33.27	Detroit Edison	Disagree	R11, R12 and R14 use term “remote electronic access” and R13 uses the term “remote access”. Revise to maintain consistency.Wireless electronic access is not an access method; it is just the medium to obtain access. In an effort to remove reference to specific technology, wireless should not be identified anywhere in the standard. References to specific technologies should be addressed in the guidance documentation.
33.28	Ameren	Disagree	R14.1 - The complexity and scope of the documentation of the Low Impact Systems will be challenging to keep succinct for auditors.R14.3 - Deny access by default is not needed. Requiring authentication implies access is denied by default.R14.4 - Not all systems support user banners. This will be hard to keep from being a TFE on many “high” systems.
33.29	Southern Company	Disagree	R14.1-4 addresses remote access only and does not include wireless, the table title and R14 includes wireless.
33.30	Entergy	Disagree	R14.2 dictates multifactor authentication controls for only high impact BES Cyber Systems. Entergy recommends serious consideration of extending this to low and medium impact BES Cyber Systems where localized wireless technology is employed.

#	Organization	Yes or No	Question 33 Comment
			Eliminate 14.4. We understand the purpose of this requirement but do not believe that it adds to the protection of any cyber system. If it is to be added then it should be placed outside of the wireless and remote electronic access control section and placed elsewhere. Entergy believes some aspects of R11 and R14 are redundant and suggests combining them. We also believe criteria in R14 should apply to high, medium and low risk assets and provide a footnote indicating that where requirements are unable to be met explicitly that the strongest possible controls should be employed alternatively.
33.31	US Bureau of Reclamation	Disagree	R14.3: Add deny access by default requirement for low systems. Specific access permissions are not required, however.
33.32	San Diego Gas and Electric Co.	Disagree	SDG&E recommends that a definition of what is meant by “multifactor authentication controls” be included in a definition box near R14.
33.33	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS proposal. Criteria in 14.3 and 14.4 are very specific in application of technology that may not be supported by devices in the field. These criteria should be removed or reworded to cover various methods of operation. If the drafting team keeps these requirements the following is our recommended language: R14 Table 14.3: If a BES cyber system component supports explicit access permission capability, the device should deny access by default. R14 Table 14.4: If a BES cyber system component supports notification capability, remote electronic access control device users should be notified that unauthorized use of the system is prohibited.
33.34	MidAmerican Energy Company	Disagree	The new definition of BES Cyber System creates confusion over what technologies are intended to be in-scope. The core changes significantly changes how a responsible entity (RE) establishes and secures remote access to these systems. The REs will develop their own unique determination on how to deal with this situation. Which is likely not going to deliver the intended result the Standards drafters are looking for industry-wide? As this relates to R22 - firewalls, our CIP defined access points, are

#	Organization	Yes or No	Question 33 Comment
			defined as part of a given BES Cyber System. One likely scenario is that we will define a separate BES Cyber System that manages these firewalls that might include a client PC, a firewall manager, and some network infrastructure components. The remote access rules and even the other general protections of these cyber components to manage this type of communication become very ambiguous.Retain the existing ESP concept versus adopting the BES Cyber system concept and make some of the other operational improvements this draft makes.While the criteria themselves are not onerous for the long term/future development of the systems, the current BES technology in place or available, will require technical feasibility exceptions as not all systems within the BES can support all criteria listed.
33.35	PacifiCorp	Disagree	The new definition of BES Cyber System creates confusion over what technologies are intended to be in- scope. The core changes significantly changes how a responsible entity (RE) establishes and secures remote access to these systems. The REs will develop their own unique determination on how to deal with this situation. Which is likely not going to deliver the intended result the Standards drafters are looking for industry-wide? As this relates to R22 - firewalls, our CIP defined access points, are defined as part of a given BES Cyber System. One likely scenario is that we will define a separate BES Cyber System that manages these firewalls that might include a client PC, a firewall manager, and some network infrastructure components. The remote access rules and even the other general protections of these cyber components to manage this type of communication become very ambiguous.Retain the existing ESP concept versus adopting the BES Cyber system concept and make some of the other operational improvements this draft makes.While the criteria themselves are not onerous for the long term/future development of the systems, the current BES technology in place or available, will require technical feasibility exceptions as not all systems within the BES can support all criteria listed.
33.36	Bonneville Power Administration	Disagree	The objective of this requirement (‘to ensure that no unauthorized access is allowed to its BES Cyber System”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than

#	Organization	Yes or No	Question 33 Comment
			appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.In addition: Table R14, Section 14.2 is excessive. Given the draft Standard's definition of external connectivity, remote access could also be a case of accessing a system from a nearby system over secured communications paths. An example would be a user on one BES Cyber System accessing another BES Cyber System in the same Control Center. It is not reasonable to justify multi-factor authentication in these circumstances. In addition, many existing systems do not have the capability of enforcing multi-factor authentication. Finally, there are other authentication controls stronger than username/password which are not multifactor: biometric, one time passwords, dial-back, and so forth. Recommendation: Delete the requirement. If not, change the definition of "external connectivity" as discussed in question 13, and change the requirement from "multifactor authentication controls" to "authentication controls stronger than username/password".Section 14.4. There are significant issues with this requirement. - The warning banner is a legal requirement, not a security requirement. Its only purpose is to provide support for legal recourse if someone violates what it says. - No unauthorized person should be accessing High Impact Cyber Systems. Any user with authorized electronic access will have completed security training, which includes proper use of BES Cyber Systems. Any unauthorized user will ignore the banner. - It does not prevent unauthorized access, and therefore does not support the purpose of the requirement. - The requirement has technical feasibility issues. To provide specific scenarios: 1. The user connects from a device controlled by the Responsible Entity, using networks owned by the RE. The user authenticates at the local device. When attempting to connect the the BES Cyber System, the firewall access point allows the traffic, based on the originating point within the trusted network. The user again authenticates at the BES CYber System. At no time does the user authenticate at the access point itself (nor does the rest of Table R14 require authentication at the access point.) In fact, under these circumstances firewalls generally do not have the capability to request authentication or present a banner. 2. The user connects via a

#	Organization	Yes or No	Question 33 Comment
			VPN. The VPN client authenticates the user, then uses a PKI certificate to authenticate to the access point. The user is then granted access to the network and can proceed to authenticate and connect to a BES Cyber System. At no point did the user authenticate to the access point, nor was there an opportunity to present a banner.Recommendation: The best solution is to eliminate the requirement. If the requirement cannot be removed:First, change the definition of remote access and/or external connectivity as discussed above. This would eliminate the requirement to present a banner to users attempting access from equipment belonging to the Responsible Entity. Second, allow the banner to be present at locations other than the access point. A possible revised requirement would be: "Display an "appropriate use banner" to the user that, upon an interactive attempt ..." Also, change "Required" to "Required for external connectivity only".
33.37	Consultant	Disagree	The terminology "wireless and remote access" is redundant. The definition of remote access (near requirement R11) includes wireless access implicitly. Suggest using the defined term "Remote Access" rather the redundant terminology.Table R14 - Item 14.1 It seems illogical to require authentication controls on Low Impact systems when there is no Account Management required for these systems. Suggest deleting the requirement for Low Impact BES Cyber Systems.Items 14.1 & 14.2 - The terminology "is used and/or implemented" seems redundant. It appears that being "implemented" creates the vulnerability, and the requirement for control. Suggest changing the words "is used and/or implemented" to "is implemented".Item 14.3 - This includes two different requirements: (1) Deny access by default & (2) specify explicit access permissions. The first requirement is a technical implementation and should remain here. The second is an account management requirement and should be moved to the account managment requirement R8.
33.38	Minnesota Power	Disagree	These criteria are generally acceptable; however, Minnesota Power requests that the Standards Drafting Team consider defining “authentication controls.”Also in Part 14.2, the requirement regarding the use of multifactor authentication controls sets a technology-specific direction that may not stand over time, including the possibility of

#	Organization	Yes or No	Question 33 Comment
			biometric authentication that, while not multifactor, is a stronger control.
33.39	Dominion Resources Services, Inc.	Disagree	To avoid the potential for TFE's associated with R14.4, a footnote similar to the one used for Table R10 on Page 11 of CIP-011 should be added. Also, access controls related to access points would be better addressed in the Boundary Controls Section of CIP-011.
33.40	Hydro One	Disagree	We don't understand the emphasis on wireless communication and believe that in the present form, it would be very complex to implement. It's our opinion that the protection should remain the same regardless of the type of access point.
33.41	Progress Energy (non-Nuclear)	Disagree	What conditions would dictate different authentication controls for different impact levels? Is it better for them to all be the same?R14.4 is unnecessary. The population of persons granted remote access rights is extremely limited and these people are highly trained and trustworthy. The appropriate use banner is used in situations where a general population was granted this type of access and that is not the case for remote access to any control systems.
33.42	National Grid	Disagree	What types of authentication controls are valid? (Authentication level such as a shared password or a user level control)
33.43	Alberta Electric System Operator	Disagree	Wireless access and remote access should be two separate concepts.
33.44	Network & Security Technologies Inc	Disagree	Wording of 14.4 gives the (doubtless unintended) impression a banner must be displayed on the user screen of electronic access control devices. Re-word to clarify banner must be displayed on the user screen of the accessing device.

34. Table R14 provides direction concerning what impact level of BES Cyber Systems to which Requirement R14 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R14 has moved to CIP-005-5 R1.

Commenters expressed that the 'deny by default' requirement should also apply to Low impact BES Cyber Systems. In response, the SDT agrees that some network access control should apply to all BES Cyber Systems, including the Low Impact BES Cyber Systems. CIP-005-5 R1 – Electronic Security Perimeter allows considerable flexibility for the entity to determine which security controls to apply, because of the significant number of Low Impact BES Cyber Systems.

Commenters suggested requiring a banner on Medium and Low Impact BES Cyber Systems. However, the SDT disagrees and felt the requirement to have "appropriate use banners" was administrative; therefore, it has been removed.

#	Organization	Yes or No	Question 34 Comment
34.1	CWLP Electric Transmission, Distribution and Operations Department	Agree	As long as TFEs are available for systems that do not support the password requirements.
34.2	Bonneville Power Administration	Agree	But see comments on R14.2, above. In addition, 14.4 is only acceptable if the definitions of remote access and external connectivity are changed, as discussed above. A banner is appropriate for someone accessing a BES Cyber System from completely outside the control of the entity.
34.3	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
34.4	FirstEnergy Corporation	Agree	With the exception of the concerns presented in the previous question.

#	Organization	Yes or No	Question 34 Comment
34.5	Oncor Electric Delivery LLC	Disagree	(R14.2)Multifactor authentication in legacy substation devices is extremely difficult and not needed. Appropriate logging and access controls will eliminate most threats. (R14.4)Appropriate Use Banners are not possible on many legacy dial-up devices used in substations. Appropriate logging and access control will eliminate most threats.
34.6	Southwest Power Pool Regional Entity	Disagree	14.2 and 14.4 should also apply to Medium impact BES Cyber Systems.
34.7	US Army Corps of Engineers, Omaha Distirc	Disagree	14.2 Multifactor authentication will be a major burden for small IT staffs. Standard should offer alternatives to mitigate - stronger passwords and or more frequent password changes.
34.8	WECC	Disagree	14.3 should be required for low impact.Remote access controls should apply to all impact levels.
34.9	Black Hills Corporation	Disagree	14.4 should be “Required” for all. Others are OK.
34.10	ERCOT ISO	Disagree	14.4: Should apply to Medium Impact BES Cyber System.
34.11	Tenaska	Disagree	18.1 all should be each.19.1 Validation of inbound data is more often done on the host application level and not at the boundary or host level.19.2 Is this RTU data? The protection is done at the applications level and I cannot examine data at my perimeter if it is encrypted at the host level.
34.12	Progress Energy (non-Nuclear)	Disagree	Believe it should be required for Low, Medium and High for R14.1, R14.2 and R14.2.
34.13	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
34.14	The Empire District	Disagree	Comments: We believe items 14.3 and 14.4 are going to set the stage for numerous

#	Organization	Yes or No	Question 34 Comment
	Electric Company		TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.15	E.ON U.S.	Disagree	E.ON U.S. believes that the proposed time requirements are not reasonable and require 24x7 support personnel with the privilege to revoke access.
34.16	Entergy	Disagree	Entergy believes some aspects of R11 and R14 are redundant and suggests combining them. We also believe criteria in R14 should apply to high, medium and low risk assets and provide a footnote indicating that where requirements are unable to be met explicitly that the strongest possible controls should be employed alternatively.
34.17	Dominion Resources Services, Inc.	Disagree	High Impact should be removed from 14.1 since it is covered by 14.2.
34.18	GE Energy	Disagree	If user accounts are audited on Medium Impact systems (see question 20), there should be an appropriate use banner.
34.19	LCEC	Disagree	Is this for remote access and wireless network access or does it also apply to wireless communications between BES Cyber System Components?
34.20	US Bureau of Reclamation	Disagree	It would seem that this criteria is in conflict with sound business practices. The concept of allowing access by default to Low Impact BES Cyber Systems does not make sense. Add deny access by default requirement for low systems. Specific access permissions are not required, however.
34.21	MidAmerican Energy Company	Disagree	Items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.Table R14 should be rewritten in a manner that minimizes TFEs. As an example, eliminate the word upon in 14.4 to eliminate TFE for systems that can only display banners immediately after access.

#	Organization	Yes or No	Question 34 Comment
34.22	National Grid	Disagree	National Grid suggests having 14.3 for Low Impact systems as well.
34.23	NextEra Energy Corporate Compliance	Disagree	NextEra believes Medium Impact BES Cyber Systems should have to comply with requirement 14.4. However, the rest of the impact levels are appropriate.
34.24	American Municipal Power	Disagree	Please provide a little or no impact category
34.25	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, and Table 14. Puget Sound Energy suggests including wording similar to Table 11: “Required for external connectivity only”.
34.26	Garland Power and Light	Disagree	Requirement 14.3 and 14.4 Should add "required" to all impact levels
34.27	USACE HQ	Disagree	Requirements 14.3 should be required for every level of impact.
34.28	San Diego Gas and Electric Co.	Disagree	SDG&E believes that Medium impact assets should also be required to have multifactor authentication controls (within the definition question mentioned in Question 33).
34.29	ISO New England Inc	Disagree	Should apply to all
34.30	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in row 14.2.
34.31	Consultant	Disagree	Table R14 - Item 14.1 It seems illogical to require authentication controls on Low Impact systems when there is no Account Management required for these systems. Suggest deleting the requirement for Low Impact BES Cyber Systems.
34.32	Alberta Electric System Operator	Disagree	The AESO suggests adding the following to Table R14: o 14.3 - Required for Low Impact. o 14.4 - Required for Low and Medium Impact.

#	Organization	Yes or No	Question 34 Comment
34.33	Southern California Edison Company	Disagree	The same authentication methods should be applied to all Levels.Also, SCE requests that the drafting team provide justification for the lack of a deny access by default for low impact system.
34.34	Minnesota Power	Disagree	These impact levels are generally acceptable, however to maintain consistency with Table R10, Parts 10.4 and 10.5, the High Impact cell in Part 14.1 should be blank since it is addressed in Part 14.2.
34.35	American Transmission Company	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.36	Florida Municipal Power Agency	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.37	MRO's NERC Standards Review Subcommittee	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.38	Hydro One	Disagree	We don't understand the emphasis on wireless communication and believe that in the present form, it would be very complex to implement. It's our opinion that the protection should remain the same regardless of the type of access point.
34.39	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R14:R14 Table 14.1: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR14 Table 14.2: Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredR14 Table 14.3: (if this requirement is retained)Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredR14 Table 14.4: (if this requirement is retained)Low Impact: N/AMedium Impact: N/AHigh Impact: Required

35. Requirements R15 to R19 of draft CIP-011-1 concern procedures for system security protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R15 to R19? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R15 through R19 have moved to CIP-007-5 R1 through R4.

For physical ports and services, several commenters expressed confusion around the term "externally accessible." The SDT agrees, and "externally accessible physical ports" was removed and substituted with physical ports used for "network connectivity, console commands, or removable media."

In addition, for physical ports and services, commenters expressed concern that physical port protection seems unnecessary, since overall physical security and personnel vetting is required, and many devices do not allow for configurable disabling of ports. The SDT agrees the objective of disabling unnecessary physical ports is primarily to prevent accidental propagation of malicious code. In response, the requirement was modified to "restrict" access. A description of acceptable forms of restriction is included in the measures; for example, these could be physically disabling the port or including signage about the use of ports.

For security event monitoring, several commenters stated that there is no need for weekly log review/clarity or manual log review since continuous monitoring is required. The SDT disagrees and references paragraph 528 of the FERC Order 706 that provides context for a weekly log review. The requirement allows for a review to include a sampling or summarization of security event logs.

For security event monitoring, several commenters expressed concern that there is no definition of "cyber security event" (i.e., a normal good logon is a "security event"). The SDT agrees and has modified the requirement to ensure that audit events must be organizationally defined. An enumerated list of events in the Standard is of little value.

For security event monitoring, commenters expressed concern that the requirement can be interpreted to include monitoring and logging for systems that don't support this functionality. The SDT agrees, and in response, this requirement was modified to apply log generation to the BES Cyber System (rather than the component) and allow the entity to define the generated events to audit.

For patch management, commenters expressed concern that not every patch is applicable to a BES Cyber System. The SDT agrees with this observation and notes that this requirement should be covered through the patch evaluation process. The focus of the requirement should be a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner."

For patch management, commenters expressed concern that flexibility is needed for the installation of patches; these dates can be based on equipment outage schedules, which could change the frequently or grid conditions that may or may not allow patching. The SDT agrees that the date of installation needs to be flexible to take into account equipment outage situations or high risk system conditions that could present an undesirable time for installing patches. Requiring an install date for the patches does nothing to improve BES Cyber System reliability. The overall goal of security patching should be to decrease the latency between security patch release date, application vendor certification date, entity testing, and implementation date. The SDT has revised the patch management requirements to achieve this goal.

For patch management, some commenters posed the question of what starts the clock for patching (release vs. availability vs. OS vendor vs. control system vendor). The SDT agrees there should be a starting point, but requiring an install date for the patches does nothing to improve BES Cyber System reliability. In response, the requirement has been modified so that Responsible Entities are required to create or revise an implementation plan within 30 days of the patch release from the identified source of the patches.

For malicious code prevention, commenters posed the question of whether the standard requires testing against actual malicious code. In response, the SDT disagrees and feels the intent was strictly focused on insuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.. This has been clarified in the guidance for the standards.

For malicious code prevention, commenters expressed there is still nothing specifying that malicious code prevention does not apply to field or network equipment. The SDT agrees, and in response, the requirement was modified to include malware prevention processes. It is now much more a “what” and not a “how” level of requirement.

#	Organization	Yes or No	Question 35 Comment
35.1	Dairyland Power Cooperative		15. It is good that this section is not wrongly specific as CIP-007:R4 is. This should allow for solutions that are not specifically signature based. This should allow for a network-based solution rather than individual solutions on each component. BES systems should not be used like typical Internet user systems, and therefore it should not be enforced that Internet user solutions be applied.16.2 requires a fixed implementation schedule of patches. However there should be an allowance that not every little security patch needs application, and it should be acceptable to defer insignificant patches until a later date when a significant patch needs to be applied. Additional controls to compensate may not be needed other than the security already designed to isolate a BES cyber system.17.1 Focusing on documenting the process to

#	Organization	Yes or No	Question 35 Comment
			harden seems wrong-the focus should be on requiring/verifying that a system is hardened. 19.1/19.2 How is validating inbound data (19.1) different than determining if inbound data has been compromised (19.2)? Was the intent of 19.1 to validate/authenticate the remote host/application on inbound connection? There should be requirements to restrict inbound connections from known remotes only. Validation of data should be defined. Perhaps inbound need definition too. Is it inbound initiated connection vs. data transferred inbound regardless of initiation direction?
35.2	National Rural Electric Cooperative Association (NRECA)		In R17.1, what specifically is the mitigation plan required to address/accomplish? Please ensure this requirement is clarified to explain this better.
35.3	Progress Energy (non-Nuclear)		R16.2 fixed dates for generating stations that depend on outages for implementing this is impractical as outage dates frequently change. Also, the ambiguity from v1-v3 (resulting in so many TFEs) remains here and still needs to be addressed.R17.2 - do not understand the externally accessible port requirement, there are no externally accessible physical ports outside of the six-walled boundaries, requirement not needed.CIP-011 R15 - Require detecting and responding to introduction of malicious for Medium Impact Cyber Systems which could be an electronic relay, what if there isn't a commercial solution for installing malware detection for relays or any other electronic device that runs with only proprietary closed firmware? Would it be impractical to require this only for devices that run a general purpose programmable commercially available operating system such as Microsoft Windows Operating System variants/UNIX and LINUX variants/SUN SOLARIS variants/Apple OS variants, etc --- or Is there going to be TFE process for these such as for switches, etc.?We like that this requirement does not require the use of traditional virus protection software.CIP-011 R18.3 - Requirement to keep logs of system events for 1 year for each high impact device could be massive in terms of storage and archive and may not be technically feasible for electronic relays.CIP-011 - R19 table - Need additional clarification as to what data validation methods (data integrity checking) are to be

#	Organization	Yes or No	Question 35 Comment
			employed. Can this be satisfied solely by employing Secure FTP or Secure ICCP for all inbound data?Calibration ports on programmable relays must remain open for calibration but this requirement would require rendering them unusable. We want to ensure this use is interpreted as “normal” operations.CIP-011-1 R15.3 (System Security) - The statement ‘Implement processes to test and update malicious code protections’ should be clarified to specify that in no case should malicious code be purposefully exposed to operational BES Cyber Systems as a part of this testing.CIP-011-1 R16.2 (Security Patch Management) - Requiring a ‘fixed date for either installation of the applicable patches or completion of mitigating measures that address the vulnerability’ is too inflexible in a real world where such activities may need to be accomplished during the next plant outage.CIP-011-1 R19 (Communications and Data Integrity) - This sounds like a ‘best practices’ type of requirement, but depending on how BES Cyber Systems are defined, this could require redesign/implementation of front-end processors on all inbound traffic to all Control Center BES Cyber Systems. Such a requirement cannot be quickly implemented without significant potential impact on the BES. We would like to suggest that this be listed as a requirement for any new BES Cyber System implemented at a Control Center.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security.”
35.4	FEUS	Agree	Agree with Comments: The drafting team should consider revising the wording of 17.1 from ‘implement a mitigation plan’ to ‘implement mitigating measures’ to reduce confusion with mitigation plans submitted to correct a violation.
35.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.R15.This is very poorly worded, and too open to interpretation on a number of areas.15.1 - how do you audit this item? FMPA suggests: “Document and implement procedures implemented to limit the

#	Organization	Yes or No	Question 35 Comment
			propagation of malicious code."15.3 - This could be interpreted to read that you need a full-scale development environment/copy of your production system to introduce malware to and guage the responsiveness of the mitigation techniques you put in place. If the intent of the standards is to protect the BES, by testing malicious code on systems that's not helping anyone. Time should be spent making sure it doesn't happen, not testing to see what happens when you introduce it. FMPA suggests "Review logs of malware detection systems within the following time periods: 30 calendar days for medium impact, 7 calendar days for high impact."R16.FMPA agrees with the intent of this standard; however there are some underlying issues that should be addressed before the standard is implemented. One such example might be a requirement to change out hardware to meet a new patch released by a vendor; before equipment is purchased it has to be tested - in some cases equipment shortages may make it impossible to comply with the 30-day requirement.R17.17.1 - How does "external connectivity" apply to network ports being shut down? Does that mean for devices that route data to other external networks?17.2 - What does "externally accessible physical ports" mean? Does this refer to ports that are connected via Ethernet cable to an area outside of the protected area? If so, the standard should explicitly say this.R18.18.1 - Requiring components that do not have logging capabilities to be monitored could be a real problem. While there are a number of technical ways to accomplish logging of systems, there is no clarity in the standard as to what is and is not acceptable levels of logging on a device - this needs to be better defined. FMPA suggests "Implement automated tools or organizational processes to monitor and log all available system events that are related to cyber security for all BES Cyber System components." This would give more flexibility in collecting data from other centralized devices (such as SCADA systems) and limit the data collection to what is available.18.2 - what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining criteria?18.3 - what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining criteria?18.4- what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining

#	Organization	Yes or No	Question 35 Comment
			criteria?R19.This is a very difficult implementation. As a general comment, if the intent is to protect the BES, perhaps more effort spent on ensuring that no unauthorized machine can communicate with BES components is a better place to spend effort.
35.6	Emerson Process Management	Agree	For R16, keeping cyber systems current so that they can be supported with security patches is very essential in maintaining system security. This should be a requirement under R16 and provide a TFE opportunity if this can not be met immediately, but with a auditable mediation plan.
35.7	SCE&G	Agree	How does the SDT intend to account for equipment incapable of supporting certain requirement (e.g. malicious code)? Will the TFE process be utilized. If so, it would be helpful for entities to see where the SDT envisions initially allowing for TFEs.
35.8	Southern California Edison Company	Agree	SCE requests guidance on whether the list of requirements apply to each component or if they only apply at a system level. For instance, can testing and malicious code protection in R15.3 be performed at a system level or should each component demonstrate this capability?A separate standard with highly prescriptive methods to document situations where it is not technically possible to implement a certain control, controlled and auditable documentation of mitigation plans will enable registered entities to record instances of non-conformity.A prime example would be that R 17.1 may be impossible to implement because of the technical design for a particular device. While the standard allows or a mitigation plan, the draft does not indicate whether or not the lack of such capability is a case of strict compliance.
35.9	Nebraska Public Power District	Agree	Security protection for cyber components that cannot connect to an external network do not require the same level of protection as those cyber components with connectivity to an external network. I recommend adding an exclusion to R16 and R18 for cyber components that cannot be connected to an external network.
35.10	USACE - Omaha Anchor	Agree	This is a less strenuous requirement than previous version of CIP. Previously every

#	Organization	Yes or No	Question 35 Comment
			item in the ESP had to comply - requirement states every system must comply - implying not every item must comply as long as the system does.
35.11	Xcel Energy	Agree	While we agree overall, we do have some suggestions/requests for clarification1. R15 to R19 should allow for TFEs2. R18.4/R20.6 We do not agree with a need to review logs every 7 days.3. R19.1 Further definition is needed of the expectation to "Validate data". Our concern is if were to include RTU data that can not be validated. A TFE allowance may be needed in this case.
35.12	Independent Electricity System Operator	Disagree	- R15.1 define malicious code. For R15 and sub requirements, does malicious code mean AV or Spyware detection/prevention or does Malicious code require a code review when deploying code and patches to systems?- - R16.2 does not require that the mitigatio
35.13	National Grid	Disagree	1. Inconsistency in using "processes" versus "one or more processes" in all requirements. National Grid suggests using "one or more processes". 2. Recommend new wording for 15.2 similar to 26.2 -Respond to the detection of malicious code.3. Recommend new wording for 15.3 - Implement processes to test and update protections in place to respond to the detection of malicious code.4. Recommend using the controls for Low Impact BES CS too since once the code is propagated it spreads across network irrespective of low/medium/high BES CS.5. Recommend changing 16.1 from "release" to "availability". 6. Recommend removing "with a fixed date" from 16.2 because the cyber system may not be available for maintenance due to grid system conditions.7. Request a R17 local definition of "attack surface".8. 17.2 - recommend changing "externally accessible physical ports" to "externally accessible physical communication ports". Also please clarify external to what.9. Request a local definition of "security events".10. In 18.2, is the SDT considering providing the timeline for issuing alerts and also to respond to those alerts? 11. Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.12. Recommend that 18.4 be re-worded to be consistent with FERC Order P526 - "Some manual review of logs to improve automated detection settings, even if

#	Organization	Yes or No	Question 35 Comment
			alerts are employed on the logs."13. Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven days.14. Recommend that R19 should "insure the integrity of the data."15. Recommend that 19.1 should be "Entity should document process to insure the integrity of the data link between the BES Cyber System and the remote node." This new 19.1 should be "Required" for High Impact and Medium Impact BES Cyber Systems.16. Recommend that 19.2 should be "Where links cannot be secured, the Entity shall document the mitigation in use." This new 19.2 should be "Required" for High Impact and Medium Impact BES Cyber Systems.
35.14	Southwest Power Pool Regional Entity	Disagree	15.1: The criteria should "limit the introduction and propagation of malicious code." 15.3 should require such testing prior to implementation rather than assuming. The objective statements in R16 and R18 are prescribing a requirement through the use of the statement "to ensure." 16.1: Clarify who is "releasing" the security patch. For example, is it being released by the operating system vendor (e.g., Microsoft) or the third-party application vendor (e.g., the EMS/SCADA vendor) subsequently certifying the patch against the supported application? 16.2: Clarify that compensating measures must be implemented within a prescribed timeframe after determining a security patch to be applicable unless the patch is installed within that prescribed timeframe. If compensating measures are implemented as an interim measure, they must remain in place until the security patch is installed with the understanding that the compensating measures can be improved during the interim period. 17.1: The term "mitigation plan" has an enforcement connotation. Consider requiring the documentation and implementation of compensating measures instead. 17 overall: there are a number of additional system hardening techniques other than disabling logical and physical ports. Additional hardening should be required for High impact systems. See the baseline configurations found on the Center for Internet Security web site for additional information. 18.2: This requirement presumes 100 percent availability of the monitoring process, which is unreasonable for automated solutions. Additionally, prescribe a timeframe for issuing alerts for detected system events.

#	Organization	Yes or No	Question 35 Comment
			18.3: Consider rewording the criteria to read “Maintain logs of system events related to cyber security for the specified time period.” 18.4: The requirement to maintain records documenting the review of logs is a compliance evidence issue and should not be included in the requirement. 19.1: Questionable if this is an auditable requirement. Clarify what is intended by inbound data validation? 19.2: Encrypted data does not mean uncompromised / valid data. Is this requirement essentially the same as 19.1? Is this asking for the validation process to be external to the normal validation processes included in the application software running on the BES Cyber System? Is this an indirect requirement to implement “Secure ICCP?”
35.15	Regulatory Compliance	Disagree	15.3 - STRIKE "testing" from the criteria. There is very little bennefit to test signature. 16.1a - Need clarification on components not patchable.16.b for those devices that are patchable - assessment of patches within 30 days.16.2 - Clarification - assess whwther vulnerabilities exist for a device.17.2 - need definition of external connectivity - more guidance on physical switch ports18.4 - propose 30 days for 30 days for manual review of automated systems - it is redundantR19 - wait and see - need guidance
35.16	LADWP	Disagree	15.3 states to test and update malicious code protections. Testing the code protections should be removed.
35.17	Network & Security Technologies Inc	Disagree	16.1 - Please clarify meaning of “release” of security patches by specifying patch source (the corporation, organization, or individual that wrote it?). This matters because some application vendors combine O/S patches in “bundles” they release to customers with service contracts.17.2 - Given the restrictions on physical access and the requirements to train and background check personnel with unescorted physical access to BES Cyber Systems, this requirement seems unnecessary. Moreover, on any given day it may be very difficult to predict whether a given physical port might be of use in an emergency troubleshooting or restoration situation. Could be contentious during audits.R18 - Does the SDT intend that Responsible Entities be able to, if necessary, determine what user(s) was on what system and when? If so, this

#	Organization	Yes or No	Question 35 Comment
			requirement should be made explicit.19.1 - Please clarify types of “inbound” data this requirement applies to. Operational data only? Mirrored backup data received at a backup Control Center from a primary Control Center? An emergency “hot fix” from a SCADA/EMS vendor? Meaning of “validate” also needs to be clarified. SDT has solicited input on which proposed requirements should be “eligible” for TFEs - surely this is one. Depending on the intent of this requirement, “data validation” may be something that can only be done in a useful/meaningful way by application logic.19.2 - We consider this to be an unenforceable requirement and therefore suggest it be dropped unless compelling evidence exists that replay and/or MITM attacks are a real and growing problem. Investigating a single occurrence of invalid data could consume scores of person-hours, lengthy interactions with communication providers, other Responsible Entities (e.g., for a BA that operates a Control Center that receives all its data feeds from other companies), and even law enforcement with no guarantee of success. Cryptographic protection of in-transit data, even if achievable (probably not unless a Responsible Entity owns and/or controls both ends of the data feed), offers no protection against corruption of data at the source and could also cause latency issues.
35.18	ERCOT ISO	Disagree	16.1: Clarify “release” from whom--the product vendor (e.g., Microsoft) or other vendor that prohibits installation of a patch until certified with their applications?17.1: Compensating measures should be allowed in instances where a mitigation plan to achieve strict compliance is not possible. 18.2: Specify the timing for responding to alerts. 18.3: Should be removed to data retention section. 18.4: Should address the use of automated security event monitoring systems. TFEs should be allowed for R16. TFEs should be allowed for R17.TFEs should be allowed for R18.TFEs should be allowed for R19.
35.19	MidAmerican Energy Company	Disagree	16.2 - Define when the implementation schedule needs to be completed by and define how far in the future the installation can be scheduled. For example a patch is assessed within 30 days; the currently wording would allow me to develop an implementation schedule a year later and the schedule could call for the installation

#	Organization	Yes or No	Question 35 Comment
			to take place three years later. 17.2 Change to “Disable, render unusable or configure such that it has no access to a BES System” This would allow us to put ports into logical VLANS that do not have access to the BES Systems.19.1 What does “validate data” mean? This sounds like in would need to be an application level control. Is that what is intended?
35.20	PacifiCorp	Disagree	16.2 - Define when the implementation schedule needs to be completed by and define how far in the future the installation can be scheduled. For example a patch is assessed within 30 days; the currently wording would allow me to develop an implementation schedule a year later and the schedule could call for the installation to take place three years later. 17.2 Change to “Disable, render unusable or configure such that it has no access to a BES System” This would allow us to put ports into logical VLANS that do not have access to the BES Systems.19.1 What does “validate data” mean? This sounds like in would need to be an application level control. Is that what is intended?
35.21	ReliabilityFirst Staff	Disagree	16.2 - need a time frame (60 days), for row 17.1 does there need to be a time frame for implementation of a mitigation plan?
35.22	Luminant	Disagree	17.1 implement a mitigation plan or compensitory measures
35.23	Progress Energy - Nuclear Generation	Disagree	Agree with Table 15, R16.2, Table 17, 18.1 AND 18.2. R15-R19 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments. Durations for R16.1, R18.3, and R18.4 should align with comments in Attachment 1.
35.24	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.15.3 should include more clarification on what "testing" entails and whether that just refers to signature updates.Recommend replacement of the word "known" with "discovered" in R18. 18.4: more clarity

#	Organization	Yes or No	Question 35 Comment
			needed regarding the allowance of both automated and manual review of logs. R19 creates a potentially impossible level of obligation. Recommend striking.
35.25	American Transmission Company	Disagree	As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.26	MRO's NERC Standards Review Subcommittee	Disagree	As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.27	Western Area Power Administration	Disagree	Assuming one can detect and respond to the introduction of malicious code, how is it expected that we limit propagation of malicious code? By definition, malicious code is often not detected, and if it is detected (by virus prevention software, for instance), that software generally quarantines or deleted the malicious code automatically. This section seems to need a little thought as to what is really being required. This opens up technical interpretation of what "limits" malcode. This also assumes only a specific

#	Organization	Yes or No	Question 35 Comment
			vector (rootkit, malware, virus/worm) but doesn't address Denial of Service attacks which could be much more serious. Maybe they need to specify intent. R16: A plan for every patch as opposed to relying on the change control process? This seems excessive.R17: Seems to be an improvement. For 17.2, does this mean plug up physical ports like USB? This is unclear. If it does, cannot rely on physical perimeter for protection?R19: Since this applies only to external connectivity (ICCP connections or equivalent), how is it intended that we validate the actual data coming into the system? What level of validation? Ex: end-point validation (ipsec and certs) vs application endpoint (ssl), the way this is worded it goes WAY beyond this. This is not a communications validation issue. Are they wanting to get to MITM attacks? If so it isn't clear.
35.28	E.ON U.S.	Disagree	CIP-011, R15.1 Limiting propagation of malicious code is an integral part of any standard A/V protection. If this requirement is calling for something more than this then the requirement should be clarified to remove this ambiguity. If it is one and the same as R15.2, then E ON U.S. suggests combining these two sub-requirements.CIP-011, R17.2 The term "...externally accessible physical ports" is ambiguous. Does this refer any externally-facing port through which a party may attempt to gain unauthorized electronic access to a BES Cyber System Component? Or, does this refer to an externally-facing port directly on the BES CSC itself?CIP-011, R18.3 The requirement to maintain logs for one year is a significant burden. This can be a tremendous amount of data depending on the level of logging enabled.CIP-011, R18.4The expectations regarding review of logs should be more clearly defined. The whole point in having "continuous security monitoring for detected system events" is to avoid the extremely burdensome requirement of manually sifting through tremendous volumes of log data. Though some mechanism should be in place to ensure the automated logging and alert systems are not disabled, the requirement to manually review system logs is excessive and provides little if any security enhancement.CIP-011, R19.1The expectations for validation of data inbound to a BES Cyber System should be more clearly defined. How is this reasonable to be accomplished? Parameter checking is already a common mechanism within most

#	Organization	Yes or No	Question 35 Comment
			SCADA / DCS systems, but this does not protect against tampering or data manipulation within the prescribed bounds for a given data point.CIP-011, R19.2 Same comment as for R19.1...how is this to be accomplished?
35.29	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
35.30	The Empire District Electric Company	Disagree	Comments: As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.31	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy has the following concerns with requirements R15 - R19:R15 - A TFE may be required for programmable electronic devices within a substation environment where is not technically feasible to manage malicious code.R16.1 - The definition of a “release” needs to allow for vendor verification of the applicability of a patch to a given systems functionality before the thirty day clock begins.R17.2 - CenterPoint Energy recommends clarification as to what are considered "externally accessible physical ports" R18 - the phrase "related to cyber security" is ambiguous. R18.2 -implementing "continuous security monitoring that issue alerts for detected system events related to cyber security" would seem to require installation of external communications to remote substations increasing their vulnerability. R18.4 - A manual review every 7 calendar days is overly burdensome. Automated processes are already mandated to detect and alert personnel of cyber security events. CenterPoint Energy recommends a 30 day review.R19.1 - Concerned

#	Organization	Yes or No	Question 35 Comment
			with the method to "validate data inbound to a BES Cyber System". This requirement is intended to address data integrity issues associated with man-in-the-middle attacks, but it does not specifically address the issue. It leaves open the issue of data which was intentionally or unintentionally manipulated by responsible entities. The issue becomes something different if our Control Center must validate data from a Reliability Coordinator or Transmission Operator which has been intentionally or unintentionally modified by trusted personnel. Data integrity implies encryption. This requirement should state: “One or more of the following encryption standards are required to ensure data integrity inbound to the Control Center.R19.2 - Concerned with ability to provide evidence that we "evaluate invalid data inbound to a BES Cyber System" to determine whether the data has been compromised maliciously with current systems capability. As stated previously, this requirement does not address the issue of malicious entities entering malicious data from the endpoints. This requirement is an attempt to address issues associated with MITM attacks. Inherent in the various SCADA protocols is error detection and data delivery, but not data integrity. The ICCP protocol is encapsulated within TCP/IP. The TCP/IP protocol will ensure communication reliability and error detection, but it will not ensure data integrity.
35.32	Entergy	Disagree	Entergy suggests making requirements in general apply to high, medium, and low assets alike and provide a footnote to allow a TFE for assets which are not capable of meeting the requirements. 17.1 suggests that unused network ports only have to be disabled in the event there is external connectivity. This requirement appears to be extremely relaxed from version 1. The current language suggests that the perimeter firewall can be used to control port usage thus relieving the requirement to control at the asset itself. In 17.2 there is a reference to externally accessible physical network ports. Entergy suggests language change to just say “unused physical network ports.” In 18.2 there is a time requirement of maintaining logs for 1 year for high and 90 days for medium. Maintaining logs for 1 year can be problematic due to the amount of space required. Suggest making requirement for 90 days for high, medium and adding the same requirement for low assets. Also suggest adding a footnote to allow TFE for

#	Organization	Yes or No	Question 35 Comment
			assets that are unable to meet requirements. In R19 it appears the requirement is to encrypt all data coming into a BES Cyber System. The intent is to ensure data integrity. Most EMS systems have CRC checks, and reasonability checks, etc., embedded in the systems to validate the integrity of the data being received. Entergy does not believe that encryption is required for all digital data as it greatly increases overhead, operation and troubleshooting of the data networks. Entergy suggests that encryption should be required for remote access as remote access connectivity many times traverses the Internet or some non-private network links at some point. Entergy suggests providing alternate methods to validate inbound data rather than encryption.
35.33	Southern Company	Disagree	For 17.2, what does this mean? An externally accessible physical port would require a switch next to an open window or something.R15.3 requires testing of malicious code protections. This is an effort better left for malware protection suppliers. Often only the production system is available to the end user, the quantity and frequency of malware release prohibit an effective end user test program.R16.1 requires assessment of security patches within 30 days of release. This assessment is typically performed by control system supplier to assure that no adverse impact occurs to their product. Often only the production system is available to the end user. The end user has no control over vendor testing schedules. If this requirement is placed on the end user MS KB977165 type “blue screen” events may occur.R16.2 The requirement of a fixed date for patch installation may not be possible in all cases if a system restart is required for an operating unit.For R15 & R16, there is the potential that implementing malicious code detection and security patch management on substation devices could interfere with the primary function of these substation devices which is the reliable delivery of power.For R17.2, what will be considered acceptable for rendering physical ports unusable? We should not be required to permanently disable ports thereby making the ports unavailable for future use.For R18, not all BES Cyber System components in substations are capable of monitoring and logging system events.For R18, implementing security monitoring processes on substation devices may interfere with the primary function of these substations devices which is the reliable delivery of

#	Organization	Yes or No	Question 35 Comment
			power.R18.2 Clarify intention, is continuous monitoring with manual review of logged alerts acceptable? What is a "detected system event"? Is a single or double incorrect password attempt an alarmed event?R18.1 requires an automated log system R18.4 requires a review of log events. Is a manual review of all logs required in an automated system or just the alarms?
35.34	Detroit Edison	Disagree	In 15.2, "respond" is vague. Propose rephrase to read "Detect the introduction and mitigate the effects of malicious code."Remove table entry 19.1 since it is redundant to 19.2.The term "applicability" in 16.1 is vague. Consider introducing vulnerability severity classifications to patch management that determines the action and timetable required. Please note that this is submitted for consideration as a concept. The language and time tables will need further review and editing before this would be ready to add to the standard. o Level 4 - Intruders can easily gain control of a BES Cyber System Component, which can lead to the compromise of BES Cyber System security. For example, vulnerabilities at this level may include full read and write access to files, remote execution of commands, and the introduction of backdoors. High: patch within 7 days; Medium: patch within 14 days; Low: patch within 30 days. o Level 3 - Intruders can possibly gain control of a BES Cyber System Component, or there may be potential leakage of highly sensitive information. For example, vulnerabilities at this level may include full read access to files, potential backdoors, or a listing of all the users on the host. High: patch within 14 days; Medium: patch within 30 days; Low: patch within 90 days. o Level 2 - Intruders may be able to gain access to specific information stored on a BES Cyber System Component, including security settings. For example, vulnerabilities at this level may include partial disclosure of file contents, access to certain files, directory browsing, disclosure of filtering rules and security mechanisms, and unauthorized use of services. High: patch within 30 days; Medium: patch within 60 days; Low: patch during next system maintenance window. o Level 1 - Intruders may be able to collect sensitive information from a BES Cyber System Component, such as the precise version of software installed, open ports, services, etc. High: during next system maintenance window; Medium: during next

#	Organization	Yes or No	Question 35 Comment
			system maintenance window; Low: Patch during next system maintenance window.
35.35	RRI Energy	Disagree	In regards to 17.1, for clarification purposes, based on the definition of external connectivity written in the Standard, if a web server is actively listened on port 80 inside the BES boundary protection but is not accessible externally from the outside of the BES boundary protection, the Responsible Entity does not have to report and assess that port and service.In R17.2, what does externally accessible mean? Ex. Physical port is on a device that is in a cabinet, the cabinet is within a building, and the building is within a fence-lined property. Is the port non-accessible? What type of physical ports are we trying to protect? Is it only physical "network" ports? How about USB ports, PC (PCMCIA) Card slots, CD/DVD drives?Not all devices can be logged such as PLC's, meters, etc.; therefore 18.1 should allow for a TFE.In regards to R19, what defines an internal versus external boundary. Within a single facility, are all boundaries internal? If cables transverse hallways between "computer rooms" within a Control Center does an external connection exist? Can a back-up control center be an extension of a primary control center where all data connections between the control centers are considered "internal"?
35.36	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
35.37	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R16, but recommends changes as follows: o Regarding Part 16.2, this requirement contains no timeframe by which this schedule must be developed. If it was intended that the development of this schedule is to coincide with the activity described in Part 16.1, then that should be explicitly stated. Also, there is no limitation regarding how far in the future is reasonable to set the "fixed date." Minnesota Power recommends that if a timeframe for the "fixed date" is not established in the Standard then there should be a stipulation that if the date for installation of the patch is greater than a pre-determined amount (say 45 days), then mitigating measures need to be in place until the security patch is implemented.Minnesota Power generally agrees with the

#	Organization	Yes or No	Question 35 Comment
			proposed Requirements R17, but recommends changes as follows: o Regarding Part 17.1, the first sentence creates some confusion. Minnesota Power recommends that it be reworded as follows: “One or more processes to ensure that for each BES Cyber System Component, only those network accessible ports and services that are required for normal and emergency operations are enabled.” o For Part 17.2, is it the Standards Drafting Teams intent that a CD or DVD drive be considered an “externally accessible physical port?” If so, this should be explicitly defined. Logically, mounting a DVD is no different than plugging a memory stick into a USB port.Minnesota Power generally agrees with the proposed Requirements R18, but recommends changes as follows: o If it is the Standards Drafting Teams intent that Requirement R18 apply only to cyber security events, then Minnesota Power recommends that the term “security events,” which is used throughout this requirement, is reworded to state “cyber security events.” o Regarding Part 18.1, the Standards Drafting Team should consider clarifying the timeframe within which the monitoring of system events should occur (i.e., real-time, minutes, hours, days, etc.). If monitoring is done using a manual process, rather than an automated tool, real-time may not be possible, and guidelines should be established regarding how quickly events must be examined. o Is it the Standards Drafting Teams intent that Part 18.1 address the collection of security events into logs and Part 18.2 address the process to review and act upon the logs collected under Part 18.1? If so, the Standards Drafting Team should consider wording that would clarify the differences between these two Parts. o In Part 18.2, does the term “continuous” refer to “real-time?” If so, Minnesota Power recommends changing the term to real-time to avoid confusion. o Minnesota Power recommends rewording Part 18.3 as follows: "Retain logs of system events related to cyber security for the specified time period." o Minnesota Power recommends communicating all time frames in calendar days to eliminate confusion regarding what constitutes “1 year.” o Regarding Part 18.4, if 18.2 provides for “continuous” monitoring of system events for these same systems, why is it also required that a Registered Entity manually review these logs? In addition, can the Standards Drafting Team provide guidance regarding what should be included in this review? On an SEIM, for instance,

#	Organization	Yes or No	Question 35 Comment
			these logs can be enormous - to the point that manual review is not possible within reasonable time constraints.Minnesota Power generally agrees with the proposed Requirements R19, but recommends changes as follows: o Regarding Part 19.1, How, in real-time operation, can external data be validated (protocols already validate message structure)? For example, an LBA receives unit set-points from its ISO-BA via ICCP. If the data being received is within operating limits for that unit, it is "valid." The ISO may truly be requesting the unit to drop by xx MW. How is that differentiated from someone altering an inbound message to maliciously tell a unit to drop by the same xx MW value? The process for echoing values back to the external system does not solve this, since this, too, can be manipulated. o Part 19.2 appears to be a specific instance of Part 19.1 and given that this Part starts with the phrase "Where not cryptographically protected," it seems that Part 19.1 may be misstated. Is Part 19.1 supposed to discuss "protecting" inbound data, rather than "validating" it, via encryption, authentication, etc.? Also, in Part 19.2, what constitutes "invalid" data? Is this data which is outside of normal operating limits? Or maybe outside of reasonability limits? Again, maliciously inserting perfectly normal or valid data could have detrimental effects to the BES, whereas "invalid data" should, by default, be thrown out by normal processing.
35.38	Idaho Power Company	Disagree	Need to put a limit on how far out the fixed date should occur for implementation or mitigation of security patches. R18 refers to security events but the sub-requirements refer to system events related to cyber security. Need to make this clearer that the focus is on abnormal system events as a normal authorized log-in is a normal security event but not one that needs review or response.
35.39	NextEra Energy Corporate Compliance	Disagree	NextEra believes the current language did not provide clear guidance and is too lax which leaves room for interpretation. The following are the recommended updates for the requirements:15.1 - Implement technical, procedural and/or process controls to limit the impact of code which modifies or destroys data, steal data, allow unauthorized access Exploits or damage a system, and does something that user did not intend to do. o Implement technical controls, where technically feasible, to

#	Organization	Yes or No	Question 35 Comment
			detect and mitigate malicious code o Implement technical and/or procedural controls to limit the propagation of malicious code o Implement technical and/or process and procedural controls to respond to introduction of malicious code15.2 - Malicious code protections should be updated at least on a quarterly basis if applicable updates are available and technically feasible. Updates should be tested prior to implementation to ensure no adverse impact by the software updates.As far as the order of requirements, detection should come first and it should be a requirement by itself. Combined 15.1 and 15.2 and removed 15.3 from the initial version.NextEra believes the implementation of processes incorporating the criteria specified in CIP-011-1 Table R16 - Security Patch Management in order to ensure that security vulnerabilities in BES Cyber Systems are mitigated was not clearly identifiedThe current language did not provide clear guidance and left room for interpretation. The following are the recommended updates for the requirement: 16.1 - The Responsible Entity shall establish a security patch management assessment program to track, evaluate, and test cyber security patches within 30 calendar days of their release to validate their applicability to its BES Cyber Systems.16.2 - The Responsible Entity shall develop an implementation schedule with a fixed date for either installation of the applicable security patches or the completion of mitigating measures that address the vulnerability if application of the security patch is not technically feasible.It should be stated that there needs to be a program to track, evaluate, and test cyber security patches within the defined timeframe that are applicable to the BES Cyber System.It is also recommended that there is more in depth guidance on the implementation schedule.CIP-011-1/R17Did not account for technical feasibility for disabling of ports.The following are the recommended updates to the requirements:17.1 - Implementation of process (es) to ensure that only those network accessible ports and services required for normal and emergency operations are enabled. In cases where unused network accessible ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document and implement compensating measures to mitigate the risk of exposure.If it is not technically feasible, the entity must have documented compensating measures to mitigate the

#	Organization	Yes or No	Question 35 Comment
			risk of exposure. This requirement should be applied to Medium and High BES Cyber Systems.The CIP CIP-011-1 Table R18 - Security Event Monitoring to ensure that security events are known, logged, and responded to on BES Cyber Systems did not provide enough guidance.The current language did not provide clear guidance and left room for interpretation. The following are the recommended updates: 18.1 - Implement automated tools or organizational processes to monitor and log system events that are related to cyber security for all BES Cyber System components, where technical feasible. Instances, that are not technical feasible the Responsible Entity shall implement manual processes to mitigate risk exposure.18.2 - Implement and document security processes for continuous (24/7 365 days, except when conducting system maintenance of the monitoring devices) security monitoring that issue alerts for detected system events related to cyber security.18.3 - Maintain system logs of system events where technical feasible, related to cyber security within the specified time period. If not technically feasible, the Responsible Entity shall document and implement manual processes to mitigate risk exposure.18.4 - The Responsible Entity shall verify that the log and alerting system is working in the time intervals mentioned. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs within 90 daysAdded language provides more definition.The CIP-011-1 Table R19 - Communications and Data Integrity to protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems did not provide enough guidance.The current language did not provide clear guidance and left room for interpretation. The following are the recommended updates:19.1 - Validate data inbound in the Control Center for specific connections and verify if those are the correct connections. 19.2 - Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to the BES Cyber System in a Control center to determine whether the data has been compromised. All unauthorized access attempts to a control center must be identified and investigated.Added language provides more definition.Also, In 15.1, please clarify the term "limit propagation". How would a Responsibility Entitity demonstrate the compliance to 15.1? Is a documented

#	Organization	Yes or No	Question 35 Comment
			technical or procedural control to limit the propagartion of malicious code sufficient? Furthermore, NextEra asks that examples be provided on how to meet this requirement at BES Transmission Facilities where all BES Cyber System Components are not capable of running anti-virus software.In 16.1, is the assessment necessary when regular patch cycle or planned installation is under 30 calendar days?In 16.2, what is a reasonable "implementation schedule with a fixed date for either installation of the applicable security patches or completion of mitigating measures that address the vulnerability"In 16.2, is an implementation schedule necessary when regular patch cycle or planned installation is under 30 calendar days?In 16.2, if the "installation of the applicable security patches" would cause a risk on the availability and performance of BES Cyber System, is it sufficient to complete the mitigation measures that address the vulnerability? If so, we propose that the language of 16.2 be modified to have this as an option in lieu of the installation of the applicable security patchesIn 17.1, does this apply only to BES Cyber System Components that are accessible from the outside? If yes, does this apply only to the ports that are externally connected or for all ports if the BES Cyber system Component has external connectivity?In 18.4, please clarify the term "review logs of system events" -- how will compliance be demonstrated?In 19.1, how do we validate data inbound to a BES Cyber System in a Control Center? Please provide methods that could be employed by the Responsible Entity. Could 19.1 and 19.2 be simplifeid by jjust requiring cryptographic protection for High Impact BES Cyber System in a Control Center?Regarding R-18, the log review of assets is too short. (i.e. 30 / 7 days). With this constraint, there will be limited knowledgeable personnel available for review. Some systems do not provide data to allow for this type of analysis. Need support from external vendors, which may not be feasible on a weekly / monthly basis. Due to volume in the industry, it is anticipated that vendor resources will be limited to support us in this capacity. NextEra suggests at least quarterly for Medium / High.18.1 states logging events "related to cyber security". This is subject to broad interpretation and should be clarified. NextEra suggest providing specific examples, such as: Abnormal System Shutdown Account Lockouts Admin User Account Changes

#	Organization	Yes or No	Question 35 Comment
			All Domain Account Logon Failures All Group Account Changes All User Account Changes All Policy Changes Domain Admin Acct Logon Failures Domain Admins-Admin Group Acct ChgDomain Admins-Admin Group ChgDomain Trust Rel Policy ChangesEvent Log FullLogon Logoff SummaryNormal System Startup-ShutdownPassword Changes and ResetsSecurity Log ResetsSrv Wkst All Logon FailuresTerm Srv All Logon Logoff SuccessesTerm Srv All Session Discon-ReconUser Account Creation or DeletionUser Account Password ChangesUser Rights Policy Changes18.2 uses the term "issue alerts" which could imply alarming or otherwise performing a notification. If NextEra had to raise an alert for every system event we could potentially have a continuous alarm stream. If it is determined that event alarms are necessary, then the events have to be further defined and our systems have to be specifically tuned on site for the real running environment.NextEra recommends defining the term further to either include explicit alarm/notification or not. Would also push further for alert in the form of logging to be reviewed or alarmed for review.19.1 states validate data inbound to a control center. Data should be further classified as data directly related to real-time BES operation. If a Monitoring and Diagnostics Center is classified a control center they would potentially have to perform data validation on all historical data made available to that center, depending on interpretation. An alternative is to further classify or define "validate" to allow validation simply by verification of traffic from a reliable source, i.e. identifying the source historical data server.NextEra proposes considering validation of the originating source rather than validating the data itself.
35.40	Con Edison of New York	Disagree	o R16.2 requires a “fixed date” for apply security patches or mitigation. This requirement does not take into consideration that entities may require vendors to test the patches on their systems before they will be applied to operational systems. The release dates for these patches is not fixed by the vendor. The requirement should allow for the planned install date to be a fixed period after the patch is tested and available to the user. A fixed date may be a challenge when predicated on manufacturer certification which may introduce unnecessary risks to operations. o R17.1 “external connectivity” is expected to mean external to the (ESP) boundary. o

#	Organization	Yes or No	Question 35 Comment
			R17.2 It is not clear what externally accessible physical ports includes. External to the location or external to the device (i.e.: located on the front of the workstations) o R18.2 - need clarification on type of events that need continuous monitoring; security logs can be voluminous with excessive informational notifications o R18.4 - if automated tools are used this should not be required o R19 - need more info on ensuring data integrity. What does "external" mean? Does this require special checks of RTU inbound data? Unclear what will be considered validation. Is Encryption validation? If the RTU data is not encrypted is the EMS validation of data sufficient? If the systems (especially legacy equipment) do not support integrity checks the addition or development may not be possible or recommended. Will this require a TFE?
35.41	Puget Sound Energy	Disagree	Puget Sound Energy has the following comments:R15.1 - Puget Sound Energy feels that "Limit propagation..." is an abstract term and needs clarity to it in order for NERC to be able to consistently validate compliance.R15.3 - Puget Sound Energy suggests clarity to what type of testing is required of malicious code protections. Is NERC requiring functional testing that the malicious code protections are reliably functioning or security testing (penetration testing)?R17.1 - Puget Sound Energy would like clarity into the degree of documentation required to validate compliance with "...required for normal and emergency operations are enabled." Puget Sound Energy would also like clarity into NERC's definition of "enabled" and "disabled". For example, can network accessible ports be "enabled" and "disabled" through the use of host based firewalls?R17.2 - Puget Sound Energy suggests that the disabling of physical ports on BES Cyber System Components only be required where physical security protections are not required, as outlined in Table 5. If physical security is provided, per Table 5, then the disabling of physical ports seems unnecessarily redundant. Puget Sound Energy would like clarity on "externally accessible physical ports", in cases where the BES Cyber System Component is physically protected by measures outlined in Table 5.Table 18 - Puget Sound Energy suggests including "Where Technically Feasible" to R18, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 18. For example, entities may incorporate

#	Organization	Yes or No	Question 35 Comment
			dialup accessible devices that, by the nature of a connection that is built up and torn down as necessary, is incapable of providing “continuous security monitoring that issues alerts”.R19.1 - Puget Sound Energy requests clarity into what NERC means by “validate data inbound”. “Validate” is subjective and Puget Sound Energy would like clarity on how entities can prove compliance. Puget Sound Energy would also like clarity into the scope of the inbound data it must validate. For example, is NERC asking for validation of interconnections with other utilities and balancing authorities or validation of every RTU that provides an inbound data stream to a control center’s BES Cyber System?
35.42	BCTC	Disagree	R15 - Â Change title to “Prevent Malicious Code”Â 15.1 - suggest replacing the words “Limit propagation” to “Prevention”Â 15.3 - we do not agree with this requirement. Recommend removal of the words “to test”. It is not a good practice to introduce malicious code into a BES Cyber System - even in QA!Â Another potential area for TFEsR16 - Â R 16.2: if the patch results in a system upgrade it could take up to 6 months to implement the patches; if the patch does not result is a system upgrade then recommend allowing 30 days to implement said patchesR17 - Â The requirements needs to provide more guidance on how to provide evidence for open/ closed TCP (static) versus UDP (dynamic) ports Â R 17.1 Guideline would be appreciated on how to meet this requirement. We have struggled with this one in the past.Â Provide a definition of what is “system hardening” R 17.2 - what is the objective of this requirement? We feel that simply disabling a physical report does not provide much value from a security perspective (i.e. can unplug an active port and plug in an unapproved device); instead we recommend locking down devices’ MAC addresses as this would result in a more secure environmentR18 - Â R18.3. A year seems excessive to require an entity to retain ALL logs. What is the objective in requiring utilities to do this?R18.4. Suggest breaking this one in to two requirements - one for log review and the other for maintaining records - current wording can be interpreted as having to retain events for medium impact systems for a longer period than high impact? R19 - Â R19.1. We request a definition of what is meant by “validation” as well as guidance on how to perform this taskÂ Potential area for TFEsÂ

#	Organization	Yes or No	Question 35 Comment
			R19.2. We are struggling with how to comply with this requirement. We have an IDS implemented in our environment where users are alerted on suspect packets - is this what this is referring to? Intent not clear with the current wording.
35.43	WECC	Disagree	R15 - alright with all criteria, R16 - alright with all criteria, R17 - Item 17.1 should cover local ports and services not just network ports and services. Consider removing the words "network accessible" like text in previous standards and make required for Medium and High impact levels. Physical ports should be rendered unavailable on components of Medium impact systems as well as High. Item 18.2 needs to define "continuous" or remove it from the criteria. R17 - Consider adding more criteria for system hardening including system base-lining or move system base-lining from the change management section to here. Look for other overlap between R17 and change management. R19 - agree with criteria but would suggest adding the following after validate data "(eg. syntax checking, bounds checking, sanity checking, etc)"There needs to be more language specifying a definition of malicious code, what it means to limit its propagation, and to detect and respond to its introduction. As written, there is very little to audit against in this requirement.Additional language is needed to describe what it means for a patch to be released.System hardening should be required for all systems, not just those that are externally connected.Additional language is needed to clarify the requirements for security event monitoring, for example, what continuous monitoring means.Log review intervals are too long to be effective.The data integrity criteria are good additions but need additional language to clarify the intent. What does it mean to validate inbound data? Also, consideration should be given to the fact that cryptographic protection is not fully effective in all circumstances. More direction is needed as to when cryptography is an acceptable control. Also there are no requirements in the standard that define criteria for cryptographic controls.
35.44	Alberta Electric System Operator	Disagree	R15 - Change requirement to include confidentiality, to address potential MITM or MITB attacks. "...malicious software that could affect availability, integrity, or confidentiality of the..."Table R16 - include additional row similar to 16.1, but to

#	Organization	Yes or No	Question 35 Comment
			assess security patches within 60 days. Make this a requirement for Low Impact BES Cyber Systems. All BES Cyber Systems should be assessed, however High and Medium Impact systems should be assessed sooner.Table R19 - 19.1 states "Validate data inbound to a BES Cyber System in a Control Center." And the corresponding impact states "Required for external connectivity only." Based on the definitions, "inbound to a BES Cyber System" can only be from a device "external to the BES Cyber System" so the impact is redundant. Similar situation for 19.2. Suggest changing "Required for external connectivity only" to "Required". Table R19 - consider adding additional rows to Table R19 to address validating inbound data to BES Cyber Systems that are not in a control centre. 19.1 Validate data inbound to a BES Cyber System in a Control Center. Required for Medium and High 19.2 Validate data inbound to a BES Cyber System. Required for High19.3 Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to a BES Cyber System in a Control Center to determine whether the data has been compromised maliciously. Required for Medium and High19.4 Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to a BES Cyber System to determine whether the data has been compromised maliciously. Required for High.
35.45	LCEC	Disagree	R15 - Testing for malicious code protection is not auditable.R16 - Device end of life support issues need to be addressed. Release needs to be clarified to address the situation where a vendor may release a security patch for a BES Cyber System Component but it is not yet approved by the BES Cyber System vendor.R17 - o It is not often clear whether the standard is referring to logical and physical ports. Physical, logical or both should be specified any time the term port is used.R18 - What constitutes a security event?Is the 90 day requirement meant to be an absolute 90 days as opposed to 3 years and 90 days to be able to show compliance?R19 - How would one validate inbound data? Was this clearly meant to be data integrity as opposed to data protection? Why was this scope chosen?
35.46	Dominion Resources	Disagree	R15 - The stated intentions of the SDT at the May Workshop were to reduce TFEs and to distinguish between Control Centers vs. Substations and Power Stations. Neither

#	Organization	Yes or No	Question 35 Comment
	Services, Inc.		of these stated goals is presented in R15. TFEs will be required for 15.2 and 15.3 and there is nothing indicating that these should not apply to field equipment or network equipment (e.g., firewalls, routers, switches). Dominion agrees with the stated intentions of the SDT team.To avoid the potential for TFE's associated with R15.2 and R15.3, a footnote similar to the one used for Table R10 on Page 11 of CIP-011 should be added. Also, access controls related to access points would be better addressed in the Boundary Controls Section of CIP-011.R16.2. The word "fixed" should be replaced with "planned" to allow some flexibility for installing the patch. 17.2. It should be clarified that an alternative where the equipment does not provide a configurable method of disabling the port is that methods, such as using security tape, to indicate any tampering with the port may be used.18.2. This section will require a TFE since many devices do not have the capability of issuing alerts. A footnote to avoid need for a TFE should be added.18.3. One year is too long to maintain logs for network devices. Storage space is at a premium. There will be a substantial increase in cost to increase storage space for each high impact cyber system This should be changed back to 90 days for High Impact cyber systems. 18.4. Logs of system events should only be required to be reviewed every 90 days. Logs should be reviewed only when an alert is issued for a detected system event. Routine reviews would take an extraordinary amount of time with no expected substantial results. R19. Common methods for ensuring data integrity include physical protection of the asset, authentication and authorization of data sources/inputs, using data validation and error checking rules at the application or database level, and a variety of other technical, operational and management controls. Dominion recommends the wording used in R19.1 be modified as follows to state the objective without specifying how it should be accomplished since the methods vary depending on the nature of the system and the technology in use:"19.1 Implement methods to maintain the integrity of data inputs to a BES Cyber System in a Control Center. " 19.2. It is sometimes impossible to determine if data has been compromised. Dominion understands that the proposed re-wording for 19.1 will also suffice to meet the requirements for 19.2 and recommends that 19.2 be removed.

#	Organization	Yes or No	Question 35 Comment
35.47	FirstEnergy Corporation	Disagree	R15 - We prefer the new text over the old CIP standards and it would reduce TFEs. In R15/Table 15: need some type of exception for devices incapable of running anti-malware.R16 - We prefer the new text over the old CIP standards. R17 - We prefer the new text over the old CIP standards.R17/Table 17: Need clarity on "externally accessible and physical ports". Does that mean serial, parallel, USB, Fireware, etc. or ports that are capable of transmitting routable protocols (e.g. network interface cards).R18 - 18.4 - Need greater clarity around whether automated alarming can be used rather than manual review of system event logs. Also - should it be specified somewhere in R18 that these sub-requirements apply to electronic security only, not physical security events (which is spelled out in R6)? 18.2 - We question the use of the word 'continuous' in this sub-requirement as this would be difficult for those entities that use 'organizational processes' to monitor and log.R19 - Overall this requirement appears to be too broadly worded. 19.1 - The use of the word 'validate' seems vague. Is the intent of the SDT that entities provide the specifics on what 'validate' means - e.g. the appropriate data or a point-for-point comparison, how often, etc? 19.2 - Many existing systems do not provide a means to accomplish compliance with this sub-requirement - for example, legacy RTU protocols. R19/Table 19: Need clarity on "invalid data". How do you evaluate invalid data?
35.48	US Army Corps of Engineers, Omaha Distirc	Disagree	R15 needs to be limited to general processing equipment. Requirement for anti-virus type software on all systems will numerous TFE's. R18 logging of all BES Cyber System components will generate numerous TFE's. R19 concerned about what realistic measures are available to meet requirements.
35.49	US Bureau of Reclamation	Disagree	R15.3 - If it is truly intended that entities test malicious code protections (not just ensure signatures are up to date and that protection software is running, the Standard should provide some additional guidance. Few entities are going to be willing to introduce malicious code, even into a test system, to verify malicuious code protection. Further, there is not timeline for when the malicious code protection must be tested. It would not be unreasonable to require and annual test of the

#	Organization	Yes or No	Question 35 Comment
			malicous code protections. The malicious code protections should be an intelligent requirement. Some devices that are not addressable may not need malicious code protection. R16.2 - Suggest the phrase "if the patch will not be installed" be added to the end of the requirement. R17.2 - Is locking within an enclosure satifactory? R18.3 - Suggest medium impact requirement be "for at least 90 calendar days" and that high impact timeframe be considered for reduction, perhaps to at least 180 calendar days.R19.1 - Explain how this is to be accomplished within the Standard - based on some specific criteria. This requirement is too open-ended. Since the concept of BES Cyber Systems now includes such devices as programmable multifunction or solid state relays, the requirement to "validate data" inbound makes no sense. Many of these devices reside within a control center. The definition now includes those center which are used to control more than one BES generator. The data going into the relays is from transducers either inside or outside the physical security perimeter but within another physical security perimeter. This data may be digital or analog. How would it be validated, cryptographically progracted or analyzed for malicious compromise?It is not clear how an "interactive user" session would apply to "programmable" relays.
35.50	Ameren	Disagree	R16.1 - This requirement should address documenting the installation date of patches and that patches have been installed.R18 - should only apply to network based systems with external connections only; currently this required is not limited on what it applies to.R19.1 and R19.2 - There is no way to comply with this standard without requiring the vendors to write better code. Suggest removing these requirements.
35.51	Northeast Utilities	Disagree	R17 appears to be significantly weaker than the previous standards. It also does not appear to align with the draft change control standards. Ports and services are a strong control to ensure only services required for operation are allowed. At minimum the High Impact BES Cyber systems should be “Required”.R19 needs more explanation. What does validate data mean?

#	Organization	Yes or No	Question 35 Comment
35.52	Hydro One	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious code.Requirement 15.3 implies that testing ensures that the deployment will not adversely impact security. However, the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing 16.1 from “release” to “availability”.Recommend removing “with a fixed date” from 16.2. The cyber system may not be available for maintenance due to grid system conditions.Request a R17 local definition of “attack surface”.Recommend changing 17.2 from “Disable, or render unusable, externally accessible physical ports” to “Disable or secure externally accessible physical communications ports”.Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.Requirement 18.4 seems to have one purpose and that is to prove 18.2. To us this seems redundant since R18.2 require alert for system events. Why do we need a review at some later point? We recommend removing the requirements R18.4 Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommend that R19 should “ensure the integrity of the data”.Recommend that 19.1 should read “Entity should document process to ensure the integrity of the data link between the BES Cyber System and the remote node.” This new 19.1 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should read “Where links cannot be secured, the Entity shall document the mitigation in use.” This new 19.2 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Please clarify the applicability of R19. Does this requirement apply only to code releases into the system or it applies only to external data streams (e.g. weather data from a service provider, data from RTUs etc)?
35.53	ISO New England Inc	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious codeBelieve the SDT meant that 15.3 testing insures that the deployment will not adversely impact security. However the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing

#	Organization	Yes or No	Question 35 Comment
			16.1 from “release” to “availability”Recommend removing “with a fixed date” from 16.2 because the cyber system may not be available for maintenance due to grid system conditions, implement based on your documented patch process. Request a R17 local definition of “attack surface”Recommend changing 17.2 from <<Disable, or render unusable, externally accessible physical ports>> to <<Disable or secure externally accessible physical communications ports>>Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber SystemsR18.3 Some automated tools do not have separate log retention based on the asset. The log retention applies to all assets. It is unclear if the log retention is the actual log from each Cyber System component or the log that an automated tool keeps (ie parsed out info from syslog). Either way a years worth of logs will require terrabytes upon terrabytes of storage for useless information. Recommend that 18.4 be re-worded to be consistent with FERC Order P526 - <<Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs. >>Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven daysRecommend that R19 should “insure the integrity of the data.”Recommend that 19.1 should be “Entity should document process to insure the integrity of the data link between the BES Cyber System and the remote node.” This new 19.1 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should be “Where links cannot be secured, the Entity shall document the mitigation in use.” This new 19.2 should be “Required” for High Impact and Medium Impact BES Cyber Systems.
35.54	Northeast Power Coordinating Council	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious code.Requirement 15.3 implies that testing ensures that the deployment will not adversely impact security. However, the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing 16.1 from “release” to “availability”.Recommend removing “with a fixed date” from 16.2. The cyber system may not be available for maintenance due to grid system conditions.Request a R17 local definition of “attack surface”.Recommend changing

#	Organization	Yes or No	Question 35 Comment
			17.2 from "Disable, or render unusable, externally accessible physical ports" to "Disable or secure externally accessible physical communications ports".Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.Recommend that 18.4 be re-worded to be consistent with FERC Order 706 paragraph 526 - "Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs."Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommend that R19 should "ensure the integrity of the data".Recommend that 19.1 should read "Entity should document process to ensure the integrity of the data link between the BES Cyber System and the remote node." This new 19.1 should be "Required" for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should read "Where links cannot be secured, the Entity shall document the mitigation in use." This new 19.2 should be "Required" for High Impact and Medium Impact BES Cyber Systems.
35.55	USACE HQ	Disagree	Requirement 15.1 should be deleted from the list. Limiting the propagation of malicious code is a logical step in the "respond to the introduction of malicious code" phase, process which is required in 15.2. Therefore 15.1 present a possible double jeopardy since it is logical to think that when responding to the introduction of malicious code in the environment the steps will include limiting the propagation of the same before removing it from the system. Also, requirement 15.1 language is to broad in the interpretation of it. "Limit propagation of malicious code" implies that the code has moved through some part of the system, therefore the question is, how much movement of the code is acceptable when creating a response process?. The acceptable answer to this question could depend on the auditor's subjective views of what is acceptable safe propagation of the code inside the system.
35.56	Garland Power and Light	Disagree	Requirement 16.1 - Reword requirement to say assess within 60 days - reason is because we feel it is adequate to check the vendor web site every 30 days and allow 30 days for testing and determination of implementationRequirement 18 - Reword

#	Organization	Yes or No	Question 35 Comment
			requirement to allow for Responsible Entity to develop a definition of a "system security event". The words are used in the main requirement and each subrequirement. Requirement 19 - o Delete Requirement R19 - Control systems currently validates data for quality and limits and then tags the data with any issues so that downstream applications can handle appropriately. This is sufficient for the security and reliability of the BES. R19 is impractical for implementation in the field for large or small utilities. This will reduce reliability of the overall system.
35.57	Oncor Electric Delivery LLC	Disagree	Requirements 15.1 and 15.3 are not necessary. The use of antivirus and malware software is problematic on some systems, while “whitelisting” requires additional hardware which may contain its own vulnerabilities. Detection and response should be sufficient. Many programmable devices are not capable of propagating malicious code or running prevention software.Requirement 18.2 does not apply to many legacy cyber systems and should only be applicable to systems which utilize routable communications.
35.58	Manitoba Hydro	Disagree	Revise the wording of Requirement R15 to “... integrity of the BES Cyber Systems.” Please clarify the intent of “test and update malicious code protections”. Requirement R16.2 should be revised to indicate the development AND implementation of the schedule. The wording of Requirement 16.2 currently does not require the application of mitigating measures prior to the installation of the applicable patch, and may need to be revised. For Requirement R17, please what is the meaning of “network accessible ports”, and “externally accessible physical ports”. Are physical ports enclosed within an unlocked cabinet “externally accessible ports”? Are physical ports within a non-public space, “externally accessible ports”? Requirement R18 does not contain any requirement for response to security event alerts or monitoring. Remove the word “maliciously from Requirement R19.2. It may be very difficult to determine if the data compromise was malicious or not. There are no specifics given with respect to “limit” propagation in Requirement R15.1. It is assumed to be at the Responsible Entity’s discretion in terms of criteria, means, etc. There are no specifics given with respect to “validate” data in Requirement R19.1 so it is assumed to be at the

#	Organization	Yes or No	Question 35 Comment
			Responsible Entity's discretion in terms of criteria, means, etc.
35.59	San Diego Gas and Electric Co.	Disagree	SDG&E thinks that R17.2 sounds good in theory (disabling external physical ports on assets), but in practice this can be difficult to achieve without damaging the port for future legitimate use. Many shops use epoxy or other glue-based products to physically disable / protect such ports, and these solutions tend to be permanent. If we are physically protecting the asset from access anyway with card readers and other physical means, why is it necessary to take this redundant step of sealing physical ports on assets when only people with authorized physical access (who have had training) can actually access the asset?SDG&E has concerns about the viability of complying with R19.1 (validating inbound data to a BES Cyber System in a control center) in a situation where the incoming data is encrypted. How does the SDT define "validate"? Where does the validation need to occur?SDG&E also has concerns about the viability of complying with R19.2 (evaluate invalid data for malicious compromise) without MUCH additional vendor support. How does the SDT define "evaluate invalid data"?
35.60	Platte River Power Authority	Disagree	Suggested Revision (clarify what to test):15.3 Implement processes to update malicious code protections including testing security controls
35.61	Duke Energy	Disagree	Table 15: will need a TFEWithin generation, we have differing opinions on the definition of code. Suggest clarifying that it does not include programming code.Requirement 16.1: Assessment of security patches within 30 calendar days of their release for applicability to its BES Cyber Systems. Release from whom? It makes a big difference if the patch is released from Microsoft, for example, or the patch is released from the control system vendor (e.g. Emerson, Invensys, Areva, etc.) as to how/if the patch is implemented to prevent risk to the BES cyber system.Table 17: for devices inside a locked cabinet, are the physical ports on that device externally accessible?Requirement 17.2: how does the definition of "externally" in "externally accessible physical ports" compare with the definition of external in "external connectivity" in R3? Also, this definition implies that there are physical ports that are

#	Organization	Yes or No	Question 35 Comment
			NOT “externally accessible”. Need to make definition more clear. Suggest taking out reference to “externally accessible”.Table 18: 18.1 - not all devices are capable of logging, need a TFE18.2 - it would be helpful to have a definition of ‘events related to cyber security’18.4 - remove for systems where automated tools are in place. Requirement 18.2: " one or more security processes for continuous security monitoring" - is there any interpretation of the expectation here so that we don't have disagreement at audit? Are alternate controls allowed for BES Cyber Components that don't support logging/monitoring (example: manual review of physical access logs for stand-alone equipment)?Table19:Item 19.1 & 19.2 Additional explanation is needed to explain acceptable threshold for “validation of inbound data.”Clarify validate in 19.1. Is encryption a form of validation?What is meant by Data in 19.1?Requirement 19.1: What types of data validation controls are acceptable to meet this requirement? For example, control totals, presence check etc. Requirement 19.2: Need to provide an example with what methods can invalid data be evaluated to conclude that the data has been compromised maliciously?
35.62	Consultant	Disagree	Table R15 - Item 15.3 The requirement to "Implement processes to test and update malicious code protections." is confusing. Is the intent to "test malicious code protections and update malicious code protections" or to "test updates to malicious code protections" Please clarify the intent. There is a need to distinguish between updates to the malicious code protection "software" and malicious code protection "signature files". The software should be implemented in accordance with change control processes. The "signature files" are a specific subset of update to malicious code protection where it is unlikely a registered entity would have the capability to test what are typically vendor proprietary file formats. The extent of the 'testing' necessary for these signature files should be clarified.Table R16 - Item 16.2 While the concept of a "fixed date" sounds good, the requirement should allow for reasonable scheduling, including rescheduling, of the installation of applicable security patches or completion of mitigating measures. An option could be to remove the words "with a fixed date" and add a new item that would require that "Events that delay a security patch implementation schedule greater than thirty days shall be documented."Table

#	Organization	Yes or No	Question 35 Comment
			R17 Item 17.1 The first sentence uses the terminology "network accessible ports and services" and the second sentence uses the terminology "network accessible services and communication methods". Suggest using consistent terminology to avoid confusion.Suggest defining the term "network accessible ports and services" (may be multiple terms) as they are intended for use in the standards. There does not appear to be a standardized definition for this term in the industry. The term "network accessible ports and services" appears to imply access across the protection boundary? If it does then the requirement statement of "Required for external connectivity only" is unnecessary and should be changed to "Required".Table R18 - Item 18.3 Suggest changing the word "within" to the word "for" for clarity of meaning.Item 18.4 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 18.1 and 18.2 require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Table R19 - The limitation of these items to a Control Center is an added dimension of Impact that is not included in the impact categorization criteria. If data is an issue, then these requirement should apply to all assets based on impact categorization without addendum or modification by the requirement. Suggest modifying the impact categorization criteria to clearly identify those assets.Table R19 - "Inbound data" implies remote access, and the terminology "Required for external connectivity only" is redundant. Suggest changing the wording to "Required".Items 19.1 and 19.2 are inconsistent. Item 19.1 requires validation of inbound data, and item 19.2 provides an exception to validation for encrypted data. If you comply with item 19.1, then item 19.2 is irrelevant. If you comply with item 19.2, then you are in violation of item 19.1.R19 - Overall, this requirement should be removed in it's current form. Automatic system operation cannot exist if "inbound data" is required to be validated. Automatic system operation is dependent on responses to external data inputs. If the intent is to return the BES to manual operation, this requirement

#	Organization	Yes or No	Question 35 Comment
			will achieve that end.
35.63	American Electric Power	Disagree	Table R15: 15.1, regarding "Limit propagation of malicious code", suggest replacing "propagation of" with "propagation and introduction of".15.2, regarding "Detect and respond to the introduction of malicious code." Would this be covered in a traditional cyber security incident response program? This should already be covered in R27.Table R16:16.1: Regarding the word "release" within "Assessment of security patches within 30 calendar days of their release for applicability to its BES Cyber Systems." Release from who? For example, is it the release of a new patch by Microsoft, or is it the certification of the patch by the control system vendor that the patch does not negatively impact the control system? Further clarification is needed. Patches released by Microsoft are not typically tested for several days or weeks by Control System vendors to validate that the patch does not impact functionality. Industry cannot test software patches as thoroughly as the Control System vendors.16.2: Is it a violation if you do not meet the fixed date? Suggested wording: replace "fixed date" with "scheduled date". Add a provision to supply reasoning for not meeting scheduled dates. The rewording provides flexibility to the Responsible Entity to push installation of the patch to a later date without being in violation.17.2: Add a sentence similar to the last sentence in 17.1, "In the case where unused, externally accessible physical ports cannot be disabled, the Responsible Entity shall document and implement a mitigation plan." The disabling of physical ports is not supported by all network devices. To meet the literal wording an entity may need to physically damage equipment which would void warranties and prevent further vendor support.18.1: Regarding "organizational processes" and "system events that are related to cyber security". Is it reasonable to think this can be done without automated tools?18.2: Regarding "continuous security monitoring", is this redundant to 18.1? If you are implementing automated tools to monitor and log system events are you not providing continuous security monitoring? Suggest removing these words to eliminate double jeopardy.This requirement should be focused on issuing an alert.Regarding "system events related to cyber security", what constitutes a system event related to cyber security? What criteria should be used? Is there an accepted

#	Organization	Yes or No	Question 35 Comment
			standard that an entity will be held to in an audit? If the right system events are not classified in an auditors' eyes, is this a violation? Suggest rewording to reference an acceptable set of minimal system events to monitor. What if a BES Cyber System does not generate a sufficient amount of detail to determine if a cyber security event occurred? Suggest allowing a TFE in this instance.18.3: Regarding "Maintain logs of system events related to cyber security within the specified time period", what if a BES Cyber System cannot store events for the duration required? Is a responsible entity required to go out to a device repeatedly to export their logs if they cannot meet the 90 day or 1 year increment? Suggest rewording to take into account limitations of BES Cyber Systems. Possibly use as a TFE item, if TFE's are maintained.What benefit does this provide for reliability or security? 18.4 is the important element, not the data retention.R19: With real-time or near real-time control systems, these requirements could increase latency and pose a negative impact to reliability.19.1: Regarding "Validate data inbound to a BES Cyber System in a Control Center", validate against what? Is the source being validated? Is the data itself being validated? Is providing encryption on the data sufficient? Who determines the appropriate level of validation? Is it being left to an auditor?Reliability could be compromised if this induces extra latency on the systems sending and receiving real-time data. This should be included as a TFE; older systems may not be able to handle the latency.19.2: Would "bad quality" indicators in the EMS system be an example of this?
35.64	APPA Task Force	Disagree	The APPA Task Force believes that Requirement R15 as currently drafted will require numerous TFE's. Each entity will need to document that they are not following this requirement since a vast array of devices in substations and generation stations are BES Cyber System Components but are not capable of propagating malicious code. Therefore we recommend the following edits for R15:R15. Objective:To protect BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions.R15. Requirement:Each Responsible Entity shall document and implement one or more processes incorporating the criteria specified in CIP-011-1 Table R15 - Malicious Code Protection. This requirement applies only to BES Cyber

#	Organization	Yes or No	Question 35 Comment
			System Components that have the capability to propagate malicious code. Change the Table legend to "Malicous Code Protections".The APPA Task Force is concerned that the criteria in R15 Table 15.3 do not constitute a reasonable requirement when looking at the transmission and generation environments that will be required to comply. The drafting team may not fully appreciate the full magnitude and implications of the phrase "test and update". We recommend that the criteria in Table 15.3 be removed or only be required for control centers.R16 Objective:To ensure that security vulnerabilities in BES Cyber Systems are mitigated. R16. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R16 - Security Patch Management R17. Objective:To reduce the available attack surface of the BES Cyber System.R17. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R17 - System Hardening The APPA Task Force agrees with the MRO-NSRS proposal noting that as written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings. This would require an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We recommend that this item be deleted.R18. Objective:To ensure that security events are known, logged, and responded to on BES Cyber Systems.R18. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring R19. Objective:To protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems.R19. Requirement:Each Responsible Entity shall implement processes incorporating the criteria specified in CIP-011-1 Table R19 - Communications and Data Integrity The APPA Task Force is extremely concerned with the actual ability of the industry to comply with the criteria in R19 as proposed. A discussion is necessary to understand if this requirement is actually feasible for all entities with High Impact facilities.

