

Duke Energy appreciates having the opportunity to participate in the Frequency Response Technical Conference. It was a very helpful for our team to hear the issues that were brought by others to the discussion, along with the opinions of NERC staff, the Frequency Response Standard Drafting Team (FRRSDT), and FERC staff. Duke Energy provides the following comments and proposed resolutions to some of the issues we believe should be addressed. Frequency Response Obligation (FRO) As the FRRSDT reviews all of the issues discussed and subsequent comments provided, we ask that consideration be given to drilling down to the “root cause” of the issues, to see what is driving them. We have found one of the root causes of a few issues to be the allocation of the FRO. In the current proposal, a BA’s FRO is the Interconnection Frequency Response Obligation applied to the ratio of the BA’s generation and load at peak divided by the Interconnection BA totals of generation and load at peak. Including generation in the allocation helps accommodate treatment of generation-only BAs (representing perhaps one percent of the total generation in the Interconnection), but in the process creates issues for both individual generating resources and all other BAs. Duke Energy believes that the FRO allocation should be based upon load only, based upon the numerous issues and inequities that an FRO allocation based upon load and generation would otherwise create, including but not limited to: a) An FRO allocation based upon generation at peak treats resources on a non-comparable basis within a “traditional” (load and generation) BA, biased against resources dedicated to peaking operation (CTs as an example), and in favor of resources which may not operate at peak capacity during such times (wind resources as an example). b) A third party resource added to a BA footprint

would add to the BA's response requirement, but the third party resource would have no requirement to provide frequency response. If such resources are only providing peaking energy to off-system loads, the generation would add to the response requirement for the BA for the year, though the resources may run a small fraction of that time. Even if the resources were capable of providing frequency response when online, they may do little to compensate the BA for the increased year-round requirement. The allocation methodology creates the issue that the BA must now address – compensation for the increased response requirement or some other tariff provision to make it whole. c) The allocation methodology creates a gaming opportunity – a strategy to purchase external energy across the peak would be a small premium to pay to achieve a reduced Frequency Response Obligation for the year – but a large price to pay for the BA with the resources selling off-system outside its control. d) Discussed further below, the inclusion of generation in the FRO allocation creates a significant discrepancy between the methodology used to determine the FRO and the methodology used to determine the minimum Frequency Bias Setting. In our opinion, these are among the issues that neither the BAs nor the resources need to face. An allocation based upon the load within the BA rather than load plus generation would resolve them. An additional modification to enhance equitable treatment and eliminate gaming is the use of total energy for the period rather than peak loads in the FRO allocation. There is uncertainty that the use of 12 monthly peaks accurately represents the load benefiting from the continuous provision of Frequency Response. Similar to the gaming discussed above for generation, BAs capable of "peak shaving" are able to reduce a year-round requirement based upon a few hours of operation. Duke Energy proposes that the determination of a BA's FRO be the Interconnection FRO applied to the ratio of the BA's NEL (for those submitting EIA-714 reports, this would be the annual total in column e of Part II, Schedule 3; for others, this would be the sum of LSE NELs in the BA as reported for determination of NERC and Regional fees) divided by the Interconnection BA totals of these NELs. Basing the FRO allocation upon annual energies rather than peak loads eliminates the potential for a year-round FRO to be pushed to others by peak shaving if a peak value is used. The FRO for generation-only BAs (representing approximately 1% of the total generation within an Interconnection) can be set to a fixed percentage of total capacity, similar to current requirements for calculating the Frequency Bias Setting. Frequency Bias Setting (FBS) Notwithstanding our concern raised in the past that the secondary control measures are too tightly bound to the FBS and believing that in some cases the FBS is used as a convenient measure of BA size, Duke Energy agrees with the proposal to gradually reduce the magnitude of the FBS to some margin above the natural Frequency Response of the Interconnection. However, as proposed in the "Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard" dated February 21, 2012, the allocation of the FBS reduction would be a margin based upon peak load or peak generation, rather than a margin based upon a methodology similar to that used for the allocation of the Frequency Response Obligation. As an example, based upon the proposed FRO allocation using load plus generation at peak, two BAs with the same peak load, but with differing levels of generation at peak due to off-system transactions, would have a different FRO allocation; however, these two BAs would be given the same minimum Frequency Bias Setting based upon a percentage of peak load only. A generation-only BA with the same amount of generation as a traditional BA serving a similar amount of load, would have an FRO allocation approximately half that of the traditional BA, however these two BAs would be given the same minimum FBS. Under the proposed procedure for reducing the magnitude of the FBS, the generation-only BA would always have a minimum FBS set almost twice what it would need to have compared to the traditional BA. We believe that the incremental reduction in the FBS will not achieve an equitable allocation in its final state. Duke Energy believes that the minimum FBS for each BA should be reduced in magnitude to a fixed percentage above each BA's FRO (but no lower individually than its FRM), while assuring that the Interconnection FBS remains at some margin above the Interconnection FRM. The current procedure posted for the FBS reduction will not achieve that equitable allocation, as the minimum FBS will always be based upon a different methodology than the FRO allocation in its current form. Upon request, Duke Energy can provide a procedure which could be used for determining the minimum FBS which would allow the minimum FBS for each BA to be incrementally reduced in magnitude over time based upon the FRO allocation, and ensure that the Interconnection FBS remains at some margin above the Interconnection FRM. However, given the timeline for moving this standard forward, Duke Energy would propose that consideration be given to basing the FRO allocation on load only as discussed above, setting a value for the generation-only BAs, and returning to the issue of aligning the methodologies used for the FRO allocation and minimum FBS calculation at a later time. Variable Frequency Bias Setting Duke Energy disagrees with the FRRSDT's proposal not to require a minimum

FBS for BAs using a Variable FBS in multiple BA Interconnections. There are no defined requirements on how a Variable FBS SHALL be calculated, yet its use changes not only the ACE measured against the BAL-001 secondary control requirements, but also the bounds of those secondary control requirements. Overall, Duke Energy questions whether the proposed standard should continue to allow the use of a Variable FBS in calculating ACE or secondary control performance. Duke Energy does not question the value of a BA implementing the logic of a variable FBS in its generation control algorithm, along with other factors to more efficiently control resources, however its operation should be measured in a manner consistent with all other BAs. Nathan Cohn was of the opinion that the secondary control assistance provided by the FBS should be a shared obligation. In the publication "IEEE Transactions on Power Systems, Vol. 3, No. 3, August 1988", Cohn noted the following in the article VARIABLE, NON-LINEAR TIE-LINE FREQUENCY BIAS FOR INTERCONNECTED SYSTEMS CONTROL: "The very conditions that create a variable frequency response to which an area bias is linked as in the subject paper would create a variable level of bias assistance by the area in fulfilling system needs." Nathan Cohn goes on to state, "It is of course recognized that the extent of bias assistance to be scheduled by individual areas is, as are all operating practices, a matter for system operating personnel to determine. This discusser suggests, however, that there are potential advantages in bias assistance based on a common percentage-of-peak for all areas. It would provide an equitable, cooperative, and democratic systems approach." As supported by the statements of Cohn, Duke Energy believes that the assistance provided by the FBS should be a shared obligation equally applied to all BAs by using a fixed FBS in the calculation of ACE and secondary control performance. BAL-003-1 Documents The document, "Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard" dated February 21, 2012, no longer has a reference to being "Attachment B" to the draft BAL-003-1 standard. Duke Energy would appreciate clarification of whether this document is within the scope of what will be eventually be included in the ballot of Project 2007-12 — Frequency Response, and what process would be required to make any subsequent revisions to the procedure.
Individual
Rebecca Moore Darrah
MISO
The Midwest Independent Transmission System Operator, Inc. ("MISO") appreciates the opportunity to comment on the technical conferences that NERC recently held on Frequency Response issues, and, in particular, the proposed changes to BAL-003. MISO adds only two brief comments here. MISO agrees with the proposed change in BAL-003-1 with respect to the calculation of minimum amount of frequency response to be provided by a Balancing Authority (this is the Frequency Response Obligation under Requirement R1 of BAL-003-1). The allocation of Frequency Response Obligation among Balancing Authorities in an Interconnection is to be based on peak load data, which is a reasonable approach to determining what proportion of frequency response should be contributed to each Balancing Authority. MISO also agrees with the manner of calculating each Balancing Authority's Frequency Response Obligation under Requirement R1; the proposal by the Standards Drafting Team will ensure that adequate frequency response is provided by each Balancing Authority. At the same time, the Standards Drafting Team should reconsider its approach to variable bias. Balancing Authorities with variable bias are not subject to some of the requirements. Variable bias methodologies are not identified, and that lack of an identified methodology opens the opportunity for individual Balancing Authorities to engage in gaming (such as having bias go to zero or a small positive number every 15 minutes to ensure DCS and BAAL is never failed).

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee approved the SAR for posting on January 13, 2005.
2. The SAR was posted for industry comment from January 17, 2005 through February 17, 2005.
3. Reply comments and a revised SAR were posted for a second industry comment period from April 4, 2006 through May 3, 2006.
4. Reply comments and a revised SAR were posted for a third industry comment period from February 8, 2007 through March 9, 2007.
5. Standards Committee approved moving the project into the standards development phase on July 12, 2007.
6. The Standards Committee appointed the Standard Drafting Team on August 13, 2007.
7. The draft standard was posted for a 30 day formal comment period from February 4, 2011 through March 7, 2011.
8. The draft standard was posted for a 45-day formal comment period and a 10 day initial ballot from October 25, 2011 through December 8, 2011.

Proposed Action Plan and Description of Current Draft:

This is the third posting of the proposed standard and its associated documents for a 30 day formal comment period and a successive 10 day ballot, from October 5, 2012 through November 5, 2012.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments submitted within the comment period and with the successive ballot.	January, 2013
2. Conduct a recirculation ballot for ten days.	January, 2013
3. BOT adoption.	February, 2013

Definitions of Terms used in the Standard

Frequency Response Measure (FRM)

The median of all the Frequency Response observations reported annually by Balancing Authorities or Frequency Response Sharing Groups for frequency events specified by the ERO. This will be calculated as MW/0.1Hz.

Frequency Response Obligation (FRO)

The Balancing Authority's share of the required Frequency Response needed for the reliable operation of an Interconnection. This will be calculated as MW/0.1Hz.

Frequency Bias Setting

A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's inverse Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems.

Frequency Response Sharing Group (FRSG)

A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the sum of the Frequency Response Obligations of its members.

A. Introduction

Title: Frequency Response and Frequency Bias Setting

Number: BAL-003-1

Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations and supporting frequency until the frequency is restored to its scheduled value. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Applicability:

1.1. Balancing Authority

1.1.1 The Balancing Authority is the responsible entity unless the Balancing Authority is a member of a Frequency Response Sharing Group, in which case, the Frequency Response Sharing Group becomes the responsible entity.

1.2. Frequency Response Sharing Group

Effective Date:

1.3. In those jurisdictions where regulatory approval is required, Requirements R2, R3 and R4 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2, R3 and R4 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.

1.4. In those jurisdictions where regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

B. Requirements

R1. Each Frequency Response Sharing Group (FRSG) or Balancing Authority that is not a member of a FRSG shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported in accordance with Attachment A) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each FRSG or BA that is not a member of a FRSG to maintain Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation. *[Risk Factor: Medium][Time Horizon: Real-time Operations]*

R2. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period specified by the ERO and shall use this Frequency Bias Setting until directed to change by the ERO. *[Risk Factor: Medium][Time Horizon: Operations Planning]*

R3. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and is utilizing a variable Frequency Bias Setting shall maintain a Frequency Bias Setting that is: *[Risk Factor: Medium][Time Horizon: Operations Planning]*

3.1 Less than zero at all times, and

3.2 Equal to or more negative than its Frequency Response Obligation when Frequency varies from 60 Hz by more than +/- 0.036 Hz.

R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation, in order to represent the Frequency Bias Setting for the combined Balancing Authority Area, to be equivalent to either: *[Risk Factor: Medium][Time Horizon: Operations Planning]*

- The sum of the Frequency Bias Settings as shown on FRS Form 1 and FRS Form 2 for the participating Balancing Authorities as validated by the ERO, or
- The Frequency Bias Setting shown on FRS Form 1 and FRS Form 2 for the entirety of the participating Balancing Authorities' Areas.

C. Measures

M1. Each Frequency Response Sharing Group or Balancing Authority that is not a member of a Frequency Response Sharing Group shall have evidence such as dated data plus documented formula in either hardcopy or electronic format that it achieved an annual FRM)in accordance with the methods specified by the ERO in Attachment A with data from FRS Form 1 reported to the ERO as specified in Attachment A) that is equal to or more negative than its FRO to demonstrate compliance with Requirement R1.

M2. The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service shall have evidence such as a dated document in hard copy or electronic format showing the ERO validated Frequency Bias Setting was implemented into its ACE calculation within the implementation period specified or other evidence to demonstrate compliance with Requirement R2.

M3. The Balancing Authority that is a member of a multiple Balancing Authority Interconnection, is not receiving Overlap Regulation Service and is utilizing variable Frequency Bias shall have evidence such as a dated report in hard copy or electronic format showing the average clock-minute average Frequency Bias Setting was less than zero and during periods when the clock-minute average frequency is outside of the

range 59.964 Hz to 60.036 Hz was equal to or more negative than its Frequency Response Obligation to demonstrate compliance with Requirement R3.

M4. The Balancing Authority shall have evidence such as a dated operating log, database or list in hard copy or electronic format showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation as specified in Requirement R4 to demonstrate compliance with Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the responsible entity works for the Regional Entity. Where the responsible entity works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Investigation

Self-Reporting

Complaints

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Balancing Authority shall retain data or evidence to show compliance with Requirements R1, R2, R3 and R4, Measures M1, M2, M3 and M4 for the current year plus the previous three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Frequency Response Sharing Group shall retain data or evidence to show compliance with Requirement R1 and Measure M1 for the current year plus the previous three calendar years unless directed by its Compliance Enforcement

Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority or Frequency Response Sharing Group is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all subsequent requested and submitted records.

1.4. Additional Compliance Information

For Interconnections that are also Balancing Authorities, Tie Line Bias control and flat frequency control are equivalent and either is acceptable.

2.0 Violation Severity Levels

Definitions of Terms used in the Standard

Frequency Response Measure (FRM)

The median of all the Frequency Response observations reported annually by Balancing Authorities or Frequency Response Sharing Groups for frequency events specified by the ERO~~on FRS Form 1~~. This will be calculated as MW/0.1Hz.

Frequency Response Obligation (FRO)

The Balancing Authority's share of the required Frequency Response needed for the reliable operation of an Interconnection. This will be calculated as MW/0.1Hz.

Frequency Bias Setting

A number~~value~~, ~~(~~either ~~a~~ fixed or variable ~~Frequency Bias)~~, usually expressed in MW/0.1 Hz, included in~~set into~~ a Balancing Authority's Area Control Error equation to account for~~that allows~~ the Balancing Authority's inverse Frequency Response contribution ~~to contribute its Frequency Response~~ to the Interconnection, and discourage response withdrawal through secondary control systems.

Frequency Response Sharing Group (FRSG)

A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the sum of the Frequency Response Obligations of its members.

A. Introduction

Title: Frequency Response and Frequency Bias Setting

Number: BAL-003-1

Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations and supporting frequency until the frequency is restored to its scheduled value. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Applicability:

1.1. Balancing Authority

~~1.1.~~**1.1.1** The Balancing Authority is the responsible entity unless the Balancing Authority is a member of a Frequency Response Sharing Group, in which case, the Frequency Response Sharing Group becomes the responsible entity.

~~1.1.1~~**1.2.** Frequency Response~~eserve~~ Sharing Group ~~(where applicable)~~

Effective Date:

~~1.2.~~**1.3.** In those jurisdictions where regulatory approval is required, Requirements R2, R3 and R4 ~~and R5~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2, R3 and~~,~~ R4 ~~and R5~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.

~~1.3.~~**1.4.** In those jurisdictions where regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

B. Requirements

R1. Each Frequency Response Sharing Group (FRSG) or Balancing Authority that is not a member of a FRSG~~(BA) or Reserve Sharing Group (RSG)~~ shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported ~~detailed~~ in accordance with Attachment A ~~and calculated on FRS Form 1~~) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each FRSG or BA that is not a member of a FRSG~~or RSG~~ to maintain ~~an adequate level of Frequency Response in the~~ Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation. *[Risk Factor: Medium][Time Horizon: Real-time Operations~~Operations Assessment~~]*

R2. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving~~participating in~~ Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as ~~(fixed or variable)~~ validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period~~beginning on the date~~ specified by the ERO and shall use this Frequency Bias Setting until directed to change by the ERO~~to ensure effectively coordinated Tie Line Bias control~~. *[Risk Factor: Medium][Time Horizon: Operations Planning]*

R3. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and is utilizing a variable Frequency Bias Setting shall maintain a Frequency Bias Setting that is:~~operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area.~~ *[Risk Factor: Medium][Time Horizon: Operations Planning~~Real-time Operations~~]*

3.1 Less than zero at all times, and

~~3.1~~3.2 Equal to or more negative than its Frequency Response Obligation when Frequency varies from 60 Hz by more than +/- 0.036 Hz.

R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation, in order to represent the Frequency Bias Setting for the combined Balancing Authority Area, to be equivalent to either~~the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO or calculate the Frequency Bias Setting based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled.~~: *[Risk Factor: Medium][Time Horizon: Operations Planning]*

- The sum of the Frequency Bias Settings as shown on FRS Form 1 and FRS Form 2 for the participating Balancing Authorities as validated by the ERO, or
- The Frequency Bias Setting shown on FRS Form 1 and FRS Form 2 for the entirety of the participating Balancing Authorities' Areas.

~~**R3.** In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: *[Risk Factor: Medium][Time Horizon: Operations Planning]*~~

- ~~The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B.~~

~~The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.~~

C. Measures

M1. Each ~~The~~ Frequency Response Sharing Group or Balancing Authority that is not a member of a Frequency Response Sharing Group ~~or Reserve Sharing Group~~ shall have evidence such as dated data plus documented formula in either hardcopy or electronic format that it achieved an annual FRM)in accordance with the methods specified by the ERO in Attachment A with data from FRS Form 1 reported to the ERO as specified in Attachment A) that~~with data to show that its FRM~~ is equal to or more negative than its FRO to demonstrate compliance with Requirement R1.

M2. The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service shall have evidence such as a dated document in hard copy or electronic format showing the ERO validated Frequency Bias Setting was implemented~~entered~~ into its ACE calculation within the implementation period~~on the date~~ specified or other evidence to demonstrate compliance with Requirement R2.

M3. The Balancing Authority that is a member of a multiple Balancing Authority Interconnection, is not receiving Overlap Regulation Service and is utilizing variable Frequency Bias shall have evidence such as a dated report~~operating log, database or list~~ in hard copy or electronic format showing the average clock-minute average Frequency Bias Setting was less than zero and during periods when the clock-minute average frequency is outside of the range 59.964 Hz to 60.036 Hz was equal to or more negative than its Frequency Response Obligation ~~or operator interviews supported by other evidence showing the AGC operating mode including explanation when operating in other than Tie Line Bias mode~~ to demonstrate compliance with Requirement R3.

~~**M4.**~~ The Balancing Authority shall have evidence such as a dated operating log, database or list in hard copy or electronic format showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation as specified in Requirement R4~~when Overlap Regulation Service is provided including Frequency Bias Setting calculation to~~ to demonstrate compliance with Requirement R4.

~~**M5.**~~**M4.** ~~The Balancing Authority shall have evidence such as dated data plus documented formula to support the calculation retained in either hardcopy or electronic format showing the monthly average Frequency Bias Setting or other evidence to demonstrate compliance with Requirement R5.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the responsible entity works for the Regional Entity. Where the responsible entity

works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance ~~Violation~~ Investigation~~s~~

Self-Reporting

Complaints

~~Periodic Data Submittals~~

1.3. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Balancing Authority shall retain data or evidence to show compliance with Requirements R1, R2, R3 and~~,~~ R4 ~~and R5~~, Measures M1, M2, M3 and~~,~~ M4~~, and M5~~ for the current year plus the previous three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Frequency Response~~eserve~~ Sharing Group shall retain data or evidence to show compliance with Requirement R1 and Measure M1 for the current year plus the previous three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority or Frequency Response~~eserve~~ Sharing Group is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all subsequent requested and submitted records.

1.4. Additional Compliance Information

For Interconnections that are also Balancing Authorities, Tie Line Bias control and f~~F~~lat ~~F~~frequency control are equivalent and either is acceptable.

2.0 Violation Severity Levels

R#	Lower VSL	Medium VSL	High VSL	Severe VSL
R1	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the Interconnection's FRO, and the Balancing Authority's, or Frequency Response~~eserve~~ Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the Interconnection's FRO, and the Balancing Authority's, or Frequency Response~~eserve~~ Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO, and the Balancing Authority's, or Frequency Response~~eserve~~ Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO, and the Balancing Authority's, or Frequency Response~~eserve~~ Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO
R2	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting failed to implement the validated Frequency Bias Setting value into its ACE calculation within the implementation period~~on the date~~ specified but did so within 5 calendar days from the implementation	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 5 calendar days but less than or equal to 15 calendar days from the implementation period~~ollowing the~~	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 15 calendar days but less than or equal to 25 calendar days from the implementation period~~ollowing the~~	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting did not implement the validated Frequency Bias Setting value into its ACE calculation in more than 25 calendar days from the implementation period~~ollowing the date~~ specified by the ERO.

BAL-003-1 Frequency Response & Frequency Bias Setting Standard

Supporting Document

Frequency Response Obligation (FRO) for the Interconnection

The ERO, in consultation with regional representatives, has established a target contingency protection criterion for each Interconnection. The default target listed in Table 1 is based on the largest category C (N-2) event identified except for the Eastern Interconnection, which uses the largest event in the last 10 years. Additionally, this contingency protection criterion includes uncertainty adjustments at a 95 % confidence level to prevent Point C from encroaching on the interconnection's highest Under Frequency Load Shed (UFLS) step for credible contingencies. The Obligation for each Interconnection in Table 1 is calculated by dividing the Target Protection Criteria MWs by 10 times the difference between the starting frequency and the Prevailing UFLS First Step. This number is then multiplied by the C to B Ratio to arrive at a MW/0.1 Hz number. In the Eastern Interconnection there is an additional adjustment for the event nadir being below the Value B due to primary frequency response withdrawal. This Interconnection Frequency Response Obligation (FRO) includes uncertainty adjustments at a 95 % confidence level. Detailed descriptions of the calculations used in Table 1 below are defined in the *Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard*.

Interconnection	Eastern	Western	ERCOT	HQ	Units
Starting Frequency	**59.974**	**59.976**	**59.963**	**59.972**	Hz
Prevailing UFLS First Step	**59.5**	**59.5**	**59.3**	**58.5**	Hz
Base Delta Frequency	**0.474**	**0.476**	**0.663**	**1.472**	Hz
CC_{ADJ}	**0.007**	**0.004**	**0.012**	**N/A**	Hz
Delta Frequency (DF_{CC})	**0.467**	**0.472**	**0.651**	**1.472**	Hz
CB_R	**1.000**	**1.625**	**1.377**	**1.550**	Hz
Delta Frequency (DF_{CBR})	**0.467**	**0.291**	**0.473**	**0.949**	Hz
BC'_{ADJ}	**0.018**	**N/A**	**N/A**	**N/A**	
Max. Delta Frequency	**0.449**	**0.291**	**0.473**	**0.949**	
Resource Contingency Criteria	**4,500**	**2,740**	**2,750**	**1,700**	MW
Credit for LR		**300**	**1,400**		MW
IFRO	**-1,002**	**-840**	**-286**	**-179**	MW/0.1 Hz

Table 1: Interconnection Frequency Response Obligations

**The Eastern Interconnection UFLS set point listed is a compromise value set midway between the stable frequency minimum established in PRC-006-1 (59.3 Hz) and the local protection UFLS setting of 59.7 Hz used in Florida and Manitoba.*

***In the Base Obligation measure for ERCOT, 1400 MW (Load Resources triggered by Under Frequency Relays at 59.70 Hz) was reduced from its Contingency Protection Criteria level of 2750 MW to get 239 MW/0.1 Hz. This was reduced to accurately account for designed response from Load Resources within 30 cycles.*

An Interconnection may propose alternate FRO protection criteria to the ERO by submitting a SAR with supporting technical documentation.

Balancing Authority Frequency Response Obligation (FRO) and Frequency Bias Setting

The ERO will manage the administrative procedure for annually assigning an FRO and implementation of the Frequency Bias Setting for each Balancing Authority. The annual timeline for all activities described in this section are shown below.

For a multiple Balancing Authority interconnection, the Interconnection Frequency Response Obligation shown in Table 1 is allocated based on the Balancing Authority annual load and annual generation. The FRO allocation will be based on the following method:

$$\mathrm{FRO_{BA}} = \mathrm{FRO_{Int}} \times \frac{\mathrm{Annual\ Gen_{BA}} + \mathrm{Annual\ Load_{BA}}}{\mathrm{Annual\ Gen_{Int}} + \mathrm{Annual\ Load_{Int}}}$$

Where:

- Annual $\mathrm{Gen_{BA}}$ is the total annual "Output of Generating Plants" within the Balancing Authority Area (BAA), on FERC Form 714, column c of Part II - Schedule 3.
- Annual $\mathrm{Load_{BA}}$ is total annual Load within the BAA, on FERC Form 714, column e of Part II - Schedule 3.
- Annual $\mathrm{Gen_{Int}}$ is the sum of all Annual $\mathrm{Gen_{BA}}$ values reported in that interconnection.
- Annual $\mathrm{Load_{Int}}$ is the sum of all Annual $\mathrm{Load_{BA}}$ values reported in that interconnection.

The data used for this calculation is from the most recently filed Form 714. As an example, a report to NERC in January 2013 would use the Form 714 data filed in 2012, which utilized data from 2011.

Balancing Authorities that are not FERC jurisdictional should use the Form 714 Instructions to assemble and submit equivalent data to the ERO for use in the FRO Allocation process.

Balancing Authorities that elect to form a FRSG will calculate a FRSG FRO by adding together the individual BA FRO's.

Balancing Authorities that elect to form a FRSG as a means to jointly meet the FRO will calculate their FRM performance one of two ways:

- Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or
- Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that that contains the sum of each participant's individual event performance.

Balancing Authorities that merge or that transfer load or generation are encouraged to notify the ERO of the change in footprint and corresponding changes in allocation such that the net obligation to the Interconnection remains the same and so that CPS limits can be adjusted.

Each Balancing Authority reports its previous year's Frequency Response Measure (FRM), Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO each year to allow the ERO to validate the revised Frequency Bias Settings on FRS Form 1. If the ERO posts the official list of events after the date specified in the timeline below, Balancing Authorities will be given 30 days from the date the ERO posts the official list of events to submit their FRS Form 1.

Once the ERO reviews the data submitted in FRS Form 1 and FRS Form 2 for all Balancing Authorities, the ERO will use FRS Form 1 data to post the following information for each Balancing Authority for the upcoming year:

- Frequency Bias Setting
- Frequency Response Obligation (FRO)

Once the data listed above is fully posted, the ERO will announce the three-day implementation period for changing the Frequency Bias Setting if it differs from that shown in the timeline below.

A BA using a fixed Frequency Bias Setting sets its Frequency Bias Setting to the greater of (in absolute value):

- Any number the BA chooses between 100% and 125% of its Frequency Response Measure as calculated on FRS Form 1
- Interconnection Minimum as determined by the ERO

For purposes of calculating the minimum Frequency Bias Setting, a Balancing Authority participating in a Frequency Response Sharing Group will need to calculate its stand-alone Frequency Response Measure using FRS Form 1 and FRS Form 2 to determine its minimum Frequency Bias Setting.

A Balancing Authority providing Overlap Regulation will report the historic peak demand and generation of its combined BAs' areas on FRS Form 1 as described in Requirement R4.

There are occasions when changes are needed to Bias Settings outside of the normal schedule. Examples are footprint changes between Balancing Authorities and major changes in load or generation or the formation of new Balancing Authorities. In such cases the changing Balancing Authorities will

work with their Regions, NERC and the Resources Subcommittee to confirm appropriate changes to Bias Settings, FRO, CPS limits and Inadvertent Interchange balances.

If there is no net change to the Interconnection total Bias, the Balancing Authorities involved will agree on a date to implement their respective change in Bias Settings. The Balancing Authorities and ERO will also agree to the allocation of FRO such that the sum remains the same.

If there is a net change to the Interconnection total Bias, this will cause a change in CPS2 limits and FRO for other Balancing Authorities in the Interconnection. In this case, the ERO will notify the impacted Balancing Authorities of their respective changes and provide an implementation window for making the Bias Setting changes.

Frequency Response Measure (FRM)

The Balancing Authority will calculate its FRM from Single Event Frequency Response Data (SEFRD), defined as: "the data from an individual event from a Balancing Authority that is used to calculate its Frequency Response, expressed in MW/0.1Hz" as calculated on FRS Form 2 for each event shown on FRS Form 1. The events in FRS Form 1 are selected by the ERO using the *Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard*. The SEFRD for a typical Balancing Authority in an Interconnection with more than one Balancing Authority is basically the change in its Net Actual Interchange on its tie lines with its adjacent Balancing Authorities divided by the change in Interconnection frequency. (Some Balancing Authorities may choose to apply corrections to their Net Actual Interchange (NA_I) values to account for factors such as nonconforming loads. FRS Form 1 and 2 shows the types of adjustments that are allowed. Note that with the exception of the Contingent BA column, any adjustments made must be made for all events in an evaluation year. As an example, if an entity has non-conforming loads and makes an adjustment for one event, all events must show the non-conforming load, even if the non-conforming load does not impact the calculation. This ensures that the reports are not utilizing the adjustments only when they are favorable to the BA.) The ERO will use a standardized sampling interval of approximately 16 seconds before the event up to the time of the event for the pre-event NA_I, and frequency (A values) and approximately 20 to 52 seconds after the event for the post-event NA_I (B values) in the computation of SEFRD values, dependent on the data scan rate of the Balancing Authority's Energy Management System (EMS).

All events listed on FRS Form 1 need to be included in the annual submission of FRS Forms 1 and 2. The only time a Balancing Authority should exclude an event is if its tie-line data or its Frequency data is corrupt or its EMS was unavailable. FRS Form 2 has instructions on how to correct the BA's data if the given event is internal to the BA or if other authorized adjustments are used.

Assuming data entry is correct FRS Form 1 will automatically calculate the Balancing Authority's FRM for the past 12 months as the median of the SEFRD values. A Balancing Authority electing to report as an FRSG or a provider of Overlap Regulation Service will provide an FRS Form 1 for the aggregate of its participants.

To allow Balancing authorities to plan its operations, events with a “Point C” that cause the Interconnection Frequency to be lower than that shown in Table 1 above (for example, an event in the Eastern Interconnection that causes the Interconnection Frequency to go to 59.4 Hz) or higher than an equal change in frequency going above 60 Hz may be included in the list of events for that interconnection. However, the calculation of the BA response to such an event will be adjusted to show a frequency change only to the Target Minimum Frequency shown in Table 1 above (in the previous example this adjustment would cause Frequency to be shown as 59.5 Hz rather than 59.4 HZ) or a high frequency amount of an equal quantity. Should such an event happen, the ERO will provide additional guidance.

Timeline for Balancing Authority Frequency Response and Frequency Bias Setting Activities

Described below is the timeline for the exchange of information between the ERO and Balancing Authorities (BA) to:

- Facilitate the assignment of BA Frequency Response Obligations (FRO)
- Calculate BA Frequency Response Measures (FRM)
- Determine BA Frequency Bias Settings (FBS)

Target Date	Activity
April 30	The ERO reviews candidate frequency events and selects frequency events for the first quarter (December to February).
May 10	Form1 is posted with selected events from the first quarter for BA usage by the ERO.
May 15	The BAs receive a request to provide load and generation data as described in Attachment A to support FRO assignments and determining minimum FBS for BAs.
July 15	The BAs provide load and generation data as described in Attachment A to the ERO.
July 30	The ERO reviews candidate frequency events and selects frequency events for the second quarter (March to May).
August 10	Form1 is posted with selected events from the first and second quarters for BA usage by the ERO.
October 30	The ERO reviews candidate frequency events and selects frequency events for the third quarter (June to August)
November 10	Form1 is posted with selected events from the first, second, and third quarters for BA usage by the ERO.
November 20	If necessary, the ERO provides any updates to the necessary Frequency Response.
November 20	The ERO provides the fractional responsibility of each BA for the Interconnection's FRO and Minimum FBS to the BAs.
January 30	The ERO reviews candidate frequency events and selects frequency events for the fourth quarter (September to November).

2nd business day in February	Form1 is posted with all selected events for the year for BA usage by the ERO.
February 10	The ERO assigns FRO values to the BAs for the upcoming year.
March 7	BAs complete their frequency response sampling for all four quarters and their FBS calculation, returning the results to the ERO.
March 24	The ERO validates FBS values, computes the sum of all FBS values for each Interconnection, and determines L10 values for the CPS 2 criterion for each BA as applicable.
Any time during first 3 business days of April (unless specified otherwise by the ERO)	The BA implements any changes to their FBS and L10 value.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for BAL-003-1 – Frequency Response & Frequency Bias Setting Standard

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

BAL-003-0.1b should be retired at midnight of the day immediately prior to the Effective Date of BAL-003-1 in the Jurisdiction in which the new standard is becoming effective.

New or Modified Definitions

The following definitions shall become effective when BAL-003-1 Requirements R2, R3, R4 and R5 become effective:

Frequency Response Measure (FRM): The median of all the Frequency Response observations reported annually on FRS Form 1.

Frequency Response Obligation (FRO): The Balancing Authority's share of the required Frequency Response needed for the reliable operation of an Interconnection.

Frequency Bias Setting: A number~~value~~, either fixed or variable, usually expressed in MW/0.1 Hz, included in~~set into~~ a Balancing Authority's Area Control Error equation to account for ~~algorithm that allows~~ the Balancing Authority's Frequency Response contribution~~to contribute its frequency response~~ to the Interconnection and discourage withdrawal through secondary control systems.

The existing definition of Frequency Bias Setting should be retired at midnight of the day immediately prior to the Effective Date of BAL-003-1 in the Jurisdiction in which the new standard is becoming effective.

The proposed revised definition for "Frequency Bias Setting" is incorporated in the following NERC approved standards:

- BAL-001-0.1a Real Power Balancing Control Performance
- BAL-004-0 Time Error Correction
- BAL-004-1 Time Error Correction
- BAL-005-0.1b Automatic Generation Control

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Balancing Authorities
- Reserve Sharing Groups

Proposed Effective Date

Compliance with BAL-003-1 shall be implemented over a two-year period, as follows:

- In those jurisdictions where regulatory approval is required, Requirements R2, R3, R4 and R5 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2, R3, R4 and R5 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.

- In those jurisdictions where regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan for BAL-003-1 – Frequency Response & Frequency Bias Setting Standard

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

BAL-003-0.1b ~~Requirements R1, R2, R3, R4 and R6~~ should be retired midnight of the day immediately prior to the Effective Date of~~when~~ BAL-003-1 in the Jurisdiction in which the new standard is becoming ~~becomes~~ effective.

~~BAL-003-0 Re1quirement R5 should be retired as outlined in the following table.~~

~~For those Balancing Authorities that serve native load:~~

- ~~May 2011 through December 2011 -0.8% of peak/0.1 Hz~~
- ~~January 2012 through December 2012 -0.6% of peak/0.1 Hz~~
- ~~January 2013 through December 2013 -0.4% of peak/0.1 Hz~~
- ~~January 2014 through December 2014 -0.2% of peak/0.1 Hz~~
- ~~January 2015 through -0.0% of peak/0.1 Hz~~

~~For those Balancing Authorities that do not serve native load:~~

- ~~May 2011 through December 2011 -0.8% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2012 through December 2012 -0.6% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2013 through December 2013 -0.4% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2014 through December 2014 -0.2% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2015 through -0.0% of upcoming years maximum generation/0.1 Hz~~

~~The FRR drafting team, NERC and the NERC Resources Subcommittee will observe the impact on frequency and will implement a reversion plan should frequency performance decline.~~

New or Modified Definitions

The following definitions shall become effective when BAL-003-1 Requirements R2, R3, R4 and R5 become effective:

116-390 Village Boulevard, Princeton, New Jersey 08540-5721
Phone: 609.452.8060 ▪ Fax: 609.452.9550 ▪ www.nerc.com

Frequency Response Measure (FRM): The median of all the Frequency Response observations reported annually on FRS Form 1.

Frequency Response Obligation (FRO): The Balancing Authority's share of the required Frequency Response needed for the reliable operation of an Interconnection.

Frequency Bias Setting: A number, either a fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems.

The existing definition of Frequency Bias Setting should be retired midnight of the day immediately prior to the Effective Date of BAL-003-1 in the Jurisdiction in which the new standard is becoming effective.

The proposed revised definition for "Frequency Bias Setting" is incorporated in the following NERC approved standards:

- BAL-001-0.1a Real Power Balancing Control Performance
- BAL-004-0 Time Error Correction
- BAL-004-1 Time Error Correction
- BAL-005-0.1b Automatic Generation Control

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Balancing Authorities
- Reserve Sharing Groups

Proposed Effective Date

Compliance with BAL-003-1 shall be implemented over a two-year period, as follows:

- In those jurisdictions where regulatory approval is required, Requirements R2~~1~~, R3, R4 and R5~~4~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2~~1~~, R3, R4 and R5~~4~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.
- In those jurisdictions where regulatory approval is required, Requirements R1~~2~~ of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1~~2~~ of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

Event Selection Process

This procedure outlines the ERO process for supporting the Frequency Response Standard (FRS). A Procedure revision request may be submitted to the ERO for consideration. The revision request must provide a technical justification for the suggested modification. The ERO shall post the suggested modification for a 45-day comment period and discuss the revision request in a public meeting. The ERO will make a recommendation to the NERC BOT, which may adopt the revision request, reject it, or adopt it with modifications. Any approved revision to this Procedure shall be filed with FERC for informational purposes.

Event Selection Objectives

The goals of this procedure are to outline a transparent, repeatable process to annually identify a list of frequency events to be used by Balancing Authorities (BA) to calculate their Frequency Response to determine:

- Whether the BA met its Frequency Response Obligation, and
- An appropriate fixed Bias Setting.

Event Selection Criteria

1. The ERO will use the following criteria to select FRS frequency excursion events for analysis. The events that best fit the criteria will be used to support the FRS. The evaluation period for performing the annual Frequency Bias Setting and the Frequency Response Measure (FRM) calculation is December 1 of the prior year through November 30 of the current year.
2. The ERO will identify 20 to 35 frequency excursion events in each Interconnection for calculating the Frequency Bias Setting and the FRM. If the ERO cannot identify 20 frequency excursion events in a 12 month evaluation period satisfying the criteria below, then similar acceptable events from the subsequent year's evaluation period will be included with the data set by the ERO for determining FRS compliance. This is described later.
3. The ERO will use three criteria to determine if an acceptable frequency excursion event for the FRM has occurred:
    a. The change in frequency as defined by the difference from the A Value to Point C and the arrested frequency Point C exceeds the excursion threshold values specified for the Interconnection in Table 1 below.
        i. The A Value is computed as an average over the period from -16 seconds to 0 seconds before the frequency transient begins to decline.
        ii. Point C is the arrested value of frequency observed within 12 seconds following the start of the excursion.

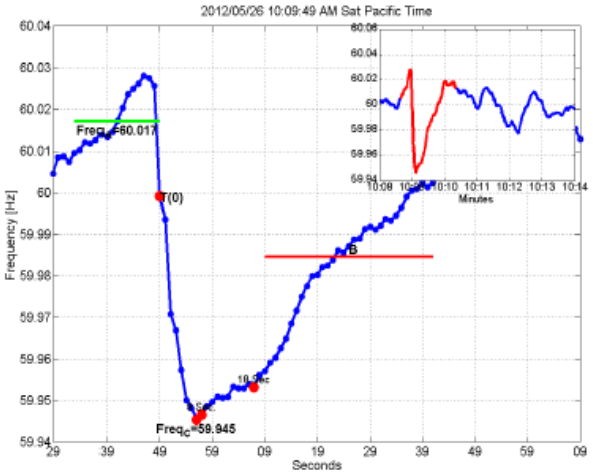
Interconnection	A Value to Pt C	Point C (Low)	Point C (High)
East	0.04Hz	< 59.96	> 60.04
West	0.07Hz	< 59.95	> 60.05
ERCOT	0.15Hz	< 59.90	> 60.10
HQ	0.30Hz	< 59.85	> 60.15

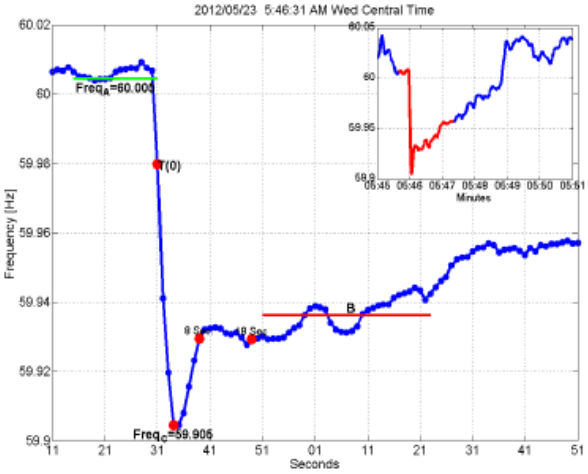
Table 1: Interconnection Frequency Excursion Threshold Values

b. The time from the start of the rapid change in frequency until the point at which Frequency has stabilized within a narrow range should be less than 18 seconds.

c. If any data point in the B Value average recovers to the A Value, the event will not be included.

4. Pre-disturbance frequency should be relatively steady and near 60.000 Hz for the A Value. The A Value is computed as an average over the period from -16 seconds to 0 seconds before the frequency transient begins to decline. For example, given the choice of the two events below, the one on the right is preferred as the pre-disturbance frequency is stable and also closer to 60 Hz.





5. Excursions that include 2 or more events that do not stabilize within 18 seconds will not be considered.

6. Frequency excursion events occurring during periods when large interchange schedule ramping or load change is happening, and frequency excursion events occurring within 5 minutes of the top of the hour, will be excluded from consideration if other acceptable frequency excursion events from the same quarter are available.

7. The ERO will select the largest (A Value to Point C) 2 or 3 frequency excursion events occurring each month. If there are not 2 frequency excursion events satisfying the selection criteria in a month, then other frequency excursion events should be picked in the following sequence:

a. From the same event quarter of the year.

b. From an adjacent month.

c. From a similar load season in the year (shoulder vs. summer/winter)

d. The largest unused event.

As noted earlier, if a total of 20 events are not available in an evaluation year, then similar acceptable events from the next year's evaluation period will be included with the data set by the ERO for determining Frequency Response Obligation (FRO) compliance. The first year's small set of data will be reported and used for Bias Setting purposes, but compliance evaluation on the FRO will be done using a 24 month data set.

To assist Balancing Authority preparation for complying with this standard, the ERO will provide quarterly posting of candidate frequency excursion events for the current year FRM calculation. The ERO will post the final list of frequency excursion events used for standard compliance as specified in Attachment A of BAL-003-1. The following is a general description of the process that the ERO will use to ensure that BAs can evaluate events during the year in order to monitor their performance throughout the year.

Monthly

Candidate events will be initially screened by the "Frequency Event Detection Methodology" shown on the following link located on the NERC Resources Subcommittee area of the NERC website: http://www.nerc.com/docs/oc/rs/Frequency_Event_Detection_Methodology_and_Criteria_Oct_2011.pdf. Each month's list will be posted by the end of the following month on the NERC website, http://www.nerc.com/filez/rs.html and listed under "Candidate Frequency Events".

Quarterly

The monthly event lists will be reviewed quarterly with the quarters defined as:

- December through February
- March through May
- June through August
- September through November

Based on criteria established in the "*Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard",* events will be selected to populate the FRS Form 1 for each Interconnection. The Form 1's will be posted on the NERC website, in the Resources Subcommittee area under the title "Frequency Response Standard Resources". Updated Form 1's will be posted at the end of each quarter listed above after a review by the NERC RS' Frequency Working Group. While the events on this list are expected to be final, as outlined in the selection criteria, additional events may be considered, if the

number of events throughout the year do not create a list of at least 20 events. It is intended that this quarterly posting of updates to the FRS Form 1 would allow BAs to evaluate the events throughout the year, lessening the burden when the yearly posting is made.

Annually

The final FRS Form 1 for each Interconnection, which would contain the events from all four quarters listed above, will be posted as specified in Attachment A. Each Balancing Authority reports its previous year's Frequency Response Measure (FRM), Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO as specified in Attachment A using the final FRS Form 1. The ERO will check for errors and use the FRS Form 1 data to calculate CPS limits and FROs for the upcoming year.

Once the data listed above is fully reviewed, the ERO may adjust the implementation specified in Attachment A for changing the Frequency Bias Settings and CPS limits. This allows flexibility in when each BA implements its settings.

Process for Adjusting Interconnection Minimum Frequency Bias Setting

This procedure outlines the process the ERO is to use for modifying minimum Frequency Bias Settings to better meet reliability needs. The ERO will adjust the Frequency Bias Setting minimum in accordance with this procedure.

The ERO will post the minimum Frequency Bias Setting values on the ERO website along with other balancing standard limits.

Under BAL-003-1, the minimum Frequency Bias Settings will be moved toward the natural Frequency Response in each interconnection. In the first year, the minimum Frequency Bias Setting for each interconnection is shown in Table 2 below. Each Interconnection Minimum Frequency Bias Setting is based on the sum of the non-coincident peak loads for each BA from the currently available FERC 714 Report or equivalent. This non-coincident peak load sum is multiplied by the percentage shown in Table 1 to get the Interconnection Minimum Frequency Bias Setting. The Interconnection Minimum Frequency Bias Setting is allocated among the BAs on an interconnection using the same allocation method as is used for the allocation of the Frequency Response Obligation (FRO).

Interconnection	Interconnection Minimum Frequency Bias Setting (in MW/0.1Hz)
Eastern	0.9% of non-coincident peak load
Western	0.9% of non-coincident peak load
ERCOT*	N/A
HQ*	N/A

Table 2. Frequency Bias Setting Minimums

*The minimum Frequency Bias Setting requirement does not apply to a Balancing Authority that is the only Balancing Authority in its Interconnection. These Balancing Authorities are solely responsible for providing reliable frequency control of their Interconnection. These Balancing Authorities are responsible for converting frequency error into a megawatt error to provide reliable frequency control, and the imposition of a minimum bias setting greater than the magnitude the Frequency Response Obligation may have the potential to cause control system hunting, and instability in the extreme.

The ERO, in coordination with the regions of each interconnection, will annually review Frequency Bias Setting data submitted by BAs. If an Interconnection's total minimum Frequency Bias Setting exceeds (in absolute value) the Interconnection's total natural Frequency Response by more (in absolute value) than 0.2 percentage points of peak load (expressed in MW/0.1Hz), the minimum Frequency Bias Setting for BAs within that Interconnection may be reduced (in absolute value) based on the technical evaluation and consultation with the regions affected by 0.1 percentage point of peak load (expressed in MW/0.1Hz) to better match that Frequency Bias Setting and natural Frequency Response.

The ERO, in coordination with the regions of each Interconnection, will monitor the impact of the reduction of minimum frequency bias settings, if any, on frequency performance, control performance,

and system reliability. If unexpected and undesirable impacts such as, but not limited to, sluggish post-contingency restoration of frequency to schedule or control performance problems occur, then the prior reduction in the minimum frequency bias settings may be reversed, and/or the prospective reduction based on the criterion stated above may not be implemented.

Interconnection Frequency Response Obligation Methodology

This procedure outlines the process the ERO is to use for determining the Interconnection Frequency Response Obligation (IFRO).

The following are the formulae that comprise the calculation of the IFROs.

$$DF_{Base} = F_{Start} - UFLS$$

$$DF_{CC} = DF_{Base} - CC_{Adj}$$

$$DF_{CBR} = \frac{DF_{CC}}{CB_R}$$

$$MDF = DF_{CBR} - BC'_{Adj}$$

$$ARLPC = RLPC - CLR$$

$$IFRO = \frac{ARLPC}{MDF}$$

Where:

- DF_{Base} is the base delta frequency.
- F_{Start} is the starting frequency determined by the statistical analysis.
- UFLS is the highest UFLS trip setpoint for the interconnection.
- CC_{Adj} is the adjustment for the differences between 1-second and sub-second Point C observations for frequency events. A positive value indicates that the sub-second C data is lower than the 1-second data.
- DF_{CC} is the delta frequency adjusted for the differences between 1-second and sub-second Point C observations for frequency events.
- CB_R is the statistically determined ratio of the Point C to Value B.
- DF_{CBR} is the delta frequency adjusted for the ratio of the Point C to Value B.
- BC'_{ADJ} is the statistically determined adjustment for the event nadir being below the Value B (Eastern Interconnection only) during primary frequency response withdrawal.
- MDF is the maximum allowable delta frequency.
- RLPC is the resource loss protection criteria.
- CLR is the credit for load resources.
- ARLPC is the adjusted resource loss protection criteria adjusted for the credit for load resources.
- IFRO is the interconnection frequency response obligation.

Introduction

This document provides background on the development, testing and implementation of BAL-003-1 - Frequency Response Standard (FRS).[1] The intent is to explain the rationale and considerations for the Requirements of this standard and their associated compliance information. The document also provides good practices and tips for Balancing Authorities ("BAs") with regard to Frequency Response.

In Order No. 693, the Federal Energy Regulatory Commission ("FERC" or the "Commission") directed additional changes to BAL-003.[2] This document explains how compliance with those directives is met by BAL-003-1.

The original Standards Authorization Request ("SAR"), finalized on June 30, 2007, assumed there was adequate Frequency Response in all the North American Interconnections. The goal of the SAR was to update the Standard to make the measurement process of frequency response more objective and to provide this objective data to Planners and Operators for improved modeling. The updated models will improve understanding of the trends in Frequency Response to determine if reliability limits are being approached. The Standard would also lay the process groundwork for a transition to a performance-based Standard if reliability limits are approached.

This document will be periodically updated by the FRS Drafting Team (FRSDT) until the Standard is approved. Once approved, this document will then be maintained and updated by the ERO and the NERC Resources Subcommittee to be used as a reference and training resource.

Background

This section discusses the different components of frequency control and the individual components of Primary Frequency Control also known as Frequency Response.

Frequency Control

Most system operators generally have a good understanding of frequency control and Bias Setting as outlined in the balancing standards and the references to them in the NERC Operating Manual. Frequency control can be divided into four overlapping windows of time as outlined below.

> **Primary Frequency Control (Frequency Response) –** Actions provided by the Interconnection to arrest and stabilize frequency in response to frequency deviations. Primary Control comes from automatic generator governor response (also known as speed

[1] Unless otherwise designated herein, all capitalized terms shall have the meaning set forth in the Glossary of Terms Used in NERC Reliability Standards, available here: http://www.nerc.com/files/Glossary_of_Terms.pdf.

regulation), load response (typically from motors), and other devices that provide an immediate response based on local (device-level) control systems.

Secondary Frequency Control – Actions provided by an individual BA or its Reserve Sharing Group to correct the resource – load unbalance that created the original frequency deviation, which will restore both Scheduled Frequency and Primary Frequency Response. Secondary Control comes from either manual or automated dispatch from a centralized control system.

Tertiary Frequency Control – Actions provided by Balancing Authorities on a balanced basis that are coordinated so there is a net zero effect on Area Control Error (ACE). Examples of Tertiary Control include dispatching generation to serve native load; economic dispatch; dispatching generation to affect Interchange; and re-dispatching generation. Tertiary Control actions are intended to replace Secondary Control Response by reconfiguring reserves.

Time Control includes small offsets to scheduled frequency to keep long term average frequency at 60 Hz.

Primary Frequency Control – Frequency Response

Primary Frequency Control, also known generally as **Frequency Response**, is the first stage of overall frequency control and is the response of resources and load to a locally sensed change in frequency in order to arrest that change in frequency. Frequency Response is automatic, not driven by any centralized system, and begins within seconds rather than minutes. Different resources, loads, and systems provide Frequency Response with different response times, based on current system conditions such as total resource/load and their respective mix.