#	Organization	Yes or No	Question 35 Comment
			Utilities hire capable operators to make decisions on incomplete data all the time. If validating the data inbound means another electronic verification, this is impractical. If validating the data inbound means calling a lineworker in the field to check a setting in a substation when an operator is not comfortable with the data he is receiving, this is reasonable, but still not an auditable requirement. We agree with the MRO-NSRS evaluation of 19.2, which notes that as written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously. We recommend that this requirement be removed and placed in the guidance in support of the standard as a future technology.
35.65	Bonneville Power Administration	Disagree	The objectives of these requirements ("to protect its BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions," "to ensure that security vulnerabilities in BES Cyber Systems are mitigated," "to reduce the available attack surface of the BES Cyber System, "to ensure that security events are known, logged, and responded to on BES Cyber Systems," and "to protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirements rather than appearing at the end of the requirements (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.The phrase "Reliability Functions" at the end of R15 is not a defined term in the April 20, 2010, Glossary of Terms Used in NERC Reliability Standards. Does the drafting team mean CIP-01-01 - Attachment 1, Functions Essential to Reliable Operation of the Bulk Electric System? If so, that should clearly be stated. If not, there should be a definition in the Glossary. Table 16, Section 16.2. We applaud the new standard, which makes it clear that immediate mitigation or installation of patches is not required. However, there are still some issues:1. Security patches arrive weekly to daily to multiple times a day. Many may be applicable to systems, but of minimal

#	Organization	Yes or No	Question 35 Comment
			threat. Entities should be able to not only evaluation the applicability, but the threat and risk of the threat to their systems within their environment, and choose to escalate or deescalate patches as appropriate to them. Low impact, or low risk patches may be assigned to a regular patch or maintenance cycle, while high risk patches may be tested and implemented immediately. This should be up to the system owners, and not prescribed in the requirement.2. Mitigation plans are not necessarily applicable. Some patches, while technically applicable to specific equipment or operating systems, may have such a low risk or impact that they entity may choose not to apply the patch.3. There are instances where a patch may be applicable from a security perspective, but the risk it presents from a reliability perspective may outweigh it. 4. Where systems are isolated from external affects, even a patch that applies to a specific device may not be necessary.5. Meaning of "fixed date" is not clear. Does it mean "the same for every patch", or "the date can't be changed"? Both are bad choices. Different patches might require different schedules, depending on their impact and the availability of outage time on the system.R17: Rename this back to "Ports and Services" to avoid confusion. In the electrical industry "Hardened" systems are those that meet specific electrical requirements and interference requirements.Also, the use of the word surface implies something physical rather than electronic.Recommendation for R17: "Objective 17 - To reduce the available electronic attack points of the BES Cyber System.R17. Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R17 - Ports and Services"Table 17, Section 17.1. A mitigation plan might not be appropriate. In the context of NERC standards, a mitigation plan describes the actions that will be taken to achieve compliance. That is not the situation here. Recommendation: "cannot be disabled, the Responsible Entity shall document the reasons for the inability and compensating measures used."Section 17.2. We understand that FERC wishes the standard to address physical ports. However, this could have negative conquences:1. There are hundreds of thousands of devices in service that have physical ports that may not be used. The fact that they are not needed or used normally means that there is nothing connected

#	Organization	Yes or No	Question 35 Comment
			to them. If there is nothing connected to them, they are not vulnerable to any kind of external or remote attack.2 - Disabling physical ports on electrical system components may be: o Impossible o Degrade the operation of the equipment o Render the warranties on the equipment void thereby removing vendor service o Create such a huge national work load that it could never be accomplished.Recommended change - Eliminate 17.2Table R18:18.1 & 18.2 - The use of the term "all BES Cyber System Components" is not accomplishable:1. Many, if not most "components" in the field do not capture what would be considered cyber security related events. They only capture electrical system events. They don't even have the capability to capture access events.It is the access points to these devices that may have the ability to capture even the most rudimentary cyber security information (Access Attempt, Date, Time, Account, Source, Target)2. It may not be possible to place monitoring equipment within electronic monitoring proximity of these components. 3. The term "events that are cyber security related" is not defined. What exactly does it mean? Is this access events, Intrusion Detection systems, Antivirus, ??? Much of this cannot be implemented on or even for "all BES Cyber Components". Recommendation: 1. Remove "components", so that the requirement is at the BES Cyber System level.2. Change "...security for all..." to "...security, as defined by the Responsible Entity, for all..."18.3 has the same issue with the definition of "events related to cyber security". In addition, this time frame has caused some confusion from an audit perspective. - Some have read that to mean that there must be, on the originating system, at all times, at least 90 days worth of logs. While others (rightfully, we feel) are maintaining archives of their logs in alternate locations for 90 days or longer. Recommendation: replace with "Maintain captured log information within the specified time period on-line, in archives, or in some other readily accessible form."Section 18.4. Consistently accomplishing manual review of logs could be difficult for large entities with large numbers of devices, especially within the 7 days required for high impact systems. The obvious solution is the use of an automated log review tool. This should be explicitly addressed in the standard. Recommendation: "Review, either manually or by automated means, logs...." Entries in Table R19 are acceptable only if the

#	Organization	Yes or No	Question 35 Comment
			definition of external connectivity is changed, as discussed above. Otherwise, entities would be forced to validate data inbound from one BES Cyber System to another BES Cyber System, all within the same Control Center. This does not seem to be the intent: using the existing definition of external connectivity, any data inbound to a BES Cyber System uses external connectivity. In that case, why state it so? Clearly, the intent was to validate traffic inbound from outside the Control Center, at most.
35.66	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The requirements are to prescriptive for the range of systems that it will apply to.
35.67	Constellation Power Source Generation	Disagree	The term “release” in R16.1 needs to be further defined. The issue with it being vague is that some patches for a system may be released for all users, but if that system is tied to a distributed control system, the distributed control system vendor has to validate the patch before its implemented by a facility. Using this example, there are really 2 release dates. For auditing purposes, a suggestion would be to define release locally as “the date of which a security patch has been safely validated by a vendor. If another vendor must validate this release before implementation, than the date it has been released by the second vendor will be used as the release date.” R16.2 is not worded correctly. A suggested change would be “Development of an implementation schedule with a fixed date for installation of the applicable security patches and a fixed date for completion of mitigating measures that address the vulnerability, until implementation of the patch.” In R18.1, is the monitoring and logging continuous, or on a fixed schedule? The SDT should add clarity to this requirement. R18.2 discusses issuing alerts but does not give a timeframe for issuing them. A suggestion would be 90 days to ensure a proper review of an incident to determine if it was a cyber event. At the CIP V4 Workshop, the drafting team stated that R18.4 was not meant to be an exhaustive manual review of logs, but rather a check to ensure the automated log is functioning. This needs to be included in the verbiage of the requirement. R19.1 should be reworded to say “Implement a process to validate data received by a

#	Organization	Yes or No	Question 35 Comment
			Control Center's BES Cyber System." Doing so would clarify R19 as a whole, and R19.2 can be removed due to its redundancy with R19.1.
35.68	Public Service Enterprise Group companies	Disagree	There are several clarifications necessary to make the language understandable and ensure that entities know what is required. [1] Please clarify the distinction between requirements 15.1 and 15.2. Performance degradations and potentials for false positives from detection mechanisms that inspect each file when accessed, as possibly implied by 15.2, may not appropriate for real-time systems. [2] In requirement 18.2 please specify what is meant by "continuous"? Is a periodic check sufficient? [3] Please clarify the distinction between requirements 19.1 and 19.2. In requirement 19.1 please specify what is meant by "Validate"?
35.69	Constellation Energy Commodities Group Inc.	Disagree	There is no definition of malicious code provided. Clarify the scope of malicious code to include virus, malware and spyware protection, as currently generally commercially understood.Please define the stipulation 'Required for external connectivity only'.Are the tools and processes listed in R18 intended to provide automated detection, or manual\narrative logging of events detected under the heading of other controls? If automatic, what sorts of events are contemplated? What is intended by the term 'Validate' in 19.1? Does this mean the identification of a separate, independent source for the data, business rules, or something else? Without understanding the intent of the standards drafting team, I cannot suggest specific changes.
35.70	Allegheny Energy Supply	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of

#	Organization	Yes or No	Question 35 Comment
			the BES cyber systems/BES cyber components to be protected. Is it sufficient for a relay (which has very limited operating system capability) to validate the specific version of firmware operating on it? It may be appropriate to add discrete requirements for systems that support the addition of anti-virus software. These requirements could require a validation of signature file updates prior to use on a production BES system. Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.71	Allegheny Power	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of the BES cyber systems/BES cyber components to be protected. 35.72	EEI	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. Requirement 15.3 is unclear as to what is

#	Organization	Yes or No	Question 35 Comment
			meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of the BES cyber systems/BES cyber components to be protected. Is it sufficient for a relay (which has very limited operating system capability) to validate the specific version of firmware operating on it? It may be appropriate to add discrete requirements for systems that support the addition of anti-virus software. These requirements could require a validation of signature file updates prior to use on a production BES system. Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.73	Reliability & Compliance Group	Disagree	To help eliminate TFE's here, you need to add a qualifier such as "to protect its BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions if mechanisms exist that can protect the BES Cyber System Component."
35.74	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
35.75	We Energies	Disagree	We Energies agrees with EEI: There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. With respect to requirement 15.1, We Energies believes this may not be possible for non-windows based devices/systems.We Energies agrees with EEI: Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of the BES cyber systems/BES cyber components to be

#	Organization	Yes or No	Question 35 Comment
			protected. Is it sufficient for a relay (which has very limited operating system capability) to validate the specific version of firmware operating on it? It may be appropriate to add discrete requirements for systems that support the addition of anti-virus software. These requirements could require a validation of signature file updates prior to use on a production BES system. We Energies agrees with EEI: Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.76	GTC & GSOC	Disagree	We Recommend: 1. In R15.3: taking out the words "test and" or, alternatively, clarifying what is meant by "test"2. In R19.1: clarifying whether encryption is required or if CRC will be sufficient3. Completely removing R19.2 because of the following reasons referenced from the DHS Catalog of Control System Security: a. The use of cryptography within a control system will introduce latency to control system communication. The latency introduced from the use of cryptographic mechanisms must not degrade the operational performance of the control system or impact personnel safety. b. Failure of a cryptographic mechanism must not create a denial of service. Control systems generally support the objectives of availability, integrity, and confidentiality. Therefore, the use of cryptography should be determined after careful consideration.
35.77	Midwest ISO	Disagree	What does it mean to validate data in R19.1. What is the expectation if a piece of data has been changed/modified when the value received is within reasonable limits but is not the actual value sent? This could be particularly troubling for the Interregional Security Network and ICCP. For example, how can an RC validate that the SCADA system sent valid data to the ICCP server at a TOP if it is within an expected range? More details around the expectation of validating data would be helpful to ensure entities can be compliant.

36. Tables R15 to R19 provide direction concerning what impact level of BES Cyber Systems to which Requirements R15 to R16 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 Requirements R15 through R19 have moved to CIP-007-5 Requirements R1 through R4.

Many commenters disagreed with the proposed BES Cyber System impact levels and made suggestions for improving these requirements, including suggestions to revise or refine the impact levels based on the particular characteristics of the BES Cyber Systems involved. For example, some suggested that certain requirements should apply only to Medium Impact BES Cyber Systems with external connectivity. Others suggested that there were key requirements such as malware prevention that should apply at all BES Cyber System impact levels. In response, the SDT has made changes to include an applicability column in each table for each requirement. The applicability column further refines the set of BES Cyber Systems and assets to which each part of the requirement must be applied. The intent of this approach is to refine, as commenters suggested, the scope of requirements that apply to each type of BES Cyber System or device based on its characteristics. The drafting team recommends that commenters carefully review the proposed applicability column in the table for each requirement in CIP-003-5 through CIP-011-1.

#	Organization	Yes or No	Question 36 Comment
36.1	Northeast Utilities	Agree	Need TFE language added; not all CCAs or protecting assets require malicious code protection.
36.2	FirstEnergy Corporation	Agree	R17 - Does ‘external connectivity only’ mean only firewalls? If not, please provide intent of SDT.
36.3	BGE	Disagree	15.1, 15.2 and 15.3 should also apply to Low impacted systems. 16.2 implies that the patching can only occur on the same day every month.19.1 Define “validate”.
36.4	ERCOT ISO	Disagree	15.1-15.3: Should apply to Low Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
36.5	American Electric Power	Disagree	17.1: Regarding "Required for external connectivity only" within the High and Medium

#	Organization	Yes or No	Question 36 Comment
			impact categories. Is this required for "routable external connectivity" only, or all connectivity?How will items in R18 and R19 be performed on systems with nonroutable connectivity? Will dedicated IT Security Operation staff need to be added to isolated networks to perform the security status monitoring?
36.6	US Bureau of Reclamation	Disagree	Add R15.1, R15.2 and either R18.1 or R18.2 to the requirements for a low impact system. Concept of REMOTE connectivity is not defined. Without that definition, it is hard to assess if a High Impact is appropriate or if no Medium Impact is reasonable..
36.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
36.8	Black Hills Corporation	Disagree	At least 15.2 and 16.1 should also apply to low impact BES Cyber Systems.
36.9	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
36.10	The Empire District Electric Company	Disagree	Comments: For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: “Required for routable external connectivity only”. We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.We believe the time frames for item 18.4 may not be practical at distributed locations without routable external connections, where logs would need to be reviewed locally.
36.11	US Army Corps of Engineers, Omaha Distirc	Disagree	define terms "continuious security monitoring" and "detected system events."
36.12	CWLP Electric Transmission, Distribution and	Disagree	Due to the requirement for continuous monitoring and alerts defined in R18.2 the requirement for log reviews every 7 days should not be needed. A standard 30 day review as in the medium impact area should be appropriate for both high and

#	Organization	Yes or No	Question 36 Comment
	Operations Department		medium impact levels.Does the fact that the data has been successfully passed through a Firewall or Access List meet the obligation to validate data incoming to a Control Center in R19 or does this require the data be inspected all the way down to the packet level?
36.13	American Transmission Company	Disagree	For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
36.14	MRO's NERC Standards Review Subcommittee	Disagree	For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.We believe the time frames for item 18.4 may not be practical at distributed locations without routable external connections, where logs would need to be reviewed locally.
36.15	Southern California Edison Company	Disagree	In order to appreciate the impact based categorization and reflect the actual impact on BES reliability, an additional requirement can be added to R16 for medium and low impact system. The drafting team should look at NERC PRC standards on maintenance schedules and synchronize CIP patching and upgrades to a maintenance and inspection schedule that is already mandated by NERC.Requirement R18 requiring logs be reviewed manually every seven days, when controls to automatically monitor such logs are already in place, is a control that does not seem to add additional security value. If the intent of the drafting team is to manually ensure and certify that the logging capability is functioning adequately, the drafting should include such verbiage. The current draft language of the standard seeks only a manual review of

#	Organization	Yes or No	Question 36 Comment
			the log rather than the manual verification of the logging capability.
36.16	Progress Energy - Nuclear Generation	Disagree	Incorporate information contained in the matrix in Attachment 1 for durations to ensure consistency by aligning CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
36.17	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
36.18	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's observations below:There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Suggested change for overarching R18:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring to collect and as appropriate, respond to security events on BES Cyber Systems that are able to detect and transmit such events.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring

#	Organization	Yes or No	Question 36 Comment
			that issue alerts for detected system events related to cyber security."Requirement R19 creates a potentially impossible level of obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is present to it.
36.19	NextEra Energy Corporate Compliance	Disagree	NextEra believes requirement R17 should be applied to both high and medium BES Cyber Systems.
36.20	PacifiCorp	Disagree	PacifiCorp agrees with EEI's observations below:There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Suggested change for overarching R18:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring to collect and as appropriate, respond to security events on BES Cyber Systems that are able to detect and transmit such events.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: "Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security."Requirement R19 creates a potentially impossible level of

#	Organization	Yes or No	Question 36 Comment
			obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is presented to it.
36.21	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation 'Required for external connectivity only'.
36.22	American Municipal Power	Disagree	Please provide a little or no impact category
36.23	The United Illuminating Co	Disagree	R15.2, introduction of malicious code, responding to the introduction of malicious code is a specific cyber security incident. Suggest 15.2 be limited to processes to detect malicious code. Response is already part of cyber incident response.
36.24	Southwest Power Pool Regional Entity	Disagree	R15: Malicious code prevention is a basic security control and should be applicable to all impact categories. R17 and R19 should not make a distinction between external and non-external connectivity. R17: Once access is gained into the network by any means to any cyber system on the network, external access is immaterial.
36.25	Southern Company	Disagree	R19 comes from the DHS catalog, requirement 2.8.8. In the DHS catalog, there are 4 requirement enhancements, two of which are warnings which could greatly affect reliability. The DHS catalog presumes this requirement would be implemented on a case by case basis after appropriate research and testing. It therefore has no place in a mandatory standard that will force its use everywhere without regard to the reliability impacts. This requirement should be removed from a reliability standard.
36.26	National Grid	Disagree	Refer to answers in Q. 35.
36.27	Manitoba Hydro	Disagree	Requirement 18.4 can be very onerous for the industry for legacy systems which don't support automated log consolidation or review. The requirements must allow more flexibility.

#	Organization	Yes or No	Question 36 Comment
36.28	Garland Power and Light	Disagree	Requirement 19, 19.1 and 19.2 should not be required for any level
36.29	San Diego Gas and Electric Co.	Disagree	SDG&E feels that if R17.1 is a requirement for Medium Impact systems, then R17.2 should be as well for Medium Impact systems. For R18.3 and R18.4, SDG&E recommends that consistency be applied to the requirements to help ease the compliance burden of companies that have both High and Medium Impact BES Cyber systems. SDG&E also feels that instead of using the word "impact" for these Requirements, apply a concept of "risk" for inclusion. We would want to identify the risks with associated systems security and protect accordingly.
36.30	Con Edison of New York	Disagree	Section 15 & 16 should be limited to networked systems. Isolated microprocessors not part of a network should not have the same requirement.
36.31	ISO New England Inc	Disagree	see answer to question 35
36.32	Progress Energy (non-Nuclear)	Disagree	See comment 14.
36.33	WECC	Disagree	See comments for Q35Criteria should aplpy to all impact levels
36.34	LCEC	Disagree	See previous comments
36.35	BCTC	Disagree	See response to Q35.
36.36	Hydro One	Disagree	see response to Question 35
36.37	Entergy	Disagree	See response to Question 35 immediately above.
36.38	Northeast Power Coordinating Council	Disagree	See response to Question 35.

#	Organization	Yes or No	Question 36 Comment
36.39	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in rows 15.1, 15.2, 15.3, and 17.2. Suggest “Required for external connectivity only” for Medium Impact in rows 19.1 & 19.2.
36.40	Duke Energy	Disagree	Table 18: Manual reviews every 7 days is not practical.
36.41	Consultant	Disagree	Table R15 - Item 15.3 The requirement to "Implement processes to test and update malicious code protections." is confusing. Is the intent to "test malicious code protections and update malicious code protections" or to "test updates to malicious code protections" Please clarify the intent. There is a need to distinguish between updates to the malicious code protection "software" and malicious code protection "signature files". The software should be implemented in accordance with change control processes. The "signature files" are a specific subset of update to malicious code protection where it is unlikely a registered entity would have the capability to test what are typically vendor proprietary file formats. The extent of the 'testing' necessary for these signature files should be clarified.Table R16 - Item 16.2 While the concept of a "fixed date" sounds good, the requirement should allow for reasonable scheduling, including rescheduling, of the installation of applicable security patches or completion of mitigating measures. An option could be to remove the words "with a fixed date" and add a new item that would require that "Events that delay a security patch implementation schedule greater than thirty days shall be documented."Table R17 Item 17.1 The first sentence uses the terminology "network accessible ports and services" and the second sentence uses the terminology "network accessible services and communication methods". Suggest using consistent terminology to avoid confusion.Suggest defining the term "network accessible ports and services" (may be multiple terms) as they are intended for use in the standards. There does not appear to be a standardized definition for this term in the industry. The term "network accessible ports and services" appears to imply access across the protection boundary? If it does then the requirement statement of "Required for external connectivity only" is unnecessary and should be changed to "Required".Table R18 - Item 18.3 Suggest changing the word "within" to the word "for" for clarity of

#	Organization	Yes or No	Question 36 Comment
			meaning.Item 18.4 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 18.1 and 18.2 require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Table R19 - The limitation of these items to a Control Center is an added dimension of Impact that is not included in the impact categorization criteria. If data is an issue, then these requirement should apply to all assets based on impact categorization without addendum or modification by the requirement. Suggest modifying the impact categorization criteria to clearly identify those assets.Table R19 - "Inbound data" implies remote access, and the terminology "Required for external connectivity only" is redundant. Suggest changing the wording to "Required".Items 19.1 and 19.2 are inconsistent. Item 19.1 requires validation of inbound data, and item 19.2 provides an exception to validation for encrypted data. If you comply with item 19.1, then item 19.2 is irrelevant. If you comply with item 19.2, then you are in violation of item 19.1.R19 - Overall, this requirement should be removed in it's current form. Automatic system operation cannot exist if "inbound data" is required to be validated. Automatic system operation is dependent on responses to external data inputs. If the intent is to return the BES to manual operation, this requirement will achieve that end.
36.42	Alberta Electric System Operator	Disagree	Table R15 - make 15.1, 15.2, 15.3 required for Low Impact BES Cyber Systems, but possibly on a longer time horizon than for Medium and High Impact BES Cyber Systems.Table R16 - make 16.2 required for Low Impact BES Cyber Systems.Table R17 - make 17.1 “Required for external connectivity only” for Low, and “Required” for Medium and High. Make 17.2 required for Medium also.Table R18 - make 18.1 and 18.2 required for Low Impact systems. Make 18.3 90 calendar days for Low Impact systems. Make 18.4 30 calendar days for Low Impact systems.

#	Organization	Yes or No	Question 36 Comment
36.43	Idaho Power Company	Disagree	The review of logs every 7 days or even 30 days is extreme unless the logs are filtered for only abnormal events and only logs of abnormal events are reviewed.
36.44	Ameren	Disagree	The system hardening in Table for R17 is rendundant when other standards already restrict physical access to these systems.â€,â€,â€,R18.1, R18.2, R18.3, and R18.4 - Log file monitoring at Medium Impact Systems will be costly as there may not be bandwidth available to send the logs to a central location to be reviewed. Suggest removing these requirements for Medium Impact Systems.
36.45	Allegheny Energy Supply	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security.”Requirement R19 creates a potentially impossible level of obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is present to it.

#	Organization	Yes or No	Question 36 Comment
36.46	Allegheny Power	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. 			Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required for routable external connectivity onlyR15 Table 15.3: (If retained)Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required for routable external connectivity onlyR16 Table 16.1: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required for routable external connectivity onlyR16 Table 16.2: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required for routable external connectivity onlyR17 Table 17.1: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required for routable external connectivity onlyR17 Table 17.2: (If retained)Low Impact: N/AMedium Impact: N/AHigh Impact: Required for routable external connectivity onlyWe believe the “continuous security monitoring” as described in 18.2 is not practical for all BES Cyber System Components. We also believe the time frames for item 18.4 may not be practical at distributed locations without routable external connections, where logs would need to be reviewed locally. Therefore we propose that for Medium impact facilities 18.1-18.4 be “Required for Control Centers only.”R18 Table 18.1: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: RequiredR18 Table 18.2: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: RequiredR18 Table 18.3: Low Impact: N/AMedium Impact: 90 calendar days for Control Centers OnlyHigh Impact: 1 yearR18 Table 18.4: Low Impact: N/AMedium Impact: 30 calendar days for Control Centers OnlyHigh Impact: 7 calendar daysR19 Table 19.1: (If retained)Low Impact: N/AMedium Impact: N/AHigh Impact: Required for external connectivity onlyR19 Table 19.2: (If retained)Low Impact: N/AMedium Impact: N/AHigh Impact: Required for external connectivity only

37. Requirements R20 to R22 of draft CIP-011-1 concern procedures for boundary protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R20 to R22? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1Requirements R20 through R22 have moved to CIP-005-5 Requirement R1.

Many commenters suggested phrases or aspects of the requirements that needed to be clarified. Several commenters questioned the need for weekly review of log entries, indicating that reviewing log entries at this interval would be burdensome with little or no positive impact on reliability.

Several commenters suggested reverting to the old name of Electronic Security Perimeter in place of Electronic Boundary Protection. In addition, several commenters suggested removing the system boundary protection requirement because it is overly prescriptive.

The drafting team agrees with commenters that some aspects of the requirement were too prescriptive, and has made significant changes to update the requirement both to clarify it and make it less prescriptive, while still addressing FERC Order 706 directives. The drafting team also agreed to revert to the Electronic Security Perimeter designation.

#	Organization	Yes or No	Question 37 Comment
37.1	WECC		Agree with concept, however, some work on the wording might make this more clear. R21 should have an additional item 21.3 - Cyber System components will not be shared with non-BES cyber systems or BES Cyber Systems of different impact levels.The former requirements for ESPs were better. The new language describing access points on communication paths may be an indirect way to get there, but it does not make things clearer or more auditable. This method of describing controls will make matters more complex and create additional work for entities.
37.2	GE Energy	Agree	"Logical Separation." Logical separation should be clarified. Logical separation could mean network access separation through an access point or it could be account separation by having separate user, system or service accounts that are different

#	Organization	Yes or No	Question 37 Comment
			amongst BES systems.
37.3	USACE - Omaha Anchor	Agree	Define 'unauthorized access attempts' is this a ping, or is this when a bad password is given to the system.
37.4	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.R20.20.2 - How does one implement a deny access by default for a dialup modem? That effectively either takes the modem out of service, or if you were to rely on the PSTN to do any kind of 'validation' of the incoming call, this is at best security through obscurity as it is trivial to spoof the callerid which is the only form of data validation that can be done over a dialup line.20.4 - What does "unauthorized access" mean? Does that mean an access attempt? Would a port scan of a firewall qualify as "unauthorized access"?20.5 - What does "unauthorized access" mean? If something as simple as a connection attempt qualifies, this requirement puts a tremendous burden on staff to track every little event that might happen on the firewall, and would not accomplish much in the end. If the intent of the standard is to keep unauthorized login attempts at bay, it should say that.R21.21.2 - Communication through an "electronic access point" for dial-up communications could prove difficult for some devices. Some devices are extremely sensitive to any sort of jitter introduced to a data stream, and having a security device in front of these kinds of devices may introduce enough jitter to make the communications unusable. R22.This seems duplicative of R14, R16, R18 and R23. FMPA suggest modifying those requirements to incorporate the protective cyber systems elements.22.2 - This should be consistent with R16; medium should be required to patch access control points. Also, low should have to patch at least quarterly. For access points, consider forcing high impact to asses 'critical' patches within 7 days.
37.5	Green Country Energy	Agree	Footnotes, guidance document?
37.6	Exelon Corporation	Agree	If systems are connected to a master station/location that is a BES Cyber system, do all the connected systems become BES Cyber systems? At what level do these

#	Organization	Yes or No	Question 37 Comment
			requirements apply - for example at the relay level where someone is logging into the relay? Exelon would like clarification on the definition of the electronic access point - is it at the component level or at the system level?
37.7	Progress Energy - Nuclear Generation	Agree	R20-22 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
37.8	Independent Electricity System Operator	Disagree	- R20.1 R20.4 20.5 and 20.6 External and External connectivity needs to be defined. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary? - - R20.5 Please define
37.9	National Grid	Disagree	1. National Grid requests clarification on “all communication paths” in 20.1 which can be every possible communication path between two end points. The entity should be required to document only external communication paths with dial up access or routable protocol. Recommend removing R20.1 and 20.2 from LOW impact category.2. National Grid recommends removing “within the following time period” from 20.5 and 20.6. Also, for dial ups it would be difficult to review the alerts in the given time period. Suggest 30 days for logging related to dial-ups. 3. National Grid recommends that 20.6 be re-worded to be consistent with FERC Order P526 - “Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs.”4. National Grid recommends that 20.6 High Impact BES CS should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven days. Also should it be included for Medium Impact BES CS?5. National Grid recommends removing 21.2 since it is covered in 20.26. National Grid recommends removing R22 since it is redundant and move it’s table into the respective Requirements o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23

#	Organization	Yes or No	Question 37 Comment
37.10	Dairyland Power Cooperative	Disagree	20. What are the boundary rules for serial connectivity vs. routable protocols. Serial connections can be external to different systems and they can be internal. How do we determine if there is a boundary to protect?21. The logical separation rule needs more detail "Logical Separation" should have a definition. What is the impact for an RTU field device than can be scanned by multiple systems or entities? Is the mere configuration of available data on each physical or logical port enough to satisfy logical separation? What about components used as system-to-system gateways?
37.11	Regulatory Compliance	Disagree	20.1 - clarify - are these communication paths external to the electronic boundary?20.2 - clarify - This implies a firewall for even low impact?20.3 - guidance on what required elements to document20.6 - Clarify if this is for firewall logs only21.1 - Major clrification needed - what about BES Sytems that rely on input and out from system to system in having the logical separations?
37.12	Dominion Resources Services, Inc.	Disagree	20.1. The language "Document all communication paths" is too vague and suggests a need to map out the entire LAN/WAN infrastructure. Based on the May workshop discussion, the intent of the requirement is to document inputs and outputs associated with the BES Cyber System. Dominion recommends the following alternate wording for R20.1:"Document all digital interfaces associated with each BES Cyber System."20.4. Dominion recommends revising the language of this requirement to read:"Document and implement one or more processes for logging all access attempts at each electronic access point."Firewall logs cannot identify all "actual unauthorized access." Someone using a trusted source to gain access to a BES Cyber System would be permitted through a firewall. That is "actual unauthorized traffic" but it is not detectable. Blocked access attempts are shown in firewall logs as a dropped or denied entry.20.5. As explained in the comment for requirement 20.4, firewall logs cannot identify all "unauthorized access attempts." Therefore, Dominion recommends rewording this requirement to read as follows: "Document and implement one or more processes for alerting and review of alerts by designated response personnel at each electronic access point within the following time period."

#	Organization	Yes or No	Question 37 Comment
			20.6. Compliance with this requirement is labor intensive and, therefore, not practical for a large number of BES Cyber Systems. Requiring a manual review every 7 days is excessive for the benefit received and does not make allowances for reviewer unavailability due to sickness, emergency work or vacation. At minimum Dominion recommends extending the review requirement to every 30 calendar days or revising the requirement to allow for selected BES Cyber Systems to be reviewed every 7 calendar days as follows: "Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs for selected BES Cyber Systems within the following time period."21.1. The word "either" should be inserted after the word "provide." The phrase "or controlled access from one system to the other" should be added after "between each system." This modification is reflected in the revised language below: "Cyber System Components in Control Centers that are shared between BES Cyber Systems must provide either logical separation that prevents access between each system or controlled access from one system to the other."The issue is devices that provide a gateway between 2 systems. An example is the node that passes data between the EMS and ICCP networks.
37.13	Network & Security Technologies Inc	Disagree	20.2 - Current wording could be interpreted to mean an access point is required between a BES Cyber System and any other BES Cyber System the Responsible Entity may have defined, even if on a shared network. Could also be interpreted to mean access points are required on a per routable protocol basis. Assuming these interpretations were not intended, 20.2 should be rewritten for greater clarity.20.3 - Except for "document," this requirement seems to duplicate 20.2.20.6 - Wording suggests this requirement applies to all BES Cyber Systems. Is this what was intended, or is it to be applied to access point devices? Please clarify.21.1 - Please clarify intent and applicability of this requirement. Is it intended to apply to virtual machines? Disk arrays shared by multiple application servers? Both? Neither?21.2 - Redundant if all access points are properly identified. Suggest eliminating it or combining the statement with one of R20's sub-requirements.R22 - Seems to overlook physical protections for cyber systems that establish electronic boundaries.22.4 - Configuration changes such as updating access control settings on a firewall or

#	Organization	Yes or No	Question 37 Comment
			revising the physical access permissions associated with a card key should not be subject to this requirement, and it should so state.
37.14	American Electric Power	Disagree	20.2 & 20.3: Regarding "Document and implement access control at each electronic access point established in Part 20.2", is this redundant to R14 - lines 14.1 through 14.3? Suggest rewording or removing if it poses double jeopardy.20.6: Regarding "Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs for each BES Cyber System within the following time period", does this provide any security benefit? If a system event for cyber security was missed by an automated tool, is it reasonable to expect it to be found in a manual review? What is an entity supposed to look for in this manual review?21.2: Regarding "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20", it appears that this is a restatement of the elements of R20. If that is not a correct assumption, the SDT need to provide additional information.
37.15	ERCOT ISO	Disagree	20.2: Recommend using “ingress or egress point” instead of “access point”. 22.1-22.3: Please remove reference to other standard. Address the content in the appropriate standard only. The circular references in the existing standards are very difficult to navigate and provide opportunity to miss the requirement.
37.16	BGE	Disagree	20.5 timeframe should be consistent for medium and high.
37.17	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
37.18	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
37.19	Southwest Power Pool Regional Entity	Disagree	Clarify the requirement. A reader could interpret the criteria as requiring an access point between each defined BES Cyber System regardless of network segment placement. 20.4: More often than not, authentication is performed at the end host

#	Organization	Yes or No	Question 37 Comment
			system. Rather than prescribing logging of attempted or actual unauthorized access at the access point, simply require such logging at the point such unauthorized access is detected. 20.6: What are the minimum expectations for a log sampling program (e.g., how much, how often?). 21: Clarify that shared BES Cyber System Components (e.g., a networked storage device) must be afforded the highest impact categorization of all of the BES Cyber Systems sharing the component (similar to the sharing aspect of the electronic access point definition). 22: Include the requirement to protect the access control system from unauthorized physical access.
37.20	CenterPoint Energy	Disagree	Disagree - R20.2 CenterPoint Energy suggests striking the word dial-up. If dial-up is not stricken a TFE may be required to comply with this requirement for serial dial-up paths.CenterPoint Energy believes requirements, R20.3-R20.6, may require a TFE for compliance for non-routable protocols.R20.6 CenterPoint Energy believes the 7 day calendar requirement to review sampling of log entries is overly burdensome and unnecessary. Controls and alert processes to notify appropriate personnel of unauthorized access attempts are mandated in prior requirements. CenterPoint Energy recommends a 30 day review.
37.21	E.ON U.S.	Disagree	E.ON U.S. interprets R20.1 to require documentation of “all” communication paths which could include communication links to all RTUs, etc. This level of documentation is not necessary
37.22	Duke Energy	Disagree	Elimination of terms such as electronic security perimeter without a completely thought through substitute concept contributes to industry frustration. The industry, at least, had come to understand the concept of an ESP. How the “boundary” is identified does not seem well thought through. In the text box, information such as “...cyber systems sharing one or more common electronic access points ...will be treated at the highest BES Cyber system impact categorization level of the BES Cyber system...” seems to belong in CIP 010 where the actual categorization occurs. This information is NOT a technical control and does not seem to belong in CIP 011. Rather it provides additional information concerning the categorization. This standard

#	Organization	Yes or No	Question 37 Comment
			will cause entities to document a lot of confidential information, which then must be protected. R20 - electronic security perimeter is a retired term, suggest replacing with a different term.Table 20: 20.2 is confusing for initial setup processes. How can we explicitly authorize?Requirement 20.2: The electronic access point can therefore be shared between systems as defined in the text box beside R20. For generation stations in particular, there are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). Sharing such an access point is highly desirable. Requirement 20.2, as written, seems to contradict the definition in the text box in requiring that the Responsible Entity establish an electronic access point on EACH routable protocol or dialup communication path between BES Cyber Systems.Requirement 20.4: this requirement makes sense if remote/external access is defined by the "shared access point" as described here (which seems to be in agreement with comments made in sections R11, R12, R13, where the emphasis was on communication between the devices rather than "at the access point").Requirement 20.6: please consider including the words "related to electronic boundary protection" to make the sentence read as follows: Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs relating to electronic boundary protection for each BES Cyber System within the following time period. Also, where logs are accumulated, there is no way to tell if the user was internal or external to the edge device.Table 2121.1 Suggest changing 'prevents' to 'limits' or remove 'that prevents access'. Within Generation, that access is required. Also, Does "logical separation" include "virtual separation"?21.2. Verify this is not just for control centers.
37.23	RRI Energy	Disagree	For 20.1, define communication path, eg., source and destination(s) only or everything in between?For 20.5, what does "all unauthorized access attempts" mean? If an operator fat-fingered login password, does the standard expect alert and follow up each time? "all unauthorized access attempts" needs to be redefined with some threshold before declaring it as unauthorized access attempt. Otherwise, Entities and operators will spend a lot of time documenting unauthorized access and instead of

#	Organization	Yes or No	Question 37 Comment
			securing their assets.
37.24	Northeast Utilities	Disagree	For 20.5, please provide clarification on the meaning of "all unauthorized access". Every password violation for example, is not an unauthorized access attempt but could be interpreted as such. Do we really need to follow-up on every invalid password attempt? Instead of every invalid password attempt, are password lockouts an appropriate trigger? Also, please consider addressing repeated lockouts in the criteria specified.R22 appears to be significantly weaker than the previous standards. One area that is specifically weaker is with regard to access control to Protective Cyber Systems. How can an entity not authorize, review and revoke a role as important as a firewall administrator?
37.25	Constellation Power Source Generation	Disagree	In R20.1 as well as the definition box, the term digital information needs to be defined further. R21 inherently forces entities to further segment their BES Cyber Systems, which is counter to the entire premise of allowing the entities to define their own BES Cyber Systems. Allowing the entities to define their own BES Cyber Systems would limit the scope of an attack, which the SDT stated in the CIP V4 Workshop as their goal in R21. Constellation suggests removing this requirement entirely. Likewise, R22 should be removed as it is completely redundant. Note that in each sub requirement it merely points to another requirement in the document. A suggestion would be to implement the verbiage found in Table R22 to each of the requirements it points to.
37.26	Alberta Electric System Operator	Disagree	In Table R21, was the intent of 21.1 only for Control Centers? The AESO would suggest removing the Control Center parameter and make 21.1 applicable to all High and Medium BES Cyber Systems.
37.27	Constellation Energy Commodities Group Inc.	Disagree	Is the intent to require use of hardware firewalls? If so, is it possible to state that clearly? If not, what is the intent?
37.28	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).

#	Organization	Yes or No	Question 37 Comment
37.29	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's observations below:Suggest using electronic security perimeter rather than “Boundary Protection.”Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than “System Boundary Protection.”Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for “Protective Cyber Systems” to include remote access controls, patch management, security event alerting, change control and change management.
37.30	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R20, but recommends changes as follows: o Regarding Part 20.2, since Low Impact BES Cyber

#	Organization	Yes or No	Question 37 Comment
			Systems do not require any Physical Security as defined in previous requirements, it seems inconsistent to require electronic access point security for those systems. o Regarding Part 20.4, how does the Standards Drafting Team envision that a Registered Entity would log "actual unauthorized access?" Actual unauthorized access is not identifiable since it would appear to have been authorized (or the attempt would not have succeeded. o Regarding Part 20.4, in reading and applying the definitions of "remote access" and "external connectivity," remote access is a specific type of external connectivity. Therefore, any reference to criteria for remote access based on whether or not it is externally connected is redundant. o Is it the Standards Drafting Teams intent that Part 20.5 require an after the fact review of unauthorized access attempts? If so, it may not be possible to adhere to proposed timeframes, especially in instances where BES Cyber System support is 8 hours a day, 5 days a week. If it is the Standards Drafting Teams intent that Part 20.5 address responding and monitoring a potential malicious attack situation, then the time frames are not sufficient.Minnesota Power generally agrees with the proposed Requirements R22, but recommends changes as follows: o The language in Part 22.1 creates confusion. The requirement states that remote access is to be restricted as stated in R14 and that for Low Impact BES Cyber Systems this is required. However, in reviewing Requirement R14, only Part 14.1 is required for Low Impact BES Cyber Systems. As a result, does this mean that only Part 14.1 needs to be implemented for Low Impact Cyber Systems in 22.1 or do 14.1-14.4 need to be implemented? The same should be addressed for Medium Impact BES Cyber Systems. o The same type of confusion regarding the language in Part 22.1 exists in Parts 22.2, 22.3, and 22.4. The Standards Drafting Team should consider whether these cross-references are necessary. It does not appear that Parts 22.1-22.4 are identifying specific criteria, but rather are a reminder that these assets need to comply with R14, R16, R18, and R23.
37.31	NextEra Energy Corporate Compliance	Disagree	NextEra believes requirement 20.1 is unclear as written. Is the communication path expected to end at each and every end point that receives digital information to each BES Cyber System? If this communication path is to each end point, it would be difficult to demonstrate compliance. Does compliance to this requirement also

#	Organization	Yes or No	Question 37 Comment
			require all the communications paths within a WAN or ISP?Requirement 20.2 does not allow a responsible entity to put more than one BES Cyber System inside an access point since it requires access points between systems. This is highly inefficient and creates access points where not needed and could potentially impact the reliability a BES Cyber System. It is unclear why the requirements are moving away from the well established ESP concept. This concept is well established in 'defense in depth' and other security frame works. The requirements for boundary protection should follow the ESP model from V1 and V2 of the NERC CIP requirements. In addition the definition also (inadvertently) conflicts with the definition given at the start of this requirement related to access points and therefore is open to interpretation by auditors.Requirement 20.4 requires the documentation and implementation of one or more "processes for logging of all authorized remote access and all attempts at or actual unauthorized access at each electronic access point." Until the definition of remote access is clearly defined, it is unclear how responsible entities must comply and demonstrate compliance. In addition, it is unclear if remote access is considered any an access attempt from outside of the access point.Requirement 20.5 requires, "Document and implement one or more processes for alerting and review of alerts by designated response personnel on all unauthorized access attempts at each electronic access point within the following time period." The responsible entity should be able to determine the threshold for unauthorized access attempts. The way the requirement is written now, personnel would have to investigate every single denied access attempt including someone who accidentally fat fingered their credentials when trying to gain authorized access to a BES Cyber System component. The recommended approach would be to require a review of 4 or more failed attempts against a common UserID without a successful login within 1 hour. Also consider more than X total bad access attempts within one hour for User ID brute force attacks or reconnaissance. Also, in 20.1, please define what is meant by the word "paths" Is it logical or is it physical path?In 20.4, is a single failed login classified as an attempt? The wording states "all attempts at or actual unauthorized access at each electronic access point"In 21.1, does this mean that for example, a SAN

#	Organization	Yes or No	Question 37 Comment
			(Storage Area Network) can be shared by Cyber System Component and other devices as long as there is logical separation?In 21.1, if two BES Cyber Systems "share" a network switch, does this meet the requirement of "logical separation"?
37.32	PacifiCorp	Disagree	PacifiCorp agrees with EEI's observations below:Suggest using electronic security perimeter rather than “Boundary Protection.”Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than “System Boundary Protection.”Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for “Protective Cyber Systems” to include remote access controls, patch management, security event

#	Organization	Yes or No	Question 37 Comment
			alerting, change control and change management.
37.33	Puget Sound Energy	Disagree	Puget Sound Energy has the following comments:R21.1 - Puget Sound Energy has concerns that Cyber System Components that are shared between BES Cyber Systems must provide logical separation. For example: For entities with Control Centers that utilize a Microsoft infrastructure, multiple BES Cyber Systems may centrally authenticate (or have logical security controls) facilitated by a single or clustered Microsoft Active Directory domain controller. As the requirement is currently written, Puget Sound Energy feels that those shared domain controllers would not be able to reside on the same local area network segment as the domain they participate in. Puget Sound Energy requests clarity be added in to this requirement.Table 22 - Puget Sound Energy suggests including "Where Technically Feasible" to R22, as some Protective Cyber Systems may be incapable of meeting all the requirements in Table 22.Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, Table 14, and Table 22. Puget Sound Energy suggests including wording similar to Table 11: "Required for external connectivity only".
37.34	LCEC	Disagree	R20 - 20.1 Must define what is included in communication paths. If needed specify physical interface. Digital information is actually digital data, control, or signals.20.3 is not auditable. What is access control. There is no defined scope.20.5 includes requirements for cyber incident response which is covered in a later requirement.Need to clearly identify what is considered an access point on multiple interface devices.20.6 what's the difference between this and 18.4?21.2 A BES Cyber System could include components at different physical locations that communicate with each other. This is not technically external to the system so does it apply here?
37.35	FirstEnergy Corporation	Disagree	R20 - 20.6 - Need greater clarity around whether automated alarming can be used rather than manual review of logs. This sub requirement is unnecessary with an automated system in place.R21 - We agree with the use of 'logical separation' in this requirementR22 - We do not like the way R22 refers back to other requirements. This

#	Organization	Yes or No	Question 37 Comment
			is redundant and the requirement should be eliminated.
37.36	Consultant	Disagree	R20 - The terminology appears to be incorrect. Electronic access points do not define an electronic security perimeter. It also seems odd to say the defined term Electronic Security Perimeter is going to be retired, and then use that same term to define a requirement. "Electronic Boundary Protection" is created by identifying an electronic security perimeter based on the logical network connections of cyber assets, which includes electronic access points for External Connectivity that provides Remote Access to the assets within the electronic security perimeter. Suggest retaining the term Electronic Security Perimeter as described here.Table R20 - Items 20.1 & 20.2 - This appears to be "Identifying the Electronic Security Perimeter" as describe in the comment above regarding the usage of the term Electronic Security Perimeter, but stated in more confusing language in both cases.Item 20.3 Suggest rewording as "Implement and document access control mechanisms for each electronic access point (to the Electronic Security Perimeter)."As a general comment you would "implement and document" rather than "document and implement"Item 20.4 Suggest rewording as "Implement and document access attempts and access authorizations at each access point." Item 20.4 - The terminology "Required for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest changing to "Required"Item 20.5 contains two requirements:1. Implement and document processes to identify unauthorized access attempts at each electronic access point.2. Responsible entities shall review unauthorized access attempts in the time frame specified.Item 20.4 - The terminology "Required for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest changing to "48 hours" & "12 hours".Item 20.4 - It would appear to create an excessive administrative burden without corresponding decrease in risk to require this review every 12 hours for High Impact Assets. Suggest changing required review time to "Daily".Item 20.6 - The requirement statement is subjective in regard to the degree of sampling, sorting, and filtering allowed, expected, or required. This is a requirement similar to event log review of Table R18 - Item 18.4 and the wording of these two requirements should be similar.Item 20.6 -

#	Organization	Yes or No	Question 37 Comment
			This requirement is regarding access through electronic access points and "7 calendar days for external connectivity only" is redundant. Suggest deleting "for external connectivity only"Item 20.6 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 20.4 and 20.5 (as commented) require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Items 20.1, 20.4, & 20.5 - Delete the word "all" It is redundant and unnecessary to the requirement statement. (The word "all" should be removed from "all" requirement statements in the standard")Table R21 - Item 21.1 This requirement appears to create a mutually exclusive situation where shared cyber system components are separated. The wording needs to be clarified or, as it is worded it should be deleted.Item 21.1 The application of the requirement to control centers creates an added dimension to the impact categorization. The application of requirements is based on impact categorization. Modify the impact categorization criteria to capture the assets where this requirement should be applied.Item 21.2 This item appears to restate what is previously stated in the referenced R20. If some additional requirement is intended, then that requirement should be included in the reference R20 requirements list, rather than a 'hidden' requirement that is cross-referenced here.R22 - This requirement appears to be redundant. The requirements referenced in the Table R22 (R14, R126, R18, & R23) appear to include whatever is listed in this requirement. If there is some additional requirement that is intended, that requirement should be put in the respective referenced requirements. Each requirement statement and table should be contain everything related to that requirement, rather than having a separate requirement that 'adds' to other requirements.
37.37	Xcel Energy	Disagree	R20.1 - The definition and level of detail for “communication paths” is needed. For example, does this include a commercial telephone carrier used to communicate between relays?R20.2 - Clarifying language is needed for “Establish an electronic

#	Organization	Yes or No	Question 37 Comment
			access point". Does this mean in documents, drawings, etc?R20.5 - This requirement needs clarification. Are these intended to be automatically generated alerts, such as logs? The current language could be interpreted to require a 12 hour review of a login attempted that failed due to an incorrectly typed login ID, as automated software may interpret this as an authorized login attempt. Also, 12/48 hours to complete a review of a failed unauthorized login attempt is unreasonable and unnecessary. R21.1 - We would like additional information on what type of "logical separation" is expected.
37.38	Ameren	Disagree	R20.1 - This will require use of a firewall at all locations or similar devices. Simply documenting this information is not practical for non routable devices. Also, clarify if communication paths, refer to physical equipment or locical paths. R20.2 - What is the difference between R20.2 and R20.3? Suggest combining the two requirements.R20.5 - 12 hours does not allow for weekends or for events that occur outside business hours. This should be increased to 24 hours or lowered to 24x7 (continuous). Also, need to clarify whether the alerts need to be reviewed during the time frame given (48 hours, 12 hours, or 7 days) or that alerts need to be sent every 48 hours, 12 hours, or 7 days. Please clarify how often should alerts be sent and how often do they need to be reviewed. R21.2 - Where does an RTU or serial communication fit into this requirement? Need to add more clarification on this requirement of what devices are included. R22 - Need to add requirements at a minimum for account listings, approvals, and access controls. There are no considerations for risk assessment or training for users of these devices. Also, these devices should be included in the Vulnerability Assessment.
37.39	US Bureau of Reclamation	Disagree	R20.2 should be modified to read "Establish an electronic access point on each routable protocol or dialup communication path between BES Cyber Systems." Define the use of "other devices" in this context. R20.4 - add "where feasible" to this requirement.R21.2 - Please provide and example...

#	Organization	Yes or No	Question 37 Comment
37.40	Entergy	Disagree	R20.5 Entergy cannot understand the reasoning behind the criteria of 12 hours? Why not 6 or why not 24?R21.1 is unclear and must be reworded to better reflect exactly what the SDT had in mind. We cannot guess at what that might have been.R22 - Entergy suggests R22 apply equally for high, medium and low assets; and thatthe requirements for processes and procedures in this section should be placed back into each of the respective sections (R14, 16, R18 and R23).
37.41	Western Area Power Administration	Disagree	R20.6 - Is this a requirement to review, and document the review, of logs weekly?R21.2 - Unclear. Does it mean our "one-way" rule from internal to external? Or does it mean use a proxy located outside the ESP?
37.42	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R20.6. With the obligation of reviewing alerts designated in R20.5 the requirement for manual review of logs should be extended to a 30 day window.
37.43	BCTC	Disagree	R22. Suggest just removing this requirement as it just references previous requirements
37.44	Hydro One	Disagree	Request clarification on “all communication paths” in 20.1 which can be every possible communication path between two end points.Recommend removing R21 because: o 21.1 is prescriptive in requiring Entity’s to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move its table into the respective Requirements: o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23
37.45	ISO New England Inc	Disagree	Request clarification on “all communication paths” in 20.1 which can be every possible communications between two end points20.3 should be part of 20.2 - denys and explicit allows might be better language. R20.5 Please define what is an unauthorized access attempt. A user may be authorized but may try to connect using telnet where telnet is disabled. Is this considered unauthorized? Recommend

#	Organization	Yes or No	Question 37 Comment
			removing R21 because: o 21.1 is prescriptive in requiring Entity's to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move it's table into the respective Requirements o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23R21.1 = question on what is "logical separation" very vague
37.46	Northeast Power Coordinating Council	Disagree	Request clarification on "all communication paths" in 20.1 which can be every possible communication path between two end points.Recommend removing R21 because: o 21.1 is prescriptive in requiring Entity's to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move its table into the respective Requirements: o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23
37.47	Oncor Electric Delivery LLC	Disagree	Requirement 20.4, 20.5 and 20.6 are not applicable to some legacy cyber systems. These requirements should only be required for systems which utilize routable communication.Requirement 22 references other requirements and should be eliminated because it is redundant.
37.48	Garland Power and Light	Disagree	Requirement 20.6 - What we really feel is that this is impractical and should be deleted. However, it was stated at the NERC CIP workshop that the intent was to verify that the automated system capturing various logs off cyber devices was actually capturing each log - intent needs to be added to the requirement or wording changed to better express the intent at a minimum. Requirement 22 - Keep life simple - add the words "and Protective Cyber Systems" after the words BES cyber systems in each of the referenced requirements (14, 16, 18, and 23) and DELETE Requirement 22 - that way, everything is covered by the referenced requirements that this R22 uses
37.49	San Diego Gas and Electric Co.	Disagree	SDG&E feels that R20.1 is not clear. What is the point of documenting paths that transmit or receive digital information external to each BES Cyber System if they may not interface with other BES Cyber Systems? In addition, another observation from SDG&E related to R20.1 has to do with non-routable protocols. If this requirement

#	Organization	Yes or No	Question 37 Comment
			includes the documentation of non-routable protocols, it can become VERY expensive to document "chatty" protocols that broadcast to lots of assets (DHCP and BOOTP, to name just two examples).In R20.2, SDG&E asks for a clarification of the term "explicitly".SDG&E recommends grammatical changes for R20.4. We feel it should read "Document and implement one or more processes for logging all authorized remote access sessions and all successful and unsuccessful attempts of unauthorized access at each access point within the following time period. SDG&E suggests the following changes to R20.5: "Document and implement one or more alert processes that includes review of alerts by designated response personnel..." SDG&E feels that R21.1 is a bit confusing and worthy of discussion. If affected cyber systems and components are on the same network anyway, then what are the benefits of logical separation?
37.50	Allegheny Energy Supply	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection." (In general, using the existing terms where possible will cause much less confusion.)
37.51	Allegheny Power	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection."
37.52	EEI	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection."Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for

#	Organization	Yes or No	Question 37 Comment
			manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than "System Boundary Protection."Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for "Protective Cyber Systems" to include remote access controls, patch management, security event alerting, change control and change management.
37.53	Progress Energy (non-Nuclear)	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection." Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.Is the relay communications port for local interface with a laptop considered as an electronic access point? If so, this complicates these requirements.R20.1 by external to each BES system do you mean outside individual six walled boundaries?R20.6 is not needed, as long as we do R20.5.For 20.5 - Don't see the need for more than one capability.For 20.6 - change to "document process to ensure automatic monitoring and alerting process is working properly"CIP-011 - R20 - Are communications between Control centers and field RTUs/IEDs which do not employ routable protocols considered remote external communications?R20.6 - Need additional guidance as to what constitutes a manual review and the minimum sampling required.CIP-011 - R21 - Need clarification with guidance as to what constitutes "Cyber systems components in control Centers that are shared between BES Cyber Systems"

#	Organization	Yes or No	Question 37 Comment
37.54	Detroit Edison	Disagree	Table entries 20.4, 20.5, and 20.6 specify external connectivity only. This text is not necessary since the requirement is boundary protection and that implies external connectivity is the scope.
37.55	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments on this question, but also provides the following drafting suggestions:R20. Objective:To define an electronic security perimeter thereby minimizing the risk of system intrusion.R20. Requirement:Each Responsible Entity shall document and implement processes that establish electronic access controls point that incorporate the criteria in CIP-011-1 Table R20 - Electronic Boundary Protection. In R20 Table 20.2 we are concerned about the term “explicitly authorized communication.” It is our assumption that a password is sufficient to comply with this requirement. If the drafting team intended another meaning we believe this will not be reasonable and we could not support this definition. We propose the following revised language:Table 20.2: Establish electronic access control on each routable protocol or dialup communications path between BES Cyber Systems and other devices.We recommend that R20 Table 20.4 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. We recommend that R20 Table 20.5 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. We recommend that R20 Table 20.6 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. R21. Objective:To protect each BES Cyber System from other cyber systems by establishing protected boundaries between each cyber system and any shared components. R21. Requirement:Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R21 - System Boundary Protection. The APPA Task Force supports the MRO-NSRS proposal to delete criteria in R21 Table 21.2. This is a redundant requirement and would put an entity in noncompliance of 2 requirements for one violation. The APPA Task Force recommends removal of R22. All of the criteria in Table 22.1 - 22.4 refer to previous requirements and will put an entity in noncompliance of 2 requirements for one violation.

#	Organization	Yes or No	Question 37 Comment
37.56	Bonneville Power Administration	Disagree	The objectives of these requirements ("to define an electronic security perimeter thereby minimizing the risk of system intrusion," "to protect each BES Cyber System from other cyber systems by establishing protected boundaries between each cyber system and any shared components," and "to protect each cyber system that establishes physical or electronic boundaries of BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirements rather than appearing at the end of the requirements (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R20Section 20.1 This is unacceptable. The requirement does not limit the extent of the documentation. Conceivably, it could require documentation of the entire Internet, if the BES Cyber Asset had direct or even indirect access to the Internet. The requirement needs to be limited. Recommendation: Remove the requirement. It is difficult to see how to write it in a way that encompasses all possibilities without leading to results such as the one described above. Instead, document external interfaces as part of the configuration management process.20.2: Requiring an electronic access point between a BES Cyber System and any other system produces unacceptable complication, latency, and administrative burden for a facility with multiple BES Cyber Assets in close proximity. As an example: 20.2 would require that all traffic from one BES Cyber System within a Control Center to any other system within the Control Center to go through a firewall or some other access control device. It is unlikely that this was the intent of the entry. Recommendation: Replace "Required" with "Required for external connectivity only", using the redefinition of external connectivity described above.20.3 Similar issue to 20.2 Recommendation: Replace "Required" with "Required for external connectivity only" throughout the table.20.4 - 20.6. Remove, the are already covered under 18.3 and 18.4. R18 and Table R18 require monitoring of all cyber security events, whether at access points or at BES Cyber Systems themselves.20.6. First, the requirement is already covered more clearly in Table R18. Second, it is unclear why a Electronic Boundary Protection requirement should be addressing BES Cyber Systems. Third, The intent is unclear,

#	Organization	Yes or No	Question 37 Comment
			due to the plethora of "ors" in the requirement. It could be that a manual review is always required, using sampled, sorted or filtered logs. It could also be that a manual view of logs is required, using sorted or filtered logs. It could also be that either a manual review or {sorted or filtered logs} is required. Part of the confusion is that filtering is clearly a method to sample, and sorting may be, as well. It would probably be better not to use those terms at all. In addition, there should be a provision to allow automated review of log entries. Recommendation: Delete the entry.Table R21Section 21.1 is completely unacceptable. It is quite possible in a Control Center for a single Dispatch workstation to provid access to several BES Cyber Systems. The requirement in 21.1 would make this impossible. The alternate would be to provide a separate workstation for each such system, which is unacceptable.Section 21.2 is acceptable only with externally connected redefined as described above.R22 and Table R22: These are references to other requirements. It seems that rather than referring to the other standards from this one, it would be cleaner to simply include this requirement as part of those other standards. That is, put the necessary references in R14, R16, R18 and R23.
37.57	Constellation Energy Control and Dispatch, LLC	Disagree	The timeframe in 20.5 for medium and high should be the same.
37.58	ReliabilityFirst Staff	Disagree	To eliminate confusion, we believe the drafting team should develop a definition for “protective cyber system”. We also believe that Table R22 should include an additional requirement stating, “Implement processes as specified in Requirement R15 - System Security.” and make this new requirement TFE eligible. Further, this new requirement should be “Required” for medium and High Impact BES Cyber Systems.
37.59	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
37.60	American Transmission	Disagree	We believe item 20.2 is going to set the stage for numerous TFE’s within the industry. Many devices (i.e., protective relays) do not support explicitly authorized

#	Organization	Yes or No	Question 37 Comment
	Company		communication.We believe items 20.4 - 20.6 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. These items do not appear to be applicable for non-routable connections, and adding this language would assure they are limited to routable and dialup connections only.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.61	MRO's NERC Standards Review Subcommittee	Disagree	We believe item 20.2 is going to set the stage for numerous TFE’s within the industry. Many devices (i.e., protective relays) do not support explicitly authorized communication.We believe item 20.4 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only.We believe item 20.5 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only.We believe the following should be added to the end of item 20.6: “at each electronic access point established in Part 20.2”. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only. It also makes for a consistent approach with item 20.3.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs

#	Organization	Yes or No	Question 37 Comment
			non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.62	The Empire District Electric Company	Disagree	We believe item 20.2 is going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicitly authorized communication.We believe items 20.4 - 20.6 should specify "at each electronic access point established in Part 20.2", similar to item 20.3. These items do not appear to be applicable for non-routable connections, and adding this language would assure they are limited to routable and dialup connections only.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.63	We Energies	Disagree	We Energies agrees with EEI: Suggest using electronic security perimeter rather than "Boundary Protection."We Energies agrees with EEI: Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.We Energies agrees with EEI: There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.We Energies agrees with EEI: Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: We Energies agrees with EEI: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.We Energies agrees with EEI: For R 20.5: Document and

#	Organization	Yes or No	Question 37 Comment
			implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.We Energies agrees with EEI: For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. We Energies agrees with EEI: Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.We Energies agrees with EEI: R21: Suggest using electronic security perimeter rather than "System Boundary Protection."We Energies agrees with EEI: Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. We Energies agrees with EEI: R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.We Energies agrees with EEI: Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.We Energies agrees with EEI: There may need to be additional requirements for "Protective Cyber Systems" to include remote access controls, patch management, security event alerting, change control and change management.
37.64	GTC & GSOC	Disagree	We recommend rewording R21.1 to provide clear direction on what is expected to comply with this requirement because the wording is ambiguous. We are unable to suggest alternative language because we are not certain of the intent. If this requirement would prevent, for example, the use of a shared backup system for two Cyber Systems we do not see the reliability based justification for the requirement and would recommend its elimination.
37.65	Emerson Process Management	Disagree	What is the difference between "Electronic Access" in R20-R22 and the "Remote and Wireless Electronic Access" in R11-R13?

#	Organization	Yes or No	Question 37 Comment
37.66	Manitoba Hydro	Disagree	What is the meaning of "dial-up"? The wording for Requirement R20.2 is unclear. The suggested wording for Requirement 20.2 is "Establish an electronic access point that denies access by default and allows explicitly authorized communications on each routable protocol or dial-up communication path between BES Cyber Systems and other devices. Requirement R20.2 is inconsistent with Requirement R20.3. It is unclear how explicitly authorized communication is allowed without the implementation of access controls for Low Impact BES Cyber Systems. Requirement R20 does not contain any requirement for response to alerts. The wording for Requirement 21.1 is unclear. The suggested wording for Requirement 21.1 is "Cyber System Components that are shared between BES Cyber Systems must provide logical separation that prevents access between each system." and change the wording in the impact columns to "Control Centre Only". The wording for Requirement R21.2 is unclear. The suggested wording for Requirement R21.2 is "All external communication to the BES Cyber System must occur through an electronic access point as specified in Requirement R20." Requirement R22 is missing the requirement for the physical protection of the cyber system that establishes the physical or electronic boundaries of the BES Cyber System. There are no specifics given with respect to 'logical' separation in Requirement R21.1 so it is assumed to be at the Responsible Entity's discretion to determine.

38. Do you agree with the proposed definition of electronic access point? Please explain and provide any suggestions for modification.

Summary Consideration:

Many commenters agreed with the definition of Electronic Access Point, but other commenters requested clarifications in the definition. A number of commenters recommended changes to language concerning systems sharing an electronic access point. Some commenters suggested removing the sharing of electronic access points from the definition.

In response, the SDT has modified the definition of an **Electronic Access Point** to: *"An interface on a Cyber Asset that restricts routable or dial-up data communications between Cyber Assets"*.

The sharing of electronic access points is likely not an issue because High Impact BES Cyber Systems are Control Centers and would rarely share an Electronic Access Point with Medium Impact BES Cyber Systems.

#	Organization	Yes or No	Question 38 Comment
38.1	WECC		Move to definition to beginning of the standard; dislike the definition box in the middle of a requirement. Make clear that access points can be anything that meets the definition and not only firewalls or devices specifically created for this purpose that must be put "in line". Ie. an Access Point can be the actual device itself providing access control.The phrase "where electronic access can be controlled" will prove difficult to audit. Inherently it allows an exception. All communication paths should be in scope regardless of the ability to control electronic access. It is not foreseen that communication paths could not be controlled.
38.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
38.3	NextEra Energy Corporate Compliance	Agree	Is a serial connection to a BES Cyber System considered an electronic access point? Please clarify in requirements.
38.4	Minnesota Power	Agree	Minnesota Power agrees with the proposed definition of electronic access point, but recommends replacing "All cyber systems sharing..." with "All BES Cyber Systems

#	Organization	Yes or No	Question 38 Comment
			sharing..."
38.5	Duke Energy	Agree	The second sentence is a requirement, not part of a definition; consider moving. Specify that "All cyber systems" only applies to BES Cyber Systems. This definition, particularly the concept of "sharing one or more common electronic access points or components" is much more practical in a power plant environment. See previous comments on R11, R12, R13.
38.6	Public Service Enterprise Group companies	Agree	There is general agreement, but need for clarification in the language in one regard. Please clarify whether this requirement would necessitate classifying a Distribution cyber system at a High Impact level if both the Distribution cyber system a High Impact BES cyber system at substation are interconnected using a single router/firewall device to a communications provider. I.e., effectively an additional router/firewall would be required in this situation to not entail classification of the Distribution cyber system at a High Impact level.
38.7	Consultant	Disagree	According to this definition electronic access point where electronic access cannot be controlled for communication paths that transmit and/or receive digital information would not be considered an access point?An access point should defined as locations where information crosses the established protection boundary, or as the locations where external connectivity or remote access occurs. An access point is not dependent on the ability to control the communication path. The sentence "All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s)." is a requirement. It is not a definition nor part of a definition. The concept is sensible, but still not a definition. Suggest moving this to the requirements table.Suggest modifying this definition to be consistent with "External Connectivity" and "Remote Access" definitions.

#	Organization	Yes or No	Question 38 Comment
38.8	Northeast Utilities	Disagree	Agree in principle with the definition but disagree that all cyber assets sharing the access point will be treated at the highest BES Cyber System impact categorization. This will have a big impact on development and test systems as well as other related but not critical systems. How will this impact DMZ systems which by design are not trusted?
38.9	Alliant Energy	Disagree	Alliant Energy agrees with EEI in that it is appropriate to apply protective measures to the literal ingress points (interfaces) on the electronic access points, but not the requirement to apply protective measures to all of the components that connect to said ingress interfaces (to require this creates a house of mirrors.)
38.10	E.ON U.S.	Disagree	CIP-011, R20.1 See previous comments regarding the definition of “external”.CIP-011, R20.1 “Document all communication paths that transmit and/or receive digital information external to each BES Cyber System.” Does this include the WAN if the defined BES Cyber System is inclusive of multiple sites/locations? All equipment and communication paths such as a Sonet ring?CIP-011, R20.3 The term “access control” should be further clarified. Does implementation of firewall rules alone limiting access as defined in R20.2 meet this requirement, or does this require further mechanisms to provide “access control” on an individual user-basis?CIP-011, R20.4, R20.5, R20.6 See previous comments regarding the definition of “external.”CIP-011, R21.1 How might the logical separation called for here be implemented?CIP-011, R21.2 See previous comments regarding the definition of “external.”
38.11	Progress Energy (non-Nuclear)	Disagree	Communication paths may be better defined by including routable protocol and/or ‘external to the BES Cyber System’.Assuming this is the same as external access point it does seem somewhat repetitious.
38.12	American Electric Power	Disagree	Electronic access point for the purpose of this standard is defined as a point where electronic access can be controlled for communication paths that transmit and receive; or only receive digital information. All cyber systems sharing one or more

#	Organization	Yes or No	Question 38 Comment
			common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).Rational: An electronic access point that provides a transmit and receive path or a receive only path to a BES Cyber System provides an access path into the system to be used for possible exploit. By limiting traffic to transmit only communications the risk to the protected BES Cyber System is reduced since an electronic access point is not provided.
38.13	Entergy	Disagree	Entergy suggests adding specific language to the definition that includes “uses routable protocol or is dial-up accessible”
38.14	APPA Task Force	Disagree	In the APPA Task Force comments for Question 37 we proposed changing electronic access point to electronic access control. We do not feel it is necessary to define an electronic access point. We do believe it is necessary for entities to have control of their boundaries. We have proposed using electronic access control in R10, Account Access Control Specifications, in the place of the term Password since we feel there are other methods of controlling access that are equivalent or superior to password protection. We recommend the drafting team use electronic access control rather than defining another High Impact BES Cyber System outside of CIP-010-1.
38.15	Dairyland Power Cooperative	Disagree	In trying to be general, it adds more question as to the intent. Is an access point one a device physically connecting multiple communications paths? What about a terminal server? Is an authentication server or policy managing server an access control point even if it is not in-line with the path?
38.16	Constellation Energy Commodities Group Inc.	Disagree	Is the intent to require use of hardware firewalls? If so, is it possible to state that clearly? If not, what is the intent?
38.17	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's suggestion below:Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact

#	Organization	Yes or No	Question 38 Comment
			categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement fails to recognize that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.18	LCEC	Disagree	Need to clarify the specific access point from an interface perspective. What is meant by the term controlling access? Is this from a network protocol perspective? Is a radio link that extends serial communications considered to be an access point?
38.19	Progress Energy - Nuclear Generation	Disagree	Not all EAPs constitute the highest degree of risk especially is nuclear facilities which are highly secure.
38.20	PacifiCorp	Disagree	PacifiCorp agrees with EEI's suggestion below:Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement fails to recognize that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.Further, PacifiCorp believes the proposed definition is too broad. The preference would be to and should be restricted it to communications supporting routable protocols and or dial-up communication. In 20.2 the standard refers to the use of an access point on routable protocol and or dial-up paths but the definition is currently proposed to be broader. In plant control systems, we have many devices which use an IP routable protocol and an industrial communication control protocol such as fieldbus or profibus in the same device. The new definition would require each of these devices to be defined as an access point.
38.21	American Municipal Power	Disagree	Please provide a little or no impact category

#	Organization	Yes or No	Question 38 Comment
38.22	FirstEnergy Corporation	Disagree	Please provide clarification and examples on definition. Propose changing the second sentence to “All BES cyber systems sharing one or more common electronic access points or components will be logically separated such that each logical system is treated at its own categorization level or, where not separated, electronic access points will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).”
38.23	Dominion Resources Services, Inc.	Disagree	Please see Dominion’s response to Question 13. The interface between systems contained wholly within an access controlled facility should not constitute an electronic access point or be subjected to the Boundary requirements.
38.24	Southern Company	Disagree	R20.5 Is a single or double access attempt on a single access point required to be reviewed?
38.25	San Diego Gas and Electric Co.	Disagree	SDG&E has concerns about the last half of the proposed definition for electronic access points. If two medium or one medium and one low BES Cyber System share an access point, this definition makes the shared access point High impact? Regardless of other controls that may be in place? We feel that this definition is not reasonable.SDG&E suggests the definition of electronic access points should include the words "...between networks." Otherwise, every device on the network becomes an access point.
38.26	BGE	Disagree	Should include wording to clearly define the communication paths that transmit and or receive digital information to a BES Cyber System.
38.27	Allegheny Energy Supply	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security

#	Organization	Yes or No	Question 38 Comment
			requirements.
38.28	Allegheny Power	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.29	EEI	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.30	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The concept of sharing access points must be better defined. Does connectivity to an outside entity at a firewall constitute a shared access point?
38.31	Luminant	Disagree	The definition of access points infers that cyber systems and BES Cyber Systems can share an access point but 20.2 states that BES Cyber systems must be seperated from other devices. re. Cyber systems protected by same firewall but in different zone
38.32	US Bureau of Reclamation	Disagree	The definition proposed is that "ALL cyber system sharing one or more common electronic access point or components..." Components can mean many things and almost all devices share components which have not impact on the BES. It would be better to indicate that "ALL BES cyber systems sharing one or more common

#	Organization	Yes or No	Question 38 Comment
			electronic access point or BES CYBER SYSTEM components...."
38.33	Constellation Energy Control and Dispatch, LLC	Disagree	The definition should clearly establish that the access point is a place where digital information is transmitted or received.
38.34	US Army Corps of Engineers	Disagree	The definition states that an electronic access point is a point where electronic access can be controlled for communication paths that transmit and/or receive digital information. What does "controlled" mean? Would network switches fall under this definition because network switch ports can be electronically controlled with port security?Suggest definition be changed to: An electronic access point is an electronic security point where traffic flowing from different security areas are restricted, controlled, and monitored from entering or leaving a particular security area. This may be restricting traffic from a lower security area (devices external to the BES Cyber System) from entering a higher security area (BES Cyber System.) It may also be restricting sensitive traffic from leaving a higher security area to a lower security area.
38.35	Bonneville Power Administration	Disagree	The first sentence, "Electronic access point for...digital information.", is acceptable, but only because it says what an electronic access point is, not where one has to be located. Second sentence is completely unacceptable, more so than anything else in the standard, for numerous reasons:First, it leads to the equivalent of CIP-007's including every network device within the Electronic Security Perimeter. In retrospect, that inclusion caused additional workload and costs which far exceeded the gain in security. To repeat that error would be totally unacceptable. The requirement should apply only to BES Cyber Systems, and not all cyber systems.Second, it ignores the level of threat posed by the various systems. Just because a cyber system or even a BES Cyber System is behind the same access point as a High impact BES Cyber System does not mean that poses the same risk to the BES, or even any risk at all.Third, it ignores the possibility of nested access point. For instance, consider systems A and B residing within a highly protected network and sharing a single access point. Add system C residing with a less protected network with an access point to the internet. If A and B access the internet through the same

#	Organization	Yes or No	Question 38 Comment
			access point that C uses, then C has to be treated as stringently as the highest impact of A or B.Fourth, applying impact levels based on the highest level of the BES Cyber System is a problematic issue that has been discussed at length. The mere fact that a cyber component exists within a High Impact BES cyber system does not make that specific component a high impact component. There are levels of impact that should be applied within and to the Cyber System. Devices or equipment (Components) within a High impact BES cyber system, may actually have little or no impact on that cyber system regardless of what happens to them. The standard that applies to that device should not necessarily be tied to the Impact rating for the whole BES cyber system.Finally, the second sentence is a statement of a requirement, not a definition. To use an example, assume a Control Center that relies on nested networks, with the outermost controlling external access, and further firewalls controlling access to their nested layers. The outermost firewall would be a common access point, shared by all systems within the Control Center. In that case, all the cyber systems would have to be treated as BES Cyber Systems at the highest impact level of any BES Cyber Systems in the Control Center. Such a treatment ignores the threat a system might or might not pose to the BES. To provide a somewhat absurd but demonstrative limiting case, a minimally functional print server residing in the outermost layer, barely able to accept an IP address, and having no connectivity except Ethernet on one side and a printer interface on the other, would have to be treated the same as an AGC system within the innermost layer controlling thousands of megawatts of generation at sites scattered across multiple states.Recommendation: Delete the second sentence.
38.36	Southern California Edison Company	Disagree	The requirement does not adequately address the technical nuances of virtualization. The central point of virtualization capability can be interpreted as the “shared” access point. At the same time, the centrally located virtualization device may also be interpreted as a BES critical cyber system. In the first case, the controls for the virtualization system will be those afforded to an access point, which may be less stringent than those afforded to a BES critical cyber system. In the second case, where the virtualization device is a BES critical system, on the user end, end user computing devices such as mobile laptops can potentially be considered as BES cyber system

#	Organization	Yes or No	Question 38 Comment
			component, and on the SCADA end, automation devices would be considered as BES cyber system components. Requirement R21 does not make drawing such distinctions clear of subjective interpretation.
38.37	Oncor Electric Delivery LLC	Disagree	The term “public communication paths” should replace “communication paths”. Systems which are isolated from the internet are less susceptible to cyber attacks.
38.38	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
38.39	Xcel Energy	Disagree	We believe the second sentence places an unnecessary burden on lower impact systems if they are unable to communicate with the higher impact system, as is the case with dial-up based systems.
38.40	We Energies	Disagree	We Energies agrees with EEI Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.41	US Army Corps of Engineers, Omaha Distirc	Disagree	What does "controlled" mean? Definition also appears to contain a requirement "All cyber systems sharing one or more . . " The requirement doesn't appear to be in line with industry practice. A firewall can protect 2 or more networks from external connections and from each other. Both networks do not have to be at the same sensitivity level. suggest definition be changed to:An electronic access point is an electronic security point where traffic flowing from different security areas are restricted, controlled and monitored from entering or leaving a particular security area. This may be restricting traffic from a lower security area (devices external to the BES Cyber System) from entering a higher security area (BES Cyber System.) It may

#	Organization	Yes or No	Question 38 Comment
			also be restricting sensitive traffic from leaving a higher security area to a lower security area.

39. Tables R20 to R22 provide direction concerning what impact level of BES Cyber Systems to which Requirements R20 to R22 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Many commenters disagreed with the proposed BES Cyber System impact levels and made suggestions to clarify them, including suggestions to revise or refine the impact levels based on the particular characteristics of the BES Cyber Systems involved. In response, the SDT has made changes to include an applicability column in each table for each requirement. The applicability column further refines the set of BES Cyber Systems and assets to which each part of the requirement must be applied. For example, the SDT made changes to the applicability column to include the scoping filter of External Routable Connectivity where the use of a routable connection would be required to comply with the requirement, such as the requirement to have Electronic Access Points.

The intent of this approach is to refine the scope of requirements that apply to each type of BES Cyber System or device based on its characteristics. The drafting team recommends that commenters carefully review the proposed applicability column in the table for each requirement in the CIP Version 5 standards.

#	Organization	Yes or No	Question 39 Comment
39.1	US Army Corps of Engineers		The statement in Table R21, 22.1 "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20.", is confusing. What is the standard trying to say here?
39.2	GE Energy	Agree	20.2: Low BES systems should be required to document and implement access controls.
39.3	Black Hills Corporation	Agree	21.1 requires further definition of logical separation requirements in a disaster recovery scenario. As stated, this does not allow for control centers to back-up each other in a fail-over mode for disaster recovery.
39.4	Duke Energy	Agree	Agree if the external connectivity is via a shared electronic access point as discussed in previous comments.Apply all requirements, where currently in place, only for external connectivity. 20.6: Review of logs every 7 days is not practical.21.2: Only

#	Organization	Yes or No	Question 39 Comment
			require for external connectivity
39.5	Progress Energy (non-Nuclear)	Agree	See comment 14.
39.6	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
39.7	GTC & GSOC	Agree	We recommend a slight rewording of R20.2 as follows “Establish an electronic access point that denies access by default and allows explicitly authorized communication on each path where a routable protocol or dialup communication exists between BES Cyber Systems and other devices.”
39.8	E.ON U.S.	Disagree	: E.ON U.S. does not believe there is a need for compliance requirements for low impact systems. High Impact has such a short timeframe for revocation, that it would require employees be available to revoke privileges 24/7. The SDT should adopt a more reasonable time frame- at least 24 hours. E.ON U.S. believes that R22 is merely a repeat of other requirements and therefore should be deleted
39.9	NextEra Energy Corporate Compliance	Disagree	: NextEra believes it is unclear what the timeframes for Medium Impact and High Impact BEST Cyber Systems are supposed to mean. Do response personnel have to review security logs related to external connectivity every 48 hours or are the expectation for designated personnel supposed to respond to an alert within a 48 hour period? The recommendation is to document and establish one or more processes for automated alerting and response to alerts by designated response personnel for unauthorized access attempts at each electronic access point. This requirement would be applicable to both Medium and High Impact BES Cyber Systems. If automated alerting and notification is not technically feasible, Responsible Entities should be able to develop a process to manually review security logs to determine potential cyber security incidents.

#	Organization	Yes or No	Question 39 Comment
39.10	Regulatory Compliance	Disagree	20.1 STRIKE "Required for Low Impact20.5 Propose - 72 hours for Medium Impact Propose - 48 hours for High Impact21.1 - STRIKE "required" for Medium Impact
39.11	BGE	Disagree	20.5 timeframe should be consistent for medium and high.
39.12	Florida Municipal Power Agency	Disagree	22.2 - Add medium, require low to asses quarterly. Consider high impact to review 'critical' patches within 7 days.22.3 - This should be consistent with R18; medium should be required to monitor their systems. Low should review logs at least quarterly for events, or at least have an automated system in place to alert for specific threats.
39.13	ERCOT ISO	Disagree	22.2-22.3: Should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
39.14	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
39.15	The Empire District Electric Company	Disagree	Comments: For items 20.4 - 20.6, we believe "for external connectivity only" should be removed from the impact levels to properly coordinate with the comments on these items made under question 37.
39.16	Progress Energy - Nuclear Generation	Disagree	Durations should align with information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
39.17	EEI	Disagree	EEI recommends deleting R21 because it is vague and the risks are addressed in R20. Introducing boundaries within engineered systems will result in decreased reliability.
39.18	Entergy	Disagree	Entergy suggests making R20.3 and R20.4 apply to low impact assets.

#	Organization	Yes or No	Question 39 Comment
39.19	MRO's NERC Standards Review Subcommittee	Disagree	For items 20.4 - 20.6, we believe “for external connectivity only” should be removed from the impact levels to properly coordinate with the comments on these items made under question 37.
39.20	US Army Corps of Engineers, Omaha Distirc	Disagree	Intent of 22.1 is unclear
39.21	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
39.22	Luminant	Disagree	Low impact BES Cyber Systems should be protected but not have to be seperated from all other cyber systems. re introduces the concept of cyber systems in "ESP". R21 How can cyber systems be shared and not be a BES Cyber System
39.23	LADWP	Disagree	Low impact requirements will become an administration issue.
39.24	Minnesota Power	Disagree	Per the discussion regarding these tables in Question 37, Minnesota Power recommends that for Parts 20.1, 20.2, 21.2 and 22.1 “Required” be removed for Low Impact BES Cyber Systems.
39.25	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation ‘Required for external connectivity only’. In 20.5, aligning the time requirement on 48 hours for clarity and consistency.
39.26	American Municipal Power	Disagree	Please provide a little or no impact category
39.27	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, Table 14, and Table 22. Puget Sound Energy suggests including wording similar to Table 11: “Required for external connectivity only”.
39.28	FirstEnergy Corporation	Disagree	R20 - Timeframes should not be in ‘hours’ (i.e. less than a full day). Tracking by time

#	Organization	Yes or No	Question 39 Comment
			rather than days would not be logistically possible on all systems and compliance could not be maintained.The new requirements now have too many different time frames to meet. Again, not logistically possible on all systems and compliance could not be maintained for larger utilities.R21 - R21.2 - Remove 'Required' for Low Impact Cyber Systems.R22 - Eliminate - see Q37 above.
39.29	Con Edison of New York	Disagree	R20 dialog box; speaks to inheritance of HIGH Impact BES requirements for all cyber systems with shared access points.o Does the inheritance only apply to R20 requirements or does this mean all requirements for these devices would be at the High Impact level?o If all cyber systems regardless of BES use that are within the same boundary require High, this may cause significant manpower or create the need to isolate the true BES systems. The isolation will take significant time to plan and implemento This standard must allow the use of 1 physical firewall, logically separated to isolate networks without inheritance of BES levelR21.1 does this require Cyber Components on the same isolated network be logically separated? Is that correct?o This should not apply to devices on the same network.o Should only be required for high.R20.6 - if automated review and alerting is used this should not be requiredR22 mentions established physical boundaries --- the draft CIP standards do not mention physical boundaries are the PSP requirements defined in this version?
39.30	Southwest Power Pool Regional Entity	Disagree	R20: Distinction between external and non-external connectivity is not appropriate. R22: Patch management should be applicable to all impact categories.
39.31	Hydro One	Disagree	Recommend that 20.4 and 20.5 should be Required instead of specifying "external connectivity" since the criteria limits the scope to remote access. Also recommend removing "within the following time period" from 20.5.Recommend that 20.6 be re-worded to be consistent with FERC Order 706 paragraph 526 - "Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs."Recommend that 20.6 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommended removing R21 in the response to

#	Organization	Yes or No	Question 39 Comment
	Reclamation		and wireless access.
39.37	San Diego Gas and Electric Co.	Disagree	SDG&E feels that too many classifications make compliance more difficult and likely more risky. We would suggest making the time in R20.5 24 hours for both High and Medium impact systems.SDG&E also feels that instead of using the word “impact” for these Requirements, apply a concept of “risk” for inclusion. We would want to identify the risks with associated systems security and protect accordingly.
39.38	LCEC	Disagree	See previous comments
39.39	Bonneville Power Administration	Disagree	See Question 37, above.
39.40	Constellation Energy Control and Dispatch, LLC	Disagree	See response to question number 37.
39.41	ReliabilityFirst Staff	Disagree	Suggest “30 calendar days for external connectivity only” for Medium Impact in row 20.6. Suggest “Required” for Medium Impact in rows 22.2. and 22.3.
39.42	Ameren	Disagree	Suggest removing R21.2 from Low Impact Systems.
39.43	Alberta Electric System Operator	Disagree	Table R20 - For 20.5 set Low Impact to “120 hours for external connectivity only”; for 20.6, set Medium Impact to “30 calendar days for external connectivity only”Table R22 - Consider making 22.1, 22.2, 22.3, 22.4 Required for all Low, Medium, and High Impact BES Cyber Systems because they are protecting the boundary.
39.44	Consultant	Disagree	The impact levels would be impacted by previous comments on this group of requirements.The terminology "for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest removing these words from the table where they occur.

#	Organization	Yes or No	Question 39 Comment
39.45	Southern California Edison Company	Disagree	The standard should read such that the centralized/federated primary virtualization system and its back-up are afforded protections commensurate with the impact level of the automation devices that support a particular reliability function. The standard should comply with the intent of Order 706 to prevent intentional or accidental misuse of BES components and limit BES cyber system classification to the automation nodes and virtualization nodes. End-user computing devices in a virtualization system should be classified as conduits to the virtual system that is protected by an electronic border.
39.46	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The time frame for requirement 2.5 would be difficult to comply with for smaller entities.
39.47	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R20 - R22 if our changes proposed in Question 37 are accepted:R20 Table 20.1: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.2: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.3: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.4: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.5: Low Impact: N/AMedium Impact: 48 hoursHigh Impact: 12 hoursR20 Table 20.6: Low Impact: N/AMedium Impact: N/AHigh Impact: 7 calendar daysR21 Table 21.1: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR21 Table 21.2: (Removed)R22 Table 22.1 - 22.4: (Removed)
39.48	MidAmerican Energy Company	Disagree	While the concept of applying various levels of security controls to BES Cyber Systems based upon their impact level appears to be appealing, until the assessment of each BES Cyber System is made by a utility and the catalog of security controls that must be maintained for each BES Cyber System is understood, the impact level strategy cannot be accessed.

#	Organization	Yes or No	Question 39 Comment
39.49	PacifiCorp	Disagree	While the concept of applying various levels of security controls to BES Cyber Systems based upon their impact level appears to be appealing, until the assessment of each BES Cyber System is made by a utility and the catalog of security controls that must be maintained for each BES Cyber System is understood, the impact level strategy cannot be accessed.

40. The configuration change management requirement is centered on the identification of a component inventory and baseline configuration. Do you agree with the list of criteria that are included in the baseline configuration? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the baseline and managed through the configuration change management process? Do you agree with the list of criteria that are included in Requirements Table R23? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in Table R23? Please explain and provide any suggestions for modification.

Summary Consideration:

Commenters are concerned about a lack of clarity on what is expected for a baseline configuration, and if it should be applicable to an entire BES Cyber System or to individual components. Commenters also expressed a lack of understanding on how detailed inventories should be and to what category they should apply. Many comments addressed the requirements that include component-based actions for low-impact BES Cyber Systems. These are viewed as potentially overwhelming in the overall CIP compliance process. Also, identifying the physical location of a virtual component is identified in several comments as "confusing." Concerns were also identified about the definitions and clarification around terms. For example, what is meant by "Other documentation," "baseline configuration," and "virtual BES Cyber System component" were the primary terms mentioned. Also, more specific information on "security controls" was requested.

This requirement has been moved into a new standard, CIP-010-1 -- Cyber Security — Configuration Management and Vulnerability Assessments. In response to stakeholder comments, the drafting team has provided additional guidance in the 'Application Guidelines' section for the standard regarding the elements of a baseline configuration. The requirement to have an explicit inventory has been removed. This requirement is effectively inferred by the requirement to document a baseline configuration. The drafting team also agrees that maintaining an inventory for all Low Impact BES Cyber Assets within the current compliance framework in which the NERC CIP standards exist is problematic. As such, the drafting team has made an effort to prioritize controls for Low Impact BES Cyber Assets that don't require the documentation of every individual component and may be managed on a site-by-site basis, where feasible.

Several commenters suggested that inventories and monitoring should also apply to Medium and High Impact categories, since impact of the Low category to the BES Cyber System is minimal, and the effort appears to be greater than the benefit. In addition, there are questions on the timeframe and processes for monitoring. Does it need to be real time or can the Responsible Entity establish a tailored schedule for response to the detection of unauthorized changes? With regard to Requirement 23, Part 23.2, several commenters stated that it was written around typical IT equipment configurations and not the multitude of devices within generating or transmission facilities. They believe that because of this situation, the requirement should be limited to control centers similar to Requirement 23, Part 23.6. They further state that for generating facilities and substations, it would be adequate to require the entity to document and implement one or more processes for configuration change management, and that this would be applied to all Low Impact, Medium Impact, and High Impact BES Cyber Systems.

The drafting team intends for the monitoring and alerting capabilities to occur on a near real-time basis. The drafting team appreciates the concerns regarding substation and generation environments and believes that tools to perform these processes on a near real-time basis in these environments are either too immature to be included as part of a mandatory standard or simply do not exist, particularly since a large number of these cyber assets have no external communication method. Additionally, the drafting team believes that other NERC reliability standards, such as those regarding protective relay maintenance and testing, provide some level of mitigation for this lack in currently available technology.

The configuration management requirements state that an inventory must be developed of the physical or virtual BES cyber components "excluding software running on the component". Several commenters questioned why software should not be considered as constituting a "virtual" BES cyber component. Many comments were also submitted on what is perceived as a cumbersome process around inventory, monitoring, and responding to changes in the baseline configuration. They state that the criteria should be simplified, with items such as removing "physical location" from the requirement.

The drafting team has attempted to address these concerns by modifying the impact levels to which they apply. The drafting team, however, continues to believe that a rigorous configuration management program, including documented baseline configurations, is essential to an effective cyber security program.

#	Organization	Yes or No	Question 40 Comment
40.1	USACE - Omaha Anchor		23.2 - clarify "software" - is this all software on the machine or version of the OS?
40.2	US Army Corps of Engineers		Does requirement R23.7 "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes" imply or require automated monitoring?
40.3	WECC		Not sure that baseline is the right word to use as many entities define baselines only at specific times in implementation projects or as part of system hardening. Item 23.5 says to "assess potentially impacted security controls" then Item 23.6 says to test them. Is this the same requirement? The second bullet in 23.6 is very difficult to read. Consider having a separate requirement for 1) Change Management Criteria, 2) Testing Criteria, 3) Test Environment Criteria.Virtualization is mentioned in 23.1. This is good, but should probably be considered in other requirements as well. In 23.2 an inventory is required of components. Based on the current definition of component,

#	Organization	Yes or No	Question 40 Comment
			this would not need to be done down to the device level; however, management at the device level is needed for effective application of change management.In 23.6 there does not appear to be a provision for changes to the baseline configuration itself. Also, the requirement for established procedures was removed. This will lead to inconsistent testing and makes auditing much more difficult.
40.4	Exelon Corporation	Agree	Exelon seeks clarification on the following questions. Do Requirements 23.2 and 23.4 include relay and SCADA equipment settings and settings changes? Would documentation of an assessment be required in a test environment before each and every relay or SCADA setting change?
40.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.There is no process to identify when any changes made to the BES might affect the actual identification of the BES component(s) as a new impact rating.FMPA does not believe that a Responsible Entity will be able to fully comply with some of these standards as they are written. For example, to fully assess how a change might impact the BES Cyber System could be interpreted to mean the RE would need a fully functional replicated copy of the production environment. FMPA does not believe this is reasonable.
40.6	Progress Energy - Nuclear Generation	Agree	R23 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
40.7	CWLP Electric Transmission, Distribution and Operations Department	Agree	R23.5. What are the ramifications to the Responsible Entity if the assessment is inaccurate and a change does adversely affect the BES Cyber System? Conducting an assessment does not guarantee success as there are always unforeseen incidents that may impact upgrades and new installations.
40.8	Xcel Energy	Agree	We believe additional guidance is requires as to what type of monitoring is expected

#	Organization	Yes or No	Question 40 Comment
			in R23.7. Is active monitoring expected, or periodic review of logs sufficient?
40.9	Dairyland Power Cooperative	Disagree	23 Note that on many SCADA systems, the simple matter of summing two telemetered values may require the modification of software/scripts. For simple calculations such as these the overhead of change control and security track will serious slow the process of making adjustments during a field checkout. Are there any further criteria that can be used to minimize the overhead on changes that are not reasonably expected to impact security posture?
40.10	FirstEnergy Corporation	Disagree	23.1 - Should also exclude data.23.2 - Cyber System Components is used two different ways in 23.1 and in 23.2. And neither uses really match the definition provided in CIP 010. What is expected for a baseline configuration for an entire BES Cyber System as opposed to a configuration for an individual component?23.3 - Change 30 days to 90 days. Remove 'other documentation as necessary' or be more specific as to what that means.23.2 - 23.4: Is the standard requiring the Responsible Entity to update the baseline documentation every time a patch is applied?
40.11	Dominion Resources Services, Inc.	Disagree	23.1 & 2 & 3(inventory only). It should be clarified that the inventory is for in-service equipment and that location refers to an area or room and not to a rack or slot. 23.4. A definition of "Authorize" should be provided.23.5. At the May workshop, an entity said they were audited by 2 regions and each region had a different definition of what cyber security controls were. On this point Dominion recommends that the word "Assess" be changed to "Define cyber security controls and assess." 23.7 Dominion is unclear how this requirement can be met. For example, an alarm is received when a relay is placed into "configure" mode, but there is no ability to see what is being changed. Stated differently, Dominion can respond to a change, but cannot monitor what is being changed. If the relay is in a remote location, Dominion's response time will be impeded. This is the best case scenario. Much equipment does not alarm when its configuration has been changed (e.g., a computer does not generate an alarm when a new program is loaded.) Dominion requests that this requirement be

#	Organization	Yes or No	Question 40 Comment
			removed.
40.12	BGE	Disagree	23.2 custom software/scripts should not be part of the baseline inventory. Recommend having 1 inventory for Low, medium and High.
40.13	American Electric Power	Disagree	23.3: Regarding "Authorize and document changes to the BES Cyber System that deviate from the existing inventory and update the inventory and other documentation as necessary within 30 days of the change being completed", what changes must be authorized and documented? Is this targeting physical network changes or adding/deleting equipment? Is this targeting software changes?23.7: Regarding "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes", is this a continuous monitoring requirement? If not, what is the frequency that a comparison between the actual and latest approved baseline be conducted? Comparing baseline to existing configurations would be a manual process is most instances. Suggest rewording to specify that this will be conducted on the individual BES Cyber System components at some frequency, possibly quarterly.
40.14	Regulatory Compliance	Disagree	23.4 - propose adding - "Authorize and document changes that present a high risk to the BES....23.4a - additional criteria - Entity documents changes into categories of risk, based on the risk assessments determines if changes are in or out of scope.23.7 - unreasonable expectation based on the definition of baseline configuration. Instead propose the following: Do an annual review, recapturing the baseline configuration. Review for unauthorized changes during this process. If unauthorized changes are found remediate and document within 60 days of the documented annual review.
40.15	Southwest Power Pool Regional Entity	Disagree	23.5: Clarify what is meant by “deviation from the existing baseline configuration.” A new or replacement BES Cyber System Component needs to be validated before placing into service even if it uses an existing baseline configuration if for no other reason than to verify the configuration as built matches the baseline. Additionally, “potentially impacted cyber security controls” is highly subjective and open to

#	Organization	Yes or No	Question 40 Comment
			interpretation. Remove the "potentially impacted" language. 23.6: "included in the baseline configuration of the BES Cyber System" has a vendor baseline connotation. Consider clarifying to refer to the currently approved configuration of the production BES Cyber System. Additionally, the criteria need to clarify just what is meant by "baseline configuration." Does this mean the currently approved hardware and software, including versions or release levels? Or is it less granular, such as "a server running Linux and EMS/SCADA software." Without the clarification, the term is open to interpretation and the ability to audit will be affected.
40.16	MidAmerican Energy Company	Disagree	23.7 Most entities do not have the capability, resources or tools currently to live monitor configuration changes on all category A devices. There could be impacts to performance to run agents on equipment and some vendor supported devices may not allow live monitoring.
40.17	BCTC	Disagree	Â R23. Define in more explicit terms the definition of a "baseline configuration" - what comprises a baseline config - i.e. patch level, etc. R23.6. There are expected to be scenarios whereby a test environment may not exist for a high impact BES Cyber System. In such cases would a scenario like rolling out changes to a non-critical environment represent a test environment from a compliance perspective?
40.18	Southern Company	Disagree	As long as there are requirements which include per-component action for each low-impact BES Cyber System, the effort needed to implement those actions will overwhelm the rest of the CIP compliance effort. With 100's of low impact BES substations, there are 1000's of BES Cyber System components. These substation devices are being changed daily. The documentation requirements of R23 are overly burdensome with little benefit for low impact BES Cyber Systems. We recommend removing Low Impact BES Cyber Systems from all R23 controls.
40.19	E.ON U.S.	Disagree	CIP-011, R23.1 The requirement states that an inventory must be developed of physical or virtual BES CSC's excluding software running on the component. What

#	Organization	Yes or No	Question 40 Comment
			constitutes a "virtual" BES CSC if not software?
40.20	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
40.21	Constellation Energy Commodities Group Inc.	Disagree	Clarify R23 to not require tracking of routine changes within the container of existing software (example, add a point or change data type of a point), but to track code migrations and changes to the baseline of deployed components.
40.22	The Empire District Electric Company	Disagree	Comments: This requirement, especially evident in item 23.2, appears to be written around typical IT equipment, and not the multitude of electronic programmable devices an entity will encounter in the field at a generating facility or substation. Therefore, we believe the current intent of this requirement should only apply to control centers, similar to item 23.6, where typical IT equipment is becoming more of the standard.For generating facilities and substations, we believe it would be adequate to require the entity to document and implement one or more processes for configuration change management, and this would be applied to all Low Impact, Medium Impact, and High Impact systems.
40.23	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy disagrees with the list of criteria in the baseline configuration. Maintenance of such a list including, software versions, active ports and services, any patches and custom software/scripts will be burdensome and subject to unintended error as the list will contain a significant number of entries. CenterPoint Energy is unsure of the value of such a list regardless of R23 assertion that it is meant "...to prevent and detect unauthorized modifications to BES Cyber Systems." Unless such a list is reviewed on a daily basis, or perhaps even more often, there is no "detection" involved. As to "protection", CenterPoint Energy fails to see where that would occur from the development of and maintenance of such a list. CenterPoint Energy does understand the need to maintain current configuration data, however this criteria is too prescriptive.

#	Organization	Yes or No	Question 40 Comment
40.24	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Having a hard time with the idea of documenting the physical location of the cell phone described in question 1.a, and with documenting every change in its location within 30 days of every move.
40.25	Progress Energy (non-Nuclear)	Disagree	If the BES Cyber System Component is a microprocessor relay/device, this can get complicated. These devices have numerous 'configurations' based on an application. Also, firmware versions would need to be considered. Today, most utilities lock firmware on many relay models. Another issue may be when a cyber component is returned to a manufacturer for repair - how do we verify that a replaced operating system component is compliant.R23.2 need to be explicit that the baseline is the inventory in existence at compliance time for existing systems.R23.7 in most existing generating plant systems would not be able to meet this requirement and the value is questionable since the use of administrator accounts is highly restricted by multiple other requirements.CIP-011 - R23 - Need clarification as to what constitutes a "virtual BES Cyber System Component".
40.26	Midwest ISO	Disagree	It is not clear how R23 inventories differ from those inventories that must be identified in CIP-010 R2. To the extent that these are duplicate, the duplications should be eliminated.
40.27	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
40.28	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R23, but recommends changes as follows: o For Parts 23.1 and 23.2, Minnesota Power recommends that Standards Drafting team define what constitutes a "Virtual BES Cyber System Component." o Regarding Part 23.2, Minnesota Power recommends that the Standards Drafting Team further define the level of software versions are required for tracking purposes. For example, an EMS has hundreds of small programs that make up the system. Each of these individual programs is combined under an

#	Organization	Yes or No	Question 40 Comment
			overall version number. In addition, different Registered Entities, with the same EMS version, may have different internal applications with different levels of fixes. To what level should those be documented? o For Parts 23.5 and 23.6, Minnesota Power recommends that the Standards Drafting Team define the term “cyber security control.” o For Part 23.6, what constitutes a “deviation?” What level of baseline is required? o Regarding Part 23.7, Minnesota Power requests that the Standards Drafting Team consider defining the term “monitor” and identify the level of detail required for these changes. For example many EMS sub-programs constantly create/modify/remove files as a normal course of business. Would these changes need to constantly be reviewed and verified?In general, Minnesota Power believes that the list of items to be tracked/tested/monitored is vague and could cause Registered Entities to incorrectly implement processes to satisfy this Requirement.
40.29	NextEra Energy Corporate Compliance	Disagree	Nextera believes there is not an agreement for the list of criteria that should be included in the baseline configuration, the requirement is a big undertaken to manage the software on BES Cyber Systems and provides little improvement to the reliability of the BES Cyber Systems.The following is the recommended updates:23.2 - Develop a baseline configuration of the BES Cyber System, which shall include an inventory of its physical or virtual BES Cyber System Components (excluding software running on the component), physical location, active ports and services, any patches, and any custom software/scripts.Keeping inventory on running software on medium and high impact BES systems will be a big undertaken. With the other levels of controls to develop baseline configurations, software should be excluded.In 23.7, this implies implementation of automated tools to detect configuration changes. Not all systems will support these tools. If not possible to automate, are manual processes acceptable? If so, wording should specify "automatic or manual detection".
40.30	LCEC	Disagree	No. The baseline configuration is not specific enough and leaves much open to interpretation.

#	Organization	Yes or No	Question 40 Comment
40.31	National Grid	Disagree	o National Grid suggests rewording 23.5 - "Assess changes to baseline configuration to verify controls are not adversely affected ..." o 23.6 - Need more information on testing requirements. o23.7 - Expand on "monitor changes". Is the SDT considering a timeline to respond to detection of any unauthorized changes o National Grid recommends the SDT to check the new EOP Backup Facility Standard for testing in 23.6
40.32	PacifiCorp	Disagree	PacifiCorp seeks clarity on 23.2 as to the 'components'. In the case of a server, is this every component in the case (including fans?) or additionally all apparatus which are directly attached (Mouse, Keyboard etc) which would not normally be included in a change record.
40.33	RRI Energy	Disagree	Part 1: does "active ports and services" refer to the network accessible ports and services as mentioned in the above requirement 17.1?Part 2: Some application uses port ranges. Netstat command only reports actively listening port(s). The requirement explicitly states "active ports and services". Some ports in the port ranges may not be active when the netstat command runs. So when the inactive ports are not in use, depending on the vendor/program, entity could be out of compliance. Active could be replaced with "Active or documented system design ports and services".What does "closely models" mean?Is a "test environment" an actual thing or a state? Example: a generation unit is online generating x MWs - no test environment "state' exists due to the unit being online; a generation unit is in a 2 week maintenance outage, all cyber assets related to the unit are in a test environment "state".
40.34	Northeast Utilities	Disagree	Please clarify 23.7. Specifically, does this monitoring need to be automated? If not, how often will the monitoring need to be performed to meet the standard?
40.35	Network & Security Technologies Inc	Disagree	R23 - Sound configuration change management practices can minimize the risk of unauthorized modifications but cannot "prevent and detect" in all instances. Suggest

#	Organization	Yes or No	Question 40 Comment
			revising the overall goal here.23.6 - Suggest adding a provision allowing a Responsible Entity to suspend this requirement under emergency conditions (e.g., to apply an emergency hot fix needed to restore a disabled or impaired BES Cyber System).23.7 - Absent the use of automated tools, this may be a very hard requirement for Responsible Entities to meet. Suggest SDT consider reasonable approaches to how it might be done on a manual basis (e.g., periodic comparisons of running configurations and stored configuration profiles) without imposing an undue burden on Responsible Entities with large numbers of High Impact systems and no current investment in automated monitoring.
40.36	Consultant	Disagree	R23. The terminology "incorporate the criteria" seems incorrect. The table is actually listing the requirements. Suggest changing to "incorporate the requirements".Table R23 - Item 23.1 The terminology "virtual BES Cyber System Components (excluding software running on the component)" seems confusing. Software would seem to be the 'virtual' component, so if software is excluded then the 'virtual' aspect seems unnecessary. Please clarify the intent of this requirement. Item 23.1 The "physical location" of a "virtual component" does not appear to make sense. Suggest rewording to specify physical location of hardware. Item 23.1 & 23.2 Qualification of "physical or virtual" components should be unnecessary. The defined term 'BES Cyber System Component' should be the basis for the requirement. Adding these qualifiers implies that the definition is not adequate. Suggest removing the qualifiers physical or virtual.Item 23.2 Suggest changing "software (including version)" "installed software versions".Item 23.2 & 23.6 The terminology "any patches, and any custom software/scripts" is vague. Suggest changing to "installed patches, and installed custom software or custom scripts".Items 23.3, 23.4, & 23.6 - Suggest changing "that deviate from the existing" to "that modify the existing".Item 23.4 - The terminology "and other documentation" is vague and subjective. Suggest deleting that phrase from this item. While "other documentation" may require an update this requirement should stay focused on configuration status.Items 23.3, 23.4, & 23.5 - The terminology shifts from 'BES Cyber System Components' used in Items 23.1 & 23.2 to 'BES Cyber System' in the last three items. If the inventory & baseline configuration is on the

#	Organization	Yes or No	Question 40 Comment
			component level then these three items should address changes on the component level to be dealing at the same level of detail. Suggest using consistent terminology in this table, either 'systems' or 'components'.Item 23.6 - Suggest deleting "each" as an unnecessary word. "For changes that modify the..." is better phrasing.Item 23.6 - Suggest deleting "software versions, active ports and services, any patches, and any custom software/scripts included in the" as unnecessary wording. The statement that the test environment closely models the baseline configuration should be adequate.Item 23.6 - Suggest punctuation or reformatting the second bullet for clarity. Possibly a separate line item: "For testing changes that modify the document: (1) the results of the testing (2) the difference between the test environment and the baseline configuration..., and (3) a description of measures used to account for the differences in operation between the test environment and the baseline configuration...."Item 23.7. This requirement statement is vague. Does it mean an inventory of hardware to monitor if any additional hardware was added, or hardware was removed? It appears to relate to some type of software status monitoring, but is not clearly stated. The terminology "respond to the detection of any unauthorized changes" is not clear and is subjective. As it is written, suggest deleting this item, or clarify the wording so it is a viable requirement.
40.37	ISO New England Inc	Disagree	r23.2 - custom software/scripts? Maybe better language is those custom software scripts that are required for the function of the BES cyber system component would be more appropriate. Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see answer to question 41)R23.5 A entity may define that it's only security control is password complexity while other may try to adopt a Security Controls from the Center for Internet Security. As an entity defines more security controls the higher the risk for violating a requirement. Can cyber security controls be defined or identify requirements within this standard?R23.5 looks like the wording of the requirement allows the change to be made to production then test (after the change is made) to determine if the security has been adversely affected? Appears to contradict R23.6.As written, 23.5 is confusing. Suggest using “Assess changes to baseline configuration to verify controls are not adversely affected

#	Organization	Yes or No	Question 40 Comment
			..."Recommend the SDT check the new EOP Backup Facility Standard for testing in 23.6R23.7 What is the timeframe for monitoring? R23.4 gives 30 days to document the difference so can you monitor 30 days after the change. Does monitoring need to be real-time or can a daily process be used (other than weekends and holidays) to detect changes and reconcile to change management requests?
40.38	Independent Electricity System Operator	Disagree	R23.2 - what is meant by "software". Is this requiring that the version of Notepad, Wordpad, WinZip be recorded or only software that is needed to operate the component?- R23.5 A entity may define that it's only security control is password complexity while other may try to adopt a Security Controls from the Center for Internet Security. As an entity defines more security controls the higher the risk for violating a requirement. Can cyber security controls be defined or identify requirements within this standard?- - R23.5 looks like the wording of the requirement allows the change to be made to production then test (after the change is made) to determine if the security has been adversely affected? Appears to contradict R23.6.- - R23.7 What is the timeframe for monitoring? R23.4 gives 30 days to document the difference so can you monitor 30 days after the change. Does monitoring need to be real-time or can a daily process be used (other than weekends and holidays) to detect changes and reconcile to change management requests?- R23.3: replace "existing inventory" with "existing baseline" since above the baseline configuration was defined to include an inventory...; replace "update the inventory" with "update the baseline"- R23.3: what is "other documentation"- R23.3: is 30 days calendar days or business days?- Not clear on the difference between 23.3 and 23.4- R23.5: define "cyber security controls"- R23.6: could the statement "test the changes to the BES Cyber System in a test environment..." be changed to replace the second "test" with another word-what if it is tested in an environment that is not "test" but meets the requirements as stated?
40.39	Ameren	Disagree	R23.3 - Does change only constitute replacing hardware as inventory and replacement of software is not a requirement for low systems? Need to clarify requirement.R23.4 - This requirement will be challenging to audit as there is no clear lower threshold for

#	Organization	Yes or No	Question 40 Comment
			changes to the baseline configuration. Suggest adding the term significant changes.R23.7 - Is this requiring the installation of additional software to perform this function? Some systems may not allow the addition of this type of software, this requirement will likely end up needing a TFE.
40.40	Allegheny Energy Supply	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.
40.41	Allegheny Power	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.
40.42	EEI	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high

#	Organization	Yes or No	Question 40 Comment
			impact cyber systems.
40.43	Constellation Power Source Generation	Disagree	R23.7 describes monitoring, but not how the monitoring should be implemented (automated, manual, etc). What is the timeline to respond to the detection of unauthorized changes? Yearly? Daily? Continuously? A suggestion would be a yearly manual monitoring system.
40.44	Hydro One	Disagree	Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see response to Question 41).As written, 23.5 is confusing. Suggest rewording to “Assess changes to baseline configuration to verify controls are not adversely affected ...”Recommend the SDT check the new EOP Backup Facility Standard as it applies to testing in 23.6.Please explain the rational to limit 23.6 to Control Centers only.
40.45	Northeast Power Coordinating Council	Disagree	Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see response to Question 41).As written, 23.5 is confusing. Suggest rewording to “Assess changes to baseline configuration to verify controls are not adversely affected ...”Recommend the SDT check the new EOP Backup Facility Standard as it applies to testing in 23.6.
40.46	Garland Power and Light	Disagree	Requirement 23.2 23.4, 23.6 and 23.7 - should not apply to database changes or display changes
40.47	Alliant Energy	Disagree	Requirement 23.7 forces entities to implement discovery tools where they may not already exist into environments that may incur negative impact from the very nature of these discovery mechanisms. Where the operational risk of discovery tool deployment precludes its introduction, this requirement would necessitate manual processes. These manual processes would tax the operational resources normally dedicated to increasing the reliability of the BES.
40.48	Public Service Enterprise	Disagree	Requirement 23.7 may not be technically feasible for certain types of BES Cyber

#	Organization	Yes or No	Question 40 Comment
	Group companies		System Components such as older generation or legacy Remote Terminal Unit (RTU) products. To implement this requirement, an Operating System level change to the component may be required, which may be infeasible or not available from the Original Equipment Manufacturer (OEM). This requirement needs to be qualified with the phrase “where technically feasible”.
40.49	San Diego Gas and Electric Co.	Disagree	SDG&E feels that unless there is a major change in the number of types of assets that fall into the low category, there is little reason to have these assets be subject to a different set of requirements than those in the medium and high impact areas. Also, if there is consistency in the application of medium and high impact assets for R23.2 and R23.4, then why is R23.5 only required for high impact assets? SDG&E also requests an example of a virtual BES Cyber System Component (excluding software running on the component).
40.50	Duke Energy	Disagree	Some software on a BES Cyber system may not be relevant to the system (ex. Microsoft calculator or other bundled software) we don’t want to include a version of that. Suggest removing software since the software itself may be the BES cyber systemRequirements 23.3, 23.4, 23.5 - authorization should be able to be made more than 30 days BEFORE the installation.Requirements 23.3, 23.4: documentation via "red-marked" drawings ("interim as built") should satisfy this requirement. Is that the case?Requirement 23.5: as written, it allows the assessment to occur AFTER the fact. Should this not occur BEFORE the change is made?Requirement 23.6: with the proposed definition, it is open for interpretation how closely test environment should model the production environment.Requirement 23.7: what is the expectation for implementing this control? Manual? Automatic? Suggest removing. We are unaware of any device capable of doing this.
40.51	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments to require the current drafted language of R23 Table 23.1 - 23.7 for Control Centers Only. We also offer the following recommendation to cover a Configuration Change Management process for the rest of the facilities:R23 Table 23.8 (NEW): Develop one or more processes for

#	Organization	Yes or No	Question 40 Comment
			configuration change management for BES Cyber System Components in generation and transmission facilities.R23 Table 23.8: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR23. Objective:To prevent and detect unauthorized modifications to BES Cyber Systems. R23. Requirement:Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R23 - Configuration Change Management.
40.52	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent and detect unauthorized modifications to BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.In addition, Section 23.7 of Table R23 has issues.It is not clear what is meant by "monitor changes...." If this implies some form or ongoing or periodic "monitoring" consider the following:Depending upon the definition of "change" and because of the nature of devices located at substations and other BES equipment, any form of ongoing check or monitoring would be extremely difficult. Because there is the potential for each device to have specific configurations and settings depending up the conditions of the circuit it might be connected to, this would mean that each piece of equipment would have to be manually connected to and checked on a periodic basis. These are industrial controls that are not normally connected to unless service is required for some reason. The definition of a change should not include day to day work processes that are performed to keep the lights on such as settings changes, resetting relays, AV signature updates, or other services and settings kinds of activities. Nor should it necessarily include data changes that do not affect the executable code or configuration of the system. We would expect to be able to define what a change is within our environment.Recommendation: Delete 23.7. Modify R23 to read:Objective 23 - To prevent and detect unauthorized modifications to BES Cyber Systems.R23. Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R23 - Configuration Change Management. Such processes shall include an Entity-specific

#	Organization	Yes or No	Question 40 Comment
			definition of what constitutes a system change.
40.53	US Bureau of Reclamation	Disagree	The table requires additional clarification, particularly for different sorts of devices (relays, etc.)
40.54	Con Edison of New York	Disagree	These systems are constantly be upgraded all year long with little impact on any security. The need to do this within 30 days is excessive and should be limited to an annual review.
40.55	MRO's NERC Standards Review Subcommittee	Disagree	This requirement, especially evident in item 23.2, appears to be written around typical IT equipment, and not the multitude of electronic programmable devices an entity will encounter in the field at a generating facility or substation. Therefore, we believe the current intent of this requirement should only apply to control centers, similar to item 23.6, where typical IT equipment is becoming more of the standard.For generating facilities and substations, we believe it would be adequate to require the entity to document and implement one or more processes for configuration change management, and this would be applied to all Low Impact, Medium Impact, and High Impact systems.
40.56	Western Area Power Administration	Disagree	This requires a near-identical test system and makes no adjustments for risk analysis, and does not allow testing on failover devices (maybe) as it says "test environment" specifically. Is that truly the intent?
40.57	We Energies	Disagree	We Energies agrees with EEI: R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.We Energies agrees with EEI: R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.

#	Organization	Yes or No	Question 40 Comment
40.58	Manitoba Hydro	Disagree	We support the baseline approach to change management. It is unclear as to what "other documentation" in Requirements R23.3 and R23.4 is being referenced.
40.59	Emerson Process Management	Disagree	What is the significance of excluding software from the inventory requirement in 23.1 for low-impact BES Cyber System? Cyber security is mostly related to software than hardware. This exclusion does not give any value to the low impact systems.

41. Table R23 provide direction concerning what impact level of BES Cyber Systems to which Requirement R23 applies. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Configuration Change Management" is now addressed in CIP–010–1 — Cyber Security — Configuration Change Management

Commenters raised concerns about requirements that include component level actions for Low Impact BES Cyber Systems, such as inventories and development and maintenance of documentation. Commenters believed that the effort needed to implement those actions will detract from other, more critical actions on Medium and High Impact BES Cyber Systems and Components. Some recommendations are to remove Low Impact BES Cyber Systems from all Requirement R23 controls. In addition, because inventories are required in R23.1-2 for Low Impact components, commenters recommend that these should be limited to devices that have an external accessible connection with a potential direct impact on BES reliability. The drafting team appreciates the concern regarding the level of effort necessary for compliance on Low Impact assets. As such, the drafting team has attempted to implement a framework where the controls for Low Impact assets are those that can be implemented at a higher level of abstraction (such as on a site-by-site basis versus a component level basis) or are primarily programmatic or organizational in nature.

Commenters recommended that monitoring changes to the baseline configuration and responding to the detection of any unauthorized changes be limited to control centers only. The commenters submit that although the requirement may be appropriate for certain types of assets, the technology required to monitor many devices in generation and transmission facilities does not exist. As indicated in its response to Question 40, the drafting team appreciates these concerns and has modified the applicability for configuration monitoring to High Impact control centers.

Commenters noted that Requirement R23.2 adds a requirement for a detailed level of inventory including software versions. Commenters were not clear on the granularity required of this inventory. In addition they question how custom code is tracked for systems such as EMS and scripts that are routinely developed to streamline operational functions. In response, the specific language of the requirement regarding the necessary elements in a baseline configuration has been updated by the drafting team with the intent to provide additional clarity. (See Requirement R1, Part 1.1 in CIP-010-5)

Comments were submitted that recommend one inventory be required to cover all Low, Medium and High Impact BES Cyber Systems. It was also suggested that in Requirement R23.6, the requirements identified for Control Centers should only be extended to High Impact BES Cyber Systems as well as Control Centers. In response, the drafting team has adjusted the impact levels of the items that require an inventory to more suitably focus the effort of the Responsible Entity on items that are not as documentation-centric. None of the requirements in proposed CIP-010-5 apply to Low Impact BES Cyber Systems.

Regarding the testing of changes, commenters recommended testing of all High and Medium Impact BES Cyber Systems, not just those in Control Centers. They also recommended, however, that developing a test environment that models the production environment and documents differences should be applied only to High Impact BES Cyber Systems in Control Centers. In response, the drafting team has modified the standard to require testing of security controls for both High and Medium Impact BES Cyber Systems, but only requires testing in a test environment for those High Impact BES Cyber Systems in Control Centers. (See Requirement R3, Part 3.2 in the proposed CIP-010-5).

#	Organization	Yes or No	Question 41 Comment
41.1	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
41.2	Reliability & Compliance Group	Agree	You need to provide a definition of a virtual BES cyber system component.
41.3	LCEC	Disagree	23 What level does the software inventory include? Driver versions? What about devices with embedded OSes? Needs to include functionality testing.Is the requirement in 23.6 for control center only in reference to the cyber system components?
41.4	Black Hills Corporation	Disagree	23.5 should apply to Medium impact BES cyber systems.
41.5	ERCOT ISO	Disagree	23.5-23.7: Should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
41.6	Regulatory Compliance	Disagree	23.7 - High Impact - "required for Control Center only"
41.7	US Bureau of Reclamation	Disagree	All impact levels should have some minimum level of requirement established.
41.8	Southwest Power Pool Regional Entity	Disagree	Although the language will work as written, it could be improved by separating the component inventory requirement defined in 23.1 from the more comprehensive

#	Organization	Yes or No	Question 41 Comment
			requirements in 23.2, making 23.1 applicable to all impact categories. Similar improvement is possible with 23.3 and 23.4. 23.6: Testing prior to implementation should apply to Medium category systems.
41.9	Southern Company	Disagree	As long as there are requirements which include per-component action for each low-impact BES Cyber System, the effort needed to implement those actions will overwhelm the rest of the CIP compliance effort. With 100's of low impact BES substations, there are 1000's of BES Cyber System components. These substation devices are being changed daily. The documentation requirements of R23 are overly burdensome with little benefit for low impact BES Cyber Systems. We recommend removing Low Impact BES Cyber Systems from all R23 controls. R23.1-2 requires an inventory of all Low Impact components, this is an intensive work load addition for the Low category components. Components as identified in the definition include all programmable devices. This includes most instrumentation in a generation unit. This should be limited to devices which have an external accessible connection with a potential direct impact on BES reliability.
41.10	WECC	Disagree	Change management and testing should be done for all medium and high impact level BES Cyber System Components not just control center or high.Criteria should apply to all impact levels.
41.11	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
41.12	The Empire District Electric Company	Disagree	Comments: See comments under question 40.
41.13	US Army Corps of Engineers, Omaha Distirc	Disagree	Define "changes" as used in 23.4. Does requirement R23.7 "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes" imply or require automated monitoring? If automated monitoring is required this could result in numerous TFE's for other than general processing equipment.

#	Organization	Yes or No	Question 41 Comment
41.14	Alberta Electric System Operator	Disagree	In 23.5 and 23.7, consider setting Medium Impact both to Required
41.15	Entergy	Disagree	Inventory and component baseline configuration management are basic care and feeding requirements generally accepted as best practice - 'systems management 101'; and should therefore apply for intelligent infrastructure employed throughout a control system. It is also clear from Order 706 that this is what FERC intends.
41.16	Consultant	Disagree	Item 23.6 - Stating that this is required for Control Centers only adds an additional dimension to the impact categorization. The impact categorization criteria should clearly identify the assets that go into a particular impact classification. The table should only state whether the requirement is required for that classification or not, it should not add an additional classification criteria.
41.17	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
41.18	Oncor Electric Delivery LLC	Disagree	Need an inventory for Medium and High systems(R23.1) and should document changes for Medium and High systems(R23.3) Requirement R23.7 should allow for manual processes to detect changes. It is also unclear how an entity would document a phased implementation - is it based on "in-service" designation?
41.19	Con Edison of New York	Disagree	o R23 changes and adds to Change Management Configuration requirements. This requirement mentions the need for an inventory of BES cyber components. This is not mentioned in CIP-010 o R23.2 This requirement adds a much more detailed level of inventory including software versions. This would be an extensive task, and does this require an inventory of all, such as any Microsoft Office on the workstations, non- MS app's etc? Shouldn't this be limited to knowing the release level you are on, without the line-by-line level information? How do you handle custom code for custom systems such as EMS?How do you manage scripts, they can be written to pull information from the database as shorthand; would that count? These are routinely

#	Organization	Yes or No	Question 41 Comment
			written by staff to get something quickly, and to address repetitive solutions/commands.
41.20	American Municipal Power	Disagree	Please provide a little or no impact category
41.21	Madison Gas and Electric Company	Disagree	R23.1 states: Develop an inventory of its physical or virtual BES Cyber System Components (excluding software running on the component), including its physical location.The BES Cyber System Component definition states: One or more programmable electronic devices (including hardware, software and data).... This requirement excludes software, but what about data?
41.22	BGE	Disagree	Recommend having 1 inventory for Low, medium and High.
41.23	Hydro One	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber Systems.Recommend 23.6 High Impact BES Cyber Systems should be Required, not Required for Control Center Only.Recommend a clarification of “monitor” in 23.7.
41.24	ISO New England Inc	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber SystemsRecommend 23.6 High Impact BES Cyber Systems should not be Requireed for Control Center Only
41.25	Northeast Power Coordinating Council	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber Systems.Recommend 23.6 High Impact BES Cyber Systems should be Required, not Required for Control Center Only.Recommend a clarification of “monitor” in 23.7.
41.26	National Grid	Disagree	Refer to comments in Q. 40.
41.27	San Diego Gas and Electric	Disagree	SDG&E feels that unless there is a major change in the number of types of assets that

#	Organization	Yes or No	Question 41 Comment
	Co.		fall into the low category, there is little reason to have these assets be subject to a different set of requirements than those in the medium and high impact areas. Also, if there is consistency in the application of medium and high impact assets for R23.2 and R23.4, then why is R23.5 only required for high impact assets?
41.28	American Electric Power	Disagree	See comments under question 40.
41.29	MRO's NERC Standards Review Subcommittee	Disagree	See comments under question 40.
41.30	Southern California Edison Company	Disagree	Should be unilateral across all levels.
41.31	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in rows 23.5, 23.6, and 23.7.
41.32	Network & Security Technologies Inc	Disagree	Suggest requiring changes be tested for all High and Medium Impact Cyber Systems. Requirements to use a test environment that models production environment and to document differences could be applied only to High Impact systems in Control Centers.
41.33	Midwest ISO	Disagree	The requirement to document changes to the inventories in R23 is 30 days. The requirement to update inventories CIP-010 R2 is 45 days per CIP-010 R2. These should be consistent and we recommend it should be 60 days per our response in Q5.
41.34	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R23 if our changes proposed in Question 40 are accepted:R23 Table 23.1: Low Impact: Required for Control Centers OnlyMedium Impact: N/AHigh Impact: N/AR23 Table 23.2: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: Required for Control Centers OnlyR23 Table 23.3: Low Impact: Required for Control Centers OnlyMedium Impact: N/AHigh Impact: N/AR23 Table 23.4: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: Required for Control Centers

#	Organization	Yes or No	Question 41 Comment
			OnlyR23 Table 23.5: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.6: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.7: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.8: Low Impact: RequiredMedium Impact: RequiredHigh Impact: Required
41.35	GTC & GSOC	Disagree	We recommend that R23.7 be applicable for control centers only. This requirement is more appropriate for control centers and not for transmission and generations operations. While this requirement may be feasible for certain types of protective relays, this technology generally does not exist for a wide range of devices including certain RTUs and meters. In fact, some RTU's must be taken offline in order to retrieve their configuration. Thus, compliance with this requirement would have a negative reliability benefit.
41.36	Progress Energy (non-Nuclear)	Disagree	We see 23.5 as documented lab and field testing for any change to an existing relay/gateway/etc. configuration. Is this what was intended?Baseline configuration is not clear - does this start with the implementation date of the standard or the original production of the facility/element.Virtual BES is not clear. Please specify intention.

42. The definition of sensitive information was derived from the previous version of the CIP standards to minimize disruption to entity information protection programs that are already in place. Do you agree with the proposed definition? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

The definition of "sensitive information" that was originally posted as an informal definition adjacent to Requirement R24 in the draft CIP-011-1 was:

For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.

The primary issue identified with sensitive information was the term itself. Many commenters indicated that this term is already being used by organizations for other purposes, and its inclusion in the NERC CIP standards will cause much confusion. There were several suggestions of alternative terms to use including "CIP-sensitive information" and "protected information." In response to these comments, the drafting team has changed the term to "BES Cyber System Information." The commenters also included numerous suggestions for the improvement of the definition. One commenter indicated that this was not really a definition at all, but rather a list of examples. The drafting team did recognize this as a list of examples, and as such removed it from the requirement language and included the suggestions in the definition of the term BES Cyber System Information.

Several commenters indicated that "floor plans of computing centers" should be removed from the definition. The drafting team agrees that floor plans are problematic as they often are required to be submitted as part of work permits or other items. As such, the drafting team has clarified that only those floor plans that include impact designations of BES Cyber Systems should be identified as BES Cyber System Information, since it is the aggregate data that rises to the level of required protections and not just floor plans alone. This modification was also made to other elements of the definition such as equipment layouts.

A few commenters suggested that the scope of the definition was not broad enough and should be modified by saying "includes but not limited to" or changed entirely to include all data that affects the confidentiality, integrity, and availability of the BES. The drafting team appreciates this suggestion, but sees difficulty in the ability to measure such a broadly scoped definition. Additionally, the drafting team wanted to base the definition on the elements previously defined in CIP-003-3 R4.1 to leverage the investment that Responsible Entities have already made in their existing NERC CIP Information Protection Programs.

The proposed definition of "**BES Cyber System Information**" is:

"Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain BES Cyber System Impact designations; equipment layouts that contain BES Cyber System Impact designations; BES Cyber System disaster recovery plans; and BES Cyber System incident response plans."

#	Organization	Yes or No	Question 42 Comment
42.1	Florida Municipal Power Agency	Agree	24.4 - How can a RE "revoke access" from data which may have been copied by personnel?
42.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
42.3	CWLP Electric Transmission, Distribution and Operations Department	Agree	Does network topology or similar diagrams include in-house wiring or plant wiring that may include fiber and Ethernet facilities?
42.4	Exelon Corporation	Agree	Exelon seeks clarification on the following question. Is it the intention of the Standard Drafting Team to include blueprints (schematics and one lines diagrams) for relay and SCADA components in the definition of sensitive information? And, to the extent that such information described large generation facilities or combinations of facilities greater than 2000 MW, then would the electronic record system be considered a High BES Cyber System?
42.5	USACE - Omaha Anchor	Agree	Question - it's difficult to electronically distribute controlled information - however the incident response plan and the recovery plan are supposed to be easily available to all folks. Seems a bit of an oxymoron.

#	Organization	Yes or No	Question 42 Comment
42.6	Northeast Utilities	Agree	The prior version had a concern with user lists, logon-ids, etc. Was applicability to that type of information intentional removed? Also, please clarify whether a recipient of CIP sensitive information must be CIP cleared (PRA & trained).
42.7	Consultant	Disagree	"...network topology or similar diagrams..." should be modified to "network topology that includes BES Cyber Systems" Corporate network topology should not be included in the standards, but this wording would include such diagrams."...floor plans of computing centers that contain BES Cyber Systems..." should be removed, or clarified to specify "floor plans that indicate locations of BES Cbyer Systems". Building floor plans exist in many places that are beyond the control of the Responsible Entities, e.g. architects, landlords, building maintenance companies. A better option might be rewording to qualify the entire list of items as applying to BES Cyber Systems. "... includes (1) security operational procedures, (2) network topology or similar diagrams, (3) floor plans of computing centers, (4) equipment layouts, (5) disaster recovery plans, (6)incident response plans, and (7) security configuration information that contain BES Cyber System information.The definition should be written as a definition, i.e. Sensitive Information - (1) security operational procedures, (2) network topology or similar diagrams, (3) floor plans of computing centers, (4) equipment layouts, (5) disaster recovery plans, (6)incident response plans, and (7) security configuration information that contain BES Cyber System information.The definition is NOT 'For the purposes of this standard', it is expected to be included in the next Glossary update after approval of the standard, and the defined term is hidden somewhere in the statement.
42.8	Luminant	Disagree	"floor plans of computing centers that contain BES Cyber Systems" should be changed to "floor plans that specifically identify BES Cyber Systems or their locations". " BES Cyber System disaster recovery plans" should be “BES Cyber System recovery plans"
42.9	Tenaska	Disagree	24.1 should say: Identify sensitive information.24.2 should say: implement procedures protect sensitive information25.1 should say: render sensitive information unusable

#	Organization	Yes or No	Question 42 Comment
			when disposing of documents and equipment that may contain that information.
42.10	Alliant Energy	Disagree	Alliant Energy agrees with EEI on all points and timeframe consistency. Table 24 is another occurrence where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement.
42.11	Dairyland Power Cooperative	Disagree	BES systems actually contain information/data about the BES that is sensitive as well, but are ignored. Definitions for SCADA, electrical network topology, schematics, and other information can also be BES information related to critical infrastructure that requires protection.
42.12	E.ON U.S.	Disagree	CIP-011, R24 The definition of sensitive information should provide examples of what constitutes a “security operational procedure.”
42.13	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes the Responsible Entity should identify and classify data as sensitive information and therefore the definition is too restrictive. CenterPoint Energy recommends it be revised as follows: For the purpose of this standard, sensitive information includes but is not limited to, security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and

#	Organization	Yes or No	Question 42 Comment
			security configuration information.
42.14	Dominion Resources Services, Inc.	Disagree	Dominion recommends changing “contain” to “identify” and adding the phrase “that specifically identify Medium or High Impact components” after the phrase “equipment layout of BES Cyber Systems.” This modification is reflected in the revised definition below: For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that identify BES Cyber Systems, equipment layouts of BES Cyber Systems that specifically identify Medium or High Impact components, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.
42.15	Bonneville Power Administration	Disagree	FERC, NERC and the Regional Entities do not have the information necessary to determine what information is sensitive or not as it regards any Responsible Entity. This is conditional and depends on more that just the types of information involved. The determination of what is sensitive information, and what is not can only be done by the Responsible Entity and under the laws and regulations they must comply with. Floor Plans, network diagrams, equipment layouts and other information may or may not be sensitive depending upon what additional information is provided with it. In addition, legal contracts, Federal, state and municipal laws, regulations, and fiduciary requirements may also govern what information may be protected and what must be released.Recommended Change - For the purpose of this standard, sensitive information may include security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information as determined by the Responsible Entity.
42.16	NextEra Energy Corporate Compliance	Disagree	In R24, is it a requirement to map every user's access privileges to sensitive information?In R24, for every new document that contain security operational procedures, network topology or similar diagrams, floor plans of computing centers

#	Organization	Yes or No	Question 42 Comment
			that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information, do we need to record the explicit authorization of every personnel that has access privileges for each type of documents?In 24.2, does this mean that the handling procedures for hard copies of sensitive information include a documentation for chain-of-custody for High Impact BES Cyber Systems?
42.17	Regulatory Compliance	Disagree	Incident Response plans and Diaster and Recovery plans should not be included as sensitive information - these plans should be psuedo public as long as they have written without security configuration information in them.
42.18	Progress Energy (non-Nuclear)	Disagree	It is not clear if this includes relay device information such as electrical diagrams/schematics.Incident response plans typically do not contain any system specific information. The plans provide the actions that must be taken and must be freely available to many. Will that approach meet the intention of the new standard?
42.19	MidAmerican Energy Company	Disagree	Many entities including MEC use "Sensitive" information as one of the classifications for information that needs to be protected. Calling all information to be protected sensitive will cause confusion. Change the term "sensitive information" to "protected information" in CIP-011.
42.20	Con Edison of New York	Disagree	o R24.3 does the word explicitly mean we cannot say all EMS staff has access to information? Does it need to be by name?
42.21	Network & Security Technologies Inc	Disagree	R24 and/or its sub-requirements should be modified to make it clear they apply sensitive information regardless of media type (including paper copies).24.4 - Revocation of access can be hard to do, and even harder to verify, in cases where an individual has taken either electronic or paper copies of sensitive documents off the Responsible Entity premises (sometime for legitimate reasons). Suggest revising this requirement in a manner that acknowledges this reality - something like “best effort” to retrieve sensitive information the individual may have in his or her possession,

#	Organization	Yes or No	Question 42 Comment
			accompanied by warnings that subsequent unauthorized disclosure of any such information may result in prosecution.
42.22	Hydro One	Disagree	Recommend that the definition change “includes” to “includes but not limited to”.
42.23	ISO New England Inc	Disagree	Recommend that the definition change “includes” to “includes but not limited to”
42.24	Northeast Power Coordinating Council	Disagree	Recommend that the definition change “includes” to “includes but not limited to”.
42.25	US Army Corps of Engineers, Omaha Distirc	Disagree	Remove "floor plans of computing centers"
42.26	Allegheny Energy Supply	Disagree	Requirement 24.3 is in conflict with 24.1 and 24.2 as it brings specific obligations that may or may not be appropriate.The existing definition of sensitive information:For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.is overbroad and inappropriate. A corporate procedure or signage indicating that visitors to a facility must register their presence could be considered a security operational procedure, and be considered sensitive information. A diagram “similar” (but not identical) to a network topology diagram, even if written on the back of a napkin, could be considered sensitive information. Floor plans are routinely required to be filed (generally publically) by municipal building and zoning authorities before construction permits are issued. Elements of BES Cyber System incident response plans such as local or regional law enforcement personnel contact information should be made widely available to responsible entity personnel. Elements of incident response plans that call for the protection of human life and safety as a primary directive should be made widely available to responsible entity personnel. Acceptable Use Banners could be considered part of security

#	Organization	Yes or No	Question 42 Comment
			configuration information.The definition of sensitive information and associated requirements needs extensive revision. Before beginning, the revision, some effort should be invested to define the security objective. For example the objective may be to prevent an unauthorized party from receiving information that could directly lead to the compromise of BES Cyber Systems. To achieve this objective, it would be desirable to protect BES Cyber System passwords. It may also be desirable to protect documents that provide a complete listing of BES Cyber System dial-in numbers or TCP/IP addresses. Operational plans to protect certain information must reasoned and be balanced with other requirements e.g. the training requirements that are part of this standard.
42.27	LCEC	Disagree	Sensitive is a classification that is specific to the CIP standards per this definition but is used in organizations as one of the levels of information classification. To differentiate, the term BES Sensitive might be considered.
42.28	Public Service Enterprise Group companies	Disagree	Sensitive should be changed to “protected Information”, the definition is fine.
42.29	Progress Energy - Nuclear Generation	Disagree	Sensitivity levels for information are established for nuclear generation facilities by CFR. This definition should be adjusted to acknowledge information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
42.30	Southwest Power Pool Regional Entity	Disagree	Should include more than “security” operational procedures. IT-specific operating procedures (“run books”) are very sensitive and could be used to exploit a system. Operations procedures may also be sensitive to some extent if they describe the use of the BES Cyber System.
42.31	San Diego Gas and Electric Co.	Disagree	The "definition" is only a list of examples, not a real definition. SDG&E suggests the following definition: "Sensitive information is defined as any information owned by

#	Organization	Yes or No	Question 42 Comment
			the Responsible Entity, or for which the Responsible Entity is the custodian of, that, if inappropriately disclosed, modified, or rendered unavailable, could adversely impact human safety or the reliability of the BES. Examples include...(their list)"
42.32	APPA Task Force	Disagree	The APPA Task Force would like to comment on the definition of sensitive information: As pointed out in Question 44, the following disclaimer needs to be added to that definition: "To the extent that state/local laws allow"
42.33	Entergy	Disagree	The definition of sensitive information is nearly identical to the one currently being used in version 3. R24.1 and R24.2 explicity allow the Entity to classify and protect "sensitive" information under its own auspice. As long as the classification guidelines are left for the Entity to decide, this definition should prove sufficient.The requirement indicates that the drafting team believes protection of sensitive information associated with allegedly "low impact" BES Cyber Systems/Components that provide routable protocol attack vector access to control hosts, etc., is unnecessary. Suggest this be rethought.Please define "Explicitly Authorize"? Does this mean that every individual with access to a particular piece of information needs some type of documented approval? Can this be done at a group level based on job function? Is approval documentation all that's required, or is a maintained list required as well?
42.34	Manitoba Hydro	Disagree	The definition should also reference control rooms.
42.35	Southern California Edison Company	Disagree	The definition should clearly distinguish BES operational information and cyber security related information. A smaller subset of the former and larger subset of the latter form potential candidates for "protected information".
42.36	Oncor Electric Delivery LLC	Disagree	The definition should not prescribe items as being "sensitive". The identification and classification process of Requirement 24.1 should do that. "For the purpose of this standard, sensitive information includes procedures, diagrams and any other document which provides proprietary information about BES Cyber Systems or BES

#	Organization	Yes or No	Question 42 Comment
			Cyber System Components."
42.37	Allegheny Power	Disagree	There is no reasoned basis to simply bring forward a historic definition then add significant additional requirements based on a legacy definition.Requirement 24.3 is in conflict with 24.1 and 24.2 as it brings specific obligations that may or may not be appropriate.The existing definition of sensitive information:For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.is overbroad and inappropriate. A corporate procedure or signage indicating that visitors to a facility must register their presence could be considered a security operational procedure, and be considered sensitive information. A diagram "similar" (but not identical) to a network topology diagram, even if written on the back of a napkin, could be considered sensitive information. Elements of incident response plans that call for the protection of human life and safety as a primary directive should be made widely

#	Organization	Yes or No	Question 42 Comment
			available to responsible entity personnel. Acceptable Use Banners could be considered part of security configuration information.We Energies agrees with EEI: The definition of sensitive information and associated requirements needs extensive revision. Before beginning, the revision, some effort should be invested to define the security objective. We Energies agrees with EEI: For example the objective may be to prevent an unauthorized party from receiving information that could directly lead to the compromise of BES Cyber Systems. To achieve this objective, it would be desirable to protect BES Cyber System passwords. It may also be desirable to protect documents that provide a complete listing of BES Cyber System dial-in numbers or TCP/IP addresses. Operational plans to protect certain information must reasoned and be balanced with other requirements e.g. the training requirements that are part of this standard.
42.43	American Transmission Company	Disagree	We propose deleting “floor plans of computer centers” from the definition of sensitive information. Floor plans do not typically include information specific to devices, IP addresses, etc which could be used to compromise a BES Cyber System. Moreover, a computer center is an undefined term which could mean anywhere there was more than one computer.
42.44	LADWP	Disagree	Word sensitive needs to be changed as it can coincide with actual classification used by entities.
42.45	FirstEnergy Corporation	Disagree	Would like to see the definition even more narrow, to focus on information that truly can compromise the BES (e.g. Vulnerability assessments’, mitigation strategies, passwords, and DR plans).

43. Do you agree with the proposed definition of Media? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

The definition of "media" that was originally posted as an informal definition adjacent to Requirement R25 in draft CIP-011-1 was:

Media for the purpose of this standard means any mass storage devices within a BES Cyber System Component including, but not limited to, magnetic tapes, optical disks, and magnetic disks onto which information is recorded and stored.

The proposed definition of "media" received significant agreement from those entities that chose to respond to this question. The majority of comments on the definition of media indicated that the definition should be expanded to include additional storage types as well as more traditional media types such as paper. The drafting team intends for Responsible Entities to protect media, such as paper, through the required handling procedures included in the Information Protection requirement.

One commenter indicated that USB drives, CDs, and floppy disks should be included in the definition of media. It was the intent of the drafting team that these device types would be considered devices used to perform maintenance and thus treated in accordance with the maintenance requirements. As the maintenance requirements evolved with the inclusion of additional remote access requirements, the drafting team considered expanding the scope of the media definition.

Another commenter made an interesting case regarding the media being "within" a BES Cyber System and suggested that once the media was removed that it no longer met the definition. The drafting team considered this comment and has modified the standard to require sanitization of BES Cyber System Information contained on media. The remaining comments focused primarily on the requirements themselves and not the definition. Specifically, commenters were concerned about the level of sanitization that would be required on the media. Several commenters noted that the level of sanitization should be commensurate with the potential threat to BES reliability, while others suggested that there be a defined minimum acceptable sanitization process, such as an NSA standard. The drafting team understands the need for a minimum acceptable sanitization process. However, the NERC Standards Development Process does not allow the drafting team to simply reference another standard. As such, we have modified the language in the revised standard to require that media be destroyed or other actions taken to prevent unauthorized retrieval.

Given the potential confusion with establishing a NERC Glossary definition for media, the drafting team has elected to define the term within the language of the standard itself.

#	Organization	Yes or No	Question 43 Comment
43.1	Florida Municipal Power Agency		How would one define the process used to render the media unrecoverable? What does unrecoverable mean? Unrecoverable by NSA standards or unrecoverable by means of something like phase transition?
43.2	Black Hills Corporation	Agree	Believe that solid-state mass-storage (flash drives, thumb drives, jump drives, etc,) should be included as examples in the definition.
43.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
43.4	Northeast Utilities	Agree	Suggest that a minimum acceptable sanitization process (i.e., NIST standard) is specified.
43.5	APPA Task Force	Agree	The APPA Task Force agrees with the definition.
43.6	Dairyland Power Cooperative	Agree	With the proliferation of flash memory solutions, the only way to sanitize some media is physical destruction. Many devices use flash memory in a way that is not removable. Is destruction of this equipment intended?
43.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
43.8	FirstEnergy Corporation	Disagree	Believe the definition should not include example because of the quickly changing storage technologies.
43.9	Xcel Energy	Disagree	Further clarification, similar to the definition of Maintenance in R26, is needed to make it clear that media such as hard drives on laptops used for maintenance do not need to be sanitized after temporary connection to BES Cyber Systems.

#	Organization	Yes or No	Question 43 Comment
43.10	LADWP	Disagree	Is portable storage included here?
43.11	Emerson Process Management	Disagree	It should include USB memory stick which is becoming very popular.
43.12	LCEC	Disagree	Media can be removed from the BES Cyber System and it should still be considered media per this requirement. Remove the word "within" and replace with "used by" or "written to by" a BES Cyber System.
43.13	Public Service Enterprise Group companies	Disagree	Media should also include persistent configuration data that is stored in solid state devices (e.g. flash memory, EEPROM (electrically-erasable programmable read-only memory), etc.)
43.14	Southwest Power Pool Regional Entity	Disagree	Portable media, including CD/DVD and USB devices should be included. Basically, anything that sensitive information can be written to.
43.15	Reliability & Compliance Group	Disagree	Recommend removing the word “mass” and instead use the term storage devices.
43.16	USACE - Omaha Anchor	Disagree	Sanitization should only apply to media internal to the devices.
43.17	San Diego Gas and Electric Co.	Disagree	SDG&E notes that the proposed definition does not appear to include "old school" media like paper that is often used to store sensitive information.
43.18	ERCOT ISO	Disagree	Should also specifically address CDs and USB storage devices in the definition.
43.19	Progress Energy (non-Nuclear)	Disagree	Should the definition also clearly state device hard drives?
43.20	Manitoba Hydro	Disagree	The current definition would also require the sanitization of other mass storage devices, such as flash memory, which could render the cyber component unfit for

#	Organization	Yes or No	Question 43 Comment
			reuse outside of the BES Cyber System. The strict sanitization requirement does not permit the return of a failed BES Cyber System or BES Cyber System Component to the vendor for failure analysis. The information protection requirements must provide more flexibility, which may also be achieved through processes and procedures.
43.21	ReliabilityFirst Staff	Disagree	The definition does not need to specify “mass storage devices” and, in fact, should include devices such as flash drives. Media should also be defined to include media types other than electronic such as paper.
43.22	Consultant	Disagree	The definition is technology limited by magnetic and optical technologies. While pervasive, there are and will be other technologies to retain information.Suggest: Media - computer components and recording media that retain digital data used for computing for some interval of time.Might also consider making the definition "Electronic Media" to eliminate books, notebooks, paper, etc. which are also 'information storage media'.
43.23	Entergy	Disagree	The definition of "media" includes the open-ended term "including, but not limited to", which could practically bring anything into scope. A more concise definition with specific examples would remove ambiguity and leave less room for interpretation. The examples of Media in the box should also include flash memory as well.An example of the type of sanitization required should be provided.
43.24	Alberta Electric System Operator	Disagree	The definition states “including, but not limited to,”. The AESO suggests modifiying the definition to explicitly include non-volatile storage to ensure coverage of memory cards and flash drives.
43.25	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
43.26	We Energies	Disagree	We Energies agrees with EEI: When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of

#	Organization	Yes or No	Question 43 Comment
			voltage or frequency does not pose a risk to the BES.
43.27	Allegheny Energy Supply	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of ambient air temperatures does not pose a risk to the BES.
43.28	Allegheny Power	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
43.29	EEI	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.

44. Requirements R24 and R25 of draft CIP-011-1 concern procedures for information protection and media sanitization. Do you agree with the list of criteria that are included in each Requirements Table for R24 and R25? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

Concerns regarding the requirement for information protection centered around the revocation timeline and scope as well as differentiating access to information vs. access to systems. The drafting team is attempting to address the FERC directive that requires the revocation of access to BES Cyber System Information. The drafting team is proposing to address revocation of access to BES Cyber Systems and to BES Cyber System Information all in one place to ensure more consistency in the requirements and their implementation.

There were a number of commenters who raised concerns with the requirement for media sanitization regarding media failure conditions or disposal. The word "sanitization" appeared to cause confusion for a number of commenters and as such has been removed from the revised standard. Additionally, a couple of commenters raised concerns about the burden of proof, compliance requirements, legal issues, and ownership responsibilities.

As with other areas of this standard, there were a significant number of the comments asking for clarity of phraseology and terminology, including words such as consequence, annually, explicitly, acceptable, commensurate, etc. The drafting team eliminated the words, "explicitly, acceptable, commensurate, and annual" from the revised CIP-011-1 standard.

#	Organization	Yes or No	Question 44 Comment
44.1	ISO New England Inc		Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for causeWhat about revoking access for other than cause?Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing "reuse outside of BES Cyber Systems" to "reuse outside of the Entity's High Impact or Medium Impact BES Cyber Systems"
44.2	Northeast Utilities	Agree	Agree that this requirement covers the key cyber assets but how does this apply to

#	Organization	Yes or No	Question 44 Comment
			protective systems such as the physical access system, firewalls and logging devices?
44.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
44.4	Black Hills Corporation	Agree	Legally Required Release: There may be "legal" situations in which we may be required to share certain information with outside entities, both government and non-government. Examples could include OSHA or MSHA investigations, employee lawsuits (with the associated discovery). There does not appear to be any provision in the regulation to allow this sharing. We could be placed in the position of violating this regulation, or violating some other legal requirement (subpoena, etc)
44.5	Puget Sound Energy	Agree	Puget Sound Energy suggests modifying R24.4 to "Revoke access to media containing sensitive information within 24 hours..." to align with the NERC definition in R25 and to provide clarity around sensitive information in a hardcopy format.
44.6	GTC & GSOC	Agree	We recommend the verbiage and timelines for R24.4 be consistent with tables R5 and R13.
44.7	Independent Electricity System Operator	Disagree	- R24.4 define for cause. Should the wording be involuntarily terminated to include those that are terminated unwillingly due to layoffs, job cuts, fired/performance, etc.- R24.4 how do you remove access where personnel may have physical copies offsite o
44.8	ERCOT ISO	Disagree	24.2: Recommend: "Implement labeling and handling procedures for sensitive information according to its defined classification level." 24.3: It is unclear whether the requirement includes internal and external personnel. 24.4: Should be combined with other access management requirements (physical, cyber)24.5: Should also address "need to know". The requirement did not address the access control means for protecting information or the access to hard copies of information.
44.9	Duke Energy	Disagree	24.3 - We don't feel it is realistic to explicitly authorize access to paper copies of

#	Organization	Yes or No	Question 44 Comment
			information. Add 'repositories' at the end of the sentence.Include "repository" in 24.4 and 24.5 as well. Requirement 24.3 is particularly burdensome in a nuclear environment where there is already heavy physical security. There are thousands of drawings, for example, available for the plant. There are hundreds of personnel that have a business need to know certain things about the plant that are contained in these drawings. During outages that number often goes above 1000 personnel. Segregating all drawings/manuals/equipment layouts/floor plans/procedures and EXPLICITLY authorizing personnel for access is difficult at best. Certainly, protecting cyber specific information such as firewall rules, group policies, passwords, and other specific cyber information makes sense and is done already.
44.10	Regulatory Compliance	Disagree	24.4 - Strike altogether. Revocation should go back and be included in the scope of System revocation.25.1 - Propose : Sanitize only media containing sensitive information prior to disposal for reuse outside of BES Cyber Systems, using a method to render the data unrecoverable.
44.11	Southwest Power Pool Regional Entity	Disagree	24.4: Is this requirement prescribing Information Rights Management? There are many types of access, including access to information no longer under the direct control of the entity. 24.5 is poorly worded. Would be better to require that access is authorized, not that it reflects authorization. 25.1 should require either sanitization or physical destruction.
44.12	American Electric Power	Disagree	25.1: Regarding "Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a method to render the data unrecoverable", what evidence would be required from an audit perspective? If a USB harddrive is used to copy patches onto a system, would that USB harddrive need to be destroyed with documented evidence if it failed 2 weeks down the road?Suggested rewording:Media for the purpose of this standard means any mass storage devices within a BES Cyber System Component including, but not limited to, magnetic tapes, optical disks, and magnetic disks onto which sensitive information is recorded and stored.Rational: Adding sensitive to the "Media" definition will clarify that this is intended to be used

#	Organization	Yes or No	Question 44 Comment
			to protect the inadvertent distribution of protected information, not all media devices that are plugged into a BES Cyber System will need to be sanitized.
44.13	BCTC	Disagree	Â R24.4. We need clarification on revocation of access. We are assuming it is from the point the person departs their job - i.e. access to the BES Cyber System is revoked. Such personnel could have hard copies of information but how would you prove that such documentation was shredded? What about information they have retained within their brain? ï?Š We need some clarity on what the parameters are herePlease provide a concise definition for 'sanitize'. We discussed scenarios such as patching the BES Cyber System via a CD - would compliance require that we 'sanitize' the CD? If yes, seems like overkill from our discussions on the subject. Please provide more concise language to define the scope.over real time to either. Yet, in reading the requirements we could potentially be found non-compliant based on the wording of the version 4 standards - this should not be! FYI, I raised this point at the recent 2 day workshop in Texas and the drafting team was in agreement that our current configuration is an example of excellence ... yet is a potentially non-compliant based on current wording ... this needs to be revisited.
44.14	Progress Energy - Nuclear Generation	Disagree	Agree with R24.1, R24.2 and R25.1. Disagree with R24.3, R24.4 and R24.5 which are governed for nuclear generating facilities by CFR. R24-24 should acknowledge information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
44.15	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
44.16	E.ON U.S.	Disagree	CIP-011-1, R24.4 is unnecessary and difficult to impossible to document. At this point, all authorized unescorted physical and electronic access would have been removed per other requirements. E ON U.S. proposes that this requirement be deleted.

#	Organization	Yes or No	Question 44 Comment
44.17	USACE - Omaha Anchor	Disagree	Definition would include external hard drives and other external media. It seems ridiculous if you are installing patches to sanitize the media before going to the next cyber system. You are treating the cyber system as a classified system. This is serious overkill. External media for the most part should be exempt from this requirement unless sensitive information is placed on the media in which case it should follow the rules of R24.
44.18	Dominion Resources Services, Inc.	Disagree	Dominion recommends revising Requirement R24.1 to read:"Identify and designate controls for protection of sensitive information commensurate with its importance to the security and reliable operation of the associated BES Cyber System."24.3. With the heavy industry reliance on vendors and contractors and the requirements throughout other NERC standards to share data with other entities, it is impractical to "Explicitly authorize personnel for access to sensitive information." For example, when information is sent outside Dominion, it is impossible to know every person who sees it. Moreover it is unlikely that whoever does see it would want to sign an agreement with every entity that can submit information. The controls specified above in the requested revision to 24.1 should cover the requirements for access to the information. Dominion requests that this requirement be removed.24.4. It is possible to revoke electronic access to company-controlled devices containing sensitive information and to revoke physical access to company-controlled areas containing sensitive information within 24 hours. It is not reasonable to identify and retrieve information within 24 hours that may have been taken by an authorized user prior to being terminated for cause and it may not be possible to ever retrieve this information if it has been hidden by the individual. Please restate this requirement to indicate that it covers physical and electronic access as follows:"24.4 Revoke electronic access to company-controlled devices containing sensitive information and physical access to company-controlled areas containing sensitive information within 24 hours."24.5. As stated in Dominion's comment to 24.3, it is impractical to authorize individuals. As applied to this requirement it is also impractical to track individuals. In the example given in the above response to 24.3, any non-company

#	Organization	Yes or No	Question 44 Comment
			personnel that might see sensitive data would need to be authorized by every Registered Entity and their companies would have to keep every RE appraised of every personnel change and provide annual lists of all personnel. Dominion requests that this requirement be removed.Note: At Dallas, the SDT requested input as to requiring training and a PRA for access to sensitive information. Dominion requests that training and a PRA NOT be required. Training and a PRA are not required by versions 1, 2, and 3 of the CIP standards and could be impossible to implement across vendors within the electric industry. In the example given in the above response to 24.3, every vendor or business partner would have to take the training from every Registered Entity or have their training approved by every entity (including annually providing the training program to each RE for approval) and ES-ISAC would have to keep every RE appraised of every personnel change and provide annual lists of all personnel. And then, PRAs would have to be addressed. Registered Entities should be required to have internal requirements for access to sensitive information.
44.19	ReymannGroup, Inc.	Disagree	Expand the list of procedures to include 3rd party data recovery services in accordance with an approved vendor management policy for all impact levels.
44.20	RRI Energy	Disagree	Explicitly define “access” as related to sensitive information. Data can be locally cached on web browsers, remote or personal pc’s, etc. These cannot easily be removed let alone 24 hrs removal.
44.21	Constellation Power Source Generation	Disagree	In R24.1, what classifications for sensitive information should be used? The SDT should develop classifications specifically for CIP. As written, this is not an auditable requirement.
44.22	ReliabilityFirst Staff	Disagree	In row 24.1, what is meant by “consequence”? In Table R24, row 24.5, we suggest the verification of access privileges be performed at least quarterly. To Table R24, add a new row 24.6 stating, “Revoke access to sensitive information within 72 hours for personnel terminated not for cause.” And assign this requirement an impact level of “Required” for both Medium and High Impact BES Cyber Systems. Table R25, row

#	Organization	Yes or No	Question 44 Comment
			25.1; we believe there should be a definition of “sanitize” to eliminate confusion regarding what actions must be taken to comply with this requirement.
44.23	MidAmerican Energy Company	Disagree	It was mentioned in the May workshop that the SDT would consider the necessity for Personnel risk assessments and training required prior to granting access to protected information.Personnel risk assessments and training should not be required prior to granting access to protected information. As an example, entities would have a nearly impossible task of completing personel risk assessments for international employees at global help desks that are allowed view only access to a BES Cyber System.
44.24	WECC	Disagree	Item 24.2 should be made clear that individual hard drives, servers, laptops, etc do not need to be labeled. Perhaps “labeling of media” was meant. Item 24.3 will have great impact on the ability to have technical support from large global vendors such as Cisco. Consider exception to this requirement for maintenance or add something to Maintenance requirement R26 to deal with it.Clarify how sensitivity and consequence are determined.Clarify the requirements for authorization for access to sensitive information (i.e. need to know).
44.25	LCEC	Disagree	Need to clarify the acceptable methods.
44.26	NextEra Energy Corporate Compliance	Disagree	NextEra believes that R24 did not take into consideration access privileges with sensitive information. It does not provide clear guidance and left room for interpretation. The following are the recommended updates:R24.5 Verify at least every 12 months that the access privileges to sensitive information reflect the appropriate need with the personnel roles and responsibilities. Access privileges to sensitive should correspond with the needs and appropriate personnel roles and responsibilities.Regarding CIP-011-1/R25, R25 did not provide a standard to sanitize media. The current language did not provide clear guidance and left room for interpretation. The following is the recommended updates:25.1 - Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using clearing

#	Organization	Yes or No	Question 44 Comment
			utility supporting the Department of Defense clearing and sanitation standard. R24.4 - Requirement covered by revocation of physical and cyber access.Revoking physical and cyber access would revoke access to protected information. Therefore, NextEra suggests removing 24.4
44.27	National Grid	Disagree	o Provide timelines for access revocation for reasons other than "terminated for cause" o Do laptops and devices that maintain the BES Cyber Systems need to be sanitized?
44.28	PacifiCorp	Disagree	PacifiCorp asks that the reference to "at least every 12 months" is modified to read "annuallyonce every calendar year." Allowing responsible entities the flexibility to require trying once every calendar year rather than at least every 12 months would relieve entities of the significant administrative burden of tracking specific training deadlines for each individual employee. At the same time, this change will still ensure that employees are trained at regular enough intervals to achieve the reliability goal of the training requirement.
44.29	Ameren	Disagree	R24.3 - Listing people who have access to information serves no purpose in protecting BES systems from Cyber attack. The list of people with this information is not the same as the list of people that have access to the systems. This requirement should be removed.R24.4 - This requirement is impossible to prove for printed documentation. Suggest removal.
44.30	Liberty Electric Power, LLC	Disagree	R25 appears to require the hard drives of laptops used in relay calibrations to be wiped before leaving site. This is a serious issue for smaller entities, due to almost all of the relay work being done by outside contractors. These contractors often need the data taken to write reports which are required by other NERC standards. This requirement needs to be removed.
44.31	Allegheny Energy Supply	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to

#	Organization	Yes or No	Question 44 Comment
			perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of ambient air temperature does not pose a risk to the BES.
44.32	Allegheny Power	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
44.33	EEI	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.

#	Organization	Yes or No	Question 44 Comment
44.34	Hydro One	Disagree	Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for cause.Revoking access for other than cause should be addressed.Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing “reuse outside of BES Cyber Systems” to “reuse outside of the Entity’s High Impact or Medium Impact BES Cyber Systems”.
44.35	Northeast Power Coordinating Council	Disagree	Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for cause.Revoking access for other than cause should be addressed.Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing “reuse outside of BES Cyber Systems” to “reuse outside of the Entity’s High Impact or Medium Impact BES Cyber Systems”.
44.36	Idaho Power Company	Disagree	Revocation of access to sensitive information is virtually impossible if the person terminated has the information in their possession either hard copy or portable media. Access to additional information can be revoke. Consider rewording this requirement to accommodate this reality.
44.37	Southern California Edison Company	Disagree	SCE feels the standard, as written, may be operationally difficult to implement. As such SCE recommends allowing for the revocation of electronic access to sensitive information within 24 hours, or make a written demand (which may be followed up by legal process) for such information within a 24 hour timeframe. This distinction is crucial as not all sensitive information may reside within the physical confines of the registered entity. Business concerns may require registered entities to allow sensitive information (if adequately protected by contractual or employment terms) to leave the confines of the company. For example, employees may have CIP-protected information in company-issued laptops. In some scenarios, it may be impossible to recover those laptops if they were left offsite when the employee was terminated. However, it would be possible to issue a written demand, supported by law, for such

#	Organization	Yes or No	Question 44 Comment
			documents. The drafting team is requested to rephrase R24.4 with a view on implementability, enforceability and auditability.
44.38	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that R24.3 should read "Explicitly authorize role-based access to sensitive information."In R24.4, SDG&E asks how would we do this for hard-copy information?In R24.5, SDG&E suggests changing the wording to read "Verify at least every 12 months that the role-based access privileges to sensitive information reflect authorization."
44.39	Progress Energy (non-Nuclear)	Disagree	Should there be an item in table R25 to identify the media to be sanitized that may be overlooked, i.e. printers/plotters/scanners, relay test sets, etc.
44.40	Consultant	Disagree	Table R24 - Item 24.3 This is an access control requirement, and should be moved to access control requirement table. Access control should cover cyber access, physical access, and information access together, as the process for attaining each type of access is related.Item 24.4 is an access revocation requirement, and should be moved to the access revocation requirement table. Access revocation should cover cyber access, physical access, and information access together, as the process for revoking each type of access is related. The comments related to timeframes in those sections are applicable to information access revocation as well.Item 24.5 is an account management requirement, and should be moved to the account management requirement table. Account Management and reviews should cover cyber access, physical access, and information access together, as the process for reviewing and confirming each type of access is related. The comments related to timeframes in those sections are applicable to information access access review as well.Table R26 - Item 26.1 Replace the word "all" with "BES Cyber System" as a better statement.Item 26.1 If 'media' is a defined term it should be capitalized. (See comments on definition of Media.)
44.41	APPA Task Force	Disagree	The APPA Task Force cautions the drafting team on the information protection requirements in R24. Nearly every state in the United States has a public records law

#	Organization	Yes or No	Question 44 Comment
			that applies to public power systems as units of state or local government (These laws are often referred to as “Government in the Sunshine” laws.). We recommend that the drafting team consult with NERC legal counsel prior to revising this requirement. We do not want public power systems to have to choose between being in noncompliance with the proposed requirements or violating their state open records laws. Rebecca Michaels of NERC Staff is familiar with this issue. If this must move forward as proposed we recommend that the following be added to the requirement: “To the extent that state/local laws allow.”R24.Objective:To prevent unauthorized access to sensitive information associated with BES Cyber SystemsR24. Requirement:To the extent permissible under federal and state laws, each Responsible Entity shall document and implement one or more processes that incorporate the criteria in CIP-011-1 Table R24 - Information Protection.
44.42	Reliability & Compliance Group	Disagree	The method of sanitizing media should be done in an industry accepted manner to provide for auditability of the standard.
44.43	Bonneville Power Administration	Disagree	The objectives of these requirements (“to prevent unauthorized access to sensitive information associated with BES Cyber Systems” and “to prevent the unauthorized dissemination of BES Cyber System information”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R24, Section 24.1. Recommend replacing "classify" and "classification" with "categorize" and "category" and "categorization", . "Classify" and "classification" have very specific meanings to any Federal agency. Those meanings are restricted to the realm of National Security Information and are different from what is presented here. Such information requires storage in General Services Administration-approved safes, transmission using National Security Agency-approved encryption, and can be only be processed on computer systems if those systems are dedicated to such use, totally isolated from any publicly accessible network, and stored in secure facilities when not

#	Organization	Yes or No	Question 44 Comment
			in use. Furthermore, the Federal Agencies do not have the option of using a different definition. In fact, using Regional Entity standard forms marked "Confidential" is problematic for Federal agencies, as such a marking is reserved for a particular level of classified information. Given the large number of Federal organizations to which this standard applies, it would simplify matters to restrict the use of "classify" and similar terms to the realm of National Security Information.Recommend deletion of Table 24, Section 24.3. Requiring formal authorization is a process more stringent to that required to gain access to National Defensed Information at the Confidential and Secret level: A formal determination of trustworthiness, but no formal further formal authorization required for access once the clearance has been granted. For sensitive information other than National Defense Information, Federal agencies are required only to determine the the recipient needs the information to support the activities of the agency. Such a determination can be made informally, by any person with custody of the information. We realize that there seem to be conceptual difficulties about revoking access without formally authorizing it. But, they are resolved when we note that authorizing access is not the same as granting it. Authorizing access is a declaration that the person is allowed to have access. Granting access is giving them the info. It is not clear to which of these "revoke" is intended to apply. However, R24 is only concerned about revocation following termination for cause. In those cases, electronic and physical access to all Entity assets is generally revoked. That would effectively deny access to the information, as well. Thus, revocation can be accomplished even though a formal access authorization is not used.
44.44	US Bureau of Reclamation	Disagree	The use of the term classification is not appropriate, suggest "categoruize" to avoid conflict with other requirements in the federal sector.
44.45	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments regarding Requirement 25.1.
44.46	We Energies	Disagree	We Energies agrees with EEI: R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the

#	Organization	Yes or No	Question 44 Comment
			responsible entity is unable to perform sanitization on the media.We Energies agrees with EEI: Requirement 25.1 uses the word "Unrecoverable". This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.We Energies agrees with EEI: When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
44.47	FirstEnergy Corporation	Disagree	We would like to have clearer definition on what is acceptable sanitation methods.
44.48	Entergy	Disagree	What exactly does "Explicitly Authorize" mean? Does this mean that every individual with access to a particular piece of information needs some type of documented approval? Can this be done at a group level based on job function? If so, it should be stated as such.Is approval documentation all that's required, or is a periodically maintained list required as well?What is the definition of "Revoking Access"? Does the individual need to be removed from every Cyber System he/she had access to?
44.49	Manitoba Hydro	Disagree	What is the meaning of "consequence" in Requirement R24.1? There is currently no requirement for revocation of access to sensitive information for any other reason than "for cause". There are no specifics given with respect to "classify" sensitive information in Requirement R24.1 so it is assumed to be at the Responsible Entity's discretion in terms of criteria, methodology, etc. There are no specifics given with respect to "method" in Requirement R25.1 so it is assumed to be at the Responsible Entity's discretion.

45. Tables R24 and R25 provide direction concerning what impact level of BES Cyber Systems to which Requirements R24 and R25 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

Concerns were raised by commenters regarding the applicability of the information protection and media sanitization requirements. The issues centered around the tables being too broad brushed. There was also concern surrounding the differentiation of information sensitivity vs. impact categorization. The drafting team modified the standard to only include information protection for High and Medium Impact BES Cyber Systems and associated Physical Access Control Systems, associated Electronic Access Control or Monitoring Systems, and associated Protected Cyber Assets.

#	Organization	Yes or No	Question 45 Comment
45.1	WECC		Criteria should apply to all impact levels
45.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
45.3	Consultant	Agree	Table R24 - Items 24.3, 24.4, & 24.5 should be moved to their respective subject areas as suggested in the comment on Question 44. (Cyber access, physical access, and information access requirements should be addressed together, as the requirements and processes for each type of access is related.)
45.4	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R24-R25 if it is understood that a blank in the table means N/A.
45.5	PacifiCorp	Disagree	: Lines 24.1 and 24.2 imply that multiple classifications levels for "Sensitive Information" will be required. Need to allow for entities to use one classification for "Sensitive Information".24.4 The requirement to revoke access to sensitive information within 24 hours is impractical. The information may be offsite on paper hardcopy or electronically on media. 24.5 Entities should also be required to correct

#	Organization	Yes or No	Question 45 Comment
			access privileges found to be inaccurate once they have been verified.
45.6	Southwest Power Pool Regional Entity	Disagree	24.1, 24.2, and 25.1 should be applicable to all impact categories.
45.7	US Army Corps of Engineers, Omaha Distirc	Disagree	24.3 does a job description constitute "explicit authorization?" Restrictions on media use as written would preclude using media to transfer information to external systems using media. Should be reworded with the intent that the media be sanitized before disposed of or released outside the organization or allowances made for transfering information. Also could be interpreted to mean an update disk used to update BES Cyber System 1 would have to be wiped and could not be used to update system 2.
45.8	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
45.9	Allegheny Energy Supply	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.10	Allegheny Power	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.11	EEI	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.12	MidAmerican Energy Company	Disagree	Lines 24.1 and 24.2 imply that multiple classifications levels for “Sensitive Information” will be required. Need to allow for entities to use one classification for “Sensitive Information”.24.4 The requirement to revoke access to sensitive information within 24 hours is impractical. The information may be offsite on paper hardcopy or electronically on media. 24.5 Entities should also be required to correct access privileges found to be inaccurate once they have been verified.

#	Organization	Yes or No	Question 45 Comment
45.13	American Municipal Power	Disagree	Please provide a little or no impact category
45.14	US Bureau of Reclamation	Disagree	Requirements should be applied to information sensitivity, not the impact level of the system(s).
45.15	Southern California Edison Company	Disagree	SCE feels that R24 and R25 apply regardless of the BES Control System impact level.
45.16	Progress Energy (non-Nuclear)	Disagree	See comment 14.
45.17	LCEC	Disagree	See previous comments
45.18	BCTC	Disagree	See Question 44 response
45.19	Bonneville Power Administration	Disagree	See the response to question 44.Item 24.5 in Table R24 states as follows: "Verify at least once every 12 months that the access privileges to sensitive information reflect authorization". Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently verifications must occur.
45.20	LADWP	Disagree	Should be restricted to high level only.
45.21	ReliabilityFirst Staff	Disagree	Suggest "Required" for Low Impact in row 25.1.
45.22	Entergy	Disagree	The requirement indicates that the drafting team believes that protection of sensitive information associated with allegedly "low impact" BES Cyber Systems/Components that provide routable protocol attack vector access to control hosts, etc., is unnecessary. Suggest this be rethought.
45.23	Pepco Holdings, Inc. -	Disagree	We agree with EEI's comments.

#	Organization	Yes or No	Question 45 Comment
	Affiliates		
45.24	We Energies	Disagree	We Energies agrees with EEI: As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.

46. The BES Cyber System Maintenance requirement is intended to cover the instances where it is necessary to directly connect a device to the BES Cyber System temporarily to perform a support function, provide appropriate controls on the maintenance device to protect the BES Cyber System. Do you agree with the definition of maintenance as provided?

Summary Consideration:

The definition of "maintenance" that was originally posted as an informal definition adjacent to Requirement R26 in draft CIP-011-1 was:

Maintenance for the purpose of this standard includes the activities associated with the support, testing and upkeep of a BES Cyber System. Examples of maintenance activities for BES Cyber Systems include configuration changes, vulnerability assessments, and software patches. Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System.

There were questions and concerns raised by commenters about what is included in the scope of maintenance activities. There were comments that the term "maintenance devices" needs to be defined. In addition, there was a question regarding whether remote access is included as maintenance. There were suggestions that the definition of maintenance should be focused on the temporary connections.

One commenter suggested the following definition: "Maintenance for the purpose of this standard includes any activity requiring the temporary connection of digital equipment (e.g., laptops) capable of altering the configuration of, or introducing malicious code, to the BES Cyber System." The drafting team considered this feedback, and removed the definition of maintenance from the revised standard, and instead focused on temporarily connecting to a BES Cyber System (such as for maintenance) rather than on the activity being performed. (See proposed CIP-007-5 – System Access Control.)

The requirement for Transient Cyber Assets and media in CIP-007-5 R3.4 is intended to ensure that devices used for temporary access to the BES Cyber System (such as for maintenance) do not accidently introduce malicious code into the BES Cyber System or introduce an unauthorized external access point to the BES Cyber System. This requirement also clarifies that these devices may be temporarily connected to the BES Cyber System, but do not become a part of the BES Cyber System, nor are they considered Protected Cyber Assets. The definition for **Transient Cyber Asset** is as follows:

A Cyber Asset that is: 1) directly connected for 30 calendar days or less to a BES Cyber Asset or Protected Cyber Asset, 2) used for data transfer, maintenance, or troubleshooting purposes, and 3) capable of altering the configuration of or introducing malicious code to the BES Cyber System.

#	Organization	Yes or No	Question 46 Comment
46.1	WECC		Provide a separate definition of maintenance device. The requirement does not state that maintenance devices "directly connect" to BES Cyber Systems. In practice, much maintenance is done via network connections. These criteria need to be reassessed if they are intended to apply to network or remote access.
46.2	SCE&G	Agree	Are maintenance devices also to be treated as remote access, as it is a device external to the BES cyber system?26.2: TFEs may be necessary for maintenance devices not capable of supporting malicious code prevention.
46.3	Regulatory Compliance	Agree	BUT -Please clarify definition of "not permanently connected"What if you have a device that might be connected for several months?
46.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
46.5	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	Definition is good, but please see comments for questions 1.a and 1.b.
46.6	NextEra Energy Corporate Compliance	Agree	NextEra comments that if a laptop is used to remotely connect to a High Impact Control Center BES Cyber System to debug a problem or view Operator issues by temporarily gaining alarm permissions that are assigned to the Operator, is this considered a maintenance activity?
46.7	Progress Energy - Nuclear Generation	Agree	Nuclear facilities have maintenance programs based on CFR. This definition can be improved by acknowledging 10CFR50.65.
46.8	APPA Task Force	Agree	The APPA Task Force agrees with the definition.

#	Organization	Yes or No	Question 46 Comment
46.9	GTC & GSOC	Agree	We recommend the last sentence in this definition (“Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System”) be removed from R.26 and instead be included as part of the BES Cyber System definition, as suggested in our comment to 1.b. above.
46.10	Consultant	Disagree	"Examples of maintenance activities for BES Cyber Systems include configuration changes, vulnerability assessments, and software patches." NONE of these activities are maintenance activities.Configuration changes & software patches are changes covered by change control. Vulnerability assessments are tests covered by vulnerability assessments."Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System." This is not a definition of "Maintenance". This is (or should be) part of the definition of BES Cyber System Component. Suggest both of these statements be removed from the "definition".
46.11	Dairyland Power Cooperative	Disagree	26.2 A definition of a maintenance device seems needed here. I’m presuming this typically would be the computer used by the support staff to access the BES system for maintenance. What if maintenance is being directly performed on a BES system, is there no maintenance device involved in that case?
46.12	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
46.13	Network & Security Technologies Inc	Disagree	Definition is good overall but should address the question of whether a maintenance device is “external” and must therefore connect via an access point.
46.14	National Grid	Disagree	Does testing the capabilities of the relays part of the maintenance activities?
46.15	Dominion Resources Services, Inc.	Disagree	Dominion recommends revising the definition of Maintenance as follows:”Maintenance for the purpose of this standard includes any activity requiring the temporary connection of digital equipment (e.g., laptops) capable of altering the

#	Organization	Yes or No	Question 46 Comment
			configuration of, or introducing malicious code, to the BES Cyber System.”
46.16	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's comment below:The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.17	Black Hills Corporation	Disagree	Middle sentence of Maintenance definition should add ... include but are not limited to configuration...
46.18	Minnesota Power	Disagree	Minnesota Power recommends that the following definitions be adopted by the Standards Drafting Team:Maintenance: Maintenance, for the purpose of this standard, is defined as activities associated with the support, testing and upkeep of a BES Cyber System. Maintenance Equipment: Maintenance Equipment, for the purpose of this standard, is defined as any programmable, electronic device used for maintenance activities that are not permanently connected to the BES Cyber System(s). These devices are not considered part of the BES Cyber System(s).
46.19	PacifiCorp	Disagree	PacifiCorp agrees with EEI's comment below:The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.20	Southwest Power Pool Regional Entity	Disagree	Programmable, general purpose devices connected temporarily are a potentially high risk to the BES Cyber System and should have some minimum set of applicable requirements to minimize that risk. An example is the “wandering laptop” that the support staff uses to connect to High impact BES Cyber Systems and also to surf the Internet from a home Internet connection.
46.21	Duke Energy	Disagree	Suggest replacing “Cyber System Maintenance” with “Cyber System Configuration Management”. The definition (first sentence) states: "Maintenance for the purpose of this standard includes the activities associated with the support, testing and upkeep of a BES Cyber System." There are numerous activities that are associated

#	Organization	Yes or No	Question 46 Comment
			with support, testing, and upkeep of a BES Cyber System that are not related to cyber. This could be tuning, calibrating, etc. and could be done with a screwdriver and a meter. The second sentence includes configuration changes, vulnerability assessments, and software patches. These items are more applicable to the cyber related definition. The suggestion is to combine these sentences:"Maintenance for the purpose of this standard includes the cyber security related activities associated with the support, testing and upkeep of a BES Cyber System, including configuration changes, vulnerability assessments, and software patches."Also, please clarify if non-portable test systems that are connected to BES Cyber Systems thru an access point are included. Otherwise define “permanently connected.”
46.22	BGE	Disagree	Systems used for maintenance should be protected and sanitized per 25.1.
46.23	FirstEnergy Corporation	Disagree	The definition does not clearly specify that the intention is for temporary direct connections.
46.24	Allegheny Energy Supply	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.25	Allegheny Power	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.26	EEI	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.27	Southern California Edison Company	Disagree	The justification of separating end users of BES systems and those involved in maintenance is not consistent with the justification for systems that are used for maintenance. The drafting team has chosen to treat ancillary systems used to perform maintenance type activities on a BES system as equally critical. However, a distinct list of maintenance personnel is required to be maintained. The suggestion for the drafting team is to move this requirement to the section dealing with personnel.

#	Organization	Yes or No	Question 46 Comment
46.28	Progress Energy (non-Nuclear)	Disagree	Troubleshooting also needs to be explicitly included as an example.
46.29	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
46.30	We Energies	Disagree	We Energies agrees with EEI: The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.31	LADWP	Disagree	Will require multiple list management. Individual doing maintenance will already be on physical and electronic access list. Now another list is introduced which will also need to be maintained with the same revocation requirements. 26.1 is not necessary.

47. Requirement R26 of draft CIP-011-1 concerns procedures for BES Cyber System maintenance. Do you agree with the list of criteria that are included in Requirements Table R26? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Commenters raised concerns about the interaction between the list of personnel in draft CIP-011-1 R26.1 and the lists of those granting authorized electronic and physical access. In addition, commenters were concerned about the interaction with other user/account management requirements. Some commenters suggested that all maintenance devices should be documented in a list. In addition, there were comments regarding the allowance for emergency maintenance situations.

Some commenters suggested that Requirement R26.1 is duplicative of Requirement R8 and should be removed, and that Requirement R26.2 is duplicative of Requirement R23 and should also be removed. The drafting team considered this feedback and has attempted to address these concerns by incorporating the requirements associated with maintenance into the requirement in CIP-007-5 – System Access Control regarding preventing the introduction of malware into the BES Cyber System, as the objective of these two requirements is the same.

#	Organization	Yes or No	Question 47 Comment
47.1	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
47.2	National Grid	Agree	Please provide clarification on 26.2.
47.3	Puget Sound Energy	Agree	Puget Sound Energy suggests additional language to clarify if personnel referenced in R26.1 are required to be maintained on the lists associated with Table 5.
47.4	Southern California Edison Company	Agree	SCE requests the Standards Drafting Team combine Requirement R26.1 with other requirements for personnel management and rationalize compliance requirements across personnel.
47.5	APPA Task Force	Agree	The APPA Task Force has no comment on this question.

#	Organization	Yes or No	Question 47 Comment
47.6	Emerson Process Management	Agree	This seems to be a typical task for properly maintaining a cyber (or computer) system. The personnel for doing this task should be already identified in the personnel training, awareness, and risk assessment. This requirement seems to be extra.
47.7	Independent Electricity System Operator	Disagree	- R26.2 define malicious code. Does malicious code mean AV or Spyware detection/prevention or does Malicious code require a code review when deploying code and patches to systems?- R26.1: suggest using a word other than “personnel”
47.8	Network & Security Technologies Inc	Disagree	26.1 - Should be reworded to distinguish “maintenance” personnel from System Administrators, who in most instances also perform maintenance activities. If the SDT concludes there is really no distinction, this requirement becomes redundant and should be eliminated, as lists of users and the permissions they have (including “System Administrator”) are already required.26.2 - Many test devices are appliances and may not be capable of meeting other CIP-011 requirements, including malicious code protection. Thus, this requirement needs to be eligible for TFEs.
47.9	Dairyland Power Cooperative	Disagree	26.1 This overlaps with the requirement of limits access based on electronic accounts. How can this be blended with user/account management?
47.10	ERCOT ISO	Disagree	26.1: Recommend addressing emergency situations more clearly. How should an entity address listing authorized personnel where support companies use a call center and cannot provide dedicated resources for the entity? This is particularly relevant for after-hours issues.
47.11	Regulatory Compliance	Disagree	26.2 - Propose this phrasing:Insure maintenance devices are free and clear of malicious code prior to the intoduction to the BES System.
47.12	Luminant	Disagree	26.2 should read "Detect and respond to the introduction of malicious code."
47.13	Southwest Power Pool	Disagree	26.2: Requirement is not necessarily applicable to special purpose testing devices, such as Fluke meters. Need to revise to limit the requirement to general purpose

#	Organization	Yes or No	Question 47 Comment
	Regional Entity		devices for which malware prevention is possible.
47.14	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
47.15	Liberty Electric Power, LLC	Disagree	CIP-026 will penalize entities if malware gets on any device, even if we employ the best available technology and processes to prevent it. This requirement needs to be removed.
47.16	Alberta Electric System Operator	Disagree	Consider revising R26.1 (or creating a new sub-requirement) to include verifying and updating the list of authorized personnel.
47.17	PacifiCorp	Disagree	Devices used for maintenance should also meet the system hardening criteria of R16 and R17.
47.18	MidAmerican Energy Company	Disagree	Devices used for maintenance should meet the system hardening criteria of R16 and R17.
47.19	Dominion Resources Services, Inc.	Disagree	Dominion appreciates the SDT's thoughts in providing this section and its associated exclusions and is very much in favor of this type of requirement. Dominion agrees with the need to protect the BES Cyber System from harm during this process, but is concerned that these requirements are overly broad.26.1. Dominion recommends that this requirement be deleted. All of these actions are covered by other requirements - access controls, change management, training (roles and responsibilities). It adds another layer of administrative paperwork to track every action made by every authorized technician with no corresponding protection to the BES. 26.2. It appears that this requirement intends to allow technicians to connect their personal laptops to relays without having to reformat them afterwards. This requirement has the unintended consequence of including any device used for maintenance (e.g., fluke meters, etc.). A footnote to avoid the necessity of a potential TFE should be added.