The proposed NERC Glossary of Terms defines **Frequency Response** as:

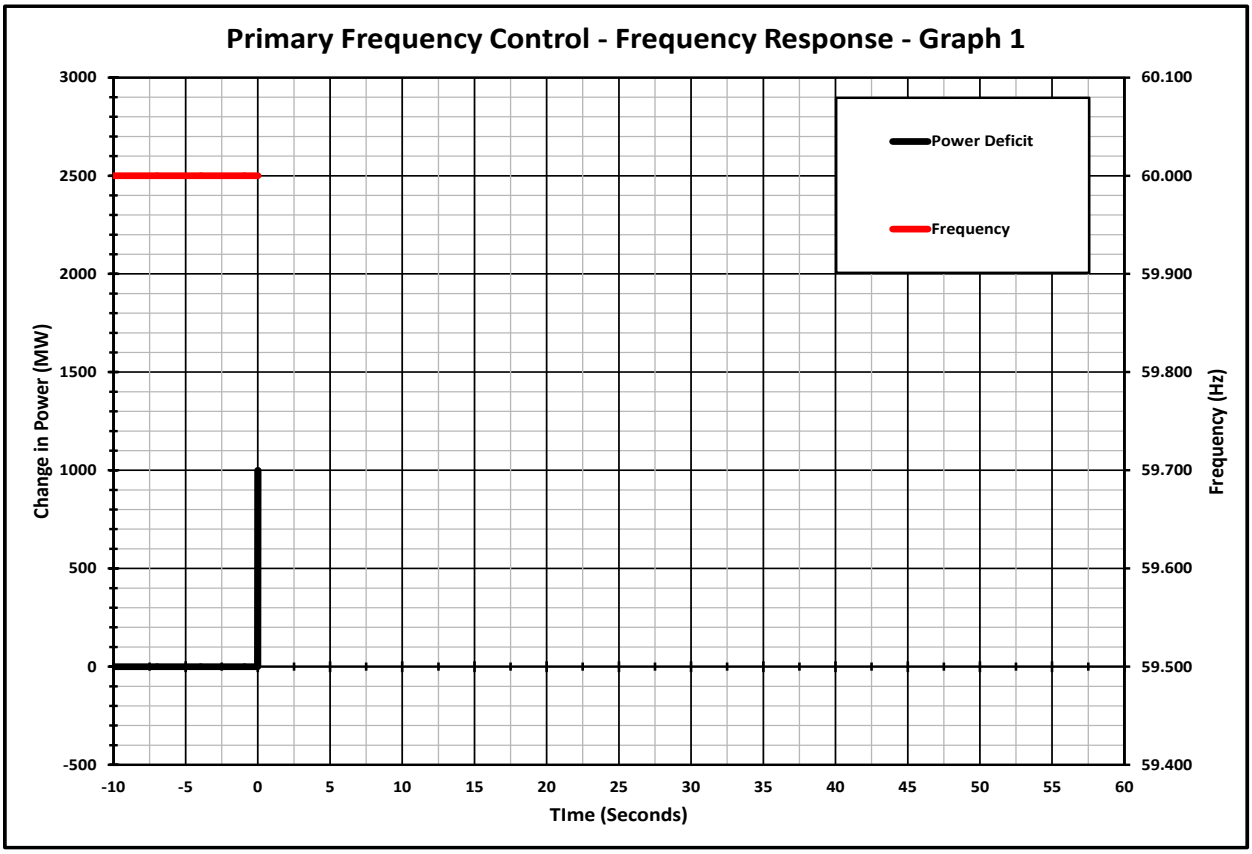
- (Equipment) The immediate and automatic reaction or response of power from a system or power from elements of the system to a change in locally sensed system frequency.
- (System) The sum of the change in demand, and the change in generation, divided by the change in frequency, expressed in megawatts per 0.1 Hertz (MW/0.1 Hz).

As noted above, Frequency Response is the characteristic of load and generation within Balancing Authorities and Interconnections. It reacts or responds with changes in power to attempt changes in load-resource balance that result in changes to system frequency. Because the loss of a large generator is much more likely than a sudden loss of an equivalent amount of load, Frequency Response is typically discussed in the context of a loss of a large generator. Included within Frequency Response are many components of that response. Understanding Frequency Response and the FRS requires an understanding of each of these components and how they relate to each other.

Frequency Response Illustration

The following simple example is presented to illustrate the components of Frequency Response in graphical form. It includes a series of seven graphs that illustrate the various components of

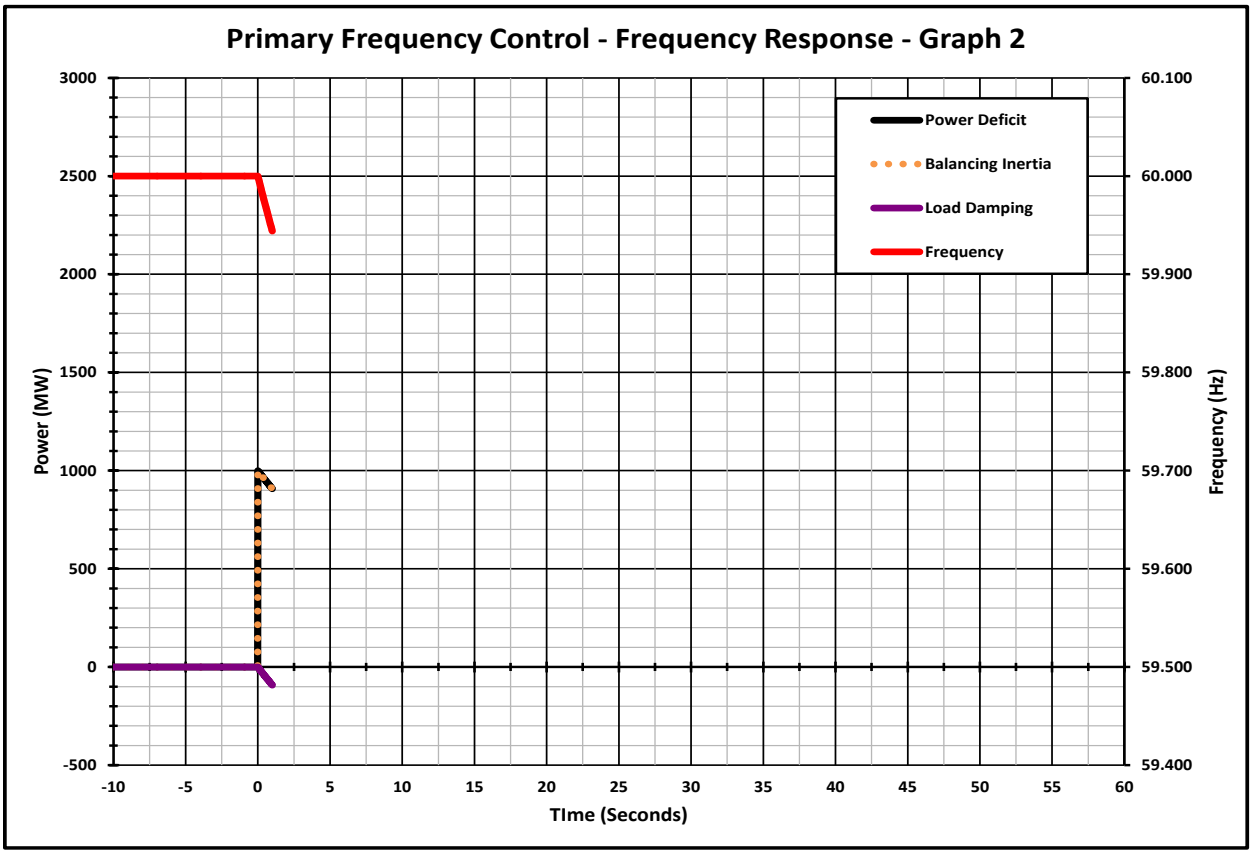
Frequency Response and a brief discussion of each describing how these components react to attempted changes in the load-resource balance and resulting changes in system frequency. The illustration is based on an assumed Disturbance event of the sudden loss of 1000 MW of generation. Although a large event is used to illustrate the response components, even small frequently occurring events will result in similar reactions or responses. The magnitude of the event only affects the shape of the curves on the graph; it does not obviate the need for Frequency Response.



The first graph, Primary Frequency Control – Frequency Response – Graph 1, presents a sudden loss of generation of 1000 MW. The components are presented relative to time as shown on the horizontal Time axis in seconds. This simplified example assumes a Disturbance event of the sudden loss of generation resulting from a breaker trip that instantaneously removes 1000 MW of generation from the interconnection. This sudden loss is illustrated by the power deficit line shown in black using the MW scale on the left. Interconnection frequency is illustrated by the frequency line shown in red using the Hertz scale on the right. Since the Scheduled Frequency is normally 60 Hz, it is assumed that this is the frequency when the Disturbance event occurs.

Even though the generation has tripped and power injected by the generator has been removed from the interconnection, the loads continue to use the same amount of power. The

"Law of Conservation of Energy"[3] requires that the 1000 MW must be supplied to the interconnection if energy balance is to be "conserved". This additional 1000 MW of power is produced by extracting kinetic energy that was stored in the rotating mass of all of the synchronized generators and motors on the interconnection when they were increased from zero to synchronous speed – essentially using this equipment as a giant flywheel. The extracted energy supplies the "balancing inertia"[4] power required to maintain the power and energy balance on the interconnection. This balancing inertia power is produced by the generators' spinning inertial mass' resistance to the slowdown in speed of the rotating equipment on the interconnection that both provides the stored kinetic energy and reduces the frequency of the interconnection. This is illustrated in the second graph, Primary Frequency Control – Frequency Response – Graph 2, by the orange dots representing the balancing inertia power that exactly overlay and offset the power deficit.



As the frequency decreases, synchronized motors slow, as does the work they are providing, resulting in a decrease in load called "load damping." This load damping is the reason that the power deficit initially declines. Synchronously operated motors will contribute to load damping. Variable speed drives that are decoupled from the interconnection frequency do not

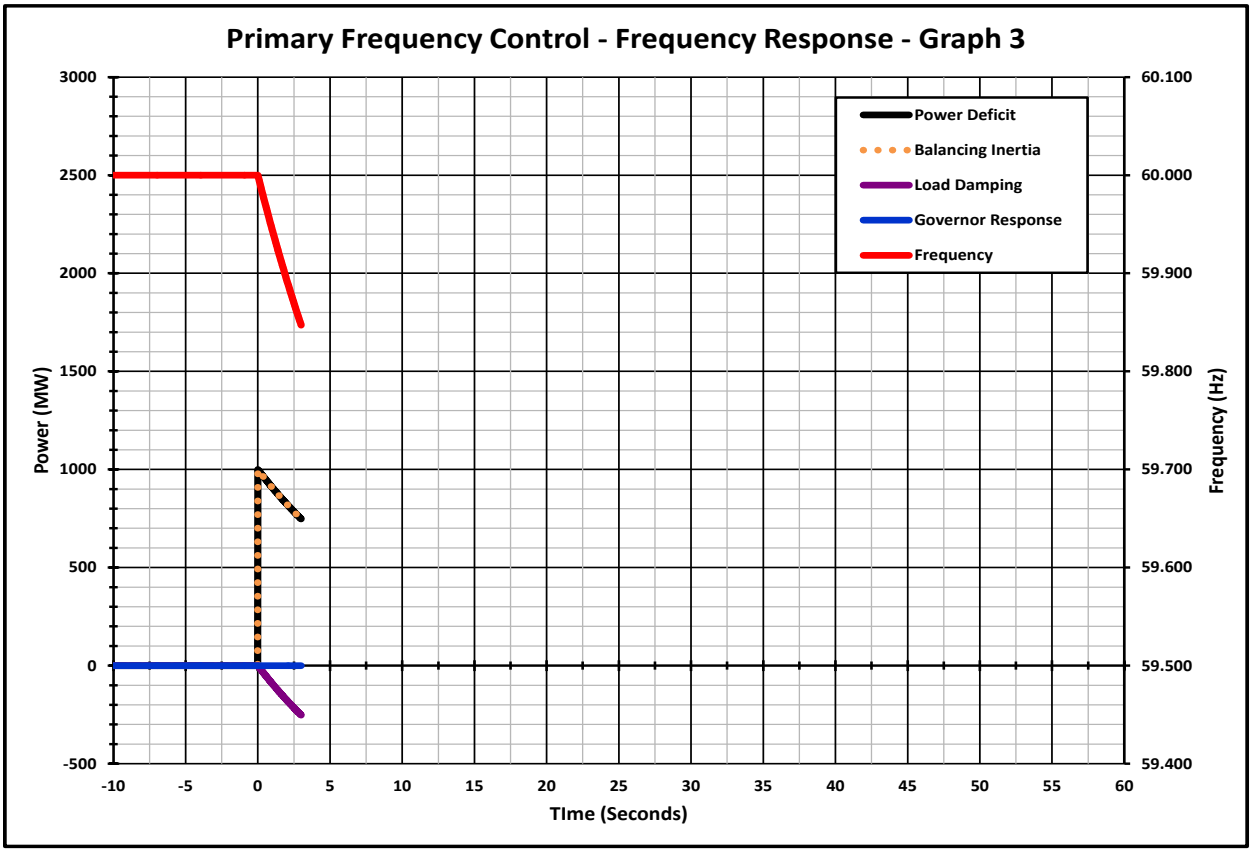
[3] The "Law of Conservation of Energy" is applied here in the form of power. If energy must be conserved, then power which is the first derivative of energy with respect to time, must also be conserved.

[4] The term "balancing Inertia" is coined here from the terms "inertial frequency response" and "balancing energy". Inertial frequency response is a common term used to describe the power supplied for this portion of the frequency response and balancing energy is a term used to describe the market energy supposedly purchased to restore energy balance.

contribute to load damping. In general, any load that does not change with interconnection frequency including resistive load will not contribute to load damping or Frequency Response.

It is important to note that the power deficit equals exactly the balancing inertia, indicating that there is no power or energy imbalance at any time during this process. What is normally considered as "balancing power or energy" is actually power or energy required to correct the frequency error from scheduled frequency. Any apparent power or energy imbalance is corrected instantaneously by the balancing inertia power and energy extracted from the interconnection. Thus the balancing function is really a frequency control function described as a balancing function because ACE is calculated in MWs instead of Hertz, frequency error.

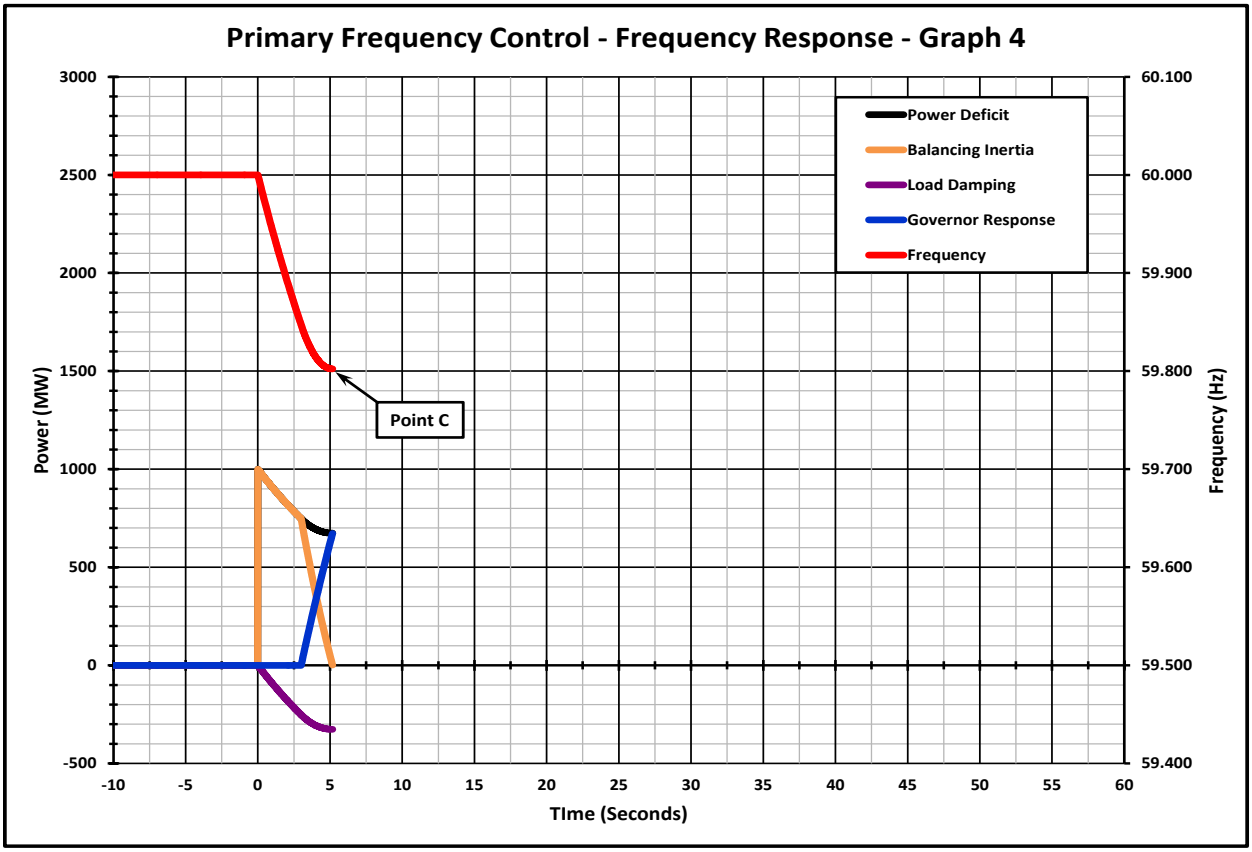
During the initial seconds of the Disturbance event, the governors have yet to respond to the frequency decline. This is illustrated with the Blue line on the third graph, Primary Frequency Control – Frequency Response – Graph 3, showing Governor Response. This time delay results from the time that it takes the controller to adjust the equipment and the time it takes the mass to flow from the source of the energy (main steam control valve for steam turbines, the combustor for gas turbines, or the gate valve for hydro turbines) to the turbine-generator blades where the power is converted to electrical energy.



Note that the frequency continues to decline due to the ongoing extraction by balancing inertia power of energy from the rotating turbine-generators and synchronous motors on the interconnection. The reduction in load also continues as the effect of load damping continues

to reduce the load while frequency declines. During this time delay (before the governor response begins) the balancing inertia limits the rate of change of frequency.

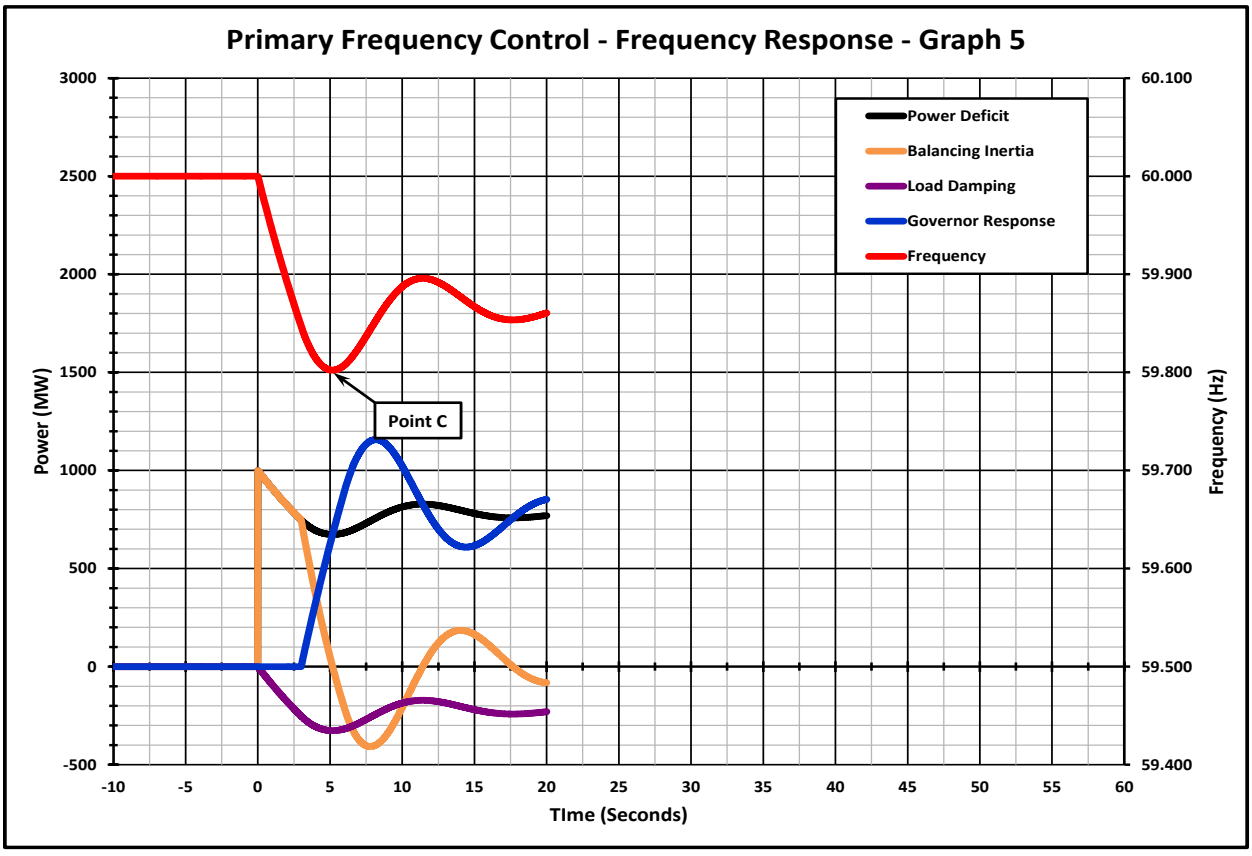
After a short time delay, the governor response begins to increase rapidly in response to the initial rapid decline in frequency, as illustrated on the fourth graph, Primary Frequency Control – Frequency Response – Graph 4. Governor response exactly offsets the power deficit at the point in time that the frequency decline is arrested. At this point in time, the balancing inertia has provided its contribution to reliability and its power contribution is reduced to zero as it is replaced by the governor response. If the time delay associated with the delivery of governor response is reduced, the amount of balancing inertia required to limit the change in frequency by the Disturbance event can also be reduced. This supports the conclusion that balancing inertia is required to manage the time delays associated with the delivery of Frequency Response. Not only is the rapid delivery of Frequency Response important, but the shortening of the time delay associated with its delivery is also important. Therefore, two important components of Frequency Response are 1) how long the time delay is before the initial delivery of response begins; and 2) how much of the response is delivered before the frequency change is arrested.



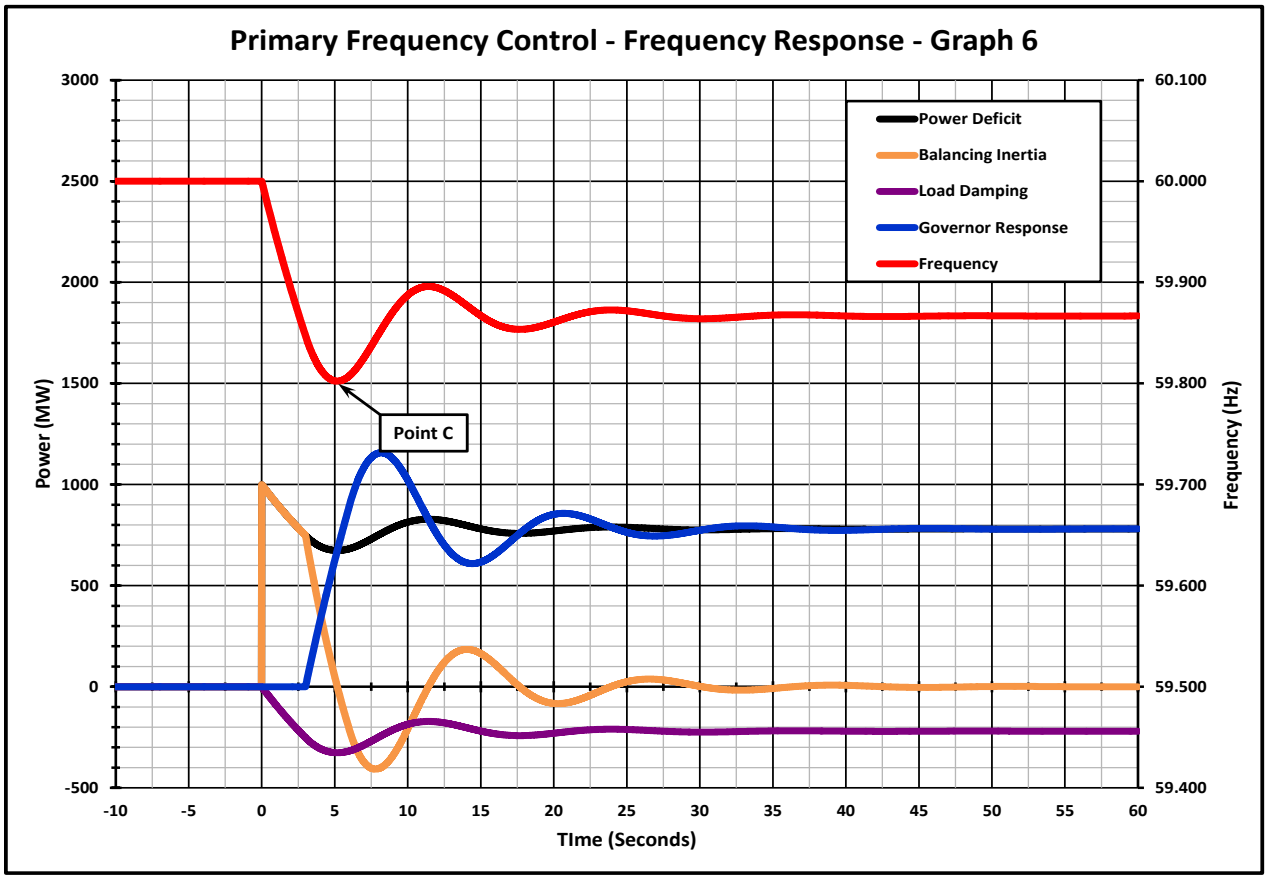
This point, at which the frequency is first arrested, is defined as "Point C" and Frequency Response calculated at this point is called the "**arrested frequency response**." The arrested frequency is normally the minimum (maximum for load loss events) frequency that will be

experienced during a Disturbance event. From a reliability perspective, this minimum frequency is the frequency that is of concern. Adequate reliability requires that frequency at the time frequency is arrested remain above the under-frequency relay settings so as not to trip these relays and the firm load interrupted by them. Frequency Response delivered after frequency is arrested at this minimum level provides less reliability value than Frequency Response delivered before Point C, but greater value than Secondary Frequency Control power and energy which is delivered minutes later.