#	Organization	Yes or No	Question 47 Comment
47.20	US Bureau of Reclamation	Disagree	Either individuals have access authorization or they don't. This would appear to be an unnecessary tracking requirement.
47.21	RRI Energy	Disagree	Even if a maintenance device is completely up-to-date on all security patches, and also has up-to date virus detection software with the most recently release virus pattern definitions, I can not 100% ensure that malicious code will not accidentally be introduced to a BES cyber system while connected. "Ensure" is a very absolute word that is hard to match in practice. It would be better to "require " that maintenance devices have the same level of virus protection and patch management as BES Cyber Assets which the maintenance devices are being used to maintain.
47.22	ReliabilityFirst Staff	Disagree	How do personnel get authorized for addition to the list in row 26.1 and how often does this list get reviewed and updated. Add requirements for the conduct of a vulnerability assessment and actions to be taken (i.e., mitigation plan) resulting from this vulnerability assessment.
47.23	Western Area Power Administration	Disagree	How do we differentiate between "maintenance" and "administration"? This seems like a new role? This should be worked into Table R10.
47.24	WECC	Disagree	Item 26.1 would have strong impact on the ability to get timely technical support from large global companies such as Cisco Systems. Perhaps there needs to be distinct definitions for "authorized access" vs "maintenance access"? Item 26.2 seems to be covered in previous R15.The requirement does not state that maintenance devices "directly connect" to BES Cyber Systems. In practice, much maintenance is done via network connections. These criteria need to be reassessed if they are intended to apply to network or remote access.
47.25	NextEra Energy Corporate Compliance	Disagree	NextEra believes that Requirement R26 does not provide anytime frame in which the list should be reviewed nor does it take into consideration vendors. The current language does not provide clear guidance and leaves room for interpretation. The following are the recommended updates:26.1 - NextEra suggests maintaining a list of

#	Organization	Yes or No	Question 47 Comment
			personnel authorized to perform maintenance on the BES Cyber System, allow authorized personnel to escort cyber and physical vendors, and allow only authorized personnel to perform maintenance on the BES Cyber System. The list of personnel authorized to perform maintenance of the BES Cyber System should be updated at least annually.Maintenance devices not permanently connected to BES Cyber Systems are not considered part of the BES Cyber System.
47.26	Allegheny Energy Supply	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.27	Allegheny Power	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.28	EEI	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.29	Southern Company	Disagree	R.26.1 If personnel are required to have a PRA, are granted physical access, system usage is logged and the individual has access credentials for cyber systems, the additional list generation should not be required.Vendor personnel supporting systems would need to be added to the personnel listing, these personnel frequently change. The addition of a name to the list would become a common event.
47.30	Consultant	Disagree	R26 - Suggest changing wording to "implement and document"Suggest changing wording to: "Systems and to ensure that" for correct grammar.R26 - Delete the word "accidentally" from the statement. It would appear a better objective is to prevent the introduction of malicious code, "accidentally" or "intentionally" is not relevant to the objective.Table R26 - Item 26.1 This is a new account management requirement. There are account management activities for cyber access, physical access, information access, and now maintenance access. As such this requirement should be moved to the account management requirements table.Item 26.2 This is not a requirement statement, it is a statement of a desired objective. It is not clear what

#	Organization	Yes or No	Question 47 Comment
			requirement or requirements are intended to meet this objective. Please clarify the requirement.
47.31	FirstEnergy Corporation	Disagree	R26 text needs to be more specific that the intention is for temporary direct connections. Otherwise, R26 appears to be covering CIP 7R1 and 7R3.
47.32	Progress Energy (non-Nuclear)	Disagree	R26.1 - do not see need for this requirement. Changes can only be made with cyber access rights which is covered by other requirements.R26.2 - either eliminate this requirement or make additional provisions for the safe use of maintenance components. CIP standards shouldn't mandate malware protection on all test equipment. The BES Cyber Systems components should already be adequately protected from threats as a result of being compliant with the other requirements.We like the use of the footnote earlier in the standard that allowed the use of the highest level of protection the components can support maybe something like that could be used here too.
47.33	Public Service Enterprise Group companies	Disagree	R26.1 requires maintaining another list of personnel who perform maintenance on a BES Cyber System. These individuals are already tracked and documented under other access lists. Seems like a duplication of effort with no benefit and thus the requirement should be deleted.
47.34	Xcel Energy	Disagree	R26.2 - The requirement should be worded to require anti-malware protection on all maintenance devices. The current wording would make it an enforceable violation if, in spite of best efforts, malware was introduced in to a device.
47.35	Hydro One	Disagree	Recommend adding a Requirement for listing the devices used for maintenance activities.
47.36	Northeast Power Coordinating Council	Disagree	Recommend adding a Requirement for listing the devices used for maintenance activities.

#	Organization	Yes or No	Question 47 Comment
47.37	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that different sections with similar requirements be aligned to avoid confusion. In Table 26, with respect to R26.1, other sections contain similar requirements for Physical Security, Electronic Access, and System Security. We'd prefer to see them re-aligned in a fashion similar to the way the older version of the Standards have them. The new maintenance requirements can be added into those Standards. Similar comment for 26.2; SDG&E feels that this could have been added to the System Security/Protection area.
47.38	LADWP	Disagree	See previous
47.39	BGE	Disagree	Should not have a separate list for maintenance personnel. All personnel should be included on the access control lists created per R7 - R14.
47.40	Duke Energy	Disagree	Suggest replacing "Cyber System Maintenance" with "Cyber System Configuration Management".Requirement 26.1: Please consider adding the word "cyber security related" to make the definition read as follows:Maintain a list of personnel authorized to perform cyber security related maintenance on the BES Cyber System and allow only authorized personnel to perform maintenance on the BES Cyber System.Requirement 26.2: Please consider changing as highlighted below:Detect and prevent the introduction and propagation of malicious code on all computer based maintenance devices.Remove 'accidently' from R26. Suggest removing all of R26.26.1 Specify maintenance performed is done with the maintenance device. We interpret 26.1 to be that the maintenance personnel would not have to be background screened and trained. Suggest including screens and trains for these folks. Or remove the requirement with the understanding that these personnel will have electronic or unescorted physical access to the BES Cyber System. This is extra work for no added security.26.2 will need a TFE. Within generation, we have differing opinions on the definition of code. Suggest clarifying that it does not include programming code.
47.41	Detroit Edison	Disagree	Table R26.2 only addresses the introduction and propagation of malicious code into

#	Organization	Yes or No	Question 47 Comment
			the BES Cyber System. It is likely however, that a device may be modified not to introduce or propagate code but act as a bridge to another rogue network via wireless, cellular or other medium. This would be akin to introducing an unsecured access point into the boundary if this system is not subject to the same requirements equal to or greater than that of highest impact BES Cyber System component. A possible solution could be to require mitigation for multi-homed or bridged networks for all components used for BES Cyber System maintenance, and/or append R26 to read "...and ensure that systems used for maintenance do not introduce malicious code into the BES Cyber System or act as an unauthorized access point into an Electronic Security Perimeter."
47.42	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent unauthorized maintenance on BES Cyber Systems and ensure that systems used for maintenance do not accidentally introduce malicious code into the BES Cyber System") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R26, Section 26.2. It is impossible to prevent the introduction and propagation of malware. This is already addressed in Requirement 15. Recommendation: Delete Section 26.2.
47.43	Manitoba Hydro	Disagree	The personnel authorized to perform maintenance on the BES Cyber System should be identified by roles, not individual names. There are no specifics given with respect to "prevent" in Requirement R26.2 so it is assumed to be at the Responsible Entity's discretion in terms of means, criteria, etc.
47.44	Reliability & Compliance Group	Disagree	There is a possible issue that could occur with this requirement regarding collective bargaining unit rules. It may require that job classifications be created for individuals who work on these systems.

#	Organization	Yes or No	Question 47 Comment
47.45	Constellation Energy Commodities Group Inc.	Disagree	There is no definition of malicious code provided. Clarify the scope of malicious code to include virus, malware and spyware protection, as currently generally commercially understood.
47.46	Minnesota Power	Disagree	Using the definitions proposed in Question 46, Minnesota Power recommends that Requirement R26 state that "prior to connecting Maintenance Equipment or importing data, patches, code or other electronic files into the BES Cyber System, the device and/or files shall be scanned for malware and up-to-date on security patches."
47.47	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
47.48	We Energies	Disagree	We Energies agrees with EEI: R 26.1 is duplicative of Requirement 8 and should be removedWe Energies agrees with EEI: R 26.2 is duplicative of Requirement 23 and should be removed.
47.49	Florida Municipal Power Agency	Disagree	Why is malware mentioned in 26.2, when it already has been covered in R15? FMPA believes this should be removed.

48. Table R26 provides direction concerning what impact level of BES Cyber Systems to which Requirement R26 applies. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Several commenters suggested that the types of connectivity used for temporary connections should be considered. In addition, several commenters suggested that the criteria should be applied to all impact levels. There was also a comment for a no impact category.

The drafting team considered this feedback and attempted to address these concerns by incorporating the requirements associated with maintenance activity into the requirement in CIP-007-5 – System Access Control regarding preventing the introduction of malware into the BES Cyber System, as the objective of these two requirements is the same.

#	Organization	Yes or No	Question 48 Comment
48.1	WECC		Criteria should apply to all impact levels
48.2	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R26 if it is understood that a blank in the table means N/A.
48.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
48.4	Progress Energy - Nuclear Generation	Agree	R26 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
48.5	Allegheny Energy Supply	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extend an electronic security perimeter.

#	Organization	Yes or No	Question 48 Comment
48.6	Allegheny Power	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extend an electronic security perimeter.
48.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
48.8	American Municipal Power	Disagree	Please provide a little or no impact category
48.9	BGE	Disagree	Should not be separate requirements for maintenance of BES Cyber Systems.All personnel should be included on the access control lists created per R7 - R14.
48.10	Consultant	Disagree	The comments on Question 47 regarding moving item 26.1 elsewhere, and Item 26.2 not being a requirement statement preclude an evaluation of application to impact categories.
48.11	Duke Energy	Disagree	Require for low when the maintenance device also connects to medium or high systems.
48.12	EEI	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extent an electronic security perimeter.
48.13	Entergy	Disagree	Basic Maintenance requirements should apply equally for all components of a control system
48.14	FirstEnergy Corporation	Disagree	Until clarity is provided on the above comments (Q46 and Q47), we can not provide a

#	Organization	Yes or No	Question 48 Comment
			response to this question.
48.15	Florida Municipal Power Agency	Disagree	FMPA believes this standard should be removed entirely, as it is already addressed under account control, R7.
48.16	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
48.17	Progress Energy (non-Nuclear)	Disagree	See comment 14.
48.18	Public Service Enterprise Group companies	Disagree	General agreement, but Requirement 26.2 may not be technically feasible for certain types of maintenance devices. To implement this requirement, an Operating System level change to the component may be required, which may be infeasible or not available from the Original Equipment Manufacturer (OEM). This requirement needs to be qualified with the phrase "where technically feasible".
48.19	ReliabilityFirst Staff	Disagree	Suggest "Required" for Low Impact in rows 26.1 and 26.2.
48.20	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that different sections with similar requirements be aligned to avoid confusion. In Table 26, with respect to R26.1, other sections contain similar requirements for Physical Security, Electronic Access, and System Security. We'd prefer to see them re-aligned in a fashion similar to the way the older version of the Standards have them. The new maintenance requirements can be added into those Standards. Similar comment for 26.2; SDG&E feels that this could have been added to the System Security/Protection area.
48.21	Southern California Edison Company	Disagree	The drafting team has chosen to treat ancillary systems used to perform maintenance type activities on a BES system as equally critical. If this is not the intent of the team, the wording of the standard should be modified to reflect the difference in impact levels.

#	Organization	Yes or No	Question 48 Comment
48.22	Southwest Power Pool Regional Entity	Disagree	26.2 should be applicable to all impact categories.
48.23	US Army Corps of Engineers, Omaha Distirc	Disagree	There needs to be a provision for emergency work. Whether that means talking someone through a fix at 2am or hiring a vendor for additional expertise.
48.24	We Energies	Disagree	We Energies agrees with EEI: R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extent an electronic security perimeter.

49. Requirements R27 to R29 of draft CIP-011-1 concern procedures for Cyber Security Incident response. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R27 to R29? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Cyber Security Incident Response" is now addressed in CIP–008–5 — Cyber Security — Incident Reporting and Response Planning.

One of the primary focus areas of the comments concerned coordination with the reporting requirements in CIP 001 and EOP-004 for reporting to the ES-ISAC, and additional guidance in determining incident classifications. The SDT has attempted to coordinate with the drafting team working on revisions to CIP-001 and EOP-004 to ensure the two sets of requirements are coordinated. As the two teams are working in parallel, continued coordination will be necessary.

Several commenters asked for definitions for cyber security incidents and reportable cyber security incidents. The SDT developed a revised definition for "**BES Cyber Security Incident**" as follows:

A malicious act or suspicious event that:

- *Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or*
- *Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or*
- *Results in unauthorized physical access into a Defined Physical Boundary.*

The SDT also proposed a new definition of "**Reportable Cyber Security Incident**" as follows:

Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service.

Several requests were made to clarify the periodic timing requirements such as annual, calendar year, and 12 months. The drafting team reviewed the timing elements of all requirements and where there was a reference to "annual" the SDT replaced this with the following:

". . . at least once each calendar year, not to exceed 15 calendar months between. . ."

Some commenters recommended placing all requirements in the table, not in the objective or in the "pre-amble" for cyber incident reporting, and the drafting team has included all mandatory performance in the requirements.

Many commenters requested clarifications for plan testing requirements, operational exercises, test environment, as well as the number of tests required. The drafting team did attempt to add more clarity to plan testing requirements along with operational exercise, test environment, and number of tests required in the revised standard (CIP-008-5).

Guidance was requested regarding review of the results of incident response tests in less than 60 days. The revised standard now requires the review to take place within 30 calendar days and the update, based on lessons learned, to take place within 60 calendar days of the test.

Some commenters asked for clarity on the inclusion of physical breach aspects of cyber security incidents as reportable. The drafting team is coordinating its revisions with the revisions to CIP-001 and EOP-004 underway through Project 2009-01 – Disturbance and Sabotage Reporting.

There were concerns raised as neither logging nor monitoring are required for Low Impact BES Cyber Systems, there is no basis for requiring Cyber Security Incidents on these systems to be tracked or classified. The applicability section of the entire suite of CIP Version 5 standards has been revised to provide greater clarity on which BES Cyber Systems (High, Medium, and Low Impact) are applicable to specific requirements.

#	Organization	Yes or No	Question 49 Comment
49.1	National Rural Electric Cooperative Association (NRECA)		In R27.1 a "process" is required, but it is not clear as to how a utility is required to "classify" events. Please provide further clarification as to how one is required to "classify" these events.In R29.1 the requirement is to review the plan once every 12 months. Please provide specificity as to what "once every 12 months" means. If I review the plan on Jan. 15, 2001, am I in compliance if I review it again by Jan. 25, 2002? Please make sure that this is clear in the requirement and in all requirements of CIP-010-1 and CIP-011-1.
49.2	Tenaska		Consider combining 28 and 29
49.3	Black Hills Corporation	Agree	Request that the language in 27.3 be broadened to include contacting appropriate law enforcement authorities, similar to CIP-001.
49.4	FEUS	Agree	Agree with Comments: the drafting should clarify the reporting time requirement for

#	Organization	Yes or No	Question 49 Comment
			27.3, reporting to the ES-ISAC
49.5	Green Country Energy	Agree	I really see the need for a reference document or footnotes pointing to sources for guidance on the expectations for these requirements.
49.6	SCE&G	Agree	R29 is a good example of an instance where there are a lot of timing requirements embedded in the requirements. It would be helpful to entities if timing requirements were consistently put in the same location in the tables (under the low, medium, and/or high columns) rather than embedded in the text. The SDT should evaluate the number of timed requirements in relation to the low, medium, and high impact categories. Once the requirements are finalized it would be of benefit to entities to have a list of the timeframe type requirements which must be met for each low, med, and high impact system, as these often present some of the greatest administrative burden in documenting these timeframes were met.
49.7	Allegheny Energy Supply	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.
49.8	Allegheny Power	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.
49.9	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
49.10	Ameren	Disagree	R27 would be better suited in CIP-001, Sabotage Reporting.â€,â€,â€,

#	Organization	Yes or No	Question 49 Comment
49.11	American Electric Power	Disagree	27.1 - 27.3: Recommend requiring this for systems with routable external connectivity only. To properly monitor and alert on cyber security events, a trained IT Security Operations staff and dedicated set of monitoring tools are required. If there is no external connectivity, there is no access for the IT teams to monitor these cyber systems.
49.12	APPA Task Force	Disagree	The APPA Task Force supports the drafting team's efforts on incident response. We propose the following edits:The APPA Task Force believes that NERC, as the ES-ISAC, should have a standard process for entities to use in reporting Cyber Security Incidents. Therefore, we propose the following wording for R27 Table 27.3: 27.3: Use the reporting guidance developed by the ES-ISAC for reporting Cyber Security Incidents, either directly or through an intermediary, or develop a process equivalent or superior to that guidance.28.1, recommend changing "once every 12 months" to "Annually."29.1, recommend changing "once every 12 months" to "Annually."
49.13	Bonneville Power Administration	Disagree	The objectives of these requirements ("so that responses to Cyber Security Incidents involving BES Cyber Systems can occur" and "to verify its response plan's effectiveness in responding to a Cyber Security Incident impacting a BES Cyber System") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table 28, Section 28.1. It's not clear whether testing in January 2010 and June 2011 would satisfy the requirement, since February 2010 through January 2011 would be a 12-month period with no testing. Recommendation: Replace "every 12 months" with "each calendar year". Also, there are other ways to test, as well. Recommendation: "Test the execution of the incident response plan (by recovering from an actual incident, or with a test at least as comprehensive as a paper drill) at ... Table 29, Section 29.1. Same comment as 28.1

#	Organization	Yes or No	Question 49 Comment
49.14	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
49.15	Consultant	Disagree	R27 - "...so that responses to Cyber Security Incidents involving BES Cyber Systems can occur." should be reworded. Suggest "to identify responsibilities and actions in response to an incident associated with BES Cyber Systems."Table R27 - should specify in each statement that it applies to BES Cyber Systems."Cyber Security Incident" is defined in the Glossary using the terminology from CIP-002 through CIP-009. That definition should be revised by including a new definition in this standard using the terminology associated with CIP-010 and CIP-011.Item 27.3 Not all Cyber Security Incidents are reportable to ES-ISAC as indicated in The Security Guidelines for the Electricity Sector: Threat and Incident Reporting, version 2.0, dated April 1, 2008. Suggest clarifying the statement about reporting.Table R28 - Item 28.1 Clarify the periodicity to be consistent throughout the standard. Annual, 12 months, or other statement. Suggest getting information from the nuclear industry on stating and handling periodicity of requirements.Table R28 - Item 28.1 It is not clear from the table whether one test is required, or two tests (one for High Impact & one for Medium Impact) Suggest some clarification wording in the requirement statement.Table R29 - Item 29.1 Clarify the periodicity to be consistent throughout the standard. Annual, 12 months, or other statement. Suggest getting information from the nuclear industry on stating and handling periodicity of requirements.Item 29.2 - Suggest deleting the word "each" as an unnecessary word.Item 29.3 - Actions necessary to address documented plan deficiencies may not be completed within 30 days, so requiring an update to the plan with 30 days would appear to create a situation where compliance is not viable, or sensible. Suggest modifying to be based on completion of corrective actions.Item 29.5 Suggest deleting the word "all" as an unnecessary word.
49.16	Detroit Edison	Disagree	Table 28.1 and 29.1 refer to a period of "12 months". We prefer “at least once per calendar year, not to exceed 14 months between instances”.

#	Organization	Yes or No	Question 49 Comment
49.17	Dominion Resources Services, Inc.	Disagree	Per R18, neither logging or monitoring are required for Low Impact Systems, hence there is no basis for requiring Cyber Security Incidents on these systems to be tracked or classified.
49.18	Duke Energy	Disagree	Requirement 27: The requirements need a definition of a "Cyber Security Incident". This needs to differentiate between a cyber security attack and a mistake that a technician makes in the plant. We don't need to report every time a technician forgets their password.Requirement 28 only has one item and it is related to Requirement 29. Perhaps combine these two?Table 28: 28.1 assumes there is only one incident response plan when R27 allows for multiple plans. We would like to test AN incident response plan instead of all of them. Or allow for a different time frame (12 months per plan) to test all of them. Combine 28 with 29 if the VSL is the same.Table 29: 29.1 We would like to review AN incident response plan instead of all of them. Or allow for a different time frame (12 months per plan) to review all of them.
49.19	E.ON U.S.	Disagree	Comments: CIP-011, R27 The application of this standard to low-impact BES CS's seems inconsistent. There are not requirements for monitoring security events associated with these assets.CIP-011, R29.1 The application of this standard to low-impact BES CS's seems inconsistent with other requirements for monitoring security events associated with these assets.CIP-011, R30.2 Please clarify whether "...identification of the personnel responsible..." require naming individuals, or job functions?
49.20	EEI	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.

#	Organization	Yes or No	Question 49 Comment
49.21	Emerson Process Management	Disagree	Without being required to perform tasks in System Security, low impact BES Cyber systems may not be able to easily classify cyber security incidents.
49.22	Entergy	Disagree	The current definition of “Cyber Security Incident” will need to be changed as it references ESPs and PSPs. As such, it may be a good idea to define what this term means here.It is observed that as written there is no longer a requirement to keep documentation associated with a Cyber Security Incident (i.e., akin to CIP-008 R2). Is this the intent?
49.23	ERCOT ISO	Disagree	29.2: Should be 30 days rather than 60 days to align with FERC Order 706.
49.24	FirstEnergy Corporation	Disagree	27.1: From CIP-008 R1.1, what happened to the concept of "reportable"?
49.25	Independent Electricity System Operator	Disagree	- R27.1: note that the word “reportable” has been removed; CIP-008-2, R1.1 stated “Procedures to characterize and classify events as reportable Cyber Security Incidents”- R28.1: modify the sentence to state “Test the execution of the Cyber Sec
49.26	ISO New England Inc	Disagree	see recommendation for review in prior requirements use same for all annual/ 12 month review.
49.27	Manitoba Hydro	Disagree	The wording of Requirement R28.1 should be revised as the phrase “with a paper drill” could be misinterpreted. There are no specifics given with respect to ‘classifying’ events in 27.1 so it is assumed to be at the Responsible Entity’s discretion in terms of criteria, etc.
49.28	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R27, but recommends that the last phrase be changed from “so that responses to Cyber Security Incidents involving BES Cyber Systems can occur” to “so that responses to Cyber Security Incidents involving BES Cyber Systems follow a defined plan.” Responses can (and will) happen with or without a plan. The purpose of R27 is to define, ahead of time, a process to ensure an orderly response.Minnesota Power

#	Organization	Yes or No	Question 49 Comment
			generally agrees with the proposed Requirements R29, but recommends that this Requirement should be revised to ensure consistency with Requirement R32. For example, Part 29.1 should state "Review the incident response plan(s) at least once every 12 months or when BES Cyber System(s) have any system, organization or technological changes. Document any identified deficiencies, changes or improvements.") If this language was consistent with Requirement R32, the following issues could be resolved. In addition, the Standards Drafting Team should consider whether or not Parts 29.2 - 29.5 should also be required of Medium Impact Systems (since Part 28.1 requires testing for those systems) with a longer timeframe.
49.29	Network & Security Technologies Inc	Disagree	R27 - should clarify whether cyber security incidents of a physical nature are included and, if so, should tie back to 5.11.29.2 - Sixty days seems like a very long time to wait before evaluating the effectiveness of response actions, esp. if they were taken in response to an actual incident. Suggest revising to require a much more immediate "after action" review, at least for actual incidents. Should be a matter of days - perhaps 7 or less, not months. Even for tests, 60 days seems overly generous. Suggest revising to 30 days.
49.30	Nuclear Energy Institute	Disagree	Does the definition of cyber security incident, as used in this Standard, comport with the definition in Section 215 of the FPA? ("The term "cybersecurity incident" means a malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communication networks including hardware, software and data that are essential to the reliable operation of the bulk power system.")
49.31	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
49.32	Progress Energy - Nuclear Generation	Disagree	Incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security

#	Organization	Yes or No	Question 49 Comment
			Plans for comments for nuclear generating facilities.
49.33	Progress Energy (non-Nuclear)	Disagree	What makes 28.1 and 29.1 different that requires 2 different requirements? If you test the execution every 12 months then you have effectively done a review.
49.34	ReliabilityFirst Staff	Disagree	Problem with auditing the "effectiveness" of R28 without some clear guidelines that would lead to consistent application by all auditors. For R29.4, please clarify what is meant by system, organizational, and technology changes.
49.35	San Diego Gas and Electric Co.	Disagree	SDG&E believes that the Incident Response Plan requirements should only apply to Medium and High impact assets. Including Low impact assets in these requirements seems like overkill. For example, in R27.3, we don't feel that we would necessarily report a "Cyber security incident" on a Low impact item to ES-ISAC.
49.36	Southwest Power Pool Regional Entity	Disagree	27.1: Should be a "reportable" cyber incident. May be appropriate to add as a separate requirement to identify Cyber Security Incidents as "reportable." 27.2: "Communication plans" needs to be defined somewhere. 28.1: Consider changing "Test the execution of the incident response plan" to "Exercise the incident response plan." Clarify that the exercise scenario must involve a covered BES Cyber System and that the exercise must follow (actually exercise) the incident response plan steps. Also need to clarify whether each BES Cyber System, or at least one in each impact category represented, must be included in the exercise. Requiring the inclusion of each BES Cyber System is not recommended due the potential burden; this is a clarification issue to ensure the entities and the auditors have the same understanding. 29.1: Should the 12-month requirement be +/- one month? 29.2: Reviewing an exercise or actual response 60 days after the fact is too long. To keep it fresh in the minds of the responders, 30 days max is suggested, 15 days for High impacting systems is preferred.
49.37	US Bureau of Reclamation	Disagree	Why would we have incident reporting requirements related to systems that we have no processes to track them on...? This would appear to be in conflict with many of

#	Organization	Yes or No	Question 49 Comment
			the previous requirements that did not apply to low systems.
49.38	We Energies	Disagree	We Energies agrees with EEI: Suggested modification to R27.3: “Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC).”We Energies agrees with EEI: If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.

50. Tables R27 to R29 provide direction concerning what impact level of BES Cyber Systems to which Requirements R27 to R29 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Cyber Security Incident Response" is now addressed in CIP–008–5 — Cyber Security — Incident Reporting and Response Planning, and "Cyber Security Incident Response Plan Testing" is addressed in CIP-009-5 - Cyber Security — Recovery Plans for BES Cyber Assets and Systems."

The primary focus areas of the comments received was on impact levels and the concern for coordination with the reporting requirements in CIP 001. The SDT has coordinated with the drafting team working on revisions to CIP-001 to ensure the two sets of requirements are coordinated.

Many commenters requested that Incident Response requirements for Low Impact BES Cyber Assets or non-routable connections be removed along with providing improved consistency between requirements related to impact level. The revised requirements (now contained in CIP-008-5) do not apply to Low Impact BES Cyber Assets. The SDT updated the applicability section of all requirements in the entire suite of CIP Version 5 standards.

It was suggested that Requirement R28.1 should be modified to clarify that test plans should be exercised once each calendar year (vs. every 12 months), and that these tests will be conducted on an overall system basis and not on a per system or per component level basis. This requirement is defined in CIP-009-5 Requirement R2.1, Recovery Plan Implementation and Testing. There were suggestions regarding the clarification of the plan testing requirements, operational exercises, and test environment, and there were comments regarding the addition of guidance on Cyber Security Incident classification by adding glossary definitions of Cyber Security Incident and Reportable Cyber Security Incident. The testing requirements, operational exercises, and test environment are described in CIP-009-5, and a couple of terms were added to the NERC Glossary for completeness.

The SDT developed a revised definition for "**BES Cyber Security Incident**" as follows:

"*A malicious act or suspicious event that:*

- *Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or*
- *Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or*
- *Results in unauthorized physical access into a Defined Physical Boundary."*

The drafting team proposed a new definition of "**Reportable Cyber Security Incident**" as follows:

" Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service."

A few comments were directed at reviewing of results of Incident Response tests in less than 60 days, including the physical aspects of Cyber Security Incidents. The SDT modified this requirement and now requires that this review be performed within 30 days of the BES Cyber Security incident or test and to update the BES Cyber System Incident response plan based on lessons learned within 60 calendar days of the BES Cyber Security incident or test.

Issues identified in comments for the SDT to consider for modifications included additional guidance on performing Cyber Security Incident classification. This is now covered in the guidance documentation for CIP-008 and CIP-009..

With Version 5, the drafting team has worked to make the applicability for each requirement very clear.

#	Organization	Yes or No	Question 50 Comment
50.1	Hydro One		Recommend for consistency incident response plan for medium and high impact mirrors 31.1 and 31.2 time frames not to exceed 24 and 12 months respectively.
50.2	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R27-R29 if it is understood that a blank in the table means N/A.
50.3	Bonneville Power Administration	Agree	Items 28.1 in Table R28 and 29.1 in Table R29 states that the incident response plan shall be tested "at least once every 12 months" and that the incident response plan should be reviewed at least once every 12 months." Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently testing or review must occur.
50.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
50.5	Florida Municipal Power	Agree	FMPA believes "12 months" should be changed to "annual"

#	Organization	Yes or No	Question 50 Comment
	Agency		
50.6	PacifiCorp	Agree	29.3 - Does the requirement to update each response plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?29.4 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the response strategy or response activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the response.
50.7	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
50.8	Southern California Edison Company	Agree	SCE recommends that the standards drafting team use the phrase “cyber security incident” or “physical security incident” to differentiate them from the occurrence of system events that may or may not result from the breach of a “cyber” or “physical” control. As the Requirements are currently written, there is no logging and monitoring requirements for low impact systems. It is inconceivable how a registered entity could implement an incident response plan at these facilities when per CIP standards access and use of these facilities is not required. If the drafting team intends for incident response, as it pertains to Sabotage Reporting under CIP 001, they should state it.
50.9	Alberta Electric System Operator	Disagree	In Table R29, for 29.2, consider revising to review results for High Impact systems to within 30 days, and Medium Impact systems to within 60 days.
50.10	Allegheny Energy Supply	Disagree	R 28.1 should be modified to be clear that testing of incident response plans need not

#	Organization	Yes or No	Question 50 Comment
			include every possible BES Cyber System.
50.11	Allegheny Power	Disagree	R 28.1 should be modified to be clear that testing of incident response plans need not include every possible BES Cyber System.
50.12	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
50.13	Ameren	Disagree	R28.1 - Based on the number of Medium Impact Systems this will be labor intensive with no added protection to the BES. Suggest that this requirement only remain for High Impact Systems.
50.14	American Electric Power	Disagree	Please see response to Question 49.
50.15	American Municipal Power	Disagree	Please provide a little or no impact category
50.16	American Transmission Company	Disagree	R27 requires a response to cyber security incident for all Low Impact BES Cyber Systems; however R18 does not require monitoring and/or logging of Low Impact BES Cyber Systems. How do you respond to an incident unless it is being monitored?
50.17	BGE	Disagree	R29 should apply to any BES Cyber System required in R28.
50.18	Black Hills Corporation	Disagree	28.1 and 29.2 should also be required for Low Impact BES Cyber Systems.
50.19	Consultant	Disagree	Table R27 to Table R29 - It doesn't appear to make sense that the Incident Response Plan applies to all impact level categorizations, while testing the plan applies to Medium Impact & High Impact assets, and actions related to updating the plan only apply to High Impact assets.It would seem logical that the columns in this table should indicate the requirements apply to the same impact level assets, which would be either only High Impact assets, or Medium & High Impact assets, but not a mix.
50.20	Dominion Resources	Disagree	29.2 - 29.5 should be required for Medium Impact to be consistent with R28. R29.2 thru R29.5 currently use text to convey numbers (e.g., sixty vs. 60). This is not

#	Organization	Yes or No	Question 50 Comment
	Services, Inc.		consistent with the convention used throughout CIP-011 and is more difficult to read. A single convention using numerical values should be used throughout.
50.21	Duke Energy	Disagree	Requirement 28.1: is this one test of the cyber incident response plan (global) once per 12 months or is this the test of test of the cyber incident response plan for EACH BES cyber system per 12 months? Once globally per 12 months should be plenty.Requirement 29.5: is the communication of updates a broadcast or is specific feedback from each person required? Remove these requirements for Low Impact.
50.22	EEI	Disagree	EEI suggest that R 28.1 should be modified to be clear that test plans should be exercised annually and not at a per system or per component level.
50.23	Entergy	Disagree	These Requirements should apply for all three BES Cyber System/Component Impact categories.
50.24	Garland Power and Light	Disagree	Requirement 27.1, 27.2, 27.3 and 29.1 - remove from “Low Impact” classification
50.25	ISO New England Inc	Disagree	If the Entity’s Incident Response Plan is tested (instead of testing each BES Cyber System), recommend that “Require” should apply for High Impact, Medium Impact, and Low Impact BES Cyber Systems
50.26	LADWP	Disagree	Table 27 - low impact should not be included.
50.27	Manitoba Hydro	Disagree	Cyber Security Incidents for Low Impact BES Cyber System should not require reporting to the ES-ISAC.
50.28	MidAmerican Energy Company	Disagree	29.3 - Does the requirement to update each response plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency? 29.4 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is

#	Organization	Yes or No	Question 50 Comment
			considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the response strategy or response activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the response.
50.29	Minnesota Power	Disagree	With the implementation of the changes discussed in Question 49, these impact levels are generally acceptable.
50.30	National Grid	Disagree	o National Grid recommends deleting 27.3 for Low Impact BES CS o National Grid recommends the timeframes for Medium and High Impact in R28 similar to Table R31 31.1 and 31.2 for consistency.
50.31	Network & Security Technologies Inc	Disagree	Table 27 includes Low Impact systems, but Table 18 (event monitoring) does not. Need to change one or the other.
50.32	Northeast Power Coordinating Council	Disagree	Recommend for consistency incident response plan for medium and high impact mirrors 31.1 and 31.2 time frames not to exceed 24 and 12 months respectively.
50.33	Oncor Electric Delivery LLC	Disagree	The Incident Response Plan should be required for the entity, not for every High Impact cyber system. Requirement 29.4, update of Incident Response Plan, we suggest these reviews be conducted quarterly.
50.34	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
50.35	Progress Energy (non-Nuclear)	Disagree	Need to clarify the annual/12 month/365 day issue.
50.36	ReliabilityFirst Staff	Disagree	For R29, each subrequirement should be "Required" for all the "Medium" impact BES Cyber Systems.

#	Organization	Yes or No	Question 50 Comment
50.37	San Diego Gas and Electric Co.	Disagree	SDG&E also feels that instead of using the word “impact” for these Requirements, apply a concept of “risk” for inclusion. We would want to identify the risks with associated systems security and protect accordingly
50.38	Southwest Power Pool Regional Entity	Disagree	28.1 should be applicable to all impact categories. An incident response plan should be tested to verify that it will work when needed. 29.2 through 29.5 should be applicable to all impact categories, perhaps with shorter time frame for higher impact systems.
50.39	US Bureau of Reclamation	Disagree	Why would we have incident reporting requirements related to systems that we have no processes to track them on...? This would appear to be in conflict with many of the previous requirements that did not apply to low systems.
50.40	We Energies	Disagree	We Energies agrees with EEI R 28.1 should be modified to be clear that testing of incident response plans need not include every possible BES Cyber System.
50.41	WECC	Disagree	All items should be required for medium impact levels in R29Criteria should apply to all impact levels.

51. Requirements R30 to R32 of draft CIP-011-1 concern procedures for BES Cyber System Recovery. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R30 to R32? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Recovery Plans" are now addressed in CIP–009–5 — Cyber Security — Recovery Plans for BES Cyber Systems

The primary focus areas of the comments were concerns with improving the clarity of the periodic timing requirements, the requirement to reinstall and configure any application and system software using its baseline configuration vs. functionality, and the recognition that a large amount of test equipment will be necessary to develop representative environments for numerous disparate facilities.

Some commenters noted the different terms used for references to annual activities. The SDT reviewed the use of annual, calendar year, 12 months, etc. and in the revised standards used the phrase, ". . .at least once each calendar year, not to exceed 15 calendar months between. . ." .

There were suggestions that the testing requirements should only apply to control centers. Additional guidance was requested for operational testing, the use of redundant sites as an acceptable means to address recovery, and for testing of information that is stored on backup media. The SDT added some information about testing in the Rational Box for the proposed CIP-009-5 R1. Testing is necessary to verify the Responsible Entity's Recovery Plan's effectiveness. Planned and unplanned maintenance activities may also present opportunities to execute and document an Operational Exercise (see NIST SP 800-84, Functional Exercise). This is often applicable to operational systems where it may be otherwise disruptive to test certain aspects of the system or contingency plan. NIST SP 800-53, Appendix I, contains supplemental guidance.

Recovery Testing – Operational Test every 36 months should count for the annual test. The SDT notes that there is a FERC directive to add a requirement to conduct a full operational test of the recovery plan once every three years – so the suggestion to count the full operational test as the annual test was adopted. Areas of opportunity suggested for modification of the standards by the SDT were to provide recovery plan testing clarifications, data retention plan clarification, identification requirements of "Personnel Responsible", and incident recovery plan reviews.

Commenters suggested changes and provided various requests/suggestions for re-wording/wordsmithing and improved coordination of backup and recovery with EOP-008. The SDT has coordinated its proposed requirements with the now FERC approved EOP-008-1 – Loss of Control Center Functionality. Commenters suggested that all requirements should be in the table, not in the objective or in the "pre-amble" to the requirements and that the SDT should consider providing a summary table for all periodic requirements and remove the "how to" statements from the requirements. The SDT has included all mandatory performance in the requirements of the revised

standards. The SDT did not adopt the suggestion to develop a summary table for periodic requirements as the format for Version 5 is considerably different from the format proposed when the requirements were all combined in CIP-011.

Several commenters suggested adding definitions for terms such as "initially stored," and the SDT believes that these terms do not have a unique meaning when used in the standard and do not require a formal definition. The team has tried to limit its proposed definitions to those terms that either have a unique meaning when used in a NERC Reliability Standard, or when misunderstanding a word may have a material impact to reliability.

#	Organization	Yes or No	Question 51 Comment
51.1	Dairyland Power Cooperative		30.5 does the system test require a test of every element in the recovery plan? If a recovery plan covers multiple systems, must all systems be tested annually? Or is it sufficient to test some scenarios affecting some systems?
51.2	National Rural Electric Cooperative Association (NRECA)		In R31.1 and R31.2 there are references to "once every 24 months" and "once every 12 months." Please ensure these timeline requirements are clear similar to my comments in Question 49 regarding R29.1.
51.3	SCE&G		R31.3: What constitutes and operational exercise? What is the scope of the recovery and systems to be covered (all high impact cyber systems, or one sample system if the same recovery plan is used acroos all)?
51.4	WECC		Item 31.2 looks like it should be two separate items. Consider making a separate item for "Test any information used..." at the same required level for high impact.
51.5	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
51.6	Florida Municipal Power Agency	Agree	30.5 mentions restoring to the previous baseline configuration, without regard to the fact that the baseline may have been the source of the problem. FMPA suggests "prior", giving the RE the flexibility to restore systems based on what they know to be a working system.

#	Organization	Yes or No	Question 51 Comment
51.7	Independent Electricity System Operator	Agree	- R30.1 Please define Recovery Plan. Some regions are not accepting a backup control center, with redundant systems and data as suffice for recovery and think it means building a component from scratch (ie install os, configuration, install application,
51.8	PacifiCorp	Agree	30.4 - Define “protection of information required to successfully restore”.30.5 - The requirement to reinstall and configure any application and system software using its baseline configuration does not consider strategies, such as redundancy or high availability, making the reinstall of a system unlikely and impractical.Define “secure backups” and “functionality”.31.2 - By including the testing of information used in the recovery of BES Cyber systems that is stored on backup media in 31.2 means that Low and Medium Impact BES Cyber Systems do not require testing of such information? If so, it should be a standalone requirement.Define “initially stored”, “useable and current”. This could be interpreted as a full restore to a system, one file being restored as verification that data is not corrupt and process to restore are in place to looking at a tape log and seeing that a backup was made of the data.32.4 and 32.6 - When does the clock start ticking. There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the recovery strategy or recovery activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the recovery.31.5 - Does the requirement to update each recovery plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?
51.9	Southern California Edison Company	Agree	The standard should clarify that the time line for the operational exercise that is required by R31.3 is not 36 months for every device is scope, but rather than every disaster recovery plan has to be tested on a scheduled basis.The operational impact of protecting backups at par with operational BES systems is substantial. The backup

#	Organization	Yes or No	Question 51 Comment
			does not support real time BES reliability and should be treated as an ancillary system (i.e. climate control, fire prevention etc.) or similar to systems such as access points and boundary protection devices.
51.10	Alberta Electric System Operator	Disagree	In Table R30, for 30.5, consider changing “known secure backups” to “known good backups” since availability and integrity are more important than confidentiality during system recovery.
51.11	Ameren	Disagree	R30.1 - If you miss listing all conditions or you fail to activate your plan if the certain condition is met makes this difficult to provide complete documentation for an audit. Suggest removal or changing the phrase to "List possible conditions that may activate the recovery plan, update these conditions within 30 days of an actual incident that was not included within the scope of the originally documented conditions."
51.12	American Electric Power	Disagree	31.2: Regarding "Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current", should this be a separate line item? It seems out of place in 31.2.
51.13	APPA Task Force	Disagree	The APPA Task Force supports the drafting team’s efforts on System Recovery. We propose the following edits:31.2, recommend changing “once every 12 months” to “Annually.”32.1, recommend changing “once every 12 months” to “Annually.”32.4, recommend changing “once every 12 months” to “Annually.”
51.14	BGE	Disagree	Provide definition of “operational exercise”
51.15	Bonneville Power Administration	Disagree	The objectives of these requirements (“so that BES Cyber Systems can be restored to a defined state,” “to verify recovery plan readiness and effectiveness,” and “to ensure that the recovery plan(s) will function as intended and that personnel are aware of any relevant changes”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than

#	Organization	Yes or No	Question 51 Comment
			appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R30, Section 30.5 is too prescriptive. For example, one way to do backups is to take a complete image of the system. Restoration becomes merely an issue of restoring that image. There is no need to reinstall and reconfigure. Recommendation: Remove 30.5Table R31, Sections 31.1 and 31.2. There are other ways to test, as well. Testing methods should be devised by the RE, not the standard. The frequency may vary based on the Impact status of the system. However, standardization on the middle ground of at least once every 24 months would simplify compliance.
51.16	Con Edison of New York	Disagree	This criterion should be for control centers or SCADA system only. Many cyber systems which would need to comply with CIP-011 do not have back-ups. The BES can be operated effectively even if other cyber systems are down.
51.17	Constellation Energy Control and Dispatch, LLC	Disagree	Provide a definition of operational exercise.
51.18	Constellation Power Source Generation	Disagree	R31.3 uses the term “representative environment.” At the CIP V4 Workshop, the team stated they used this vague term to give entities flexibility in their operational exercises, but this is not auditable.
51.19	Consultant	Disagree	Table R30 Item 30.5 - First bullet - Suggest changing the word "defined" to "documented" or "identified" or "identified and documented". R23 does not define the baseline.Item 30.5 - Second Bullet - Suggest deleting the words "any" & "most" & "known" & "secure" New wording: "Load information from recent backups." Suggest deleting this bullet. Reloading backup date should be an operational decision made based on the conditions that exist at the time of recovery, and not "forced" by a requirement.Table R32 - Item 31.2 This is two requirements. Suggest separating each into it's own line item.Table R32 - The periodicity requirements of this table should be adjusted. The testing and operational exercise statements are not consistent with the

#	Organization	Yes or No	Question 51 Comment
			incident response plan requirements. Suggest making the requirements for incident response plans and recovery plans consistent.Item 32.2 & 32.3 Suggest changing the word "execution" to "occurrence".Item 32.5 - Actions necessary to address documented plan deficiencies may not be completed within 30 days, so requiring an update to the plan with 30 days would appear to create a situation where compliance is not viable, or sensible. Suggest modifying to be based on completion of corrective actions.Item 32.7 Suggest deleting the word "all" as an unnecessary word.
51.20	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R31.2 the term “current” is not valid if any data has changed since the backup. A backup completed 12 months earlier could never be considered current on an operational system. Consider removing this term.
51.21	Detroit Edison	Disagree	Table 31.2 and 32.1 refer to a period of "12 months". We prefer “at least once per calendar year, not to exceed 14 months between instances”.Table 32.4 should not be an annual update but should be triggered on the required review in 32.2. Consider revising to a sixty day window after the review.Table 32.6 The term "any" is too broad. Consider revising to read "...changes that impact the recovery plan."Table 32.7 Revise "recover" to "recovery"
51.22	Dominion Resources Services, Inc.	Disagree	30.2. The phrase “including identification of the personnel responsible” should be removed from this requirement. Roles and responsibilities should be adequate for the plan. There should not be a need to list 20 relay technicians that could be allowed to recover a substation system. 31.2. The second paragraph of this requirement should be revised to state “Verify BES system can be restored from backup initially and at least annually thereafter”.32.1. The phrase “or when BES Cyber Systems are replaced” should be changed to “or when impacted by BES Cyber System changes.”32.6. The phrase “technology changes” should be changed to “technology changes that impact the recovery plan.” (e.g., not all organizational changes affect the recovery plan.)32.7. The word “recover” should be changed to “recovery”.

#	Organization	Yes or No	Question 51 Comment
51.23	Duke Energy	Disagree	Table 30:30.2 remove “including identification of the personnel”30.3 change ‘personnel responsible’ to “responders”30.5 CIP should not prescribe HOW we restore the system. Suggest removing and adding ‘restoration’ to the list in 30.4Table 31:31.1 multiple plans may be required. Same comment as 28.1 above. Is this once per 12 months per the plan or once per 12 months for each BES cyber system? Suggest allowing 12 months per plan to test.31.2 specify that verifying backup media functionality is an acceptable test.31.3 operational exercises at some generation stations may be unrealistic (unrealistic for availability or costs)Table 32:32.6 this should be part of change managementSuggest allowing 12 months per plan for review.Remove ‘incident’ from 32.2 and 32.3
51.24	EEI	Disagree	Suggested revision for R30.2:Roles and responsibilities of responders, including identification of the personnel (using Job title or job function) responsible for recovery efforts.
51.25	Emerson Process Management	Disagree	It seems there is a conflict between 31.2 and 31.3. If the operational exercise needs to be donw every 36 months per 31.3, then, it should not be needed again every 12 months per 31.2.
51.26	Entergy	Disagree	Entergy agrees for High and Medium Impact Cyber Systems it is important to be able to recover and demonstrate that the recovery plan and backup media used in the process is sufficient to recover the BES Cyber System however, requirement 31.2 and 31.3 appear to be a little redundant although not completely. In requirement 31.3 the entity is required to demonstrate recovery in a representative environment where 31.2 only the backup media is required to be verified as useable and current. Both of these activities provide validation that data can be recovered from the backup media. Requirement 31.3 should be deleted - testing the plan every 12 months either via paper drill or full operational exercise or actual incident coupled with validating the backup media is readable is sufficient to the demonstrate recovery. Requirement 31.1 should be change to include: “Testing any information used in the recovery of

#	Organization	Yes or No	Question 51 Comment
			the BES systems that is stored on backup media when initially stored and at least every 24 months to ensure that the information is useable and current."
51.27	ERCOT ISO	Disagree	30: Request that the use of redundant sites is an acceptable means to address recovery.30.2: Recommend noting what information is necessary here. Are group notifications considered sufficient (e.g., on-call rotations)? 32.2: Should be 30 days rather than 60 days to align with FERC Order 706.
51.28	FirstEnergy Corporation	Disagree	R31 - 31.3 - Need clarity on what is meant by 'Operational' exercise. We believe the intent was business operations, not IT system operations and related DR plan recovery. A business operational exercise is a business continuity planning issue. (example: EMS Operation hot-site testing) Sub-requirement 31.3 would need to be answered by each business unit and not within an IT DR Team response as business operational (BCP) tests are not performed for DR Plans. DR Plans have physical and media type testing which it appears to be what the intent was for 31.1 and 31.2. Need clarity on ownership. It seems like 31.1 and 31.2 are owned by IT, and 31.3 is owned by business units. R32 - 32.6 - We do not agree with changing names in individual recovery plans except during the annual review. Normally organization changes affect the recovery plan approvers list and if changed, would require re-approval of the DR plan. Given the complexity of our critical DR plans, this requirement is not reasonable, and certainly not within a 30 day window - especially if the new name is for someone just starting in a position. We agree that interim organizational changes could be made for call trees of 'personnel expected to respond to/perform a recovery using the recovery plans', but call trees are not part of the individual recovery plans and are instead part of an overall recovery plan. R32 - 32.7 - Recovery is misspelled ('communicate all recover plan...')
51.29	Garland Power and Light	Disagree	Requirement R30 requires the implementation of the plan to be in compliance - Concern is that for some business reason (perhaps a certain business strategy or the economy) some system or facility might not need to be rebuilt. There should be a provision for the Responsible Entity to provide justification to Regional Entity for not

#	Organization	Yes or No	Question 51 Comment
			rebuilding and not be in violation for not implementing and actually rebuilding the "whatever" that failed.
51.30	GE Energy	Disagree	36 months is too long between operational recovery exercises. This should be at maximum 24 months, and should require re-validation if a large system configuration change is made, such as hardware changes, version upgrades, or 3rd party software upgrades.
51.31	GTC & GSOC	Disagree	We recommend R32.1 be changed to the following: "Review and update recovery plan(s) at least once every 12 months or when a Cyber Security Incident recovery of BES Cyber System(s) does not effectively proceed according to the documented plan."We recommend the word "incident" be replaced throughout R30 through R32 with the words "Cyber Security Incident"
51.32	Hydro One	Disagree	Recommend changing the bullets for 30.5 to start with "plans for". The first bullet should be "install" not "reinstall." The recovery plan does not need to include non-BES Cyber Systems. The third bullet should test the BES Cyber System Component(s).
51.33	ISO New England Inc	Disagree	31.2 - "Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current. "impossible to test " - is this to test if your backup works and is usable? Realtime data is never restored - clarification on information and is this test your media for usability? "Test when initially stored"?? Not feasible. More appropriate Verify backup completed successfully, not verify data that was backed up. Control Centers utilize full functioning backup facilities for recovery from the main center being compromised and or rendered unavailable, so for control centers the recovery should be to run from the backup control center once a year. The media should be tested on an annual base to make sure that the data from the offline storage is still recoverable. For facilities that do not have a backup BES cyber systems then I would agree that they need to recover in the way stated. Recommend changing 30.5 bullets to start with "plans for". The first bullet should be "install" not

#	Organization	Yes or No	Question 51 Comment
			"reinstall." Recommend that the recovery plan does not need to include non-BES Cyber Systems. Recommend that the third bullet should test the BES Cyber System Component(s).
51.34	LADWP	Disagree	CIP-011-1 R30 Cyber System Recovery (CSR) should not require to document identification of the personnel responsible for recovery effort (R30.2) within the CSR. Identification of specific personnel will lead to revision of the document when personnel are reassigned.
51.35	Manitoba Hydro	Disagree	The wording of Requirement R31.1 should be revised as the phrase "with a paper drill" could be misinterpreted. There are no specifics given with respect to the Requirements of R30 (in terms of "conditions", "roles and responsibilities", etc., so it assumed to be at the Responsible Entity's discretion in terms of criteria, etc. Consider whether Requirement R31.2 should be two separate Requirements - R31.2 with respect to "Conduct a test..." and R31.3 with respect to "Test any information...". There are no specifics given with respect to "demonstrates readiness" in Requirement R31.3 so it assumed to be at the Responsible Entity's discretion as to whether the test has demonstrated readiness or not. The word "recover" in Requirement R32.7 should be "recovery".
51.36	MidAmerican Energy Company	Disagree	Define "protection of information required to successfully restore".30.5 - The requirement to reinstall and configure any application and system software using its baseline configuration does not consider strategies, such as redundancy or high availability, making the reinstall of a system unlikely and impractical.Define "secure backups" and "functionality".Define "initially stored", "useable and current". This could be interpreted as a full restore to a system, one file being restored as verification that data is not corrupt and process to restore are in place to looking at a tape log and seeing that a backup was made of the data.32.4 and 32.6 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is

#	Organization	Yes or No	Question 51 Comment
			introduced or is modified. Modifications to the recovery strategy or recovery activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the recovery.31.5 - Does the requirement to update each recovery plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?
51.37	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R30, but recommends that the Standards Drafting Team consider defining the term "known secure backups" as it is not currently defined in the Standard and is open to interpretation. Part 31.2 requires that data be "tested" at the time of backup and every 12 months to ensure that it is "useable and current" and to ensure consistency with that requirement, Minnesota Power recommends that the Standards Drafting Team replace "known secure" with "useable". Minnesota Power generally agrees with the proposed Requirements R31, but recommends that the Standards Drafting Team further define what is meant by "test" data stored on backup media to "ensure that the information is useable and current" in Part 31.2. While testing usability can be done by verifying one can read the tapes' contents, how does one test that data is current? This would require more of a manual verification or comparison function than a test, correct? In addition, is R31.3 requiring a full restoration, or is it requiring that each scenario documented in the Restoration Plan be fully tested every 36 months? Minnesota Power recommends that the Standards Drafting Team revise the wording of Part 31.3 to eliminate confusion regarding their intent.Minnesota Power generally agrees with the proposed Requirements R32, but to be consistent with the "update" portion R32, Minnesota Power recommends that Part 32.1 be modified to state "Review the recovery plan(s) at least once every 12 months, or when BES Cyber System(s) have any system, organization or technological changes. Document any identified deficiencies, changes or improvements."Minnesota Power generally agrees with the proposed Requirements R32, but recommends that the term "recover" be

#	Organization	Yes or No	Question 51 Comment
			changed to “recovery” for Part 32.7.
51.38	National Grid	Disagree	National Grid recommends changing 30.5 bullets to start with “plans for”. The first bullet should be “install” not “reinstall.” Also recommends that the recovery plan does not need to include non-BES Cyber Systems and that the third bullet should test the BES Cyber System Component(s).
51.39	Network & Security Technologies Inc	Disagree	30.5 - Suggest revising to require use of either baseline configuration or most recent known “good” configuration. Covers the possibility a (new) baseline configuration is causing problems (can and does happen - even if tests pass).30.5 - Need to define what “secure” backup means.31.2 - Requirement to test information “when initially stored” may be extremely burdensome in some environments, depending on backup mechanisms used. Some types of backup systems use on-the-fly techniques to verify a copy/write operation is “good” but SDT should use language that is less prescriptive. Should also drop the word, “current.” Certain types of operational data will cease to be “current” moments after it is copied. Only real-time mirroring can satisfy this requirement and entities should not be compelled to implement it.
51.40	NextEra Energy Corporate Compliance	Disagree	NextEra believes the CIP-011-1 Table R30 - Recovery Plan Specifications so that BES Cyber Systems can be restored to a defined state did not provide enough guidance and left room for interpretations.The following are the recommended updates:30.1 - The Responsible Entity shall define conditions for activation of the recovery plan(s).30.4 - Processes and procedures for the backup, storage and protection of information required to successfully restore a BES Cyber System30.5 - Implement a test plan to identify the processes and procedures for the restoration of BES Cyber Systems to include the following: o Reinstall and configure any application and system software using its baseline configuration defined in Requirement R23, o Load any information from the most recent, known secure backups, o Conduct a system test to verify functionalityModified the wording and additional guidance should be provided by NERC on the minimum conditions which would activate the plan.NextEra also believes that Table R31 - Recovery Plan Testing Specifications to verify recovery

#	Organization	Yes or No	Question 51 Comment
			plan readiness and effectiveness did not talk about documenting test resultsThere should be documentation of test results to validate that it was performed. The following are the recommended updates:31.1 - Conduct a test (by recovering from an actual incident, with a paper drill, or with a full operational exercise) of the recovery plan at least once every 24 months. All testing results shall be documented.31.2 - Conduct a test (by recovering from an actual incident, with a paper drill, or with a full operational exercise) of the recovery plan at least once every 12 months. Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current. All testing results shall be documented.31.3 - Conduct an operational exercise at least once every thirty-six months that demonstrates recovery in a representative environment unless an actual incident response occurred within the thirty-six month timeframe that demonstrates readiness. All testing results shall be documented.In 30.5, the recovery plan expands the current backup and restore of any application and system software using its baseline configuration. Is the definition of baseline the current or previous version of an application and system software?In 31.2, does the testing of any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored to ensure that the information is useable and current require the Responsible Entity to "load back" the data that is stored on backup media to an operational system to prove usability? Is loading it back to a test environment sufficient?In 31.2, "Test any information used in the recovery of BES Cyber systems." Does the requirement imply that in the case of protective relays at a BES Transmission Facilities, the backup settings file for every protective relay at High Impact facilities should be tested every 12 months?
51.41	Northeast Power Coordinating Council	Disagree	Recommend changing the bullets for 30.5 to start with “plans for”. The first bullet should be “install” not “reinstall.” The recovery plan does not need to include non-BES Cyber Systems. The third bullet should test the BES Cyber System Component(s).
51.42	Oncor Electric Delivery LLC	Disagree	These requirements are unnecessarily burdensome. Entities have been recovering from man-made and natural disasters for many years without these requirements.

#	Organization	Yes or No	Question 51 Comment
			Entities should be able to leverage Business Continuity, High Availability architectures and Standardization to demonstrate their ability to recover from unforeseen events. Requirement 32.6, update of Recovery Plan, we suggest this review be conducted quarterly.
51.43	Progress Energy - Nuclear Generation	Disagree	Agree with R30 and R31. Disagree with R32. Incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments for consistency in regulation for R30-32.
51.44	Progress Energy (non-Nuclear)	Disagree	R30.5 the first bullet should not be a requirement based on the second bullet.
51.45	Regulatory Compliance	Disagree	30.5 - STTRKE all the bullet points. Recovery plan should be system wide. Test restoration annually - document processes.31.2 - Make the second item a separate criteria line item - it's too confusing the way it is currently written. "Required" for High Impact.32.2 - "Annually" review the results.....
51.46	ReliabilityFirst Staff	Disagree	For R30, change “or failure” to “failure, or destruction.” For 30.4, please clarify what is meant by “successfully restore”. For R30.5, please clarify what is meant by “known secure backups”. For R31.3, change “incident response” to “activation of the recovery plan”. For R32, delete “relevant” so all changes are communicated. For R32.7, change “recover” to “recovery”.
51.47	ReymannGroup, Inc.	Disagree	R30.4 should be expanded to include processes for the recovery, restoration, and protection of data from a damaged or failed BES Cyber System. R30.5 should be expanded to include a review to ensure that malicious code has not been installed on the recovered files or device.
51.48	RRI Energy	Disagree	What constitutes a representative environment?

#	Organization	Yes or No	Question 51 Comment
51.49	San Diego Gas and Electric Co.	Disagree	R30 - R32 were originally covered in CIP-009-3. Referencing Table R30 - SDG&E suggests that R30.4 and R30.5 be removed. The IT Disaster Recovery Plan covers this and it would not normally be part of our Business Continuity Recovery Plan. The Responsible Entity (RE) should not be required to develop Recovery Plans with detailed IT processes for storage, backup, protection and reinstallation of software, etc. Referencing Table R31 criteria 31.3, SDG&E suggests that this wording be changed. CIP-009-3 R2 provides the RE with more options for "exercising" the recovery plan and we prefer the way the Requirement is worded in CIP-009. Referencing Table R32, CIP-009-3 R3 provides the RE more options when developing plans and procedures to comply with the Requirements. The new table seems to hold the Entities (both Medium and High) to several compliance timetables that are extremely restrictive. SDG&E suggests that we utilize the same wording for this Requirement from CIP-009-3 R3.
51.50	Southwest Power Pool Regional Entity	Disagree	R30: Is a recovery plan required for each BS Cyber System or is a generic plan acceptable? Recovery plans need to range from device component failure to catastrophic failure (e.g. physical facility disaster). 30.2: Is the identification by individual name or by position title? 30.5: What is meant by "secure" backups? Encrypted? Securely stored? Something else? Also, the backup and restoration processes should be "as applicable." Not all recovered systems are restored from a "backup." 31.2: Does the requirement to test backup media when initially stored apply to every daily backup, or only after BES Cyber System updates? Does the test include a restoration to an offline environment to verify the backup is not only readable but also complete? 31.3: Clarify that the operational exercise is more than a system or site fail over (NERC Standard EOP-008 exercise) but must also include performing the necessary steps to recover from the failure and restore the failed systems to normal operation by following the steps of the plan. 32.1: Include BES Cyber Systems that are significantly updated / upgraded requiring an update to the recovery plan. 32.4: Require the update within a much shorter time following determination of the need through the methods defined in the criteria. Delayed

#	Organization	Yes or No	Question 51 Comment
			updates are at risk of being overlooked and out of date plans pose a risk to the entity's ability to quickly recover. 60 days is recommended.
51.51	USACE - Omaha Anchor	Disagree	A) 30.5 - how often must system test be conducted? B) 31.2 Clarify "initially stored" is this the first time the tape is used?C) 32.6 - this could be interpreted to require a change in the recovery plan every time a software change occurs. This is very extensive - and unrealistic. Potential verbiage could be 'whenever system, organizational, or technology changes effect the recovery plan.'
51.52	We Energies	Disagree	We Energies agrees with EEI: Suggested revision for R30.2:Roles and responsibilities of responders, including identification of the personnel (using Job title or job function) responsible for recovery efforts.
51.53	Xcel Energy	Disagree	Definition is needed as to what constitutes an "operational Exercise". Is this a table top drill, or something more.

52. Tables R30 to R32 provide direction concerning what impact level of BES Cyber Systems to which Requirements R30 to R32 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Recovery Plans" are now addressed in CIP–009–5 — Cyber Security — Recovery Plans for BES Cyber Systems

The primary focus areas of the comments were concerned improving the clarity of the periodic timing requirements and the large amount of test equipment it would take to develop representative environments for numerous disparate facilities.

Some commenters noted the different terms used for references to annual activities. The SDT reviewed the use of annual, calendar year, 12 months, etc. and in the revised standards used the phrase, ". . .at least once each calendar year, not to exceed 15 calendar months between. . ."

There were suggestions that the testing requirements should only apply to control centers as Recovery Plans apply to Medium & High Impact Level categorizations, while some aspects of the recovery plan may only apply to High Impact assets. Additional guidance was requested for operational testing and for testing of information that is stored on backup media. The SDT added some information about testing in the Rationale Box for Requirement R1 in the revised CIP-009-5. Testing is necessary to verify the Responsible Entities Recovery Plan's effectiveness. Planned and unplanned maintenance activities may also present opportunities to execute and document an Operational Exercise (see NIST SP 800-84, Functional Exercise). This is often applicable to operational systems where it may be otherwise disruptive to test certain aspects of the system or contingency plan. NIST SP 800-53, Appendix I, contains supplemental guidance.

Issues identified in comments for SDT consideration were Recovery Testing – Operational Test every 36 months should count for the annual test, recovery plan testing clarifications, data retention plan clarification, identification requirements of "Personnel Responsible", coordination of physical aspects of Cyber Security Incidents, and incident recovery plan reviews. The SDT notes that there are FERC directives (e.g., P686, P687, P725) to add a requirement to conduct a full operational test of the recovery plan once every three years – so the suggestion to count the full operational test as the annual test was not adopted. (CIP-009-5 R2)

Commenters suggested changes and provided various requests/suggestions for re-wording/wordsmithing and improved coordination of backup and recovery with EOP-008. The SDT has coordinated its proposed requirements with the now FERC approved EOP-008-1 – Loss of Control Center Functionality. Commenters suggested that all requirements should be in the table, not in the objective or in the "pre-amble" to the requirements and that the SDT consider providing a summary table for all periodic requirements and remove the "how to" statements from the requirements. The SDT has included all mandatory performance in the requirements of the revised standards. The SDT did not adopt the suggestion to develop a summary table for periodic requirements as the format for Version 5 is considerably different from the format proposed when the requirements were all combined in CIP-011.

	Organization	Yes or No	Question 52 Comment
52.1	Alberta Electric System Operator	Agree	There appears to be a typo in 32.7 - "Communicate all recover plan updates" - recover should be recovery.
52.2	Emerson Process Management	Agree	In reality, it would be a good practice to exercise recovery plan during or toward the end of each scheduled unit outage for generation.
52.3	Florida Municipal Power Agency	Agree	FMPA suggests changing “12 months” to “annual” and “24 months” to “biennial”
52.4	PacifiCorp	Agree	31.2 - By including the testing of information used in the recovery of BES Cyber systems that is stored on backup media in 31.2 means that Low and Medium Impact BES Cyber Systems do not require testing of such information? If so, it should be a standalone requirement.
52.5	American Municipal Power	Disagree	Please provide a little or no impact category
52.6	American Transmission Company	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.7	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments on impact levels and therefore proposes the following changes:R31 Table 31.3: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyThe APPA Task Force agrees with the impact levels for the rest of R30-R32 if it is understood that a blank in the table means N/A.
52.8	BGE	Disagree	R30 - R32 should synchronized with R29 to include both Low and medium impacted

	Organization	Yes or No	Question 52 Comment
			BES Cyber Systems.
52.9	Black Hills Corporation	Disagree	30.4 should also apply to Medium Impact systems. Without this basic information, recovery would have to start from scratch.
52.10	Bonneville Power Administration	Disagree	Table R32Sections 32.2 and 32.3. Both should allow 60 days for review.Section 32.4: 12 months is too long. No more than 6 months should be allowed. Items 31.1 through 31.3 in Table R31 and 32.1 and 32.4 in Table R32 states certain events must occur "at least once every 12, 24, or 36 months." Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently the events referenced above must occur.
52.11	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
52.12	Con Edison of New York	Disagree	See 51
52.13	Consultant	Disagree	Table R30 - It doesn't appear to make sense that the Recovery Plans applies to Medium & High impact level categorizations, while aspects of the recovery plan only applies to High Impact assets.Table R31 & R32 - How many test and exercises are required? The structure here will create an administrative burden to track what was done when that has no corresponding risk reduction.Mixed requirements would force multiple recovery plans based on categorization of assets, which could mean two recovery plans for the same asset type where the application of each asset has a different impact categorization. This does not appear to be a sensible approach to recovery plans.Suggest deciding on a consistent set of requirements that can be applied equally to High Impact and Medium Impact assets.
52.14	CWLP Electric Transmission, Distribution	Disagree	R32.6. In order to meet the required change management process in R23 this window should be extended to 60 days.

	Organization	Yes or No	Question 52 Comment
	and Operations Department		
52.15	ERCOT ISO	Disagree	All requirements should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
52.16	FirstEnergy Corporation	Disagree	R32 - Combine R32.5 and R32.6 and eliminate the word 'organizational'.
52.17	Garland Power and Light	Disagree	Requirements 30.1 & 30.2 - remove Medium Impact classification
52.18	ISO New England Inc	Disagree	32.6 - clarification on scope of "any" technology and system change scope. (organizational change is fine). R32.7 spelling "recover" should be recovery? CIP Standard use of the term "annual": The term "annual" should be replaced with the phrase: "no fewer than X (e.g. 9) months, but no greater than Y (e.g. 18) months". The time duration in "X" and "Y" should be clarified by the Standard Drafting Team, taking into consideration the appropriate level of exposure the time duration would provide. This phrase would provide Registered Entities with flexibility within any given calendar year to accomplish the prescribed action, but at the same time restrict companies from taking action in December of one calendar year, and then again in January of the next.
52.19	LADWP	Disagree	Medium Impact should not be a factor.
52.20	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
52.21	Manitoba Hydro	Disagree	Medium Impact BES Cyber System should be included as "Required" in sections 30.3 to 30.5
52.22	MidAmerican Energy Company	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous

	Organization	Yes or No	Question 52 Comment
			disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.23	MRO's NERC Standards Review Subcommittee	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.24	Oncor Electric Delivery LLC	Disagree	Verification of the entity's Recovery Plan for High Cyber Systems every 12 months should cover Requirement 31.1. This should require only one test for the entity - remove low/medium/high)
52.25	Progress Energy (non-Nuclear)	Disagree	See comment 14.What is meant by an operational exercise in a representative environment? Does it mean individual components that can be easily tested for recovery plans?
52.26	ReliabilityFirst Staff	Disagree	For R30, each subrequirement should be "Required" for all the "Medium" impact BES Cyber Systems. For R32.6, should be "Required" for "Medium".
52.27	San Diego Gas and Electric Co.	Disagree	SDG&E would agree with Table R30 if item 30.5 were to be removed. Similarly, SDG&E would agree with Table R31 if item 31.3 were to be removed. Referencing Table R32 - SDG&E prefers the wording in CIP-009 R3 in this area because it provides more flexibility for the Entities while still covering the issues.
52.28	Southern California Edison Company	Disagree	The drafting team should state in CIP 010 that back-up systems should be treated at par with system key to real time BES reliability if the intent of this requirement is that CIP-011 be applied to all BES systems.
52.29	Southwest Power Pool	Disagree	30.3, 30.4, and 30.5 should be applicable to Medium impact systems. 32.6 should be

	Organization	Yes or No	Question 52 Comment
	Regional Entity		applicable to Medium impact systems with perhaps a 60-day update timeframe.
52.30	The Empire District Electric Company	Disagree	Comments: Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.31	WECC	Disagree	All items should be required for medium impact levels in R30Criteria should apply to all impact levels.

53. Which requirements in draft CIP-011-1 should allow for TFE submissions? Note that not all requirements will be considered as being applicable for TFE submissions. The drafting team has attempted to minimize the need for TFEs by modifying the language to allow for flexibility in meeting the requirements. Please provide suggestions on how the language of the standard may be modified to eliminate the need for TFEs. If TFEs are still needed, please provide specific examples to justify the inclusion of a requirement as being TFE eligible.

Summary Consideration:

Some commenters stated that the requirements should be written around the specific device types. The drafting team considered this option, but believes that it becomes problematic for entities and auditors to determine when a device is multi-purpose versus purpose-built. Some purpose-built devices can be considered multi-purpose depending on how the device was manufactured and implemented.

A variety of comments were received regarding the TFE process and its applicability to the specific CIP Cyber Security requirements. While the TFE process itself was outside the scope of the drafting team's work, commenters stated that TFEs should be allowed for passwords, malicious code monitoring, system hardening, system event monitoring, wireless and remote access, as well as for communications and data integrity. The drafting team considered these comments and revised the requirement text where necessary to allow entities more flexibility in implementing these requirements thereby reducing the need for TFEs. In some cases, the requirement was removed or written at a system level to prevent the need for TFEs.

#	Organization	Question 53 Comment
53.1	Detroit Edison	14.4, 17.1, 17.2, 16.2, 10.1-10.8 should retain TFE status.
53.2	Network & Security Technologies Inc	19.1 (see comments on Question 35), 26.2 (see comments on Question 47)
53.3	ISO New England Inc	Actual language on several requirements need to be clarified, many are still open to interpretation which may lead to TFE's.
53.4	EEI	Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.

#	Organization	Question 53 Comment
53.5	Progress Energy - Nuclear Generation	All CIP 011-1 Requirements should contain provisions similar to NIST 800-53, Regulatory Guide (RG) 5.71, and NEI 08-09, Revision 6, CIP standards should provide for nuclear facilities' use of alternative methods which implement security controls equivalent to those required by CIP. Nuclear programs, required by regulation, currently in place at nuclear facilities provide these alternate methods. Technical Feasibility Evaluations (TFE) should not be required with such documentation. One example is that nuclear facilities have one of the most effective Physical Security Programs of Critical Infrastructures. CIP-011-1 requirements R5 and R6 should acknowledge nuclear generating station physical security programs.
53.6	Ameren	All of the following requirements would need a TFE o R10 for passwords complexity o R14.4 for user banners o R15 for malicious code protection o R16 for installing patches o R18 for logging security events o R19 for validating data inbound o R23.7 for monitoring changes to a baseline configuration.
53.7	US Army Corps of Engineers, Omaha Distirc	All requirements that require existing hardware and software be capable of performing any function should allow for the possibility of TFE's. Sections R10, R15, R17, R18, R19, & R23 have requirements that are likely to require TFE's.
53.8	Southwest Power Pool Regional Entity	Any time a requirement specifies "continuous", "all", or prescribes a specific solution or characteristics of a technical solution, a TFE may be necessary. Try to avoid specific technology requirements as discussed elsewhere in these submitted comments.
53.9	The Empire District Electric Company	Comments: See comments under questions 34, 35, and 37.
53.10	RRI Energy	Cyber assets that are not on your standard IT equipment list are the most likely devices to need TFEs. This list could include meters, vibration monitors, PLCs, DCS, RTUs, cpu based test equipment.
53.11	E.ON U.S.	E.ON U.S. believes that many of the requirements remain ambiguous and additional clarity is needed. Absent such clarity it is difficult to ascertain where TFE ability can be eliminated. In fact, the proposal to provide greater compliance flexibility for responsible entities makes this determination even more difficult. As the requirements currently read, E.ON U.S. believes that more, not less, TFE requests will

#	Organization	Question 53 Comment
		result. Areas where responsible entities have requested additional clarity need to be addressed prior to issuance of a final industry draft. The informal comment period does not provide an adequate forum to identify all areas of concern and suggest specific replacement language.
53.12	Cogeneration Association of California and Energy Producers & Users Coalition	Entities should be able to use TFEs for any instance where unsupported technology is in place that may not be compliant with CIP-011 requirements due to age or vendor proprietary technology. Patches, updates, virus scanning, or firewalls may not be available for older, unsupported technology. An entity should not be required to upgrade or replace a system that currently satisfies the needs of the entity. The entity should be able to use other mitigation methods to protect a system if patches, updates, virus scanning, or firewalls cannot be applied.
53.13	Northeast Utilities	Equipment that never has security software patches or virus protection should be exempt. Also, those cyber assets that do not have user authentication capabilities should be exempt from password requirements.
53.14	ERCOT ISO	ERCOT ISO supports the proposed form of combining all requirements into a single reliability standard. The use of a single standard will eliminate the need for cross-referencing to other reliability standards. ERCOT ISO does request a realignment of some requirements. All requirements for access authorization, revocation, and review should be combined to eliminate confusion of how access should be managed.The timing of updates to documentation should be consistent throughout the requirements. Recommend the use of 30 days to be in compliance with the directives of FERC Order 706.
53.15	Bonneville Power Administration	If the standards present the overall security controls required, and do not attempt to dictate how those controls are accomplished, there should be no need for TFEs.If there is a need:First, the TFE process as presently constituted has shown to be cumbersome, not well understood, and inflexible. Neither NERC nor The Regional Entities have the detailed internal system knowledge or manpower to do make an intelligent judgment. At best, they can make a broad, industry best guess. The TFE approval process belongs within the Responsible Entity, at a technical level where there are people who know the environment, the systems, and their capabilities can evaluate them. They should be audited as part of the normal compliance audit.Second, if a system will not, or can not perform a

#	Organization	Question 53 Comment
		required function, it should be up to the RE to determine what steps should be taken to meet the standard. Third, because there are so many ways to accomplish the security of systems, the only time a TFE should be necessary is when all methods have been exhausted that could provide a level of protection required.That being said - Any time a situation arises where for technical reasons, or because implementation of security features may present BES reliability issues, or where application of one security measure would compromise others, the RE should have the authority to choose how to proceed. If this is called a TFE, the RE should approve it and document it as part of the overall security planEven if TFEs with approval required by the REs or NERC are used under CIP-010 and CIP-011, the process needs to be revised. As examples:1. There needs to be an opportunity for entities to appeal or request reconsideration of a rejection of the initial submission. Under the current, at best they can resubmit one time to correct errors.2. It should be possible to submit TFEs under multiple justifications.3. There are claims that the regional entities have been instructed to reject any TFEs other than those based on legacy equipment. If true, this violates the process, which allows TFEs for both new and legacy systems. It is also unreasonable: there are still systems today, and will be for the foreseeable future, that may be the best overall solution for reliable operation of the grid but which do not allow full compliance. Having said that:10.6 may not be possible for all systems. For overly simplistic example, routers intended for small office/home office use often allow either full access or no access. If all that is necessary is to review a log, full administrative access is overkill. To avoid the need for a TFE, recommend "To the extent possible for the particular device or system, require that authorized..."10.8. Same comment as 10.6.14.2. Unless the definitions of external connectivity and/or remote access or change, 14.2 may not be possible in every instance. For example, consider a legacy multi-user system in a Control Center that is not capable of multi-factor authentication. Any access from a system not part of the BES Cyber System containng the legacy system would constitute remote access and require multi-factor authentication for a High Impact system. It is not clear from R14 whether that multi-factor authentication is required at the BES Cyber System itself or at the access point. If it is required at the system itself, then a TFE would be required. Recommendation: Redefine external connectivity and remote access as described above. Multi-factor could then be required clearly at the external access point.14.4. It is not always possible to display an appropriate use banner under such circumstances. As an example, consider remote connection using a VPN. The access point in that case would the device at the endbound end of the encrypted tunnel. The user never sees a

#	Organization	Question 53 Comment
		screen on that access point, and therefore sees no such banner. Recommendation: See the suggested revisions to 14.4 R19. For both 19.1 and 19.2, validation might not be possible. In particular, commercial off the shelf software (COTS) may or may not provide such validation. If the COTS is the best solution otherwise, a TFE would be required.
53.16	Public Service Enterprise Group companies	Implementation of requirements 10 (Response to Question 24), 13(Response to Question 32), 23.7 (Response to Question 40) and 26.2 (Response to Question 48) may not be feasible in all situations. Please see comments in the questions that relate to these requirements for description of the potential infeasibility.
53.17	Idaho Power Company	In R19, data validation and encryption may in some control center applications, introduce a data latency that renders the application degraded or useless and may result in a more secure environment but less reliability. In R19.2, I am unaware of technology that can determine whether invalid data has been maliciously compromised. Most EMS/SCADA systems which would be the most common BES cyber system in a control center filter or ignore invalid data anyway and I do not see that the benefit of this requirement outweighs the technology investment needed to meet this requirement.The ability to alert on unauthorized access attempts may require a TFE depending on the boundary device that is protecting the system. Some boundary devices do not lend themselves to providing alerting and may require a TFE until they are replaced with a device that can meet this requirement.
53.18	Lincoln Electric System	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
53.19	MidAmerican Energy Company	MidAmerican Energy agrees with EEI's comment below:Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.
53.20	Minnesota Power	Minnesota Power recommends that the following requirements should still be eligible for Technical Feasibility Exceptions:Requirement 8, Part 8.3:Depending on the definition of “monitor the use,” it may be impossible to do this for many devices. For example, for Windows computers, how does one monitor the use of someone when much of the interaction involves mouse clicks? Will software be

#	Organization	Question 53 Comment
		required to log, not just keystrokes, but mouse clicks? Further, certain devices do not even maintain an audit trail of logins/logouts (e.g.: networked KVMs for remote console access to servers to allow for efficient system administration).Requirement 10, Part 10.2:While this is certainly good IT Security practice, implementing this on every BES Cyber System could very well put the reliability of the BES at greater risk. Since there is no way to change all passwords in all the various devices simultaneously, especially in a utility that is geographically distributed and remote, this will result in a continual need to change passwords. As a result, it could become commonplace for technicians and engineers to not know/remember what password to use on what device. Not only will this keep them from accessing devices at potentially critical times to perform needed maintenance, but EVERY failed login attempt will then have to be investigated in detail. This could be minimized by requiring this for only Medium and High Impact systems.Requirement 10, Parts 10.4 and 10.5:It is quite probable that devices exist that cannot meet these requirements.Requirement 10, Parts 10.8:It is quite probable that devices exist that do not allow for the creation of accounts, whereby all functions must be performed from the system/admin account(s).Requirement 15:For any BES Cyber Systems that are not on routable protocol networks, it is not possible to have network-based malware detection/prevention. Thus, if the device itself does not support the installation of malware-prevention software, Requirement R15 would be not technically feasible.Requirement 18:For any BES Cyber Systems that are not on routable protocol networks, it is not possible to have network-based malware detection/prevention. Thus, if the device itself does not support the security event logging, R18 would be not technically feasible.Requirement 19:The way this is written, the requirement is likely technically infeasible for most any system. To correct, Part 19.1 could be changed by replacing the word “Validate” with “Encrypt”.Requirement 23, Part 23.7:This implies detecting changes that have occurred outside of the approved methods of Parts 23.3-23.6. As such, not all devices may support the installation of software that would allow for such monitoring.
53.21	Progress Energy (non-Nuclear)	Need to include language that allows for procedural controls - example as for password requirements which cannot typically be enforced technologically.
53.22	WECC	No requirements should be so prescriptive to required a TFE. The SDT has done a good job in rewriting requirements to describe WHAT is required without describing HOW it must be achieved.It is impossible to draft standards language that anticipates all possible limitations for implementation.

#	Organization	Question 53 Comment
		The standards, or Rules of Procedure should allow for exceptions to any requirement if an entity could provide justifiable basis and acceptable alternative controls.
53.23	Nuclear Energy Institute	Older computer based equipment may not support all of the controls such as logging/monitoring and accounts/passwords. Alternate controls should be allowed in these cases.
53.24	PacifiCorp	PacifiCorp agrees with EEI's comment below:Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.R10 - equipment still exists in the field that cannot meet the requirement of a 6 character password. R14 - equipment still exists in the field that cannot meet the requirements.
53.25	Dominion Resources Services, Inc.	Please see Dominion's responses above suggesting the addition of footnotes to avoid required TFEs for requirements 10.8, 14.4, 15.2, 15.3, 18.2, 26.2.
53.26	Puget Sound Energy	Puget Sound Energy suggests Table 10, Table 18, and Table 22 as inclusive for TFE eligibility for the following reasons (also stated in those sections):Table 10 - Puget Sound Energy suggests including "Where Technically Feasible" to R10, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 10.Table 18 - Puget Sound Energy suggests including "Where Technically Feasible" to R18, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 18. For example, entities may incorporate dialup accessible devices that, by the nature of a connection that is built up and torn down as necessary, is incapable of providing "continuous security monitoring that issues alerts".Puget Sound Energy suggests including "Where Technically Feasible" to R22, as some Protective Cyber Systems may be incapable of meeting all the requirements in Table 22.
53.27	FEUS	R10: Access Controls; some legacy systems do not allow for default factory accounts to be changed; some legacy systems only allow for a single level of access.R14: For systems not connected to an external network that use Dial-Up access for remote support multifactor authentication may not be technically feasible. Keeping some systems/networks separate from an external cooperate network can reduce cyber vulnerabilities.

#	Organization	Question 53 Comment
53.28	Southern California Edison Company	R7.2: Enforcing this control may be limited by the technical capability of a SCADA device. A device such a PLC that has preset accounts forces the RE to develop acceptable use for a set of accounts retroactively rather than have the capability to limit the account types.R10.4 and R10.5: There are SCADA devices in service that are not at the end of their service life that do not offer this capability. R15.1, 15.2 and 15.3: While these capabilities may be possible at the electronic boundary, individual SCADA devices may not support this functionality. Strict compliance is restricted by technical limitation.R17.1: The mitigation plan that is suggested should be a part of a formal technical feasibility exception program.R28.1: The phrase "or a full operational exercise" is expected to result in technical feasibility exceptions since this will require test data/ setting to be loaded onto in-service SCADA systems.
53.29	Alliant Energy	Recommended changes for any TFE program implemented:Security patch TFEs should be programmatic and not based on individual patch releases.Cyber Asset counts should be stricken. Approved changes to the environment create an immediate ad-hoc obligation for TFE update to the RRO for what is already a burdensome process.Quarterly updates should be removed and replaced by re-approval on an annual basis by the Sr. Manager or delegate.NERC should create a standard Class-Type list as originally proposed.
53.30	USACE HQ	Requirements 10, 14.4, 15 and 17, among others, should have a TFE.
53.31	San Diego Gas and Electric Co.	SDG&E recommends that the TFE processes be changed and incorporated into the Vulnerability Management Process; where the Entity would identify, track, and mitigate any TFEs as a Vulnerability. This methodology will streamline and enhance the TFE process and thereby 1) allow Entities to manage their TFE's internally, 2) reduce Entity, NERC, Reliability Coordinators and Regional Reliability Organization resource requirements, 3) reduce paperwork, resources, and overhead, 4) reduce the potential for errors or leakage of secured information, 5) enhance the audit process and 6) standardize and clarify the process across all Entities.
53.32	BGE	See comments for R13 under Q31-31 and R23 comments under Q40-41.

#	Organization	Question 53 Comment
53.33	MRO's NERC Standards Review Subcommittee	See comments under questions 17, 34, 35, and 37.
53.34	American Transmission Company	See comments under questions 34, 35, and 37.
53.35	Florida Municipal Power Agency	See comments under R7, R14, R16, R23, R20
53.36	CenterPoint Energy	See references to possible TFE issues in comments above.
53.37	SCE&G	Similar to RG 5.71 and NEI 08-09, allowances should be provided for use of alternatives to the required security controls. Alternate controls would be justified and documented that the Threat Vector has been mitigated. TFEs are administartively burdomesome and currently require annual certification and ultimate elimination. The scope of equipment eligible for TFEs will drastically increase the number of filed TFEs, especially for eligble requirements with low impact categories. The SDT needs to consider the feasibility and practicality of implementing the current TFE process with these standards.
53.38	ReliabilityFirst Staff	Table R10, requirements 10.1 and 10.2, Table R14, requirement 14.4, requirement R15, Table R19, requirement 19.2.
53.39	Consultant	Technical Feasibility Exceptions should be allow for any requirement. There are about 2,000 registered entities. Trying to address every configuration of every asset across that spectrum would result in either the requirements being written in a convoluted and confusing manner to address the multiple configurations or being written with little detail to allow the multiple configurations, neither of which could even approach a "bright lines" concept of the requirements. The Technical Feasibility Exception should include a technical basis that shows implementing the specific requirement as stated would not achieve the requirement objective, or improve the security position as it relates to the requirement objective.The Technical Feasibility Exception process probably needs to be improved to deal with exceptions as described here.

#	Organization	Question 53 Comment
53.40	Kansas City Power & Light	TFE should continue to be allowed. Unsure of all the requirements that this may apply to at this point. Recommend the Drafting Team at least consider a direct translation from the CIP version 2 requirements to these CIP-011 requirements at a minimum since CIP-011 is intended to be a translation but less prescriptive.
53.41	USACE - Omaha Anchor	TFE's will still be required in several standards - I've addressed the requirement for TFE in applicable standards.
53.42	Allegheny Energy Supply	TFEs can be reduced by providing additional language in the standard that recognizes the limitations of certain BES Cyber Components.
53.43	Allegheny Power	TFEs can be reduced by providing additional language in the standard that recognizes the limitations of certain BES Cyber Components.
53.44	National Grid	TFEs related to Password and Appropriate Use Banner.
53.45	CWLP Electric Transmission, Distribution and Operations Department	TFEs should be allowed for requirements R10, R13, R14, R15, R16, R17, R18, R19, and R23.
53.46	Reliability & Compliance Group	The best thing that could be done for this Standard is to ensure that everything is well defined so that there is no ambiguity when it comes to identifying BES Cyber Systems and also categorizing their impact.
53.47	Manitoba Hydro	The language or the requirements should be written such that there should be no need for TFE submissions. The standards should allow for compensating measures. For all instances where it is not technically possible to meet strict compliance with a requirement, the Responsible Entity should apply compensating controls which are documented and approved by the senior manager or delegate, similar to the policy exception process in CIP-003-1. The current TFE process creates a enormous administrative burden on the electric industry which provides no additional value to the reliability of

#	Organization	Question 53 Comment
		the Bulk Electric System.
53.48	LADWP	The need for TFEs still exist as certain control systems are legacy systems that may not have current update or patch capability (e.g. SCADA systems). Removal of TFEs for these systems would result in non-compliance as replacement or upgrade of these systems must be done on a planned and scheduled manner.
53.49	Garland Power and Light	There are 2 requirements specifically listed below that need TFE's but there should be provision for any equipment that cannot be made strictly compliant with any requirement that either a TFE or a mitigation plan can be written and implemented such as is stated in 16.1 or 17.1.Requirement R10 - Unless the requirement is rewritten to allow for procedural controls to suffice for compliance or the language in the footnote is actually included in the requirement, a TFE is needed for this requirementRequirement R14 - A printed circuit board (with a network connection) in most cases will not allow for any process to be loaded onto it to protect against malicious software - need a TFE for this requirement
53.50	GE Energy	These changes should eliminate the need for the vast majority of TFEs. There may still be a requirement for TFEs on systems that cannot enforce the password complexity rules.
53.51	FirstEnergy Corporation	This question should be postponed until the Standards are in a more final state so that entities can better see how the new requirements would apply to specific devices, etc. It appears that R20 would necessitate new TFEs.
53.52	NextEra Energy Corporate Compliance	Though NextEra believes TFEs are very important part of the CIP process, given the number of changes proposed, NextEra will wait until the next draft to comment on TFEs.
53.53	Oncor Electric Delivery LLC	To eliminate the need for TFE’s the standard will have to be more granular. Many legacy systems are immune to cyber attacks, yet cannot satisfy the requirements of this standard. R8.3 as an example, there is no system to monitor access at the physical port of relays. R10 - legacy devices do not support account management.

#	Organization	Question 53 Comment
53.54	American Electric Power	We encourage the SDT efforts in drafting requirements in such a manner that will eliminate the need for a TFE. The TFE process should be standardized between the Regional Entities. Currently, Responsible Entities are required to submit multiple forms and varying information for the TFE process depending on the Regional Entity. AEP suggests standardizing on a single submission form and process and have all TFE data submitted to a single source maintained by NERC that can be used by all Regional Entities. This will allow Responsible Entities to submit and/or modify TFE data once and have it available to all Regional Entities on a consistently.See comments under questions 24 and 35.
53.55	We Energies	We Energies agrees with EEI: Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.
53.56	Regulatory Compliance	We feel that TFE's should still be considered for the following tables:R10 - Account Access Control SpecificationsR14 - Wireless and Remote Access ControlsR16 - Security Patch ManagementR17 - System HardeningR18 - Security Event MonitoringR19 - Communications and Data IntegrityR20 - Electronic Boundary ProtectionR23 - Configuration Change Management
53.57	BCTC	We have embedded this information in our individual responses to previosu questions.
53.58	US Bureau of Reclamation	We have not had an opportunity to assess which requirements may require a TFE yet. We will evaluate the requirements during the next evaluation period.
53.59	Duke Energy	We prefer that all of the requirements allow for an exception. Older computer based equipment may not support all of the controls such as logging/monitoring and accounts/passwords. Alternate controls should be allowed in these cases.
53.60	GTC & GSOC	We recommend that TFEs should be considered for all requirements with the exception R1 because of the ability of the regional entity and NERC to review the appropriateness of the TFE. We recommend adding language to the requirements on acceptable use banners and passwords to clarify that they do not require TFEs.If our recommendation to allow TFEs for all requirements is not viable then the following requirements should allow an entity to request a TFE. (R5, R6, R8, R9, R10, R13, R14, R15,

#	Organization	Question 53 Comment
		R16, R17, R18, R19, R21, R22, R23, R26)Example justifications are as follows:R5: BES Cyber Systems where physical security cannot reasonably be provided such as devices that are physically hung on a transmission line such (i.e. transmission line fault detectors). R6: While physical protection of the physical security systems should be feasible in most instances, there may still be instances where mitigation measures need the oversight provided by the TFE process.R8: The majority of substation devices use the concept of "shared" accounts. While an entity can add a device to facilitate logging into substation devices, there is not a feasible way to "monitor" these accounts on the purpose built devices themselves such as protective relays. R9: Depending on the method chosen to physically protect the BES Cyber System, it may not be technically feasible to revoke physical access to every location within 24 hours for an individual terminated for cause if an individual does not return their key (physical key, electronic key, or otherwise).R10: There are numerous examples of legacy devices which cannot meet the requirement of a 6 character password, or a password with special characters, etc.R13: Depending on the method chosen to electronically protect remote access to the BES Cyber System, it may not be technically feasible to revoke remote access to every location within 1 hour for an individual terminated for cause if an individual does not return their key (physical key, electronic key, or otherwise).R14: There are rare instances where remote access may be needed without 2-factor authentication such as for the administration of the device that authenticates the remote access itself. There are also instances where a display of appropriate use banner is not technically feasible.R15: While this requirement should greatly reduce the number of TFE's submitted based on the existing CIP v3 malware requirement, there will still be existing legacy purpose built BES Cyber Systems that do not have the ability to detect and respond to the introduction of malicious code. Specifically, consider the case of a protective relay with no external connectivity.R16: The allowance for TFE's should carry over from the existing CIP-007-3 R3.R17: Based upon the existing TFE framework, the language "shall document and implement a mitigation plan" from row 17.1 would necessitate that a TFE be filed.R18: There exists no such tool or process to monitor for system events related to cyber security on protective relays with no external connectivity.R19: Not all data protocols include a checksum. Whereas most SCADA protocols do contain this data error detection functionality, this requirement (19.1) is not limited to those inbound SCADA connections. There are a number of reasons, supported by the DHS Catalog of Control System Security itself, where an entity may choose not to encrypt all data inbound to a BES Cyber System (19.2).R21: There may be shared

#	Organization	Question 53 Comment
		cyber system components between BES Cyber Systems that do not provide logical separation. Clarification of this requirement may resolve the need for a TFE allowance on R21.R22: The TFE allowance justification for R22 carries over from the justifications for R14, R16, R18, and R23.R23: There are a number of devices for which there exist no such tool to monitor changes to the baseline configuration (23.7). In addition, it will not be feasible to monitor and detect changes for those systems with no external connectivity.R26: There are maintenance devices for which there are no known methods to detect and prevent the introduction and propagation of malicious code. Examples include devices such as data analyzers, birdogs, etc.
53.61	Constellation Energy Commodities Group Inc.	We support the effort to reduce the need for TFEs; however, the complexity and variability of systems across industry make it difficult and inappropriate to expect one-size-fits-all requirements.The password complexity requirements should either be written so as to avoid the need for TFE's, or clarified to specify that the use of maximum complexity allowed by the device is sufficient.
53.62	Entergy	Where the need for TFE has been obvious to us we have noted as such in comment to the respective requirements. We will be more thorough during the formal comment period.
53.63	Con Edison of New York	Will Technical Feasibility Exceptions still be accepted, required or will this process no longer be enforced? The Password requirements would still drive the need for TFE's. TFE's may be avoidable if the standard allows for internal documentation and approval of exceptions. There will be many TFE required because the net has been cast on so many different unique type systems that are located on the power system. Many of these systems are 20 to 30 years old. The CIP is written to address concerns for new technology computer network systems. Much of the equipment used on the power system is uniquely built and not designs with a full wide area network design.It would be a much better approach to address the SCADA systems (remote control and indications) & EMS systems and pay less attention to trying to force all the other unique (less critical) equipment in the same square hole.

54. Do you have any other comments to improve this version of draft standard CIP-011-1?

Summary Consideration:

Many of the commenters stated that the Standards need additional clarity. Define what is meant by words like monitor and review and remove potential ambiguity. Make clear the intent or objective of each requirement. The timing requirements of the standards need to be clearly defined. In response to these comments, the drafting team has made several steps to improve the clarity of the standards. These steps include moving to a Results-Based Standard approach, where the reliability objective must be specified for each requirement. Also the Drafting Team reviewed these standards with regional CIP auditors, with FERC, and with industry representatives ahead of the NERC Quality Review process to gain additional clarity in the requirements. The Drafting Team agrees and has made efforts to eliminate inconsistent terms and phrases and to consistently and unambigouously use timing phrases throughout the standards.

Commenters stated that the Implementation Plan should address the significant amount of effort required to comply with the standards for the many new cyber systems that will be in scope. Significant time should be included in the Implementation Plan for the categorization of BES Cyber Assets and for the transition from previous versions of the CIP standards to the Version 5 standards. The Drafting Team is proposing to allow 2 years for the Responsible Entities become compliant with all of the CIP standards and to allow entities the option to become compliant earlier if they choose to bypass Version 4 compliance.

Many commenters expressed a common theme to remove or minimize requirements for Low Impact BES Cyber Systems. Since the overarching objective is to provide for some level of security for all BES Cyber Assets, the Drafting Team has kept the requirements for physical and electronic boundary protection as well as basic security program elements such as policy, awareness and incident response, for the Low Impact BES Cyber Systems.

#	Organization	Question 54 Comment
54.1	Independent Electricity System Operator	- Specify calendar or business days when referring to a time frame- Issue with the bundled approach-- if you violate more than 3 in the same standard, this affects the VSL? need to look at NERCs governing procedure on VSLs- Strongly suggest that standards
54.2	Consultant	1. Each requirement should have a unique title. Currently the requirements are grouped by the subject area, but the requirements typically are just a statement. This makes it difficult to reference requirements except by number. What will really happen is everyone will develop their own "short title" for each requirement number, and it will not be consistent across the industry, and will result in

#	Organization	Question 54 Comment
		confusion.2. There should be consistency for the requirement title, the associated table name, & the requirements column heading for each requirement. Currently these three items are not necessarily consistent, and in some cases there doesn't seem to be a connection or relationship in the terminology in these locations.3. If the Requirements Groups are going to stay in the standard then they should be numbered in order to facilitate cross referencing the groups.4. The word "criteria" in the requirement statement should be change to "requirements" where it occurs. The tables list requirements, not criteria. (Multiple instances throughout CIP-011)5. There is different sentence structure and grammatical structure throughout CIP-011. While it is a good idea to combine the requirements in a single standard, it still appears to be written by multiple authors. There are still access control and account management requirements scattered across multiple requirement groups, and each is a bit different. Another example, the incident response and the recovery plan requirements groups should be very similar, but are, in fact, very different in the requirement and the wording of the requirements, much like the differences noted in CIP-008 and CIP-009. The structure of the "local definitions" is different throughout.Suggest a "wide area" review to make the standard appear to be written by a single author rather than multiple authors.6. The definitions should be written as definitions. [Defined Term - Definition statement.] The wording "for the purpose of this standard" is not correct, and thus unnecessary. The glossary collects definitions from the standards when the glossary is updated. The next update should add the terms defined in these standards, and therefor they are not "for the purposes of this standard". Also, the words "is defined as" are redundant as it is a definition.7. Data retention requirements should be included as requirements. Moving data retention to Section D isn't logical. If there is no requirement for data retention, then it isn't a viable compliance activity. At the workshop it was stated that this was a NERC format. In this case NERC is wrong and needs to correct the format, both for these standards and for the other reliability standards. 8. Suggest dropping all requirements for assets categorized as Low Impact. They are after all, low impact on the BES. Based on the discussion at the workshop, looking at a 10 year implementation timeline for low impact assets is effectively the same as no implementation. Many things will change in 10 years, and expenditure of resources in the low impact is unlikely to have any increase in BES security. The Low Impact category needs to remain as part of the categorization process in order to include all BES assets in that process.9. There are multiple requirements that differentiate between types of facilities in the requirements tables. This is an indication that the categorization criteria is incomplete or incorrect, or

#	Organization	Question 54 Comment
		that the requirements are not properly stated. If a requirement currently indicates in the High Impact column that it applies to Control Centers only, then either (1) the transmission, generation, and special systems are not "High Impact", or (2) the requirement statement doesn't properly address all asset classes.The categorization criteria should properly place each asset in each asset class in the appropriate category with "bright lines" to eliminate adding categorization in the requirements.10. While this format for commenting and collecting comments seems good, there should be a mechanism to complete the form 'non-sequentially'. For example, as comments are made through the form's current sequence, if a 'general' comment arises, the only method to enter that comment is to page through to the end, save the comments, and then reopen and page back to the location where you started. This is not very user friendly.11.The commenting tool should have a "Save and Continue" option to allow saving work in progress without exiting and re-entering the tool.12. An improvement to the "status bar" of the commenting tool would be a table of the questions with an indication for each question if a response has been entered.
54.3	Con Edison of New York	A few general questions:Will there be an implementation plan? The document for comments indicates there will be an implementation schedule that will take into consideration existing BES Systems (CCA's) and newly defined BES Systems (CCA's). In order to be able to meet the requirements in CIP-011, the devices on secured networks that are not currently CCA's by definition but are "treated as" since they are on the same network need to be considered as part of the implementation plan. The inheritance rules may require newly defined CCA's in order to allow the time that we be needed to address these additions. If they are considered existing since they are "treated as" a short implementation period could be an issue.Is there a six-wall physical boundary requirement in this version of the standards? Suggested additional defined terms:"BES Cyber System Failure": should be defined to serve as shorthand for the long list of items currently used in the draft CIP-010/011 Reliability Standards.Current Wording: "disruption, compromise or failure of BES Cyber Systems""if destroyed, degraded, misused or otherwise rendered unavailable"Proposed Wording:The term 'failure' when used in conjunction with the terms BES Cyber Component and/or BES Cyber System shall encompass the meanings 'malfunction, disruption, compromise, failure, destruction, degradation, misuse or unavailability' of those.Suggest replacing term "affect" with already defined term "adverse reliability impact". The drafting team (DT) uses the terms "affect" and/or "affects" without providing any specific meaning, system impacts, or other bounding explanation to describe that term. Proposed

#	Organization	Question 54 Comment
		Alternative Wording:NERC Glossary of Terms - Substitute definition for BES Cyber System "affect" or "affects." [Causes] Adverse Reliability Impact - The impact of an event that results in o frequency-related instability; o unplanned tripping of load or generation; or o uncontrolled separation or cascading outages, that affects a widespread area of the Interconnection.
54.4	Allegheny Energy Supply	A lot of work went into the prepration of the existing CIP-002 through CIP-009 standards. This new CIP-011 standard completely throws away that body of work in favor of this new approach. While there are many good things about the new approach, please consider the amount of work that entities have given to helping to refine the CIP-003 through CIP-009 drafts and to create and implement the current compliance plans and related software systems. We suggest that you consider incorporating the new ideas as incremental changes to the existing standards. It would be helpful for the drafting team to develop additional documentation providing more information about the threat basis that the standard is intended to provide protection against. The opportunity is to inform asset owners/operators of how and where to prioritize efforts to protect components of the BES.Suggest that the standard require physical security controls for BES Cyber Systems that no more stringent than other requirements for the BES equipment that the BES Cyber System controls, protects, or monitors.Suggest that the standard require controls that are commensurate with the amount of risk of compromise that a device presents. Not all BES Cyber System components face the same risk, or if compromised, have the same potential impact on the BES. For example: - Serially attached electronic components do not face or create the same risk as those that use routable protocols. - Devices that communicate to each other within a self-contained, isolated network segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.- Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
54.5	Allegheny Power	Allegheny Power does not understand the need to eliminate and combine CIP-003 thru CIP-009 into a new standard CIP-011. AP believes that the objectives of the Standard Drafting Team to provide further clarification and remove the uncertainty of the current CIP standards are proper and necessary. However, AP believes that these same objectives can be accomplished by incrementally revising the current CIP standards and not force changes in terms, concepts and numbering schemes

#	Organization	Question 54 Comment
		which would essentially force all entities to start their CIP compliance efforts over from the beginning. AP would like the SDT to abandon the concept of completely rewriting the CIP standards in favor of incrementally revising the existing standards to accomplish the same objectives.
54.6	Lincoln Electric System	Although much of the standard seems very practical, LES believes it was written with routable systems in mind. When applied to systems with only non-routable connections, or even no connections, many of the requirements are not very applicable, and would set the stage for numerous TFE's within the industry. LES believes this either needs to be addressed requirement-by-requirement, as in the approach taken by the MRO NERC Standards Review Subcommittee (MRO NSRS), or there should be a blanket statement that removes non-routable systems from the requirements that are not applicable. Either way, LES believes this differentiation is extremely important, since non-routable connections (or even better, no connections) are inherently more secure against, and limit potential damage from, remote attacks, and by default eliminate the threat of propagating localized attacks to other facilities.
54.7	Oncor Electric Delivery LLC	As the tables of CIP-011-1 specify certain requirements for "Control Center Only" or "External Connectivity", the additional requirement of "Routable Communication or Dial-up Only". Many requirements do not even make sense without integral communications being part of the cyber systems. If there isn't communication involved, the cyber system should be excluded from a requirement.
54.8	Garland Power and Light	At the CIP workshop, there were several comments that were made that were "depends" or "our intent was" o The "depends" requirements need to be reworded so that requirement is clear. o The "intents" need to be expressed clearly in the document because it is almost guaranteed that the will be many different interpretations if they are not expressed.
54.9	Constellation Power Source Generation	At the workshop, it was stated that an assumption of the SDT that High Impact BES Cyber Systems were most likely already Critical Cyber Assets per the older standard. This is false. Non routable protocols and other criteria used by Registered Entities have excluded certain assets at critical locations from being critical cyber assets. A 3 year timeframe should be implemented for High BES Cyber Systems to be fully compliant if it was previously not classified as a CCA. Another suggestion for implementation is to make the procedural requirements auditable first, and then implementing the

#	Organization	Question 54 Comment
		other requirements in stages. Furthermore, as stated in the workshop, allowing an entity to declare advanced implementation for audits would be of great benefit, as compliance with the new standard will take years to implement. The blank boxes found in the requirements tables of CIP-011 are implying that a high/medium/low BES Cyber System does not need to comply with that requirement's particular control, but that is not written anywhere. A blanket statement in the beginning of CIP-011 needs to state that the intent of an empty box to avoid confusion. An audit standardization or guidance document should be developed for use by auditors/reviewers of compliance to NERC CIP standards. Even though the formalization of cyber protection compliance programs are relatively new within the NERC standards body, there are mature examples of cyber protection and information security controls frameworks comprised of formalized cyber security standards, compliance management methodologies and auditing guidance such as defined in NIST 800-XX and ISO 2700X regimens . These regimens include guidance and standardization for auditing compliance (e.g., NIST SP800-53A). Other examples of formalized auditing guidance include guidance documents published by ISACA (Information System Audit and Control Association). These regimens include formal auditing guidance to ensure comprehensive coverage of compliance requirements, consistency in auditing approaches and better insight for auditees in ensuring auditability for their compliance audits. This improves the effectiveness as well as the business efficiency of companies' compliance programs. This rationale also applies to the NERC CIP program.
54.10	E.ON U.S.	Because Distribution Providers are for the first time made subject to CIP standards they may need additional time to come into compliance
54.11	ReliabilityFirst Staff	Because the acronym "BES" is not included in the NERC Glossary of Terms, we suggest that BES should be spelled out in the Introduction to this standard.
54.12	Reliability & Compliance Group	By dividing up the Standards and just revising CIP-002 through CIP-009, it makes it easier for the Registered Entities to update their existing documentation. It allows for the creation of a "crosswalk" document that helps examine the changes. While it may not be able to be done requirement by requirement and sub-requirement by sub-requirement, it can be done Standard by Standard. Where possible, it would be good to create a change crosswalk document that lists the version 3 requirements and the points to where they are now covered in the version 4 standards and note that

#	Organization	Question 54 Comment
		there is either a major change or a minor change.
54.13	LADWP	CIP-011-1 R16 The patch management does not specify a required time for installation of patch. The entity should be given the ability to determine the schedule as systems vary on when they can be brought down to install a patch. The language in R16.2 addresses the issue and no additional language to restrict the installation time needs to be included.
54.14	City Utilities of Springfield, Missouri	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
54.15	US Army Corps of Engineers	Definitions within the standard need to be improved so they are less ambiguous.Statements like those found in Table R21, 22.1 "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20", are confusing. What is the standard trying to say here?
54.16	USACE HQ	Definitions within the standard need to be more direct and narrower scope. Also, the relocation of all of them to a separate attachment would help too.
54.17	Dominion Resources Services, Inc.	Dominion recommends placing all requirements into a requirements table. It is sometimes difficult to distinguish requirements mixed into the preambles.Using a single standard for all requirements is preferred; however the format internal to the single standard is inconsistent. For example, some requirements are in paragraph form while others are embedded in a requirements Table. All requirements should be contained within a requirements Table. Where possible, information preceding the table should be used only to state the context and establish the security objective or intent behind the requirements.
54.18	EEI	EEI would like to thank the members of the Drafting Team for their significant efforts on this important issue.
54.19	Black Hills Corporation	Emergency Response: Emergency Response provisions are limited to R3 & R4, and address training and risk assessment controls. There are many possible scenarios that could be identified which would

#	Organization	Question 54 Comment
		require emergency exceptions to most of the requirements of CIP-011. There should be a general emergency clause that allows appropriate response to many possible emergency situations.Outside Vendors: There is no mention in the rules how the use of outside vendors should be addressed. A common solution could be to have the responsible entity extend the necessary requirements of these regulations to the third party via contract. (Example from other regulatory efforts includes the HIPAA regulations and their business associate requirement). An example of this in action could be the requirement that a contractor conduct the personal risk assessment, according to the requirements specified in CIP regulations.
54.20	Exelon Corporation	Exelon companies have embraced the development of logical, clear and effective reliability standards as evidenced by its commitment of time and resources to various standard development initiatives (including participation on several NERC and Regional Committees, Sub-Committees and Standard Drafting Teams). As evidence of our commitment, Exelon has devoted in excess of 4 years and $11 million for the implementation and integration of the NERC CIP-002 to CIP-009 Standards. We have concerns with several aspects of the CIP Version 4 Standards. The CIP Version 4 Standards represent a significant change in the scope of the standards in the equipment/systems that fall under the standards as well as the elimination of terms/categories of assets. Exelon is also not in favor of changing the current CIP-002-009 standards to the new CIP-010 and CIP-011 format.. Each change in itself represents a significant “change management” issue that impact databases used for the tracking/storing of evidence of compliance, training requirements, safeguards, and systems that have been put into place to ensure Exelon’s continued compliance to all NERC Standards. Exelon feels strongly that the proposed changes must be accompanied by a risk based analysis as justification for such dramatic and costly changes which to date have not shared with the industry. Essentially we are most interested in understanding the incremental difference or benefit of moving away from the current Regulatory approved CIP-002 to CIP-009 standards to a different set of standards that will result in many of us “starting from square one” to implement. Policies, procedures, contracts, training, drawings, methodologies, systems, data structures, and countless other documents will need to change to reflect the new language and concepts. The confusion that this will cause within organizations to retrain personnel and realign around the new standards cannot be underestimated. In fact, Exelon may even need to put some value-added compliance projects on-hold because the entire design will need to change with the implementation of the new standards.Specifically, Exelon

#	Organization	Question 54 Comment
		would like to see the SDT: Discard the concept of a wholesale rewrite of the CIP standards -- but use the standards drafting team work as an input to the process. Incrementally change the existing CIP-002 through CIP-009 standards to clarify and improve upon the established approach. Retain the fundamental terms, concepts, and standards numbering scheme to enable continuity.This approach would more effectively build upon the work that has already been accomplished, while allowing the industry to continue to improve on security and compliance related to critical infrastructure.Compliance with NERC cyber security standards should be re-scheduled for nuclear generation. That is, nuclear generation is currently in the process of compliance with Version 3 of CIP-002 thru -009 by September, 2011. However, it appears that compliance with Version 4 of the standards may be required by 2013. In terms of resource expenditures, ultimately borne by consumers of electricity, it seems wasteful to build a program for nuclear generators based on CIP-002 thru 009 that will be scrapped roughly two years later to be compliant with CIP-010 and CIP-011. Such scheduling will result in maintenance of a program based on CIP-002 thru -009, including audit support, and purchasing and installing equipment during refueling outages, at the same time a new program built on CIP-010 and -011 is being constructed. This new Version 4 program will include doing away with the concept of Critical Assets so that purchase and installation of the equipment previously installed may no longer be required. The existing cyber security programs and regulations in place or in process to protect nuclear generators, e.g., NEI-04-04 and 10CFR73.54, the limited contribution of nuclear generation to the BES (roughly 20%), and the limited time until Version 4 of the NERC Standards are expected to be in force all limit the cyber vulnerability of nuclear units. It is recommended that the implementation of Version 3 of CIP-002 thru -009 for nuclear units be deferred, and compliance with NERC cyber security standards for nuclear generation be re-scheduled for Version 4.
54.21	BGE	General - The wording was changed to “at least every 12 months” instead of “annually” in previous CIP versions. Can the exercise or test occur in the same month each year or must it be 11 months 29 days or less from the previous exercise/test?
54.22	Network & Security Technologies Inc	Good start! Strive for clarity. Ask both individuals responsible for compliance and auditors for their interpretation of every requirement. Be explicit about what’s required (e.g., documentation of, records to demonstrate compliance with, etc.). It’s okay to not be very prescriptive but try to avoid

#	Organization	Question 54 Comment
		implied requirements - they will be a source of endless debate.
54.23	CWLP Electric Transmission, Distribution and Operations Department	Guidance documents should be available before balloting these standards. All terms used should be defined in the NERC Glossary of Terms or in the standard.
54.24	Green Country Energy	I really like the way the standard is developing it is a huge improvement and hopefully with industry comments it will develop into a fine standard that meets everyones expectations.I would like to see a Guidance Document, footnotes, measures and VSLs etc to make compliance and auditability a lot clearer and less subjective.
54.25	US Bureau of Reclamation	It seems that the standards are applying a postage stamp level of security to Cyber elements involved in BES reliability. Multifunction relays or Solid State relays which are programmable must now have eletronic access attributes which are normally associated with BES computer control systems. The SDT should reexamine the true nature and scope of these types of systems before lumping these deviced together with traditional computer control systems. Lumping everything into one standard will make adminstration by the Responsible Entities and Reliability Entities difficult and may add to confusion with respect to individual table elements.While the tables applied to requirements in CIP-011 are an excellent way to establish security requirements for the 3 levels of system impact addressed, the empty fields should be avoided as they lead to confusion on the part of readers. All blocked fields should indicate something, even if it is an indication that the requirement is “Not Applicable,” “Not Required,” “Addressed under Requirement xx.x, above,” or “In accordance with entity policy.” Further, all requirements should include the 3-level requirement application table, even if the requirement applies equally to all three levels. This will further avoid confusion when reading the Standards.Appreciate the “blocked-out” area-specific definitions, but the drafting team must ensure that this feature is only used for area-specific needs and not global definitions. If the scope of the definition extends beyond a specific section there could be problems with sub-dividing the document to simplify what is handed over to organizational components with different functional responsibilities, particularly if the definitions do not also appear in the NERC glossary.The use of “objective statements” is very much appreciated, both as a guide to entities addressing

#	Organization	Question 54 Comment
		implementation and also (we would assume) to reviewers and audit staff addressing compliance. We encourage the drafting team(s) to continue this direction and to strengthen and refine the objective statements in order to provide clear direction for Standards users, including down to the sub-requirement level (as applicable).
54.26	Luminant	Measures need to be defined
54.27	Minnesota Power	Minnesota Power believes that, for all requirements which specify that something must be completed within X hours, the Standards Drafting Team consider using the following statement:"As soon as practical, but not exceed x business days from the date reported."This would preserve the spirit of the requirement, but also allow for more practical time frames.With so many auditable elements included in these Draft Standards, Minnesota Power believes that the VSL's cannot be written with the current zero-defect mentality. It would be more practical to allow for minor issues to be identified and scheduled for corrective action without representing immediate non-compliance which will result in extended investigations and settlement proceedings.Minnesota Power recommends that the Standards Drafting Team consider using a technical writer and/or solicit feedback from multiple proofreaders who have not been involved in the creation of this Standard to ensure that the following items are addressed: o any interpretable vocabulary is defined o grammar is correct o punctuation is correct o meaning is clear and does not require any guessing as to the intention of the Standards Drafting Team.This should be done prior to the official comment period, so that the Industry can concentrate on technical aspects of the review, rather than spending time on interpretation. The ability of Registered Entities to properly interpret the Requirements is highly dependant upon clear wording, good grammar and proper punctuation. This has been one of the greatest problems with the version 1 through 3 CIP standards. Minnesota Power requests that the Standards Drafting Team ensure that improper writing does not change or hide the intended meaning. The misuse of
54.28	Progress Energy (non-Nuclear)	More examples of requirement application to the real world would aid auditors and the industry.In CIP-011 If the record keeping and retention for compliance is similar to previous standards this standard significantly increases the record keeping administrative burden on utilities and compliance authorities due to the number of devices which are now to be declared without actually increasing security of BES.Implementation plan (when developed) needs to consider how it will overlap existing

#	Organization	Question 54 Comment
		standards compliance record-keeping and documentation, then establish a phased-in approach of the new standards to eliminate double record-keeping and double documentation across audit compliance periods.Implementation schedule needs to be developed that allowsHigh - 4 yearsMedium - 4 yearsLow - 4 yearsNeed clearer definitions of annual, quarterly, etc.Need to resolve issues/questions with current standards:How is communication/wiring covered by the standards? This becomes even more of a question when a BES Cyber System could be defined as a SCADA system including all of the RTU's which support it.Within ESPBetween ESP'sInto/Out of ESPPassword strength/management. Improvement has been made here, but it is still not clear if requirements must be enforced by the assets in question or if policies are sufficient. For instance, regarding the requirement to change passwords at least once every 12 months, must the device force this password change, or is it sufficient for an entity to have a policy requiring compliance along with documentation to attest that the policy was followed?Timeframe for revocation of access for expired training/background checks. NERC CIP Training is required at least every 12 months. It can be assumed that if the training is not completed in the allowed timeframe that access must be revoked; however, it isn't clear if this revocation must be done immediately, within 24 hours, 36 hours, 72 hours.There is currently no provision for moving cyber systems from one ESP to another (such as between a primary and backup ECC). Although this type of even will need to happen from time-to-time, it is left up to each entity to determine how that can be accomplished within the standards.There is no clear distinction between various types of Access control. It is obvious that the standards apply to network facing logins for BES Cyber System Components;however there are other types of access that are not clearly addressed or excluded such as-Access to configuration controls for something like a time standard which are only available to someone with physical access to the front of the device-Access to the BIOS on a typical PC-Access to various functions/programs on a machine - some of which may require special login - others which don't.How 7 year background checks are handled for someone under the age of 25 since juvenile records prior to the age of 18 may not be legally searched in many cases.Will the TFE process continue? What a TFE is, where it is/is not allowed, how it is to be handled (regarding documentation, approvals, submittals, periodic reviews, etc)
54.29	Michigan Public Power Agency	MPPA is concerned with how these standards would impact its members who are registered entities but do not own or operate facilities that are, by NERC definition, a part of the BES. MPPA recommends clarification in the applicability section with the insertion of ", that operates BES facilities,

#	Organization	Question 54 Comment
		" between "...Functional Entities..." and "...will be collectively...". This segment of the sentence would then read as: "...Functional Entities, that operates BES facilities, will be collectively..."
54.30	ISO New England Inc	Need more precise, well-defined language. Several requirements are measures, not standard requirements to measure against. Provide examples, FAQ, what is the actual risk/ driving requirement - what are we trying to protect against? Understanding the background to the requirement will help to define defenses to perceived threats that this standard is trying to protect. Clearer definitions of Cyber Systems, Cyber System Components, Control Center. Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional pageRequest that the tables and time constraints be consistentEliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (see R5-R32)Request a cross-reference of CIP-011 Requirements that refer to another CIP-011 Requirement - especially the Access Control Requirements. Diagram might help.
54.31	WECC	Need to have consistency in spelling out time periods versus numerically showing them (ie thirty-six months vs 36 months). Also need consistency in use of the tables as some say "criteria" and others say "procedures" or "processes". In many cases when a requirement states that you should have a process or a procedure it might be easier for audit purposes to instead require a program that addresses many of the processes or procedures required. A single requirement for a program or plan that meets a table of criteria might reduce the number of requirements and ease audits. For instance "Wireless Security Program covering the following risks" "Remote Access Program addressing the risks in Table X" "Maintenance Program addressing the criteria in Table X" "Physical Security Program addressing the criteria in Table X"
54.32	US Army Corps of Engineers, Omaha Distirc	Next draft should include the measurement criteria. Standards are very computer center centric.
54.33	Regulatory Compliance	NRG Energy Inc. is concerned with some of the impact criteria in Attachment II related to transmission and generation Facilities. To base impact on "bright line" Facility Rating thresholds, i.e., MW, kV, MVAR, etc., could lead to mis-categorization and ultimately unprotected cyber systems. These thresholds do not take into consideration regional differences in configuration and load flows.

#	Organization	Question 54 Comment
		Therefore, it is our suggestion that categorization could be based on the results of a regional engineering study, similar to what is currently required in the TPL Standards. This study could be conducted by the regional Planning Authority(s) or an independent third party and approved by the Regional Entity. The results of the study would identify the contingencies that have the potential to cause the following levels of impact to the BES: Â· High Impact (has the potential to cause an Adverse Reliability Impact) Â· Medium Impact (has the potential to require planned/controlled loss of load) Â· Low impact (has no potential to cause loss of load)
54.34	National Grid	o There is inconsistency in using “processes” or “one or more processes” in several requirements. For example R25 states that Each Responsible Entity shall document and implement one or more processes...” while R26 states that Each Responsible Entity shall document and implement processes...”. National Grid recommends using “one or more processes”. o Request that the tables and time constraints be consistent o Eliminate confusion caused by two 3.1’s. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (see R5-R32) o Request a cross-reference of CIP-011 Requirements that refer to another CIP-011 Requirement - especially the Access Control Requirements. Diagram might help.
54.35	Southwest Power Pool Regional Entity	Overall auditing issue: The requirements need to consider issues of sufficiency (adequacy of the entity solution) without being prescriptive in the solution. Where possible, clearly define the objective and do not prescribe technical solutions. Also, avoid the use of adjectives in defining the objective and / or specific requirement. Terms such as “adequate”, “sufficient”, and the like are very difficult to objectively audit. Overall observation: The implementation plan concept presented at the May 19-20 workshop in Dallas, coupled with the proposed applicability matrix for Medium and Low impact BES Cyber Systems will likely reduce, not improve the overall cyber security protection afforded the BES Cyber Systems today. A good number of existing Critical Cyber Assets will fall out of the High impact category, many becoming Low impact, with the resultant relaxation of protections. The applicability matrix as it appears today does not define a reasonable baseline of protections for Low and Medium impact systems. Re-categorization of BES Cyber Systems: While this will hopefully not happen very often, a BES Cyber System that sits on the cusp between two categories could find itself being re-categorized more than necessary unless some sort of a dead-band is introduced that would preclude re-categorization as a result of a small change. Implementation Plan: There needs to be a consistent

#	Organization	Question 54 Comment
		implementation plan for any BES Cyber Systems represented under today's standards as Critical Cyber Assets regardless of their ultimate categorization. Any existing Critical Cyber Asset should be afforded a very short timeframe to achieve compliance under the new standard(s) as it can be reasonably be expected to be already compliant. This is similar to the Table 1 entities concept for Version 1 of the existing standards where entities subject to the UA 1200 standard were given the shortest timeframe to comply. Consideration needs to be given to how an entity will migrate from compliance with the existing standards to the new standards. A piecemeal approach will be very difficult for the entity to maintain and for an auditor to evaluate compliance.
54.36	Alliant Energy	Per previous comments, all occurrences where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement. Per previous comments, all instances where 12 calendar months are used as the outside allowance for renewal a rolling creeping calendar is introduced. Recommend changing all 12 month timeframes to either 13 calendar months or 5 calendar quarters from the previous completion to allow entities to maintain a program with an annual training rollout with the appropriate amount of lead time to be successful in annual renewal. A 12 month timeframe will create a training program that becomes administered on a user by user, day by day basis without considerations for consistent annual content updates and bulk annual renewal.
54.37	FirstEnergy Corporation	Please see our response to Question 1 for the FE Summary view of the proposed CIP V4 standards.The new format, tables, information boxes is a good change o We question whether the new format (low-to-high impact, in particular) will encourage us to categorize more as high so we track things in a similar way. It seems like an administrative burden to try to track things at three levels. It is hard enough to track everything now with just one level. This 'administrative burden' issue crops up in

#	Organization	Question 54 Comment
		several places.
54.38	PacifiCorp	Procedural exceptions are onerous to manager operationally; the standards would be more effective if less differences in revocation of access were implemented across the BES system and criteria.The term "Annual" is not defined. "Annual" requirements were changed to 12 months in most cases (not consistently). The 12 month requirement causes "schedule creep". Define "Annual" in the NERC glossary to be 12 months not to exceed 15 months. Change all 12 month references back to "Annual" or, preferably, use the definition of annual defined for the NERC FERC Standards of Conduct (calendar year). The following FERC Directives need to be addressed with version of of CIP-010 and CIP-011: o 2 or more diverse security measures for defense in depth at the security boundaries o Active vulnerability assessments every 3 years o Incorporate forensic data collection and proceduresThe framework is in place to incorporate requirements in CIP-011 that address the directives. CIP-011 has a potentially long implementation time. FERC will likely not wait for the implementation of CIP-011-1 to be complete prior to making NERC address these directives. Incorporating these directives in the middle of the implementation of CIP-011-1 will be confusing and cause additional expense and effort. Don't wait. Address the following FERC Directives in version 1 of of CIP-010 and CIP-011.
54.39	Southern California Edison Company	SCE recommends revising the numbering of CIP-0011-1. Between CIP-010 and CIP-011 the drafts should indicate the intention of the intent is to retire CIP-002 through CIP-009 then it would make more sense to call these standards CIP-002-5 and CIP-003-5 with CIP-004 through CIP-009 being retired. Otherwise, the gap of unused numbers between CIP-001 and CIP-010 will potentially cause confusion. SCE also suggests rearranging the structure of these new requirements. for example, by breaking up CIP 011 into functional areas such as Governance & Personnel, System Security & Boundary Protection (with Incident response since “incidents” are cyber security incidents), Access Management (Physical, Electronic and Information), and Disaster Recovery Planning & Capability. From a policy formulation perspective, this would result in fewer policies than CIP 011 as it is currently structured. For example, combining physical access controls with electronic access controls provide the means of utilizing a combination of both to determine sufficient total security. Providing secure physical access controls and disconnecting routable communications such as gateways and/or modems.Finally, separate and apart from the recommendations made above, SCE also recommends allowing use of local definitions as in-line guidance at the requirement level. The use of local

#	Organization	Question 54 Comment
		definitions in addition to the NERC glossary is good approach. The text of each requirement objective should be such that it is only a objective and not a control statement. A control should reside within the impact level table. For instance, R11, R12, R18 contains control statements within the objective.
54.40	San Diego Gas and Electric Co.	SDG&E notes that it appears the drafting team took the approach of defining the details and then working up to the bigger picture items, i.e., BES Cyber Systems Component to BES Cyber System. SDG&E feels that there is risk associated with taking this "bottom up" approach to the standard setting process vs. the "top down" as used in the previous three versions of the standards. The risk is that components posing no significant risk to the BES system can get "swept up" into BES Cyber System definition and require protection commensurate with components that are correctly required to have strong security measures.SDG&E feels that part of the issue with Versions 1-3 of the CIP standards was that the "top down" approach to critical asset identification was not started high enough; it was started at the Responsible Entity level rather than at the Region / Reliability Coordinator level. If that level is deemed too high, even a sub-region level would be more appropriate. In SDG&E's case, it has a view of its assets in the context of its service territory that serves 1.4 million retail customers. Independent generators on the other hand don't have that regional view. In Southern California, for instance, congestion is high in some places and regulatory mandates for incorporating renewable energy are growing. Thus, the risk to the BES can only be fully evaluated when considering sources (generation - fossil and renewable) and uses of energy (load) in the region as well as the adequacy of transmission to balance and move power. In such a scenario, the assets critical to BES stability and/or restoration are much easier to identify and so too are the BES Cyber Systems that support them. For those entities that do not have a region or sub-region view, perhaps the Regional Entity, Reliability Coordinator or Balancing Authority could be responsible for identifying which assets are critical.
54.41	Manitoba Hydro	Section D Compliance: 1.4 Data Retention should include all documentation, inventories, logs, etc that are mentioned throughout the Requirements, or include a "catch all" requirement for data retention for all other documentation referenced by the Requirements.General Comments: The language in Requirement R1 indicates that each Responsible Party shall "develop, implement and annually review one or more formal, documented cyber security policies" addressing the listed Requirements. This should be clarified to confirm whether a formal written policy is required for each of the listed Requirements or only for selected Requirements. From the language of the specific Requirements one

#	Organization	Question 54 Comment
		could assume that those Requirements that indicate "document and implement" require the Responsible Entity to prepare a written policy/process of some kind, while those Requirements that indicate only "implement" do not. Then there are those Requirements that require the Responsible Entity to "create, document and implement" - it is not clear if this would require something different than "document and implement". There are also those Requirements that simply require that certain criteria be applied which would seem to indicate that no documentation is necessary. If the Responsible Entity is to assume that the Requirements that indicate "document and implement" require the Responsible Entity to prepare a written policy/process of some kind, it is assumed that there may be one master policy covering all elements of the Requirements that must be documented given the language in Requirement R1 "one of more formal documented cyber security policies" and that separate documented policies for each of the Requirements requiring documentation are not necessary. Certain references to "review" in the Requirements should be clarified to indicate on what basis the review is to be conducted, what criteria should be applied, what the Responsible Entity should do with the results, etc. i.e. Requirements R5-5.6, R12-12.1, R18 -18.4. The same comment applies for certain references to "monitor" (i.e. Requirements R8-R8.3) and "verify" (i.e. Requirements R24-R24.5). Where no review or monitoring of developed protections or processes is specified, is it to be assumed that no review or monitoring is required? (Requirements R15 and R16) Each of the Requirements seems to provide a reason or justification for their inclusion i.e. Requirement R2 ".....to ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems." Consider whether it is necessary to state the justification for each Requirement, especially if it could be that the objectives achieved by the Requirement are not exactly as specified or if the Requirement does not necessarily meet the objective as set out. It would be preferable to just have the broad purpose statement in the introduction which is stated to apply to each of the Requirements that follow. What is the purpose of the Measures in these standards? If they are to re-state the wording of the Requirement, they provide no value and create opportunities for legal interpretation if the wording in the measure does not exactly match the wording in the specific requirement. Entities should be allowed to employ multiple layers and tailor their approaches to cyber security to meet the intent of the requirement, such as including the inherent security benefits provided by private entity owned and managed communication networks. Manitoba Hydro is also concerned that the multiple layers of physical and electronic security directed by FERC Order 706 are

#	Organization	Question 54 Comment
		not included in this proposed version of the CIP-010 and CIP-011. While we understand that these directives were not included at this time for the sake of expediency, there is a risk that the electric industry may expend considerable resources to meet the requirements these proposed standards, only to revisit the electronic and physical security issues and expend more resources in the near future. Implementing physical security changes for electric facilities is proving to be a monumental task. This standard does a disservice to the industry if it does not provide the complete scope of the physical security changes required. If the entire scope of the physical security requirements, including the directives in FERC Order 706, cannot be provided to the industry in this proposed version of the standard, then all the requirements for physical security should be removed at this time and submitted to the industry, in its entirety, at a later date.
54.42	Alberta Electric System Operator	Specifying the units of measure (e.g. business vs. calendar days) and exact ordinal amounts ("365 days from date of implementation" vs. "annually") might help resolve some ambiguity surrounding some of the criteria.
54.43	Northeast Power Coordinating Council	Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional page.Request that the tables and time constraints be consistent. Also where the document refers to processes in some cases it specifies one or more processes and in others just processes. Eliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (refer to R5-R32).Request a cross-reference of CIP-011 Requirements that refers to another CIP-011 Requirement, with emphasis on the Access Control Requirements. A diagram might help.Remove adjectives such as substantial, adequate, minimum, etc., as these are difficult to measure and can lead to different interpretations.Situational awareness displays currently in use at the Regions and FERC should not be included in the applicability of these standards. No operational actions or decisions are being made based on the information on those displays.
54.44	Nuclear Energy Institute	Terms should be clearly defined and unambiguous. Examples of items covered by the term and not covered by the term should be given. CIP-011-1 is a vast change from the prior CIP-003 through CIP-009, and clear definitions with examples will be valuable.

#	Organization	Question 54 Comment
54.45	Puget Sound Energy	The amount of work relative to CIP-010 is almost as much as CIP-010 because of the broad application of BES Cyber Systems. It would be prefereable to be able to manage this scope better up front so that entities don't have to evaluate and record so much to then only focus possibly a much smaller pool of work as more defined by CIP-011. It still not clear how to evaluate a system for "misuse" effectively and defensibly. Further guidance would be appreciated. Lastly their should be some grace period and easier interpretation process when these versions become effective in order to more quickly flush out interpretations of concepts once implementation starts. To date the interpretation is a lengthy process or determined in an audit as a result of a violation when the entity may have been well intended.
54.46	APPA Task Force	The APPA Task Force commends the drafting team on the overall development of CIP-011-1. We believe this document is another step in the right direction of cyber system protection. We did, however, notice a theme throughout the requirements that caused us some concern. There is an IT focus to a number of the requirements. The drafting team seemed to be focusing on control centers when developing requirements to protect critical facilities. As a result, a number of the requirements are not practical for remote substations and generation stations, that may be owned by many entities and operated by only one of them, or another entity. What may be simple in a control center environment may be next to impossible for a transmission substation or a generator.
54.47	Constellation Energy Commodities Group Inc.	The blank boxes in CIP-011 tables need to be filled in. While the intent appears to be that if the box is blank the control is not required, by leaving it blank, liability questions could be raised. Compensatory measures should be allowed in the compliance structure. Entities may find that alternative, but comparable protection measures will better fit the circumstances of their system.An audit standardization or guidance document should be developed for use by auditors/reviewers of compliance to NERC CIP standards. Even though the formalization of cyber protection compliance programs are relatively new within the NERC standards body, there are mature examples of cyber protection and information security controls frameworks comprised of formalized cyber security standards, compliance management methodologies and auditing guidance such as defined in NIST 800-XX and ISO 2700X regimens . These regimens include guidance and standardization for auditing compliance (e.g., NIST SP800-53A). Other examples of formalized auditing guidance include guidance

#	Organization	Question 54 Comment
		documents published by ISACA (Information System Audit and Control Association). These regimens include formal auditing guidance to ensure comprehensive coverage of compliance requirements, consistency in auditing approaches and better insight for being audited in ensuring auditability for their compliance audits. This improves the effectiveness as well as the business efficiency of companies' compliance programs. This rationale also applies to the NERC CIP program.The Implementation Plan should allow for sufficient time to complete the comprehensive task of identifying and categorizing BES cyber systems.The R3 and R4 tables should address each requirement. All tables should be completed in full stating either not applicable or required.
54.48	Midwest ISO	The categorization approach in CIP-010 appears to require any BES Cyber System that touches the BES in any way to be included no matter how minimal the impact of the Cyber System on the BES, we are concerned that the Midwest ISO energy and ancillary services markets will be impacted. We believe that market portals could become High, Medium or Low Impact facilities and, thus, require application of the CIP standards or modification of the systems to isolate them so that CIP standards don't apply. Our conservative estimate is that we could easily spend in excess of $10 million dollars without anywhere close to this impact because our existing processes would prevent the market from negatively impacting reliability. We request that the drafting team make clear that market systems should not be included per NERC standard development tenets. In some cases, drawing in market systems could present impossible challenges. For instance, if a market portal becomes a High Impact BES Cyber System, CIP-011 R4 appears to require that we would have to conduct personnel risk assessments on all users which would include thousands of employees from market participants submitting bids and offers. State laws make this impossible. The drafting team could help solve this problem by making clear that personnel does not include market participants/customers who already have significant financial incentive to enter good bid and offer data. Opportunity costs do not appear to be considered in the development of these standards. All business resources are limited. Requiring registered entities to focus on these specific issues may divert attention away from other important cyber and physical security initiatives and work that offer greater improvements to reliability.We are also concerned that cyber and physical security could initially be compromised as entities focus on becoming compliant for Low and Medium impact cyber systems. Likely, High Impact Cyber systems will meet the new requirements because they were likely Critical Cyber Assets under the existing CIP standards. Thus, their reliability could degrade as entities may lose focus on the High Impact BES

#	Organization	Question 54 Comment
		Cyber Systems.
54.49	Florida Municipal Power Agency	The drafting team seems to have added an objective into the requirements which adds ambiguity to the requirement. For instance, R2 adds the phrase “to ensure that personnel maintain awareness ...” which adds ambiguity to the requirement. Is the auditor going to measure “quarterly reinforcement” or “personnel ... awareness” or both? If the drafting team wishes to add an objective to each of the requirements, then consider one of two other alternatives: (1) adopt International Standards Organization format where they have an objective for each requirement introducing each requirement; or (2) develop a longer Purpose section where the purpose of each of the requirements is further embellished.Throughout the standard, there is confusion among the terms “grant” and “authorize”. “Authorize” is senior manager approval, “grant” is giving the person a key, keycard, or user account. The requirements should keep these two concepts clear. For instance, in 5.5, “authorize” should be changed to something like: “Grant unescorted physical access to areas containing BES Cyber Systems only to those who are authorized such access”.Overall, added complexity to the cyber systems will reduce the reliability of the BES, so this needs to be kept in mind when drafting these standards.Almost all of the standards need to have stronger language in them to remove ambiguity and give specific guidelines as to what it expected.
54.50	NextEra Energy Corporate Compliance	The following are specific language changes for clarity:1. Title: Cyber Security - BES Cyber System Protection 2. Number: CIP-011-1 3. Purpose: To provide clear understanding of the protections that are to be applied to BES Cyber System Components identified as a result of the applicable of CIP-010-1 to the Responsible Entity’s BES.Also, for clarity, this section should be re-written as follows:R2. Each Responsible Entity shall reinforce sound security practices to all employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access to a BES Cyber System Component reinforcements in sound security practices at the beginning of each quarter. The Responsible Entity also has the discretion to reinforce sound security practices at any time, it deems appropriate. The reinforcement may be delivered via e-mail, intranet, posters, classes or other educations methods. .R3. Prior to granting employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access, each Responsible Entity shall ensure the personnel requesting access completes cyber security training consistent with that required in. CIP-011-1 Table R3 - Cyber Security Training,.3.1. For employees and contractor personnel requesting

#	Organization	Question 54 Comment
		authorized cyber access, this cyber security training shall cover the following: o The proper use of BES Cyber Systems o Physical access controls to BES Cyber Systems o Visitor control program o The proper handling of BES Cyber Systems information and storage media o Identification and reporting of a Cyber Security Incident For employees and contractor personnel requesting only unescorted physical access, this cyber security training shall cover the following: Procedures for not intervening with a BES Cyber System ComponentVisitor control programIdentification and reporting of a Cyber Security Incident 3.2. For employees and contractors personnel who engage in the operation or control of the BES via authorized cyber access to a BES Cyber System Component, cyber security training shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber System Components and BES Cyber Systems. 3.3. For employees and contractor personnel who have a role in BES Cyber System recovery this cyber security training shall additionally include those related action plans and procedures to recover or re-establish BES Cyber Systems. For employee and contractor personnel who have a role in BES Cyber System incident response this cyber security training shall additionally include those related action plans and procedures.3.4. For employee and contractor personnel who have a role in BES Cyber System incident response this cyber security training shall additionally include those related action plans and procedures. 3.5. Each Responsible Entity shall maintain document for each employee and contractor personnel required to take cyber security training as required in R3 and its sub-requirements that the training was conducted at least once every 12 months plus or minus one month. R4. Prior to granting employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access, each Responsible Entity shall perform or have performed a personnel risk assessment on the employee or contractor personnel requesting access consistent with CIP-011-1 Table R4 - Personnel Risk Assessment, expect as prohibited or limited by federal, state, provincial, and local laws, and existing collective bargaining unit agreements. 4.1. This personnel risk assessment program shall at a minimum include: o Identity verification via photographic identification documentation issued by a government agency (i.e., Federal, State or Provincial); and o A seven year criminal history screened against specific criteria developed and documented by the Responsible Entity. The seven year criminal history shall include a records check that covers all locations where, during the previous seven years up to date the check was performed, the subject has resided, been employed, and/or attended school for six months or more, including

#	Organization	Question 54 Comment
		current residence regardless of duration. 4.2. Each Responsible Entity shall document the results of each personnel risk assessment. 4.3. Each Responsible Entity shall update or have updated each personnel risk assessment at least once every seven years after the initial personnel risk assessment.
54.51	Entergy	The industry has now had experience grappling with a one-size-fits-all set of cyber security standards' requirements for its grid and generation control systems. At a high level of abstraction the problems with this approach are manifest in two major ways. The first concerns the age of the control system components we have at work relative to cyber vulnerabilities, threats, and hence risk. In brief, our control host systems and operator consoles by and large today use mainstream "IT" commercial off the shelf computer (COTS) hardware, operating systems, and application code bases. These are the very same networked-computing systems components that are widely hacked on the Internet and within mainstream commercial businesses around the world, and accordingly represent highest risk to reliable grid operation from cyber malfunction or nefarious attack. If hacked, they provide the ability for perpetrators to commandeer and use the systems against us - which represents the worst case scenario (e.g., a widespread unplanned "load shedding event" - trip all). On the other far extreme, we have often decades-old computing equipment still widely used "in the field" at substations, switching stations, hydro dams, etc. Increasingly these field sites are connected to control hosts over ("Internet") routable protocol communications networks, and increasingly emergent wireless communications transmission technologies. But there also remains very high dependency on "legacy serial" and "POTS" dial-up communications. So, we have both very old and very new networked-computing control systems technology woven together that requires some kind of cyber security protection. The second major distinction is the physical orientation of control host and generating plant sites on the one hand, and the far flung field assets on the other. The former are typically referred to in security circles as "bastion sites," in that they can be defended in much the same way as castles of old using concentric rings of physical defenses, complimented by armed guards. The field sites on the other hand have more in common with gas and oil pipelines, rail infrastructure, and the like that are characterized by long stretches of geographical separation between sites. These are hard to physically defend economically, and, through use of protocols that by design enable "network navigation" akin to being able to telephone-dial anyone in the country on demand, provide an attack vector path back to control hosts, and therewith also creating opportunities for "island hoping" from one organizational network to another. Given these two decidedly different continuums of variables that the industry needs to

#	Organization	Question 54 Comment
		defend, “one size fits all” standards’ requirements result in situations where the requirements are expensive overkill in one circumstance, and if watered-down to ease this burden do not provide robust enough protections for the circumstance at the other end of the spectrum. The only standards-writing approach that affords appropriate cost-effective security is to define granular sets of standards that are specific to the real vulnerabilities and threats incumbent to each scenario. From this perspective, specific recommendations for improving the current Version 4 draft CIP Standards are outlined below.The SDT was directed in Order 706 to consider adaptation of the NIST Security Risk Management Framework, especially noting SP800-53. This comment is neither about the individual requirements themselves nor the fact that most of the specific CIP-011-1 requirement language was drawn from the DHS Catalog of Controls. Rather, this comment focuses on the fact that the SDT has diverged from FERC directive in not employing a major foundational construct of SP800-53. Specifically, the SDT has developed a single set of requirements, and then through use of sub-requirement tables indicate in binary fashion whether or not each (sub)requirement of note is applicable or not, based strictly on the high-medium-low “impact categorization” based exclusively upon a facility’s size (electrical operating characteristics). Contrast this with the SP800-53 paradigm, where there are three graduated, hierarchical layers of cyber security control and countermeasure requirements. First, there is a baseline set of requirements, which applies for all cyber systems, and these are the only requirements applicable for low-impact-on-mission cyber systems. Then, there is a second and third set of requirements that apply cumulatively for medium and high mission-impact cyber systems respectively. The SP800-53 approach is responsive to the stated FERC preference that there be a baseline set of requirements that must apply for all grid BES Cyber Systems/Components. Draft CIP-010-1 is not responsive to FERC Order 706 - many requirements as stated in the Standards’ language simply do not apply for BES Cyber Systems/Components in use at low and medium-sized grid sites.Recommendation: A) Modify the categorization of grid assets (Attachment II) into two groups:i) “Bastion Installations” consisting of data centers, control centers, and generation sites. Rationale: At least the ‘data center’ part tends to employ mainstream IT COTS HW/OS/and to some degree appl code; and, physical security measures can be used to greater advantage as compensating measures where cyber security measures may be difficult to implement for a variety of reasonsii) “Grid Field Assets” consisting of any physical site that does not have a control host/control center within their physical perimeters, regardless of what protocols are in use. The distinction again revolves around

#	Organization	Question 54 Comment
		physical security, in this case the difficulty in physically securing far flung field sites.B) Create layers of requirements akin to the SP800-53 paradigm, labeled 'a-z': i) The lowest enumerations being baseline requirements; e.g., 'a' could be associated with bastion installations, and 'b' could pertain for field grid asset sites. Important distinctions at the baseline can pertain for each site type.ii) Similarly, create appropriate sets of succeeding requirements applicable specifically to each column (bastion/field) depending on the type of data networking communications employed. This way appropriate requirements - not more nor less than necessary - and be specified for the unique characteristics and attack surfaces posed by each technology. As technologies are retired, e.g., serial legacy, POTS dial-up, so can entire categories of requirements.C) Create a "Scoping Table" consisting of: i) Two columns: Bastion/Field - #1 above); and,ii) X number of rows: #2 above - list of different communications technologies, i.e., routed, legacy serial, dial-up, non-routed LAN, non-routed wireless, etc., as the SDT deems appropriate. D) Apply requirements sets (a-z) as appropriate within each box on the grid.2) Entergy submits that NERC's intention to address the following FERC Order 706 directives in action subsequent to adoption of CIP Version 4 will create undue hardship for the industry. The following Order 706 directives are central to implementation of any organizational cyber security program, and it is unreasonable, inefficient, and potentially financially wasteful to require the industry to implement one approach per Version 4 Requirements, and then be made to re-visit entire cyber security programs in order to comply with post Version 4 changes. Entergy submits that the entire puzzle should be addressed at once, i.e., including the following FERC Order 706 directives, at the same time while recasting the CIP Standards under Version 4:...develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter... a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process.... consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.... revise the Reliability Standard to require two or more defensive measures.... modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years... that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a

#	Organization	Question 54 Comment
		physical security perimeter around critical cyber assets.... consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.... provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan.... to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard.... to revise CIP-009-1 to require data collection, as provided in the Blackout Report.... proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years.Entergy recommends that NERC appeal to FERC for permission to extend the deadline for final Version 4 drafting a modest amount of time necessary for the entire puzzle to be grappled at once. The industry is now hardly complete in implementation of CIP V1-V3 Standards' Requirements. The prospect of having to endure adaptation to two more waves of fundamental change to the tenets of these standards is not only onerous, but also not responsive to the imperative to provide service at lowest reasonable cost to ratepayers. We didn't build our national electric infrastructure overnight, and apt response to relatively recent emergence of cyber security threats will not be accomplished overnight either.
54.52	IRC Standards Review Committee	The organization of the 32 requirements and all of the subrequirements is lesser of a concern to us, although separate standards that group similar requirements allows for better administration. The greater concern is the degree of specificity of many of these standards. As discussed in the response to Q #8, many of these requirements go into exacting detail specific to technology and may duplicate either other industry standards or practices already employed. Many of these requirements can be elevated to "higher level" requirements that requires certain types of protections, e.g. - require user access identification, rather than specific password practices. For examples, the list of criteria that are included in Requirements Table R9, the details in the Tables for R10 and R11, and the specific treatment of wireless access in R12, to name a few.
54.53	Public Service Enterprise	The requirements for wireless and remote access (R11 to R14) are not well integrated with other

#	Organization	Question 54 Comment
	Group companies	requirements for access to BES Cyber Security Systems (R7 to R10).
54.54	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	The table format is great, makes it very easy to see what applies.If we say “CIP-011-1 R3.1” do you know what we am referring to? There is a sub-requirement 3.1 as well as a line 3.1 in Table R3. This could lead to confusion. Suggest extending the table to cover all sub-requirements, or otherwise avoid repeating numbers. This occurs only in R3 and R4.Regarding R21, no definitions have been provided for “other cyber systems” and “Cyber System Components” (without “BES” in the phrase.) Note that “Cyber System Components” is capitalized as if it was defined, but no definition exists or is proposed. While “other cyber systems” is not capitalized, it should also be defined to avoid any ambiguity over what the SDT intends. We appreciate the objectives that the SDT has included in the requirements, since this will help us to see the SDT’s intent. There is the risk, however, that auditors will see this as more than guidance when placed in the requirement. For example, an auditor might read R5 and R6 as requiring the prevention and/or detection of all unauthorized physical access, and find an entity non-compliant for an undetected or un-prevented intrusion. We suggest the objectives (“to prevent..”, “to ensure..”, etc.) be placed in the guidance document, or otherwise be removed from the requirements. Note that some of these objectives when read as requirements are absolute, such as R14; “..to ensure no unauthorized access is allowed.
54.55	MidAmerican Energy Company	The term "Annual" is not defined. Define "Annual" in the NERC glossary to be 12 months not to exceed 15 months. Change all 12 month references back to "Annual".The following provides a summary of the reasons for using a definition of “12 months not to exceed 15 months.” o It does not force “creep.” A definition of 365 days or 12 months, without a “not to exceed” clause means that work must be planned to be done enough before the 365 days to allow time for unexpected situations. This can result in doing “annual” requirements every 10 months or less to ensure compliance is not jeopardized. o It does not jeopardize compliance for either delivery or supply due to current implementation plans. A calendar year definition could unintentionally jeopardize compliance if delivery did not complete a task between June 30 and Dec. 31, 2009. o There is no effect of leap years, which could be a problem with a definition of 365 days._____Requirements that are defined to be completed within x hours are impractical and unnecessary. Entities do not currently document the precise hour that (as an example) a termination takes place. Thus hourly requirements are impractical to measure or audit.

#	Organization	Question 54 Comment
		Convert all hourly requirement as follows: o Convert 1 Hour requirements to "As soon as possible not to exceed date reported". o Convert 4 Hour requirements to "As soon as possible not to exceed date reported". o Convert 6 Hour requirements to "As soon as possible not to exceed date reported". o Convert 12 Hour requirements to "As soon as possible not to exceed date reported". o Convert 24 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 36 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 48 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 72 Hour requirements to "As soon as possible not to exceed second day from date reported"._____The following FERC Directives need to be addressed with version 1 of CIP-010 and CIP-011: o 2 or more diverse security measures for defense in depth at the security boundaries o Active vulnerability assessments every 3 years o Incorporate forensic data collection and proceduresThe framework is in place to incorporate requirements in CIP-011 that address the directives. CIP-011 has a potentially long implementation time. FERC will likely not wait for the implementation of CIP-011-1 to be complete prior to making NERC address these directives. Incorporating these directives in the middle of the implementation of CIP-011-1 will be confusing and cause additional expense and effort. Entities will be required to make additional expenditures at greater cost if these issues are resolved in later versions. NERC should ask FERC for more time to implement version 1 if necessary.
54.56	Dairyland Power Cooperative	There are very few requirements that apply to low impact systems and many that do not apply to medium impact systems. Considering that many high impact systems will connect with lower impact systems, how will data integrity be adequately implemented? Consider a large RTO/ISO connecting a shared communications system to all entities in a region, regardless of impact to the BES.The standard basically excludes serial communications from being governed. This not only does not address protecting serial systems, but it introduces oddities and ambiguities about routable connections in relation to serial connections. There are security questions, as well as questions as to how such connections will be viewed by an auditor. Serial communications should not be ignored.
54.57	Ameren	These standards will require a substantional amount of effort to implement for entities while also maintianing compliance with the previous versions of the CIP standards, how will the implementation schedule address this? Will their be a period were the entity does not have to comply with the old

#	Organization	Question 54 Comment
		standards while implementing the new standards, for examle 30 days to 90 days while the entity is updating systems or updating/revising procedures for the new standards. Also, the local definitions should be included in the NERC glossary of terms rather than by the standard to which they apply.
54.58	Bonneville Power Administration	This is far better than the current standards. The requirements are more straight forward by not cross referencing each other in separate standards. Much time is spent "mapping" out how the standards relate to each other and under what specific requirements. If misinterpreted it could lead to potential violations. This is a much better approach. Not directly relating to the newly proposed standards but still a concern is the time for implementation. Numerous resources have been extended and significant dollars spent to meet the current requirements. There needs to be sufficient time to review the new standards, identify Cyber Systems and allow for proper prior planning to physically protect these systems. Depending on the category, low-high, significantly more dollars could be spent. There needs to be sufficient time to address the new standards and implement in a manner that is cost effective. The overall approach is superb: target the standards only at systems that can actually affect the BES in near-real time, include other systems only to the minimum extent necessary, require outcomes rather than specify actions. However, this draft has some wording issues that apparently have inadvertently broadened the scope far beyond the intent of the SDT, or even practicality. As described above, correcting these errors will produce a set of standards that enforce security where it needs to be, but do not waste time, money, and people addressing tasks that do not improve the security of the BES. In particular, we find that the following questions address issues that must be corrected before the standards could be acceptable:- Q5, addressing CIP-010 Table R3 Section 3.2- Q12, addressing CIP-011 Table R3 Section 3.2- Q13, addressing the the definition of "External Connectivity". Note that several other questions rely upon changing this definition.- Q16, addressing CIP-011 Table R5, sections 5.8 and 5.9- Q22 and Q23, addressing revocation time limits- Q24, addressing authentication schemes- Q27, definition of "Remote Access"- Q32, addressing revocation of remote access- Q33, addressing Table R14 Sections 13.2 and 14.4- Q35, addressing Table R16, Section 16.2 and patch risk assessment- Q35, addressing Table R17, Section 17.2 and disabling of physical ports- Q35, addressing Table R18, Sections 18.1, 18.2, 18.3, and 18.4- Q37, addressing Table R20, Sections 20.1, 20.2, 20.3, 20.6- Q37, addressing Table R21, Section 21.1- Q38, addressing the second part of the definition of electronic access point. This is the most serious flaw in the standard. It must be corrected.- Q40, addressing Table R23 section 23.7- Q42, addressing the definition of

#	Organization	Question 54 Comment
		sensitive information- Q44, addressing Table R24, Section 24.1 and 24.3- Q47, addressing Table R26, section 26.2- Q51, addressing Table R30, Section 30.5- Q51, addressing Table R31, sections 31.1 and 31.2- Q53, addressing TFEs Overall, an excellent start. Here are some additional suggestions:1. In all cases - Write the standards to identify the outcome of the requirement. Never say how to do something, say what you intend for it to accomplish. Let the Responsible Entities figure out the "how".2. Use Industry Standard wording wherever possible. For example, the term "Hardened" means one thing in IT and another in a substation.3. Define any terms that may present confusion - Example - Ports and services. There is a common IT understanding when you hear that term. It is almost always assumed to mean logical ports 0 to 65535 and the networking services they support. However, it can also mean physical ports like Ethernet jacks, RJ45, Serial connectors, parallel connections etc. If there is a question, put it in the definitions.4. Wherever possible, include all the elements of a standard into one standard. Only break requirements apart where it makes real sense to do so. So If you get to R32 and find that something there seems to fit in 20, go back and put it there rather than making a reference back. 5. Keep paring this down in size. It is so much better.6. If any of your experts know that equipment used in the electrical generation and distribution industry cannot perform specific functions, don't write the standards to say they have to.7. There were questions in the May webinar about the meaning of "revocation". Our suggestion is this: revocation is the act of ensuring that a person can no longer gain access to a system, physical area, or information. It can be accomplished directly or indirectly. For instance, if a cyber asset is only accessible from within a physical facility, then denying physical access to the facility also denies cyber access to the cyber asset. If sensitive information on a system resides only in electronic form on particular servers, then denying cyber access to those servers denies access to the information. The emphasis should be on the denial of access, not how that denial is accomplished.Definition of "annual" or "annually": There are numerous occurrences of these terms in the Requirements. Also now, Requirements state that activities must occur “at least once every 12, 24, or 36 months.” Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. “/A/t least once every 12 months” could lead to some confusion. Let’s assume that the event occurred on July 15, 2010, and again on March 15, 2011. That is “at least once every 12 months.” But it raises the question of when the next activity or compliance event must occur. Is it no later than July 15, 2011, or no later than March 15, 2012? The exact questions could be asked for events that are supposed to occur “at

#	Organization	Question 54 Comment
		least once every 24 or 36 months."Following on to comment 1 immediately above, there are two other phrases that could be used depending on what NERC intends. o "every 12 months" - in this case, the event would occur on the same date each year. This would be virtually impossible. Same concern with "every 24 or 36 months." o "within 12 months of" the event - in this case let's assume that the event occurred on March 15, 2010. The next event would have to occur no later than March 15, 2011, but could occur earlier (let's say it occurred on December 15, 2010). If it occurred on December 15, 2010, the next event would have to occur no later than December 15, 2011. The same example with different dates would work for "at least once every 24 or 36 months."The SDT should be very specific as to what it means for how frequently the events referenced above must occur. BPA appreciates the opportunity to provide comments. Thank you.
54.59	MRO's NERC Standards Review Subcommittee	We believe all of the requirements that specify something to be completed within X hours would be better suited to the following language: "As soon as practical, but not to exceed x business days from the date reported". This would maintain the spirit of the requirement, while also allowing for more practical time frames.With so many auditable elements included within the requirements, we believe the VSL's cannot be written with the current zero-defect mentality. We feel a practical approach is required, where minor issues are allowed to be addressed without representing immediate non-compliance and associated investigations and settlement proceedings, but instead are identified and scheduled for corrective action.We understand the burden on the drafting team to meet FERC's deadlines, but we would propose that all outstanding FERC directives be addressed as part of the current process, as opposed to leaving some items for a later date.
54.60	Idaho Power Company	We commend the SDT on its efforts to draft a standard that meets the FERC directives but is feasible for the industry to implement. That is an extremely difficult assignment. This version will greatly expand the number of cyber assets that are impacted by the CIP requirements and represents a major shift in the identification and classification of an entities BES cyber systems. We are certainly willing to implement the standards because we understand the impact of failure to do so. However, the standards must be accompanied by as much guidance documentation as possible along with realistic implementation plans that take into account the technology required, time required to realistically implement the controls, the fact that registered entities must first assess the financial impact and then

#	Organization	Question 54 Comment
		budget appropriately, and the massive volume of work that implementation represents.
54.61	Xcel Energy	We do not agree that Low impact systems should have mandatory, enforceable cyber security standards. By their very definition, Low impact systems have very little potential to impact the BES. As such, cyber security controls on these systems is best left to the business judgment of each individual entity. The terms defined throughout the standard have not followed the convention of being capitalized. They should be capitalized so that it is clear to the reader that they are defined terms when they are used later in the standard. The Standard would be enhanced if it were to differentiate between software based versus firmware based devices.The Standard would also be enhanced if it were to separately define requirements for Control Centers, Substations, and Generation Facilities. The cyber security issues between these different types of facilities are vastly different. Transmission Control Centers are typically fully digital control systems with the ability to have wide area impacts. On the other extreme, where Generation facilities typically have digital systems are for retrofits to older, analog systems controlling individual components within the facility, such as digital feedwater or digital turbine controls. These are much different that Transmission Control Centers as they have only limited, local impact. Additionally, they typically have mechanical controls that can override the digital systems providing limited, if any benefit from protecting the digital aspects of the system from malicious attacks.
54.62	We Energies	We Energies agrees with EEI: Please see the earlier discussion about identification of a rational and understandable threat basis that should be used when constructing security requirements. The requirements should focus on the highest probability risks that will have the most negative impact. The requirements should not treat all threats and impacts equally.
54.63	Duke Energy	We had previously gone a long way towards getting common understanding on terms such as “Critical Assets”, Critical Cyber Assets”, “Electronic Security Perimeter” and Physical Security Perimeter”. Moving away from these terms in the current Version 4 draft creates uncertainty.Tables and subrequirements should have different numbering schemes so that, for example, there are not two 3.1 listings.If the standard is broken into smaller standards, please provide separate measures for each standard.

#	Organization	Question 54 Comment
54.64	Hydro One	We noticed that combined CIP-011-4 standard excluded vulnerability management program. We'd like to know what the rationale was behind this decision and if this might be considered in the next draft.Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional page.Request that the tables and time constraints be consistent. Also where the document refers to processes in some cases it specifies one or more processes and in others just processes. Eliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (refer to R5-R32).Request a cross-reference of CIP-011 Requirements that refers to another CIP-011 Requirement, with emphasis on the Access Control Requirements. A diagram might help.Remove adjectives such as substantial, adequate, minimum, etc., as these are difficult to measure and can lead to different interpretations.
54.65	GTC & GSOC	We recommend a local definition of "Implement" should be added to CIP 011: "Implement means to put into place and consistently utilize. An entity has implemented a policy, procedure, or plan when it has created such policy, procedure or plan and consistently uses it in appropriate circumstances."Throughout the standards the inclusion of the words "for external connectivity only" in the tables is redundant and confusing. If used at all, the qualifier should be on "access" in the text of the standard rather than in the table.We recommend Annual be defined as recurring at least once every Calendar year and at least once within any thirteen (13) consecutive calendar months. Otherwise, annual training will necessarily have to take place earlier each calendar year to ensure all personnel are trained within twelve (12) months.We appreciate the significant effort that the NERC Cyber Security Order 706 Standards Drafting Team has put into developing these proposed standards and communicating them to the industry, especially the CIP Workshop held in Grapevine, TX. We are in full support of the NERC standards development process for the development of reliability standards to secure and protect North America's critical electric infrastructure. In particular, we appreciate the multiple opportunities to guide the development of the CIP standards through both informal and formal comment periods. We are supportive of the proposed standards. We believe these standards are a significant step forward in terms of being able to clearly understand the expectations that are placed upon the entity as well as the security that they provide for the Bulk Electric System.

#	Organization	Question 54 Comment
54.66	PNM Resources, Inc.	We suggest not removing explicit examples from the language of the standards. The incorporation of examples provides clarity and brightline guidance that improves a Responsible Entity's opportunity to comply with the standard. The introduction of new and additional "flexibility" can lead to ambiguity and differences of opinion between the entities and auditors and creatr more opportunities for Regional Entities to allege violations.
54.67	MWDSC	When looking at logical tasks to mitigate risk, e.g., malicious code propagation, could a malicious code in one cyber component affect another component and result in a change in the impact categorization, e.g., low vs medium?
54.68	Progress Energy - Nuclear Generation	Yes, see comments a - f below.a. Comments: Attachment 1 included in responses above follows this question. To obtain full benefit of this review, see Attachment 1.b. The security controls in CIP-011-1 should provide for acceptance of Common Controls as defined by NIST 800-53. CIP-011-1 would offer a more consistent approach in cyber security regulation by considering the mature physical security programs, engineering control programs, emergency plans and physical segregation programs within the nuclear industry that offer alternative countermeasures. These countermeasures provide at least the same degree of cyber security protection as the corresponding cyber security control. c. NIST 800-53 establishes provision for tailoring security controls and states that the level of detail required in documenting tailoring decisions in the security control selection process is strictly at the discretion of the organization consistent with the impact level of the information system. CIP-010-1 and CIP-011-1 should allow use of this provision in the nuclear industry consistent with acceptance by nuclear regulators.d. Nuclear applicability is specified in CIP-010-1, Section 4.2.1. The following comments are based on applicability to nuclear generating facilities: o Definitions for Bulk Electrical System (BES) Cyber System and BES Cyber System Component conflict with definitions that have been accepted by the NRC in NEI 08-09, Revision 6, for Critical System and Critical Digital Asset. Recommend, that for nuclear systems subject to FERC Order 706-B, that definitions for FERC and NRC regulated systems be consistent. o CIP-010-1 requirement R2 and Attachment 1 - some of these functions are covered by NRC regulation. Will issuance of this document require re-submittal of systems for exemption after the Bright Line submittal of systems? o The implementation schedule for CIP-010-1 and CIP-011-1 versus CIPs 002 through 009 requires doing the same reviews twice and is an unnecessary burden on

#	Organization	Question 54 Comment
		nuclear licensees as well as other FERC critical assets.e. Several requirements include periodic review of controls (e.g., R8.2, R12.1). This CIP should contain a provision that permits nuclear facilities to use the periodicities in its NRC approved Cyber Security Program in lieu of those in the CIP standards. This allowance would minimize the administrative burden of having two sets of requirements for the same Cyber Security programmatic element so that plant digital systems that support safety, security, EP or BOP functions are not regulated differently. The following are used to establish frequency or periodicity for security controls with identified durations: o NRC Regulations, Orders o Operating License Requirements (e.g., Technical Specifications) o Site operating history o Industry operating experience o Experience with security control o Guidance in generally accepted standards (e.g., NIST, IEEE, ISO) o Audits and Assessments o Benchmarking o Availability of new technologies. f. R27.1 - The definition of "Cyber Security Incident" should be revisited in light of current definitions, especially NRC and NEI, and revised to align with the definition of "Cyber Attack." It is not on the list of terms to be defined. From NERC Glossary of Terms used in NERC Reliability Standards updated April 20, 2010, the "Cyber Security Incident" definition is: o Any malicious act or suspicious event that:o Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,o Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.o It is unclear what NERC does with cyber incident reports and whether these reports are consistent with those required by the NRC in the event of a "cyber attack." Progress Energy Nuclear Generation Group CommentsCIP- 011-1ATTACHMENT 1NIST Security Control Description NIST 800-53 NEI 08-09 NEI 08-09 Description CIP-011-1 CIP-011 Description NRC CommentsSecurity Planning Policy and Procedures PL-1 N/A N/A R1 Security Governance and Policy 50 App B 50 App E73.5473.5573.56 The development and implementation of cyber security policies that address the requirements identified in R1 are mandated for nuclear by one or more Code of Federal Regulations (CFR). This requirement duplicates and/or is not consistent with the CFR and could lead to regulatory uncertainty. Review of cyber security is mandated by 73.55(m) and R1 conflicts with its duration. This would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant.Security Awareness AT-2 E9.2 Awareness Training R2 Personnel Training, Awareness and Risk Assessment 73.5450 App B Training requirements for nuclear personnel are established by CFR. R 3.3.2 would result in personnel without a need to know becoming knowledgeable in technical aspects of digital equipment. R3.3.4 is not required for users to perform

#	Organization	Question 54 Comment
		their job. This conflicts with 73.54 requirements that personnel are trained to the extent necessary to perform their assigned duties. This would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant.Security Training AT-3 N/A N/A R3 Personnel Training, Awareness and Risk Assessment 73.5473.55 Physical and logical access to plant digital systems is governed by CFR. Personnel who are granted access to these systems are required to complete training that result in their receiving formal and documented Qualifications. Requalification is at established intervals required by plant procedures. Whether the plant system performs functions associated with safety, security, emergency preparedness or BOP, the requirements are the same. Additional training and duration not consistent with established mature training programs would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant. R4 Personnel Risk Assessment 73.56 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. Results are documented and stored in Records. The requirements in R4 conflict with the requirements in the CFR that nuclear personnel supporting plant system performs functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from requirement R4. R5.1 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted unescorted physical access to nuclear plants. The nuclear plant is protected by armed security officers and other protective strategy that restricts access. The requirements in R5.1-3 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.2 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.2 are covered by the CFR for restricting physical access for all plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.3 Physical Security for BES Cyber

#	Organization	Question 54 Comment
		Systems 73.55 Nuclear personnel must pass through security access points before being granted physical access to nuclear plants. Automated scanning records entry. The requirements in R5.3 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Monitoring Physical Access PE-6 E5.8 Monitoring Physical Access R5.4 Physical Security for BES Cyber Systems 73.55 Visitors must receive approval prior to arriving at the security access points and are subject to search before being granted physical access to nuclear plants. Entry and exit are documented. The requirements in R5.4 are covered by the CFR for nuclear visitors supporting plant systems performing functions associated with safety, security, emergency preparedness, BOP or other. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Physical Access Authorizations PE-2 E5.4 Physical Access Authorizations R5.5 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted unescorted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.5 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Physical Access Control PE-3 E5.5 Physical Access Control R5.6 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to annual retraining in order to maintain unescorted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.6 conflict with the CFR that cover access authorization for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.7 Physical Security for BES Cyber Systems Part 2673.56 Requirements for nuclear personnel terminated for cause are covered by the CFR. The requirements in R5.7 conflict with the CFR that direct termination for cause of nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting

#	Organization	Question 54 Comment
		nuclear facilities from this requirement. R5.8 Physical Security for BES Cyber Systems 73.55 N/A to nuclear - applicable to Control Center R5.9 Physical Security for BES Cyber Systems 73.55 Requirements for nuclear personnel who no longer require physical access are covered by CFR. The requirements in R5.9 conflict with the CFR that covers removing physical access for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement.Monitoring Physical Access PE-6 E5.8 Monitoring Physical Access R5.10 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are trained and qualified to provide continuous escort for visitors while they are granted physical access to nuclear plants. The requirements in R5.10 are covered by the CFR for nuclear personnel who escort visitors supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement. R5.11 Physical Security for BES Cyber Systems 73.55 Unauthorized physical access is handled by armed security officers in nuclear security. The requirements in R5.11 are covered by the CFR for unauthorized physical access to the plant where systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement. R6.1 Physical Access Control Systems 73.55 Physical access control systems are covered by CFR requirements. The requirements in R6.1 are covered by the CFR and this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement. R6.2 Physical Access Control Systems 73.55 Physical access control systems are covered by CFR requirements. The requirements in R6.2 are addressed in the CFR and this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement. R6.3 Physical Access Control Systems 73.55 Physical access control systems are maintained and tested per CFR requirements. The requirements in R6.3 are addressed in the CFR. Therefore, this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement.Account Management AC2 D1.2 Account Management R7 Account Management Specifications Consistent with nuclear cyber security plan.Least Privilege AC6 D1.6 Least Privilege R8.1 Account Management Implementation Consistent with nuclear cyber security plan.Account Management AC2 D1.2 Account Management R8.2 Account Management Implementation Duration is inconsistent with nuclear cyber security plan. 		should not be regulated differently. R32 Recovery Plan Review, Update, and Communications Specifications Neither nuclear regulation nor NIST 800-53 contain expectations reviews, updates and communication of recovery plans at the frequencies established by R32. The bases for R32 requirements are unclear and consideration should be given to removing it.