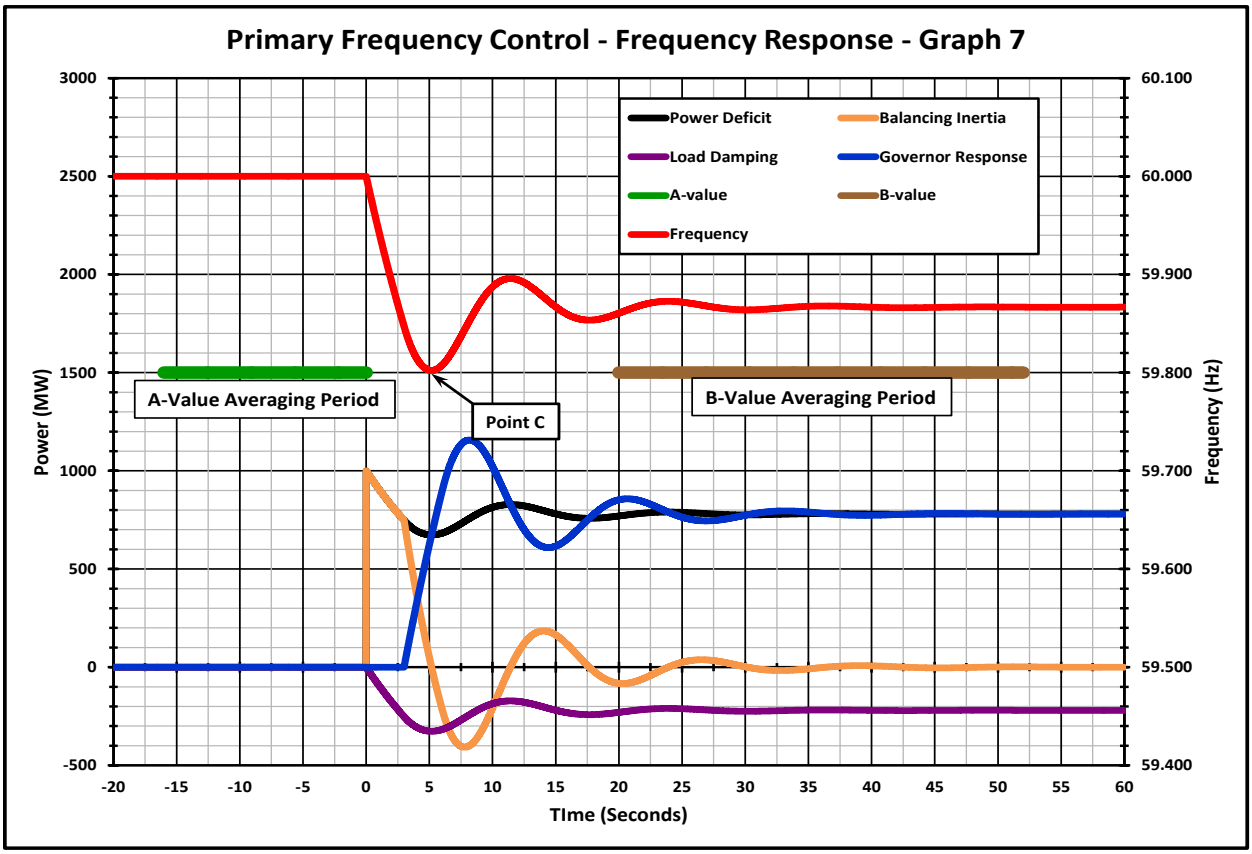
Once the frequency decline is arrested, the governors continue to respond because of the time delay associated with their Governor Response. This results in the frequency partially recovering from the minimum arrested value and results in an oscillating transient that follows the minimum frequency (arrested frequency) until power flows and frequency settle during the transient period that ends roughly 20 seconds after the Disturbance event. This post-disturbance transient period is included on the fifth illustrative graph, Primary Frequency Control – Frequency Response – Graph 5.



The total Disturbance event illustration is presented on the sixth graph, Primary Frequency Control – Frequency Response – Graph 6. Frequency and power contributions stabilize at the end of the transient period. Frequency Response calculated from data measured during this settled period is called the "Settled Frequency Response." The Settled Frequency Response is the best measure to use as an estimator for the "Frequency Bias Setting" discussed later.



The final Disturbance event illustration is presented on the seventh graph, Primary Frequency Control – Frequency Response – Graph 7. This graph shows the averaging periods used to estimate the pre-disturbance A-Value averaging period and the post-disturbance B-Value averaging period used to calculate the settled frequency response. A discussion of the measurement of Frequency Response immediately follows these graphs. That discussion includes consideration of the factors that affect the methods chosen to measure Frequency Response for implementation in a reliability standard.



Frequency Response Measurement (FRM)

The classic Frequency Response points A, C, and B, shown below in Fig. 1 Frequency Response Characteristic, are used for measurement as found in the Frequency Response Characteristic Survey Training Document within the NERC operating manual, found at http://www.nerc.com/files/opman_7-1-11.pdf. This traditional Frequency Response Measure has recently been more specifically termed "**settled frequency response**." This term has been used because it provides the best Frequency Response Measure to estimate the Frequency Bias Setting in Tie-line Bias Control based Automatic Generation Control Systems. However, the industry has recognized that there is considerable variability in measurement resulting from the selection of Point A and Point B in the traditional measure making the traditional measurement method unsuitable as the basis for an enforceable reliability standard in a real world setting of multiple Balancing Authority interconnections.

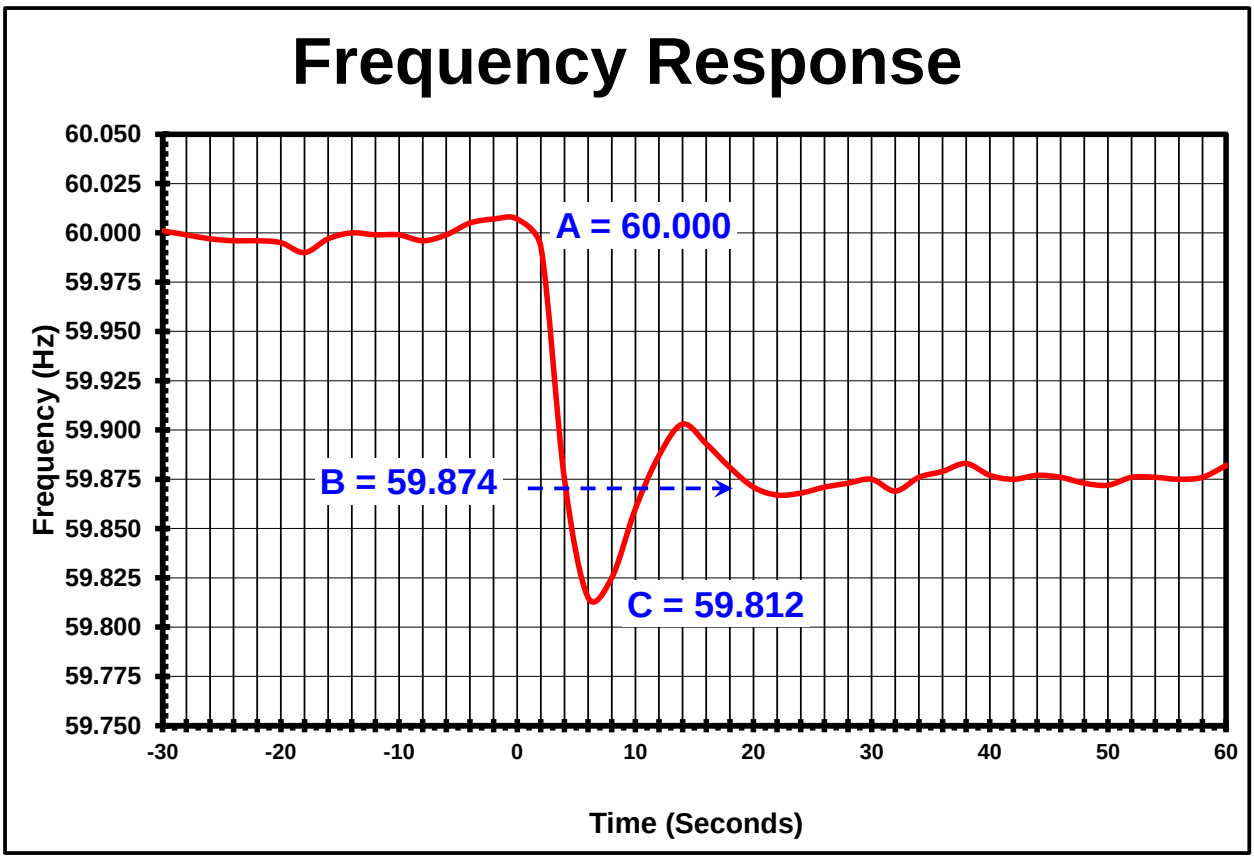


Figure 1. Frequency Response Characteristic

By contrast, measuring an Interconnection's settled frequency response is straightforward and fairly accurate. All that's needed to make the calculation is to know the size of a given contingency (MW), divide this value by the change in frequency and multiply the results by 10 since frequency response is expressed in MW/0.1Hz.

Measuring a BA's frequency response is more challenging. Prior to BAL-003-1, NERC's *Frequency Response Characteristic Survey Training Document* provided guidance to calculate Frequency Response. In short, it told the reader to identify the BA's interchange values "immediately before" and "immediately after" the Disturbance event and use the difference to calculate the MWs the BA deployed for the event. There are two challenges with this approach:

- Two people looking at the same data would come up with different values when assessing which exact points were immediately before and after the event.
- In practice, the actual response provided by the BA can change significantly in the window of time between point B and when secondary and tertiary control can assist in recovery.

Therefore, the measurement of settled frequency response has been standardized in a number of ways to limit the variability in measurement resulting from the poorly specified selection of Point A and Point B. It should be noted that t-0 has been defined as the first scan value that

shows a deviation in frequency of some significance, usually approaching about 10 mHz. The goal is such that the first scan prior to t-0 was unaffected by the deviation and appropriate for one of the averaging points.

- The A-value averaging period of approximately the previous 16 seconds prior to t-0 was selected to allow for an averaging of at least 2 scans for entities utilizing 6 second scan rates. (All time average period references in this document are for 2 second scan rates unless noted otherwise.)
- The B-value averaging period of approximately (t+20 to t+52 seconds) was selected to attempt to obtain the average of the data after primary frequency response was deployed and the transient completed(settled), but before significance influence of secondary control. Multiple periods were considered for averaging the B-value:
    - 12 to 24 sec
    - 18 to 30 sec
    - 20 to 40 sec
    - 18 to 52 sec
    - 20 to 52 sec

  It is necessary for all BAs from an interconnection to use the same averaging periods to provide consistent results. In addition, the SDT decided that until more experience is gained, it is also desirable for all interconnections to use the same averaging periods to allow comparison between interconnections.

The methods presented in this document only address the values required to calculate the frequency response associated with the frequency change between the initial frequency, A-Value, and the settling frequency, B-Value. No reasonable or consistent calculations can be made relating to the arresting frequency, C-Value, using Energy Management System (EMS) scan rate data as long as 6-seconds or tie-line flow values associated with the minimum value of the frequency response characteristic (C-value) as measured at the BA level.

Both the calculation of the frequency at Point A and the frequency at Point B began with the assumption that a 6-second scan rate was the source of the data. Once the averaging periods for a 6-second scan rate were selected, the averaging periods for the other scan rates were selected to provide as much consistency as possible between BAs with different scan rates.

The Frequency at Point A was initially defined as the average of the two scans immediately prior to the frequency event. All other averaging periods were selected to be as consistent as possible with this 12 second average scan from the 6-second scan rate method. In addition, the "**actual net interchange immediately before Disturbance**" is defined as the average of the same scans as used for the Point A frequency average.

The Frequency at Point B was then selected to be an average as long as the average of 6-second scan data as possible that would not begin until most of the hydro governor response had been delivered and would end before significant Automatic Generation Control (AGC) recovery response had been initiated as indicated by a consistent frequency restoration slope. The "**actual net interchange immediately after Disturbance**" is defined as the average of the same scans as used for the Point B frequency average.

B Averaging Period Selection:

Experience from the Electric Reliability Council of Texas ("ERCOT") and the field trail on other interconnections indicated that the 12 to 24 second and 18 to 30 second averaging periods were not suitable because they did not provide the consistency in results that the other averaging periods provided, and that the remaining measuring periods do not provide significantly different results from each other. The team believed that this was observed because the transients were not complete in all of the samples using these averaging periods.

The 18 to 52 second and 20 to 52 second averaging periods were compared to each other, with the 20 to 52 second period providing more consistent values, believed to result from the incomplete transient in some of the 18 to 52 second samples.

This left a choice between the 20 to 40 second and the 20 to 52 second averaging periods. The team recognized that there would be more AGC response in the 20 to 52 second period, but the team also recognized that the 20 to 52 second period would provide a better measure of squelched response from outer loop control action. The 20 to 52 second period was selected because it would indicate squelched response from outer-loop control and provide incentive to reduce response withdrawal. The final selections for the data averaging periods used in FRS Form 1 are shown in the table below.

Definitions of Frequency Values for Frequency Response Calculation

Scan Rate	T 0 Scan	A Value (average)	B Value (average)
6-Seconds	Identify first significant change in frequency as the T 0 scan	Average of T-1 through T-2 scans	Average of T+4 through T+8 scans
5-Seconds		Average of T-1 through T-2 scans	Average of T+5 through T+10 scans
4-Seconds		Average of T-1 through T-3 scans	Average of T+6 through T+12 scans
3-Seconds		Average of T-1 through T-5 scans	Average of T+7 through T+17 scans
2-Seconds		Average of T-1 through T-8 scans	Average of T+10 through T+26 scans

Consistent measurement of Primary Frequency Response is achievable for a selected number of events and can produce representative frequency response values, provided an appropriate sample size is used in the analysis. Available research investigating the minimum sample size to provide consistent measurements of Frequency Response has shown that a minimum sample size of 20 events should be adequate.

Measurement of Primary Frequency Response on an individual resource or load basis requires analysis of energy amounts that are often small and difficult to measure using current methods. In addition, the number of an interconnection's resources and loads providing their response could be problematic when compiling results for multiple events.

Measurement of Primary Frequency Response on an interconnection (System) basis is straight forward provided that an accurate frequency metering source is available and the magnitude of the resource/load imbalance is known in MWs.

Measurement on a Balancing Authority basis can be a challenge, since the determination of change in MWs is determined by the change in the individual BA's metered tie lines. Summation of tie lines is accomplished by summing the results of values obtained by the digital scanning of meters at intervals up to six seconds, resulting in a non-coincidental summing of values. Until the technology to GPS time stamp tie line values at the meter and the summing of those values for coincidental times is in use throughout the industry, it is necessary to use averaging of values described above to obtain consistent results.

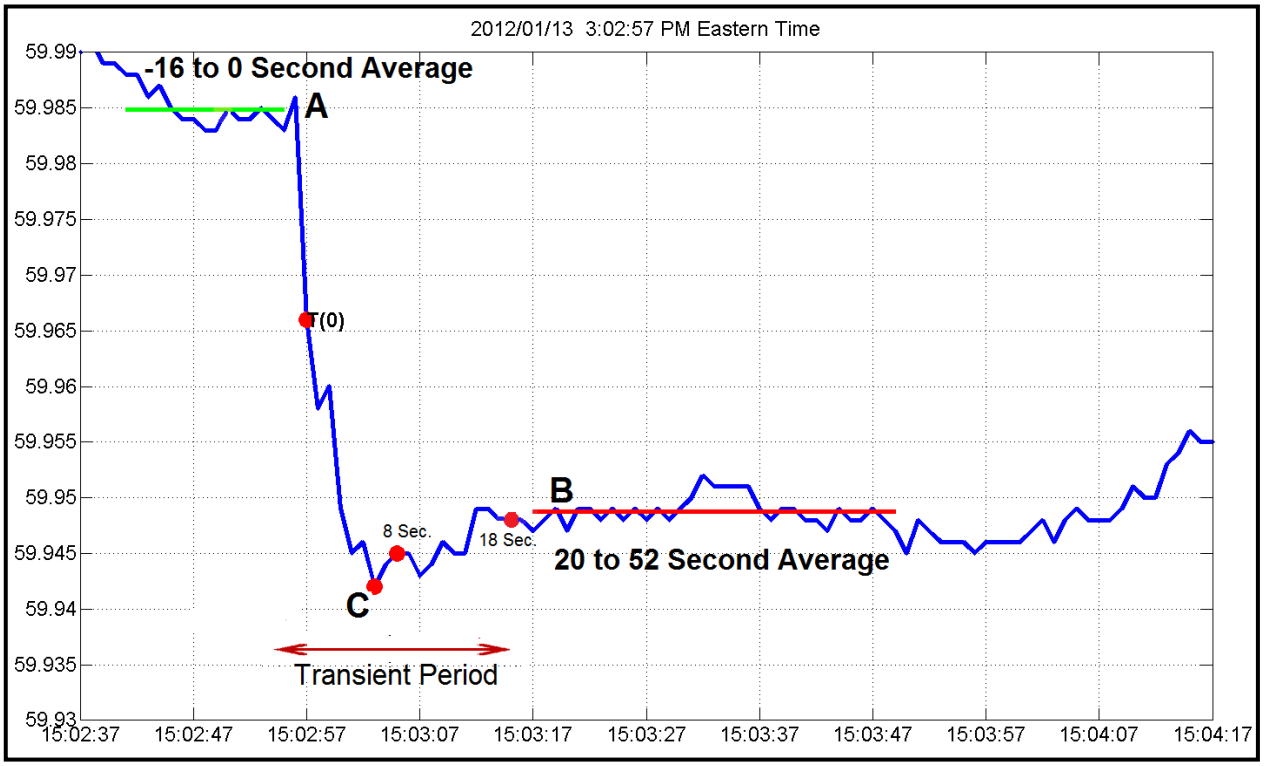

Figure 2. Frequency Response Measurement

The standardized measure is shown graphically in Fig. 2 Frequency Response Measurement with the averaging periods shown by the solid blue lines on the graph. Since FERC directed a performance obligation for BAL-003-1, it is important to be more objective in the measurement process. The standardized calculation is available on FRS Form 2 for EMS scan rates of 2, 3, 4, 5, and 6 seconds at http://www.nerc.com/filez/standards/Frequency_Response.html.

Arrested Frequency Response

There is another measure of Frequency Response that is of interest when developing a Frequency Response estimate that not only will be used for estimating the Frequency Bias Setting, but will also be used to assure reliability by operating in a manner that will bound interconnection frequency and prevent the operation of Under-frequency Relays. This Frequency Response Measure has recently been named "**arrested frequency response.**" This Frequency Response is significantly affected by the inertial Frequency Response, the governor Frequency Response and the time delays associated with the delivery of governor Frequency Response. It is calculated by using the change in frequency between the initial frequency, A,

and the maximum frequency change during the event, C, instead of using the change between A and B. Arrested Frequency Response is the correct response for determining the minimum Frequency Response related to under-frequency relay operation and the support of interconnection reliability. This is because it can be used to provide a direct estimate of the maximum frequency deviation an interconnection will experience for an initial frequency and a given size event in MW. Unfortunately, arrested frequency response cannot currently be measured using the existing EMS-based measurement infrastructure. This limitation exists because the scan rates currently used in industry EMSs are incapable of measuring the net actual interchange at the same instant that the maximum frequency deviation is reached. Fortunately, the ratio of arrested frequency response and settled frequency response tends to be stable on an interconnection. This allows the settled frequency response value to be used as a surrogate for the arrested frequency response and implement a reasonable measure upon which to base a standard. One consequence of using the settled frequency response as a surrogate for the arrested frequency response is the inclusion of a large reliability margin in Interconnection Frequency Response Obligation to allow for the difference between the settled frequency response as measured and the arrested frequency response that indicates reliability.

As measurement infrastructure improves one might expect the Frequency Response Obligation to transition to a measurement based directly on the arrested frequency response while the Frequency Bias Setting will continue to be based on the settled frequency response. However, at this time, the measurement devices and methods in use do not support the necessary level of accuracy to estimate arrested frequency response contribution for an individual Balancing Authority.

Frequency Response Definition and Examples

Limitations of the measurement infrastructure determine the measurement methods recommended in this standard. The measurement limitations provide opportunities to improve the Frequency Response as measured in the standard without contributing to an improvement in Frequency Response that contributes to reliability. These definitions and examples provide a basis for determining which contributions to Frequency Response contribute the most to improved reliability. They also provide the basis for determining on a case by case basis whether the individual contributors to the Frequency Response Measure are also contributing to reliability.

General Frequency Response Characteristics

In the simplest case Frequency Response includes any automatic response to changes in local frequency. If that response works to decrease that change in frequency, it is beneficial to reliability. If that response works to increase that change in frequency, it is detrimental to reliability. However, this definition does not address the relative value of one response as compared to other responses that may be provided in a specific case.

There are numerous characteristics associated with the Frequency Response that affect the reliability value and economic value of the response. These characteristics include:

1. **Inertial** – the response is inertial or approximates inertial response
   Inertial response provides power without delay that is proportional to the frequency and the change in frequency. Therefore, power provided by electronic control as

synthetic inertial response must be proportional to the frequency and change in frequency and be provided without a time delay.

2. **Immediate** – no unnecessary intentional time delays or reduction in the rate of response delivery
    a. time delay before the beginning of the response
    Turbines that convert heat or kinetic energy have time delays related to the time delay from the time that the control valves are moved to initiate the change in power and the time that the power is delivered to the generator. These times are usually associated with the time it takes a change in mass flow to travel from the control valve to the first blades of the turbine in the turbine generator.

    b. reduction in the rate of response delivery
    There are natural delays associated with the rate of response delivery that are related to the mass flow travel from the first turbine blades to the last turbine blades. In addition, some turbines have intentional delays designed into the control system to slow the rate of change in the delivery of the kinetic energy or fuel to the turbine to prevent the turbine or other equipment from being damaged, hydro turbines, or to prevent the turbine from tripping due to excessive rate of change, gas turbines.

3. **Proportional** – the amount of the total response is proportional to the frequency error
    a. No Deadband – the response is proportional across the entire frequency range
    b. Deadband – the response is only proportional outside of a defined deadband

4. **Bi-directional** – the response occurs to both increases and decreases in frequency

5. **Continuous** – there are no discontinuities in the delivery of the response (no step changes)

6. **Sustained** – the response is sustained until frequency is returned to schedule

Frequency Response Reliability Value

This section contains a more detailed discussion of the various characteristics of Frequency Response listed in the previous section. It also provides an indication of the relative value of these characteristics with respect to their contribution to reliability. Finally, it includes some examples of the described responses.

Inertial Response is provided from the stored energy in the rotating mass of the turbine-generators and synchronous motors on the interconnection. It limits the rate of change of frequency until sufficient Frequency Response can be supplied to arrest the change in frequency. Its reliability value increases as the time delay associated with the delivery of other Frequency Response on the interconnection increases. If those time delays are minimal, then the value of inertial response is low. If all time delays associated with the Frequency Response could be eliminated, then inertial response would have little value.

The reliability value of Inertial Response is the greatest on small interconnections because the size of the Disturbance events is larger relative to the inertia of the interconnection. Electronic

controls have been developed to provide synthetic inertial response from the stored energy in asynchronous generators to supplement the natural inertial response. Some Type III & IV Wind Turbines have this capability. In addition, electronically controlled SCRs have been developed that can store energy in the electrical system and release this stored energy to supply synthetic inertial response when required.

Immediate Response is provided by load damping and because the time delays associated with its delivery are very short (related to the speed of electrical signal in the electrical system); load damping requires very little inertial response to limit arrested frequency effectively. Synthetic immediate response can also be supplied from loads because in many cases, there is no mass flow time delay associated with the load process providing the power and energy reduction. Therefore, loads can provide an immediate response with a higher reliability value than generators with time delays required by the physics of the turbine-generator.

Governor response has time delays associated with its delivery. Governor response provided with shorter time delays has a higher reliability value because those shorter time delays require less inertial response to arrest frequency. Governor response is provided by the turbine-generators on the interconnection. Time delays associated with governor response vary depending on the type of turbine-generator providing the response.

The longest time delays are usually associated with high head hydro turbine-generators that require long times from the governor action until the additional mass flow through the turbine. These units may also have the longest delivery time associated with the full delivery of response because of the timing designed into the governor response.[5]

Intermediate time delays are usually associated with steam turbine-generators. The response begins when the steam control valves are adjusted and the steam mass flows from the valves to the first high pressure turbine blades. The delivery times associated with the full delivery of response may require the steam to flow through high, intermediate and low pressure turbines including reheat flows before full power is delivered. These times are shorter than those of the hydro turbine-generators in general, but not as fast as the times associated with gas turbines.[6]

Gas turbines typically have the shortest time delays, because control is provided by injecting more or less fuel into the turbine combustor and adjusting the air control dampers. These control changes can be initiated rapidly and the mass flow has the shortest path to the turbine blades. There may be timing limitations related to the rate of change in output of the gas turbine-generator to maintain flame stability in some cases slowing the rate of change.[7]

[6] Interconnected Power System Response to Generation Governing: Present Practice and Outstanding Concerns – Final Report, IEEE, May 2007, pp. 1-4 – 1-6.

[7] Interconnected Power System Response to Generation Governing: Present Practice and Outstanding Concerns – Final Report, IEEE, May 2007, pp. 1-16 – 1-19.

Synthetic Governor Response can be supplied by certain loads and storage systems. The immediacy of the response is normally limited only by the electronic controls used to activate the desired response. Synthetic response, when it can be supplied immediately without significant time delay, has a higher reliability value because it requires less inertial response to achieve smaller arrested frequency deviations.

Proportional Response indicates that the response provided is proportional in magnitude to the frequency error. Response deadbands cause a non-proportional response and reduce the value of the response with respect to reliability. Contrary to general consensus, deadbands do not reduce the amount of Frequency Response that must be provided, they only transfer the responsibility for providing that Frequency Response from one source on the interconnection to another. For a given response, the response with the smaller deadband has the greater reliability value. Therefore, deadbands should be set to the smallest value that supports overall reliable operation including the reliable operation of the generator.

Electronic controls have also been developed to provide synthetic governor response. When these controls are applied to certain loads or stored energy systems, they can be programmed to provide synthetic governor response similar to the proportional response of a turbine-generator governor. Governor response in generators is limited to a small percentage of the output of the generating unit, while synthetic governor response could be applied to much larger percentages of loads or storage devices providing such response.

Load damping provides a proportional response.

Continuous Response is response that has no discontinuous (step) changes in the frequency versus response curve. Step changes (Non-continuous Response) in the Governor Response curve can lead to frequency instabilities at frequencies near the changes. The ERCOT Interconnection observed this and has since prohibited the use of governor response characteristics incorporating step responses.

Step responses also occur with the implementation of load interruption using under-frequency or over-frequency relays.

Bi-directional Response is response that occurs in both directions, when the frequency is increasing and when the frequency is decreasing. A uni-directional response is a response that only occurs once when frequency is decreasing or when frequency is increasing.

Inertial response, governor response and load damping are all bi-directional responses. Certain loads are capable of providing proportional bi-directional response while others are only capable of providing non-proportional bi-directional response.

The ERCOT Load Resource program is a uni-directional response program. Loads are only tripped when frequency declines below a given set-point. When frequency is restored above that set-point, the loads must be manually reconnected. As a consequence, the Frequency Response only occurs once with declining frequency and does not oppose the increase in frequency after the initial decline. If there should be a frequency oscillation, the uni-directional response will not contribute to the opposition of a second frequency decline across the set-

point during an oscillation event. Once a uni-directional response has occurred, it is unavailable for a second decline before reset.

Step or proportional responses implemented bi-directionally can lead to frequency instability when there is less continuous frequency response than the magnitude of the change in continuous response between the trip and reset frequencies in step, or the proportional response rate of change is greater than the underlying continuous response. A step bi-directional response will have the load reconnected as frequency recovers from the event thus opposing the increase in frequency during recovery, and also resetting the load response for the next frequency decline automatically. Bi-directional response obviously has a greater reliability value than uni-directional response.

Sustained Response is provided at its full value until frequency is restored to its scheduled value. On today's interconnections, few frequency responses are fully sustained until frequency has been restored to its scheduled value. On steam based turbine-generators, the steam pressure may drop after a time as the result of the additional steam flow from governor action. However, in general this has not been a problem because most responses are incomplete at the time that frequency has been initially arrested and the additional response has generally been sufficient to make up for more than the these unpreventable reductions in response. However, the intentional withdrawal of response before frequency has been restored to schedule can cause a decline in frequency beyond that which would be otherwise expected. This intentional withdrawal of response is highly detrimental to reliability. Therefore, it can be concluded in general that sustained response has a higher reliability value than un-sustained response.

On an interconnection, the withdrawal of response due to the loss of steam pressure on the steam units may be offset by the slower response of hydro turbine-generators. In these cases, the reliability of the combined response provides greater reliability value than the individual response of each type. The steam turbine-generators provide a fast response that may be reduced, while the hydro turbine-generators provide a slower response, contributing less to the arresting response, offsetting any reduction by the steam turbine-generators to assure a sustained response.

Sustained Response must also be considered for any resource that has a limited duration associated with its response. The amount of stored energy available from a resource may limit its ability to sustain response for a duration of time necessary to support reliability.

Frequency Response Cost Factors

In every system of exchange there are two sides; the supply side and the demand side. The supply side provides the services used by the demand side. In the case of Frequency Response, the supply side includes all providers of Frequency Response and the demand side includes all participants that create the need for Frequency Response.

Frequency Response Costs – Supply Side

There are a number of factors that affect the cost of providing Frequency Response from resources. Since there is a cost associated with those factors, some method of appropriate compensation could be made available to those resources providing Frequency Response.

Without compensation, providers of Frequency Response will be put in the position of incurring additional cost that can be avoided only by reducing or eliminating the response they provide. These costs are incurred independently of whether provided for in a formal Regional Transmission Organization/Independent System Operator (RTO/ISO) market or in a traditional BA subject to the FERC pro-forma tariffs.

It is the responsibility of the BA or the RTO/ISO to acquire the necessary amount of Frequency Response to support reliability in the most cost effective manner. This function is performed best when the suppliers are evaluated based on the value of the Frequency Response they provide and compensated appropriately for that Frequency Response. Suppliers provide Frequency Response when they are assured that they will receive fair compensation. Before considering how to perform this evaluation and compensation, the costs associated with providing Frequency Response should be understood and evaluated with respect to the level of reliability they offer.

Some cost factors that have been identified for providing Frequency Response include:

1. **Capacity Opportunity Cost** – the costs, including opportunity costs, associated with reserving capacity to provide Frequency Response. These costs are usually associated with the alternative use of the same capacity to provide energy or other ancillary services. There may also be capacity opportunity costs associated with the loss in average capacity by a load providing Frequency Response.
2. **Fuel Cost** – The cost of fuel used to provide the Frequency Response. The costs for fuel to provide Frequency Response can result in energy costs significantly different from the system marginal energy cost, both higher and lower. This is the case when Frequency Response is provided by resources that are not at the system marginal cost.
3. **Energy Efficiency Penalty Costs** – the costs associated with the loss in efficiency when the resource is operated in a mode that supports the delivery of Frequency Response. This cost is usually in the form of additional fuel use to provide the same amount of energy. An example is the difference between operating a steam turbine in valve control mode with an active governor and sliding pressure mode with valves wide open and no active governor control except for over-speed. This cost is incurred for all of the energy provided by the resource, not just the energy provided for Frequency Response. There may be additional energy costs associated with a load providing Frequency Response from loss in efficiency of their process when load is reduced.
4. **Capacity Efficiency Penalty Costs** – the costs associated with any reduction in capacity resulting from the loss of capacity associated with the loss in energy efficiency. When efficiency is lost, capacity may be lost at the same time because of limitations in the amount of input energy that can be provided to the resource.
5. **Maintenance Costs** – the operation of the resource in a manner necessary to provide Frequency Response may result in increases in the maintenance costs associated with the resource.
6. **Emissions Costs** – the additional costs incurred to manage any additional emissions that result when the resource is providing Frequency Response or stands ready to provide Frequency Response.

A good contract for the acquisition of Frequency Response from a resource will provide appropriate compensation to the resource all of the costs the resource incurs to provide Frequency Response. It will also provide a method to evaluate the least cost mix of resources necessary to provide the minimum required Frequency Response for maintaining reliability. Finally, it will provide the least complex method of evaluation considering the complexity and efficiency of the acquisition process.

Frequency Response Costs – Demand Side

Not only are there costs associated with acquiring Frequency Response from the supplying resources, there are costs associated with the amount of Frequency Response that must be acquired and influenced by those participants that create the need for Frequency Response. If the costs of acquiring Frequency Response from the supply resources can be assigned to those parties that create the need for Frequency Response, there is the promise that the amount of Frequency Response required to maintain reliability can be minimized. The considerations are the same as those that are driving the development of "real time pricing" and "dynamic pricing". If the costs are passed on to those contributing to the need for Frequency Response, incentives are created to reduce the need for Frequency Response making interconnection operations less expensive and more reliable. The problem is to balance both cost and complexity against reliability on both the supply side and the demand side.

Rationale by Requirement

Requirement 1

R1. Each Frequency Response Sharing Group (FRSG) or Balancing Authority that is not a member of a FRSG shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported in accordance with Attachment A) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each FRSG or Balancing Authority that is not a member of a FRSG to maintain Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation.

Background and Rationale

R1 is intended to meet the following primary objectives:

- Determine whether a Balancing Authority (BA) has sufficient Frequency Response for reliable operations.
- Provide the feeder information needed to calculate CPS limits and Frequency Bias Settings.

Primary Objective

With regard to the first objective, FRS Form 1 and the process in Attachment A provide the method for determining the Interconnections' necessary amount of Frequency Response and allocating it to the Balancing Authorities. The field trial for BAL-003-1 is testing an allocation methodology based on the amount of load and generation in the BA. This is to accommodate the wide spectrum of BAs from generation-only all the way to load-only.

Frequency Response Sharing Groups (FRSGs)

This standard proposes an entity called FRSG, which is defined as:

> *A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the sum of the Frequency Response Obligations of its members.*

This standard allows Balancing Authorities to cooperatively form FRSGs as a means to jointly meet the FRS. There is no obligation to form or be a part of FRSGs. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of FERC's Order No. 693 directives.

FRSG performance may be calculated one of two ways:

- Calculate a group NI_A and measure the group response to all events in the reporting year on a single FRS Form 1, or
- Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual event performance.

Frequency Response Obligation and Calculation

The basic Frequency Response Obligation is based on non-coincident peak load and generation data reported in FERC Form 714 (where applicable, see below for non-jurisdictional entities) for the previous full calendar year. The basic allocation formula used by NERC is:

Where:

- Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
- Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
- Annual Gen_{Int} is the sum of all Annual Gen_{BA} values reported in that interconnection.
- Annual $Load_{Int}$ is the sum of all Annual $Load_{BA}$ values reported in that interconnection.

Balancing Authorities that are not FERC jurisdictional should use the Form 714 Instructions to assemble and submit equivalent data. Until the BAL-003-1 process outlined in Attachment 1 is implemented, Balancing Authorities can approximate their FRO by multiplying their Interconnection's FRO by their share of Interconnection Bias. The data used for this calculation should be for the most recently filed Form 714. As an example, a report to NERC in January 2013 would use the Form 714 data filed in 2012, which utilized data from 2011.

Balancing Authorities that merge or that transfer load or generation need to notify the ERO of the change in footprint and corresponding changes in allocation such that the net obligation for the Interconnection remains the same and so that CPS limits can be adjusted.

Attachment A proposes the following Interconnection event criteria as a basis to determine an Interconnection's Frequency Response Obligation:

- Largest category C loss-of-resource (N-2) event.
- Largest total generating plant with common voltage switchyard.
- Largest loss of generation in the interconnection in the last 10 years.

With regard to the second objective above (determining Frequency Bias Settings and CPS limits), Balancing Authorities have been asked to perform annual reviews of their Frequency Bias Settings by measuring their Frequency Response, dating back to Policy 1. This obligation was carried forward into BAL-003-01.b. While the associated training document provided useful information, it left many of the details to the judgment of the person doing the analysis. The FRS Form 1 and FRS Form 2 provide a consistent, objective process for calculating Frequency Response to develop an annual measure, the FRM.

The FRM will be computed from Single Event Frequency Response Data (SEFRD), defined as: "the data from an individual event from a Balancing Authority that is used to calculate its Frequency Response, expressed in MW/0.1Hz". The SEFRD for a typical Balancing Authority in an Interconnection with more than one Balancing Authority is basically the change of its net actual interchange on its tie lines with its adjacent Balancing Authorities divided by the change in interconnection frequency. (Some Balancing Authorities may choose to apply corrections to their net actual interchange values to account for factors such as nonconforming loads. FRS Form 1 shows the types of adjustments that are allowed.)

A standardized sampling interval of approximately 20 to 52 seconds will be used in the computation of SEFRD values. Microsoft Excel® spreadsheet interfaces for EMS scan rates of 2 through 6 seconds are provided to support the computation.

Single Event Frequency Response Data[8]

The use of a "single event measure" was considered early in the development of the FRS for compliance because a single event measure could be enforced for each event on the interconnection making compliance enforcement a simpler process. The variability of the measurement of Frequency Response for an individual BA for an individual Disturbance event was evaluated to determine its suitability for use as a compliance measure. The individual Disturbance events were normalized and plotted for each BA on the Eastern and Western Interconnections. This data was plotted with a dot representing each event. Events with a measured Frequency Response above the FRO were shown as blue dots and events with a measured Frequency Response below the FRO were shown as red dots. In order to show the full variability of the results the plots have been provide with two scales, a large scale to show all of the events and small scale to show the events closer to the FRO or a value of 1.0. This data is presented on four charts titled Frequency Response Events as Normalized by FRO.

Analysis of this data indicates a single event based compliance measure is unsuitable for compliance evaluation when the data has the large degree of variability shown in these charts. Based on the field trial data provided, only 3 out of 19 BAs on the Western Interconnection would be compliant for all events with a standard based on a single event measure. Only 1 out of 31 BAs on the Eastern Interconnection would be compliant for all events with a standard based on a single event measure. The general consensus of the industry is that there is not a reliability issue with insufficient Frequency Response on any of the North American Interconnections at this time. Therefore, it is unreasonable to even consider a standard that would indicate over 90% of the BAs in North American to be non-compliant with respect to maintaining sufficient Frequency Response to maintain adequate reliability.

In an attempt to balance the workload of Balancing Authorities with the need for accuracy in the FRM, the standard will require at least 20 samples selected during the course of the year to compute the FRM. Research conducted by the FRSDT indicated that a Balancing Authority's FRM will converge to a reasonably stable value with at least 20 samples.

Balancing Authority

Sample Size

In order to support field trial evaluations of sample size, sampling intervals, and aggregation techniques, the FRSDT will be retrieving scan rate data from the Balancing Authorities for each SEFRD. Additional frequency events may also be requested for research purposes, though they will not be included in the FRM computation.

FERC Order No. 693 directed the ERO (at P 375) to define the number of Frequency Response surveys that were conducted each year and to define a necessary amount of Frequency Response. R1 addresses both of these directives:

- There is a single annual survey of at least 20 events each year.
- The FRM calculated on FRS Form 1 is compared by the ERO against the FRO determined 12 months earlier (when the last FRS Form 1 was submitted) to verify the Balancing Authority provided its share of Interconnection Frequency Response.

Median as the Standard's Measure of Balancing Authority Performance

The FRSDT evaluated different approaches for "averaging" individual event observations to compute a technically sound estimate of Frequency Response Measure. The MW contribution for a single BA in a multi-BA Interconnection is small compared to the minute to minute changes in load, interchange and generation. For example, a 3000 MW BA in the east may only be called on to contribute 10MW for the loss of a 1000MW. The 10 MW of governor and load response may easily be masked as a coincident change in load.

In general, statisticians use the median as the best measure of central tendency when a population has outliers. Two independent reviews by the FRSDT has shown the Median to be less influenced by noise in the measurement process and the team has chosen the median as the initial metric for calculating the BAs' Frequency Response Measure.

The FRSDT performed extensive empirical studies and engaged in lively discussions in an attempt to determine the best aggregation technique for a sample set size of at least 20 events. Mean, median, and linear regression techniques were used on a trial basis with the data that was available during the early phases of the effort.

A key characteristic of the "aggregation challenge" is related to the use of actual net interchange data for measuring frequency response. The tie line flow measurements are varying continuously due to other operational phenomena occurring concurrently with the provision of frequency response. (*See* Appendix 1 for details.) All samples have "noise" in them, as most operational personnel who have computed the frequency response of their BA can attest. What has also become apparent to the FRSDT is that while the majority of the frequency response samples have similar levels of noise in them, a few of the samples may have much larger errors in them than the others that result in unrepresentative results. And with the sample set size of interest, it is common to have unrepresentative errors in these few samples to be very large and asymmetric. For example, one BA's subject matter expert observed recently that 4 out of 31 samples had a much larger error contribution than the other 27 samples, and that 3 out of 4 of the very high error samples grossly underestimated the frequency response. The median value demonstrated greater resiliency to this data quality problem than the mean with this data set. (The median has also demonstrated superiority to

linear regression in the presence of these described data quality problems in other analyses conducted by the FRSDT, but the linear regression showed better performance than the mean.)

The above can be demonstrated with a relatively simple example. Let's assume that a Balancing Authority's true frequency response has an average value of -200 MW/ .1 Hz. Let's also assume that this Balancing Authority installed "special" perfect metering on key loads and generators, so that we could know the true frequency response of each sample. And then we will compare them with that measured by typical tie line flow metering, with the kind of noise and error that occurs commonly and "not so commonly". Let's start with the following 4 samples having a common level of noise, with MW/ .1 Hz as the unit of measurement.

Perfect measurement	Noise	Samples from tie lines
-190	-30	-220
-210	-20	-230
-220	10	-210
-180	20	-160
-200	Mean	-205
-200	Median	-215

Now let's add a fifth sample, which is highly contaminated with noise and error that grossly underestimates frequency response.

Perfect measurement	Noise	Samples from tie lines
-190	-30	-220
-210	-20	-230
-220	10	-210
-180	20	-160
-200	250	+50
-200	Mean	-154
-200	Median	-210

It is clear from the above simplistic example that the mean drops by about 25% while the median is affected minimally by the single highly contaminated value.

Based on the analyses performed thus far, the FRSDT believes that the median's superior resiliency to this type of data quality problem makes it the best aggregation technique at this time. However, the FRSDT sees merit and promise in future research with sample filtering combined with a technique such as linear regression.

When compared with the mean, linear regression shows superior performance with respect to the elimination of noise because the measured data is weighted by the size of the frequency change associated with the event. Since the noise is independent from frequency change, the greater weighting on larger events provides a superior technique for reducing the effect of noise on the results.

However, linear regression does not provide a better method when dealing with a few samples with large magnitudes of noise and unrepresentative error. There are only two alternatives to improve over the use of median when dealing with these larger unrepresentative errors:

1. Increase the sample size, or
2. Actively eliminate outliers due to unrepresentative error.

Unfortunately, the first alternative, increasing the sample size is not available because significantly more sample events are not available within the measurement time period of one year. Linear regression techniques are being investigated that have an active outlier elimination algorithm that would eliminate data that lie outside ranges of the 96th percentile and 99th percentile, for example.

Still, the use of linear regression has value in the context of this standard. The NERC Resources Subcommittee will use linear regression to evaluate Interconnection frequency response, particularly to evaluate trends, seasonal impacts, time of day influences, etc. The Good Practices and Tools section of this document outlines how a BA can use linear regression to develop a predictive tool for its operators.

Additional discussion on this topic is contained in "Appendix 1 – Data Quality Concerns Related to the Use of Actual Net Interchange Value" of this document.

The NERC Frequency Response Initiative Report addressed the relative merits of using the median versus linear regression for aggregating single event frequency response samples into a frequency response measurement score for compliance evaluation. This report provided 11 evaluation criteria as a basis for recommending the use of linear regression instead of the median for the frequency response measurement aggregation technique. The FRSDT made its own assessment on the basis of these evaluation criteria on September 20, 2012, but concluded that the median would be the best aggregation technique to use initially when the relative importance of each criterion was considered. A brief summary of the FRSDT majority consensus on the basis of each evaluation criterion is provided below.

- Provides two dimensional measurement – The FRSDT agrees that the two dimensional concept is a useful way to perceive frequency response characteristics, and that it may be useful for potential future modeling activities. Better data quality would increase support for such future efforts, and the use of the median for initial compliance evaluations within BAL-003-1 should not hinder any such effort. The FRSDT perceived this as a mild advantage for linear regression.
- Represents nonlinear characteristics – With considerations similar to those applied to the previous criterion, the FRSDT perceived this as a mild advantage for linear regression.
- Provides a single best estimator – The FRSDT put gave minimal importance to the characteristic of the median averaging the middle values when used with an even number of samples.
- Is part of a linear system - With considerations similar to those applied to the first two criteria, the FRSDT perceived this as a mild advantage for linear regression (particularly in the modeling area.)
- Represents bimodal distributions – The FRSDT put minimal weight of this criterion, as a change in Balancing Authority footprint does not seem to be addressed adequately by any aggregation technique.
- Quality statistics available – The FRSDT perceived this as a mild advantage for linear regression in that the statistics would be coupled directly to the compliance evaluation. The FRSDT also included this criterion as part of the modeling advantages cited above.

The FRSDT supports collecting data and performing quality statistical analysis. If it is determined that the use of the median, as opposed to a mean or linear regression aggregation, is yielding undesirable consequences, the FRSDT recommends that other aggregation techniques be re-evaluated at that time.

- Reducing influence of noise - This is the dominant concern of the FRSDT, and it perceives the median to have a major advantage over linear regression in addressing noise in the change in actual net interchange calculation. The FRSDT bases this judgment on: prior FRSDT studies that have shown that the median produces more stable results; the data used in the NERC Frequency Response Initiative document exhibits large quantities of noise; prior efforts of FRSDT members in performing frequency response sampling for their own Balancing Authorities over many years; and similar observations of noise in the CERTS frequency Monitoring Application. The FRSDT has serious concerns that the influence of noise has a greater tendency to yield a "false positive" compliance violation with linear regression than with the median. Also, limited studies performed by the FRSDT indicates the possibility that the resultant frequency response measure would yield more measurement variation across years with linear regression versus the median while the actual Balancing Authority performance remains unchanged.
- Reducing the influence of outliers – This is related to the previous criterion. The FRSDT recognizes four main sources of noise: concurrent operating phenomena (described elsewhere in this document), transient tie line flows for nearby contingencies, data acquisition time skew in tie line data measurements, and time skew and data compression issues in archiving techniques and tools such as PI. Some outliers may be caused in part by true variation in the actual frequency response, and it is desirable to include those in the frequency response measure. The FRSDT supports efforts in the near future to distinguish between outliers caused by noise versus true frequency response, and progress in this area may make it feasible and desirable to replace the median with linear regression, or some other validated technique. The FRSDT does note that this is a substantial undertaking, and it would require substantial input from a sufficient number of experts to help distinguish noise from true frequency response.
- Easy to calculate – The FRSDT perceives this to be a minor to moderate advantage for the median. However, more complex (but reasonably so) techniques would receive more support if clear progress can be made in noise elimination.
- Familiar indicator – The FRSDT perceives this to be a minor to moderate advantage for the median. However, more complex (but reasonably so) techniques would receive more support if clear progress can be made as a result of noise elimination.
- Currently used as a measure in BAL-003 – The present standard refers to an average and does not provide specific guidance on the computation of that average, but the FRSDT puts minimal weight on this evaluation criterion.

In summary, the FRSDT perceives an approximate balance between the modeling advantage for linear regression and the simplicity advantage of the median. However, the clear determinant in endorsing the use of the median is the data quality issue related to concurrent operational phenomena, transient tie line flows, and data acquisition and archiving limitations.

FERC Order No. 693 also directed the Standard (at P 375) to identify methods for Balancing Authorities to obtain Frequency Response. Requirement R1 allows Balancing Authorities to participate in Frequency Response Sharing Groups (FRSGs) to provide or obtain Frequency Response. These may be the same FRSGs that cooperate for BAL-002-0 or may be FRSGs that form for the purposes of BAL-003-1.

If BAs participate as an FRSG for BAL-003-1, compliance is based on the sum of the participants' performance.

Two other ways that BAs could obtain Frequency Response are through Supplemental Service or Overlap Regulation Service:

- No special action is needed if a BA provides or receives supplemental regulation. If the regulation occurs via Pseudo Tie, the transfer occurs automatically as part of Net Actual Interchange (NIA) and in response to information transferred from recipient to provider.
- If a BA provides overlap regulation, its FRS Form 1 will include the Frequency Bias setting as well as peak load and generation of the combined Balancing Authority Areas. The FRM event data will be calculated on the sum of the provider's and recipient's performance.

In the Violation Severity Levels for Requirement R1, the impact of a BA not having enough frequency response depends on two factors:

- Does the Interconnection have sufficient response?
- How short is the BA in providing its FRO?

The VSL takes these factors into account. While the VSLs look different than some other standards, an explanation would be helpful.

VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plane as single-BA Interconnections.

Consider a small BA whose performance is 70% of its FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response, because this would treat multi-BA Interconnections more harshly than single BA Interconnections on a significant scale.

The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively.

Requirement 2

R2. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area Control Error (ACE) calculation during the implementation period specified by the ERO.

Background and Rationale

Attachment A of the Standard discusses the process the ERO will follow to validate the BA's FRS Form 1 data and publish the official Frequency Bias Settings. Historically, it has taken multiple rounds of validation and outreach to confirm each BA's data due to transcription errors, misunderstanding of instructions, and other issues. While BAs historically submit Bias Setting data by January 1, it often takes one or more months to complete the process.

The target is to have BAs submit their data by January 10. The BAs are given 30 days to assemble their data since the BAs are dependent on the ERO to provide them with FRS Form 1, and there may be process delays in distributing the forms since they rely on identification of frequency events through November 30 of the preceding year.

Frequency Bias Settings generally change little from year to year. Given the fact that BAs can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date.

To recap the annual process:

1. The ERO posts the official list of frequency events to be used for this Standard in early December. The FRS Form 1 for each Interconnection will be posted shortly thereafter.

2. The Balancing Authority submits its revised annual Frequency Bias Setting value to NERC by January 10.

3. The ERO and the Resources Subcommittee validate Frequency Bias Setting values, perform error checking, and calculate, validate, and update CPS2 L10 values. This data collection and validation process can take as long as two months.

4. Once the L10 and Frequency Bias Setting values are validated, The ERO posts the values for the upcoming year and also informs the Balancing Authorities of the date on which to implement revised Frequency Bias Setting values. Implementation typically would be on or about March 1st of each year.

BAL-003-0.1b standard requires a minimum Frequency Bias Setting equal in absolute value to one percent of the Balancing Authority's estimated yearly peak demand (or maximum generation level if native load is not served). For most Balancing Authorities this calculated amount of Frequency Bias is significantly greater in absolute value than their actual Frequency Response characteristic (which represents an over-bias condition) resulting in over-control

since a larger magnitude response is realized. This is especially true in the Eastern Interconnection where this condition requires excessive secondary frequency control response which degrades overall system performance and increases operating cost as compared to requiring an appropriate balance of primary and secondary frequency control response.

Balancing Authorities were given a minimum Frequency Bias Setting obligation because there had never been a mandatory Frequency Response Obligation. This historic "one percent of peak per 0.1Hz" obligation, dating back to NERC's predecessor, NAPSIC, was intended to ensure all BAs provide some support to Interconnection frequency.

The ideal system control state exists when the Frequency Bias Setting of the Balancing Authority exactly matches the actual Frequency Response characteristic of the Balancing Authority. If this is not achievable, over-bias is significantly better from a control perspective than under-bias with the caveat that Frequency Bias is set relatively close in magnitude to the Balancing Authority actual Frequency Response characteristic. Setting the Frequency Bias to better approximate the Balancing Authority natural Frequency Response characteristic will improve the quality and accuracy of ACE control, CPS & DCS and general AGC System control response. This is the technical basis for recommending an adjustment to the long standing "1% of peak/0.1Hz" Frequency Bias Setting. The Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard is intended to bring the Balancing Authorities' Frequency Bias Setting closer to their natural Frequency Response. Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard balances the following objectives:

- Bring the Frequency Bias Setting and Frequency Response closer together.
- Allow time to analyze impact on other Standards (CPS, BAAL and to a lesser extent DCS) by adjustments in the minimum Frequency Bias Setting, by accommodating only minor adjustments.
- Do not allow the Frequency Bias Setting minimum to drop below natural Frequency Response, because under-biasing could affect an Interconnection adversely.

Additional flexibility has been added to the Frequency Bias Setting based on the actual Frequency Response (FRM) by allowing the Frequency Bias Setting to have a value in the range from 100% of FRM to 125% of FRM. This change has been included for the following reasons:

- When the new standardized measurement method is applied to BAs with a Frequency Response close to the interconnection minimum response, the requirement to use FRM is as likely to result in a Frequency Bias Setting below the actual response as it is to result in a response above the actual response. From a reliability perspective, it is

always better to have a Frequency Bias Setting slightly above the actual Frequency Response.

- As with single BA interconnections, the tuning of the control system may require that the BA implement a Frequency Response Setting slightly greater in absolute terms than its actual Frequency Response to get the best performance.