END OF REPORT

Project 2008-06 Cyber Security Order 706

Consideration of Issues and Directives — DRAFT

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 25 We direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework.	FERC Order 706	It is important to highlight differences between NERC's and NIST's approaches. At the root of these differences is the divergent responsibilities and goals. NIST is providing standards and guidance for U.S. Federal Agencies in managing risks to their information and systems in support of their unique missions. NERC, on the other hand, has the role of setting standards for managing risks to systems in support of a shared community mission to ensure the reliability of the BES. This difference is important because it enables the industry to develop better detail about the impacts that they need to avoid in order to achieve their mission. NIST does not enjoy this benefit, as they are providing standards to almost two hundred different organizations, each with vastly different missions. The advantage that the NERC Standards enjoy enables a focus on a relatively small number of reliability services that need to be protected.
		This ultimately means that the NERC Standards can be more tailored and appropriate to the industry than a wholesale adoption of the NIST Risk Management Framework. Four key

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		features of the NIST Risk Management Framework were incorporated into version 5 NERC CIP Standards: (1) ensuring that all BES Cyber Systems associated with the Bulk-Power System, based on their function, receive some level of protection, (2) customizing protection to the mission of the cyber systems subject to protection, (3) a tiered approach to security controls which specifies the level of protection appropriate for systems based upon their importance to the reliable operation of the Bulk-Power System, and (4) the concept of the BES Cyber System itself. Features 2 and 3 above are tightly coupled. In the NIST Risk Management Framework, there is a concept of tailoring and scoping which allows the organization to determine which controls are applicable to their specific environment. In the NERC compliance framework, all requirements are mandatory and enforceable and therefore this concept does not translate directly. As such, the customization of protections by mission is based upon the environment that the BES Cyber System supports (control center, transmission facility, generation facility) and utilizes the tiered model and the requirement applicability to provide this customization to the individual environments that together support a combined mission of Bulk Power System Reliability. The NIST security control catalogue in 800-53 revision 3 was also used as a reference in addressing many of the FERC directives in Order 706.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 258 and 252 "Para 258. As to Entergys suggestion that the ERO provide a DBT profile of potential adversaries, the ERO should consider this issue in the Reliability Standards development process. Para 252. Entergy suggests, as an alternative approach to critical asset identification, that the ERO provide a Design-Basis Threat (DBT) a profile of the type, composition, and capabilities of an adversary that would assist the industry as a technical baseline against which to establish the proper designs, controls and processes. Entergy claims that a DBT approach would address many of the Commission's concerns regarding the risk-based methodology. For example, a DBT would focus the appropriate emphasis on the potential consequences from an outage of a critical asset. In addition, a DBT would address the Commissions concern that responsible entities will not have enough guidance in developing a risk-based methodology and not know how to identify a critical asset. Entergy contends that a DBT approach would provide the industry with more certainty in implementing the CIP Reliability Standards."	FERC Order 706	CIP-002-5 classifies BES Cyber Systems through impact thresholds, and does not use risk-based assessments performed by individual entities. Risk-based approaches to applying cyber security requirements is a worthy objective and will continue to be explored, but the complexity and subjectivity it adds is beyond the scope of these revisions.
Para 282 The Commission directs the ERO to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets.	FERC Order 706	The definition of BES Cyber Asset as used in CIP-002-5 requires Responsible Entities to consider misuse of the Cyber Assets in identifying BES Cyber Systems.
Para 285 The Commission directs the ERO to consider the comment from	FERC Order 706	The exclusion of Cyber Assets based on non-routable protocols has been removed from CIP-002-5 and added as a

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable by testing and experience].		scoping filter for requirements where: (i) the use of non-routable protocols is a mitigating factor for the vulnerabilities a requirement addresses and (ii) implementation of routable protocols would be required to comply with the requirement (e.g. malware updates, security event monitoring and alerting, etc.).
Para 321 "Para 321. SPP and ReliabilityFirst suggest modifying CIP-002-1 to allow an entity to rely upon the assessment of another entity with interest in the matter. We believe that this is a worthwhile suggestion for the ERO to pursue and the ERO should consider this proposal in the Reliability Standards development process. We note that, even without such a provision, an entity such as a small generator operator is not foreclosed from consulting with a balancing authority or other appropriate entity with a wide-area view of the transmission system."	FERC Order 706	The SDT considered this suggestion, and it believes that the change to “bright line” criteria for identifying BES Cyber Systems, along with refining the scope of certain requirements through applicability columns based on impact and connectivity characteristics, addresses this concern.
Para 376 “the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.”	FERC Order 706	The SDT removed the CIP-003-4 requirement to document exceptions to the Cyber Security Policy. • The SDT considers this a general management issue that is not within the scope of a compliance requirement. • The SDT found no reliability basis in this requirement. • Removal of this requirement provides clarity that the

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		only exceptions to the requirements is through the defined Technical Feasibility Exception process, where specifically allowed.
Para 386 The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	FERC Order 706	To address this directive, in CIP-004-5, Requirement R7, Responsible Entities are required to revoke access to BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.
Para 397 and 398 "The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes."	FERC Order 706	Two new requirements were added to address this change CIP-010-1, Requirement R1 (item 1.4), requires additional testing prior to a configuration change in a test environment. CIP-010-1, Requirement R2 (item 2.1), requires monitoring of the configuration of the BES Cyber System. • The SDT proposes the introduction of a defined baseline configuration and an explicit requirement for monitoring for changes to the baseline configuration in High Impact Control Centers in order to capture malicious changes to a BES Cyber System. • Additionally, the SDT proposes that changes to High Impact Control Centers be tested in a test environment prior to their implementation in the

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		production environment to aid in identifying any accidental consequences of the change.
Para 433 “we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.”	FERC Order 706	The SDT addressed this by determining that identification of certain core training elements would be beneficial, and the identification of those core training elements that must be provided in the training program should be role based, as required in CIP-004-5, Requirement R2
Para 434 “The Commission adopts the CIP NOPR’s proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets.”	FERC Order 706	The SDT added this as a topic for role-specific training in CIP-004-5, Requirement R2 (item 2.10). Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems.
Para 435 “Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to assure that security trainers are adequately trained themselves.”	FERC Order 706	The SDT has considered the issue and has determined that no modifications are necessary. In practice, this training is often conducted as computer based training (CBT). As such, as long as the training material itself is adequate, which can be evaluated through the existing audit process, security trainers themselves do not need any particular or specialized training.
Para 446 "Para 446. APPA/LPPC seek clarification regarding discretion in reviewing results of personnel risk assessments and in coming to conclusions regarding the subject employees. SDG&E seeks	FERC Order 706	The SDT clarifies the discretion in reviewing personnel risk assessments in CIP-004-5, Requirement R4, by establishing criteria for personnel risk assessments.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
refinements on various issues, including an industry-wide protocol for periodic background and criminal checks, and the use of pre-employment background check procedures for current employees. The ERO should consider these issues when developing modifications to CIP-004-1 pursuant to the Reliability Standards development process."		
Para 460 "The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination)."	FERC Order 706	In CIP-004-5, Requirement R7, the SDT has addressed this directive by requiring revocation of access concurrent with the termination or disciplinary action (item 7.1) or by the end of the calendar day in cases of transfers or reassignments (item 7.2). In reviewing how to modify the requirement relating to transfers or reassignments, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement (item 7.2) from NIST 800-53 version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers. CIP-004-5, Requirement R7 (item 7.4) augments the requirements in items 7.1 and 7.2 that respond to the directive. In order to meet the immediate timeframe, Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		access revocation on individual Cyber Assets and applications without affecting reliability. This requirement (item 7.4) provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.
Para 464 We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	FERC Order 706	CIP-004-5, Requirement R5 (item 5.1), requires a personnel risk assessment as a condition of being granted access, with exceptions only for specific CIP Exceptional Circumstances which are outlined in the proposed glossary definition of the aforementioned term.
Para 473 The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP Reliability Standards. This is similar to a responsible entitys obligations regarding vendors with access to critical cyber assets.	FERC Order 706	CIP-002-5, Requirement R1 makes clear that asset owners are responsible for complying with the Standards.
Para 476 We direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent with the Commissions	FERC Order 706	Guidance in CIP-002-5 advises the owning Responsible Entities determine who is responsible for complying with the CIP Cyber Security Standards.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
determinations above.		
Para 496 "The Commission adopts the CIP NOPRs proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter"	FERC Order 706	The proposed requirement requires a Responsible Entity to deploy methods to inspect communications and detect potential malicious communications for all External Connectivity (Intrusion Detection). The drafting team addresses this in CIP-005-5, Requirement R1 (item 1.4). Per FERC Order 706, p 496-503, ESP's need two distinct security measures such that the cyber assets do not lose all perimeter protection if one measure fails or is mis-configured. The Order makes clear this is not simple redundancy of firewalls, thus the drafting team has decided to add the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs.
Para 502 "The Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process."	FERC Order 706	The directive for two defensive measures when constructing an ESP indicates a defense-in-depth approach and not simple redundancy of firewalls. CIP-005-5 adds the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs as a second security measure for High Impact BES Cyber Systems.
Para 503 "The Commission is directing the ERO to revise the Reliability Standard to require two or more defensive measures."	FERC Order 706	The directive for two defensive measures when constructing an ESP indicates a defense-in-depth approach and not simple redundancy of firewalls. CIP-005-5 adds the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs as a second security measure for High Impact BES Cyber Systems.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 511 The Commission adopts the CIP NOPRs proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	FERC Order 706	CIP-005-5, Requirement R2 has additional security requirements for remote access from the work started in the Urgent Action Revisions to CIP-005-3. One of these requirements is two-factor authentication and specific examples of two-factor authentication are provided in the referenced guideline.
Paras 525, 526, 528, and 628 Para 525. "The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require logs to be reviewed more frequently than 90 days, but clarifies its direction in several respects. At this time, the Commission does not believe that it is necessary to require responsible entities to review logs daily…" Para 526. "the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments. The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs." Para 528. "The Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted	FERC Order 706	In CIP-007-5, Requirement R4, the SDT proposes the performance of a review of log summaries or samples every two weeks. CIP-007-5, Requirement R4, combines CIP-005-4, Requirement R5 and CIP-007-4, Requirement R6, and addresses FERC's directives from a system-wide perspective. The primary feedback received on this requirement from the informal comment period was the vagueness of terms "security event" and "monitor". The term "security event" or "events related to cyber security" is problematic because it does not apply consistently across all platforms and applications. To resolve this term, the requirement takes an approach similar to NIST 800-53 and requires the entity to define the security events relevant to the system. In addition, this requirement sets up parameters for the monitor and review processes. It is rarely feasible or productive to look at every security log on the system. Paragraph 629 of the FERC Order 706 acknowledges this reality when directing a manual log review. As a result, this

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
or filtered logs." Para 628. "Requirement R6 of CIP-007-1 does not address the frequency with which log should be reviewed. Requirement R6.4 requires logs to be retained for 90 calendar days. This allows a situation where logs would only be reviewed 90 days after they are created. The Commission continues to believe that, in general, logs should be reviewed at least weekly…"		requirement allows the manual review to consist of a sampling or summarization of security events occurring since the last review. Additionally, consistent with FERC Order 706, the requirement makes clear that the objective of this control is to identify unanticipated Cyber Security Incidents and potential event logging failures, thereby improving automated detection settings.
Paras 541, 542, and 547 Para 541. we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments." Para 542. "the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems." Para 547. "we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years"	FERC Order 706	In CIP-010-1, Requirement R3, the SDT has added requirements for an "active vulnerability assessment" to occur at least once every three years for High Impact Control Centers using a test system so as to prevent unforeseen impacts on the Bulk Electric System. Requirement R3 requires annual paper assessments in the intervening years.
Para 544 "the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification." "we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability	FERC Order 706	The SDT addresses this paragraph in CIP-010-1, Requirement R3. • The SDT has proposed that prior to adding a new cyber asset into a BES Cyber System, that the new Cyber Asset undergoes an active vulnerability assessment. • An exception is made for specified CIP Exceptional

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
assessment”		Circumstances. • Additionally, the new requirement in CIP-010, Requirement R1 (item 1.5) requires testing of all changes for High Impact BES Cyber Systems that deviate from the baseline configuration in a test environment to ensure that required security controls are not adversely affected.
Para 572 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around critical cyber assets."	FERC Order 706	The SDT addressed this in CIP-006-5, Requirement R1 (item 1.3) for High Impact BES Cyber Assets
Para 581 “The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years.”	FERC Order 706	The SDT addressed this in CIP-006-5, Requirement R3 (item 3.1) by changing the frequency to a 24 month testing cycle; after deliberation and consideration, the SDT determined that a requirement of more frequent testing (e.g., 12 months), was too often.
Paras 609, 610, and 611 Para 609. “We therefore direct the ERO to develop requirements addressing what constitutes a “representative system” and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.” Para 610. “we direct the ERO to revise the Reliability Standard to	FERC Order 706	CIP-010-1, Requirement R1 (item 1.4), provides clarity on when testing must occur and requires additional testing to ensure that accidental consequences of planned changes are appropriately managed. • The SDT proposes to require a “representative system” or test system for those High Impact Control Centers to use for the purposes of testing proposed

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above." Para 611. "the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production."		changes and performing active vulnerability assessments. • The SDT proposes using the defined baseline configuration of a BES Cyber System for the measuring stick as to whether a test system is truly representative of the production system. • To account for any additional differences between the two systems, the SDT proposes using the words directly from FERC Order 706 "Document the differences between the test environment and the production environment including a description of the measures used to account for any differences in operation between the test and production environments."
Paras 620 and 622 Para 620. "The Commission will not adopt Consumers' recommendation that every system in an electronic security perimeter does not need antivirus software. Critical cyber assets must be protected, regardless of the operating system being used. Consumers has not provided convincing evidence that any specific operating system is not directly vulnerable to virus attacks. Virus technology changes every day. Therefore we believe it is in the public interest to protect all cyber assets within an electronic security perimeter, regardless of the operating system being used…"	FERC Order 706	The drafting team addressed this in CIP-007-5, Requirement R3. The drafting team is taking the approach of making this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component. The BES Cyber System is the object of protection. The drafting team believes that addressing this issue holistically at the BES Cyber System level and regardless of technology, along with the enhanced change management requirements, meets this directive.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 622. "The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above.		• The SDT rewrote the requirement as a competency based requirement that does not prescribe technology. • The SDT added Maintenance to cover malware on removable media. The drafting team also created a new requirement, CIP-007-5, Requirement R3 (item 3.4), to protect against personnel introducing malicious code when temporarily connecting to a BES Cyber Asset for Maintenance purposes. When remote access is used to connect to a BES Cyber Asset, an intermediate device is required in CIP-005-5, Requirement R2 (item 2.1) and guidance is further included for the cyber security policy in CIP-003-5, Requirement R2 to maintain up-to-date anti-malware software and patch levels before initiating interactive remote access.
Para 628. The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1	FERC Order 706	In CIP-007-5, Requirement R4, the SDT proposes the performance of a review of log summaries or samples every two weeks.
Paras 633 and 635	FERC Order 706	The SDT addresses these directives in CIP-011-1,

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 633. "The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it." Para 635. "the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data."		Requirement R2. The requirements clarify that the goal is to prevent the unauthorized retrieval of information from media. The SDT removed the word "erase" as, depending on the media itself, erasure may not be sufficient to meet this goal.
Para 643 "The Commission adopts its proposal to direct the ERO to provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan."	FERC Order 706	In CIP-010-1, R3 (item 3.4), the SDT added a requirement for an entity planned date of completion to the remediation action plan following a vulnerability assessment. In order to provide more direction on what "features, functionality, and vulnerabilities" should be addressed in a vulnerability assessment, the SDT included guidance on active and paper vulnerability assessment. The SDT further referenced NIST SP800-115 to provide entities additional guidance on how to conduct a vulnerability assessment.
Para 661 "the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced."	FERC Order 706	CIP-008-5 addresses the four parts of this directive as follows: 1. Added: Reportable Cyber Security Incidents include as a minimum any Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service. 2. Retired CIP-008-4, R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in the draft EOP-004-2, Requirement 1, Part 1.3.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		3. See 1 above 4. Guidance and measurements have been developed to be auditable and enforceable.
Para 673 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report."	FERC Order 706	Cyber Security - Incident Reporting and Response Planning: Retired CIP-008-4, R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in the draft EOP-004-2, Requirement 1, Part 1.3
Para 676 "The Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report."	FERC Order 706	Cyber Security - Incident Reporting and Response Planning: Retired CIP-008-4, R1.3 which contains provisions for reporting Cyber Security Incidents. This is addressed in the draft EOP-004-2, Requirement 1, Part 1.3.
Para 686 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.."	FERC Order 706	In CIP-008-5, R3 (items 3.3 and 3.4), the SDT includes additional specification on the update of response plan and modifies the response plan requirements to incorporate lessons learned. Maintenance of documentation of paper drills, full operational drills, and responses to actual incidents is part of the documentation required to demonstrate compliance with the security controls in CIP-008-5 and is already subject to the evidence retention requirements associated with all

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		NERC Reliability Standards.
Para 694 “For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in compliance with this Reliability Standard”	FERC Order 706	The SDT added in CIP-009-5, R1, a requirement to implement the recovery plan
Para 706 "The Commission adopts, with clarification, the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard."	FERC Order 706	CIP-009-5, R1 (item 1.5) requires a process to preserve data for analysis or diagnosis of the cause of any problem that adversely impacts a BES Reliability Operating Service. The SDT captured the objective of this control, but did not explicitly use the term “forensics” due to the legal interpretations associated with the term.
Para 710 and 706 "Therefore, we direct the ERO to revise CIP-009-1 to require data collection, as provided in the Blackout Report."	FERC Order 706	CIP-009-5, R1 (item 1.5) requires a process to preserve data for analysis or diagnosis of the cause of any problem that adversely impacts a BES Reliability Operating Service.
Para 725 "The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years."	FERC Order 706	CIP-009-5, R2 (item 2.3) requires an operational exercise at least once every three calendar years.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 739 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes."	FERC Order 706	In CIP-009-5, R1 (item 1.4), the SDT added requirements related to restoration processes based on review of the DHS Controls, and requires verification initially after backup to ensure that the process completed successfully. In CIP-009-5, R2 (item 2.2), the SDT requires an initial and once every calendar year test of the data at High Impact BES Cyber Systems or Medium Impact BES Cyber Systems at Control Centers.
Para 748 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are successful and backup failures are addressed, so that backups are available for future use."	FERC Order 706 NERC Alert regarding remote access VPN vulnerabilities	In CIP-009-5, R1 (item 1.4), the SDT added requirements related to restoration processes based on review of the DHS Catalog of Control Systems Security: Recommendations for Standards Developers (a derivation of NIST SP800-53 for Control Systems), and requires verification initially after backup to ensure that the process completed successfully. Addressed in CIP-005-5 ▪ Creates basic requirements to protect critical systems from untrusted networks. ▪ Identifies protective measures that provide secure access to critical systems. ▪ Helps ensure secure practices by employees, contractors, and service vendors to minimize exploitation of vulnerabilities. ▪ Addresses questions regarding ability to audit or

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		enforce the requirement through the design of clear measures. ▪ Significant guidance provided to address implementation options for organizations of differing sizes, capabilities, and complexity. Additionally, remote access is specifically required to be included in an entity's cyber security policy. Guidance is included to assist the entity in determining what this topic in the cyber security policy should address.
Para 13. "The Commission recognizes and encourages NERC's intention to address physical ports to eliminate the current gap in protection as part of its ongoing CIP Reliability Standards project scheduled for completion by the end of 2010. Should this effort fail to address the issue, however, the Commission will take appropriate action, which could include directing NERC to produce a modified or new standard that includes security of physical ports."	Order Approving Interpretation of Reliability Standard CIP-007-2 in Docket No. RD10-3-000, March 18, 2010	The SDT addressed this issue in CIP-007-5, R1, by having a requirement to disable or restrict use of physical I/O ports. The SDT changed the 'needed for normal or emergency operations' to those ports that are documented with reasons why they are necessary. In the March 18, 2010 FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.

Standards Announcement

Project 2008-06 Cyber Security Order 706 Version 5 CIP

Twelve Initial Ballot Windows Now Open for Ten Standards, Implementation Plan and Definitions: Friday, December 16 – Friday, January 6, 2012

Now Available

Twelve initial ballot windows, for the following ten CIP standards, the associated implementation plan, and a set of new and revised NERC Glossary definitions, are open through 8 p.m. Eastern on Friday, January 6, 2011.

- CIP-002-5 Cyber Security — BES Cyber Asset and BES Cyber System Categorization
- CIP-003-5 Cyber Security — Security Management Controls
- CIP-004-5 Cyber Security — Personnel and Training
- CIP-005-5 Cyber Security — Electronic Security Perimeter(s)
- CIP-006-5 Cyber Security — Physical Security of BES Cyber Systems
- CIP-007-5 Cyber Security — Systems Security Management
- CIP-008-5 Cyber Security — Incident Reporting and Response Planning
- CIP-009-5 Cyber Security — Recovery Plans for BES Cyber Assets and Systems
- CIP-010-1 Cyber Security — Configuration Management and Vulnerability Assessments
- CIP-011-1 Cyber Security — Information Protection

In addition, the following documents were previously posted to assist stakeholders in their review of the standards:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standards based on comments on CIP-010-1 and CIP-011-1 submitted during an informal comment period that ended June 3, 2010. (Note that the previously posted CIP-010-1 and CIP-011-1 are not the same standards as those posted for this comment/ballot period. The version of CIP-010 posted May 4 – June 3, 2010 addressed requirements associated with an earlier version of CIP-002, and the version of CIP-011 posted May 4 – June 3, 2010 was a single standard that contained all the requirements associated with earlier versions of CIP-003 through CIP-009.)
- Mapping Document – Identifies each requirement in the already-approved Version 4 CIP standards and identifies how the requirement has been treated in the Version 5 CIP standards (which includes CIP-002-5 through CIP-009-5 and CIP-010-1 and CIP-011-1).

- Clean versions of the approved versions of CIP-002-4 through CIP-009-4 – these are posted because the extent of the changes to each of the standards makes a redline of the posted draft standards against the approved standards impractical.
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically.

Note that the Standards Committee has authorized an extended formal comment period (60 days), along with an extended ballot window (20 days), in consideration of the large number of standards and substantive changes to the format and content of the Version 5 CIP standards. In addition, the Standards Committee has authorized a deferral of the nonbinding polls to allow stakeholders an opportunity to focus more closely on the requirements, definitions, and implementation plan during this posting period. The nonbinding polls will take place in parallel with the next ballot of these standards.

Instructions for Balloting CIP V5 Standards, Implementation Plan, and Definitions

Each of the ten standards (ten ballots), the associated implementation plan (one ballot), and the set of definitions (one ballot) are being balloted individually to provide stakeholders an opportunity to cast separate ballots for each item. The individual ballots will provide the drafting team better feedback on which standards require additional development to achieve stakeholder consensus, as well as allow the team to gauge stakeholder support for the proposed implementation plan and definitions. Stakeholders are encouraged to consider each standard on its own merits and cast individual ballots, rather than casting the same ballot for all ten standards, in order to assist the drafting team with evaluating which standards require additional development to achieve consensus.

Members of the ballot pool associated with this project may log in and submit their votes for both the definition and the Detailed Information to Support an Exception Request from the following page: https://standards.nerc.net/CurrentBallots.aspx.

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, January 6, 2012**. Please use this electronic form to submit comments. Please note that comments submitted during the formal comment period and the ballots for the standards all use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

In addition, in consideration of the volume of comments the drafting team anticipates, the drafting team requests that for groups of entities that develop a common set of comments, one member of the group submit the complete set of comments with other members simply submitting a brief statement that they support the comments submitted by [name/affiliation of the member of the group that

submits the complete set of comments]. This is the most efficient way to provide the drafting team with an indication of the volume of support for a set of comments.

If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will consider all comments received and determine whether to make revisions to each of the standards, implementation plan, and definitions.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

A Standard Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order No. 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order No. 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90 days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order No. 706 directives. An original draft version of CIP-010 and CIP-011, which included the categorization of cyber systems in CIP-010 and associated cyber security requirements consolidated into a single CIP-011, were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT developed a limited scope of requirements in Version 4 of the CIP Cyber Security Standards (CIP-002-4 through CIP-009-4) as an interim step to address the more immediate concerns raised in FERC Order No. 706, paragraph 236, especially those associated with CIP-002's identification of Critical Assets and the risk-based methodology used for the identification. CIP-002-4, which included a bright-line based approach for criteria used to identify Critical Assets in lieu of an entity defined risk-based methodology, and the conforming changes to CIP-003 through CIP-009, was approved by the Board of Trustees in January of 2011. On September 15, 2011, FERC issued a Notice of Proposed Rulemaking (RM11-11) to approve Version 4 of the Cyber Security Standards with a 60 day comment period.

This draft Version 5 of the NERC CIP Cyber Security Standards is intended to address the remaining standards related directives in FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2008-06 Cyber Security Order 706 Version 5 CIP

Ballot Pool Now Open: November 7 – December 15, 2011
Formal Comment Period Now Open: November 7, 2011 – January 6, 2012
Twelve Initial Ballot Windows Open for Ten Standards, Implementation Plan and Definitions: Friday, December 16 – Friday, January 6, 2012

Now Available

Ten CIP standards (CIP-002-5 through CIP-009-5, CIP-010-1, and CIP-011-1), a set of new and revised NERC Glossary definitions, and a proposed implementation plan have been posted for a formal 60-day comment period through Friday, January 6, 2012.

CIP-002-5 requires the categorization of these BES Cyber Systems according to bright-line criteria that characterize their impact on the Reliability Operations Services according to "bright-line" criteria contained in Attachment 1 – Impact Categorization of BES Cyber Assets and BES Cyber Systems of the draft CIP-002-5 standard.

CIP-003-5 through CIP-009-5, CIP-010-1 and CIP-011-1 in the draft Version 5 CIP Cyber Security Standards define the cyber security requirements to be applied to the BES Cyber Systems according to the categorization performed in CIP-002-5.

CIP-003 through CIP-009 generally follow the organization of Versions 1-4 of CIP-003 through CIP-009. CIP-010-1 is a new standard that contains the Configuration Management and Vulnerability Assessment requirements previously defined across several CIP standards in Versions 1 through 4. CIP-011-1 is a new standard that defines Information Protection and Media Sanitization requirements previously defined across many standards in Versions 1 through 4.

In addition, the following documents have been posted to assist stakeholders in their review:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standards based on comments on CIP-010-1 and CIP-011-1 submitted during an informal comment period that ended June 3, 2010. (Note that the previously posted CIP-010-1 and CIP-011-1 are not the same standards as those posted for this comment period. The version of CIP-010 posted May 4 – June 3, 2010 addressed requirements associated with an earlier version of CIP-002, and the version of CIP-011 posted May 4 – June 3, 2010 was a single

standard that contained all the requirements associated with earlier versions of CIP-003 through CIP-009.)

- Mapping Document - Identifies each requirement in the already-approved Version 4 CIP standards and identifies how the requirement has been treated in the Version 5 CIP standards (which includes CIP-002-5 through CIP-009-5 and CIP-010-1 and CIP-011-1).
- Clean versions of the approved versions of CIP-002-4 through CIP-009-4 - these are posted because the extent of the changes to each of the standards makes a redline of the posted draft standards against the approved standards impractical.
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically.

Note that the Standards Committee has authorized an extended formal comment period (60 days), along with an extended ballot window (20 days), in consideration of the large number of standards and substantive changes to the format and content of the Version 5 CIP standards. In addition, the Standards Committee has authorized a deferral of the non-binding polls to allow stakeholders an opportunity to focus more closely on the requirements, definitions, and implementation plan during this posting period. The non-binding polls will take place in parallel with the next ballot of these standards.

Instructions for Joining Ballot Pool for Version 5 CIP Standards

A single ballot pool is being formed for the balloting of all ten standards, the implementation plan, and the definitions associated with the ten standards. The ballot pool that is formed will be cloned to create twelve separate ballot pools (one for each of the ten standards, one for the implementation plan, and one for the definitions). All members of the original ballot pool will automatically be eligible to vote in the twelve individual ballots.

The standards, implementation plan, and set of definitions are being balloted individually to provide stakeholders an opportunity to cast separate ballots for each item. The individual ballots will provide the drafting team better feedback on which standards require additional development to achieve stakeholder consensus, as well as allow the team to gauge stakeholder support for the proposed implementation plan and definitions. Stakeholders are encouraged to consider each standard on its own merits and cast individual ballots, rather than casting the same ballot for all ten standards, in order to assist the drafting team with evaluating which standards require additional development to achieve consensus.

To join the ballot pool to be eligible to vote in the upcoming ballots, as well as future ballots and non-binding polls for the Version 5 CIP standards, go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited

from using the ballot pool list servers.) One ballot pool list server has been set up and can be used for communication on each of the standards being balloted for this project. The list server is: bp-2008-06_CIP-002-5_in@nerc.com

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, January 6, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments

Please note that comments submitted during the formal comment period and the ballot for the standard both use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps

The drafting team will host a series of three webinars – two on the substance of the standards, and a third to address process questions. The webinars on the substance of the standards, which have already been announced, will be held on November 15, 2011, and November 29, 2011. A separate announcement for the webinar that will address process questions will be sent with registration information as soon as details have been finalized.

Twelve initial ballots (one for each of the ten standards, one for the definitions, and one for the implementation plan associated with these standards) will be conducted beginning on Friday, December 16, 2011 through 8 p.m. Eastern on Friday, January 6, 2011.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

A Standard Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order No. 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order No. 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90-days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order No. 706 directives. An original draft version of CIP-010 and CIP-011, which included the categorization of cyber systems in CIP-010 and associated cyber security requirements consolidated into a single CIP-011, were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT developed a limited scope of requirements in Version 4 of the CIP Cyber Security Standards (CIP-002-4 through CIP-009-4) as an interim step to address the more immediate concerns raised in FERC Order No. 706, paragraph 236, especially those associated with CIP-002's identification of Critical Assets and the risk-based methodology used for the identification. CIP-002-4, which included a bright-line based approach for criteria used to identify Critical Assets in lieu of an entity defined risk-based methodology, and the conforming changes to CIP-003 through CIP-009, was approved by the Board of Trustees in January of 2011. On September 15, 2011, FERC issued a Notice of Proposed Rulemaking (RM11-11) to approve Version 4 of the Cyber Security Standards with a 60 day comment period.

This draft Version 5 of the NERC CIP Cyber Security Standards is intended to address the remaining standards related issues of FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Standards Announcement

Project 2008-06 Cyber Security Order 706 Version 5 CIP

Ballot Pool Now Open: November 7 – December 15, 2011
Formal Comment Period Now Open: November 7, 2011 – January 6, 2012
Twelve Initial Ballot Windows Open for Ten Standards, Implementation Plan and Definitions: Friday, December 16 – Friday, January 6, 2012

Now Available

Ten CIP standards (CIP-002-5 through CIP-009-5, CIP-010-1, and CIP-011-1), a set of new and revised NERC Glossary definitions, and a proposed implementation plan have been posted for a formal 60-day comment period through Friday, January 6, 2012.

CIP-002-5 requires the categorization of these BES Cyber Systems according to bright-line criteria that characterize their impact on the Reliability Operations Services according to "bright-line" criteria contained in Attachment 1 – Impact Categorization of BES Cyber Assets and BES Cyber Systems of the draft CIP-002-5 standard.

CIP-003-5 through CIP-009-5, CIP-010-1 and CIP-011-1 in the draft Version 5 CIP Cyber Security Standards define the cyber security requirements to be applied to the BES Cyber Systems according to the categorization performed in CIP-002-5.

CIP-003 through CIP-009 generally follow the organization of Versions 1-4 of CIP-003 through CIP-009. CIP-010-1 is a new standard that contains the Configuration Management and Vulnerability Assessment requirements previously defined across several CIP standards in Versions 1 through 4. CIP-011-1 is a new standard that defines Information Protection and Media Sanitization requirements previously defined across many standards in Versions 1 through 4.

In addition, the following documents have been posted to assist stakeholders in their review:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standards based on comments on CIP-010-1 and CIP-011-1 submitted during an informal comment period that ended June 3, 2010. (Note that the previously posted CIP-010-1 and CIP-011-1 are not the same standards as those posted for this comment period. The version of CIP-010 posted May 4 – June 3, 2010 addressed requirements associated with an earlier version of CIP-002, and the version of CIP-011 posted May 4 – June 3, 2010 was a single

standard that contained all the requirements associated with earlier versions of CIP-003 through CIP-009.)

- Mapping Document - Identifies each requirement in the already-approved Version 4 CIP standards and identifies how the requirement has been treated in the Version 5 CIP standards (which includes CIP-002-5 through CIP-009-5 and CIP-010-1 and CIP-011-1).
- Clean versions of the approved versions of CIP-002-4 through CIP-009-4 - these are posted because the extent of the changes to each of the standards makes a redline of the posted draft standards against the approved standards impractical.
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically.

Note that the Standards Committee has authorized an extended formal comment period (60 days), along with an extended ballot window (20 days), in consideration of the large number of standards and substantive changes to the format and content of the Version 5 CIP standards. In addition, the Standards Committee has authorized a deferral of the non-binding polls to allow stakeholders an opportunity to focus more closely on the requirements, definitions, and implementation plan during this posting period. The non-binding polls will take place in parallel with the next ballot of these standards.

Instructions for Joining Ballot Pool for Version 5 CIP Standards

A single ballot pool is being formed for the balloting of all ten standards, the implementation plan, and the definitions associated with the ten standards. The ballot pool that is formed will be cloned to create twelve separate ballot pools (one for each of the ten standards, one for the implementation plan, and one for the definitions). All members of the original ballot pool will automatically be eligible to vote in the twelve individual ballots.

The standards, implementation plan, and set of definitions are being balloted individually to provide stakeholders an opportunity to cast separate ballots for each item. The individual ballots will provide the drafting team better feedback on which standards require additional development to achieve stakeholder consensus, as well as allow the team to gauge stakeholder support for the proposed implementation plan and definitions. Stakeholders are encouraged to consider each standard on its own merits and cast individual ballots, rather than casting the same ballot for all ten standards, in order to assist the drafting team with evaluating which standards require additional development to achieve consensus.

To join the ballot pool to be eligible to vote in the upcoming ballots, as well as future ballots and non-binding polls for the Version 5 CIP standards, go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited

from using the ballot pool list servers.) One ballot pool list server has been set up and can be used for communication on each of the standards being balloted for this project. The list server is: bp-2008-06_CIP-002-5_in@nerc.com

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, January 6, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments

Please note that comments submitted during the formal comment period and the ballot for the standard both use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps

The drafting team will host a series of three webinars – two on the substance of the standards, and a third to address process questions. The webinars on the substance of the standards, which have already been announced, will be held on November 15, 2011, and November 29, 2011. A separate announcement for the webinar that will address process questions will be sent with registration information as soon as details have been finalized.

Twelve initial ballots (one for each of the ten standards, one for the definitions, and one for the implementation plan associated with these standards) will be conducted beginning on Friday, December 16, 2011 through 8 p.m. Eastern on Friday, January 6, 2011.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

A Standard Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order No. 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order No. 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90-days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order No. 706 directives. An original draft version of CIP-010 and CIP-011, which included the categorization of cyber systems in CIP-010 and associated cyber security requirements consolidated into a single CIP-011, were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT developed a limited scope of requirements in Version 4 of the CIP Cyber Security Standards (CIP-002-4 through CIP-009-4) as an interim step to address the more immediate concerns raised in FERC Order No. 706, paragraph 236, especially those associated with CIP-002's identification of Critical Assets and the risk-based methodology used for the identification. CIP-002-4, which included a bright-line based approach for criteria used to identify Critical Assets in lieu of an entity defined risk-based methodology, and the conforming changes to CIP-003 through CIP-009, was approved by the Board of Trustees in January of 2011. On September 15, 2011, FERC issued a Notice of Proposed Rulemaking (RM11-11) to approve Version 4 of the Cyber Security Standards with a 60 day comment period.

This draft Version 5 of the NERC CIP Cyber Security Standards is intended to address the remaining standards related issues of FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Standards Announcement

Project 2008-06 Cyber Security Order 706 (CIP Version 5)

Initial Ballot Results

Now Available

Twelve initial ballot windows for the following ten CIP standards, one ballot for the associated implementation plan, and one ballot for a set of new and revised NERC Glossary definitions, closed on Friday, January 6, 2011. The drafting team thanks stakeholders for the careful consideration of such a large volume of documents, and for the substantive and constructive feedback received.

Voting statistics for each ballot are listed below, and the Ballot Results webpage provides a link to the detailed results.

Ballot	Results
CIP-002-5 Cyber Security — BES Cyber System Identification	Quorum: 93.62% Approval: 22.09%
CIP-003-5 Cyber Security — Security Management Controls	Quorum: 93.62% Approval: 33.49%
CIP-004-5 Cyber Security — Personnel and Training	Quorum: 93.62% Approval: 26.82%
CIP-005-5 Cyber Security — Electronic Security Perimeter(s)	Quorum: 93.62% Approval: 28.04%
CIP-006-5 Cyber Security — Physical Security	Quorum: 93.61% Approval: 29.60%
CIP-007-5 Cyber Security — Systems Security Management	Quorum: 93.61% Approval: 24.15%
CIP-008-5 Cyber Security — Incident Reporting and Response Planning	Quorum: 94.02% Approval: 34.30%
CIP-009-5 Cyber Security — Recovery Plans for BES Cyber Assets and Systems	Quorum: 93.61% Approval: 27.28%
CIP-010-1 Cyber Security — Configuration Change Management	Quorum: 93.61% Approval: 26.61%
CIP-011-1 Cyber Security — Information Protection	Quorum: 93.61% Approval: 29.88%
CIP V5 Implementation Plan	Quorum: 92.15% Approval: 42.06%

Ballot	Results
CIP V5 Definitions	Quorum: 92.56% Approval: 25.34%

Next Steps

The drafting team will consider all comments and determine what changes to make to each of the standards, the implementation plan, and the definitions. After the drafting team has revised the standards, they will be submitted, along with the team's Consideration of Comments, for quality review and subsequently posted for a successive ballot.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

A Standard Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order No. 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order No. 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90 days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order No. 706 directives. An original draft version of CIP-010 and CIP-011, which included the categorization of cyber systems in CIP-010 and associated cyber security requirements consolidated into a single CIP-011, were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT developed a limited scope of requirements in Version 4 of the CIP Cyber Security Standards (CIP-002-4 through CIP-009-4) as an interim step to address the more immediate concerns raised in FERC Order No. 706, paragraph 236, especially those associated with CIP-002's identification of Critical Assets and the risk-based methodology used for the identification. CIP-002-4, which included a bright-line based approach for criteria used to identify Critical Assets in lieu of an entity defined risk-based methodology, and the conforming changes to CIP-003 through CIP-009, was approved by the Board of Trustees in January of 2011. On September 15, 2011, FERC issued a Notice of Proposed Rulemaking (RM11-11) to approve Version 4 of the Cyber Security Standards with a 60 day comment period.

This draft Version 5 of the NERC CIP Cyber Security Standards is intended to address the remaining standards related issues of FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed. Additional information about the project is available on the project webpage.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Individual
Doug Peterchuck
Omaha Public Power District
Yes
Definition Concerns: 1. BES Cyber Asset: A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. Please define or clarify the term “adversely”. Requesting clarification or suggest just using impact. Term “adversely” is subject to interpretation. 2. BES Cyber Security Incident: The term “suspicious” is open to interpretation and very vague. Suggest rewording to “intentional malicious act”. 3. Control Center: As defined, control

centers are as follows: one or more facilities “Hosting” a set of one or more BES Cyber Assets OR BES Cyber Systems performing one or more of the following functions that supports real-time operations by System Operations for two or more BES Generation facilities or transmission facilities, at two or more locations. While the definition of entities control centers (e.g., control centers monitoring and controlling generation and transmission facilities) are being interpreted by this definition, the control room for generation facilities could be interpreted to adhere to the same CIP standard requirements. Requesting a clear interpretation of control center, with examples for CEA’s and entities or a clear definition of generation control rooms and the separation of the two definitions in relation to CIP v5 standards. 4. Cyber Assets: Programmable electronic devices, including the hardware, software, and data in those devices. Does programmable devices include legacy Remote Terminal Units (RTU's) with eeproms? Some may not consider them as Cyber Assets. Because not all industrial devices are IT based, suggest thorough research be performed within the industry before declaring specific devices.
Yes
CIP-002-5: Attachment 1: Medium Impact Rating; 2.13: Clarification needed within the definition of (2) Generation control centers that control 300MW or more of generation. As stated within question one of this document, the definition of control center and generation control room needs to be defined separately. Entities and Compliance Enforcement Authority (CEA’s) are interpreting no difference in control centers and generation control rooms.
Yes
Yes
No
While it’s completely understandable the VSL’s are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL’s for all requirements.
Yes
Yes
Yes
Yes
Yes
Yes
No
While it’s completely understandable the VSL’s are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL’s for all requirements.
Yes
No
CIP-004-5 R2: Requirement 2.10: Role based training on the BES Cyber System’s interconnectivity and interoperability with other cyber systems. The understanding of this requirement is to perform annual training to those entities interdepartmental personnel who are responsible for implementing, maintaining and securing the interconnectivity and interoperability BES impacted networks. Many mid-range to small entities that will be impacted by CIPv5 have small internal departments controlling the CIP networks. The reality of performing training on personnel whom maintain the systems is very confusing, time consuming and redundant. Establishing training for those individuals who are so involved with the infrastructure or protecting the asset seems ineffective in protecting the reliability of

a BES Cyber System.
Yes
Yes
Yes
Yes
No
While understanding the justification of minimizing the risk scope and implementing logic from NIST 800-53 version 3 segments, clarification is needed for all requirements within CIP-004-5.R7. For example, R7.1 – HIGH & MED asset designation- individuals who resign or are terminated must have revocation of unescorted physical access and interactive remote access to BES Cyber Systems at the time of the resignation or termination. Request a sufficient timeframe (e.g., xxxx hours to complete the access revocation of physical and remote access) as entities processes may adhere to the standard, however, the phrase “at the time of the resignation or termination” is subject to interpretation. CIP-004-5.R7.2 – HIGH & MED asset designation – For reassignments or transfers, revoke the individuals unneeded electronic and physical access to BES Cyber Systems by the end of the next calendar day. Request a longer timeframe to complete the task of having a full assessment for reassignments or transfers. Recommend seven days for reassignments and transfers as too many variables may inhibit next calendar day completion.
No
While it’s completely understandable the VSL’s are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL’s for all requirements.
No
CIP-005-3 Requirement 1.1: Define technical and procedural controls to restrict unauthorized electronic access. With entities identifying assets High, Medium and Low, anticipation of many BES Cyber system assets being categorized as low should be considered when establishing criteria which are enforced. Assets that are categorized as Low could be into the thousands for any registered entity. Resources could be allotted toward High and Medium BES Cyber Systems as opposed to Low categorized BES Cyber Systems. CIP-005-3 Requirement 1.5: A documented method for detecting malicious communications at each EAP. The implementation of IDS systems at each identified ESP (internal and external), along with current security methods of deterring malicious intent seems to be extensive and very costly to entities. Recommend a re-write of the requirements to “a documented method for deterring malicious communications at each EAP”. Otherwise, if IDS is absolutely required, please consider IDS implementation on external outbound EAP’s. Internally identified EAP’s located within DBP’s, already enforced with ACL’s and logging should not be subjected to IDS implementation.
No
CIP-005-5 Requirement 2.2: Require encryption for all interactive remote access sessions to protect the confidentiality and integrity of each interactive remote access session. One element that needs to be addressed is contracts with the various service vendors and contractors that maintain systems from remote locations. Current contracts from vendor to owner have established terms and conditions that could negate the contact and void the service agreements. Also, if entities are utilizing vendor support to maintain a deemed BES Cyber System, how can entities implement encryption into vendor network, all the way to vendor end point (console)? Clarification is needed on where encryption needs to start and stop accordingly.
No
While it’s completely understandable the VSL’s are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL’s for all requirements.
Yes

Yes
No
CIP-006-5 Requirement 3.2: Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year. Clarification on the term “outage” is needed. If outage is referring to downtime that was unwarranted or unscheduled; suggest “maintenance and /or unscheduled operational downtime”.
Yes
Commend SDT on developing VSL’s for all categories.
No
CIP-007-5 Requirement 1.2: Disable or restrict the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media. Requirement itself is too vaguely written, subject to interpretation. Request clarifications on the following terms: “console commands” and “signage” used in the measures section. Entities may have difficulty disabling or restricting the use of unnecessary physical input/output ports used for console commands, as multiple operating systems are being utilized throughout the industry, not just Microsoft. Due to the Stuxnet vulnerability, entities must be proactive and protect themselves by disabling the removable media ports (USB), however, restricting and disabling physical ports for console commands (basically serial ports), is not exactly logical.
No
CIP-007-5 Requirement 2.3: A process of remediation, including any exceptions for CIP exceptional Circumstances. Recommend changing the term “remediation” to “mitigation” this change will cause less ambiguity and will be consistent with terminology currently established. Also, measurements for compliance seem to exceed the requirements. Entities are performing these tasks (measures) on a monthly basis in conjunction to their security patch management programs. The current list of measure to meet this specific requirement does not improve security or the reliability of the BES Cyber Systems or BES Cyber Assets. Recommend scaling down the measures.
No
CIP007-5 Requirement 3.1: Deploy method(s) to deter, detect or prevent malicious code. Recommend re-wording the requirement as it’s subject to interpretation. Entities and CAE’s alike, view this requirement as a “either or” statement. Recommend utilizing “where technically feasible” as not all BES Cyber Systems are designated as computers utilizing Microsoft technology, (e.g., relay’s, PLC’s, Controllers, etc.) CIP-007-5 Requirement 3.1 through 3.4: Unfortunately, the manufactures that have developed industry hardware and some software do not view malicious software to be a legit issue. Recommend adding “where technically feasible” to requirement. Substation relays, Programmable Logic Controllers (PLC’s), Printers, controllers, controller cards, etc. are a few examples that cannot adhere to the malicious software requirements. TFE’s will be abundant.
No
CIP-007-5 Requirement 4.1: Measures: Evidence may include, but not limited to, a paper or system generated listing of event classes for which the BES Cyber System is configured to generate logs. Recommend redefining measures as UNIX systems and other systems outside of Microsoft environment do not have “event classes”. CIP-007-5 Requirement 4.1.1: Any detected failed access attempts at Electronic Access Points. Request implementing this requirement within CIP-005-5; Separating EAP and BES Cyber System requirements is essential and adds clarity within the requirements. Previous NERC CIP revisions failed to separate requirements which led to more confusion. CIP-007-5 Requirement 4.3: Detect and activate a response to event logging failures before the end of the next calendar day. Clarification needed on this specific requirement; is it the expectation of automated detection? If so, from a technical standpoint, not all operating systems are capable of detection of failed logging. Entities would have a real hard time meeting compliance with this requirement. CIP-007-5 Requirement 4.5 – HIGH asset designation: Review a summarization of sampling of logged events every two weeks to identify unanticipated BES Cyber Security Incidents and potential event logging failures. Activate a response to rectify any deficiency identified from the review before the end of the next calendar day. Clarification needed for the term ‘summarization of logs’.
No

CIP-007-5 Requirement 5.4: Procedural controls for initially changing default passwords. Recommend the enforcement of the requirement be established for designated high and medium BES Cyber systems as low assets will be in the thousands requiring maximum resources protecting assets (LOW) that do not affect BES as established High and Medium BES Cyber Assets.
No
While it's completely understandable the VSL's are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL's for all requirements.
Yes
No
CIP-008-5 Requirement 2.1: The incident response plans must be used when incidents occur and include recordings of deviations taken from the plan during the incident or test. The requirement to record the "deviations" from the incident response plans offers no significant improvement in the reliability of the BES Cyber Assets or BES Cyber Systems. This can be documented within the entities internal processes as lessons learned. Deviations can be a subject to an interpretation by CEA's.
No
CIP-008-5 Requirement 3.2, 3.4, 3.5: Recommend adjusting the time frame from 30 days on 3.2, 3.4 and 3.5 to match Requirement 3.3, 60 days. Unified representation adds clarity.
No
While it's completely understandable the VSL's are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL's for all requirements.
No
CIP-009-5 Requirement 1.4: Backup media shall be verified initially after backup to ensure that the backup process completed successfully. Recommend removing the term "initially" or adding a footnote establishing a realistic timeframe in which backup can be validated. Backups can take hours and last into late evenings. Not all entities have 24/7 coverage within their establishments. Requirement is subject to interpretation. CIP-009-5 Requirement 1.5: Preserve data, where technically feasible, for analysis or diagnosis of the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1. Recommend merging this requirement into CIP-008-5, Incident Response Plans. The theory of preserving data at the time of the incident as opposed during the recovery of a BES Cyber Asset seems to be logical. If needed, lessons learned from the incident can be used to update the BES Cyber System recovery plans.
No
CIP-009-5 Requirement 2.3: Test each recovery plan referenced in R1, initially upon effected date of the standard, and at least once every 39 calendar months thereafter through an operational exercise of the recovery plans in a representative environment that reflects the production environment. The requirement itself is extremely stringent in regards to performing an operational exercise on "each" recovery plan for BES Cyber assets and BES Cyber Systems. The definition of "operational exercise" is also subject to interpretation as every entity performs this function differently and CAE's may interpret differently. Request removing operational exercise or designating this requirement for High designated assets. Depending on the amount of Medium and High BES Cyber Systems are designated, entities could be performing operational exercises on a bi-weekly basis just to meet the 39 month requirement.
No
CIP-009-5 Requirements 3.2 through 3.5: Added time frame to current revision is 30 days. Suggest establishing 60 days to complete requirements 3.2 through 3.5. Entities impacted by CIPv5 may establish a substantial amount of High and Medium BES Cyber assets and BES Cyber Systems. Thirty days seems a bit strenuous and may produce a high failure rate. Also, recommend this requirement be enforced to only High and Medium BES Cyber Assets and Systems.
No
While it's completely understandable the VSL's are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and

Severe VSL's for all requirements.
No
CIP-010-1 Requirement 1.1: Baseline configuration of BES Cyber Systems. With the understanding that this particular requirement was derived from the DHS catalog for control systems security, how does an establishing specific field within a baseline record and those records being auditable increase security and therefore the reliability of the BES Cyber system? Establishing a baseline on each BES Cyber System has been established for the prior requirements that pertain to CIP-007. Entities should have the freedom to create and maintain baseline configurations that impact their assets. With that said, sub-requirement 1.1.4 is very vague. These systems may contain thousands of scripts and the documentation of these to this level is not practical. Also, Requirement 1.1.6, "any patch levels", UNIX and other operating system outside of Microsoft do not have patch levels. Recommend updating the requirement without sub-requirements 1.1.1 through 1.1.6 and leaving the base requirement of Requirement 1.1. The specific requirements 1.1.1 through 1.1.6 provide no added security or reliability to BES Cyber Assets and BES Cyber Systems. CIP-010-1 Requirement 1.2: Measures: A record of each change performed along with the minutes of a "change Advisory board" meeting (that indicate authorization of the change) where an individual with the authority to authorize the change was in attendance. Establishing a "change advisory board" for changes to BES Cyber System baseline configurations and recording the minutes and attendance records is completely non-productive and brings no significant security or reliability to BES Cyber Systems. This requirement maybe needed within larger entities with separate divisions performing multiple functions, however, midrange to small entities have established effective processes through various methods of change control. This particular requirement establishes that NERC CIP requirements are not a "one size fits all" methodology.
No
CIP-010-1 Requirement 2.1: Where technically feasible, monitor for changes to the baseline configuration and document and investigate the detection of any unauthorized changes. This specific requirement seems to be redundant to the requirements set forth in CIP-007-5 R4.1 through 4.5. Why add more responsibility to monitoring BES Cyber Systems outside of the requirements in CIP-007?
No
CIP-010-1 Requirement 3.1: ...conduct a paper or active assessment of the security controls to determine the extent to which the controls are implemented correctly and operating as design. The term "security controls" is subject to interpretation. Recommend clarifying the term or designating areas within security that need to be assessed.
No
While it's completely understandable the VSL's are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL's for all requirements.
No
CIP-011-1 Requirement 1.1: Measures, bullet 2: Training materials that provide personnel with sufficient knowledge to recognize BES Cyber Security Information. Not sure if SDT meant BES Cyber System Information?
Yes
No
While it's completely understandable the VSL's are needed within compliance, not all entities are built equally. Therefore, the entities impact upon the BES varies. Recommend Low, Medium, High and Severe VSL's for all requirements.
No
CIPv5 implementation plan may need to be revised based on FERC's non-approval of CIP v4. OPPD would prefer FERC to approve CIPv4, which would allow entities to comply with the "bright-line" criteria, which is similar to CIP-002-5 Attachment 1. In the future, CIPv5 can be gradually implemented, while allowing entities to meet the "bright-line" criteria, which has been approved in CIPv4 by the NERC balloting body. We recommend CIPv5 be introduced in stages or establishing an implementation cycle as opposed to bypassing the CIPv4 and implementing directly into CIPv5.

Introducing CIPv5 in stages will allow entities who are not in scope to implement CIPv4 “bright-line” criteria and establish a sound level of protection to Critical Cyber Assets. Those entities that are currently in scope will continue to adhere to the CIPv4 standards while preparing internally, financially and structurally for the implementation cycle of CIPv5. Also, would like to note that while the intent of the CIPv5 is to increase security and reliability to the BES, meet FERC Cyber security order 706, and present entities with guidance to enhance their own assets, CIPv5 requirements will take a heavy financial toll on our medium sized utility. Additional resources and infrastructure modifications may cost millions to meet compliance requirements. Additionally, entities impacted by natural disasters (e.g., flooding, tornadoes) are currently recovering and rebuilding their establishments, which only add to ongoing operational cost. Please remember these elements when defining the CIPv5 implementation process.

Dominion
Connie Lowe
Yes
General Comments: The following comments are general in nature and do not apply specifically to Definitions. 1. Dominion supports the approach outlined in Mid-American’s January 3, 2012 document titled “Recommended Change Priorities for CIP Version Five” and does not believe that approach would disrupt Drafting Team efforts and the development of CIP Version Five (V5). The Drafting Team should review Mid-American’s approach and incorporate the recommendations set forth therein. 2. As part of adopting V5, existing CANs must be retired by incorporating the associated requirements and measures into V5. A reconciliation is required to determine which CANs are expected to be retired as a result of the adoption of V5 or may still be applicable at the time V5 is adopted. This information should be incorporated in either the “Reference to Prior Version” of each applicable requirement or through the “Guidelines and Technical Basis” of each applicable Standard. The associated CANs are: a. CAN-0005 b. CAN-0007 c. CAN-0010 d. CAN-0012 e. CAN-0016 f. CAN-0017 g. CAN-0024 h. CAN-0030 i. CAN-0031 Definitions Related Comments: • Annual: The term “Annual” should be created and defined as “At least once per calendar year, not to exceed 15 calendar months between occurrences.” In the requirements listed below, the phrase “on an Annual basis” should replace the phrase “initially upon the effective date of the standard and at least once each subsequent calendar year, not to exceed 15 calendar months between occurrences”. This change applies to: o CIP-002-5: R2 o CIP-003-5: R3 o CIP-004-5: R3.2, R6.5, R6.6 o CIP-008-5: R2.2, R3.1 o CIP-009-5: R2.1, R2.2, R3.1 o CIP-010-5: R3.1 o CIP-011-5: R1.3 The definition of “Annual” tracks the language already set forth in Version 5. Implementation of the definition of “Annual” simplifies the language in 13 requirements and reflects the retirement of CAN-0010.
No
No comments.
No
It is not clear how the retirement of CAN-0005 is being addressed in V5.
No
Consistent with the previous response, R2 should be modified to read “The Responsible Entity shall have its CIP Senior Manager or delegates approve the identification and categorization required by R1 initially upon an Annual basis, even if it has not identified High or Medium BES Cyber Assets or BES Cyber Systems.”
No
A clear rationale has not been provided in the Table of Compliance Elements within each of the draft standards. To better support the VRF and VSLs, a risk based rationale as it pertains to the Bulk Electric System should be provided for the risk and severity measures.
No
No comments.
No
The numbering scheme of the sub-bullets does not match the numbering scheme used in the other standards. It is recommended that “1.x” subtopics listed under CIP-003 R2 be renumbered as follows: 2.1. Personnel Security 2.2. Electronic Security Perimeters 2.3. Remote Access 2.4. Physical Security

2.5. System Security 2.6. Incident Response 2.7. Recovery Plans 2.8. Configuration Change Management 2.9. Information Protection 2.10. Provisions for declaring and responding to CIP Exceptional Circumstances

• It is not clear how the retirement of CAN-0012 is being addressed in V5 or how it applies to Personnel Risk Assessments (PRAs). • The implementation plan for V5 should address how Personnel Risk Assessments are to be conducted during the implementation period. • PRAs completed prior to V5 should be acceptable until the next time a PRA is required in the 7 year cycle. The following paragraph should be added as the last paragraph to the “Guidelines and Technical Basis” section for CIP-004-5 R4: Personnel Risk Assessments which were completed prior to the effective date of Version 5 of the CIP Standards are acceptable as evidence of completion of a Personnel Risk Assessment even though all of the requirements of Version 5 may not have been met. All Personnel Risk Assessments started after the effective date of Version 5 of the CIP Standards must address all of the sub-requirements in Table “CIP-004-5 Table R4”. • PRAs conducted in support of other compliance programs, such as compliance with requirements for the Nuclear Regulatory Commission (NRC), should be considered acceptable when an individual transfers from one compliance program to another. • The “Guidelines and Technical Basis” section should include a paragraph about “locations” to ensure time and money isn’t wasted on criminal history checks. While the PRA should include details of where an individual resided as part of the seven year criminal history check, we have concerns over the requirement to capture the location of prior employment and school attendance for periods greater than 6 months without further qualification. An individual may attend an on-line school or perform temp work remotely. In these cases, the location of the school and employer are less important to the evaluation of the individual than the location in which the schooling was completed or the work was performed. Dominion is concerned that unnecessary time and costs could be incurred in conducting PRAs without a qualification that the primary physical location of where the individual resided while performing school and work related activities is what needs to be investigated as part of the criminal history check—not the physical location of school or employer. • The requirements for original investigations and reinvestigations should be addressed separately. Reinvestigations should only be relevant for the time period after the original investigation was conducted.

• CIP-007-5 R5.1 needs to be qualified as being applicable to individual accounts. Credentials cannot be validated with shared accounts. • CIP-007-5 R5.5.1 and R5.5.2 provide that password length and complexity could be the maximum supported by the BES Cyber System. A BES Cyber System is a collection of assets that make up the system. The maximum supported password length and complexity of the system would therefore be driven by the maximum password length and complexity of the device least able to comply with the minimum requirements. The language of the requirements should be modified to read: o 5.5.1. Password length that is the lesser of at least eight characters or the maximum length supported by the Cyber Asset within the BES Cyber System. o 5.5.2. Minimum password complexity of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the Cyber Asset within the BES cyber system. • CAN-0017 must to be incorporated into the standard or retired. CAN-0017 indicated that both technical and procedural controls are required; however, the language of V5 indicates that either technical or procedural controls are required to address password complexity.

No
In contrast to previous versions of the requirement, the language in CIP-011-1 R1.1 is confusing and may unintentionally reduce the level of information protection afforded to BES Cyber Systems. CIP-011-1 R1 should more closely reflect the intent of the Version 3 and Version 4 versions of the CIP-003 R4 requirements. CIP-011-1 R1.1 states that “One or more methods to identify BES Cyber System Information”. This suggests the overt labeling of information associated with BES Cyber System information with a tag that identifies it as BES Cyber System information. The standard should not require the overt labeling of such information with a BES Cyber System tag; rather, it should allow the flexibility described in the Change Rationale associated with having multiple levels of classification, allowing more flexibility for entities to incorporate the CIP information protection program into their normal business. To this end, the language should be modified to read: “One or more methods to label BES Cyber System Information to ensure the information can be associated with an appropriate access control and handling procedure.”
No
• The standard does not specifically address backup or copies of media. If the standard is modified to address backup or copies of media, such modification should be placed in the “Guidelines and Technical Basis” section of the standard. • Application to “any media” known is too broad. Clarity on the intent and applicability of the requirement is necessary. • It is unclear how hardcopies of information are to be disposed of in the new version of the standard.
No
A clear rationale has not been provided in the Table of Compliance Elements within each of the draft standards. To better support the VRF and VSLs, a risk based rationale as it pertains to the Bulk Electric System should be provided for the risk and severity measures.

Jennifer Wright
San Diego Gas & Electric
Yes
San Diego Gas & Electric's (SDG&E)'s proposed definition revisions are as follows: BES Cyber Security Incident- Any malicious act or suspicious event that: •Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or a BES Cyber System, or, • Disrupts, or was an attempt to disrupt, the operation of an Electronic Security Perimeter or BES Cyber System, or • Results in unauthorized physical access into a Defined Physical Boundary. In general, the proposed definitions are too long, general or arbitrary. The changes to the definitions from Version 3 to Version 5 may greatly change the interpretations; and hence force changes to system design architectures which currently exceed CIP standards. For example, with respect to a BES Cyber Asset, Information Systems designs and architectures best practices include Availability and Reliability as a basis to eliminate risk and increase Availability. The proposed standard definition eliminates Redundancy as a form of risk reduction and renders useless a potential design implemented to increase Availability. Redundancy is implemented to retain availability and should be considered a security measure. Additionally, terms such as Electronic Access Point (EAP) are now greatly different from Access Point to the ESP/PSP. These terms now require major changes to documentation, procedures and evidence. It would be more efficient and cost effective to build upon the existing definitions.
Yes
In general, the criteria should continue to align with NIST standards. Section 2.1 identifies as Medium Impact Rating, generation equal to or exceeding 1500 MW. Yet, 2.13 identifies generation control centers that control 300 MW or more of generation. It's unclear why the first only considers those of 1500 MW or greater, yet drops down to control centers for much less generation (300 MW). It would seem that 2.13 should also be 1500 MW since the impact to the BES would be the same. Sections 2.8 and 2.9: Should there be a requirement that the RC, PA, or TP notify the TOP/TO that they have designated the facility as critical. It's done in Section 2.3 for the GOP/GO. Guidelines and technical basis section: It's unclear how one would interpret the use of "Operational directives" in regards to Reliability Operations Services. Could NERC provide more guidance as to their intent? Additionally, SDG&E has comments regarding the Applicability Section. In Section 4.2.2, NERC identified as an included facility, those systems or programs designed, installed, and operated for the protection and restoration of the BES to include "Its transmission Operator's restoration plan". It would seem that this should have greater details as to what that includes. For example, does it include all of distribution system assets that are used to restore system load. That effectively makes the standards applicable to all distribution, which seems unnecessary.
No
SDG&E recommends expanding the requirement to 60 days due to potential changes in project schedules and ordering or delivery of equipment.
No
SDG&E recommends that the Senior Manager could approve "prior to or initially upon". In general, with regard to the proposed CIP Version 5 Standards, it is unclear whether all the requirements have to have been completed at least once prior to the effective date? In some cases, the standard requires that the entity perform some function initially upon the effective date and then have a follow-up requirement (e.g. update cyber security incident plan within 30 days). NERC should provide further guidance in regards to implementation of CIP Version 5 in this regard.
No
SDG&E recommends that the SDT provide examples of how and when an entity would provide proof of such awareness.

No
It is unclear which “approvals” and “authorizations” are being referenced in the language “shall be responsible for all approvals and authorizations required in the CIP standards.”
No
The training program first needs to identify the roles and the training required by each role. It then requires that each person have training in each of the areas which doesn’t seem then to make a distinction in roles. Shouldn’t the training be able to be different for the different roles?
No
SDG&E recommends language for Part 6.5 which lists all “systems accounts/groups…”
No
Regarding CIP-004-5 R7.2, revoking access due to reassignment or transfers by the end of the next calendar day seems unreasonable. This doesn’t take into consideration the fact that personnel that are reassigned or transferred may have a need to provide support during the transition to new personnel. The original language in Version 3 seems more logical that when access is no longer required, it should be revoked within 7 days. However, determining the date of transfer should be dependent on the type of transfer. For example, where transfers occur outside the department, a 7-day window may be reasonable. Where a change of role occurs within an organization, a 30 to 90 day window may be reasonable due to the time needed to hand-off responsibilities.
No
SDG&E recommends in Part 1.3 to define access permissions and provide examples.
No
For R1.1, SDG&E seeks clarification from NERC regarding how one would restrict access to unnecessary logical network accessible ports that can’t be disabled?
No
SDG&E recommends rewording the language for Transient and Maintenance Cyber Asset. Logging each transient asset connection may not be possible when considering USB or serial connections. This type of activity is better employed using technologies or policies.
No
The term “log generated events” is incorrect. A log is a type of output of a system that is generated by the system. A log, unless scripted by a system sub-process, cannot generate a log, and therefore requires a system process to generate the log. A better term would be a system event log, or system log. Secondly, some legacy or specific machines may not issue a log which can be a) accessed or b) may not meet the parameters of the standard.
No
The proposed language in the standard is unclear and provides little inherent benefit to a security program. SDG&E suggests that the language in R5.5.2 be changed from “the maximum complexity supported by the BES Cyber System” to “the maximum complexity of the above that can be supported by the BES Cyber System”. In R5.5 and 5.6, process or procedural based controls provide

limited security, and to limit unsuccessful authentication attempts or alerts may only be achieved through additional technologies – not procedures. In a Generation environment, for example, small engine and generator cyber assets exist, which do not support authentication or alert for authentication failures.
No
With regard to CIP-007-5 generally, the term “where technically feasible has been removed in many cases where they existed in Version 3. Systems may still have those technical limitations. Is its NERC’s intent that entities can meet these requires with non-technical solutions (e.g. procedural)?
No
SDG&E suggests that the language in R2.2 be changed from “initially upon the effective date” to “prior to or initially upon the effective date”.
No
SDG&E suggests that the language in R3.1 be changed from “initially upon the effective date” to “prior to or initially upon the effective date”.
No
The term "security controls" may not be universally understood within a change management structure. SDG&E recommends including examples of "security controls" and the nature of potential changes impacts to security controls.
No
The issue with the existing language regarding Configuration Monitoring is one where, in a normal systems operating environment, certain changes may not require change processes, and hence change monitoring which is predicated on identifying unauthorized changes fails. An example of this is a change to a data set point, or password change. Each is a general operational change to a system, and affects the configuration of a BES Cyber Asset or System, however may be operationally infeasible - due to the amount and effort of process required to monitor, track and schedule this type of activity.
No
The Vulnerability Assessment tasks listed in the table include the assessment of a test BES cyber system and a comparison of the VMA results against the production environment. Creating a test BES cyber system which models a baseline configuration of the production environment may not be feasible, and in some cases broadly expensive. Some environments rely on older or newer technologies and equipment, and some on a variety of equipment. In addtion, a baseline of the production environment may not be accurate without a VMA against the production system. SDG&E's suggestion is to retain the Version 3 VMA process.
Yes
Group
PacifiCorp
Sandra Shaffer
Yes
As a general, overarching comment, PacifiCorp is concerned about the new direction and definitions prescribed by Version 5, particularly with respect to CIP-002-5. Rather than clarifying and building

upon the existing methodology for identifying critical assets and related critical cyber assets, CIP-002-5 attempts to create a new and unproven methodology for identifying in-scope devices that introduces several procedural and interpretation flaws, rendering the proposed methodology less straightforward than the existing standards. PacifiCorp believes the primary problem with the CIP-002-3 methodology was a failure to clearly identify critical asset facilities, and not a failure to identify related critical cyber assets. This flaw (arising from the discretionary nature of self-determined risk assessment) was corrected by the bright-line criteria introduced as the foundation of CIP-002-4 which was approved by the industry in 2010. PacifiCorp strongly recommends that CIP-002-4 be used as the basis for identifying in-scope cyber devices. This approach would provide consistency and reduce confusion, cost and administrative burdens which would accompany the new regime outlined under CIP-002-5, and adversely impact the registered entities that have already established robust NERC CIP compliance programs based on the CIP-002-3 methodology and defined terms. If CIP-002-4 is used as the basis for identifying in-scope cyber devices, Version 5 of CIP-003 through CIP-011 could be adopted with necessary changes to reflect the preservation of CIP-002-4. Rather than building upon existing definitions that have been implemented and revised by the industry for several years as part of the prior versions of the CIP standards, Version 5 introduces new and problematic definitions. PacifiCorp recommends that the SDT go back to the definitions used in Version 4, and modify those definitions to add clarity. As an example, the new Version 5 definition of BES Reliability Operating Services introduces more problems than it resolves and is not necessary for Version 5 to be effective. Instead, we propose that the terms BES Reliability Operating Service, BES Cyber Asset and BES Cyber System not be implemented and the use of existing terms such as Critical Asset, Cyber Asset and Critical Cyber Asset be retained and modified as needed. As an example, the existing definition of "Critical Cyber Asset" could be revised as follows: "A Critical Cyber Asset is a Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation or non-operation, when required, adversely impact the reliability of the Critical Asset facility where it is located and used." In the alternative, if there is consensus that the term BES Reliability Operating Service adds clarity to which cyber assets should be regulated by the CIP Standards, the definition should be properly incorporated into the definition of Critical Cyber Assets as follows: "A Critical Cyber Asset is a Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation or non-operation, when required, adversely impact the capability of the Critical Asset facility where it is located and used to perform a BES Reliability Operating Service."

Yes

One of the key problems with Version 5 is that the methodology does not follow a logical "general to specific" categorization process. To generate a list of "qualified" Cyber Assets/Systems, the first logical step is to distinguish between what elements in the universe of potential regulated Cyber Assets are relevant and which can be ignored. The current draft of CIP-002-5 begins with the entire universe of a regulated entity's Cyber Assets. The process then flips back and forth between applying general and specific filters or qualifiers (including bright line criteria that only make sense when applied to a facility and not an individual Cyber Asset associated with a facility) to finally derive a list of BES Cyber Assets. PacifiCorp recommends that the SDT return to the current CIP-002-4 process of first identifying a critical facility, and then identifying the Cyber Assets and Critical Cyber Assets that are relevant to the operation of that critical facility. In the event that the new Impact Categorization criteria outlined in Attachment I of the proposed CIP-002-5 are adopted, we propose the following modifications: 1. In Section 2.1, the Attachment I bright line criteria of 1500 MW is an appropriate threshold if one is assessing generation facilities, but is not an appropriate criteria to assess BES Cyber Assets. This is because a 2000 MW generating plant is likely to have two to four separate control rooms that run units at that plant. On the other hand, it is highly unlikely that there are many generating facilities for which a single BES Cyber Asset affects 1500 MW. Once again, we recommend that entities start with a determination of Critical Asset facilities which will reduce the universe of Cyber Assets to those that are potentially relevant to the functioning of those facilities. 2. In Section 2.7, the Weight Value per Line of 700 should be replaced with a value in the range of 500 – 600, which is more representative of typical rating of 230 kV lines. PacifiCorp operates over 3,000 miles of 230kV line and only a small percentage of them have a peak rating of over 700 MW. 3. In Sections 2.8, 2.9 and 2.11, the table titled "Major WECC Transfer Paths in the Bulk Electric System" is not actively maintained by WECC and there is no clear identified basis for why certain paths are included in this table. Rhetorically, it has been mentioned that many of the paths on the table were included for economic / marketing reasons rather than reliability impact. As an alternative, we suggest "transmission paths contained in the WECC Path Rating Catalog with a maximum path rating equal to

or greater than 1,500 MW." This catalog is actively maintained by WECC and the 1,500 MW value ties much better to other items in Table 1. 4. In Section 2.11, the table titled "Major WECC Remedial Action Schemes (RAS)" is not actively maintained by WECC and there is no clearly identified basis for why certain Special Protection Systems (SPS) are included in this table. As an alternative, we suggest "each SPS categorized as a 'Wide Area Protection System' by WECC. This is the newly created mechanism within WECC to identify SPS of significant importance. 5. The opening paragraph of the definition of Medium Impact Rating should be revised as shown below to correspond with the wording for High Impact Rating: "Each BES Cyber Asset or BES Cyber System, not included in Section 1, above, that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services used by and located at the following Facilities:"
No
PacifiCorp strongly recommends the removal of any requirements for defining or otherwise addressing Low Impact BES Cyber Assets from the current draft standard. The volume of Low Impact assets is an order of magnitude greater than Medium and High assets for most entities and poses a tremendous compliance burden. While we recognize that there may be security issues that need to be addressed with these assets, we recommend that they be addressed in a separate standard than Medium and High Impact assets. This would allow the industry to initially focus on the more important assets and provide time for further discussion and clarification with respect to Low Impact assets. R 1.1 of CIP-002-5, which requires an update to the status of a BES Cyber Asset within 30 days of a change to that BES Cyber Asset that changes its impact, is a good illustration of the problem with the Cyber Asset-first approach described above in our response to Question 2. Since the most common changes and the changes that are most relevant to the standard's intent, will be to BES Cyber Assets in the Low Impact category, to ensure compliance with the requirement, a regulated entity will have to track all changes to BES Cyber Assets in the Low Impact category – this is despite the current draft's express acknowledgement that Low Impact Cyber Assets are not relevant to the BES. So, even if this requirement can be audited via a spot check of Cyber Assets, compliance likely cannot be achieved without monitoring changes to every Low Impact BES Cyber Asset. In reality, all that really matters are changes made to BES Cyber Assets within a critical facility identified via Attachment I. Again, the starting point should be changes to a critical facility, and then to related critical cyber assets, which follows the methodology of Version 4. As currently drafted, R 1.1 of CIP-002-5 could only be audited through a highly ineffective spot check process, consisting of an auditor pointing out a specific Cyber Asset and asking about the nature of any changes made to that device. In general, PacifiCorp believes that Version 5 will be extremely difficult to audit and will lead to a wide spectrum of audit approaches, rather than a clear and consistent audit approach. Since CIP-002 is the linchpin standard for the entire suite of the CIP Standards, this standard must be clear and concise, with compliance or non-compliance easily determined. It is unlikely that an auditor would point to a Cyber Asset at a generation plant to challenge a regulated entity's determination of whether the mis-operation or non-operation of that individual BES Cyber Asset would or would not adversely impact the plant. It is much more likely that the auditor would look at the generation facility first to determine what impact the loss or mis-operation of the facility would have, and then determine what potential impact the individual BES Cyber Assets have on the plant's performance. Again, since this is the logical process for the analysis, the standard should be changed to reflect this.

The 15-minute criterion in BES Cyber Asset definition should be eliminated. This criterion should be only used in the high or low impact rating in CIP-002-5 Attachment I. Rationale: Therer are many auxiliary control sytems in power plants that will not adversely impact one ore more BES Reliability Operating Services within 15 minutes after rendered unavailable, degraded or misused. Based on the current definitions, these sytems will be totally out of CIP requirements, and not even being considered Low Impact systems. However, their continue unavailability after 15 minuts without successful recovery will have a devastating effect on sustaining continuous power generation. Also, most of them are indeed interconnected with main boiler control systems which shall be BES Cyber Systems. Excluding those auxiliary control sytems from the minimum security erquirements may be proven fatal if and when they are compromised.

Could Remote Access cause "aggregation of enough low impact BES Cyber Systems at various locations to a degree that can cause higher level impacts to the BES" as stated in the Change Rationale for Part 1.1? If this rationale is justified, R2 should also be applicable to Low Impact BES Cyber Systems.

This requirement does not address the situation when legacy systems are not supported by OEM, have no security patches, but are still vulnerable to malicious exploitaton. The guideline for this requirment only requires a note "in your source document." A more proactive mitigation should be mandated such as an upgrade plan so that the assset or system has on-going support from the OEM, industry and governments. The guideline for 2.2 suggests the "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control System" by DHS as a source. Instead of patching the BES Cyber Assets or Systems monthly, this new requirement essentially relaxes it to a quarterly basis. It does not seem properly addrssing increasing malicious attackes mostly exploiting zero-day vulnerabilities.
No
Part 3.3 significantly relaxs the signature or pattern update from weekly to monthly. Thie relaxation only puts BES Cyber Assets or Systems more vulnerable to malicious attacks if there is no proactive and preventive protection in place.

Brian Millard
Yes
1) BES Cyber Security Incident - be more specific regarding a “suspicious event” (list examples?) 2) BES Cyber System - be more specific regarding a “Maintenance Cyber Asset.” 3) It says that a Maintenance Cyber Asset is not part of a BES Cyber System. If a misused Maintenance Cyber Asset could adversely impact one or more BES Reliability Operating Services, would it still be considered a "BES Cyber Asset"? What takes precedence? 4) BES Reliability Operating Services - it says “Activities, actions and conditions necessary to assess the current condition of the BES…” What defines what is "necessary"? 5) CIP Exceptional Circumstance - would it be appropriate to also add situations that pose risks to the environment, significant damage to the system, or loss of crucial data/information? 6) CIP Exceptional Circumstance - be more specific regarding what “emergency services” are. 7) Control Center - the definition of "control center" seems to be too open, which may lead to unintended interpretations of the standard. Would any location with the ability to control more than one generation facility, regardless of size, be considered a “control center”?
Yes
Criterion 2.6 (Transmission Facilities operated at 500-kV or higher) should have an exception for radial Transmission Facilities used only to connect “Low Impact” generation to the transmission system. If the generation itself does not merit a Medium Impact designation, the associated transmission facilities should not be categorized as Medium Impact. Attachment I, 2.13 - "Generation control centers that control 300 MW or more of generation" are considered Medium Impact. The 300 MW figure seems very low, especially considering 2.1, which cites a 1500 MW figure for Real Power capability. Should these not be similar? That is, "Generation control centers that control 1500 MW or more of generation" for Medium Impact?

Refer to additional comments submitted for Question 49. “Suspicious” is not an auditable term, and should be removed. What is an “attempt”? What attempts are serious enough to justify having to be reported? The definition should be made to read: BES Cyber Security Incident A malicious act that: • Compromises the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or, • Disrupts the operation of a Critical Cyber Asset BES Cyber System, or • Results in unauthorized physical access into a Defined Physical Boundary. Under “BES Reliability Operating Services”: • “Identify and monitor flow gates” under “Managing Constraints” appears to be missing its bullet • Recommend that “Change management” under “Situational Awareness” be clarified to changes in the BES instead of IT change management • Recommend clarification that “Facility” is the NERC Glossary term--in “facility operational data and status” under “Inter-Entity Real-Time Coordination and “Communication”: • Request clarification of the scope of this “Operational Directives”. Does it include a company’s messaging system? Two-way radios? What is the relationship with the new COM-002? • Request clarification that these Coordination and Communications are limited to Reliability, not Market Systems. • Recommend that each BES Reliability Operating Services have a beginning paragraph that clearly associates that service to the BES like the "Dynamic Response to BES Conditions" • For clarity, recommend stating which Functions are associated with each BES Reliability Operating Services instead of forcing everyone to interpret.
Yes
Recommend that 2.8, 2.9 and 2.11 start with “Applies to all Regions except…” For 2.8, 2.9 and 2.11 request that the SDT clarify whether the exception is all, or not WECC. In 2.12, “system” and “Facility” are not the proper terms to use. An operator is responsible for automatic load shedding or the other forms of load relief mentioned. For 2.3, 2.8, and 2.9, need to clarify the role and responsibility of PC, TP, GO, GOp, RC and the PA on impact ratings. Who is responsible for assets being improperly categorized? What avenues are there for appeal?
No
For clarity, request changing R1.1 from “Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation” to “Update the identification and categorization within 30 calendar days when a change to BES Elements and Facilities is placed into operation”. For clarity and consistency with the previous change, request changing M1 from “as required in R1 and list of changes to the BES (” to “as required in R1 and list of changes to the BES Elements and Facilities)”. The word “intended” should not be used in the requirement because it is not auditable. Regarding CIP-002-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard. The process to classify and categorize cyber assets (CIP-002) and then identify other assets which must be protected (CIP-005 and CIP-007) is excessively complicated. In addition to the BES Cyber Assets that are classified as high, medium, and low in CIP-002, the other standards introduce 10 additional categories of assets to protect in various ways: • Associated Physical Access Control Systems • Associated Protected Cyber Assets • Associated Electronic Access Control or Monitoring Systems • Electronic Access Points (with External Routable Connectivity) • Electronic Access Points (with dial-up connectivity) • Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries • Transient Cyber Assets • Medium Impact BES Cyber Systems with External Routable Connectivity • Medium Impact BES Cyber

Systems at Control Centers • Low Impact BES Cyber Systems with External Routable Connectivity Some of these assets are defined in the Applicability Section of the standard (which will not be included in the final standard) while some are introduced in the standards themselves and these categories may or may not be included in the definitions document. This approach is overly complicated and does not allow the CIP Standards to stand alone without dependence on other documents. This also leads to the need for future questions, interpretations, CANs, etc. The Standards should be revised so that all assets which need to be protected are defined in CIP-002 rather than introduced throughout the Standards.
No
Regarding CIP-003-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
The last bullet for M4 on page 12 is inconsistent with R4 since M4 requires periodic training instead of R4’s making staff aware of cyber security policies. Request that M4 be updated to be consistent with R4.
Yes
No
The requirement has a typographical error. Footnote 2 is not in superscript. Request clarification that R6 does not require re-delegation when the CIP Senior Manager changes. Request change from “Changes to the CIP Senior Manager and” to “Changes to the CIP Senior Manager or”.
No
Regarding CIP-004-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Request clarification of whether personnel with access to only protected information need training/awareness. SDT should include this as an additional requirement. Recommend removal of

R2.3 and R2.4 since they are redundant to R2.2, or explain the difference between R2.2 and R2.3, R2.4. Request removing “potential” from R2.7 since training should include how to determine whether a BES System Event occurred or not.
Yes
No
For all R4 table entries, recommend changing “documented risk assessment program” to “documented personnel risk assessment program” to avoid confusion with a corporate risk assessment program. For R4.2 recommend adding language to “grandfather” previous seven-year criminal checks executed for the previous version of CIP Standards. The additional language should spell out when this “grandfathering” expires, which is also when a new check will be required.
No
For clarity, recommend changing 5.1 from “authorized electronic or unescorted physical” to “authorized electronic or authorized unescorted physical”.
No
For R6.1 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “authorize electronic access, except” to “authorize electronic access to BES Cyber Systems, except” 3. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.2 similar comments to R6.1, except that this requirement already refers to “BES Cyber Systems.” 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.3 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber System Information. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.5, Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.6 1. Change “minimum necessary” to “minimum that the responsible entity considers necessary” in the Requirement. 2. In the measure for 6.6, change “BES Cyber System information” to “BES Cyber System Information” – capitalize the “I” in Information.
No
Request that the footnote for 7.1 be moved into the requirement. Recommend changing 7.2 to "For an individual, no longer acting in a role requiring unescorted physical access or electronic access to BES Cyber Systems, unescorted physical access and Interactive Remote Access will be removed within the next calendar day." Recommend removing the "following the resignation or termination" since it is redundant and inconsistent with the sibling Requirements. Recommend changing 7.4 from "For resignations or terminations," to "For terminations, resignations, reassignments, or transfers,".
No
Request clarification on the scenario where Low Impact BES Cyber Systems are mixed in the ESP with High/Medium BES Cyber Systems. Is this Low Impact BES Cyber System subject to 1.1 or 1.2? Request clarification that the 1.3 Electronic Access Points is the 1.2 identified Electronic Access Points or not? Request clarification that the 1.5 EAP is the 1.2 identified Electronic Access Point or not? Request clarification on 1.5's "at each EAP". Is that inside or outside or both? Regarding CIP-005-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.

No
Recommend changing 2.1 from "Require an Intermediate Device such that the Cyber Asset initiating Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset." to "Do not allow the Cyber Asset initiating Interactive Remote Access direct access to a BES Cyber System or a Protected Cyber Asset." since the existing Requirement is too prescriptive and does not allow new technology. Recommend changing M2.3 from "Note that a UserID is not considered an authentication factor" to "Note that a UserID and password are not considered two authenticating factors" since the existing words are incomplete.
No
Request clarification of 1.1 Applicability since it does not identify which of High/Medium/Low BES Impact these are "Associated" with Request that Measure 1.2 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress". Request Requirement 1.2 be updated to allow "escorted physical access." Request clarification of Requirement 1.3 "Utilize two or more different and complementary physical access controls" is this multi-factor authentication such as key, badge, keypad or bio-metric? Request that Measure 1.4 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress" Request changing Requirement 1.4 from "Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary. " to "issue real time alerts for detection of breach through an access point". For consistency, recommend removing "applicable" from "protecting applicable BES Cyber Systems" in Requirement 1.6. Regarding CIP-006-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Recommend removing "continuous" from "Require continuous escorted access of visitors" so that the Requirement is auditable from Requirement 2.1. Recommend changing 2.2 from "the entry and exit on a per 24-hour basis," to "the entry and exit to the Defined Physical Boundary on a per 24-hour basis, ".
No
Request clarification on what the "Associated" "Applicability" (High/Medium/Low BES Impact) for 3.1 and 3.2 Request capitalization of "locally mounted hardware or devices" in Requirement 3.1 so that it refers back to the defined term "Locally Mounted Hardware or Devices" .
No
Request clarification on 1.1, is this at the BES Cyber System level or at the Asset level or can the Entity choose? Request clarification on 1.1, why does the Measure refer to BES Cyber Asset while the Applicability refers to Systems? Regarding CIP-007-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a

mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Request clarification of "remediation" in 2.2 since it reads that the patch must be applied, which does not allow to have an exception when applying the patch is the worst scenario such as creating a denial of service. For 2.2, suggest wording like "create a remediation plan or a plan to mitigate the vulnerability if it is determined that the patch cannot be safely applied". What is the intent of CIP Exceptional Circumstances in 2.3? Is it intended to mean deviating from the remediation plan in 2.2? Is the "process for remediation" specific to the patch or the overall process?
No
Request allowances in 3.3 for signatures/pattern updates that cause trouble. Recommend changing 3.4 from "Transient Cyber Assets and removable media" to "Transient Cyber Assets or removable media". The Measure for 3.4 does not match the Requirement.
No
Request changing 4.1.4 from "Any detected potential malicious activity" to "Any detected malicious activity" since the scope of potential includes all activities. Request clarification on 4.3, does the failure need to be detected within a calendar day? Request the rationale of 4.5's "two weeks". Recommend one month as a compromise between the prior version's 90 days and the suggested one week. In 4.5 clarification is needed for the associated protected cyber assets. Are these protected cyber assets associated with only high impact BES cyber systems, or could they be associated with medium impact BES cyber systems?
No
For 5.2, does the CIP Senior Manager or delegate approval policy or procedure for each authorization of access? In 5.2, should the Requirement be interpreted as "each use" as in "The CIP Senior Manager or delegate must authorize the use of each administrator, shared, default, or other generic account types." Request clarification of 5.5.3, specifically "the significance of passwords in the set of controls used to prevent unauthorized access to the BES Cyber System and existing service agreements, warranties or licenses."
No
Regarding CIP-008-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
2.1 is a new Requirement. Request the rationale for this new Requirement. Recommend changing from "When a BES Cyber Security Incident occurs, the incident response plans must be used when incidents occur and include recording of deviations taken from the plan during the incident or test." to "When a BES Cyber Security Incident is classified or identified, the Responsible Entity must follow its incident response plan." Recommend removing “initially upon the effective date of the standard” from 2.2 of Table R2 because it unrealistically forces an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered.
No

Recommend removing “initially upon the effective date of the standard” from 3.1 of Table R3 because it unrealistically forces an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Recommend that 3.2 wording be consistent with the 2.2 wording. For 3.3, recommend changing 1) "Update" to "Update as necessary" and 2) "the completion of the review of that plan" to "the completion of the review performed in 3.2" .
No
For 1.3, request clarification of the “protection of information”. Is this integrity, availability or other information protection such as access controls, encryption? For 1.4, request clarification, is this a backup media verification process? If not what is the intent? Recommend removing Requirement 1.5. Reliability's top priority is restoration of service. Forensics in a recovery mode may not support BES reliability and requiring such actions may negatively impact the BES Cyber System restoration process. Regarding CIP-009-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Recommend that 2.1 be implemented 180 days from the effective date of the Standard. For 2.1, request clarification, is “full operational exercise” the same as “functional exercise” as described in the rationale? For 2.1 and 2.3 of Table R2 recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. For 2.2, request clarification that “any information” may be a sample and not all or each type of information. Does backup media include all media used in the recovery process such as vendor media? What does current configuration mean, as this may never be current? In 2.3, request 1) a definition of “operational exercise” and 2) clarification of “representative environments”. What is the scope, all network devices, systems and items that make up the BES Cyber System? This appears to be a new requirement as paper drill does not appear to be supported. Recommend this shall be implemented 180 days from the effective date of the Standard.
No
For 3.1 recommend 1) removing “or when BES Cyber Systems are replaced” as it addressed in CIP-009 R3.4 and 2) removing “and document any identified deficiencies or lessons learned” as they are addressed in CIP-009 R3.2 and R3.3. For 3.1 of Table R3, recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Request that 3.3 be updated to be consistent with CIP-008 R3.3 for sixty days. Recommend that 3.4 be referenced by CIP-009 R3.1. Request CIP-008 R3.5 language be consistent with CIP-009 R3.5.
No
Recommend changing 1.3 to avoid double jeopardy. Change "Update the baseline configuration and other documentation required by a NERC CIP Standard, including identification and categorization of

the BES Cyber Systems, as necessary within 30 calendar days of completing the change." to "Update the baseline configuration as necessary within 30 calendar days of completing the change approved in 1.2." For 1.1, 1.2, 1.3 and 1.4, recommend changing the Requirements to be consistent with their Applicability --- from "For a change to the BES Cyber System" to "For a change to the BES Cyber System or Associated Systems or Associated Assets". Recommend removing "High Impact BES Cyber Systems" from 1.4's Applicability since these are covered by 1.5 which is a higher threshold. Regarding CIP-010-1, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Recommend removing "where technically feasible" from 2.1 since the remaining words should not need an exception.
No
For 3.1 and 3.2 of Table R3 recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Recommend changing 3.2 from "in a production environment" to "in a production environment, or a test environment" to allow Entities more flexibility in meeting this Requirement.
No
Request clarification on 1.1. Some interpret this Requirement as what is the Entity's process for identifying BES Cyber Systems Information. If correct, the Measure should be "show me the methodology (document)." Others interpret these Measures as labeling BES Cyber System Information. Recommend removing “initially upon the effective date of the standard” from 1.3 of Table R1 because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Regarding CIP-011-1, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Request that footnote 2 in 2.1 be moved into that Requirement.
The table label Scenario of Unplanned Changes is for unplanned changes after the effective date. If

true, the surrounding words should explicitly state so. Otherwise, this Scenario table is confusing because it repeatedly uses 12 months while the earlier text uses 18 months. Due to the CIP version 4 and version 5 implementation cycles, there is a lack of understanding as to what needs to be implemented, leading to uncertainty as to how long an implementation period would be needed. It is unrealistic to expect entities to begin implementing Version 4 requirements and then have to implement Version 5 requirements within a very “narrow” window. Since Version 4 is not FERC approved, there is the possibility of Version 4 being effective while version 5 is in implementation. Version 4 may only be effective for a few months. A summary of comments applicable to more than one standard: . • Recommend removing “initially upon the effective date of the standard” from 1.3 of Table R1 because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. • Request that Applicability sections of CIP-002-5 – CIP-011-5 be consistent. Note CIP-005-5 and CIP-006-5 sections 4.2.2 are different from other Standards. • Request clarification of the capitalized term “Facilities.” Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1, and note this question applies to the Applicability sections of CIP-002-5 – CIP-011-5. A fiftieth question should have been included in this comment form asking for general comments or concerns. A question asking general comments should be included as part of every comment form posted to the industry.

Yes
The definition of a BES Cyber Asset leaves room for interpretation. The major problem is in the use of the words “adversely impact”. These words are only slightly better than the words “would affect” which are used in the definition of Critical Assets in version 3. In effect, version 5 will reinstate one of the problems that version 3 has by using an undefined phrase open to interpretation. (Although Version 4 retains the definition of Critical Assets using the words “would affect”, it does not leave these words open to interpretation because of its pure use of “bright line” criteria for determining Critical Assets. Likewise, Attachment 1 of CIP-002-5 uses the words “adversely impact”; however, it also uses “bright line” criteria including MW, MVAR and kV levels to determine the specific level of adverse impact.) Although “bright line” criteria have been included in CIP-002-5, such criteria are only used for determining Impact Levels (High, Medium and Low), and not for defining a BES Cyber Asset. Even the definition of BES Reliability Operating Services does not take the place of “bright line” criteria as long as the unqualified words “adversely impact” are retained in the definition of BES Cyber Asset. One suggestion is to create bright line criteria for determining what a BES Cyber Asset is. For example, there are different levels at which a Cyber Asset could “adversely impact” the BES Reliability Operation Services. These different levels could be translated to MW levels that could be used to create bright line criteria for defining BES Cyber Assets. The definitions of External Connectivity and External Routable Connectivity are also confusing. They are both defined as routable communications between a BES Cyber Asset and a Cyber Asset external to the ESP. The only difference we can see is that External Connectivity includes dial-up communications and, presumably, External Routable Connectivity does not?
Yes
Attachment 1, Part 1.2 criterion is based solely on the functional obligations of a Balancing Authority, whereas the criteria in the other Parts of Attachment 1 are based on the characteristics of a facility/system or on a combination of functional obligations and characteristics of a facility/system. This inconsistency in the criterion of Part 1.2 could result in a distortion of the proper placement of risk to the reliability of the BES. For example, based on these criteria, a relatively small Balancing Authority with less than 700 MW of generation and less than 700 MW of peak load would be required to categorize their BES Cyber Assets at their Control Center as High Impact. In contrast to this, a Generation Operator with twice as much generation (1400 MW) would be required to categorize their BES Cyber Assets at their Control Center as Medium Impact. This inconsistency could be remedied by adding “where the peak load or maximum generation capability within the Balancing Authority area exceeds 1500 MW” to the end of Attachment 1, Part 1.2. This modification would be consistent with the 1500 MW criterion placed on Generation capability in Attachment 1, Part 2.1. Then all Control Centers performing the functional obligations of a Balancing Authority below the 1500 MW level could

be included in the Medium Impact category under Attachment 1, Part 2.13 by adding “Balancing Authorities” to the list of functional obligations in Part 2.13.
No
CIP-002-5 Requirement 1 contains the word “owns” in the first and second sentences, there by limiting this requirement of indentifying and categorizing BES Cyber Assets to the actual owner of the BES cyber Asset. We would like confirmation that this was the intention of the SDT. If it was not intended, then the word “owns” should be changed to “operates”, “uses”, “maintains” or combinations of these words, depending on the actual intentions of the SDT. Actually, we believe that keeping the concept of ownership as the sole deciding factor in determining the Entity that is responsible for indentifying and categorizing BES Cyber Assets is the best concept to use. If multiple concepts such as “owns, operates, uses or maintains” are used then you could end up with more than one Entity responsible for applying security controls to a single BES Cyber Asset or System, which could cause a host of problems. The CIP-002-5 Application Guidelines, Attachment 1 section, Overall Application sub-section, last bullet item, gives some support for maintaining ownership as the sole deciding factor in determining the Entity that should be responsible for performing R1 of CIP-002-5. However, if the concept of ownership is used as the sole determining factor then clarification should be included in the Application Guidelines stating that “owns” includes concepts such as “leases, rents, or maintains ownership-like control”, in order to accommodate unusual cases where the actual “owner” of the BES Cyber Asset is not a registered entity. Another concept of CIP-002-5 that bothers us is the idea that you do not need to discretely identify BES Cyber Assets and Systems that fall into the Low Impact category, however, presumably, you do need to apply appropriate security controls to such assets. When a Cyber Asset or System drops into the Low impact level, it just gets that much more difficult to determine it the Cyber Asset or System is a BES Cyber Asset or System at all, there by exacerbating the problem of trying to determine if a Cyber Asset is a BES Cyber Asset that the entity neglected to apply the appropriate security controls to, or the Cyber Asset was not considered to be a BES Cyber Asset at all. The definition of BES Cyber Asset is not explicit enough to resolve this problem (see response to question 1). One solution is to create bright line criteria for the definition of a BES Cyber Asset based on the MW level that the BES Cyber Asset could “adversely effect” one or more of the BES Reliability Operating Services.

Yes
No
Generally we agree with R5, however, since R5 is tied closely to R4, the Applicability column for Table R5 should be the same as the Applicability column for Table R4.
Yes
No
It appears that Requirement 7 has been written to satisfy FERC Order 706 at the expense of adopting sound security practices. The circumstances of an individual's termination or transfer should be taken into consideration when determining how long the Entity has to remove physical or electronic access. Versions 3 and 4 did a better job of addressing this by specifying different conditions such as "for cause" terminations.