- The new standardized measurement method for determining FRM in some cases results in a measured Frequency Response significantly lower than the previous methods used by some BAs. It is desirable to not require significant change in the Frequency Bias Setting for these BAs that experience a reduction in their measured Frequency Response.

Requirement 3

R3. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection, is not receiving Overlap Regulation Service and utilizing a variable Frequency Bias Setting shall maintain a Frequency Bias Setting that is:

- *Less than zero at all times, and*
- *Equal to or more negative than its Frequency Response Obligation when the Frequency varies from 60 Hz by more that +/- 0.036 Hz.*

Background and Rationale

In multi-Balancing Authority interconnections, the Frequency Bias Setting should be coordinated among all BAs on the interconnection. When there is a minimum Frequency Bias Setting requirement, it should apply for all BAs. However, BAs using a variable Frequency Bias Setting may have non-linearity in their actual response for a number of reasons including the dead-bands implemented on their generator governors. The measurement to ensure that these BAs are conforming to the interconnection minimum is adjusted to remove the dead-band range from the calculated average Frequency Bias Setting actually used. For BAs using variable bias, FRS Form 1 has a data entry location for the previous year's average monthly Bias. The Balancing Authority and the ERO can compare this value to the previous year's Frequency Bias Setting minimum to ensure R3 has been met.

On single BA interconnections, there is no need to coordinate the Frequency Bias Setting with other BAs. This eliminates the need to maintain a minimum Frequency Bias Setting for any reason other than meeting the reliability requirement as specified by the Frequency Response Obligation.

Requirement 4

R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation, in order to represent the Frequency Bias Setting for the combined Balancing Authority Area, to be equivalent to either:

- *The sum of the Frequency Bias Settings as shown on FRS Form 1 and FRS Form 2 for the participating Balancing Authorities as validated by the ERO, or*
- *The Frequency Bias Setting as shown on FRS Form 1 and FRS Form 2 for the entirety of the participating Balancing Authorities' Areas.*

Background and Rationale

This requirement reflects the operating principles first established by NERC Policy 1 and is similar to Requirement R6 of the approved BAL-003-0.1b standard. Overlap Regulation Service is a method of providing regulation service in which the Balancing Authority providing the regulation service incorporates another Balancing Authority's actual interchange, frequency response, and schedules into the providing Balancing Authority's AGC/ACE equation.

As noted earlier, a BA that is providing Overlap Regulation will report the sum of the Bias Settings in its FRS Form 1. Balancing Authorities receiving Overlap Regulation Service have an ACE and Frequency Bias Setting equal to zero (0).

How this Standard Meets the FERC Order 693 Directives

FERC Directive

The following is the relevant paragraph of Order No. 693.

> *Accordingly, the Commission approves Reliability Standard BAL-003-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification to BAL-003-0 through the Reliability Standards development process that: (1) includes Levels of Non-Compliance; (2) determines the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and (3) defines the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved.*

1. Levels of Non-Compliance

VRFs and VSLs are an equally effective way of assigning compliance elements to the standard.

2. Determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other Requirements of the Reliability Standard are met

BAL-003 V0 R2 (the basis of Order No. 693) deals with the calculation of Frequency Bias Setting such that it reflects natural Frequency Response.

The drafting team has determined that a sample size on the order of at least 20 events is necessary to have a high confidence in the estimate of a BA's Frequency Response. Selection of the frequency excursion events used for analysis will be done via a method outlined in Attachment A to the Standard.

On average, these events will represent the largest 2-3 "clean" frequency excursions occurring each month.

Since Frequency Bias Setting is an annual obligation, the survey of the at least 20 frequency excursion events will occur once each year.

3. Define the necessary amount of Frequency Response needed for Reliable Operation for each Balancing Authority with methods of obtaining and measuring that the frequency response is achieved

Necessary Amount of Frequency Response

The drafting team has proposed the following approach to defining the necessary amount of frequency response. In general, the goal is to avoid triggering the first step of under-frequency load shedding (UFLS) in the given Interconnection for reasonable contingencies expected. The

methodology for determining each Interconnection's and Balancing Authority's obligation is outlined in Attachment A to the Standard.

It should be noted the standard cannot guarantee there will never be a triggering of UFLS as the magnitude of "point C" differs throughout an interconnection during a disturbance and there are local areas that see much wider swings in frequency.

The contingency protection criterion is the largest reasonably expected contingency in the Interconnection. This can be based on the largest observed credible contingency in the previous 10 years or the largest Category C event for the Interconnection.

Attachment A to the standard presents the base obligation by Interconnection and adds a Reliability Margin. The Reliability Margin included addresses the difference between Points B and C and accounts for variables.

For multiple BA interconnections, the Frequency Response Obligation is allocated to BAs based on size. This allocation will be based on the following calculation:

Methods of Obtaining Frequency Response

The drafting team believes the following are valid methods of obtaining Frequency Response:

- Regulation services.
- Contractual service. The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1. While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration.
- Through a tariff (e.g. Frequency Response and regulation service).
- From generators through an interconnection agreement.
- Contract with an internal resource or loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response).

Since NERC standards should not prescribe or preclude any particular market related service, BAs and FRSGs may use whatever is most appropriate for their situation.

Measuring that the Frequency Response is Achieved

FRS Form 1 and the underlying data retained by the BA will be used for measuring whether Frequency Response was provided. FRS Form 1 will provide the guidance on how to account for and measure Frequency Response.

Going Beyond the Directive

Based on the combined operating experience of the SDT, the drafting team consensus is that each Interconnection has sufficient Frequency Response. If margins decline, there may be a need for additional standards or tools. The drafting team and the Resources Subcommittee are working with the ERO on its Frequency Response Initiative to develop processes and good practices so the Interconnections are prepared. These good practices and tools are described in the following section.

The drafting team is also evaluating a risk-based approach for basing the Interconnection Frequency Response Obligation on an historic probability density of frequency error, and for allocating the obligation on the basis of the Balancing Authority's average annual ACE share of frequency error. This allocation method uses the inverse of the rationale for allocating the CPS1 epsilon requirement by Bias share.

Good Practices and Tools

Background

This section outlines tips and tools to help Balancing Authorities meet the Frequency Response Standard or to operate more reliably. If you have suggested additions, please send them to balancing@nerc.com.

Identifying and Estimating Frequency Responsive Reserves

Knowing the quantity and depth of frequency responsive reserves in real time is a possible next step to being better prepared for the next event. The challenge in achieving this is having the knowledge of the capabilities of all sources of frequency response. Presently the primary source of Frequency Response remains with the generation resources in our fleets.

Understanding how each of these sources performs to changes in system frequency and knowing their limitations would improve the BA's ability to measure frequency responsive reserves. Presently there are only guidelines, criteria and protocols in some regions of the industry that identify specific settings and performance expectations of Primary Frequency Response of resources.

One method of gaining a better understanding of performance is to measure performance during actual events that occur on the system. Measuring performance during actual events would only provide feedback for performance during that specific event and would not provide insight into depth of response or other limitations.

Repeated measurements will increase confidence in expected performance. NERC modeling standards are in process to be revised that will improve the BA's insight into predicting available frequency responsive reserves. However, knowing how resources are operated, what modes of operation provide sustained Primary Frequency Response and knowing the operating range of this response would give the BA the knowledge to accurately predict frequency response and the amount of frequency responsive reserves available in real time.

Some benefits have been realized by communicating to generation resources (GO) the importance of operating in modes that allow Primary Frequency Response to be sustained by the control systems of the resource. Other improvements in implementation of Primary Frequency Response have been achieved through improved settings on turbine governors through the elimination of "step" frequency response with the simultaneous reduction in governor dead-band settings.

Improvements in the full AGC control loop of the generating resource, which accounts for the expected Primary Frequency Response, have improved the delivery of quality Primary Frequency Response while minimizing secondary control actions of generators. Some of these actions can provide quick improvement in delivery of Primary Frequency Response.

Once Primary Frequency Response sources are known, the BA could calculate available reserves that are frequency responsive. Planning for these reserves during normal and emergency operations could be developed and added to the normal planning process.

Using FRS Form 1 Data

The information collected for this standard can be supplemented by a few data points to provide the Balancing Authority useful tools and information. The BA could do a regression analysis of its frequency response against the following values:

- Load (value A).
- Interchange (Value A).
- Total generation.
- Spinning reserve.

While the last two values above are not part of Form 1, they should be readily available. Small BAs might even include headroom on its larger generators as part of the regression.

The regression would provide a formula the BA could program in its EMS to present the operator a real time estimate of the BA's Frequency Response.

Statistical outliers in the regression would point to cases meriting further inspection to find causes of low Frequency Response or opportunities for improvement.

Tools

Single generating resource performance evaluation tools for steam turbine, combustion turbine (simple cycle or combined cycle) and for intermittent resources are available at the following link. http://texasre.org/standards_rules/standardsdev/rsc/sar003/Pages/Default.aspx.

These tools and the regional standard associated with them are in their final stages of development in the Texas region.

These tools will be posted on the NERC website.

Appendix 1 - Data Quality Concerns Related To The Use Of The Actual Net Interchange Value

Actual net interchange for a typical Balancing Authority (BA) is the summation of its tie lines to other BAs. In some cases, there are pseudo-ties in it which reflect the effective removal or addition of load and/or generation from another BA, or it could include supplemental regulation as well. But in the typical scenario, actual net interchange values that are extracted from EMS data archiving can be influenced by data latency times in the data acquisition process, and also any timestamp skewing in the archival process.

Of greater concern, however, are the inevitable variations of other operating phenomena occurring concurrently with a frequency event. The impacts of these phenomena are superimposed on actual net interchange values along with the frequency response that we wish to measure through the use of the actual net interchange value.

To explore this issue further, let's begin with the idealized condition:

- frequency is fairly stable at some value near or a little below 60 Hz
- ACE of the non-contingent BA of interest is 0 and has been 0 for an extended period, and AGC control signals have not been issued recently
- Actual net interchange is "on schedule", and there are no schedule changes in the immediate future
- BA load is flat
- All generators not providing AGC are at their targets
- Variable generation such as wind and solar are not varying
- Operators have not directed any manual movements of generation recently

And when the contingency occurs in this idealized state, the change in actual net interchange will be measuring only the decline in load due to lesser frequency and generator governor response, and, none of the contaminating influences. While the ACE may become negative due to the actual frequency response being less than that called for by the frequency bias setting within the BA's AGC system, this contaminating influence on measuring frequency response will not appear in the actual net interchange value if the measurement interval ends before the generation on AGC responds.

Now let's explore the sensitivity of the resultant frequency response sampling to the relaxation of these idealized circumstances.

1. The "60 Hz load" increases moderately due to time of day concurrent with the frequency event. If the frequency event happens before AGC or operator-directed manual load adjustments occur, then the actual net interchange will be reduced by the moderate increase in load and the frequency response will be underestimated. But if the frequency event happens while AGC response and/or manual adjustments occur, then the actual net interchange will be increased by the AGC response (and/or manual adjustments) and the frequency response will be overestimated.

2. The “60 Hz load” decreases moderately due to time of day concurrent with the frequency event. If the frequency event happens before AGC or operator-directed manual load adjustments occur, then the actual net interchange will be increased by the moderate reduction in load and the frequency response will be overestimated. But if the frequency event happens while AGC response and/or manual adjustments occur, then the actual net interchange will be decreased by the AGC response (and/or manual adjustments) and the frequency response will be underestimated.
3. In anticipation of increasing load during the next hour, the operator increases manual generation before the load actually appears. If the frequency event happens while the generation “leading” the load is increasing, then the actual net interchange will be increased by the increase in manual generation and the frequency response will be overestimated. But if the frequency event occurs when the result of AGC signals sent to offset the operator’s leading actions take effect, then the actual net interchange will be decreased and the frequency response is underestimated.
4. In anticipation of decreasing load during the next hour, the operator decreases manual generation before the load actually declines. If the frequency event happens while the generation “leading” the load downward is decreasing, then the actual net interchange will be decreased by the reduction in manual generation and the frequency response will be underestimated. But if the frequency event occurs when the result of AGC signals sent to offset the operator’s leading actions take effect, then the actual net interchange will be increased and the frequency response is overestimated.
5. A schedule change to export more energy is made at 5 minutes before the top of the hour. The BA’s “60 Hz load” is not changing. The schedule change is small enough that the operator is relying on upward movement of generators on AGC to provide the additional energy to be exported. The time at which the AGC generators actually begin to provide the additional energy is dependent on how much time passes before the AGC algorithm gets out of its deadbands, the individual generator control errors get large enough for sending out the control signal, and maybe 20 seconds to 3 minutes for the response to be effected. The key point here is that it is not clear when the effects of a schedule change, as manifested in a change in generation and then ultimately a change in actual net interchange, will occur.
6. With the expected penetration of wind in the near future, unanticipated changes in their output will tend to affect actual net interchange and add noise to the frequency response observation process.

To a greater or lesser extent, 1 through 4 above are happening continuously for the most part with most BAs in the Eastern and Western Interconnections. The frequency response is buried within the typical hour to hour operational cacophony superimposed on actual net interchange values. The choice of metrics will be important to artfully extract frequency response from the noise and other unrepresentative error.

Standard BAL-003-0.1b — Frequency Response and Bias

A. Introduction

1. **Title:** **Frequency Response and Bias**

2. **Number:** BAL-003-0.1b

3. **Purpose:** This standard provides a consistent method for calculating the Frequency Bias component of ACE.

4. **Applicability:**

   4.1. Balancing Authorities.

5. **Effective Date:** Immediately after approval of applicable regulatory authorities.

B. Requirements

R1. Each Balancing Authority shall review its Frequency Bias Settings by January 1 of each year and recalculate its setting to reflect any change in the Frequency Response of the Balancing Authority Area.

R1.1. The Balancing Authority may change its Frequency Bias Setting, and the method used to determine the setting, whenever any of the factors used to determine the current bias value change.

R1.2. Each Balancing Authority shall report its Frequency Bias Setting, and method for determining that setting, to the NERC Operating Committee.

R2. Each Balancing Authority shall establish and maintain a Frequency Bias Setting that is as close as practical to, or greater than, the Balancing Authority's Frequency Response. Frequency Bias may be calculated several ways:

R2.1. The Balancing Authority may use a fixed Frequency Bias value which is based on a fixed, straight-line function of Tie Line deviation versus Frequency Deviation. The Balancing Authority shall determine the fixed value by observing and averaging the Frequency Response for several Disturbances during on-peak hours.

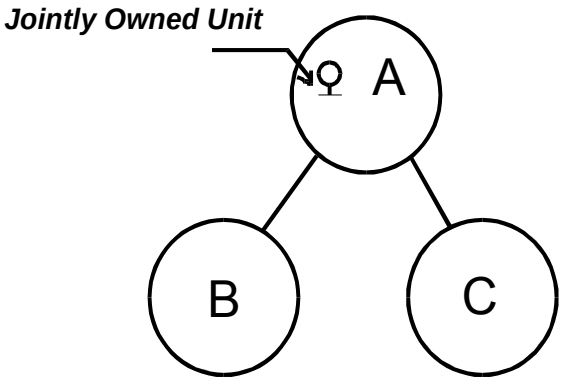
R2.2. The Balancing Authority may use a variable (linear or non-linear) bias value, which is based on a variable function of Tie Line deviation to Frequency Deviation. The Balancing Authority shall determine the variable frequency bias value by analyzing Frequency Response as it varies with factors such as load, generation, governor characteristics, and frequency.

R3. Each Balancing Authority shall operate its Automatic Generation Control (AGC) on Tie Line Frequency Bias, unless such operation is adverse to system or Interconnection reliability.

R4. Balancing Authorities that use Dynamic Scheduling or Pseudo-ties for jointly owned units shall reflect their respective share of the unit governor droop response in their respective Frequency Bias Setting.

R4.1. Fixed schedules for Jointly Owned Units mandate that Balancing Authority (A) that contains the Jointly Owned Unit must incorporate the respective share of the unit governor droop response for any Balancing Authorities that have fixed schedules (B and C). See the diagram below.

R4.2. The Balancing Authorities that have a fixed schedule (B and C) but do not contain the Jointly Owned Unit shall not include their share of the governor droop response in their Frequency Bias Setting.



R5. Balancing Authorities that serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of the Balancing Authority's estimated yearly peak demand per 0.1 Hz change.

R5.1. Balancing Authorities that do not serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of its estimated maximum generation level in the coming year per 0.1 Hz change.

R6. A Balancing Authority that is performing Overlap Regulation Service shall increase its Frequency Bias Setting to match the frequency response of the entire area being controlled. A Balancing Authority shall not change its Frequency Bias Setting when performing Supplemental Regulation Service.

C. Measures

M1. Each Balancing Authority shall perform Frequency Response surveys when called for by the Operating Committee to determine the Balancing Authority's response to Interconnection Frequency Deviations.

D. Compliance

Not Specified.

E. Regional Differences

None identified.

F. Associated Documents

1. Appendix 1 — Interpretation of Requirement R3 (October 23, 2007).

2. Appendix 2 — Interpretation of Requirements R2, R2.2, R5, and R5.1 (February 12, 2008).

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
0	March 16, 2007	FERC Approval — Order 693	New

0a	December 19, 2007	Added Appendix 1 — Interpretation of R3 approved by BOT on October 23, 2007	Addition
0a	July 21, 2008	FERC Approval of Interpretation of R3	Addition
0b	February 12, 2008	Added Appendix 2 — Interpretation of R2, R2.2, R5, and R5.1 approved by BOT on February 12, 2008	Addition
0.1b	January 16, 2008	Section F: added "1."; changed hyphen to "en dash." Changed font style for "Appendix 1" to Arial; updated version number to "0.1b"	Errata
0.1b	October 29, 2008	BOT approved errata changes	Errata
0.1a	May 13, 2009	FERC Approved errata changes – version changed to 0.1a (Interpretation of R2, R2.2, R5, and R5.1 not yet approved)	Errata
0.1b	May 21, 2009	FERC Approved Interpretation of R2, R2.2, R5, and R5.1	Addition

Appendix 1

Interpretation of Requirement 3

Request: *Does the WECC Automatic Time Error Control Procedure (WATEC) violate Requirement 3 of BAL-003-0?*

Interpretation:

Requirement 3 of BAL-003-0 — Frequency Response and Bias deals with Balancing Authorities using Tie-Line Frequency Bias as the normal mode of automatic generation control.

> **BAL-003-0**
> **R3.** Each Balancing Authority shall operate its Automatic Generation Control (AGC) on Tie Line Frequency Bias, unless such operation is adverse to system or Interconnection reliability.

- Tie-Line Frequency Bias is one of the three foundational control modes available in a Balancing Authority's energy management system. (The other two are flat-tie and flat-frequency.) Many Balancing Authorities layer other control objectives on top of their basic control mode, such as automatic inadvertent payback, CPS optimization, time control (in single BA Interconnections).
- As long as Tie-Line Frequency Bias is the underlying control mode and CPS1 is measured and reported on the associated ACE equation, there is no violation of BAL-003-0 Requirement 3:

$$ACE = (NI_A - NI_S) - 10B\,(F_A - F_S) - I_{ME}$$

Appendix 2

Interpretation of Requirements R2, R2.2, R5, R5.1

Request: *ERCOT specifically requests clarification that a Balancing Authority is entitled to use a variable bias value as authorized by Requirement R2.2, even though Requirement 5 seems not to account for the possibility of variable bias settings.*

Interpretation:

The consensus of the Resources Subcommittee is that BAL-003-0 — Frequency Response and Bias — Requirement R2 does not conflict with BAL-003-0 Requirement R5.

BAL-003-0 — Frequency Response and Bias Requirement 2 requires a Balancing Authority to analyze its response to frequency excursions as a first step in determining its frequency bias setting. The Balancing Authority may then choose a fixed bias (constant through the year) per Requirement 2.1, or a variable bias (varies with load, specific generators, etc.) per Requirement 2.2.

BAL-003-0

R2. Each Balancing Authority shall establish and maintain a Frequency Bias Setting that is as close as practical to, or greater than, the Balancing Authority's Frequency Response. Frequency Bias may be calculated several ways:

- **R2.1.** The Balancing Authority may use a fixed Frequency Bias value which is based on a fixed, straight-line function of Tie Line deviation versus Frequency Deviation. The Balancing Authority shall determine the fixed value by observing and averaging the Frequency Response for several Disturbances during on-peak hours.
- **R2.2.** The Balancing Authority may use a variable (linear or non-linear) bias value, which is based on a variable function of Tie Line deviation to Frequency Deviation. The Balancing Authority shall determine the variable frequency bias value by analyzing Frequency Response as it varies with factors such as load, generation, governor characteristics, and frequency.

BAL-003-0 — Frequency Response and Bias Requirement 5 sets a minimum contribution for all Balancing Authorities toward stabilizing interconnection frequency. The 1% bias setting establishes a minimum level of automatic generation control action to help stabilize frequency following a disturbance. By setting a floor on bias, Requirement 5 also helps ensure a consistent measure of control performance among all Balancing Authorities within a multi-Balancing Authority interconnection. However, ERCOT is a single Balancing Authority interconnection. The bias settings ERCOT uses do produce, on average, the best level of automatic generation control action to meet control performance metrics. The bias value in a single Balancing Authority interconnection does not impact the measure of control performance.

BAL-003-0

R5. Balancing Authorities that serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of the Balancing Authority's estimated yearly peak demand per 0.1 Hz change.

- **R5.1.** Balancing Authorities that do not serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of its estimated maximum generation level in the coming year per 0.1 Hz change.

NERC

Unofficial Comment Form

Project 2007-12 Frequency Response

Please **DO NOT** use this form to submit comments. Please use the electronic form to submit comments on the BAL-003-1 Frequency Response and Bias Setting. The electronic comment form must be completed by 8 p.m. ET **November 5, 2012.**

http://www.nerc.com/filez/standards/Frequency_Response.html

If you have questions please contact Darrel Richardson at darrel.richardson@nerc.net or by telephone at (609) 613-1848.

Background Information

This posting is soliciting formal comment.

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the reasons for the decline in Frequency Response can be identified. The standard would set a minimum Frequency Response obligation for each Balancing Authority, provide a uniform calculation of Frequency Response and Frequency Bias Settings that transition to values closer to natural Frequency Response, and encourage coordinated AGC operation.

The Drafting Team made significant modifications to the proposed standard BAL-003-1 and associated documents based on industry comments from the second posting and initial ballot. These modifications include:

- Modifying the definition for Frequency Response Measure
- Removing reference to Reserve Sharing Groups and replacing with Frequency Response Sharing Group
- Creation of definition for Frequency Response Sharing Group
- Modifying Requirement R2
- Creating a new Requirement R3 for entities using variable Frequency Bias
- Removing requirement for operating in Tie Line Bias mode
- Removing Requirement R5 and combining into revised Requirement R2 and new Requirement R3
- Modifying Attachment A to provide additional clarity

- Creating a Procedure to provide instructions for the ERO to follow in supporting the standard
- Re-writing the Background Document to incorporate additional language for justification of requirements and provide additional clarity

You do not have to answer all questions. Enter all comments in simple text format.

1. The SDT has made minor modifications to the proposed definition for Frequency Response Measure based on industry comments. Do you agree that these modifications provide sufficient clarity? If not, please explain in the comment area.

   ☐ Yes
   ☐ No

   Comments:

2. The SDT has created a definition for Frequency Response Sharing Group. The definition is as follows:

   A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members.

   Do you agree with this definition? If not, please explain in the comment area.

   ☐ Yes
   ☐ No

   Comments:

3. The SDT has added Requirement R3 for entities using variable Frequency Bias.

   R3. Each Balancing Authority that is a member of a multiple Balancing Authority Interconnection, is not receiving Overlap Regulation Service and utilizing a variable Frequency Bias Setting shall maintain a Frequency Bias Setting that is:

   3.1 Less than zero at all times, and

   3.3 Equal to or more negative than its Frequency Response Obligation when Frequency varies from 60 Hz by more than +/-0.036 Hz.

   Do you agree with the proposed requirement? If not, please explain in the comment area.

   ☐ Yes
   ☐ No

   Comments:

4. Based on Industry comments the SDT has modified ”Attachment A- Supporting Document” to provide additional clarity. Do you agree with the modifications? If not, what modifications do you disagree with?

   ☐ Yes
   ☐ No

   Comments:

5. The SDT has moved a portion of the material located in Attachment A and all of the material located in ”Attachment B- Process for Adjusting Bias Setting Floor” into a new document “Procedure for ERO Support of Frequency Response and Frequency Bias Setting Standard”. The SDT created this document to assign tasks to the ERO and provide instructions for the ERO to follow when carrying them out under the BAL-003-1 standard. Do you agree that the ERO should perform these tasks and that this document provides sufficient detail for the ERO to do it under the BAL-003-1 standard? If not, what needs to be added to the document?”.

   ☐ Yes
   ☐ No

   Comments:

6. The SDT is now using the method detailed in the Frequency Response Initiative Report dated September 30, 2012 to calculate the Interconnection Frequency Response Obligation. Do you agree that this method provides for the proper amount of Frequency Response? If not, what specifically needs to be changed?

   ☐ Yes
   ☐ No

   Comments:

7. Based on Industry comments received the SDT made significant clarifying modifications to the Background Document. Do you agree that this document provides sufficient information to justify the rationale used by the SDT in developing the draft standard and provides the industry with sufficient understanding of the issues being addressed by the standard?

   ☐ Yes
   ☐ No

   Comments:

8. If you are not in support of this draft standard, what modifications do you believe need to be made in order for you to support the standard? Please list the issues and your proposed solution to the issue.

   ☐ Yes
   ☐ No

   Comments:

9. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard BAL-003-1.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-12 – Frequency Response

This document provides the drafting team's justification for assigning draft standard Requirement violation risk factors (VRFs) and violation severity levels (VSLs) for:

- BAL-003-1 — Frequency Response and Frequency Bias Setting

Each primary Requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violation of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Frequency Response Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the

ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs[1]:

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

[1] North American Electric Reliability Corp., 119 FERC 61,145, order on reh'g and compliance filing, 120 FERC 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in this standard meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justification

BAL-003-1 VRF and VSL Justifications		
R1	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for the contingency. This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring calculated FRM to be equal to or more negative than FRO. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This requirement is similar in concept to the current enforceable BAL-003-0.1b standard Requirement R2 which specifies a Medium VRF.
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for the contingency. This is consistent with the NERC definition.
	FERC VRF G5	This requirement does not co-mingle reliability objectives.