We agree with most of the implementation plan, however, leading up to the day that version 5 becomes effective, we assume that it will essentially be necessary for entities to be compliant with the current version (either version 3 or version 4) and version 5 at the same time. Is this a correct assumption in the opinion of the SDT? Has thought been given to any potential problems that this may cause? We suggest that during the implementation period, entities should be allowed to be compliant with either the current version or version 5 (on the basis of individual requirements and on the basis of individual BES Cyber Assets/Critical Cyber Assets), but not necessarily both versions at the same time. In other words, during the implementation period after regulatory approval, the entity should be deemed to be compliant if it meets the requirements of either the current version or version 5, and the entity should be able to make the selection of which version it is compliant with based on individual BES Cyber Assets/Critical Cyber Assets.

Yes
We do not agree with the “Definitions”. The definition of “BES Cyber Asset” is not thoroughly defined. Using the word “adversely” makes the definition vague; i.e., how adverse? As a minimum, it should be replaced with “Adverse Reliability Impact”, from the NERC glossary, but even that may not remove all the uncertainty as to the extent a less than significant impact must be considered.
Yes
We have suggestions and do not agree with the criteria. The SDT is incorrect in stating that “most of these criteria are similar… as part of Version 4”. Version 4 provided the “bright line” criteria for defining “Critical Assets”, not cyber assets. Further tests (routable, dialup, etc.) were applied following that. The new criteria has the possibility to create substantially additional cyber assets requiring CIP compliance. Additionally, creation of the “Low Impact” category further blurs any “bright-line” concept in that nearly all other entity assets end up as “low” and under some CIP compliance. As such, the “similar” criteria is far from it.
No

We do not agree, as R1 invokes Att 1 for classification. Att 1 implies that all Blackstart resources identified in the TOs plan be categorized as medium impact. Previously, only those resources comprising the initial or primary cranking path were required. Rev 5 should reflect the same categorization philosophy. There is no justification for secondary and alternate sources to meet the compliance requirements and measures dictated by a “medium” categorization.

No
This comment is not directly related to proposed Violation Risk Factors and Violation Severity Levels for CIP-002-5, but related to the proposed Evidence Retention in the standard that states “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.” This Evidence Retention guidance simply infers that entities need to keep six years (or three years, depending on the entities’ CIP audit schedule) compliance records even though a shorter retention period is stated in the requirement(s). Because of contradictory guidance, we do not agree with the proposed Evidence Retention for the standard.

Confusing Access Revocation sub-requirements on resignations or terminations. Suggest combine all relevant sub-requirements into one with one defined access revocation period. Too short of a window for Access Revocation sub-requirement on reassignments or transfers. Suggest seven calendar days or at least three calendar days.
No
This comment is not directly related to proposed Violation Risk Factors and Violation Severity Levels for CIP-004-5, but related to the proposed Evidence Retention in the standard that states “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.” This Evidence Retention guidance simply infers that entities need to keep six years (or three years, depending on the entities’ CIP audit schedule) compliance records even though a shorter retention period is stated in the requirement(s). Because of contradictory guidance, we do not agree with the proposed Evidence Retention for the standard.
No
This comment is not directly related to proposed Violation Risk Factors and Violation Severity Levels for CIP-005-5, but related to the proposed Evidence Retention in the standard that states “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.” This Evidence Retention guidance simply infers that entities need to keep six years (or three years, depending on the entities’ CIP audit schedule) compliance records even though a shorter retention period is stated in the requirement(s). Because of contradictory guidance, we do not agree with the proposed Evidence Retention for the standard.
No
This comment is not directly related to proposed Violation Risk Factors and Violation Severity Levels for CIP-006-5, but related to the proposed Evidence Retention in the standard that states “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.” This Evidence Retention guidance simply infers that entities need to keep six years (or three years, depending on the entities’ CIP audit schedule) compliance records even though a shorter retention period is stated in the requirement(s). Because of contradictory guidance, we do not agree with the proposed Evidence Retention for the standard.
No
This comment is not directly related to proposed Violation Risk Factors and Violation Severity Levels for CIP-007-5, but related to the proposed Evidence Retention in the standard that states “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.” This Evidence Retention guidance simply infers that entities need to keep six years (or three years, depending on the entities’ CIP audit schedule) compliance records even though a shorter retention period is stated in the requirement(s). Because of contradictory guidance, we do not agree with the proposed Evidence Retention for the standard.

I can forsee a conflict with BES definition criteria, which excludes generation that is less that 75 MVA on an LN. What of the generation assets that fall between the 20 MVA registry criteria for GO / GOP registration and 75 MVA that lie on a Local Network? These assets would be responsible for the version 5 CIP standards yet are excluded in the BES definition? Would the generator be a cyber asset island? Perhaps threshold criteria for generation assts that match the BES exception criteria be

drafted into the low impact requirements.
Yes
Yes
No
Again a conflict with the BES exception criteria exists. Generation assets below 75 MVA are excluded on Local Networks, however no such provision is made in the CIP version 5 standards, thus a 20MVA generator must comply with the low impact criteria. A problem could arise where physical security is established around the generator but the transmission feeds, being a part of the excluded Local Network under the BES exception criteria are not, therefore rendering the physical security around the 20 - 75 MVA generator on an LN imaterial.

Yes
The PPL Companies suggest the follow changes: • For the definition of Inter-Entity-Real-Time Coordination and Communication in the bullet points use the term Reliability Directive" in lieu of "Operational directives" (this should mirror the efforts of Project 2006-06, COM-002-3.) • Formal definitions should be provided for the terms Impact and Adverse as these are used throughout the other standards. See current and proposed change. Current: BES Cyber Asset A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services. The timeframe is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive instructions to operate and the time in which that operation occurs and impacts the BES. Redundancy shall not be considered when determining availability. A Transient Cyber Asset is not considered a BES Cyber Asset. Proposed: BES Cyber Asset A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact the ability of a BES Element or Facility with which it is associated to perform one or more BES Reliability Operating Services. This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the ability of the BES Element or Facility with which it is associated to perform the BES Reliability Operating Services. The timeframe is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive instructions to operate and the time in which that operation occurs and impacts the BES. Redundancy shall not be considered when determining availability. A Transient Cyber Asset is not considered a BES Cyber Asset. Rationale: Clarify that the BES Cyber Asset is associated with a BES Element or Facility.
Yes
Comments: See current and proposed change. Current: 2.1. Generation with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. Proposed: 2.1. Generation Facilities with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. Rationale: Editorial comment for consistency with similar language, e.g. generation Facilities, Transmission Facilities, etc. found elsewhere in Attachment 1, Part 2.
No
Current: "Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems. All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification." Further, part 1.1 of R1 states "Update

the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation, that is intended to be in service for more than 6 calendar months and that causes a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category. Proposed: Change the current part number “1.1” to “1.2” and add part 1.1 as follows: “Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems. All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification.” Further, part 1.1 of R1 states “Each Responsible Entity shall identify and categorize its BES Elements and Facilities in accordance with CIP-002-5 Attachment 1.” Part 1.2 states “Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation, that is intended to be in service for more than 6 calendar months and that causes a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category. Rationale: It is important to identify the applicable Elements and Facilities and their impact categorization for consistent auditing purposes. The PPL Companies request clarification of the apparent inconsistency in the standards where the requirement states that each Responsible Entity shall identify and categorized its High and Medium Impact BES Cyber Assets and Systems and state that Low Impact do not require discrete identification. However, in later standards (CIP-005-5 Requirement 1.1 for example) applicability applies to Low Impact BES Cyber Systems. This inconsistency occurs when other standard require specific identification of low impact facilities but the CIP-002 specifically states that there is no need to identify the Low Impact facilities This inconsistency needs to be addressed. PPL Companies suggest that Low Impact BES Cyber Systems not be subject to the requirements as they have already been defined as Low Impact.
Yes
No
The PPL Companies request clarification on the wording “…15 calendar months between reviews and approvals”. This apparently assumes that both a review and approval needs to be done, but if no changes are made would not a review of the policy suffice? The PPL Companies suggest that the standard language be changed to eliminate the need for approvals to be required when no changes have been made.
No
See response to question 3. The PPL Companies seek clarification on: Does the term “ALL” imply that people who only have access to Low Impact BES Cyber Systems be included?
No
The PPL Companies suggest that the term Storage Media be defined as discussed in the Rationale discussion.
No
See response to Question 3 The PPL Companies suggest the following changes to the standard. The

“bolded” words are the suggest changes. R1.1 requirement defines technical or procedural controls and the measure states to provide documentation of technical and procedural controls – suggest the two match. R1.2 should be all external routable and dial-up connectivity – add the word external The PPL Companies suggest that in R1.3, which requires a listing of inbound and outbound traffic be changed tip indicate that it would be appropriate to list outbound rule set and continue to the current deny all for inbound
No
The PPL Companies suggest the following changes be made: R1.1 uses operational or procedural controls, and the measure states operational and procedural controls, the two should match. R1.3 needs to be adjusted. The term ‘complementary and different” are both included, in the requirement but the measure only uses the term “different”.
No
The PPL Companies suggest removing the last sentence of the measure for R1.2 as it provides no benefit The PPL Companies also request clarification on the definition of “defined timeframe” in the last sentence of R2.2.
No
The PPL Companies request clarification on: R3.1 applies to BES Cyber Systems and not assets, does this allow for router and switches to not require TFE. R3.3 does not include testing for the installation of signature files, should this not be in the requirement R3.4 does this requirement reach all removable items, just as wireless mouse, keyboards, PKI devices, etc. Does an inventory of all transient cyber assets need to be maintained.
No
The PPL Companies suggest that in R3.2 adding additional wording so the 30 day clock starts after the actual incident has completed, instead of 30 days from when the incident is first reported. During those 30 days the process to return to normal operations should occur before the clock begins on the review and lessons learned activities.
No
The PPL Companies have the following concerns about the scope of the requirement: R1.3 is adding information protection to a requirement, keep information protection requirement all within CIP-011-5. R1.4 the verification of each backup upon completion seems to well exceed the order, consider that verification should be completed after major system changes or upgrades The PPL Companies suggest adding to R1.5 the following language “Preserve data, where technically feasible and critical to cause determination, for analysis…”
No
The PPL Companies observe that in requirement and measures for R2.2 the requirement and the measure are just the same wording. The PPL Companies recommend that the requirement be changed so that backup media is “…tested initially upon major system changes and at least once each calendar year…” The PPL Companies seek clarification on R2.3. Does a representative environment match what has been defined to the test environment as required in CIP-010-5 R1.5?
No
The PPL Companies suggest the following wording changes: In R3.1 suggest adding the wording

"…when BES Cyber Systems that have an effect on the recovery plan are replaced…" For R3.2 consider adding wording that 30 days after a recovery plan exercise, but 30 days after an incident is not enough time, so the wording should be after incident recovery as restoring operations should be the priority. R3.4 consider adding the following wording "…any organizational or technology changes that have an effect on the recovery plan within thirty days…"
Yes
No
The PPL Companies seek clarification on: In R1.4.1 should not all security controls be tested instead of "determining" what controls, how do you determine what controls might change with the change. R1.5.2 requires that entities document the test environment with every change that is tested. PPL suggests that only when the test environment changes should an entity be required t document the testing environment
No
The PPL Companies request clarification as to in R3.2 Can the testing be completed in a passive mode in production vs. an active test in the test environment?
No
The LSE should be removed from the Applicability Section (remove entire section 4.1.6 and 4.2.1) of all CIP Version 5 standards. With the NERC BOT approval of PRC-006-1 and subsequent FERC filing (Docket No. RM06-16-000), NERC has recognized that LSEs have no role in UFLS/UVLS programs. The Applicability Section for CIP Version 5 Standards includes LSEs with UFLS/UVLS equipment. This is inconsistent with NERC BOT's recognition that LSEs do not serve a role in such programs. Therefore it is unnecessary to include such a qualified LSE in the Applicability Section. NERC's reasoning was stated in their filing for FERC approval of PRC-006-1 and EOP-003-2: Some comments suggested potential confusion with existing programs or identifying responsibility for providing load shedding. The SDT believes these concerns are addressed in the continent-wide standard by assigning applicability to "Distribution Providers" and "Transmission Owners with end-use Load connected to their Facilities where such end use load is not part of a Distribution Provider's load." We [NERC] believe this covers all load and eliminates potential confusion regarding Load Serving Entities. See Petition of the North American Electric Reliability Corporation for Approval of Proposed New Reliability Standards and Implementation Plans Related to Underfrequency Load-Shedding, FERC Docket No. RM06-16-000, at p. 273. The SDT has revised the applicability [of PRC-006-1] to include both Distribution Providers and Transmission Owners as UFLS entities that may be designated by Planning Coordinators to implement a UFLS program. The interim changes to the NERC Statement of Compliance Registry were made to reflect concerns about the definition of the LSE as a "facility owning entity" as opposed to the Distribution Provider. As demonstrated in the NERC LSE workshop, currently approved Functional Model and the interim Registry Criteria changes, for standards purposes the DP is the "wires" connection to the electric system and owner of the UFLS tripping equipment. This may be inconsistent with previous usage of the same terms in some parts of the country. The Version 0 applicability for UFLS was set prior to the Registry and determined on the then general understanding of the Functional Model and industry usage. The current Functional Model is much clearer on this issue and designates the DP as the facility owner. Since NERC has stated that the Registry Criteria now has an interim step to correct the issue, it is expected that the Registry Criteria will change as the standards are re-evaluated for appropriateness. The SDT believes that this standard is in line with the direction taken by the interim changes and the approved Functional Model. See Petition of the North American Electric Reliability Corporation for Approval of Proposed New Reliability Standards and Implementation Plans Related to Underfrequency Load-Shedding, FERC Docket No. RM06-16-000, at p. 331. This position is consistent with NERC's reasoning throughout the development of PRC-006-1: The SDT recognizes that the Functional Model Version 5 and the Statement of Compliance Registry cause confusion regarding the involvement of the LSE in UFLS

programs but the SDT refers to the section covering the Roles in Load Curtailment in Version 5 of the Functional Model Technical Document; “For non-voluntary curtailment, such as automatic underfrequency and undervoltage load shedding and manual load shedding, the Load-Serving Entity identifies which critical customer loads should be excluded from curtailment for public health, safety and/or security reasons.” See Consideration of Comments on Initial Ballot — Project 2007-01 Underfrequency Load Shedding Date of Initial Ballot: July 7-17, 2010 at p. 4.
Individual
Tom Bowe
PJM
Yes
• An explicit and exact definition of what a BES Cyber System is and what components are included in a BES Cyber System would be helpful here. Some examples may aid in this understanding. • What is the starting point for CIP 002-5 . Do we start with ALL cyber systems and then group them into 3 categories based on impact? Or do we identify ONLY those cyber systems that are used in an entity’s mission (in other words exclude payroll etc) and then classify them based on impact.
Yes
In section 2.3--Define what BES Adverse Reliability Impacts means (Adverse). Section 2.8, define derivation in “critical to the derivation of IROLs.” Is this meant to be definition instead of derivation? In section 2.10, more information is needed on Nuclear Plan Interface Requirements.
No
• Following statement not needed “All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification.” While PJM appreciates the attempt to lessen the paperwork around this requirement, entities will still need to maintain this list inherently when the listing of BES Cyber Systems is created and each system is classified. • Section 1.1 – “Update the identification and categorization within 30 calendar days”. Does this update require sign-off from Sr. Manager or delegate? • Section 1.1 ‘…categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category’ –What if the change is from higher impact to lower impact category – is that expected to be captured in the annual review ?
No
• In M2. Reference to CIP Senior Manager should include “and delegate”. • In section 1.2 (Evidence Retention) change for retaining evidence is to three years from previous plus current year. Three years can add significant amount of data retention, not necessarily for CIP-002 but for other standards. Our preference is to not change to 3 years. • Section 1.2 the word compliant is mis-spelt as complaint.
Yes
No
• Should include “document CIP Senior Manager” as noted in R6. • This should be a Low Violation Risk Factor, not a Medium. This requirement and rationale is administrative and does not pose a medium risk factor
No
• Following statement should include “minimum” “…protection of its BES Cyber Systems and addresses, at a minimum, the following topics”. • In the list in 1.1 – 1.10, what about these topics should be included in policy? Topics better suited might be common domains of security. • In M2—with a numbered listed the statement should read “Evidence must include…”. • In the second measure in M2 implemented should be replaced with documented.
Yes
• In the M2—with a numbered listed the statement should read “Evidence must include…”. • Dated signature in M2 should be updated to include, electronic approval and workflow evidence.
No
• “Elements of” in the requirement should be removed. “Each Responsible Entity shall make individuals who have access to BES Cyber Systems aware of elements of its cyber security policies appropriate for their job function”.

Yes
No
• In R6, formatting error in copy reviewed. “Changes to the CIP Senior Manager and any delegations shall be documented within thirty calendar days of the change2”. The “2” should be a super script. • In M6, any acceptable form of evidence in M5 should be acceptable in M6. • In Part C, section 1.2 (Evidence Retention) change for retaining evidence is to three years from previous plus current year. Three years can add significant amount of data retention, not necessarily for CIP-002 but for other standards. Preference is to not change to 3 years.
No
Violation Risk Factors for R1 should be Low—see comments in #6 above
Yes
No
• For R2, are all of the roles expected for training included in the table? Is an entity expected to have separate training for each of the items listed in the table, or can the training be all inclusive and given to everyone? • For R 2.5 Visitor Control Program – what are the requirements for such a program • In Part 2.10, is this referring to general networking concepts and the network layout of an entity? Is vendor training sufficient for this area (i.e. Cisco training)?
Yes
No
• Part 4.2 – This requirement appears to lessen the requirements for international individuals. While we appreciate the standards drafting team’s considerations, it seems that when dealing with security some restrictions need to be applied around using the exception process. • Part 4.3 –We believe that the term “criteria” should be left out of the requirement. Reviewing PRAs is a highly subjective process that is handled on a case by case basis, and we believe that only a process that helps drive decisions should be included here.
Yes
R 5.2 Update each personnel Risk Assessment at least once every seven calendar years. Is it OK if the repeat PRA is not within 7 years of the original PRA as long as it is within seven calendar years?
Yes
R 6.1 and R 6.2 - ‘CIP Senior manager or delegate shall authorize’ - Most organizations have defined processes for who can authorize this type of access. Adding the phrase above only increases administrative overhead to sign and maintain delegation letters. Can these requirements be reworded so that CIP Senior manager does not have to be involved in authorizing –either directly or through delegates? Measures for R 6.1 and R 6.2 have numbered list of acceptable evidence. The heading should read ‘Evidence must include’. Otherwise the list should be a bulleted list and entities can choose to maintain one more items from the list.
No
• Part 7.2 –In reassignments or transfers knowledge transfer can take extended period of time (some positions that are recently vacated also are not immediately filled when transfer/reassignment is completed). Stipulations should be present to allow for this knowledge transfer to ensure that access is not revoked before it is truly not needed any longer. • The change rationale does not match part 7.2. As stated above, the requirement in the table currently reflects the need to cut access immediately as of the transfer, rather than allowing for proper transition plans to be executed. • Measures for 7.2 contain numbered list. The opening line should read ‘Evidence must include’. Or the list should be changed to a bulleted list.
Yes
No
• Part 1.1 – Examples of topics to cover/address should be listed. Requirements state “define technical or procedural”, while the measures state “documented technical and procedural controls”.

For an application “either or” would be needed. • Part 1.5 – In measures section a grammar update for, “configuration files of an intrusion detection system(s)” • The measures section is a bulleted list – implying an entity can choose which evidence measures to maintain. It should actually be a numbered list – entities should have all items listed in this section. • There should be clarity on the location of intrusion detection systems. In the current version there is no consistency of interpretation among the CEAs.
No
• Part 2.1 – Source is not clear. In network terminology, defining the source would be helpful. Examples of User Interactive Remote Access would also be helpful for this requirement. Examples of acceptable ‘Intermediate Devices’ would be helpful too. • Part 2.3 - What is the SDT definition of multi-factor authentication? This would be helpful for the requirement.
No
All VSL’s are listed as severe. A defined range or breakdown of levels of non-compliance would be better suited for R1 and R2.
No
• Part 1.1 – Applicability: A list of what “Low Impact BES cyber systems “are, is needed. - Requirements: What is the difference between “operational and procedural controls”? “ Define operational or procedural” is listed as “ define operational and procedural” in measures column, should be consistent. - Measures: What type of evidence does the measure require? • Part 1.2 – Requirements: “ Defined Physical Boundaries”, terminology needs to be used in Measures, for consistency. • Part 1.3 – Should we have separate ESP access point for Low and High impact BES Cyber systems? • Part 1.5 – Why are the requirements between 1.4 and 1.5 separated?
No
• Part 2.1 – Requirements: Define “continuous” • Part 2.2 – Requirements: “Defined Physical Boundaries” should be added to “A process requiring manual or automated logging of the entry and exit”, in order to match the Measures.
No
• Part 3.1 – Requirements: What would be the requirements for systems already in place at time of commissioning? • Part 3.2 – Applicability: Clarify what is meant by “Physical Access”
Yes
No
• Part 1.1 – Requirements: Clarify what “restrict access” means. • Part 1.2 – Requirements: Clarify what restrict means in “restrict the use of unnecessary…” The change description and justification appears weak on the basis the SDT was encouraged to address unused physical ports. A better defined position would be helpful to understanding of 1.2.
No
• Part 2.1 – Requirements: This needs to be written in the form of a requirement. (not a statement) • Part 2.3 – Requirements: “Execute the remediation plan” should be added to this requirement. These requirements aren’t matching up with the “Change Rationale”. • Part 2.3 - Measures – Acceptable evidence should also include workflow evidence from the Change Management system.
Yes
Requirement: Clarify what type of “connection"
No
• Part 4.1 -Requirements: 4.1.1 – Clarify whether it’s just only for Electronic Access Point for 4.1.2 – 4.1.4. 4.1.4 – This is too broad. Defining potential malicious activity would be helpful to understanding of 4.1.4. Metrics around successful or failed attempts would benefit and provide clarity to requirement. • Part 4.3 - Doesn’t match up with 4.5. (Clarity to review summary of two weeks by next calendar day or next calendar day for reviews of failures). • Part 4.5 – Requirements: Clarify what “a summarization or sampling” means.
No
• Part 5.2 – Most organizations have a process for who can authorize use of shared, default, administrator or generic accounts. Adding the phrase ‘CIP Senior Manager or Delegate’ only adds

administrative overhead. Consider rewording this phrase. • Part 5.3 – Requirement does not match to change rationale. • Part 5.4 – Requirements: Move “BES Cyber Assets, Electronic Access Control or Monitoring…” to the “Applicability” section
Yes
Comments: Consider adding a sliding scale of percentage of assets where an entity failed to document ports, monitoring etc. rather than classifying everything into High or Severe VSL.
No
• Requirements: Generally 1.1 is not posed as a requirement. Similar wording of other requirements is needed. “Responsible entity shall have…” • Measures: the use of the word “targeting” implies pulling in other than CIP related impacts to the BES. Reference in measures section should only be for CIP. • Generally 1.2 is not posed as a requirement. Similar wording of other requirements is needed. “Responsible entity shall have • 1.1, 1.2, 1.3 Applicability section should list the types of assets to which this requirement applies. ‘All responsible entities’ seems to broad, and can be interpreted to include assets not in the high, medium or even low impact BES cyber systems
No
• 2.1 Clarify “deviations” (…”recording of deviations taken from the plan”…. • Also clarify if the deviations should be recorded in real time or can that be done after the incident is complete • 2.2 Clarification is requested regarding the statement of “initially upon the effective date.” Does this mean that the plan has to be effective on the effective date but not before, can the plan be effective prior to the standards effective date, etc.
No
• 3.2 – The following statement from R2.1 “recording deviations from the plan” appears to align in 3.2. Clarification on why it is in R2.1 would be helpful. • 3.4 - Organizational changes should be responsibility or role changes
Yes
No
• Part 1.1 – Requirements: Examples of conditions are needed. • Part 1.3 – Requirements: “backup, storage,..” what can be acceptable as documentation of storage? This can become cumbersome when dealing with virtual environments. • Part 1.4 – “Part” in the first, second and third column should be “Applicability”, “Requirement” and “Measures” respectively. Requirements: “initially after backup” terminology needs further clarification. This seems to give no window of failure. Typically, we would investigate if a successful backup has not occurred within 48 hours. • Part 1.5 – Requirements: More defined examples of preserved data are needed.
No
• Part 2.1 – Requirements: In the third bullet point, it is mentioned “operational exercises.” But in the Rationale “Functional exercises” is defined. Clarification is requested regarding the statement of “initially upon the effective date.” Does this mean that the plan has to be effective on the effective date but not before, can the plan be effective prior to the standards effective date, etc. • Part 2.2 – Clarification on configurations is needed (compared to baseline)? • Part 2.3 – If calendar year is defined not to exceed 15 months, how does 3 calendar years translate to 39 calendar months?
No
• Part 3.1 - Measures- ‘or when BES Cyber systems are replaced’ –This should be reworded to the effect that when there are updates to High or medium impact BES Cyber Systems or assets, the recovery plans should be updated within 30 days of update to the list. • Part 3.4 - “Part” in the first, second and third column should be “Applicability”, “Requirement” and “Measures” respectively. Organizational changes should be responsibility or role changes
Yes
No
• Part 1.1 – In requirements instead of “develop a baseline configuration” it should be read as “create and maintain a baseline configuration” ♣ 1.1.3. Non-commercial (open source) should also be tracked. ♣ 1.1.6. This is too broad. By “Any security-patch levels” does it mean security patch levels of the operating system or the version? • Part 1.2 – Requirements: Grammatical Error “Authorized”

should be “Authorize” • Part 1.3 – Requirements: “including identification and categorization of the BES Cyber Systems..” is not clear. How does this fit in with “updating baseline configuration”? Should this refer to specific assets as opposed to the system? Measures: Need examples of changes other than asset recovery plans. • Part 1.4 – Requirements: 1.4.1 – Define “cyber security controls”. • Part 1.5 - An entity may not have comparable test environment for every BES Cyber system of high , medium or even low impact. There should be room to use non-CIP assets (even if they are in production) for testing prior to implementing in a CIP environment.
No
• Part 2.1 – Requirements: add “to the baseline” at the end of the sentence. Measures: What is considered as “records of investigations..” (email chain, change record)?
No
In relation to the Compliance section Part 1.2 Evidence Retention, What does “since the last audit” refer to? Explanation is required (does audit refer to a regional entity)? Spelling error “complaint” should be “compliant” in last sentence of first paragraph Part 1.2 Evidence Retention.
Yes
No
• Part 1.1 – Requirements: Generally 1.1 is not posed as a requirement. Similar wording of other requirements is needed. “Responsible entity shall have …” ---“One of more methods..” is not suitable for a requirement. Need a clearer understanding of what identify refers to. Measures: These measures are weak. • Part 1.2 - Generally 1.2 is not posed as a requirement. Similar wording of other requirements is needed. “Responsible entity shall have…” --“Part” in the first, second and third column should be “Applicability”, “Requirements” and “Measures” respectively. - Requirements: “Access control..” is not suitable for a requirement - Measures: In the first bullet point for “the document process” there is no requirement specified. According to the second bullet point, it is read “Records from an…..need to know basis” should this be enforced in a need to know basis? There is no requirement on need to know basis Third bullet point—difficult to track authorized individuals to a locked file cabinet. • Part 1.3 – Again, in general 1.3 does not pose as a requirement. “Part” in the first, second and third column should be “Applicability”, “Requirements” and “Measures” respectively. - Requirements: Clarify the time frame on “Initially upon the effective date…” - “assess adherence to its BES Cyber System Information protection process” “its”, is vague in this wording, clearer meaning would be helpful. R 1.3 – ‘Initially upon the effective date’ – How far in advance can the assessment be completed ?
No
• Part 2.1 – Measures: The requirement for this measure needs to be clarified. • Part 2.2 – Measures: Update is needed to leave open to other ways to prevent unauthorized retrieval of Information (ie. Encrypting, locking in safe or other physical securing)
No
• R1 – Severe should be only if all three items identified are missed. If not all are missed, a lower VSL should be listed. • R2 – High VSL- severity should be based on number of occurrences. Severe VSL- there is no requirement to document. Only to take action or implement process should not be listed as severe.
No
Plan should be a rolling implementation.
Individual
Chris Higgins / BPA CIP Team
Bonneville Power Administration
Yes
1 - BES Cyber Asset A cyber asset that if rendered unavailable degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one of more BES Reliability Operating Services. This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services. The time frame (15 minutes) is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive

instructions to operate, and the time in which the operation occurs and impacts the BES. Redundancy shall not be considered when determining availability. A Transient Cyber Asset is not considered a BES Cyber Asset. Comment: BPA believes the definition for BES Cyber Asset is very difficult to understand. BPA believes the author is trying to say, regardless of when the Cyber Asset actually broke, the Cyber Asset would cause an adverse impact to the BES within 15 minutes of when it is needed. Recommended Change: A Cyber Asset that if rendered unavailable, degraded, or misused would, when required for real-time operation, adversely impact one or more BES Reliability Operating Services within 15 minutes. The 15 minutes does not start at the time of unavailability, degradation, or misuse of the Cyber Asset. It starts when the Cyber Asset is next required to support one or more of the BES Reliability Operating Services. Redundancy shall not be considered determining the availability of the Cyber Asset. A Transient Cyber Asset is not considered a BES Cyber Asset. 2 - BES Cyber Security Incident A malicious action or suspicious event that: • Compromises or was an attempt to compromise the Electronic Security Perimeter, or • Disrupts, or was an attempt to disrupt the operation of a BES Cyber System, or • Results in unauthorized physical access into a Defined Physical Boundary Comment: BPA believes that malicious attempts are Cyber Security Incidents, regardless of their success. In addition, BPA believes that compromise of BES Cyber System Information should also constitute a BES Cyber Security Incident. Recommended Change: A malicious action or suspicious event which through an investigation and escalation process has been identified that: • Compromises or was an attempt to compromise the Electronic Security Perimeter, or BE Cyber Security Information • Disrupts, or was an attempt to disrupt the operation of a BES Cyber Asset or BES Cyber System • Results in unauthorized physical access into a Defined Physical Boundary 3 - BES Cyber System One or more BES Cyber Assets that are typically grouped together, logically, or physically, to operate one or more BES Reliability Operating Services. A Maintenance Cyber Asset is not considered part of a BES Cyber System. Comment: BPA believes the CIP-002 Standard appears to allow the identification and categorization of BES Cyber Assets OR BES Cyber Systems. However, the definition BES Cyber Security Incident and most of the CIP Version 5 standards assume that every identified BES Cyber Asset is part of an identified BES Cyber System. There is no definition for Maintenance Cyber Asset. Can a BES Cyber System include Cyber Assets that are not BES Cyber Assets? One or two of BPA's current Critical Cyber Assets have non-critical Cyber Asset components. The Applicability section of the standards includes a definition for Associated Protected Cyber Assets that are associated with a corresponding High or Medium Impact BES Cyber System. BPA suggests that all BES Cyber Assets must be identified as a component of an identified BES Cyber System and whether a Cyber Asset that is not a BES Cyber Asset can be part of a BES Cyber System be added to the definition. Recommended change: One or more BES Cyber Assets that are typically grouped together, logically, or physically, to operate one or more BES Reliability Operating Services. A Transient Cyber Asset is not considered part of a BES Cyber System. 4 - BES Cyber System Information Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain BES Cyber System Impact designations; equipment layouts that contain BES Cyber System Impact designations; BES Cyber System disaster recovery plans; and BES Cyber System incident response plans. Comment: BPA infers that the large and chunky sentences are confusing and difficult to understand. BPA suggests bullet lists so the reader and implementer can wrap their arms around one or many of the concepts (requirements) in the standard or definition. Recommended change: BES Cyber System or BES Cyber Asset information that includes: • Security procedures developed by the responsible entity, including BES Cyber System disaster recovery plans and BES Cyber System incident response plans; • Network topology or similar diagrams; • BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); • Floor plans that contain BES Cyber System Impact designations; • Equipment layouts that contain BES Cyber System Impact designations. • BES Cyber System disaster recovery plans, or • BES Cyber System incident response plan 5 - BES Reliability Operating Services BES Reliability Operating Services are those services contributing to the real-time reliable operation of the Bulk Electric System (BES). They include the following Operating Services: Comment: The definition says '…those services contributing to the real-time…' The word contributing is too broad and may encompass cyber assets/systems that do not significantly impact the reliable operation of the BES. Most of the verbiage in this definition should be included as an attachment in CIP-002 if it is only used

for identification of BES Cyber Assets and BES Cyber Systems. Inter-Entity Coordination and Communication is not a service but is a communication method for other Reliability Operating Services. Recommended change: BES Reliability Operating Service (ROS) is a service that is directly essential to the real-time, reliable operation of the Bulk Electric System (BES). BPA also suggests moving the services to an attachment or guidance document as indicated above, make each ROS Service its own definition, or put the definition of the specific service only in its own standard, where used. Remove Inter-Entity Coordination and Communication as a sub-definition of ROS. At a minimum, limit this to real-time ICCP data, which equals facility operational data and status. 6 - CIP Exceptional Circumstances A situation that involves one or more of the following conditions: a risk of injury or death, a natural disaster, civil unrest, a Cyber Security Incident requiring emergency assistance, a response by emergency services, the enactment of a mutual assistance agreement, or an impediment of large scale workforce availability. Comment: BPA asks, "Should this not also include the threat of the risks that are defined?" This definition does NOT cover all exceptional circumstances. A Cyber Security Incident is limited to "a malicious act or suspicious event". It is possible that a BES Cyber Asset would fail in such a way that outside experts were needed to fix it. In most cases there is a reaction to a threat that would invoke exceptional circumstances until such time as it has been determined whether or not the threat is real. Recommended change: A situation (which includes the immediate threat or real event) that involves one or more of the following conditions: a risk of injury or death, a natural disaster, to public safety, health, welfare civil unrest, damage or destruction to Bulk Electric System equipment, a Cyber Security Incident requiring emergency assistance, a response by emergency services, the enactment of a mutual assistance agreement, or the impediment of large scale workforce availability. 7 - CIP Senior Manager A single senior management official with overall authority and responsibility for leading and managing implementation of the requirements within the NERC CIP Standards. BPA supports "7 – CIP Senior Manager" and has no comments or concerns at this time. 8 - Control Center One or more facilities hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation facilities or transmission facilities, at two or more locations: • Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems, • Inter-utility exchange of BES reliability or operability data, • Providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES, • Alarm monitoring and processing specific to the reliable operation of the BES and BES restoration function, • Presentation and display of BES reliability or operability data for monitoring, operating, and control of the BES • Coordination of BES restoration activities. BPA supports "8-Control Center" and has no comments or concerns at this time. 9 - Cyber Assets Programmable electronic devices including the hardware, software, and data in those devices Comment: The term should be singular (Cyber Asset and device) not plural (Cyber Assets and devices). The word "programmable" is not definitive enough to clearly identify all the electronic devices subject to these Standards. Recommended Change: Cyber Asset - Electronic device including the hardware, software, and data in the device that is programmable or configurable. 10 - Defined Physical Boundary (DPB) The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, or Electronic Access Control Systems reside and for which access is controlled. Change Rationale: "Defined Physical Boundary (DPB)" replaces "Physical Security Perimeter." Previous versions of the CIP standard focused on the development of a completely enclosed Physical Security Perimeter (PSP) ("six-wall" border) and managing access though this boundary. This has proven difficult due to the nature of the operating environment for many electrical utilities, especially in field locations. The intent of this standard is to focus on the controls put in place to restrict access rather than solely focusing on the PSP and a boundary protection model for physical security. Comment: BPA believes the wording is inconsistent with other usage in the standards. BPA suggests ensuring that the rational statement remains with the definition, or find some way of combining the two. Recommended change: BPA suggests adding "Monitoring" to produce the following: The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, Electronic Access Control or Monitoring Systems reside and for which access is controlled. 11- Electronic Access Control or Monitoring Systems Cyber Assets used in the access control or monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems BPA supports "11-Electronic Access Control or Monitoring Systems" and has no comments or concerns at this time. 12 - Electronic Access Point ("EAP") An interface on a Cyber Asset that restricts routable or dial-up data communications between Cyber Assets. Comment: Does this purposefully ignore serial communications in a continuation of the differentiation built into the original

CIP-002 R3. Recommended Change: Any interface to an ESP which provides access to BES Cyber Systems or BES Cyber Assets which control or restricts Electronic (routable or dial-up) communications to those assets. 13 - Electronic Security Perimeter ("ESP") A collection of Electronic Access Points that protect one or more BES Cyber Systems. BPA support "13 – Electronic Security Perimeter ("ESP")" and has no comments or concerns at this time. 14 - External Connectivity Routable or dial-up data communication through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter. Recommended change: Routable or dial-up data communication through an Electronic Access Point into an Electronic Security Perimeter between a BES Cyber Asset and a device external to the Electronic Security Perimeter. 15 - External Routable Connectivity The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol. BPA supports "15 – External Routable Connectivity" and has no comments or concerns at this time. 16 - Interactive Remote Access Any user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors or consultants Recommended Change: Interactive Remote Access: Any user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and that is not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Interactive remote access can be initiated from: Cyber Assets used or owned by the Responsible Entity; Cyber Assets used or owned by employees; or Cyber Assets used or owned by vendors, contractors, or consultants. 17 - Intermediate Device A Cyber Asset that: 1) may be used to provide the required multi-factor authentication for the interactive remote access; 2) may be a termination point for required encrypted communication; and 3) may restrict the interactive remote access to only authorized users. Intermediate devices are sometimes called proxy systems. The functions of an intermediate device may be implemented on one or more Cyber Assets. The intermediate device may be located outside the Electronic Security Perimeter, as part of the Electronic Access Point, or in a DMZ network. Comment: INTERMEDIATE DEVICE: Again, BPA applauds the inclusion of this definition. However, as stated, BPA believes a Cyber Asset can fail all the conditions and still be considered an Intermediate Device. Recommended Change: A Cyber Asset that meets one or more of the following conditions: - Is used to provide the required multi-factor authentication for the interactive remote access; - Is a termination point for required encrypted communication; and/or - Restricts the interactive remote access to only authorized users. Intermediate devices are sometimes called proxy systems. The functions of an intermediate device may be implemented on one or more Cyber Assets. The intermediate devices may be located outside the Electronic Security Perimeter, as part of the Electronic Access point, or in a DMZ network. BPA also believes the last sentence could be deleted. If it is not deleted, it should be reworded to make it clear that the three locations listed are not the only possible locations. BPA suggests; The intermediate device locations may include: - Outside the Electronic Security Perimeter, or - As part of the Electronic Access Point, or - In a DMZ network 18 - Physical Access Control Systems Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers. BPA supports "18 – Physical Access Control Systems" and has no comments or concerns at this time. 19 - Protected Cyber Asset A Cyber Asset connected using a routable protocol within an Electronic Security Perimeter that is not part of the BES Cyber System. A Transient Cyber Asset is not considered a Protected Cyber Asset. Comment: BPA believes this definition relies on the definition of "Electronic Security Perimeter". Given that definition, the definition of Protected Cyber Asset becomes "A Cyber Asset connected using a routable protocol within a collection of Electronic Access Points that protect one or more BES Cyber Systems that is not part of the BES Cyber System." This implies that a Protected Cyber Asset is an Electronic Access Point. Recommended change: A Cyber Asset located within an Electronic Security Perimeter, but which is not a part of an associated BES Cyber System but is routably connected to an associated BES Cyber System. A Transient Cyber Asset is not considered a Protected Cyber Asset. 20 - Reportable BES Cyber Security Incident Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service. Comment: BPA suggests rewording this definition for clarity. Recommended change: Any BES Cyber Security event that has been officially escalated to the level of a Cyber Security Incident which has compromised or disrupted a BES Reliability Operating Service. 21 - Transient Cyber Asset A Cyber Asset that is: 1) directly connected for 30 calendar days or less to a BES Cyber Asset or Protected Cyber Asset 2) used for

data transfer, maintenance, or troubleshooting purposes, and 3) capable of altering the configuration of or introducing malicious code to the BES Cyber System. Comment: BPA believes this should include devices such as sniffers and scanners on a temporary basis. In additions, the references to "Maintenance Cyber Assets" in the standards need to be replaced by "Transient Cyber Assets". Recommended Change: A Cyber Asset that is: 1. Located on a network segment protected by one or more Electronic Access Points protecting BES Cyber Assets or directly connected to a BES Cyber Asset, and 2. Connected to such a network segment or BES Cyber Asset for 30 days or less. Transient Cyber Assets are not considered Protected Cyber Assets. Terms to be Retired Comment: BPA believes that a Cyber Security Incident should be included in the list since the BES Cyber Security Incident is being added. Additional Comments Definitions in general: BPA believes that if a term applies to more than one standard, then it should be a defined term; however, if a term is used exclusively with a specific standard, then leave it in that standard only. Effective dates: Suggest making the Effective Dates paragraphs easier to decipher. These paragraphs are in every standard. They are extremely confusing to read and require further explanation in footnotes. Recommendation: 18 Months Minimum – The Version 5 CIP Cyber Security Standards shall become effective on the later date: January 1, 2015; or the first calendar day of the seventh calendar quarter after the applicable regulatory approval date. However, if Version 4 CIP Cyber Security Standards do not become effective, Version 3 CIP Cyber Security Standards remain in effect until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.

Yes

BPA suggests the following recommendations to High Impact: • Modify sentence to say "Each BES Cyber Asset or BES Cyber System used by and located at:" as the definition would already address the 15 minute consideration and no need for duplication here. • BPA suggests applying this to the Medium Impact sentence as well, but include the "not included in Section 1 above" portion. BPA recommends that 2.7 should have increased values assigned to lines with power transformer installations above a predefined nameplate rating at those 200kV and above substations since they are extremely important to the BES, extremely expensive, and have a very long lead time. Or revert back to the version 4 bright line criteria statement addressing number of 300kV lines only. Under the Transmission portion of Medium Impact the total aggregated weighted value indicates "3 connected 345 kV lines and 5 connected 230kV lines"–should that say "or" rather than "and" since then the aggregated totals would be 7000 rather than 3000 which I believe is the threshold desired. BPA also requests that the drafting team provide direction on how this apparent inconsistency in time horizons should be addressed in the cyber system categorization process. In Attachment I of CIP 002-5, there appears to be a conflict in time horizons for applicability of the standard. There are several references to the 15 minute "adverse impact" criteria. However, in the first sentence under Balancing Load and Generation in the Guidelines and Technical Basis section, the language suggests the need to include systems involved in monitoring and controlling generation and load "in the operations planning horizon". In the Situational Awareness section, there is also mention of Current Day "and Next Day" planning systems. Moving from a 15 minute impact criteria to the operations planning and next day planning horizons would significantly increase the scope the standard for BPA and likely for many other entities as well.

No

BPA asks, "Does this mean that we only have to update the list within 30 days if both conditions are true?" BPA believes that R1 should be broken into more requirements, one to address identification of the BES Cyber Assets and BES Cyber Systems and one or more to address updates due to changes to BES Elements and Facilities. CIP-002-5 R1 reads, "Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in CIP-002-5 Attachment 1 - Impact Categorization of BES Cyber Assets and BES Cyber Systems. All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification." (Emphasis added) BPA interprets CIP-002-5 to limit responsibility for compliance with the CIP standards for any BES Cyber Asset or BES Cyber System to the owner of that asset or system. It follows that the inverse is also true: i.e. only the owner of a BES Cyber Asset or BES Cyber System can be responsible for CIP compliance. Responsibility for CIP compliance will always fall to the asset owner. BPA believes this adds much needed clarity and strongly supports this position. BPA also supports the position that only one Entity be responsible for any BES Cyber Asset or BES Cyber System, and that the responsible Entity must be the owner or co-owner of the asset or system. BPA

supports this language because it clarifies responsibility and avoids potentially expensive and inefficient duplication of compliance efforts. BPA requests that the drafting team clarify whether they contemplate that scheduling systems would adversely impact one or more BES Reliability Operating Services within fifteen minutes if rendered unavailable, degraded, or misused. For example, does the potential for cyber attack on e-tagging systems before tags are loaded into EMS prior to the ramp suggest that scheduling systems should have a High or Medium Impact Rating? BPA requests that the drafting team define or clarify the term "generation control center" listed as having a medium impact rating in CIP-002-5 Attachment 1, at 2.13. Specifically, BPA requests that the drafting team clarify the extent of control over generation present at a "generation control center."
No
BPA would vote yes if the words “Initially upon the effective date of the standard” were changed to “within 12 months prior to effective date of the standard.
Yes
Yes
No
BPA believes that each organization should be able to create and implement cyber security policies that are suitable to their environment. The CIP version 5 standards assume a one size fits all approach across the industry. R2 Guideline: 2.3. Remote Access • Disabling VPN “split-tunneling” or “dual-homed” workstations before initiating interactive remote access This line implies that VPN access is the only an acceptable interactive remote access method. Don't be so restrictive. Allow for Secure Shell, and Secure Socket Layer, and any other secure method we have available to us now and in the future. The standard is mandating an entity’s policy be too prescriptive and does not allow the usage of other technologies.
No
Comment: BPA believes that requiring a review upon the effective date of this standard ignores the fact that Responsible Entities already have Cyber Security Policies under Version 3 and are already reviewing them annually. BPA believes the statement, "initially upon the effective date of the standard" should be removed from the requirement. Recommendation: BPA recommends the following change: Each Responsible Entity shall review each of its cyber security policies and obtain the approval of its CIP Senior Manager, at least once each calendar year, not to exceed 15 calendar months between reviews and between approvals.
Yes
BPA believes the requirement is presently being completed under the current effective standards.
Yes
BPA believes the requirement is presently being completed under the current effective standards.
Yes
BPA believes the requirement is presently being completed under the current effective standards.
No
BPA believes the proposed VRFs and VSLs, associated with R2, assume all entities have implemented all mandated cyber security policies listed in CIP-003 version 5. BPA believes this does not take into account some entities may not have the need to implement certain cyber security policies based on current business practices and technologies in use (or not in use). BPA considers the level of the VRFs and VSLs are appropriate for R1, R4, R5, and R6.
Yes
BPA believes the requirement is acceptable as written and has no comments or concerns at this time.
Yes
Yes
The CIP004 R3.2 requirement states that training must be provided prior to access being granted and that training must be completed on an annual basis. However, it does not define what actions must occur if training is not completed within the stated timeframe. BPA recommends the inclusion of a

requirement specifying the actions to be taken with regard to authorized electronic or unescorted physical access in the event of an individual exceeding the annual timeframe for annual training.
No
BPA believes the additional language within R4.4.2 regarding assessment of residence, schooling and employment falls outside the boundary of a criminal history check. Verification of schooling, employment and residence is typically a function of employment eligibility verification and should not be considered as part of the assessment processes for risks associated with access to sensitive areas. Such risk analysis is typically based on character, trustworthiness and any revealed patterns of adverse behavior, which are only able to be assessed in reviewing the criminal history check. It is the opinion of BPA that items and issues that fall outside the scope of a criminal background investigation are not relevant when contrasted against the risks to BES Cyber Systems. Further, it is imprudent to require entities to perform positive and negative personal risk assessments based on the location of an individual's school, residence, and employment history. BPA recommends making the following change to CIP-004 R4.4.2: • A criminal history check must be performed prior to granting authorized electronic access or authorized unescorted physical access to BES Cyber Systems. Assessment of the criminal history check must be conducted to assess character, trustworthiness and any revealed patters of adverse behavior.
Yes
No
BPA believes that R6.4 could be improved and suggests making the following change: • Verify at least once each calendar quarter that individuals currently provisioned for unescorted physical access or electronic access to BES Cyber Systems are authorized for such access. BPA believes that R6.6 could be improved and suggests making the following change: • Verify at least once per calendar year, but not to exceed 15 calendar months between verifications to confirm that access privileges to "BES Cyber System Information" are correct and the minimum necessary for performing assigned work functions
No
BPA believes that significant issues and problems are created by the proposed requirements throughout CIP-004 R7 and its sub-requirements. BPA believes that R7.1 should require Responsible Entities to establish documented timelines for access revocations. This presents a potential for violations due to ambiguity. BPA recommends making the following change to CIP-004 R7.1: • For resignations or terminations, the RE shall establish guidelines and processes that adequately protect Unescorted Physical and/or Interactive Remote access to BES Cyber Systems following the time of the resignation or termination • Remove section (ii) of R7.1, and section (ii) of R7.2 BPA recommends making the following change to CIP-004 R7.3: • Modify requirement R7.3 to read… For resignations revoke the individual's access to BES Cyber Systems Information within a timeframe defined by the Responsible Entity – not to exceed 30 days. For terminations, revoke the individual's access to BES Cyber Systems Information within a timeframe defined by the Responsible Entity – not to exceed 7 days. BPA recommends making the following change to CIP-004 R7.4 and 7.5 • Remove requirement R7.4 and R 7.5 altogether as it is impractical to implement. Given the number, type, geographical location, and the inability to centrally manage all the devices within scope of these requirements makes the enforcement of the requirement impractical to implement. Applying CIP-004 R7.4 and R.7.5 at the BES Cyber Asset level (i.e. relays) cannot be accomplished within the stated 30 day timeframe. To do so would require a series of approved outages for every relay designated as a BES Cyber Asset followed by individually changing the Access Level Codes to each relay. Bonneville and other region entities support each other which results in mutually shared access codes. This effectively means individuals may posses the ability to access BES Cyber Assets within several entities' operating areas. Therefore, if an individual moves out of a job that requires access to BES Cyber Assets, every relay in every operating area would require access codes to be changed, which would require a physical visit to every impacted relay.
No
As the Violation Risk Factors and Violation Severity Levels point to requirements and statements that are in question or require modification, BPA is unable to adequately answer this question until the standards are complete.
No

CIP-005 R1.2: No - BPA has concerns with the Applicability definitions. BPA requests clarification in the standard regarding the following questions: • If you can connect to a serial device through a device such as a terminal console that is connected to a routable network, does that cause the serial device to be in scope? • Would a serial device that is capable of "Reverse Telnet" be an included device? • Are EAPs required at points in the network where serial communications are bridged to Ethernet networks? CIP-005 R1.3: Yes - BPA supports CIP-005 R1.3 CIP-005 R1.5: Yes - BPA supports CIP-005 R1.5
No
CIP-005 R2.2: No - BPA also finds "Require encryption for all Interactive Remote Access sessions to protect the confidentiality and integrity of each Interactive Remote Access session." to be too prescriptive. If the interactive session is only for the purpose of showing maintenance logs or locations of faults, confidentiality and integrity may not be a requirement. If only integrity is a requirement, this can be handled with a hash of the data, not necessarily full encryption. In this case, a blanket requirement for encryption is far too encompassing and would require limits and specifics on the types of remote sessions that should be protected before we would agree to this requirement. In the end, for this matter, BPA should be allowed to determine our confidentiality and integrity needs and apply the appropriate protections as necessary.
No
CIP Version 5 takes the important step of moving toward a risk-based assessment approach by requiring Entities to classify assets and systems as High, Medium and Low Impact to the BES. However, the VSLs and VRFs do not reflect this risk-based approach. For example, in CIP-005-5, all VSLs are classified as Severe, yet CIP-005-5 R1.1 applies only to Low Impact BES Assets and Systems. BPA believes that the VSLs and VRFs in all CIP Standards should be reassessed based on the impact classification of the Assets and Systems covered by each Requirement. As an example, the Severity Levels for CIP-005-5 R1 could be rewritten as shown below. Column Heading "Requirement" = R1 Column Heading "Lower VSL" = For Low Impact Systems, Responsible Entity failed to document procedural controls to restrict access to a specific System. Column Heading "Medium VSL" = For High and Medium Impact Systems, Responsible Entity failed to document method for detecting malicious communication at each EAP. Column Heading "High VSL" = N/A Column Heading "Sever VSL" = The Responsible Entity did not establish Electronic Access Points to control and secure access to its High and Medium Impact BES Cyber Systems
No
The guidelines cited in version 5 standards “CIP 006-5 Cyber Security – Physical Security of BES Cyber Systems” Dated November 7, 2011, Page 22 and 23 “Guidelines and Technical Basis” state, in part: “Typically any opening greater than 96 square inches with one side greater than 6 inches in length would be considered an access point into the Defined Physical Boundary.” Therefore, BPA votes no. In reference to the guidelines cited above which originated from CAN-0031 referring to “…96 square inches…” as an access point, this is an area of concern for BPA. In an effort to shore up each 96 square inch opening throughout BPA’s service area, with either a physical barrier or intrusion detection system, the cost would significantly outweigh the value added for physical security protection. The challenge to utilities should be to prevent physical access to the BES Assets and to not gauge that access opportunity on 96 square inches. Accordingly, this provision will be unnecessarily costly to the utilities without an actual security benefit. BPA believes the language in the guidelines on pages 22 and 23 referring to 96 square inch access points needs to be removed from the standard, or: The proposed CIP 006 guidelines need to reflect reasonable dimensions, alternatives and language similar to other CIP standards for example: “The Responsible Entity shall document and implement physical or alternative measures for monitoring openings to the physical security perimeter greater than 150 square inches with no dimension less than 12 inches. The Responsible Entity shall implement one of the following methods:” • Physical measures: Bars, Wire Mesh, etc. • Alternative measures: Motion Sensors, Vibration Sensors, Intrusion Detection etc.
No
The guidelines cited in version 5 standards “CIP 006-5 Cyber Security – Physical Security of BES Cyber Systems” Dated November 7, 2011, Page 22 and 23 “Guidelines and Technical Basis” state, in part: “Typically any opening greater than 96 square inches with one side greater than 6 inches in length would be considered an access point into the Defined Physical Boundary.” Therefore, BPA votes no. In reference to the guidelines cited above which originated from CAN-0031 referring to “…96

square inches…" as an access point, this is an area of concern for BPA. In an effort to shore up each 96 square inch opening throughout BPA's service area, with either a physical barrier or intrusion detection system, the cost would significantly outweigh the value added for physical security protection. The challenge to utilities should be to prevent physical access to the BES Assets and to not gauge that access opportunity on 96 square inches. Accordingly, this provision will be unnecessarily costly to the utilities without an actual security benefit. BPA believes the language in the guidelines on pages 22 and 23 referring to 96 square inch access points needs to be removed from the standard, or: The proposed CIP 006 guidelines need to reflect reasonable dimensions, alternatives and language similar to other CIP standards for example: "The Responsible Entity shall document and implement physical or alternative measures for monitoring openings to the physical security perimeter greater than 150 square inches with no dimension less than 12 inches. The Responsible Entity shall implement one of the following methods:" • Physical measures: Bars, Wire Mesh, etc. Alternative measures: Motion Sensors, Vibration Sensors, Intrusion Detection etc.
No
The guidelines cited in version 5 standards "CIP 006-5 Cyber Security – Physical Security of BES Cyber Systems" Dated November 7, 2011, Page 22 and 23 "Guidelines and Technical Basis" state, in part: "Typically any opening greater than 96 square inches with one side greater than 6 inches in length would be considered an access point into the Defined Physical Boundary." Therefore, BPA votes no. In reference to the guidelines cited above which originated from CAN-0031 referring to "…96 square inches…" as an access point, this is an area of concern for BPA. In an effort to shore up each 96 square inch opening throughout BPA's service area, with either a physical barrier or intrusion detection system, the cost would significantly outweigh the value added for physical security protection. The challenge to utilities should be to prevent physical access to the BES Assets and to not gauge that access opportunity on 96 square inches. Accordingly, this provision will be unnecessarily costly to the utilities without an actual security benefit. BPA believes the language in the guidelines on pages 22 and 23 referring to 96 square inch access points needs to be removed from the standard, or: The proposed CIP 006 guidelines need to reflect reasonable dimensions, alternatives and language similar to other CIP standards for example: "The Responsible Entity shall document and implement physical or alternative measures for monitoring openings to the physical security perimeter greater than 150 square inches with no dimension less than 12 inches. The Responsible Entity shall implement one of the following methods:" • Physical measures: Bars, Wire Mesh, etc. Alternative measures: Motion Sensors, Vibration Sensors, Intrusion Detection etc.
No
Regarding R2, BPA would agree with the following concept: Failing to capture a single required logging data field, would be no violation at all. This is simply a failure to follow procedures rather than a material defect in, or lack of defined process. As an example, all data fields completed except "time of exit" would be no violation. Complete failure to log a visitor would be considered a Moderate violation because insufficient information exists to uniquely identify the visitor.
No
R1.1: The Guidelines state that ports that cannot be disabled are, by definition, needed. Therefore, BPA suggests that R1.1 be reworded to include the bracketed text as follows: • Disable or restrict access to unnecessary logical network accessible ports and document the need for any remaining logical network accessible ports. [If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed necessary]. R1.1 "Measures": CIP-010 R1.1.5 requires that all logical network accessible ports are documented as part of the baseline configuration. BPA is asking for clarification, "Is it expected that Responsible Entities would have different evidence for these two requirements, or would the same evidence suffice?" R1.2 "Measures": The phrase "and screen shots" implies that screen shots are required. BPA recognizes that screen shots are certainly useful, but may not apply to all systems. In addition, this does not follow the explanation in the third paragraph of the "Background" section. BPA suggests rewording the measure to include the bracketed text as: • Evidence may include, but is not limited to: o Documentation stating specific or types of physical input/output ports to restrict, or o [System-generated evidence] or pictures showing the ports restricted either logically through system configuration or physically using a port lock or signage. R1.1 "Guidelines": The guidelines provide additional requirements. BPA believes these requirements should be in the standard, not in the guidelines. BPA believes that Guidelines should be exactly that: a guide to achieving compliance. BPA requests that all the guidelines for CIP-007 be

carefully examined to ensure that no requirements are inadvertently introduced. In addition, to be clear include the full sentence"… blocking ports at a perimeter does not satisfy this requirement" is unnecessary, as the "Applicability" column explicitly applies to devices beyond perimeter devices. BPA suggests replacing the sentence with: • Note that the requirement is applicable to BES Cyber Systems and therefore to the Cyber Assets within those systems. This control is another layer in the defense against network-based attacks, therefore it is the intent that the control be on the device itself.

No

R2.1 "Measures": "The list could be sorted by BES Cyber System or source." BPA believes this sentence is true; in fact the list could be sorted in any of a number of ways, depending on the needs of the entity. BPA believes the standard should not address the sorting of lists. BPA recommends removing the sentence. R2.3: The requirement defines a process, but does not require that the process be followed. The Guidelines for R2.3 establish addition requirements. BPA believes that the remediation process is most appropriately defined in the plans required by R2.2. BPA suggests rewording as follows: Completion of the steps in the remediation plan required in CIP-007 R2.2, including any exceptions for CIP Exceptional Circumstances. R2.2 Guidelines: BPA is concerned about the use of terms such as "…the remediation plan will include a timeframe." This strongly implies a requirement rather than mere guidelines. "…the remediation plan should include a timeframe" is more appropriate. R2.3 Guidelines: BPA believes this guideline establishes numerous requirements: "… that plan must be implemented", "… must be implemented by the timeframe the entity documented …" BPA believes that these requirements are appropriate, but they should be in R2.3 itself, not in the guidelines.

No

R3.1: BPA agrees with and applauds the decision not to require anti-malware tools on every Cyber Asset. However, "BES Cyber System" merely groups Cyber Assets for convenience. Therefore, R3.1 could be still be construed to apply to each Cyber Asset in the BES Cyber System. BPA believes that R3.1 needs to be very explicit. In addition, the Guidelines make it very clear that the Responsible Entity can determine that a particular Cyber Asset or group of Cyber Assets is not susceptible to malware and therefore needs little or no protection. BPA suggests rewording as follows: "For Cyber Assets within the scope of CIP-007 R4.1, and which the Responsible Entity has determined to be susceptible to malware intrusion, deploy method(s) to deter, detect, or prevent malicious code". BPA believes that these need not be deployed on every applicable Cyber Asset, as long as each applicable Cyber Asset is protected. R3.1 "Measures": BPA believes "Measures" should be reworded to incorporate the changes to R3.1. BPA suggests rewording to include the bracketed changes as follows: Evidence may include, but is not limited to: • [Documentation of any determinations that specific Cyber Assets or specific types of Cyber Assets are not susceptible to malware]. • Records of the Responsible Entity's deployment of these methods (i.e. through traditional antivirus, system hardening, policies, etc.). R3.3, "Measures": "Measures" starts "Evidence may include, but is not limited to, (i) current signature or pattern updates, and (ii)…" This does not follow the explanation in the third paragraph of the "Background" section. BPA suggests rewording to include the bracketed changes as follows: Evidence may include, but is not limited to: • Current signature or pattern updates, or • [System-generated evidence showing the configuration of signature], • Pattern updates for automated controls • Work logs showing the signature, or • Pattern updates for manual controls R3.4: Applicability includes Associated Physical Access Control Systems, Associated Electronic Access Control or Monitoring Systems, and Associated Protected Cyber Assets, but excludes Low Impact BES Cyber Systems. Requirement includes all BES Cyber Assets, including Low Impact BES Cyber Assets, but excludes the associated access control systems. It also includes all Protected Cyber Assets, not just Associated Protected Cyber Assets. BPA cannot determine which is correct, but believes that the two lists must be consistent. R3.4: BPA believes the requirement makes no provisions for Transient Cyber Assets for which no anti-malware is available. BPA suspects there may be circumstances when the use of such Transient Cyber Assets is necessary for the reliability of the BES. BPA suggests adding the following to the end of the requirement: For circumstances where such methods are not possible, document (i) Compensating measures taken to reduce the risk to the BES, and (ii) Justification that the risk to the BES of not using the Transient Cyber Asset is greater than the risk of using it without anti-malware protection R3.4 "Measures": Logging connections of Transient Cyber Assets is addressed in R3.5. In addition, it does not address whether adequate methods were deployed. BPA believes it should be removed from the "Measures" for R3.4. Reword measures to add "that show" as bracketed below: Evidence may include, but is not limited to, logs [that show] when Transient Cyber Assets and

removable media were connected to BES Cyber Assets or Protected Cyber Assets, and an inventory of Transient Cyber Assets and the methods used to detect, deter, or prevent malicious code. R3.5: BPA believes the requirement does not address how the connection is made. In particular, depending on the device, it is possible to use Ethernet or serial connections. Serial connections represent a much lower threat but also represent a much lower capability for things such as automated logging. BPA does not know the intent of the drafting team, so BPA cannot offer any suggestions other than to make it clear (either in CIP-007 or in the definitions) whether or not serial connections from a Transient Cyber Asset are within scope. R3.5 “Measures”: Applicability includes Associated Physical Access Control Systems, Associated Electronic Access Control or Monitoring Systems, and Associated Protected Cyber Assets, but excludes Low Impact BES Cyber Systems. Measures section includes all BES Cyber Assets, including Low Impact BES Cyber Assets, but excludes the associated access control systems. It also includes all Protected Cyber Assets, not just Associated Protected Cyber Assets. BPA cannot determine which is correct, but believes that the two lists must be consistent. R3 Guidelines: BPA believes the guidelines require testing of signature updates, despite the lack of any mention of such testing in the requirements. BPA suggests removing the reference in the guidelines.
No
R4.1: BPA had difficulty determining the meaning of the first sentence. In addition, the requirement clearly states a minimum list of event types. BPA believes that there is no need to include “as a minimum”. With or without that phrase, the Responsibility Entity can choose to log additional types of events. Including it in similar situations in the current standards has led to confusion about what is required. BPA has no concerns with the list itself. However, the Guidelines for 4.1 state “It is not the intent that if a device cannot log a particular event that a TFE must be generated.” As presently stated, the requirement does not support this intent. BPA suggests replacing the initial paragraph with the following: Use technical or procedural means to log generated events for identification of, and after-the fact investigations of, BES Cyber Security Incidents. Log each of the types of events shown below that are applicable to and can be logged for the system or device. Document the reason for any event types not being logged. For the purpose of this requirement a Technical Feasibility Exception is not required for systems or devices that cannot log any or all the event types below. BPA believes the “Measures” should also be modified as follows: • Evidence may include, but is not limited to, a paper or system generated documentation of event classes for which the applicable system or asset is configured to generate logs, along with the justification for event types required in R4.1 not being logged. This documentation must address the required event types. R4.2 “Measures”: BPA believes that screen shots may not be applicable to all systems. BPA suggests replacing “Screen-shots” with “System-generated evidence”. In addition, the format conflicts with the explanation in the third paragraph of the “Background” section. BPA suggests rewording “Measures” with changes as bracketed below Evidence may include, but is not limited to, • Paper or system-generated listing of event classes and conditions which necessitate real-time alerts • Assessment documentation or report showing analysis was performed to determine which events the Responsible Entity determines necessitate a real-time alert, or • [System-generated evidence showing] how real-time alerts are configured R4.3: BPA believes this requirement has a fundamental flaw: To satisfy it, Responsible Entities must have a technical or procedural control to monitor the status of the logging system. BPA asks, “What happens if that control itself fails? Must there be another system to monitor the system monitoring logging?” SP800-53 control AU-5, referred to in the Rationale, addresses this first by listing typical causes for logging failure, some of which can be detected easily, and second by allowing the organization to define which events require real-time alerts (Enhancement 2). In addition, despite the explanation in the rationale, the requirement itself does not prohibit a violation for a failure to log. BPA recommends rewording as follows: • Define event logging failures which require prompt notification and correction, either at a Cyber Asset level, Cyber System level, entity level, or in combination. • Detect and initiate a response to such event logging failures before the end of the next calendar day. Logging failures in and of themselves do not constitute violations of R4. R4.3 “Measures”: BPA believes that based on the requirement, the “Measures” should show that the event was detected, and that a response was activated. The proposed “Measures” section does not do that. In particular, (i) Configuration of real-time alerts is a means to detecting a failure, not evidence that a failure was detected. In addition, screen shots are not applicable to all systems. (ii) This requires one of two specific actions. Other actions may be appropriate. In addition, the format conflicts with the explanation in the third paragraph of the “Background” section. BPA suggests replacing (i) and (ii) with: • Documentation demonstrating how and when the failure was detected • Documentation showing when the response to the failure was activated. Examples may include, but are not limited

to, dated records that personnel were dispatched or a work ticket was opened to review and repair logging failures. R4.4: Applicability includes Associated Physical Access Control Systems, Associated Electronic Access Control or Monitoring Systems, and Associated Protected Cyber Assets, but excludes Low Impact BES Cyber Systems. Requirement includes all BES Cyber Systems, including Low Impact BES Cyber Systems, but excludes the associated access control systems and Associated Protected Cyber Assets. BPA cannot determine which is correct, but believes that the two lists must be consistent. R4.4: Despite the rationale for R4.3, BPA believes R4.4 still does not prevent a violation for a failure of the logging system. In particular, a hardware failure of media used to store logs would be a violation. In addition, the phrase "where technically feasible" forces Technical Feasibility Exceptions even in the case of a failure of the logging system. Technical Feasibility Exception should only be needed in the very rare cases of a logging system that is unable to provide for long-term retention of logs. BPA suggests rewording as follows: Unless prevented by a failure of system(s) used for logging, retain BES Cyber System security related event logs identified in 4.1 for at least the last 90 consecutive calendar days. R4.4 "Measures": "Measures" introduces a requirement that entities record what was done to the logs at the end of the 90 days. In many cases logs are removed automatically by the system at the end of some specified retention period. In these cases, there would be no "records of disposition". Furthermore, retention of disposition records should be addressed in data retention, if at all, and not in the "Measures". Finally, BPA believes the format conflicts with the explanation in the third paragraph of the "Background" section. BPA suggests rewording as bracketed below: Evidence may include, but is not limited to: • Security-related event logs from the past ninety days, • [Documentation of the process used to dispose of logs, or] • [Records of disposition of security-related event logs] R4.5: As stated, the requirement does not accommodate reviews in intervals less than two weeks. BPA suggests changing the first sentence to read "…of logged events at intervals of no greater than two weeks to identify…" In addition, the phrasing "sampling of logged events" leaves the possibility of having to review every log, despite the clear indications in the Justification that it is not feasible to review all systems logs. Furthermore, it is not clear whether the Responsible Entity is required to correct the deficiency within one calendar day, or merely begin the response within one calendar day. Also, "any deficiency" implies some type of system failure, when the event types listed in R4.1 all refer to security events involving actual or potential malicious action. Finally, response to logging failures is addressed in R4.3 and should not be addressed here. BPA recommends that the response to a significant event discovered in the review be addressed under CIP-008, not CIP-007. BPA suggests rewording as follows: • Define, document, and implement a process for reviewing security event logs that ensures that (i) Logs are reviewed, either by summarization or by sampling log-by-log or event-by-event, at intervals of no less than two weeks, and (ii) The Responsible Entity's Incident Response Plan, as defined under CIP-008, is initiated before the end of the next calendar day (or within the time constraints of the Incident Response plan, if longer) for any discovery of a potential security event defined under R4.1 of this Standard Perform the actions defined in the process, as applicable. R4.5 "Measures": "Measures", as stated, requires documentation of each of four different actions. Some of the actions may or may not occur. In addition, it is not clear what "documentation describing the review" means. Finally, the format conflicts with the explanation in the third paragraph of the "Background" section. BPA suggests rewording as follows: Evidence may include, but is not limited to; • Documentation describing the review process, • Findings from reviews, or • Signed and dated documentation showing the review occurred R4.1 Guidelines: The paragraph on page 41 states: User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped. The last sentence defines four types of events that must be logged, at least three of which are clearly not within the list in R4.1. This is an extension of the requirements. BPA believes this conflicts with the purpose of guidelines. If the requirements are valid, BPA believes the requirements should be moved to the requirements section. In addition, an earlier paragraph in the Guidelines makes it clear that it is not practical for the Standard to enumerate all events. BPA agrees with that earlier paragraph, and suggests not adding additional events in the Guidelines. Even if the paragraph is left in place (to which BPA is strongly opposed), there are other concerns, as well: • BPA believes "Account management" is not defined. Typically, it includes creation, deletion or changing of accounts or of privileges associated with those accounts. If that is the intent here, it should be stated explicitly. • BPA believes that requiring logging of object access and processes started and stopped will generate voluminous logs, to no real purpose. As an example, an active database can easily generate hundreds

of file accesses per second. There is little utility in logging these, or any other routine object access. BPA believes it makes more sense to log only failed object access or failed process start/stop. R4.2 Guidelines: BPA believes that “Alerts can be configured…” and “The log analysis rules can exist…” appear to be stating additional requirements, in that each sentence provides a closed list of actions. BPA suggests “Typically, alerts are configured…” and “The log analysis rules often exist…” as possible solutions to the issue. R4.3 Guidelines: In order to eliminate the possibility of the Guidelines appearing to expand on the requirements, BPA suggests the second paragraph be rewritten as: • For centralized logging systems, it should noted that if communication goes down between the cyber asset and the logging system, there is no logging failure as long as the cyber asset can store the logs locally for a period of time until the communication comes back up. R4.5 Guidelines: BPA believes the first sentence is unnecessary, as it merely restates the requirement.

No

R5.1: Applicability includes Associated Physical Access Control Systems and Associated Electronic Access Control or Monitoring Systems, but excludes Low Impact BES Cyber Systems. Requirement includes all BES Cyber Systems, but excludes Associated Protected Cyber Assets and the associated access control systems. BPA cannot determine which is correct, but believes that the two lists must be consistent. R5.1: Based on the measures, the Rationale and the Guidelines, the apparent intent of R5 is to address user access only. To clarify this, BPA suggests modifying R5.1 to read “…granting users electronic access…” R5.1 “Measures”: The format conflicts with the explanation in the third paragraph of the “Background” section. BPA suggests modifying “and” to “or” as bracketed below. Evidence may include, but is not limited to: • Documentation describing how users are authenticated before being granted access, [or] • Demonstrations showing authenticated access enforcement of internal and remote paths to the BES Cyber System R5.2: Again, it is not explicitly stated that only user access is relevant. BPA suggests modifying R5.2 and change bracketed text to read “…other generic [user] account types.” R5.4: BPA recognizes that this is the only requirement in the standard that levies requirements on Low Impact BES Cyber Assets. It is also unusual in that it lists Responsible Entities in the “Applicability” section but lists the covered Cyber Assets in the requirement. Furthermore, it will require Technical Feasibility Exceptions that could be avoided. Finally, BPA believes this requires a procedure, but does not require that the procedure be followed. BPA suggests the following: • Applicability: o High Impact BES Cyber Systems o Medium Impact BES Cyber Systems. o Associated Physical Access Control Systems o Associated Electronic Access Control or Monitoring Systems o Associated Protected Cyber Assets Requirement: Define, document, and implement procedural controls for initially changing default passwords, unless - The default password is unique to the device or instance of the application on Cyber Assets or Cyber Systems involved, or: - The device does not allow the passwords to be changed For the purposes of this requirement an inventory of Cyber Assets is not required R5.5.3: The intent of “…or an obligation to the password…” is unclear to BPA and since BPA does not understand the intent of the phrase, BPA cannot suggest a correction. R5.3 Guidelines: This appears to apply to R5.4, not R5.3. In addition, in the first paragraph, “… passwords must be changed …” states a requirement. R5.4 adequately states the requirement. R5.5 Guidelines Table Comments: BPA does not understand all the columns in this table. In particular, BPA is uncertain of the meaning of “Significance of passwords …” and “Existing Service Agreements”. BPA suggest that the table be prefaced with a narrative describing the purpose of each column. In addition: • BPA does not understand the third and fourth entries, third column, reading “Local access path. Individuals must authenticate at an upstream device prior to gaining access.” Several things are not clear to BPA and BPA asks: • Do the two sentences refer to two independent conditions, with either or both being true, or are they both true? • What is an “upstream device”? Why must users authenticate at one? Is this a requirement for proper use of the password, or a technical issue defining when this particular entry is pertinent? • Why are there no other instances of shared passwords? • Fifth entry, third column: Is this a: o Requirement that remote users must authenticate using a different account prior to using the local account o Statement of two alternatives for using passwords, or o Definition of when the entry is applicable?

No

In the last condition for R2, Severe VSL: “except for CIP Exceptional Circumstances” is redundant, in the implementing the remediation plan is not required under those circumstances.

No

BPA believes there is a conflict in statements regarding Applicability - targeted at "All Responsible Entities" for CIP-008 R1.1 thru R3.1. Also in R3.2 thru R3.5 references High and Medium Impact

Cyber Systems. BPA does not does not understand the difference in Applicability; BPA believes it should be one or the other. Various incident response plans will need to be created and maintained. BPA believes this is a good approach both from a cyber security point of view and good business practice. BPA supports R1.0 as written and has no comments or concerns at this time. Add 1.3.4. Definition of process for documentation of allowable deviations from the plan and the documentation of those deviations. BPA supports R1.1 as written and has no comments or concerns at this time. R1.1 Measure: BPA suggests rewording to eliminate redundancy: Suggested Rewording: Evidence may include, but is not limited to, dated copies of BES Cyber Security Incident response plan(s) that include how to identify, classify, and respond to BES Cyber Security Incidents which target the Electronic Security Perimeter or Defined Physical Boundary of a BES Cyber System and covers incidents and that impact the reliability of BES. BPA supports R1.2 as written and has no comments or concerns at this time.
No
While documenting an incident is good business practice, BPA believes the standard should not dictate what evidence needs to be captured during an incident response. The standard should restrict itself to requiring documentation be provided, but the content should be up to the Responsible Entity. Lessons learned documents are valuable for example, but some incidents may be minor and there are no "lessons learned" leaving a requirement to file a Null attestation for compliance. R2.1 BPA believes the requirement needs rewording and BPA suggests that it should be revised: Current wording: "When a BES Cyber Incident occurs the incident response plans must be used when incidents occur and include recording deviations taken from the plan during the incident or test." • Suggested wording: "The incident response plan(s) must be used when a BES Cyber Security Incident occurs or when the incident response plan is exercised. Deviations from the plan must be fully documented in accordance with the plan." Note: The current requirement uses the word "test"; BPA recommends changing "test" to "exercise". R2.1 Measures: BPA believes the wording of the measure should be changed: Current wording: "Evidence may include, but is not limited to, incident reports, logs, and notes that were kept during the incident response process, and documentation that lists and justifies deviations taken from the plan during the incident." • Suggested wording: "Evidence may include, but is not limited to, incident reports, logs, and notes that were kept during the incident response process. Documentation of any deviations taken from the plan during the incident." Note: BPA believes in the measures "…the incident." at the end of the paragraph should be changed to "…incident or exercise". R2.2 Comment: BPA believes the use of the term "implement" at the front of the requirement is unusual. The normal definition is the plan is implemented upon publication; the plan can be invoked through an actual incident or through an exercise. • Suggested wording: Implement the BES Cyber Security Incident Response Plan(s) initially upon the effective date of the standard or before and at least once each calendar year thereafter…"] • Additional wording suggestion to be added: Incident response plans must be used when responding to real incidents or exercises, and must include recording deviations taken from the plan during either a real incident or the exercise. R2.3 BPA believes rewording is needed and suggests that it should be revised: Current wording: "Retain relevant documentation related to reportable BES Cyber Security Incidents for three calendar years." • Suggested wording: "Retain documentation described in the Incident Response Plan related to reportable BES Cyber Security Incidents for three calendar years."
No
R3.1 The current wording requires the Incident Response Plan to be implemented upon the effective date of the standard. BPA believes that could cause some entities to fail compliance if they did not publish their documentation on that exact date. • Suggested wording: o "Review each BES Cyber Security Incident Response Plan for accuracy and completeness o Initially, 30 days prior to the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between reviews and update as necessary." R3.2 and R3.3: BPA believes these requirements are redundant and should be combined. The requirement assumes there will be a need for a revision which may not necessarily the case. BPA suggest that requirement R3.2 be rewritten as follows and that R3 be deleted: • Suggested wording: "Review the results of BES Security Incident response Plan(s) test or actual incident response within thirty calendar days of the execution. o Document any lessons learned within thirty days of the exercise or actual incident o Update the plan within sixty days based on the any changes suggested in the lessons learned document."
Yes
R1 High VSL for R1 states that the plan ".does not communicate the incident to appropriate

organizations." BPA suggests that the VLS be changed to read "…or does not define the internal staff or external organizations that should receive communication of an incident". R2 Replace "test" with "exercise" R1 Guidelines: Comment: The Guidelines establish a definition for "Reportable BES Cyber Security Incident". BPA has issues with that definition: 1. The definition should be identical to the one in the formal CIP V5 Definitions of Terms; the SDT should pick one or the other. 2. The guideline added a new term "response action" with a definition. It also should be cross referenced to the CIP V5 Definitions of Terms. The guidelines also state that a response action can either be "necessary or elective" without defining those terms. They also go on to use "precautionary" as a term that defines elective. BPA believes it is useful to have this guideline, although it may make more sense to move the definitions out of the guideline and into the definitions section while leaving the guidance as is.
No
BPA would vote yes if the words "Initially upon the effective date of the standard" were changed to "within 12 months prior to effective date of the standard. o 18 Months Minimum – The Version 5 CIP Cyber Security Standards shall become effective on the later date: January 1, 2015; or the first calendar day of the seventh calendar quarter after the applicable regulatory approval date. However, if Version 4 CIP Cyber Security Standards do not become effective, Version 3 CIP Cyber Security Standards remain in effect until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan. (Use this format Version # CIP Cyber Security Standards to refer to the complete set of standards rather than the harder to read, takes up more space: CIP-002-3 through CIP-009-3) • Many of the requirements include the words "upon the effective date of the standard". Many recovery plans are already on an annual cycle. Will all recovery plans have to be exercised again, if they have already been tested during the calendar year prior to the effective date of the standard. This wording doesn't really make sense for systems placed into operation after the effective date of the standard. Recommendation: o CIP-009 R2 should be "prior to the effective date of the recovery plan(s) The addition of this new requirement calls for the preservation of data for forensic analysis following all events that trigger the Recovery Plans. If this requirement is implemented as written, it may delay recovery of impacted systems, as our first priority will be data preservation. This may negatively impact system reliability. We can approve this requirement if it states explicitly that recovery cannot be hampered by attempts to preserve data.
No
BPA would vote yes if the words "Initially upon the effective date of the standard" were changed to "within 12 months prior to effective date of the standard.
No
BPA would vote yes if the words "Initially upon the effective date of the standard" were changed to "within 12 months prior to effective date of the standard. Based on forensics and analyses it may take longer than 30 days to determine the cause of a failure. Please clarify if the expectation is that the analyses and updates are required to occur within this 30 day period.
No
BPA would change its position for the VRFs and VSLs if they Included the applicability of the requirements as an element. BPA believes the VRF & VSL should incorporate the risk to the BES Cyber System. As an example, High Impact BES Cyber System violation would result in a higher VRF & VSL. Likewise, a lower impact for applicability would result in a lower VRF &VSL.
No
Concerning R1.1 BPA recognizes that it would be overly burdensome to have to document every piece of software installed on an ACMS server, not just the major applications. There is some latitude available based on "specified grouping", but this continues to be a concern regarding maintaining compliance. We will address this from the "grouping" perspective and thus approve R1.1. Grouping is a software "package" or group of files. It is good requiring the differences in test vs. production to be documented demonstrates awareness that not all entities have test environments that model their production systems. This allows significant latitude that will enable us to remain compliant in the interim while we are working to enhance our test environments.
No
For the majority of programmable electronic devices in the field, especially devices that don't support routable protocols, it will not be technically feasible to monitor for changes to the baseline configuration. BPA assumes we will have to spend a lot of time submitting and managing Technical Feasibility Exceptions (TFEs) for each of these devices which does not increase reliability or cyber

security. BPA would vote yes if this requirement was not required for Medium Impact BES Cyber Systems and Associated Protected Cyber Assets.
No
BPA would vote yes if the words “Initially upon the effective date of the standard” were changed to “within 12 months prior to the effective date of the standard.
No
BPA makes the following recommendation for R2: BPA believes a 30 day window should be established to investigate and resolve the unauthorized change. Require that the unauthorized change be resolved either by formal approval of the change or that the change was backed out. The severity increases to Severe if not resolved after 30 days
No
R1.3: BPA believes the requirement needs to accommodate an initial assessment prior to the effective date of the standard. BPA suggests “Initially upon or no more than 15 months prior to the effective date…” R1.3: BPA believes the standard does not indicate what is meant by “adherence to its BES Cyber System Information protection process.” Reasonable interpretations could include any or all of: 1. Review of all BES Cyber System information to ensure it is properly labeled. 2. Review of a sampling of documents to ensure they are properly labeled. 3. Review of user access authorizations to electronic media storing the information
No
BPA believes that it is correct and true that data may be recovered from some media after erasure. However, it is also true, that for some media, erasure is fully adequate. BPA recommends the following change: Reword the requirement to make allowances for media reuse within the same control zone. In such cases, where the media stays at the same security level, there should be no need to cleanse the media prior to re-use. R2.2: Yes R2.1: There have been varying usages of the term “redeploy” in CIP-007-3 R7. In particular, there have been violations found when a change in an ESP leaves Cyber Assets that were once within an ESP (and therefore subject to CIP-007-3) outside the ESP. BPA suggests the following be added to the end of CIP-011-1 R2.1: This requirement does not apply to instances where the media remains in the Cyber Asset, but the Cyber Asset undergoes a change in status such that CIP-007 R2.1 is no longer applicable. R2 Guidelines: The last paragraph allows for the removal of a BES Cyber System from service to allow analysis of the media. BPA believes it should also point out that it may be appropriate to remove the media from the Cyber Asset to allow off-line analysis, as that would be neither reuse nor disposal.
Yes
Yes
General Comment on the Standards Development Process and Direction: The SDT has done an excellent job in capturing the weaknesses and problems that were included in the previous standards. The move toward a more FISMA/NIST based approach is obvious and should be applauded. However, this raises the question of why we are attempting another intermediate step rather than simply adopting the NIST FIPS and SP documents as our methodology for applying security. NIST has done an exceedingly good job of addressing Cyber Security for Federal systems for decades, and has taken steps to address the world of Industrial Control Systems. These standards and guides are strong yet flexible, allowing for application in many different environments. And the terminology and definitions used are already well understood industry standards. It seems that the scope of this (Version 5) change is broad enough that it would be a small step to skip over it and simply adopt the NIST Cyber Security Standards for our industry.