	Discussion	
	Proposed Lower VSL	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the Interconnection's FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO
	Proposed Moderate VSL	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the Interconnection's FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO
	Proposed High VSL	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO
	Proposed Severe VSL	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the calculated FRM being less negative than FRO.
	FERC VSL G1 Discussion	This is not applicable since there was not a Requirement mandating a certain level of Frequency Response prior to this standard.
	FERC VSL G2 Discussion	Proposed VSL's is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on the amount the calculated FRM is less negative than FRO.
	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider results of the calculation required. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

R2	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities to implement the Frequency Bias Setting validated by the ERO. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Lower VRF however BAL-003-1 Requirements R1, R3, and R4 specify a Medium VRF and the SDT believes it is appropriate for this Requirement to also possess a Medium VRF given the nature of the revision to BAL-003-0.1b.
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.

	Proposed Lower VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting failed to implement the validated Frequency Bias Setting value into its ACE calculation within the implementation period specified but did so within 5 calendar days from the implementation period specified by the ERO.
	Proposed Moderate VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 5 calendar days but less than or equal to 15 calendar days from the implementation period specified by the ERO.
	Proposed High VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 15 calendar days but less than or equal to 25 calendar days from the implementation period specified by the ERO.
	Proposed Severe VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting did not implement the validated Frequency Bias Setting value into its ACE calculation in more than 25 calendar days from the implementation period specified by the ERO.
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating increments for tardiness implementing the validated Frequency Bias Setting into the ACE calculation.
	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Lower VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL's is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on how late the validated Frequency Bias Setting is implemented.
	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider performance of required action. Proposed VSL's are consistent with the requirement.
	FERC VSL G4	Proposed VSL's are based on a single violation and not a cumulative

	Discussion	violation methodology.

R3	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting in its ACE equation and would provide support for a contingency. This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities to implement a Frequency Bias Setting validated by the ERO. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Lower VRF however BAL-003-1 Requirements R1, R2, and R4 specify a Medium VRF and the SDT believes it is appropriate for this Requirement to also possess a Medium VRF given the nature of the revision to BAL-003-0.1b.
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for a contingency. This is consistent with the NERC definition.
	FERC VRF G5	This requirement does not co-mingle reliability objectives.

	Discussion	
	Proposed Lower VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligation by more than 1% but by at most 10%.
	Proposed Moderate VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligation by more than 10% but by at most 20%.
	Proposed High VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligation by more than 20% but by at most 30%.
	Proposed Severe VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response obligation by more than 30%..
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the calculated average Frequency Bias Setting being less negative than its minimum as defined in Attachment B.
	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Medium VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based on the calculated average Frequency Bias Setting being less negative than its minimum as defined in Attachment B.

	FERC VSL G3 Discussion	Proposed VSL does not expand on what is required. The VSLs assigned only consider compliance with the Frequency Bias Setting calculation and implementation required. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

R4	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities providing Overlap Regulation Services to correctly increase its Frequency Bias Setting. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R6 which specifies a Medium VRF
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the

		previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error less than 10% of the validated or calculated value.
	Proposed Moderate VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error more than 10% but less than or equal to 20% of the validated or calculated value
	Proposed High VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error more than 20% but less than or equal to 30% of the validated or calculated value.
	Proposed Severe VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with setting error more than 30% of the validated or calculated value. OR The Balancing Authority failed to change the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting being below the minimum percentage specified by the ERO. The VSL also includes a binary requirement for failing to change the Frequency Bias Setting value when providing Overlap Regulation Services.
	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R6 which specifies a Medium VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL's has both a percentage of noncompliance performance and binary element. The binary element is designated severe. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on the amount the calculated monthly average Frequency Bias Setting is below the minimum percentage specified

		by the ERO or if the entity fails to change the Frequency Bias Setting value when providing Overlap Regulation Services.
	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider results of the calculation required and if the Frequency Bias Setting is correctly set when providing Overlap Regulation Services. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-12 – Frequency Response

This document provides the drafting team's justification for assigning draft standard Requirement violation risk factors (VRFs) and violation severity levels (VSLs) for:

- BAL-003-1 — Frequency Response and Frequency Bias Setting

Each primary Requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violation of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Frequency Response Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame

that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs[1]:

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards
The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

[1] North American Electric Reliability Corp., 119 FERC 61,145, order on reh'g and compliance filing, 120 FERC 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in this standard meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties per violation per day basis is the "default" for penalty calculations.

VRF and VSL Justification

BAL-003-1 VRF and VSL Justifications		
R1	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for the contingency. This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring calculated FRM to be equal to or more negative than FRO. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This requirement is similar in concept to the current enforceable BAL-003-0.1b standard Requirement R2 which specifies a Medium VRF.
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for the contingency. This is consistent with the NERC definition.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the

		Interconnection's FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO~~The Interconnection met its FRO and the Balancing Authority's, or Reserve Sharing Groups, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its~~
	Proposed Moderate VSL	The summation of the Balancing Authorities' FRM within an Interconnection was equal to or more negative than the Interconnection's FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO~~The Interconnection met its FRO and the Balancing Authority's, or Reserve Sharing Groups, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO~~
	Proposed High VSL	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO~~The Interconnection did not meet its FRO and the Balancing Authority's, or Reserve Sharing Groups, FRM was less negative than its FRO by more than 1% but by at most 30% or 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO~~
	Proposed Severe VSL	The summation of the Balancing Authorities' FRM within an Interconnection did not meet its FRO and the Balancing Authority's, or Frequency Response Sharing Group's, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO~~The Interconnection did not meet its FRO and the Balancing Authority's, or Reserve Sharing Groups, FRM was less negative than its FRO by more than 30% or by more than 15 MW/0.1 Hz, whichever is the greater deviation from its FRO~~
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the calculated FRM being less negative than FRO.
	FERC VSL G1 Discussion	This is not applicable since there was not a Requirement mandating a certain level of Frequency Response prior to this standard.
	FERC VSL G2 Discussion	Proposed VSL's is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on the amount the calculated FRM is less negative than FRO.

	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider results of the calculation required. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

R2	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities to implement the Frequency Bias Setting validated by the ERO. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Lower VRF however BAL-003-1~~0.1b~~ Requirements R1~~2~~, R3, and R4~~5, and R6~~ specify a Medium VRF and the SDT believes it is appropriate for this Requirement to also possess a Medium VRF given the nature of the revision to BAL-003-0.1b.
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition.

	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting failed to implement the validated Frequency Bias Setting value into its ACE calculation within the implementation period specified but did so within 5 calendar days from the implementation period specified by the ERO.~~The Balancing Authority failed to implement the validated Frequency Bias Setting value in to its ACE calculation on the date specified but did so within 5 calendar days following the date specified by the ERO.~~
	Proposed Moderate VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 5 calendar days but less than or equal to 15 calendar days from the implementation period specified by the ERO.~~The Balancing Authority implemented the validated Frequency Bias Setting value in to its ACE calculation in more than 5 calendar days but less than or equal to 15 calendar days following the date specified by the ERO.~~
	Proposed High VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting implemented the validated Frequency Bias Setting value into its ACE calculation in more than 15 calendar days but less than or equal to 25 calendar days from the implementation period specified by the ERO.~~The Balancing Authority implemented the validated Frequency Bias Setting value in to its ACE calculation in more than 15 calendar days following the date specified by the ERO, but the new Bias Setting was within 10% of the previous year's Bias Setting~~
	Proposed Severe VSL	The Balancing Authority in a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a fixed Frequency Bias Setting did not implement the validated Frequency Bias Setting value into its ACE calculation in more than 25 calendar days from the implementation period specified by the ERO. ~~The Balancing Authority implemented the validated Frequency Bias Setting value in to its ACE calculation in more than 15 calendar days following the date specified by the ERO and the Bias Setting was more than 10% different from the previous year.~~
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating increments for tardiness implementing the validated Frequency Bias Setting into the ACE calculation..

	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which specifies a Lower VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL's is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on how late the validated Frequency Bias Setting is implemented.
	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider performance of required action. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

R3	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting in its ACE equation and would provide support for a contingency~~who was not operating its AGC in Tie Line Bias would typically be the only Balancing Authority that is operating in this manner and the rest of the Balancing Authorities would pick up the slack~~. ~~In addition, this Requirement VRF is the same as the BAL-003-0 standard VRF and was approved by FERC.~~ This is consistent with the NERC definition.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities to implement a Frequency Bias Setting validated by the ERO~~operate AGC in Tie Line Bias mode~~. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1 which

		specifies a Lower VRF however BAL-003-1 Requirements R1, R2, and R4 specify a Medium VRF and the SDT believes it is appropriate for this Requirement to also possess a Medium VRF given the nature of the revision to BAL-003-0.1b.~~R3 which specifies a Medium VRF~~
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support for a contingency~~who was not operating its AGC in Tie Line Bias would typically be the only Balancing Authority that is operating in this manner and the rest of the Balancing Authorities would pick up the slack. In addition, this Requirement VRF is the same as the BAL-003-0 standard VRF and was approved by FERC~~. This is consistent with the NERC definition.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligation by more than 1% but by at most 10%.~~The Balancing Authority could not provide the type of evidence as outlined in Measure M3 that Tie Line Bias is the normal mode of AGC.~~
	Proposed Moderate VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligation by more than 10% but by at most 20%.~~N/A~~
	Proposed High VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response Obligtation by more than 20% but by at most 30%.~~A spot check during an audit found the Balancing Authority's AGC out of Tie Line Bias mode without documentation supporting the need to operate in a different AGC mode.~~

	Proposed Severe VSL	The Balancing Authority that is a member of a multiple Balancing Authority Interconnection and not receiving Overlap Regulation Service and uses a variable Frequency Bias Setting average Frequency Bias Setting during periods when the clock-minute average frequency was outside of the range 59.964 Hz to 60.036 Hz was less negative than its Frequency Response obligation by more than 30%..~~A system event occurred and it was found that a contributing factor was that the Balancing Authority failed to operate AGC in Tie Line Bias mode.~~
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the calculated average Frequency Bias Setting being less negative than its minimum as defined in Attachment B.~~The NERC VSL guidelines are satisfied by incorporating a binary requirement for failing to operating AGC in Tie Line Bias mode when an Adverse Reliability Impact did not exist.~~
	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R1~~3~~ which specifies a Medium VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based ~~only~~ on the calculated average Frequency Bias Setting being less negative than its minimum as defined in Attachment B.~~if AGC is not operating in Tie Line Bias mode unless there is an Adverse Reliability Impact~~.
	FERC VSL G3 Discussion	Proposed VSL does not expand on what is required. The VSLs assigned only consider compliance with the Frequency Bias Setting calculation and implementation~~AGC control mode status~~ required. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

R4	Proposed VRF	Medium
	NERC VRF Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.
	FERC VRF G1 Discussion	This Requirement is more administrative in nature requiring entities providing Overlap Regulation Services to correctly increase its Frequency Bias Setting. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1.

		Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R6 which specifies a Medium VRF
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error less than 10~~5~~% of the validated or calculated~~correct~~ value.
	Proposed Moderate VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error more than 10~~5~~% but less than or equal to 20~~15~~% of the validated or calculated~~correct~~ value
	Proposed High VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting error more than 20~~15~~% but less than or equal to 30~~25~~% of the validated or calculated~~correct~~ value.

	Proposed Severe VSL	The Balancing Authority incorrectly changed the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with setting error more than 30~~25~~% of the validated or calculated~~correct~~ value. OR The Balancing Authority failed to change the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting being below the minimum percentage specified by the ERO. The VSL also includes a binary requirement for failing to change the Frequency Bias Setting value when providing Overlap Regulation Services.
	FERC VSL G1 Discussion	This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R6 which specifies a Medium VRF. Proposed VSL's meet or exceed the current threshold of compliance.
	FERC VSL G2 Discussion	Proposed VSL's has both a percentage of noncompliance performance and binary element. The binary element is designated severe. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on the amount the calculated monthly average Frequency Bias Setting is below the minimum percentage specified by the ERO or if the entity fails to change the Frequency Bias Setting value when providing Overlap Regulation Services.
	FERC VSL G3 Discussion	Proposed VSL's do not expand on what is required. The VSL's assigned only consider results of the calculation required and if the Frequency Bias Setting is correctly set when providing Overlap Regulation Services. Proposed VSL's are consistent with the requirement.
	FERC VSL G4 Discussion	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

~~R5~~	~~Proposed VRF~~	~~Medium~~
	~~NERC VRF Discussion~~	~~This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.~~
	~~FERC VRF G1 Discussion~~	~~This Requirement is more administrative in nature requiring entities to determine if the monthly absolute value Frequency Bias Setting~~

		meets specified criteria. The requirement does not directly correlate to the list of critical areas identified in the FERC VRF Guideline 1. Guideline 1 appears to conflict with guideline 4. Guideline 1 identifies a list of topics that encompass nearly all topics within the NERC Reliability Standards and implies that these requirements should be assigned a High VRF. Guideline 4 directs assignment of VRFs based on the impact of a specific requirement on the reliability of the system. The SDT believes that Guideline 4 better reflects the intent for assigning VRFs for this standard since this approach is focused on the reliability impact of the requirement.
	FERC VRF G2 Discussion	Consistency within a Reliability Standard exists. This Requirement does not contain Parts. Requirement action is unique with respect to other standard requirements. All standard requirements have a common reliability focus relevant to Frequency Response and Frequency Bias Setting.
	FERC VRF G3 Discussion	The Requirement VRF is consistent with other BES standards addressing responsiveness. This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R5 which specifies a Medium VRF
	FERC VRF G4 Discussion	This Requirement, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system but would unlikely result in the bulk electric system instability, separation, or cascading failures since a Balancing Authority would have the previous year's Frequency Bias Setting already in its ACE equation and would provide support f the contingency. This is consistent with the NERC definition. In addition, this Requirement VRF is consistent with the BAL-003-0 Requirement which has been approved by FERC.
	FERC VRF G5 Discussion	This requirement does not co-mingle reliability objectives.
	Proposed Lower VSL	The absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting is 5% or less below the minimum specified by the ERO.
	Proposed Moderate VSL	The absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting is more than 5% but less than or equal to 15% below the minimum specified by the ERO.
	Proposed High VSL	The absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting is more than 15% but less than or equal to 25% below the minimum specified by the ERO.
	Proposed Severe VSL	The absolute value of the Balancing Authorities' calculated monthly average Frequency Bias Setting is more than 25% below the minimum specified by the ERO.
	Compliance with NERC Revised VSL Guidelines	The NERC VSL guidelines are satisfied by incorporating percentage of noncompliance performance for the calculated monthly average

		~~Frequency Bias Setting absolute value being below the minimum specified by the ERO.~~
	~~FERC VSL G1 Discussion~~	~~This Requirement is similar in concept to the current enforceable BAL-003-0.1b Requirement R5 which specifies a Medium VRF. Proposed VSL's meet or exceed the current threshold of compliance.~~
	~~FERC VSL G2 Discussion~~	~~Proposed VSL's is not binary. Proposed VSL language does not include ambiguous terms and ensures uniformity and consistency in the determination of penalties based only on the amount the calculated monthly average Frequency Bias Setting absolute value is below the minimum specified by the ERO.~~
	~~FERC VSL G3 Discussion~~	~~Proposed VSL's do not expand on what is required. The VSL's assigned only consider results of the calculation required. Proposed VSL's are consistent with the requirement.~~
	~~FERC VSL G4 Discussion~~	~~Proposed VSL's are based on a single violation and not a cumulative violation methodology.~~

Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

Balancing Authority MyBA

NERC FRS FORM 1 20 to 52 second Value B

1901	Bias Calculation Form 1 for Year
Eastern	Interconnection
MyBA	Balancing Authority
	Contact Name
	Contact Phone #
	Contact e-mail
	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-964	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
#DIV/0!	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
	1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.
Calculate Regression	
	BA Bias Type and Bias Setting
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
621018	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-20.87	Balancing Authority desired Bias Setting: May be set to a value between 100% to 125% of its FRM if this value is more negative than the minimum Bias based on Peak Demand. If not more negative, then the Bias must be the minimum Bias based on Peak Demand. If variable Bias is used, enter "Variable".
#DIV/0!	**1901 Frequency Bias Setting - (minimum of 100% to 125% of FRM, or 0.9% of Historical Peak Demand if not Variable)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Select Reason(s) for adjustment

Instructions

Step 1 Enter data in all green cells on this "Data Entry" worksheet.

Step 2 For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.

Step 3 PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)

MyBA_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify:
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
   Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced.
   (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

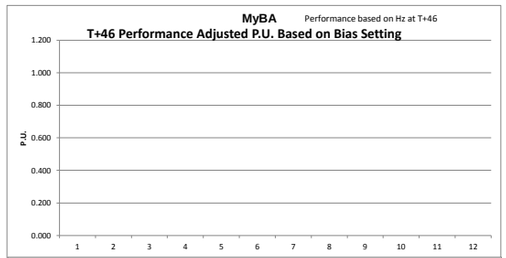
FRI - NERC Frequency Response Initiative

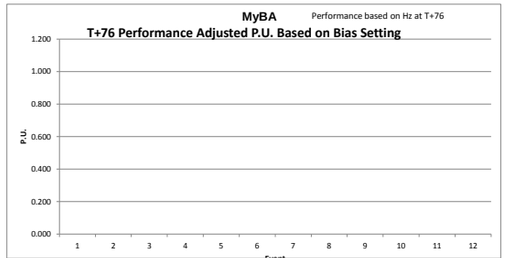
The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

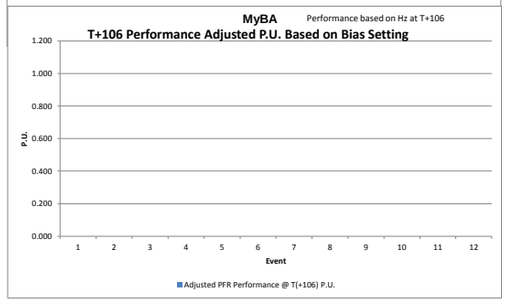
Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

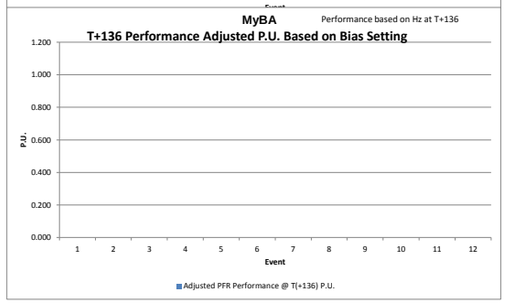
Some basic observations from this data:

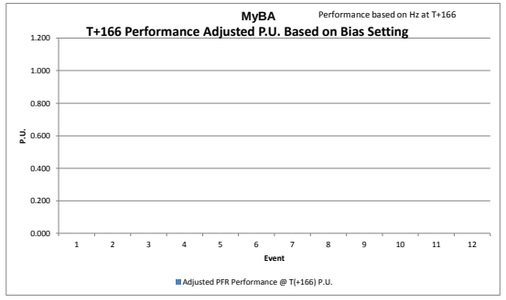
1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.











Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

Balancing Authority: ERCOT

NERC FRS FORM 1 20 to 52 second Value B

1901	Bias Calculation Form 1 for Year
ERCOT	Interconnection
ERCOT	Balancing Authority
	Contact Name
	Contact Phone #
	Contact e-mail
1	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
1	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
1	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
1	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-286	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
-286.00	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
-286.00	**1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.**
Calculate Regression	
	BA Bias Type and Bias Setting
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
65300	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
-587.70	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-653.00	Balancing Authority desired Bias Setting: Single BA Interconnections have no minimum or maximum Bias Setting requirement. If variable Bias is used, enter "Variable".
-653.00	**1901 Frequency Bias Setting - (Single BA Interconnections have no minimum or maximum Bias Setting requirement)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
-529.36	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
-529.36	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Select Reason(s) for adjustment

Instructions

Step 1	Enter data in all green cells on this "Data Entry" worksheet.
Step 2	For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.
Step 3	PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.
Step 4	Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)
	ERCOT_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify:
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
   Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced.
   (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

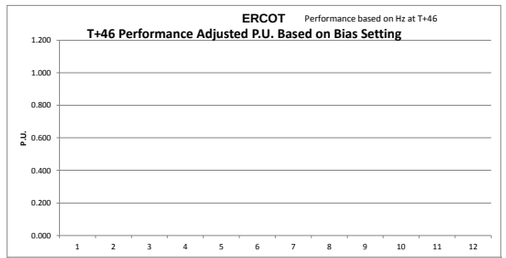
FRI - NERC Frequency Response Initiative

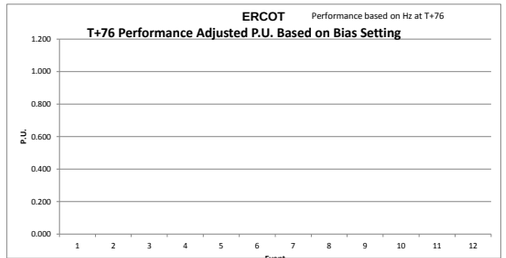
The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

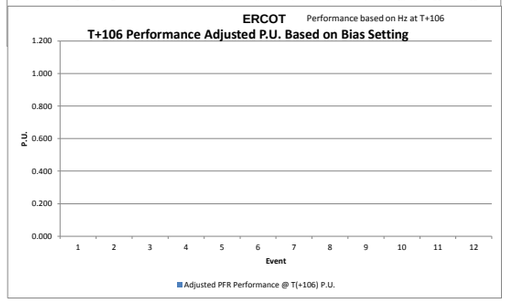
Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

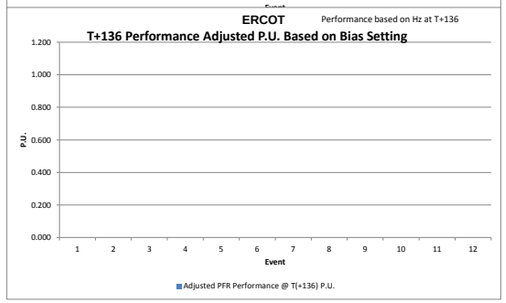
Some basic observations from this data:

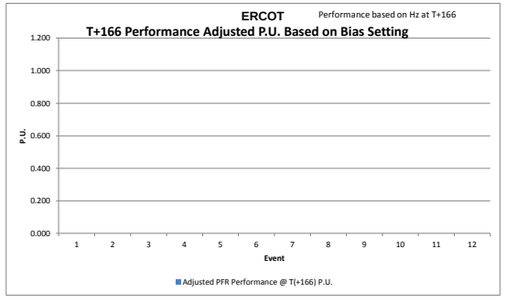
1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.











Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

1	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
1	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
1	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
1	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-179	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
-179.00	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
-179.00	**1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.**
Calculate Regression	**BA Bias Type and Bias Setting**
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
37153	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
-334.38	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-442.00	Balancing Authority desired Bias Setting: Single BA Interconnections have no minimum or maximum Bias Setting requirement. If variable Bias is used, enter "Variable".
-442.00	**1901 Frequency Bias Setting - (Single BA Interconnections have no minimum or maximum Bias Setting requirement)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

Value	Item
N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Instructions

Step 1 Enter data in all green cells on this "Data Entry" worksheet.

Step 2 For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.

Step 3 PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)

HQT_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify:
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
     Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced.
     (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

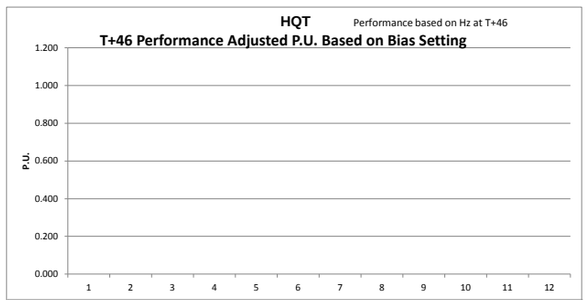
FRI - NERC Frequency Response Initiative

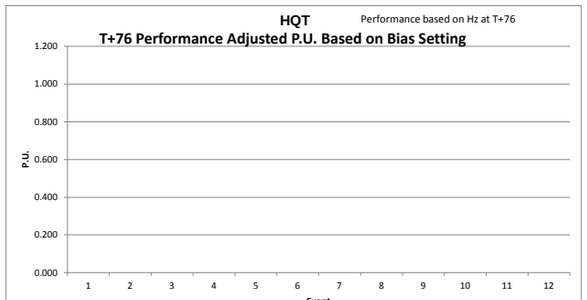
The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

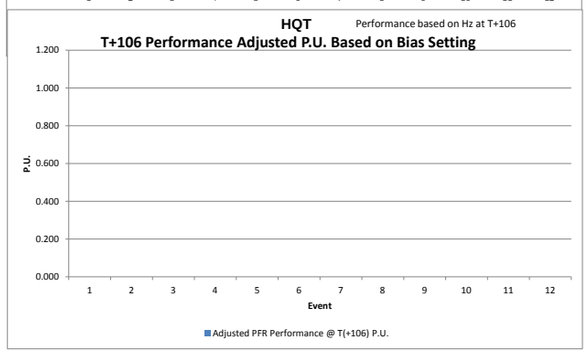
Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

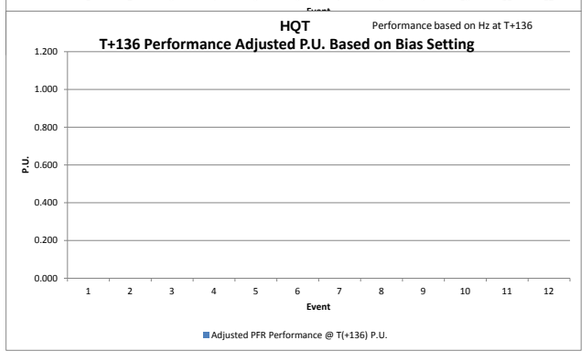
Some basic observations from this data:

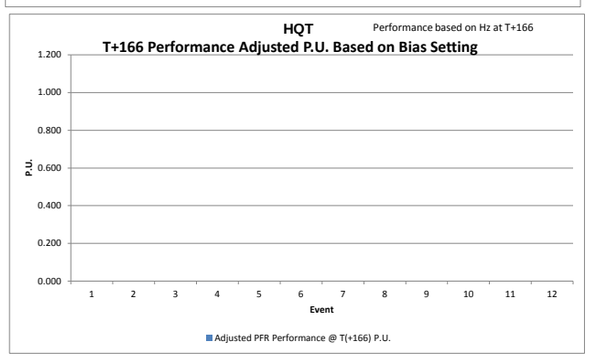
1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.











Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

Balancing Authority MyBA

Value	Description
1901	Bias Calculation Form 1 for Year
Eastern	Interconnection
MyBA	Balancing Authority
	Contact Name
	Contact Phone #
	Contact e-mail
	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-964	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
#DIV/0!	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
	1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.
Calculate Regression	
	BA Bias Type and Bias Setting
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
621018	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-20.87	Balancing Authority desired Bias Setting: May be set to a value between 100% to 125% of its FRM if this value is more negative than the minimum Bias based on Peak Demand. If not more negative, then the Bias must be the minimum Bias based on Peak Demand. If variable Bias is used, enter "Variable".
#DIV/0!	**1901 Frequency Bias Setting - (minimum of 100% to 125% of FRM, or 0.9% of Historical Peak Demand if not Variable)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

Value	Description
N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Instructions

Step 1 Enter data in all green cells on this "Data Entry" worksheet.

Step 2 For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.

Step 3 PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)

MyBA_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify.
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
   Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced.
   (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

			0.0	0.0	1900 Average Annual Bias MW/0.1 Hz

Balancing Authority: MyBA

1899	Reporting period FRS Form 1 data
0.00	1899 Reporting period: Balancinig Authority FRM MW/0.1 Hz, enter from FRS Form 1 for that year's FRM. If not know enter zero.
1.00%	1899 Reporting period: Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
	1899 Reporting period: Your BA's Annual Peak Demand or Peak Gen for Gen only BAs from your BA Form 714.
0.00	Your BA's lowest absolute Fixed Frequency Bias Setting based on BA Peak Demand (Peak Generation for Generation only BA) MW/0.1 Hz.
0.00	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
0.00	1900 Minimum, lowest absolute, conditional average Frequency Bias Setting MW/0.1 Hz.
	1899 Minimum, lowest absolute, conditional average Frequency Bias Setting MW/0.1 Hz.

*** Frequency Bias Setting (FBS)**
**** Based on the one minute values used in BAL 001 when frequency is greater than 60.036 Hz or less than 59.964 Hz.**

PasteSpecial/Values the data copied from FRS Form 2 for each event.

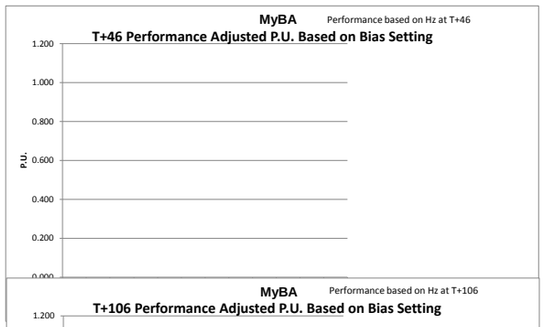
FRI - NERC Frequency Response Initiative

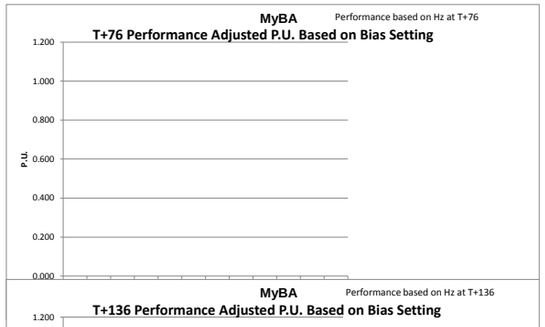
The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

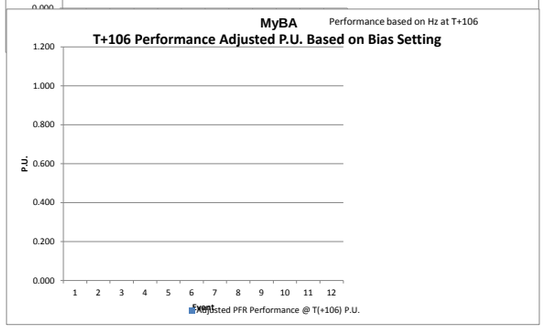
Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

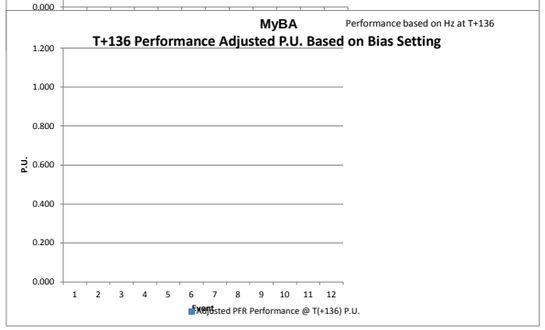
Some basic observations from this data:

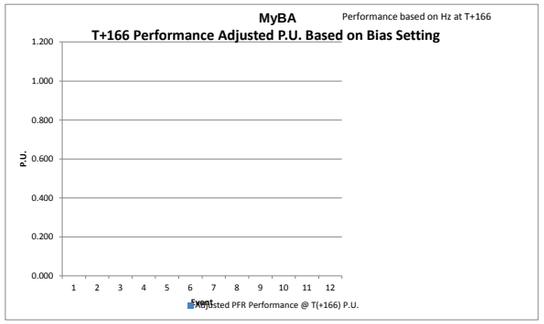
1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.











Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

Balancing Authority: ERCOT

NERC FRS FORM 1 20 to 52 second Value B

Enter Addition Data in column W ==>

Value	Description
1901	Bias Calculation Form 1 for Year
ERCOT	Interconnection
ERCOT	Balancing Authority
	Contact Name
	Contact Phone #
	Contact e-mail
1	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
1	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
1	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
1	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-286	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
-286.00	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
-286.00	**1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.**
Calculate Regression	
	BA Bias Type and Bias Setting
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
65300	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
-587.70	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-653.00	Balancing Authority desired Bias Setting: Single BA Interconnections have no minimum or maximum Bias Setting requirement. If variable Bias is used, enter "Variable".
-653.00	**1901 Frequency Bias Setting - (Single BA Interconnections have no minimum or maximum Bias Setting requirement)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
-529.36	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
-529.36	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

Value	Description
N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Instructions

Step 1 Enter data in all green cells on this "Data Entry" worksheet.

Step 2 For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.

Step 3 PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)

ERCOT_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify:
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
   Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced. (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

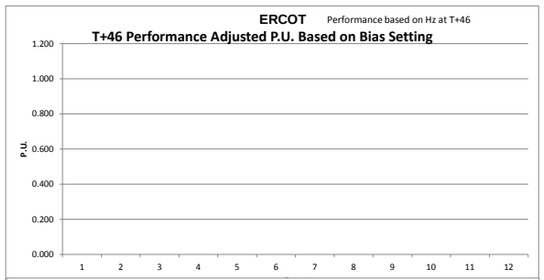
FRI - NERC Frequency Response Initiative

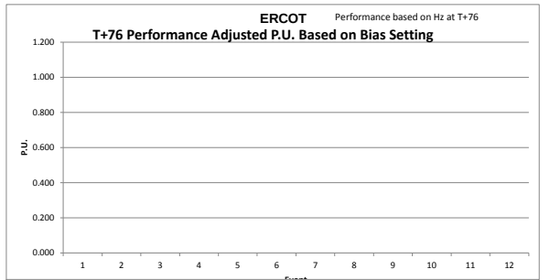
The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

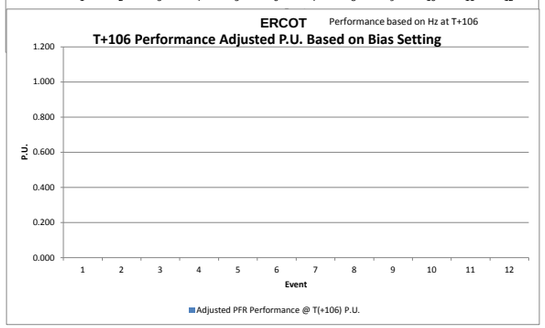
Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

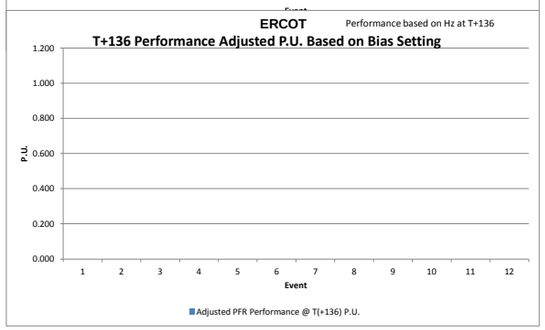
Some basic observations from this data:

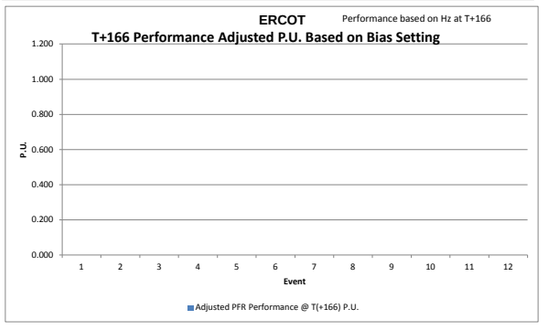
1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.











Instructions

Step 1 Enter data in all green cells on the "Data Entry" worksheet. Cell G1 with the BA name. Cells R11 through R13 with contact information. Cell R24 with BA Bias Type, Fixed or Variable.

Step 2 For identified events in column C of the "Data Entry" worksheet, collect data and complete one FRS Form 2 workbook for each event in the list.
Detailed Instructions for utilizing the "Adjustments" are located on the "Adjustments" worksheet below the table.

Step 3 PasteSpecial/Values data from FRS Form 2 "Form 1 Summary Data" worksheet into "BA Form 2 Event Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Enter FERC Form 714 data from the most recent completed Form 714 in the worksheet "Form 714 Data" in cells C7 through D18. Use Copy/PasteSpecial/Values to enter data.
Your current year's Frequency Response Obligation will be calculated in cell R20 of the "Data Entry" worksheet.

Step 5 a) If a Fixed Bias was selected, cell R27 will calculate the minimum Bias (least negative) allowed based on your Peak Demand or Peak Generation for Generation only BAs.
b) If a Fixed Bias was selected, cell R28 will calculate the minimum (in absolute terms) Bias allowed based on 100% of your FRM.
c) If a Fixed Bias was selected, cell R29 will calculate the maximum Bias (in absolute terms) allowed based on 125% of your FRM.
d) If R29 was more negative than the value in R27, you may choose a Bias setting that is between R29 and the lesser of R27 or R28 and enter it here. Based on your choice, your Bias Setting will appear in cell R33.

Step 6 a) If a Variable Bias was selected, cell R27 will indicate "not applicable" where there is no maximum or minimum Bias Setting.
b) If a Variable Bias was selected, enter "Variable" in cell R31.
c) If a Variable Bias was selected, cell R30 will calculate the minimum Bias (in absolute terms) allowed based on your FRM and Peak Demand/Peak Generation. Calculate your monthly one minute average Variable Bias setting when frequency is lower than 59.964 Hz or higher than 60.036 Hz and enter these monthly values on the "Variable Bias Supplemental Info" worksheet in cells B2 through D13.
d) If the "average annual Variable Bias Setting" in cell D14 on the "Variable Bias Supplemental Info" worksheet is less negative than cell E14 of this worksheet, R3 of the standard has not been met and cell D14 on the "Variable Bias Supplementa Info" worksheet will turn red. The average minimum Bias Setting will cover two different reporting periods and Cells J3 through K10 require past year's data from those year's Form 1s for this evaluation.
e) Depending on when the Implementation date is each year for the annual Bias Setting, the ERO may be required to edit the selection of each months' minimum average FBS value. This should be completed by the ERO before each year's FRS Form 1 is published.
f) The comparison to the FBS minimum will be from two previous year's analysis prior to the current year and the dates in the table starting at J3 will indicate the appropriate year's data to use. For example, if it is Feb 1, 2013 and you are calculating your 2012 FBS time weigted average, the minimum FBS value will be determined from your FRM that you calculated in Feb of 2012 and based on the Peak Demand/Peak Gen reported in June of 2011 for 2010 data. Enter each field in green using the appropriate year's data.

Step 7 Two FRMs are calculated. One for the BA Bias Setting and one for meeting R1 of the standard.
The FRM for the BA Bias Setting will use all selected events and all SEFRD values will use the delta frequency as measured.
The FRM for the BA compliance to R1 will limit the delta frequency to no greater than those listed in Table 2 of Attachment A for each Interconnection. (Eastern +/-0.500 Hz, Western +/-0.500 Hz, ERCOT +/-0.700 Hz and HQ +/-1.500 Hz.)

Step 7 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsx. (where NYISO is replaced with your Balancing Authority abbreviation). See cell "G74" on the Data Entry worksheet for your exact file name.

Step 8 Send completed Form 1 and each Form 2 to NERC.

003292

Balancing Authority **HQT**

Value	Description
1901	Bias Calculation Form 1 for Year
HQ	Interconnection
HQT	Balancing Authority
	Contact Name
	Contact Phone #
	Contact e-mail
1	MWh Annual Gen_{BA} is the annual "Net Generation (MWh)", FERC Form 714, line 13, column c of Part II - Schedule 3.
1	MWh Annual $Load_{BA}$ is the annual "Net Energy for Load (MWh)", FERC Form 714, line 13, column e of Part II - Schedule 3.
1	MWh Annual Gen_{INT} is the Sum of all Annual Gen_{BA} values in this interconnection
1	MWh Annual $Load_{INT}$ is the Sum of all Annual $Load_{BA}$ values in this interconnection
-179	Interconnection Frequency Response Obligation (FRO) MW/0.1 Hz. Determined by ERO.
1900	Current data year (December thru November)
-179.00	**1901 BA Frequency Response Obligation (FRO) for next year's FRM**
-179.00	**1900 BA Frequency Response Obligation (FRO) for this year's FRM from your last year's Form 1.**
Calculate Regression	**BA Bias Type and Bias Setting**
Fixed	Bias Type utilized.
0.90%	Interconnection Minimum Fixed Frequency Bias Setting % of Peak Demand or Peak Generation (Set by ERO)
37153	The Sum of the Non-Coincident peak demands for all Bas on the interconnection from FERC Form No. 714, provided by ERO.
-334.38	Your BA's lowest absolute Fixed Frequency Bias Setting based on interconnection non-coincident peak demand.
#DIV/0!	Your BA's lowest absolute Fixed Frequency Bias Setting based on 100% of FRM.
#DIV/0!	Your BA's highest absolute Fixed Bias Setting: 125% of FRM.
n/a	Balancing Authority lowest absolute Variable Bias Setting (least negative one minute average Bias while frequency is less than 59.964 or greater than 60.036 Hz).
-442.00	Balancing Authority desired Bias Setting: Single BA Interconnections have no minimum or maximum Bias Setting requirement. If variable Bias is used, enter "Variable".
-442.00	**1901 Frequency Bias Setting - (Single BA Interconnections have no minimum or maximum Bias Setting requirement)**
#DIV/0!	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for Bias
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
#DIV/0!	1900 FRM - Median Estimated Frequency Response MW/0.1Hz using SEFRD for Bias
0.00	1900 FRM - Average Estimated Frequency Response MW/0.1 Hz using SEFRD for R1
0.00	1900 FRM - Regression Estimated Frequency Response MW/0.1Hz using SEFRD for R1
0.00	**1900 FRM - Median Estimated Frequency Response MW/0.1Hz for BA Compliance to R1, minimum Frequency Response**
N	Do you RECEIVE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA in the table below.

Bias -MW/0.1 Hz	Balancing Authority

Value	Description
N	Do you PROVIDE Overlap regulation?
	If Yes, list the BA name and the associated Bias of that BA

Bias -MW/0.1 Hz	Balancing Authority

Instructions

Step 1 Enter data in all green cells on this "Data Entry" worksheet.

Step 2 For identified events in column B, collect data and complete FRS Form 2.9 for each event in the list.

Step 3 PasteSpecial/Values data from FRS Form 2.9 "Form 1 Summary Data" into "BA Form 2 Data" worksheet of this workbook. Do this for each event in the list.

Step 4 Save this workbook using the following file name format:NYISO_yyyy_FRS_Form_1.9.xlsm and send a copy of this workbook and all FRS_Form 2 workbooks to NERC. (where NYISO is replaced with your BA name)

HQT_1901_FRS_Form_1.9.xlsm

Sign Convention for scan data collected in Form 2	Imports: MWs are - Exports: MWs are +	Loads in MW as -	Load MW as - Generation MW as +	Enter Gen MW as +	The transactional amount in MW Receiver enters - Deliverer enters + on Form 2 Data sheet	Generation MW as + (If demand occurs due to gen loss, enter MW as - at value B)

Instructions for utilizing Adjustments:

1) Balancing Authorities making adjustments must retain evidence to verify.
   - Adjustment values are determined from scan-cycle data using Value A and Value B averaging periods. Scan-cycle data must be available if adjustments are made.
   - Adjustments are necessary to improve accuracy of calculations compared to using Net Actual Interchange solely.
   Said differently, unless an adjustment compensates for significant known error, it should not be made. However, as noted in the next item, once a decision to include an adjustment for one or more of the five types is made for one event, the entity must calculate adjustments for that (those) type(s) for all events except for the Contengent BA Adjustment which is only utilized for the events that you are contengent during that event.
   - Adjustments are included consistently for all events (e.g. if adjustments for nonconforming load are made for one event, the load must be included for all events, etc.).

2) Dynamic Schedules:
   - Values use schedule sign convention.
   - Adjustments should include only dynamic schedules accounting for joint-owned units. Other dynamic schedules should be ignored.

3) Nonconforming Loads:
   - Values must be negative numbers.

4) Pumped Hydro:
   - Values for pumping must be negative values.
   - Values for generating must be positive values.

5) Rampling Units:
   - Values are positive values.

6) Transferred Frequency Response:
   - This value is the amount agreed upon between the entities expressed in MW/0.1 Hz. Form 2 will adjust this amount for the frequency deviation experienced.
   (e.g. if an entity agrees to provide 20 MW/0.1 Hz to another entity and a frequency event with a deviation of 50 mHz occurs, the delivering entity should enter +20 in the data column of Form 2 and the receiving entity should enter - 20. The spreadsheet will adjust the SEFRD for each entity by the 10 for this event.)
   - Values for the entity receiving the response must be entered as a negative number.
   - Values for the entity delivering the response must be entered as a positive number.
   - Values between entities must sum to zero.

7) Contingent Balancing Authority Adjustment:
   - Data for Value A is the pre-contingency scan rate generation (+MW values) from the contingent unit(s).
   - Data for Value B is usually 0 MW, but may be the demand (-MW values) that remains on the system that was "netted" out by the now offline generation.

FRI - NERC Frequency Response Initiative

The FRI Report made recommendations to evaluate Primary Frequency Response at additional time intervals during the event recovery period.
Additional evaluations have been added to both Form 1 and Form 2 to evaluate PFR delivery for these suggested time periods.
These evaluations utilize Interconnection frequency at specific times during the recovery period and calculates the BA's delivery of PFR for each selection.
These evaluations are not part of BAL-003 and will not impact compliance to R1 of the draft standard.
The following time selections are evaluated: T+46, T+76, T+106, T+136 and T+166.
Each evaluation is a P.U. measure based on the BA's Bias setting at each of these times.
Performance is the "best" performance at the specific time through 10 seconds past each time.
This is intended to account for any delay in data in the measurement. This measurement may be changed as experience in this effort increases.

Also included is the measure of PFR delivery during the T+20 to T+52 second period, the same as R1 of the standard.
The measure (P.U.) here is based on the BA Bias setting and not the FRO. This was done to provide comparison to the additional measurement times.

Some basic observations from this data:

1) If the P.U. value is close to 1.0, the BA delivered the full amount of PFR equal to its Bias setting.
2) The average performance of the Eastern Interconnection in PFR is about 40% of the total Interconnection Bias setting. If the BA's average score is greater than 0.40 P.U. then they are providing more PFR than the average BA. If the P.U. is less than 40% then they are providing less than average PFR.
3) If the P.U. value at T+46 is consistently less than the P.U. value at T+20 to T+52, then the PFR of the BA is not being sustained.
4) If the P.U. value at later time interval measures is consistently less, then withdrawal of PFR is occurring at a slower rate, but still being withdrawn.
5) If the P.U. value at T+20 to T+52, T+46, or T+76 is consistently greater than 1.0, this indicates that the BA Bias setting is too low.

Balancing Authority Name: MyBA

MyBA_091012_0227_FRS_Form2.9.xlsm

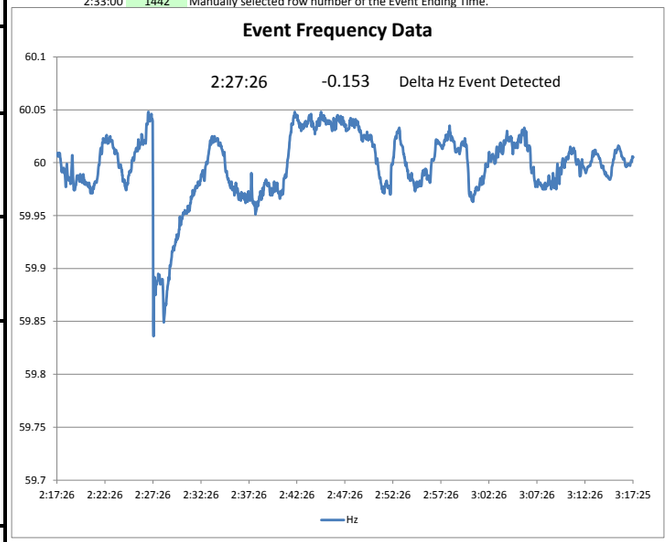
Interconnection Prevailing UFLS First Step Relay trip point 59.500 Hz

Interconnection High Relay trip point 60.500 Hz

Note: See "Instruction" tab for more detailed instructions.

	Auto	**Event Detection**	Auto
2:27:26	1245	Manually selected row number of the Event Starting Time.	Manual
2:33:00	1442	Manually selected row number of the Event Ending Time.	

Step 1.	Copy and Paste Event Data into the appropriate cells of the "Data" worksheet. Maintain date and time format of mm/dd/yy hh:mm:ss.
Step 2.	**Data must start at least 2 full minutes before the beginning of the event.** Collect the same amount of data for each event. Suggest 2 to 3 minutes before to 15 minutes after (up to 60 minutes total). Delete unused rows of data in the Data worksheet below your data, columns A through R. You must also delete any un-used event detection formulas in columns N through R as well.
Step 3.	Enter your BA name in cell B1 of this worksheet.
Step 4.	Verify that the "Auto" Event Detection selected the correct event. Verify time and delta Hz by comparing time of event and delta Hz on graph to the right to that on Form 1 for this event. If the wrong event was selected, in cell "E4" of this worksheet select "Manual" and manually select the beginning and ending row numbers of the desired event and enter these in cells "E5" and "E6". Only rarely should you have to use the "Manual" process.
Step 5.	Verify that the "Auto" selection of T(0) is correct by observing "Graph 20 to 52s". The very first frequency data point of the event on the graph must not be included in the "A Value" average. This is accomplished when the first frequency data point of the event is dead center of the graph on the center vertical grid line. The Auto event detection will select the single largest event in the data provided. An adjustment for T(0) alignment is provided in Cell Q3 on the Graph 20 to 52s.
Step 6.	When T(0) is properly aligned. Hit the big blue button to copy your data for pasting into FRS Form 1 "BA Event Data" worksheet. Copy Form 2 data for Pasting into Form 1
Step 7.	Paste data into "FRS Form 1" in the appropriate row on the "BA Event Data" worksheet. Be sure to use the latest version of Form 1. This is Form 2.9 so use Form 1.9.
Step 8.	Save this workbook using the following file name in bold below:



09/10/12 Date yymmdd

2:27 Time hh:ss of T(0)

Where "MyBA" = your BA mnemonic

Date:	Monday, October 12, 2009	
Time of T(0)	2:27:26	
Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz	2:33:00	
Value A Pre-Perturbation Average Frequency [T(-2) to T(-16)]	60.042	Hz
Value B Post-Perturbation Average Frequency [T(+20 to T(+52)]	59.889	Hz
Pre to Post Perturbation Delta Frequency Actual	-0.153	Hz
Value A Pre-Perturbation Average Interchange MW [T(-2) to T(-16)]	3645.73	MW
Value B Post-Perturbation Average Interchange MW [T(+20 to T(+52)]	3803.35	MW
Pre to Post Perturbation Interchange Delta MW Actual	157.63	MW
EPFR Pre-Perturbation Average	-43.39	MW
EPFR Post-Perturbation Average	114.21	MW
EPFR Unadjusted	157.60	MW
EPFR Adjusted	198.04	MW
Pre JOU Dynamic Schedules MW	350.00	MW
Pre Non-Conforming Load MW	165.34	MW
Pre Pumped Hydro MW	0.00	MW
Pre Transferred Frequency Response MW	-4.21	MW
Pre Contingent BA Lost Generation MW	15.00	MW
Sum of Pre Perturbation Adjustments	526.12	MW
Post JOU Dynamic Schedules MW	335.00	MW
Post Non-Conforming Load MW	214.13	MW
Post Pumped Hydro MW	6.35	MW
Post Transferred Frequency Response MW	11.09	MW
Post Contingent BA Lost Generation MW	0.00	MW
Sum of Post Perturbation Adjustments	566.57	MW
Net Total Adjustments MW	40.45	MW

T(20) to T(52) Evaluation

Pre-Perturbation Bias Setting	-103.00	MW/0.1 Hz
Post-Perturbation Bias Setting	-103.00	MW/0.1 Hz
EPFR for Bias Setting Pre-Perturbation Average	-43.39	MW
EPFR for Bias Setting Post-Perturbation Average	114.21	MW
EPFR for Bias Setting Delta	157.60	MW
Primary Frequency Response Delivery % of Bias	100.02%	
Pre-Perturbation BA Load	7651.3	MW
Post-Perturbation BA Load	7632.0	MW
Pre to Post Perturbation BA Load Change	-19.305	MW
Load Dampening Frequency Response	-12.617	MW/0.1 Hz
Load Dampening % of Total BA Frequency Response	12.25%	
Average Bias Setting when Hz is greater than +/-0.036 Hz	-103.00	MW/0.1 Hz

T(0)

First change in frequency of the event should occur here on the vertical grid line.
It is important that the pre-event frequency average to NOT contain frequency data of the event, "Average Frequency" trend to the left of center of the graph.
To shift the data on the graph left or right, adjust the value in cell Q3 highlighted in yellow above.

# of rows to shift T(0)

1

A zero value aligns the data to the hightest Frequency change value.
Usually the event begins one or two data scans earlier than this scan.

Increasing this value shifts graph data to the right.
Decreasing this value shifts graph data to the left.

Note: The P.U. Performance values indicate performance as a P.U. value of BA Bias setting.
For BAs that utilize a variable Bias, the Bias average during T(+20) to T(+52) is used.
P.U. values above 1.0 indicate that the Bias setting was below measured Frequency Response.