No
Criteria 2.13 in Attachment 1 is not acceptable because under 1) the functional obligations of TOP and TO is too vague and 2) 300MW of in many cases does not qualify as significant impact. Also 300 MW

of generation should not be equated to 300 MW of UFLS/UVLS. Intent of these criteria is not clear so suggested language is not provided

he definition of BES Cyber Asset has caused confusion. On two recent presentations by the Standards Drafting Team, a clear definition was requested and could not be provided. Given that this is a fundamental definition used in defining other terms and is a core concept of the CIP standards, a clear definition is needed. The definition of BES Cyber Incident contains the word “suspicious”. Recommend a change to “intentional”. The definition of BES Cyber System contains the term Maintenance Cyber Asset, which is not a defined term. Should that be Transient Cyber Asset? The definition of BES

Reliability Operating Services is lengthy and confusing. There is concern that it will be difficult to audit to this definition and that it conflicts with the established bright line criteria. The definition of CIP Exceptional Circumstance should include the word “may” to read “A situation that may involve one or more….” The definition of Control Center does not explicitly include generator control rooms. Is it intended to cover these facilities? If not, does that term need to be defined for greater clarity?
No
No
No
Yes
Yes
No
The areas covered are certainly appropriate to protect BES Cyber Systems, but every entity may not have processes which would be covered by all topics. Should a policy be drafted or language included where a process does not exist?
Yes
Yes
Yes
Yes
Yes
No
Language around this requirement pertaining to which personnel need to be covered is confusing. Rationale discusses personnel who have electronic or unescorted access. Information in table does not specify who should participate in awareness activities. Table specifies that language was “Changed to remove the need to ensure everyone with authorized access receives this awareness”. If all personnel, as opposed to strictly those with authorized access, at a Responsible Entity are covered by this requirement, then that should be specified in the standard.
No
Comment is specific to Part 2.10 of Table R2. Language in the table seems to require training on network connectivity for anyone with access to High and Medium BESCS. For some categories of users (e.g., Operators) this will be both out of context and irrelevant. For some categories (e.g., Network administrators) this will be unnecessary. Recommendation is to strike item 2.10.
Yes
Yes
Yes
Yes
No
Terminations, resignations and transfers all have the same access removal requirement: one business

day. This does not appropriately gauge the level of risk with each. A termination, especially an involuntary one, can expose the Responsible Entity to much more risk than a transfer. Also, how should a Responsible Entity define when the “clock starts”? For a transfer, access may still be needed during the backfill/transition process or even for resource management after the transfer has formally been completed. Also, in the Change Rationale, there is a comment that “the SDT adapted this requirement from NIST 800-53 version 3 to review access authorizations on the date of the transfer” yet the requirement is to revoke access. Reviewing access is not mentioned in the table.
Yes
No
Part 1.1 Requirement is to define controls. Yet the measure requires evidence that the controls have been implemented. The requirement and the measure should be closer in language. Part 1.2 should include only High Impact BES Cyber Systems, not Medium Impact BES Cyber Systems as well. If Medium Impact BES Cyber Systems need more protection than a Low Impact BES Cyber Systems, that protection should be described more specifically. Medium Impact BES Cyber Systems and High Impact BES Cyber Systems seem to get same treatment on this provision. This section also impacts Registered Entities who haven’t had CIP requirements previously. Some of the requirements for Low Impact BES Cyber Systems will have a high paperwork factor and burden. Part 1.5: Measures are very technology-centric around one solution, Intrusion Detection Systems or IDS. Request clarification that IDS is not required and that specific technology isn’t sole means of compliance.
No
Part 2.1 Concept of “Associated Protected Assets” is not well-understood. Clarity needed here. If Associated Protected Assets need a significant level of protection, a more direct approach would be to classify them as Medium Impact BES Cyber Systems or High Impact BES Cyber Systems? Part 2.3: User ID as an authentication method is addressed in other NERC publications and should not be included in the measure for this standard.
No
All the VSLs for this standard are Severe. A Responsible Entity with incomplete documentation is at as much risk for penalty as one with no permissions at an EAP. There should be a level of gradation in the VSL to reflect differences in severity levels. The VSL for CIP-006-5 provides a good example of the appropriate level of VSLs to reflect different degrees of noncompliance.
No
Part 1.2 and Part 1.3 contains language in the Measure of each to track egress, but the language of the standard does not specify this as a requirement. Standard includes language to restrict access (i.e. ingress) to those authorized. Egress language expands the standard and should be removed from the Measure. Part 1.3 also seems to set the stage for an additional number of Technical Feasibility Exceptions (TFEs). One of the goals of CIP Version 5 was to reduce TFEs in place of better security measures. The language “two or more…controls…where technically feasible” will lead to increased TFEs.
Yes
Yes
Yes
The VSL for CIP-006-5 is a good example of defining the appropriate degree of severity for noncompliance with a standard.
No
Part 1.1 indicates that the requirement is applicable to “systems”, but measure focuses on “assets”. Need a system approach if this requirement is intended to be applied at a broader level. The term “BES Cyber Asset” should be removed from measure if the requirement can be applied to “system”.
No
Part 2.1 Addition of “identified source” which can be final approver of patch, such as application vendor, is very helpful to Responsible Entities. Part 2.2 and Part 2.3 use the term “remediation plan”. Need clarification on when a “remediation plan” is needed. Is it required in delay between OS patch

release and vendor approval? When vendor will not approve patch? When there is a vulnerability for which no patch has been released?
No
Part 3.3 requires an update within 30 days. What “starts the clock” on this requirement? Is there an allowance for an approval step from a 3rd party vendor after the OEM has released the signature or pattern update? In some instances, a 3rd party vendor may have to approve prior to a Responsible Entity implementing a release and their delay could cause timing concerns. Part 3.5 requires logging each Transient Cyber Asset connection, but this would be captured in the Configuration Change Management requirements of CIP-010-1. As it is covered elsewhere, it should be removed from this section of the standard.
No
Part 4.1 includes the use of “any” in the list of activities to log. Not all activities require follow up or investigation and that is the purview of CIP-008-5. Specifically, “any” failed login may not be an indication of a problem. Certainly there is a threshold that deserves attention, but the broad use of the term “any” makes this requirement too broad. Part 4.3 sets a timeframe of “before the end of the next calendar day”. This is a very short timeframe. Certainly, logging failure should be addressed, but more time may be needed. Part 4.5 inserts a manual review when automation and alerting, both mentioned previously in the standard are much more effective and reasonable controls. If a Responsible Entity is compliant with Parts 4.1-4.4, then a manual review is a redundant effort which provides no additional security. Recommend that this Part be removed.
No
Requirement 5.5.3 is confusing and unclear, especially the license and service agreement language. Also, the inclusion of “based on the impact level of the BES Cyber System” is not helpful. Recommend that the impact phrase be stricken.
No
The VSLs for this standard are primarily High or Severe. A Responsible Entity with incomplete documentation is at almost as much risk for penalty as one with no implemented controls. There should be a further level of gradation in the VSL to reflect differences in severity levels. The VSL for CIP-006-5 provides a good example of the appropriate level of VSLs to reflect different degrees of noncompliance.
No
Part 1.3, requirement 1.3.3 needs the addition of “BES Cyber Security Incident” to replace the undefined “incident”.
No
Part 2.1, the language regarding “deviations” is confusing. Plans should be written at a high enough level that a Responsible Entity has the flexibility to respond best to their situation. Documenting a deviation does not provide additional security control. Recommend that the deviation language be stricken. Part 2.2 requires a test of a Responsible Entity’s BES Cyber Security Incident Response Plan “initially upon the effective date of the standard”. Is it proposed that if a Responsible Entity has completed a test 5 months prior to the effective date (complying with the “annual not to exceed 15 months” definition) that the Responsible Entity should do an additional retest on or about the effective date of Version 5?
No
Part 3.1 requires a review of a Responsible Entity’s BES Cyber Security Incident Response Plan “initially upon the effective date of the standard”. Is it proposed that if a Responsible Entity has completed a review 5 months prior to the effective date (complying with the “annual not to exceed 15 months” definition) that the Responsible Entity should do an additional review on or about the effective date of Version 5? The timeframes within Requirement 3 vary from 30-60 days. A consistent 60 days for each item would be recommended. Requirement 3.4 does not specify that the technology changes referenced are ones the Responsible Entity has actually implemented. Recommend adding “implemented” prior to “technology changes”.
No
The VSLs for this standard are either High or Severe. A Responsible Entity with incomplete documentation is at as much risk for penalty as one with no implemented controls. There should be a further level of gradation in the VSL to reflect differences in severity levels. The VSL for CIP-006-5

provides a good example of the appropriate level of VSLs to reflect different degrees of noncompliance.
No
The purpose of CIP-009 in all versions has been to provide that a Responsible Entity had adequate recovery plans. However, some CEAs are interpreting this standard to require the full restoration of facilities, including blueprints to rebuild structures. The standard should include language to reinforce the concept of BES system recovery and to specifically exclude full facility restoration. To support the recommendation above, the word “restore” used in R1, Part 1.3 should be changed to “recover” in both Requirement and Measure. Part 1.5 should be stricken. While data preservation is relevant to incident response processes, it is not relevant to recovery efforts.
No
Part 2.1 requires a test of a Responsible Entity’s Recovery Plans “initially upon the effective date of the standard”. Is it proposed that if a Responsible Entity has completed a test 5 months prior to the effective date (complying with the “annual not to exceed 15 months” definition) that the Responsible Entity should do an additional retest on or about the effective date of Version 5? A full operational test of recovery plans as required in Part 2.3 will be burdensome and expensive for smaller entities.
No
A 60 day timeframe for items 3.2-3.4, to be consistent with the recommendation for CIP-008-5, is recommended.
The VSLs for this standard are either High or Severe. A Responsible Entity with incomplete documentation is at as much risk for penalty as one with no implemented controls. There should be a further level of gradation in the VSL to reflect differences in severity levels. The VSL for CIP-006-5 provides a good example of the appropriate level of VSLs to reflect different degrees of noncompliance.
No
Part 1.1 requires a level of detail which is too granular for a baseline. Specifically, scripts and the physical location of a device, while certainly important, are not appropriate for a Change Management baseline. Part 1.2 requires that the CIP Senior Manager approve all changes. However, management approval is what is more appropriate in this instance. Recommend changing language from CIP Senior Manager to simply “Management approval”. Part 1.4 requires that “availability” is tested subsequent to a change. This should be stricken as availability of a BES Cyber System is not under the purview of CIP. Current language of CIP-007-3 R1 is preferable. Part 1.5 is duplicative of Part 1.4. Are Control Centers expected to perform dual testing procedures? This does not add to the security of a Control Center and simply adds additional work. Recommend striking 1.5.
Yes
No
An active vulnerability assessment of test environments as required in Part 3.2 will be burdensome and expensive for smaller entities. Additionally, requiring smaller entities to purchase a vulnerability assessment tool or contract for this service for every install is also burdensome and expensive.
Yes
No
The Measure for Part 1.1 contains the phrase “BES Cyber Security Information” and should be “BES Cyber System Information”.
Yes
No
The VSLs for this standard are either High or Severe. A Responsible Entity with incomplete documentation is at as much risk for penalty as one with no implemented controls. There should be a further level of gradation in the VSL to reflect differences in severity levels. The VSL for CIP-006-5 provides a good example of the appropriate level of VSLs to reflect different degrees of noncompliance.

No
Page 4 contains the phrase “CIP compliance program” yet that term is not defined. Is it intended that a Responsible Entity have a document describing their “CIP compliance program” as a part of their CIP-009-5 recovery documentation?

No
No
The wording of 1.1 is quite tortured, to say the least. It needs to be rewritten so that the action and triggers are clear.
Yes
Yes
Yes
No
CIP-003 R2 requires tracking of both exit and entry, as opposed to (for example) CIP-006 R1.6, which only requires tracking entry. The purpose of exit tracking is unclear, as is the reliability necessity of exit tracking. I would suggest deleting all reference to "egress" in CIP-003.
Yes
Yes
Yes
No
This time period should be lengthened to account for delays in personnel changes. A job search to fill a vacant position, including required background checks, takes significantly longer than 30 days in most cases. Using a 60 or 90 day window would be more appropriate, and would prevent needless paperwork where delegations are changed and then changed again simply to meet a paperwork requirement.
No
VSLs are not logically consistent - not naming a delegate for one function is considered a moderate VSL, but not changing that person within 30 days is a high VSL.
No
As written, the standard would prevent reasonable cyber access by vendors who maintain generator turbine controls. The standard requires 'individuals' to have site-specific cyber training on all aspects of the site security program. Vendors often have many agents who are capable of working on controls, and requiring each individual technician to sit through dozens of training sessions is not practical, nor does it enhance reliability of the BES.
Yes
Yes
No
See response to Q14.

No
See response to Q14.
No
See response to Q14.
No
The wording of this part of the standard should be "the effective day of the termination or resignation". Many individuals give significant notice of resignation, but would be expected to continue in their job function during the time between the resignation and actually leaving the position.
No
If failure to do a criminal background check on a single individual every seven years is a high violation, then not having background checks in the program should not be a moderate violation. Suggest breaking out this requirement so that one individual not having a complete update every seven years is a moderate, two or more a high VSL.
Yes
No
This section is too prescriptive. Cyber communication is a rapidly changing process, and including static requirements threatens to obsolete a standard, given the length of time needed to make changes to standards. Suggest rewording to "Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement processes to mitigate unauthorized access".
Yes
Yes
No
Do not see the reliability gain from requiring exit logging on a "24-hour basis". Note that an individual entered a security perimeter should be sufficient.
No
Use of the electronic devices should be sufficient to demonstrate they are functional without a "test". Standard should be written stating testing is needed only for those security devices not active for a two-year period.
Yes
Yes
Yes
No
Some transient assets will not be under the control of the RE - the equipment used for relay calibrations, for example. There will be problems documenting the history of these assets, and whether they are compliant with this standard.
Yes
No
Password requirements will actually increase the risk to cyber systems, due to human response to strong passwords. The passwords will often be written down, which is the most common way passwords are compromised. Weaker passwords with sufficient bits of entropy will be safer in the long run than requiring 3 character types.
Yes
Yes

No
The RE should have the option of providing training in lieu of a test of the system.
Yes
No
Failure to provide the updated plan to a single individual should not be more severe than not updating a plan when significant faults have been discovered in the plan.
Yes
Yes
Yes
No
Same objection as CIP-008 - failure to notify a single individual of updates is treated as more severe than not updating a plan when faults are discovered.

As criteria 1.4 and 2.13 part 2 read, a Wind Generation Control Center that controls 1500 MW or 300 MW of wind facilities may have associated High or Medium Impact BES Cyber Systems, respectively. Criteria 2.1 and 2.13 should distinguish between controllable generation and intermittent generation sources (i.e. wind and solar), since the loss of intermittent generation facilities happens naturally and regularly and is not viewed as an extreme event. Therefore, if this Control Center or generation's associated BES Cyber Systems are unavailable, degraded, or misused, the impact on the generation should not necessarily be viewed as high or medium impact. There is an overemphasis on Control Center impact versus large generation facilities. For example, a 1400 MW generation facility would only have associated Low Impact BES Cyber Systems (see 2.1), whereas a Control Center that controls 300 MW of generation may have associated Medium Impact BES Cyber Systems (see 2.13 part 2). The only material difference between these two facilities is that the Control Center controls multiple locations of generation, and the generation facility controls one. Part 2 of the Medium Impact criteria (2.13) for Control Centers should either be removed or the MW threshold should be raised

significantly to better match the Medium Impact generation criteria (2.1). Also, the enumeration in 2.13 does not make sense: "Control centers not included in High Impact Rating (H), above, that perform (1) . . , or (2) generation control centers that control 300 MW or more of generation."). The High Impact Generation Operator Control Center criteria (1.4) should be rewritten to clarify whether it is intended to include Control Centers that control one or more generation sites that each generate 1500 MW (2.1), or Control Centers that control a total of more than 1500 MW of generation. The latter meaning is suggested by CIP-002 Version 4 Attachment 1, criteria 1.15.
No
While it is documented within the definition, as referenced in the Rationale for R1 the Senior Management, the requirement that the senior manager have “overall authority and responsibility for leading and managing implementation of the requirements within this set of standards” would benefit from repetition within the R1 requirement itself. Standing alone after the removal of the rationale removal the requirement does not communicate the responsibility adequately.
No
Requirement R2 states that “Each Responsible Entity shall implement one or more documented cyber security policies…" and Measure M2, item 2 states that evidence may include "[r]ecords that indicate the required ten topics were implemented." We would like to see additional clarification of the meaning of the term "implemented". What evidence would be needed to show that the ten topics were "implemented"?
No
There needs to be additional clarity around the timing associated with the reviews and approvals. We believe what is intended is the review by the Responsible Entity and approval by the CIP Senior Manager is a combined event that must be completed initially upon the effective date of the standard and at least once each calendar year thereafter. A proposed content change might be: “Each Responsible Entity shall review each of its cyber security policies and obtain the approval of its CIP Senior Manager, initially upon the effective date of the standard and at least once each calendar year thereafter. For each cyber security policy, the annual review and approval cycle is not to exceed 15 calendar months.”
No
Proposed content change: Each Responsible Entity shall make its cyber security policies readily available to all individuals who have access to BES Cyber Systems or BES Cyber System Information.
Yes
No
The requirement includes a footnote that should be included within the requirement. Proposed content change: Changes to the CIP Senior Manager and any delegations shall be documented within thirty calendar days of the change. Delegations do not need to be reinstated with a change in the CIP Senior Manager position or other position with delegation authority.
No
R4 VSL This language cites a High VSL when ‘not all’ individuals have been made aware of elements of the cyber security policy. This seems to contradict the intent described in the R4 rationale in which ‘it is not the intent of the SDT for the responsible entity to have the burden of proving that each and every individual can access the document.’
No
The Measures for item 1.1 indicates that "Evidence must include the documented security awareness program, and additional evidence to demonstrate that this program was implemented such as, but not limited to, the quarterly reinforcement material that has been distributed." The "must," "and" and "not limited to" (underlined above) could be read to imply that evidence above and beyond quarterly reinforcement material is required as evidence. We recommend the following wording change to clarify that, while the program documentation and some evidence of implementation are required as evidence, there is not a prescriptive requirement for what evidence of implementation must be

provided.. "Evidence must include the documented security awareness program, and additional evidence to demonstrate that this program was implemented. Evidence of implementation may include, but is not limited to, the quarterly reinforcement material that has been distributed and documentation of the mechanism used to communicate the awareness content."
No
The rationale for R2 should be reworded from "…contains the proper policies…" to "…covers the required policies…" R2.6 – Requirement – Proposed word change Original - Training on handling of BES Cyber System Information and storage media. Proposed Change - Training on handling of BES High and Medium Impact Cyber System Information and storage media. Rationale – Rewording supports the applicability section. Since Low Impact Cyber Systems are not applicable, information specific to Low Impact Cyber Systems should not be in scope. R2.2 – Should this specify both cyber and physical security controls or is that "just understood"? R2.3 & R2.4 – Should the wording of the requirement and the measure be the same for both sub-requirements, given that they are addressing the same thing for each type of access control system?
No
R3.2 – requirement wording is confusing. Draft "requires" training "at least once every calendar year but not to exceed 15 calendar months." If it can go to 15 calendar months, then it is NOT required at least every calendar year. Propose re-wording along the lines of, "Training should be completed every calendar year but is required at least every 15 calendar months."
No
4.2 – Retention requirements do not extend beyond 3 years, creating confusion regarding retention of 7-year cycle background checks. Comments: R4.2 – The draft wording allows for gaps in the information required from an individual, as they would not need to provide information on where they lived, worked, or went to school (other than currently) if the duration was less than 6 months. Therefore, if someone moved/changed jobs after less than six months, that information could be excluded from the criminal history check. R4.4 – It is not clear why contractors must be separated out, rather than just having R4 be applicable to all individuals needing the access, regardless of their employer.
Yes
No
R6.1-3,6.4-6 – Propose use of language where access is appropriate for the roles and responsibilities rather than 'minimum necessary'. Comments: R6.3 – The measure, which requires a list of authorized people for BCSI would be problematic, since a person on the list, who owns BCSI, could share that BCSI with someone not on the list but who met all the requirements of R4. "Need to know" can be determined on a dynamic basis, and it would seem to potentially hamper workflow, if someone had to run through a process to show a diagram to someone. [[SSB: this one is a stretch, but not much harm in trying]] R6.5 & R6.6 – Same comment about timeframes as listed in item #15 above.
No
7.1 - There are questions in instances where resignations and/or terminations may be retroactive, which would introduce a challenge with revocation 'at the time of' events. 7.2 – Transfers or reassignments should frame access changes when no longer needed rather than the date of the transfer (as cited in the Measure (i)). The requirement may better address this issue by changing the wording to something like "For reassignments or transfers, review the individual's electronic and physical access to BES Cyber Systems by the end of the next calendar day. Revoke access when it is determined to be no longer needed." 7.3 – Propose use of 'approved BES Medium and High Impact Cyber System Information repositories,' to frame an appropriate location in which information can be managed and controlled.
Yes
No

R1.1 – This appears to address LIBCS & associated PACS; however, R1.2, R1.3 & R1.4 appear to address MIBCS, associated EACMS, associated PCA, but not associated PACS? Is this the intent? R1.2 & R1.3 –These requirements appear to now require the deployment of exit card readers at Medium and High sites – is that the intent? R1.4 – This requirement appears to address only actual access and eliminates access "attempts" – is this the intent? Also, how does this requirement apply to AEACMS or APCA, unless it is because they are required to located within a DPB? R1.6 – The change would make log retention duration 3 years. This is a big issue for video log storage . Also, this would seem to be both for authorized personnel and visitors? Since visitors are addressed in R2, this should probably say something like “Log (…) of individuals authorized unescorted physical access into each DPB….” to maintain consistency with the full definition of an authorized person, since a visitor can be an “authorized” person, they just can’t be unescorted. Also, the requirement does not appear to require tracking the time of entry into a DPB—is this the intent?? R2.2 –Requirement wording change for consideration: “A process requiring manual or automated logging of access by visitors into a DPB, which includes the date and time of first entry and last exit, the visitor’s name, and individual point of contact.”
No
R3 – Is this for commissioning the PACS or the DPB? Also, this would seem to imply that if you performed maintenance on a card reader, it would not need to be part of a later full system test?
Individual

TransAlta Centralia Generation
Yes
1. The criterion 1.4. There is no explanation why a BES Cyber Asset (BES Cyber System) located at the Control Center would have higher impact than another BES Cyber Asset (BES Cyber System) located outside the Control Center. In the case that the above two BES Cyber Assets (BES Cyber Systems), that if rendered unavailable, degraded, or misused, would have impact on the same

facilities identified in the criteria 2.1, 2.3, 2.4, or 2.12 in the same location, then, the impact on the BES would be same no matter where the locations of BES Cyber Assets (BES Cyber Systems) are. For example, an operator console is used solely to control/operate the Blackstart Resources in one location. If it is in a Control Center, it would be categorized as High Impact (criterion 1.4), while if it is outside the Control Center, for example, in a room at the Blackstart Resource's location, it would be categorized as Medium Impact (criterion 2.4). But if this console were rendered unavailable, degraded, or misused, the impact would be the same, i.e. the Blackstart Resources at this location would not be available. This case is different from another case that, if an operator console, located in a Control Center, controls/operates two Blackstart Resources, and these two Blackstart Resources are at two different locations, then the impact would be higher, i.e. affecting two Blackstart Resouces in two different locations, wider area impact. Based on the above argument, it is recommended the following change of the criterion 1.4, "Each Control Center or backup Control Center used to perform the functional obligations of the Generation Operator that includes control of one two or more of the assets identified in criteria 2.1, 2.3, 2.4, or 2.12, below, and these assets are at two or more location." 2. The criterion 1.4 has a reference to 2.12. But the criterion 2.12 is about the UVLS and UFLS. All the UVLS and UFLS standards are not applicable to GO/GOP. Generator Operators do not perform any obligation with UVLS and UFLS. Thus, it is recommended removing 2.12 in the criterion 1.4. 3. The criterion 2.13 (2), generation control centers that control 300MW or more of generation. We do not agree the 300MW number and justification in the guideline and suggest removing this 2.13 (2). The rationales are, a. In the case of a generation control center to control 300 MW, BES Cyber Systems (BES Cyber Assets), if rendered unavailable, degraded, or misused, would have an impact to cause the 300MW generation change. For a single unit of 500MW, its associated BES Cyber Systems (BES Cyber Assets) locally located at the plant, if rendered unavailable, degraded, or misused, would have an impact to cause the 500MW generation change. In the view of generation change, the second one has higher impact than the first one. But according to the criteria, it is opposite. Can the drafting team look at this situation and provide some explanation? b. The guideline says "The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold." We do not agree this statement here. The UVLS and UFLS are the last ditch efforts to save the BES, but the loss of 300 MW generation does not automatically trigger the 300MW load shedding (last ditch efforts). The UVLS and UFSL are triggered by the voltage and frequency, not directly by the generation loss. So the using the 300 MW from UVLS and UFLS is inappropriate for the generation loss. c. For the generation loss, the criterion 2.1 uses 1500MW. This number has been agreed by the industry during the version 4 standard development. In the view of generation loss, the BES Cyber Systems (BES Cyber Assets) in the generation Control Center should be categorized according the criterion 2.1, irrelevant to the BES Cyber System (BES Cyber Assets) location. Thus, there is no need to add a separate criterion to categorize the BES Cyber Systems (BES Cyber Assets) in the generation Control Center.

since there is no place for on general comments, see responses in the to the last question (49) Under "BES Reliability Operating Services" • “Identify and monitor flow gates” under “Managing Constraints” appears to be missing its bullet • Recommend that “Change management” under “Situational Awareness” be clarified to changes in the BES instead of IT change management • Recommend clarification that “Facility” is the NERC Glossary Term -- in “Facility operational data and status” under “Inter-Entity Real-Time Coordination and Communication” o Request clarification on the scope of this “Operational Directives”. Does it include company messaging system? Two way radios? What is the relationship with the new COM-002? o Request clarification that these Coordination and Communications are limited to Reliability not Market Systems • recommend that each BES Reliability Operating Services have a beginning paragraph that clearly associates that service to the BES like the "Dynamic Response to BES Conditions" • For clarity, recommend stating which Functions are associated with each BES Reliability Operating Services instead of forcing everyone to interpret
Yes
HQT recommends that CIP-002-5 allow the use of a risk-based methodology or the bright line criteria stated in Attachment 1to identify critical assets. To ensure consistency within the industry, the methodology used and the results should be subject to approval by a panel of expert (for example, the NPCC TFIST for the NPCC Region and equivalent Task Force for other Regions). HQT also note that inconsistencies may arise from V4 to V5 based on the fact that the concept of Critical assets no longer exist in CIP-002-5. So this is not true to state that “most of these criteria are similar to those approved in version 4” The 15 minutes windows is not a criteria that is repeatable as it may be influenced by system conditions. The following criteria will need to be improved: 2.2 “Net Reactive Power” should be read as “Absolute value of Reactive Power” to consider Static VAR compensator and synchronous condenser 2.3 What means this criteria? How will it apply? 2.7 How a weighted value of a line is related to reliability? The number or the operating voltage are not reliability criteria. IROL, system restoration, voltage control, frequency control, interchange, load/generation balance are reliability criteria to consider.
No
For clarity, request changing R1.1 from “Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation” to “Update the identification and categorization within 30 calendar days when a change to BES Elements and Facilities is placed into operation” For clarity and consistency with the previous change, request changing M1 from “as required in R1 and list of changes to the BES (” to “as required in R1 and list of changes to the BES Elements and Facilities (” R1 : All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification. In CIP-005-5 R1.1 and CIP-006-5 R.1.1, how can we define operational or procedural controls to restrict unauthorized electronic access or physical access if we didn't previously identified those assets either globally or specifically in CIP002-5 R1? R1 should required at least identification of type (or any other logical grouping) of LI BES CA (e.g. RTU-remote terminal unit) R1.1. Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation, that is intended to be in service for more than 6 calendar months and that causes a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category. Transient Cyber Asset definition indicates a connection limit of 30 calendar days and here, we allow something to be considered in a lower impact category if it is intended to be in service for 6 calendar months or less. It seems to have a gap between 30 calendars days and 6 calendar months for these BES Cyber Assets. If these are LI BES CA, they could then easily pass under the radar, possibly not being identified (see previous comment on R1). M1. Evidence of categorization of Low Impact BES Cyber Assets and BES Cyber Systems may be demonstrated by the application of the required controls. Does it mean the controls in CIP-005-5 R1.1 and CIP-006-5 R.1.1 could be used as evidence for CIP-002-5 R1? Isn't it like a circular reference? R1 Should add to R1, identification of "transient cyber assets". TCA could be a major threat source and should be "controlled".

No
For clarity in R2 and M2, request 1) using the term “annual” instead of all these extra words and 2) making “annual” a Glossary term
Yes
No
R1 [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] According to Order on Violation Risk Factors, 119 FERC 61, 145 (May 18, 1907) and Guidelines for Developing Violation Risk Factors and Violation Severity Levels NERC (August 10, 2009), this requirement is administrative in nature, is in a operation planning time frame and if violated, would not be expected to affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES, or under the emergency, abnormal, or restorative conditions anticipated by the preparations, would not be expected to affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. So this VRF should be "Lower" as it is for R3 and R6.
Yes
R2 [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] Efficiency of a policy is not evaluated here. A bad policy is often not better or could be even worse than no policy at all. Thus, violating this requirement should not have a medium factor risk. Should be "Lower" as previous comment on R1… and the same VRF as R3.
Yes
The term “annual” is not used consistently in the Rational, Requirement and Measure. Request a consistent use of “annual” throughout R3.
No
M4’s last bullet on page 12 is inconsistent with R4 since M4 requires periodic training instead of R4’s making staff aware of cyber security policies. Request that M4 be updated to be consistent with R4. M4. Evidence may include, but is not limited to: • Policies are accessible on the corporate Intranet site • Documented records that policies have been provided to contactors where access to BES Cyber Systems is authorized • Policies are posted on company bulletin boards Because policies would be accessible to everyone, particular attention should be taken to be those policies are exempt of BES Cyber System Information.
Yes
No
Requirement has a typo. Footnote 2 is not in superscript. Request clarification that R6 does not require re-delegation when the CIP Senior Manager changes? Request change from “Changes to the CIP Senior Manager and” to “Changes to the CIP Senior Manager or”
Yes
Yes
No
Request clarification of whether personnel with access to only protected information need training / awareness. SDT should include this as additional Requirement Should be able to exclude people using BES cyber system in consultation only and has no impact on the operability of it Recommend removal of R2.3 and R2.4 since they are redundant to R2.2, or explain the difference between R2.2 and (R2.3 and R2.4) Request removing “potential” from R2.7 since training should include how to determine whether a BES System Event occurred or not.
No
R3 Part 3.1 & 3.2 - Applicability High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets R3 Require completion of the training specified in CIP-004-5 R2… where applicability is limited to: - High Impact BES Cyber Systems - Medium Impact BES Cyber Systems So it is useless here to apply it larger. Should have the same "Applicability" for both

R2 and R3.
No
For all R4 table entries, recommend changing “documented risk assessment program” to “documented personnel risk assessment program” to avoid confusion with a corporate risk assessment program. For R4.2 recommend adding language to "grandfather" previous seven-year criminal checks executed for the previous versions of CIP Standards. The additional language should spell out when this "grandfathering" expires, which is also when new check will be required R4 [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] According to Order on Violation Risk Factors, 119 FERC 61, 145 (May 18, 1907) and Guidelines for Developing Violation Risk Factors and Violation Severity Levels NERC (August 10, 2009), this requirement is administrative in nature, is in a operation planning time frame and if violated, would not be expected to affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES, or under the emergency, abnormal, or restorative conditions anticipated by the preparations, would not be expected to affect the electrical state or capability of the BES, or the ability to effectively monitor, control, or restore the BES. Like it is for R6 "Access Management Program", this VRF should be "Lower"
No
For clarity, recommend changing 5.1 from "authorized electronic or unescorted physical" to "authorized electronic or authorized unescorted physical"
No
For R6.1 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “authorize electronic access, except” to “authorize electronic access to BES Cyber Systems, except” 3. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.2 similar comments to R6.1, except that this requirement already refers to “BES Cyber Systems.” 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.3 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber System Information. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.5, Change “minimum necessary” to “minimum that the responsible entity considers necessary”. For R6.6 1. Change “minimum necessary” to “minimum that the responsible entity considers necessary” in the Requirement. 2. In the measure for 6.6, change “BES Cyber System information” to “BES Cyber System Information” – capitalize the “I” in Information. Part 6.1 to part 6.6 – Applicability Associated Protected Cyber Assets Here the definition given in this CIP is too restrictive. Instead, we should used "Protected Cyber Assets" as given in CIP v5 Definition: meaning all cyber asset inside an ESP. R6 Part 6.5 – Requirements : Verify at least once each calendar year, not to exceed 15 calendar months between verifications, that all accounts/account groups or role categories and their specific, associated privileges are correct and the minimum necessary for performing assigned work functions. Before requiring some verification, the Access Management Program should require specification/identification of such accounts/account groups or role categories and their specific, associated privileges are correct and the minimum necessary for performing assigned work functions. R6 Part 6.6 – Requirements : Verify at least once per calendar year, but not to exceed 15 calendar months between verifications, of access privileges to BES Cyber System Information to confirm that access privileges are correct and the minimum necessary for performing assigned work functions.Before requiring some verification, the Access Management Program should require specification/identification of such access privileges are correct and the minimum necessary for performing assigned work functions. R6 Access Management Program Like R4 Personnel Risk Assessment, Program and R5 Personnel Risk Assessment, may be the R6 Access Management Program should be broke in 2 different requirements: "Access Management Program" and Access Management"
No
Request that 7.1's footnote be moved into the Requirement Recommend changing 7.2 to "For an individual, no longer acting in a role requiring unescorted physical access or electronic access to BES Cyber Systems, unescorted physical access and Interactive Remote Access will be removed within the next calendar day." Recommend removing the "following the resignation or termination" since it is redundant and inconsistent with the sibling Requirements Recommend changing 7.4 from "For

resignations or terminations," to "For terminations, resignations, reassignments, or transfers," What about the individual's user accounts on Protected Cyber Asset? It's possible that user have only user accounts on Protected Cyber Asset and any on BEC Cyber Assets. Should be reworded to: For resignations or terminations, revoke the individual's user accounts on Cyber Assets… Recommend changing 7.5 : Here the definition given in this CIP is too restrictive. Instead, we should used "Protected Cyber Assets" as given in CIP v5 Definition: meaning all cyber asset inside an ESP.
Yes
No
Request clarification on the scenario where Low Impact BES Cyber Systems are mixed in the ESP with High/Medium BES Cyber Systems. Is this Low Impact BES Cyber System subject to 1.1 or 1.2? Request clarification that the 1.3 Electronic Access Points is the 1.2 identified Electronic Access Points or not? Request clarification that the 1.5 EAP is the 1.2 identified Electronic Access Point or not? Request clarification on 1.5's "at each EAP". Is that inside or outside or both? Part 1.2 Applicability : High Impact BES Cyber Systems, Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Protected Cyber Assets Should add: "Associated Electronic Access Control or Monitoring Systems Following basic security principles, those cyber assets should have at least the same protection level that the cyber asset that they control. Because proposed revised (see comment) definition of Electronic Cyber Assets used in the access control or monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems exclusive of Electronic Access Point composing the Electronic Security Perimeter", there will have no problems for that cyber asset to be protected by one Electronic Security Perimeter: it is not a fence over the fence situation. We have to keep in mind that AEACMS include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems. 1.1 Change Rationale: Entities are to document perimeter type security controls they have implemented to segment low impact BES Cyber Systems from public or other less trusted network zones and… What is the meaning of less trusted network zones? Is it all other network zones outside an ESP? Does the corporate network a less trusted network zones?
No
Recommend changing 2.1 from "Require an Intermediate Device such that the Cyber Asset initiating Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset." to "Do not allow the Cyber Asset initiating Interactive Remote Access direct access to a BES Cyber System or a Protected Cyber Asset." since the existing Requirement is too prescriptive and does not allow new technology Recommend changing M2.3 from "Note that a UserID is not considered an authentication factor" to "Note that a UserID and password are not considered two authenticating factors" since the existing words are incomplete R2.2 ADD "if technical possible" meaning add the possibility to have a TFE for this requirement. When not possible to have log every day "Real time" systems R2 : hould add another part in R2 –Remote Access Management requiring the Intermediate Device should not be located within ESP. It is implied by definition of "protected cyber asset" are all those asset within the ESP that are not BES cyber asset and by R2.1 where it is specified that a Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset. If ID is implement within the ESP, it should be considered as a PCA and then not directly accessible. If it is not specifically required, then someone could implement the ID within the ESP and there is no violation of any requirement. Should add requirements, guidance or definition about Cyber Assets associated with communication networks and data communication links within Electronic Security Perimeters (like Ethernet switches and routers) because their misconfiguration or unavailability could have a direct impact to BES CA. Their management should be done thru an Associated Electronic Access Control or Monitoring Systems. Should add requirement to "issue real-time alerts (to individuals responsible for response) in response to detected malicious communication at any EAP of a Electronic Security Perimeter", as with CIP-006-5 R1.4, for physical counterpart This is included by CIP-007-5 R4.2, but is it the right place? Should add requirements for logging of electronic access thru EAP of a Electronic Security Perimeter", as with CIP-006-5, R1. 6 for physical counterpart. Partially included by CIP-007-5 R4.3 but is it the right place? Should add requirements for testing of the AEACMS at EAP of a Electronic Security Perimeter to ensure the required functionality is being provided, as with CIP-006-5 R3.1 for physical counterpart Should add requirements for logging dates, time, and duration for failures or outages of access control, logging, and alerting systems of the AEACMS at EAP of an Electronic Security Perimeter to ensure the required functionality is being provided, as with CIP-006-5 R3.2 for physical counterpart.

Yes
No
Request clarification of 1.1 Applicability since it does not identify which of High/Medium/Low BES Impact these are "Associated" with Request that Measure 1.2 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress" Request Requirement 1.2 be updated to allow "escored physical access." Request clarification of Requirement 1.3 "Utilize two or more different and complementary physical access controls" is this multi-factor authentication such as key, badge, keypad or bio-metric? Request that Measure 1.4 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress" Request changing Requirement 1.4 from "Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary. " to "issue real time alerts for detection of breach through an access point" For consistency, recommend removing "applicable" from "protecting applicable BES Cyber Systems" in Requirement 1.6 R1.3 The verification of outbound traffic is considered overkill since must attacked are from inside. For companies that have strong unions it could be difficult to be compliant to this requirement. Part 1.2 Applicability Medium Impact BES Cyber Systems. Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets Should add: Associated Physical Access Control Systems Because definition of Physical Access Control Systems: "Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers." There are no problems for that cyber asset to be protected by one Defined Physical Boundaries: it is not a fence over the fence situation. Part 1.3 Applicability High Impact BES Cyber Systems. Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets Should add: Associated Physical Access Control Systems Because definition of Physical Access Control Systems: "Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers." There are no problems for that cyber asset to be protected by one Defined Physical Boundaries: it is not a fence over the fence situation.
No
Recommend removing "continuous" from "Require continuous escorted access of visitors" so that the Requirement is auditable from Requirement 2.1 Recommend changing 2.2 from "the entry and exit on a per 24-hour basis," to "the entry and exit to the Defined Physical Boundary on a per 24-hour basis, " Part 2.1 Applicability High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets Part 2.1 Requirements Identify a source or sources that are monitored for the release of security related patches, or updates for all software and firmware associated with BES Cyber System or BES Cyber Assets.Applicability column is wider than the requirement that limit the identification of source or sources that are monitored for the release of security related patches, or updates for all software and firmware only to those associated with BES Cyber System or BES Cyber Assets. Should be reworded to remove this limitation to be sure that is applicable to all cyber asset indicated in the column Applicability.
No
Request clarification on what the "Associated" "Applicability" (High/Medium/Low BES Impact) for 3.1 and 3.2 Request capitalization of "locally mounted hardware or devices" in Requirement 3.1 so that it refers back to the defined term "Locally Mounted Hardware or Devices" R3.1: Return to 36 months. Require clarification on maintenance, can a normal maintenance on an appliance can be considered as maintenance.
Yes
No
Request clarification on 1.1, is this at the BES Cyber System level or at the Asset level or can the Entity chose? Request clarification on 1.1, why does the Measure refer to BES Cyber Asset while the Applicability refers to Systems? R1 and R2: ADD “if technical possible” meaning add the possibility to have a TFE for this requirement
No

Request clarification of "remediation" in 2.2 since it reads that the patch must be applied,which does not allow to have an exception when applying the patch is the worse scenario such as creating a denial of service For 2.2, suggest wording like "create a remediation plan or a plan to mitigate the vulnerability if it is determined that the patch cannot be safely applied" What is the intent of CIP Exceptional Circumstances in 2.3? Is it intended to mean deviating from the remediation plan in 2.2? Is the "process for remediation" specific to the patch or the overall process? R1 and R2: ADD “if technical possible” meaning add the possibility to have a TFE for this requirement

No

Request allowances in 3.3 for signatures/pattern updates that cause trouble Recommend changing 3.4 from "Transient Cyber Assets and removable media" to "Transient Cyber Assets or removable media" The Measure for 3.4 does not match the Requirement R3.3: Signature that require “Engine restart may ne require for version. 30 days is short for “Real time systems” and a different delay (longer) for Medium since the High will go first. Part 3.3 – Requirement Update malicious code protections within 30 calendar days of signature or pattern update availability (where the malicious code protections use signatures or patterns). As for R2 Security Patch Management, and demonstrated by event McAfee DAT 5958 (2010-04-22), applying an update of malicious code protection without prior verification of signatures or patterns file could jeopardize the availability or integrity of the control system. This requirement should be reworded to handles the situation where malicious code protections updates can come from an original source (such as an ant-virus vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system. As again R2, timeframe should run from availability from this second source. R3.5: ADD “if technical possible” meaning add the possibility to have a TFE for this requirement. If we have a paper log it does not prove anything. Part 3.5 Requirements Log each Transient Cyber Asset connection. This requirement should be move to CIP-005-5 because it is more related to Electronic Security Perimeter than this CIP more oriented about "system". (see comment in CIP-005-5)

No

Request changing 4.1.4 from "Any detected potential malicious activity" to "Any detected malicious activity" since the scope of potential includes all activities Request clarification on 4.3, does the failure need to be detected within a calendar day? Request the rationale of 4.5's "two weeks". We recommend one month as a compromise between the prior version's 90 days and the suggested one week R4.1.4: Any detected malicious activity is too wide. Need to be clarified (double avec TFIST) R4.3: ADD “if technical possible” meaning add the possibility to have a TFE for this requirement. When not possible to have log every day “Real time” systems We consider it to be not required. 24hr delay is short and too many operational and temporary situation may arise which come back to normal shortly after(24 – 48hrs) R4.5: Every 2 weeks does not match with timeframe of R4.3.When we have automatic events correlation, the 4.5 should not be required every 2 weeks. We suggest 60 days. Part 4.1 Requirements Log generated events for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: Cyber Security Incidents is capitalized here and not defined in "Definitions of Terms Used in Version 5 CIP Cyber Security Standards" but BES Cyber Security Incidents and it seems having some discrepancy between the meanings of these terms. Should be revised. Part 4.1 Requirements 4.1.1. Any detected failed access attempts at Electronic Access Points This requirement should be move to CIP-005-5 because it is more related to Electronic Security Perimeter than this CIP more oriented about "system". (see comment in CIP-005-5) Successful access thru an EAP should be logged too. In fact, it should be reworded to include all inbound and outbound successful or failed access thru an EAP.

No

For 5.2, does the CIP Senior Manager or delegate approval policy or procedure for each authorization of access? In 5.2, should the Requirement be interpreted as "each use" as in "The CIP Senior Manager or delegate must authorize the use of each administrator, shared, default, or other generic account types." Request clarification of 5.5.3, specifically "the significance of passwords in the set of controls used to prevent unauthorized access to the BES Cyber System and existing service agreements, warranties or licenses." R5.5: Why the TFE was removed? ADD “if technical possible” meaning add the possibility to have a TFE for this requirement. When not possible to have log every day “Real time” systems. Part 5.1 Applicability High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or

Monitoring Systems Associated Protected Cyber Assets Part 5.1 Requirements Validate credentials before granting electronic access to each BES Cyber System. Applicability column is wider than the requirement limiting to validate credentials before granting electronic access only to BES Cyber Systems. Should be reworded to remove this limitation to be sure that is applicable to all cyber asset indicated in the column Applicability Part 5.4 Requirements Procedural controls for initially changing default passwords, where technically feasible, unless the default password is unique to the device or instance of the application, on BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets. For the purposes of this requirement an inventory of Cyber Assets is not required. This requirement should be reworded as "BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets" be placed in "Applicability" instead of "All Responsible Entities"
Yes
No
Part 5.1 Applicability High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets Part 5.1 Requirements Validate credentials before granting electronic access to each BES Cyber System. Applicability column is wider than the requirement limiting to validate credentials before granting electronic access only to BES Cyber Systems. Should be reworded to remove this limitation to be sure that is applicable to all cyber asset indicated in the column Applicability Part 5.4 Requirements Procedural controls for initially changing default passwords, where technically feasible, unless the default password is unique to the device or instance of the application, on BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets. For the purposes of this requirement an inventory of Cyber Assets is not required. This requirement should be reworded as "BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets" be placed in "Applicability" instead of "All Responsible Entities"
No
2.1 is a new Requirement. Request the rationale for this new Requirement Recommend changing from "When a BES Cyber Security Incident occurs, the incident response plans must be used when incidents occur and include recording of deviations taken from the plan during the incident or test." to "When a BES Cyber Security Incident is classified or identified, the Responsible Entity must follow its incident response plan." For 2.2, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard"
No
For 3.1, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard" Recommend that 3.2 wording be consistent with the 2.2 wording For 3.3, recommend changing 1) "Update" to "Update as necessary" and 2) "the completion of the review of that plan" to "the completion of the review performed in 3.2"
Yes
No
For 1.3, request clarification of the “protection of information”. Is this integrity, availability or other information protection such as access controls, encryption? For 1.4, request clarification, is this a backup media verification process? If not what is the intent? Recommend removing Requirement 1.5. Reliability's top priority is restoration of service. Forensics in a recovery mode may not support BES reliability and requiring such actions may negatively impact the BES Cyber System restoration process.
Recommend that 2.1 be implemented 180 days from the effective date of the Standard. For 2.1, request clarification , is “full operational exercise” the same as “functional exercise” as described in the rational? For 2.1 and 2.3, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard" For 2.2, request clarification that “any information” may be a sample and not all or each type of information. Does backup media include all media used in the recovery process such as vendor media? What does current configuration mean, as this may never be current? In 2.3, request 1) a definition of “operational exercise” and 2) clarification of “representative

environments". What is the scope, all network devices, systems and items that make up the BES Cyber System? This appears to be a new requirement as paper drill does not appear to be supported. Recommend this shall be implemented 180 days from the effective date of the Standard.
No
For 3.1 recommend 1) removing "or when BES Cyber Systems are replaced" as it addressed in CIP-009 R3.4 and 2) removing "and document any identified deficiencies or lessons learned" as they are addressed in CIP-009 R3.2 and R3.3. For 3.1, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard" Request that 3.3 be updated to be consistent with CIP-008 R3.3 for sixty days. Recommend that 3.4 be referenced by CIP-009 R3.1. Request CIP-008 R3.5 language be consistent with CIP-009 R3.5.
Yes
No
Recommend changing 1.3 to avoid double jeopardy from "Update the baseline configuration and other documentation required by a NERC CIP Standard, including identification and categorization of the BES Cyber Systems, as necessary within 30 calendar days of completing the change." to "Update the baseline configuration as necessary within 30 calendar days of completing the change approved in 1.2." For 1.1, 1.2, 1.3 and 1.4, recommend changing the Requirements to be consistent with their Applicability --- from "For a change to the BES Cyber System" to "For a change to the BES Cyber System or Associated Systems or Associated Assets" Recommend removing "High Impact BES Cyber Systems" from 1.4's Applicability since these are covered by 1.5 which is a higher threshold R1.1.4: We consider that baselines for "scripts" is a little extreme, need clarification on the type of script required R1.1.5: The requirement is redundant and is already documented in CIP-007-5 R1 R1.4.2: Add to this requirement the possibility to add the level of criticality. Not all changes require the verification. Have the possibility to classify the changes by type and level
No
Recommend removing "where technically feasible" from 2.1 since the remaining words should not need an exception
No
For 3.1 and 3.2, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard" Recommend changing 3.2 from "in a production environment." to "in a production environment, or a production environment." to allow Entities more flexibility in meeting this Requirement
Yes
No
Request clarification on 1.1. Some interpret this Requirement as what is the Entity's process for identifying BES Cyber Systems Information. If correct, the Measure should be "show me the methodology (document)." Others interpret these Measures as labeling BES Cyber System Information. For 1.3, see the general comment on "initial bookend" aka "Initially upon the effective date of the standard"
No
Request that footnote 2 in 2.1 be moved into that Requirement R2.2: Suggestion of wording for the requirement " Prior to the disposal of BES Cyber Asset media, the Responsible Entity shall destroy or take action to prevent the unauthorized retrieval of BES Cyber System Information from the media". The objective of this requirement is to ensure that the data is not readable, the use of destroy is a little "over kill"
Yes
No
We understand that the table label Scenario of Unplanned Changes is for unplanned changes after the effective date. If true, the surrounding words should explicitly state so. Otherwise, this Scenario table is confusing because it repeatedly uses 12 months while the earlier text uses 18 months. Since Version 4 is not FERC approved, we are concerned about the possibility of version 4 being effective

while version 5 is in implementation, resulting in version 4 being effective for only a few months. Since there is no place for general comments, we provide them here • We understand that the auditors are not bound by the Measures. Request an explanation on the need for Measures if auditors are not bound by the provided Measures? What is the benefit to these Measures? Should the SDT's time be better invested elsewhere? • Recommend removing the "initial bookend" from the Requirements that specify period because eight activities (CIP-008 2.2, CIP-008 3.1, CIP-009 2.1, CIP-009 2.3, CIP-009 3.1, CIP-010 3.1, CIP-010 3.2, CIP-011 1.3) in these Standards that are unnecessarily burdensome to Entities. Another reason to remove these initial bookends is that the initial bookend's language forces the Entity to be compliant with two Versions of the Standards at the same time. We are not objecting to the initial bookend in other Requirements which are policy-oriented. The effective date should be the start of the period. Initial bookend typically says "Initially upon the effective date of the standard". • Request that Applicability sections of CIP-002-5 – CIP-011-5 be consistent. Note CIP-005-5 and CIP-006-5 sections 4.2.2 are different than other Standards. • Request clarification of the capitalized term "Facilities." Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1, and note this question applies to the Applicability sections of CIP-002-5 – CIP-011-5.
Individual
Annette Johnston
MidAmerican Energy Company
Yes
GENERAL DEFINITIONS COMMENTS: Version 5 proposes retiring three definitions and creating or revising 21 definitions. The NERC request form for development or revision of a definition for a term states the development of new definitions should be avoided unless absolutely necessary. The majority of these changes are not required to address FERC Order 706 directives or improve security and in a number of cases the changes introduce ambiguity instead of clarity. NERC's first annual report to FERC on TFEs was filed in September 2011 and noted that 241 entities had declared Critical Cyber Assets. These entities are complying with all of the CIP standards. Changes in terms require extensive resources to modify existing compliance programs. Proposed changes that are not for a directive and/or don't improve security should not be made. CRITICAL ASSETS and CRITICAL CYBER ASSETS COMMENT: Do not retire Critical Assets or Critical Cyber Assets. MidAmerican Energy supports retaining CIP-002-4, the legacy framework for identification of Critical Cyber Assets and adding impact categorization. Renaming the concept of Critical Cyber Asset serves no security purpose and only increases implementation costs and confusion for personnel trained in and operating CIP programs in place today. MidAmerican Energy supports a separate standard to identify which Critical Cyber Assets are designated as high impact and what additional controls they receive. As a result, Critical Cyber Assets would be either medium or high impact. MidAmerican Energy supports a separate standard to identify low impact Cyber Assets. The standard for lows would not use the term Critical Cyber Asset. PHYSICAL SECURITY PERIMETER COMMENT: Do not retire Physical Security Perimeter. Version 5 renames the term and revised the term's definition. Renaming the term serves no security purpose and is not a directive. It increases implementation costs. If it can be demonstrated that it will not reduce security, the definition for the term could be revised to drop "six-wall" in order to provide more flexibility (without changing the name for the term). BES CYBER ASSET COMMENT: Retain Critical Cyber Asset. Do not create this new definition. FERC Order 706 did not direct changes to Critical Cyber Asset. See Order 706 paragraph 284, where FERC "declined to direct that such a method" (for identifying Critical Cyber Assets) be incorporated in the standards. See also paragraph 285, where FERC "did not find sufficient justification to remove this provision" (Critical Cyber Asset must either have routable protocols or dial-up access). Industry produced a guidance document for identifying Critical Cyber Assets. The proposed definition has many ambiguous terms and references another new, ambiguous definition for BES Reliability Operating Services. Version 5 materials have not identified what delta (or difference in outcome) is intended by the proposed definition versus the existing framework. BES CYBER SECURITY INCIDENT COMMENT: Retain the current definition of Cyber Security Incident. Addition of "BES" in the term name is not a directive, adds no security and increases implementation costs. As commented elsewhere in this question, MidAmerican Energy supports retaining Critical Cyber Asset and Physical Security Perimeter, which are included in the existing definition, and does not support creating the new term of Defined Physical Boundary. BES CYBER SYSTEM COMMENT: MidAmerican Energy supports retaining CIP-002-4 and the legacy framework for identification of Critical Cyber Assets and does not support the CIP-002-5

framework for identification. However, MidAmerican supports the concept of grouping one or more Cyber Assets for flexibility so that some controls can be addressed at a "system" level. If a new definition is created, it should be based on grouping Cyber Assets for purposes of applying security controls at a system level. Do not use "BES." Consider what Cyber Assets can be grouped. The draft definition only included 15 minute impact (BES Cyber Assets) and did not include the option of grouping "Protected Assets." Why not? Aren't there any controls that could be applied to those assets at a "system" level? The concept of excluding Transient Assets from the system is important to retain. BES CYBER SYSTEM INFORMATION COMMENT: The draft definition uses reworded content from CIP-003-4 R4.1 and adds "BES." There is no directive, it does not increase security and does increase implementation costs. MidAmerican can support creating a definition from the CIP-003-4 R4.1 language unchanged. This language is: "The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information." BES RELIABILTY OPERATING SERVICES COMMENT: Drop this draft definition. It is 736 words full of ambiguity and lacking clarity. It creates multiple dependencies on other NERC Glossary terms and other NERC standards. It is not a directive. Version 5 materials have not identified what delta (or difference in outcome) is intended by the proposed definition versus the existing framework or if it improves security. Consideration could be given to comparing the content of the draft definition, the 2009 concept paper, ACTUAL identified Critical Cyber Assets and the NERC guideline to determine if there is a gap or lack of clarity, and the guideline could be revised. CIP EXCEPTIONAL CIRCUMSTANCE COMMENT: Version 4 requirements in CIP-004-4 R2 and R3 refer to specified circumstances such as an emergency. Start the definition with "One or more of the following circumstances, or other conditions of similar nature." CIP SENIOR MANAGER COMMENT: No comment. CONTROL CENTER COMMENT: Delete the bullets for presentation and display of BES reliability or operability data and the bullet as too ambiguous. Delete the bullet for coordination of BES restoration activities as too ambiguous. Clarify the modifying phrases as follows: "two or more transmission facilities at two or more locations or for two or more BES generation facilities at two or more locations where the aggregated generation is 300 MW or more." Ensure substations are not swept in as control centers just due to data concentrators. Revise BES Cyber Asset to Critical Cyber Asset to correspond to retaining CIP-002-4. CYBER ASSETS COMMENT: Keep Cyber Assets revision as it aligns with FERC Order 706 paragraph 285 where FERC "did not find sufficient justification to order the inclusion of communication links." DEFINED PHYSICAL BOUNDARY ("DPB") COMMENT: Do not adopt this definition. See comments on Physical Security Perimeter. ELECTRONIC ACCESS CONTROL OR MONITORING SYSTEMS COMMENT: The name for the term should be Electronic Access Control Systems and drop "monitoring" in the name to be consistent with Physical Access Control Systems. Drop the reference at the end of the definition to "or BES Cyber Systems." In this definition, does monitoring mean alerting and logging? If so, say so in the definition sentence. In other places, version 5 is using "alert" instead of "monitor," for example, in CIP-006 which says "control, alert or log." ELECTRONIC ACCESS POINT ("EAP") COMMENT: MidAmerican does not support the version 5 concept change away from the logical boundary or this definition as drafted. Also, as drafted, the definition lacks the concept of external connectivity and consequently could be applied to identify multiple access points between Cyber Assets within the ESP because some functionality on those Cyber Assets restricts communications between Cyber Assets. Retain the CIP-005-4 ESP logical border concept and electronic access point. If the existing definition is revised, it could be to specify the access point is an interface. It might also be revised to address CIP-005 interpretations. Changes were not, however, directed by 706. EXTERNAL CONNECTIVITY COMMENT: Revise to: "Routable or dial-up data communication through an Electronic Access Point between a Cyber Asset inside the Electronic Security Perimeter and a device external to the Electronic Security Perimeter." EXTERNAL ROUTABLE CONNECTIVITY COMMENT: Revise to: "Routable data communication through an Electronic Access Point between a Cyber Asset inside the Electronic Security Perimeter and a device external to the Electronic Security Perimeter." (Revised to be consistent with External Connectivity.) INTERACTIVE REMOTE ACCESS COMMENT: No comments. INTERMEDIATE DEVICE COMMENT: No comments. PHYSICAL ACCESS CONTROL SYSTEMS COMMENT: Drop Defined Physical Boundary and return to Physical Security Perimeter. PROTECTED CYBER ASSET COMMENT: In versions 1 through 4, these are noncritical. If a definition is created, it should use the existing term of noncritical. "Noncritical Cyber Asset - A Cyber Asset using routable protocol and connected within an Electronic Security Perimeter, excluding Critical Cyber Assets and Transient Cyber

Assets." REPORTABLE BES CYBER SECURITY INCIDENT COMMENT: Comments on this definition are not ready at this time, awaiting the next actions on the revisions to the EOP standard. TRANSIENT CYBER ASSET COMMENT: Refer to Critical Cyber Assets and Noncritical Cyber Assets. Might Transient Cyber Assets also be connected to Electronic Access Control Cyber Assets? "A Cyber Asset that is: 1) directly connected for 30 calendar days or less to a Cyber Asset inside an Electronic Security Perimeter, 2) … and 3)…"
Yes
GENERAL CIP-002 COMMENTS: Retain CIP-002-4 and Attachment I as approved by industry and NERC BOT and recommended to FERC. Accomplish categorization in a separate standard for high impact Cyber Assets and in a separate standard for low impact Cyber Assets. The industry has met FERC Order 706 directives for CIP-002. GENERAL CIP-002-5 ATTACHMENT COMMENTS: The specific delta (or difference in outcome) of the proposed Attachment I changes has not been identified or supported in the version 5 materials.
No
R1 REQUIREMENT COMMENTS: Retain CIP-002-4 and Attachment I as approved by industry and NERC BOT and recommended to FERC. Accomplish categorization in a separate standard for high impact Cyber Assets and in a separate standard for low impact Cyber Assets. The industry has met FERC Order 706 directives for CIP-002.The specific delta (or difference in outcome) of the proposed framework changes has not been identified or supported in the version 5 materials. NERC's first annual report to FERC on TFEs was filed in September 2011 and noted that 241 entities had declared Critical Cyber Assets. These entities are complying with all of the CIP standards. Retaining the version 4 framework allows entities to preserve and leverage investments in versions 1 through 4 and evolve to version 5. There was significant industry opposition to the version 5 framework change in the 2009 concept paper. These concerns continue to be valid today: unclear where to start, too broad, abstract, too complex, does not provide any additional clarity or value versus the current process and does not provide detail as to why the proposed concept is an improvement or will improve reliability. It will increase implementation costs for entities with existing programs. It has the potential to impede timely progress in resolving remaining FERC directives and implementing security improvements in the other CIP standards.
No
R2 REQUIREMENT COMMENTS: Retain CIP-002-4 and Attachment I as approved by industry and NERC BOT and recommended to FERC.
No
This standard has a high VRF that applies to requirements for both high and medium impact asset categories. We recommend a medium VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with proposed revisions to CIP-002 and the VRFs.
No
GENERAL COMMENTS ON CIP-003-5 Most of the changes made to CIP-003 were not directed by FERC Order 706. These changes do not result in improvements to security, and they increase implementation costs for entities with existing programs. MidAmerican Energy suggests the FERC directives be addressed within a structure and language that is more in line with version 4. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these also need revisions to be more in line with our proposed changes to the requirements. See also comments on CIP-010-1 and CIP-011-1. MidAmerican Energy does not support moving CIP-003-4 R6 to the a new CIP-010-1 separate standard. MidAmerican Energy does not support moving CIP-003-4 information protection requirements to the new CIP-011-1 separate standard. This was not directed by FERC, does not improve security and increases implementation costs for entities with fully implemented CIP programs. These requirements could remain within CIP-003-4 and preserve the numbering of the requirements within this standard. We propose the following requirements for CIP-003-5: R1: Cyber Security Policy R2: Leadership R3: Exceptions R4: Information protection The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. EXCEPTION COMMENTS: The V4 to V5 mapping document states that CIP-003-4 R3 Exceptions was deleted because "the FERC Order 706 made clear that you could not take exceptions to the policy." MidAmerican disagrees with this statement. In paragraph 376, FERC directed the ERO to "clarify that

the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards." Further, in paragraph 377, FERC stated "We do not believe that an entity's decision to not follow its cyber security policy in a particular situation should trigger a penalty, as long as no Reliability Standard Requirement (other than Requirement R1 in CIP-003-1) is violated as a result." Paragraphs 372 through 378 include discussion on documentation of exceptions and oversight by the ERO and Regional Entities. While the new term "CIP Exceptional Circumstance" has been introduced in Version 5, its use is limited to three standards (CIP-004, CIP-007 and CIP-010). There are situations outside of these three standards that may require an exception to the cyber security policy. Therefore, MidAmerican suggests going back to the Version 4 language for exceptions and modifying it to meet the FERC directive. R1 REQUIREMENT COMMENT: MidAmerican Energy proposes going back to the language in CIP-003-4 R2 for leadership and making minor modifications to address FERC directives not already addressed.
No
R2 REQUIREMENT COMMENT: MidAmerican Energy proposes going back to the language in CIP-003-4 R1 on the cyber security policy. FERC directed the ERO to provide additional guidance for topics and processes that the cyber security policy should address, but FERC did not direct any changes to the requirement itself. R2 REQUIREMENT PROPOSED REVISED TEXT: "Document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following: * The cyber security policy addresses the CIP standards, including provision for emergency situations; The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets; * Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2."
No
R3 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be deleted, in conjunction with our suggestion to go back to the CIP-003-4 R1 language, which includes the annual review and approval by the senior manager.
No
R4 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be deleted, in conjunction with our suggestion to go back to the CIP-003-4 R1 language, which includes a requirement to make the policy readily available to personnel who have access to Critical Cyber Assets. There was no FERC directive to change this requirement.
No
R5 REQUIREMENT COMMENTS: MidAmerican Energy proposes this requirement be deleted, in conjunction with our suggestion to go back to the CIP-003-4 R2 language, which includes language on delegations. FERC Order 706 did not direct any changes to the requirement. The draft requirement would create an additional administrative burden that does not improve security of the Bulk Electric System and creates a disproportionate amount of bureaucratic work.
No
R6 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be deleted, in conjunction with our suggestion to go back to the CIP-003-4 R2 language, which includes language on changes to the senior manager. FERC Order 706 did not direct any changes to CIP-003-4 R2.2. Proposed changes do not increase security over the current requirement but do increase implementation costs. The current requirement already covers changes to the senior manager that must be documented within thirty calendar days of the effective date.
No
This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with the proposed revised VRFs and other revisions proposed to the requirements. FERC Order RR08-4-000, paragraph 27, states that "as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…" We think some of the CIP-003-5 requirements could have gradated VSLs particularly as most of these requirements have lower Violation Risk Factors.
No
GENERAL COMMENTS ON CIP-004-5 Many of the changes made to CIP-004 were not directed by

FERC Order 706. These changes do not result in improvements to security, and they increase implementation costs for entities with existing programs. MidAmerican Energy suggests the FERC directives be addressed within a structure and language that is more in line with version 4. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. Further, CIP-004-4 states the entity will keep all documentation and records from the previous full calendar year unless directed by the Compliance Enforcement Authority to retain specific evidence for a longer period as part of an investigation. Version 5 expands this to three calendar years without justification. CIP-004 requirements generate a tremendous amount of detail records. The "canned" C.1.2 Evidence Retention section in this standard should be revised to correspond to the current obligation. We propose the following requirements for CIP-004-5: R1: Awareness R2: Training R3: Personnel Risk Assessment R4: Access R1 REQUIREMENT COMMENT: There were no FERC directives to change the language of this requirement. MidAmerican Energy proposes going back to the version 4 language. We would not be opposed to moving the mechanism examples to guidelines. R1 REQUIREMENT PROPOSED REVISED TEXT: "Establish, document, implement and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive ongoing reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms, such as: direct communications (for example, e-mails, memos, computer-based training); indirect communications (for example, posters, intranet, brochures); management support and reinforcement (for example, presentations, meetings)." R1 APPLICABILITY COMMENTS: Revise to medium and high impact assets.

No

R2 REQUIREMENT COMMENTS: Many of the changes made to this requirement were not directed by FERC Order 706. These changes do not result in improvements to security, and they increase implementation costs for entities with existing programs. MidAmerican Energy suggests the FERC directives be addressed within a structure and language that is more in line with version 4. MidAmerican has provided an example of how FERC directives could be incorporated into the version 4 structure. The draft version 5 did not address FERC Order 706, paragraph 435, which directed determination if modifications should be made to assure security trainers are adequately trained themselves. While we do not believe modifications are needed, we think the directive must be addressed somewhere in the draft standard so that FERC is aware of the determination on this directive. R2 REQUIREMENT PROPOSED REVISED TEXT: "R2.1 Establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets so that personnel understand how their actions or inactions could, even inadvertently, affect cyber security of all Cyber Assets within an Electronic Security Perimeter. R2.2 Review the cyber security training program annually, at a minimum, and update whenever necessary. R2.3. Ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency. R2.4. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-5, and include, at a minimum, the following core training elements appropriate to personnel roles and responsibilities: R2.5.1. The proper use of Critical Cyber Assets; R2.5.2. Physical and electronic access controls to Critical Cyber Assets; R2.5.3. The proper handling of Critical Cyber Asset information; R2.5.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident. R2.5.5. Networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of Critical Cyber Assets. R2.6. Maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records."

No

MidAmerican Energy proposes deleting this requirement, in conjunction with the suggested restructuring of R2 back to the version 4 language, since it already is covered.

No

R4 REQUIREMENT COMMENT: FERC Order 706, paragraph 443, directed change to require completion of personnel risk assessments before granting access. This change was made in an earlier version of the standard. There were no other FERC directives for the personnel risk assessment program requirement. We recommend version 4 language and numbering for CIP-004, R3 be retained. This

would mean using one table rather than two. R4 REQUIREMENT PROPOSED REVISED TEXT: (Note: Numbering would become R3) “R3 Document a personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. Conduct a personnel risk assessment pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency. The personnel risk assessment program shall at a minimum include: R3.1. Ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position. R3.2. Update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause. R3.3. Document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-5.”

No

FERC Order 706, paragraph 446, states the ERO should consider the issue of reviewing results of personnel risk assessments (PRA). This was not a directive. MidAmerican Energy would support the addition of criteria or a process for reviewing results of PRAs, but we suggest it be incorporated into the requirement discussed in question #16 (that MidAmerican would renumber to the legacy R3).

No

R6 REQUIREMENT COMMENT: In FERC Order 706, paragraph 381, the Commission stated its intent is to ensure there is a clear line of authority. Order 706 did not direct making the senior manager responsible for everything. We do not support requiring the CIP senior manager or delegate to authorize access as drafted in R6.1, R6.2 and R6.2 or the addition of ambiguity with the phrase “minimum necessary.” The version 5 draft is an additional administrative burden that does not commensurately improve security of the Bulk Electric System and creates a disproportionate amount of bureaucratic work. As mentioned in our comments on CIP-003, we propose retaining the existing V4 language for the leadership requirement. We propose the FERC directive on revocation of access be incorporated into the structure and wording from CIP-004-4 R4. CIP-004-5 R4 REQUIREMENT PROPOSED REVISED TEXT: Note: Under our proposed structure, this would become R4. “R4: Maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets. R4.1. Review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. Ensure access list(s) for contractors and service vendors are properly maintained. R4.2. Revoke such access to Critical Cyber Assets: R4.2.1 at the time of termination for personnel terminated for cause R4.2.2 by the end of the next calendar day for personnel who no longer require such access to Critical Cyber Assets.” MidAmerican Energy does not support CIP-004-5 R6.4, R6.5 and R6.6, which change an annual requirement in CIP-007-4 and makes it a quarterly requirement in version 5. The additional administrative work created is not offset by a commensurate improvement in security.

No

R7 REQUIREMENT COMMENTS: MidAmerican Energy proposes deleting this requirement, in conjunction with the suggested restructuring back to the version CIP-004-4 R4 language, since revocation already is covered.

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with the proposed revised VRFs and revisions proposed to the requirements. FERC Order RR08-4-000, paragraph 27, states that “as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…” We believe most of the CIP-004-5 requirements could have gradated VSLs.

No

GENERAL COMMENTS ON CIP-005-5 The “canned” C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4.

See also comments on CIP-010-1. MidAmerican Energy does support combining the vulnerability assessment requirement from CIP-005-4 with CIP-007-4's vulnerability assessment requirement. GENERAL COMMENTS ON CIP-005-5 R1 While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. R1.1 REQUIREMENT COMMENTS: With our proposal to create a standard for controls that are only applicable to low impact assets/systems, this requirement would be moved to the new low impact standard with the following suggested changes. R1.1 MEASURES COMMENTS: Change "…documented technical and procedural…" to "…documented technical or procedural…" to be consistent with the requirement. R1.2 APPLICABILITY COMMENTS: CIP-005-4 combined with CIP-006-4 R2.2 do not require ESPs for Cyber Assets that authorize and/or log access to the Physical Security Perimeter. MidAmerican Energy does not support expanding the scope to include Associated Physical Access Control Systems. Removing these from scope will also eliminate confusion over the applicability in R1.3-R1.5 R1.2 APPLICABILITY PROPOSED REVISED TEXT: Remove "Associated Physical Access Control Systems." R1.2 REQUIREMENT COMMENTS: As literally written, R1.2 would require traffic between two Cyber Assets inside the ESP to go through an Electronic Access Point. R1.2 does not distinguish that the traffic connecting into the ESP is to go through an Electronic Access Point. Version 5 introduces a concept change that focuses on discrete Electronic Access Points rather than the logical Electronic Security Perimeter in prior versions. This concept change adds confusion and is not an Order 706 directive. MidAmerican does not support the concept change. R1.2 REQUIREMENT PROPOSED REVISED TEXT Use version 4 CIP-005 concepts. Address R1 to ensure that every Critical Cyber Asset resides in an ESP and R1.4 to protect non-critical Cyber Assets in an ESP. R1.3 REQUIREMENT COMMENTS: This requirement appears to combine both R2.1 and R2.2 from legacy. This does not add clarity and is not a directive. Retain legacy concepts. R1.3 REQUIREMENT PROPOSED REVISED TEXT: "Processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified." "At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services." R1.4 REQUIREMENT COMMENTS: Not a directive. May not be increasing security. More prescriptive. Use legacy language. R1.4 REQUIREMENT PROPOSED REVISED TEXT: "The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s)." R1.5 REQUIREMENT COMMENTS: The requirement should be to implement. "At" is not the best preposition, "through" is better. R1.5 REQUIREMENT PROPOSED REVISED TEXT: "Implement a method for detecting malicious communications through Electronic Access Points."

No

CIP-005 R2 GENERAL COMMENTS: Overall, MidAmerican Energy does not believe the proposed Intermediate Device and encryption sub requirements provide enough security benefit to offset the impact on operations. The Intermediate Device and encryption requirements also prescribe "how," not "what," is to be accomplished and do not allow room for alternate controls that could be equally or more effective. Narrow prescriptions in a rapidly changing technology environment obsolesce faster than the standards revision process can update. External routable connectivity is a different attack vector and warrants different treatment from dial up. MidAmerican Energy does not support requirements for dial up in this table. Our comment on CIP-005-5 R1 addresses securing dial up access. R2.1 APPLICABILITY COMMENTS: Add qualifier of External Routable Connectivity. Do not require for dialup. R2.1 APPLICABILITY PROPOSED REVISED TEXT: "High Impact BES Cyber Systems with External Routable Connectivity; Medium Impact BES Cyber Systems with External Routable Connectivity; Associated Protected Cyber Assets with External Routable Connectivity" R2.1 REQUIREMENT COMMENTS: The draft definition of Intermediate Device refers to implementing the functions of an Intermediate Device and includes the very important concept of proxy systems. Revise the text of the requirement to "Implement the functions of an Intermediate Device."(Project 2010-15 CIP-005 also proposed the verb "implement.") This makes it clearer in the requirement that the desired results are the functions of an Intermediate Device, not a device itself. This also aligns with the definition better than "Require an Intermediate Device" since the definition recognizes the functions may be implemented on one or more devices. The Intermediate Device definition as posted excerpt follows for reference: "Intermediate devices are sometimes called proxy systems. The functions of an intermediate device may be implemented on one or more Cyber Assets. The intermediate device may be located outside the Electronic Security Perimeter, as part of the Electronic

Access Point, or in a DMZ network." R2.1 REQUIREMENT PROPOSED REVISED TEXT: "Implement the functions of an Intermediate Device such that the Cyber Asset initiating Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset." R2.2 APPLICABILITY COMMENTS: Add qualifier of External Routable Connectivity. Do not require for dialup. R2.2 APPLICABILITY PROPOSED REVISED TEXT: "High Impact BES Cyber Systems with External Routable Connectivity; Medium Impact BES Cyber Systems with External Routable Connectivity; Associated Protected Cyber Assets with External Routable Connectivity" R2.2 REQUIREMENT COMMENTS: R2.2 is ambiguous on where encryption is required to start and stop. The last version posted for Project 2010-15 CIP-005 R6.2 attempted to address this with the following language: "Implement interactive remote access such that communications between the Cyber Asset initiating interactive remote access and the intermediate device are encrypted … while using a network that is shared with users not associated with the Responsible Entity." Correct "Reference to prior version: CIP-007 R3.1" because that requirement is about ports, not encryption. R2.2 REQUIREMENT PROPOSED REVISED TEXT: "Implement encryption when interactive remote access uses a network that is not associated with the Responsible Entity. Encrypt communications between the Cyber Asset initiating interactive remote access and where the Intermediate Device functions are implemented." R2.3 APPLICABILITY COMMENTS: Add qualifier of External Routable Connectivity. Do not require for dialup. R2.3 APPLICABILITY PROPOSED REVISED TEXT: "High Impact BES Cyber Systems with External Routable Connectivity; Medium Impact BES Cyber Systems with External Routable Connectivity; Associated Protected Cyber Assets with External Routable Connectivity" R2.3 REQUIREMENT COMMENTS: Correct "Reference to prior version: CIP-007 R3.2" because that requirement is about ports. Multi-factor authentication correlates closer to CIP-005-4 R2.4 strong procedural or technical controls at access points to ensure authenticity for external interactive access. R2.3 REQUIREMENT PROPOSED REVISED TEXT: No changes.

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with the revisions proposed for the VRFs and to the requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that "as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…" MidAmerican Energy believes it is possible to have gradated VSLs for many of the CIP-005-5 requirements.

No

CIP-006-5 GENERAL COMMENTS: See also comments on Definitions where we recommend we retain the NERC glossary term Physical Security Perimeter. The change from Physical Security Perimeter to Defined Physical Boundaries creates the need to update numerous procedure documents and physical security drawings, etc. Changing the term does not improve security, but increases costs for 241 entities that have PSPs. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. R1.1 APPLICABILITY COMMENTS: Add Medium Impact BES Cyber Systems with no External Routable Connectivity. R1.1 MEASURES COMMENTS: Change operational "and" procedural to operational "or" procedural to be consistent with the R1.1 requirement. R1.2 APPLICABILITY COMMENTS: Change Medium Impact BES Cyber Systems to Medium Impact BES Cyber Systems with External Routable Connectivity. R1.2 REQUIREMENT COMMENTS: FERC Order 706 didn't direct changes. The proposed changes do not improve security. Delete "that restricts access to only those individuals that are authorized." Access is covered in CIP-004. R1.2 REQUIREMENT PROPOSED REVISED TEXT: "All applicable Critical Cyber Assets shall reside within an identified Physical Security Perimeter. Each Physical Security Perimeter utilizes one or more different physical access control(s), where technically feasible." (Note: Use of the term CCA is recommended in CIP-002 comments.) R1.2 MEASURES COMMENTS: FERC Order 706 didn't direct changes. Current standards do not include controlling egress. R1.2 MEASURES PROPOSED REVISED TEXT: "Evidence may include, but is not limited to, language in the physical security plan that describes how access is controlled." R1.3 APPLICABILITY COMMENTS: "Associated Electronic Access Control or Monitoring Systems" as well as "Associated Protected Cyber Assets" can be read to include devices used for electronic access to a

Medium Impact BES Cyber System or used within a Medium Impact BES Cyber System's Electronic Security Perimeter. This requirement only applies to High Impact BES Cyber Systems. R1.3 APPLICABILITY PROPOSED REVISED TEXT: “High Impact BES Cyber Systems; Electronic Access Control or Monitoring Systems associated with High Impact BES Cyber Systems; Protected Cyber Assets located within a High Impact BES Cyber System Electronic Security Perimeter” R1.3 REQUIREMENT COMMENTS: With our proposal to create a standard for controls that are only applicable to high impact assets/systems, this requirement would be moved to the new high impact standard with the following suggested changes. The phrase "different and complementary" is not clear. R1.3 REQUIREMENT PROPOSED REVISED TEXT: "All applicable Cyber Assets shall reside within an identified Physical Security Perimeter. Each Physical Security Perimeter must utilize two or more different physical access controls, where technically feasible. Physical access controls may be provided by single devices with multiple access control measures." R1.3 MEASURES COMMENTS: FERC Order 706 didn't direct changes. Current standards do not require controlling egress. R1.3 MEASURES PROPOSED REVISED TEXT: "Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * language in the physical security plan that describes how access is controlled, or * physical security perimeter drawings, or * list of physical security perimeters and access points into the PSPs” R1.4 APPLICABILITY COMMENTS: Change Medium Impact BES Cyber Systems to Medium Impact BES Cyber Systems with External Routable Connectivity. R1.4 REQUIREMENT COMMENTS: FERC Order 706 did not direct changes. The proposed changes do not improve security. Change from Physical Security Perimeter to Defined Physical Boundaries increases paperwork and related costs to update procedure documents with no security improvement. R1.4 MEASURES COMMENTS: Change from Physical Security Perimeter to Defined Physical Boundaries increases paperwork and related costs to update procedure documents with no security improvement. Add human observation from CIP-006-3 R5 as other possible alert evidence. R1.4 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * language in the physical security plan that describes the issuance of automated or human observation alerts in response to unauthorized physical access through any access point in a Physical Security Perimeter, or *additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs or other evidence that documents that these alerts were generated” R1.5 APPLICABILITY COMMENTS: Change Medium Impact BES Cyber Systems to Medium Impact BES Cyber Systems with External Routable Connectivity. R1.5 REQUIREMENT COMMENTS: FERC Order 706 didn't direct changes. The proposed changes do not improve security. R 1.5 REQUIREMENT PROPOSED REVISED TEXT: "Immediately alert personnel responsible for a response to unauthorized physical access to Physical Access Control Systems." R1.5 MEASURES COMMENTS: Add human observation from CIP-006-3 R5 as other possible alert evidence. R1.6 APPLICABILITY COMMENTS: Change Medium Impact BES Cyber Systems to Medium Impact BES Cyber Systems with External Routable Connectivity. R1.6 REQUIREMENT COMMENTS: FERC Order did not direct any changes. It is redundant to restate the applicability information. Suggest going back to legacy language. R1.6 REQUIREMENT PROPOSED REVISED TEXT: "Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent: computer logging, video recording or manual logging. Retain physical access logs for at least ninety days." R1.6 MEASURES COMMENTS: FERC Order did not direct any changes. R1.6 MEASURES PROPOSED REVISED TEXT: "Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * language in the physical security plan that describes logging and recording of physical entry into Physical Security Perimeters, or * additional evidence to demonstrate that this logging and recording has been implemented, such as logs of physical access into Physical Security Perimeters that show the date of entry into Physical Security Perimeters."

No

R2.1 REQUIREMENT COMMENTS: FERC Order 706 did not direct changes. The change from Physical Security Perimeter to Defined Physical Boundaries increases paperwork and related costs to update procedure documents with no security improvement. R2.1 REQUIREMENT PROPOSED REVISED TEXT: "Require continuous escorted access of visitors (individuals not authorized for unescorted physical access) within any Physical Security Perimeter." R2.1 MEASURES COMMENTS: FERC Order 706 did not direct changes. The change from Physical Security Perimeter to Defined Physical Boundaries increases paperwork and related costs to update procedure documents with no security improvement.

R2.1 MEASURES PROPOSED REVISED TEXT: "Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * language in a visitor control program that requires continuous escorted access of visitors within Physical Security Perimeters, or * additional evidence to demonstrate that the process was implemented"

No

R3.1 APPLICABILITY COMMENTS: Add language to clarify to which systems the physical access controls are referring. R3.1 APPLICABILITY PROPOSED REVISED TEXT: "Associated Physical Access Control Systems and locally mounted hardware or devices associated with Physical Security Perimeters for High Impact BES Cyber Systems; Medium Impact BES Cyber Systems; Associated Electronic Access Control and Monitoring Systems; and Associated Protected Cyber Assets" R3.1 MEASURES COMMENTS: Delete language that repeats the requirements. R3.1 MEASURES PROPOSED REVISED TEXT: "Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * dated maintenance records, or * other documentation showing testing and maintenance has been performed on each applicable device or system at least once every 24 calendar months." R3.2 APPLICABILITY COMMENTS: Delete "or Monitoring" to match the defined term. R 3.2 APPLICABILITY PROPOSED REVISED TEXT: "Associated Physical Access Control Systems" R3.2 REQUIREMENT COMMENTS: FERC Order 706 did not direct changes to this requirement. Suggest going back to legacy language. R3.2 REQUIREMENT PROPOSED REVISED TEXT: “Retain outage records for a minimum of one calendar year.”

No

The Table of Compliance Elements cites references to sub requirements that appear to be incorrect: Lower – Part 1.7 should point to 1.6; High – Part 1.6 should point to 1.5. R1.4 VRF COMMENT: The VRF for R1 is "Medium." This is not appropriate with R1.5, which is Associated Physical Access Control Systems, or for R1.1, which is Low Impact and Associated Physical Access Control Systems. This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with revisions proposed to the VRFs and requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that “as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…” MidAmerican Energy believes it is possible to have gradated VSLs for many of the CIP-006-5 requirements.

No

CIP-007-5 GENERAL COMMENTS: While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. See also comments on CIP-010-1 and CIP-011-1. MidAmerican Energy does not support moving CIP-007-4 requirements to the new CIP-010-1 separate standard. This was not directed by FERC, does not improve security and increases implementation costs for entities with fully implemented CIP programs. These requirements could remain within CIP-007-4 and preserve the numbering of the requirements within this standard. One exception is that we support combining the vulnerability assessment requirement from CIP-005-4 with CIP-007-4’s vulnerability assessment requirement. The “canned” C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. R1.1 REQUIREMENT COMMENTS: FERC Order 706 didn't direct changes. Requiring documentation of the need for remaining logical network accessible ports is burdensome and does not improve security. "Services" is absent from this requirement. The table heading still shows "Ports and Services." R1.1 REQUIREMENT PROPOSED REVISED TEXT: "Disable or restrict access to unnecessary logical network accessible ports. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed necessary." R1.1 MEASURES COMMENTS: FERC Order 706 didn't direct changes. Requirement revisions require Measures revisions. R1.1 MEASURES PROPOSED REVISED TEXT: Evidence may include, but is not limited to, documentation of how unnecessary logical network accessible ports for Critical Cyber Assets have been disabled. R1.2 REQUIREMENT PROPOSED REVISED TEXT: “Protect against the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media by disabling, restricting or labeling with a sign.” R1.2 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to, documentation of how unnecessary

physical input/output ports have been disabled, restricted either logically through system configuration or physically using a port lock or labeled with a sign.”
No
R2.1 REQUIREMENT COMMENTS: FERC Order 706 did not direct any changes. Clarify monitoring is for "security related" updates to software and firmware, which is comparable to security related patches. 2.1 REQUIREMENT PROPOSED REVISED TEXT: “Identify a source or sources that are monitored for the release of security related patches, or security related updates for all software and firmware associated with BES Cyber System or Critical Cyber Assets.” 2.1 MEASURES COMMENTS: Delete the last sentence regarding list sorting. 2.1 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to, a list of sources that are monitored on an individual BES Cyber System or Critical Cyber Asset basis.” R2.2 REQUIREMENT COMMENTS: Recommend two separate requirements, one for identifying applicable security related updates within 30 days of release and one for creating a remediation plan within 60 days of release unless the security related update is installed within 60 days. If installed within 60 days, the remediation plan is not required. Also add “security-related” before “updates.” 2.2 REQUIREMENT PROPOSED REVISED TEXT: First New Requirement – “Identify applicable security-related patches or security-related updates within 30 days of release from the identified source.” Second New Requirement – “Create a remediation plan, or revise an existing remediation plan, within 60 days of release from the identified source for applicable security-related patches or security-related updates to address vulnerabilities. A remediation plan is not required for security patches or security upgrades installed within 60 days of release from the identified source.” R 2.2 MEASURES COMMENTS: Revised Requirements result in revised Measures. R2.2 MEASURES PROPOSED REVISED TEXT: First New Measure – “Evidence may include, but is not limited to, an assessment conducted by, referenced by, or on behalf of a Registered Entity of security-related patches or security-related updates released by the documented sources.” Second New Measure – “Evidence may include, but is not limited to, a dated remediation plan showing when the vulnerability will be addressed or documentation showing the security-related patches or security-related updates have been installed within 60 days.” R2.3 REQUIREMENT COMMENTS: Change rationale indicates this requirement is for implementation of the remediation plan, subject to exceptions. R2.3 REQUIREMENT PROPOSED REVISED TEXT: “Implement remediation plans, allowing for CIP Exceptional Circumstances.” R2.3 MEASURES COMMENTS: Although the "Background" section states bullets in Measures indicates any one of the bulleted items, not all of them, this needs to be clear in the Measures section to be enforceable. Replace semi-colons with "comma, or" at the end of each bullet.
No
R3.1 REQUIREMENT COMMENTS: The requirements need to be clear on the competency based approach. It is only in the summary of changes and application guidelines. It needs to be in the requirement that is enforceable. Methods do not have to be used on every single Cyber Asset. R3.1 REQUIREMENT PROPOSED REVISED TEXT: "Deploy method(s) to deter, detect, or prevent malicious code based on the Cyber Asset's susceptibility to malware. Methods do not have to be used on every single Cyber Asset." R3.2 REQUIREMENT COMMENTS: Malicious code can be mitigated in various ways depending on many variables. R3.2 REQUIREMENT PROPOSED REVISED TEXT: “Mitigate identified malicious code.” R3.2 MEASURES COMMENTS: Each listed item should be separated by “or”. R3.3 REQUIREMENT COMMENTS: Include testing prior to updating. R3.3 REQUIREMENT PROPOSED REVISED TEXT: “Test and update malicious code protections within 30 calendar days of signature or pattern update availability (where the malicious code protections use signatures or patterns).” R3.3 MEASURES COMMENTS: List of measures should be separated by “comma or.” Limit evidence retention period to 90 days because retaining it for three years becomes burdensome. R3.3 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to, current signature or pattern updates, or screen shots showing the configuration of signature, or pattern updates for automated controls, or work logs showing the signature, or pattern updates for manual controls. Evidence to be retained for 90 days.” R3.4 APPLICABILITY COMMENTS: Remove the Associated Physical Access Control Systems and Associated Electronic Access and Control Monitoring items from the list. Protection is for Transient Cyber Assets and removable media when connected to Medium or High Impact BES Cyber Systems or Protected Cyber Assets according to the proposed version 5 requirements. R3.4 REQUIREMENT COMMENTS: Insert “known” prior to malicious code. It is reasonable to expect entities to protect against known malicious code, which also may protect for some unknown malicious code. However, it is not possible to protect against all unknown malicious

code. Revise the labels to use version 4 descriptions and NERC glossary terms for Critical and noncritical Cyber Assets. There is no security benefit to changing the labels. Changing the labels will be costly for the 241 entities that already have programs and documentation with these terms. R3.4 REQUIREMENT PROPOSED REVISED TEXT: “Deploy method(s) to deter, detect, or prevent known malicious code on Transient Cyber Assets and removable media when connecting them to Medium or High Impact Critical Cyber Assets or Associated Noncritical Cyber Assets.” R3.4 MEASURES COMMENTS: Logs showing when Transient Cyber Assets were connected to Critical Cyber Assets or Noncritical Cyber Assets is in CIP-007-5 R3.5. Also, including it here creates double jeopardy. It should not be included here. R3.4 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to an inventory of Transient Cyber Assets and the methods used to detect, deter, or prevent known malicious code on Transient Cyber Assets and removable media.” R3.5 APPLICABILITY COMMENTS: Delete Associated Physical Access Control Systems and Associated Electronic Access Control or Monitoring Systems because they are not Transient Cyber Asset related. R3.5 REQUIREMENT PROPOSED REVISED TEXT: “Log each Transient Cyber Asset connection to Medium or High Impact Critical Cyber Assets or Associated Noncritical Cyber Assets.” R3.5 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to, logs showing when Transient Cyber Assets were connected to Medium or High Impact Critical Cyber Assets or Associated Noncritical Cyber Assets.”

No

R4.1 REQUIREMENT COMMENTS: FERC Order 706 did not direct changes. The enumerated list is too prescriptive for the requirement. Add to guidelines. See more general requirement for R4.2. R4.1 REQUIREMENT PROPOSED REVISED TEXT: “Log generated events for identification of, and after-the-fact investigations of, Cyber Security Incidents. Devices that cannot log a particular event do not require a TFE to be generated.” R4.1 MEASURES PROPOSED REVISED TEXT “Evidence may include, but is not limited to, a paper or system generated listing of event classes for which the Cyber Asset is configured to generate logs.” R4.2 REQUIREMENT COMMENTS: FERC Order 706 did not require a change; therefore the addition of “real time” is not required. Some assets can log, but cannot alert. R4.2 REQUIREMENT PROPOSED REVISED TEXT: “Generate alerts, where technically feasible, for events that the Responsible Entity determines necessary.” R4.2 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to paper or system generated listing of event classes and conditions that necessitate alerts; assessment documentation or report showing analysis was performed to determine which events the Responsible Entity determines necessitate an alert; screenshots showing how alerts are configured.” R4.3 APPLICABILITY COMMENTS: Delete “with External Routable Connectivity” from Medium Impact BES Cyber Systems. R4.3 REQUIREMENT COMMENTS: FERC Order did not direct a change. Add clarification to timing, “after identification.” R4.3 REQUIREMENT PROPOSED REVISED TEXT: “Activate a response to event logging or alerting failures before the end of the next calendar day after identification.” R4.3 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to: dated event logging failures and screen-shots showing how alerts were configured, or dated records showing that personnel were dispatched or a work ticket was opened to review and repair logging failures.” R4.4 APPLICABILITY COMMENTS: Delete "at Control Centers" from Medium Impact BES Cyber Systems. If this is not deleted, this requirement would not apply to substations, which would decrease security. R4.4 MEASURES COMMENTS: FERC Order 706 did not direct retaining records of disposition of security-related event logs. Retaining records of disposition of security-related event logs beyond 90 days up to the evidence retention period would be burdensome. R4.5 REQUIREMENT COMMENTS: With our proposal to create a standard for controls that are only applicable to high impact assets/systems, this requirement would be moved to the new high impact standard with the following suggested changes. Delete last portion of requirement to activate a response because it is already included in R4.3. Including it in this requirement too would result in double jeopardy. The term “unanticipated” is not needed. R4.5 REQUIREMENT PROPOSED REVISED TEXT: “Review a summarization or sampling of logged events every two weeks to identify Cyber Security Incidents and potential event logging failures.” R4.5 MEASURES COMMENTS: Delete last portion of measure to show personnel were dispatched or a work ticket was opened because it is already included in R4.3. R4.5 MEASURES PROPOSED REVISED TEXT: “Evidence may include, but is not limited to, documentation describing the review, findings from the review (if any), signed and dated documentation showing the review occurred.”

No

R5.1 REQUIREMENT COMMENTS: Need to allow for where technically supported and this is more

specifically addressing electronic user access. R5.1 REQUIREMENT PROPOSED REVISED TEXT: "Validate credentials before granting electronic user access to each BES Cyber System where technically supported." R5.2 REQUIREMENT COMMENTS: Delete because this replicates the CIP-004 access authorization requirements. 5.3 REQUIREMENT COMMENTS: Delete as this would already be included in the CIP-004 access authorization requirements. R5.4 APPLICABILITY COMMENTS: Move list of applicability from Requirements to Applicability. R5.4 APPLICABILITY PROPOSED REVISED TEXT: "High Impact Critical Cyber Assets, Medium Impact Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets." R5.4 REQUIREMENT COMMENTS: It is not necessary to list the applicability in the Requirements section. Provide additional options for controlling default accounts. R5.4 REQUIREMENT PROPOSED REVISED TEXT: "Control default accounts by initially changing default passwords, or removing or disabling the accounts, where technically feasible, unless the default password is unique to the device or instance of the application. For the purposes of this requirement an inventory of Cyber Assets is not required." R5.5 REQUIREMENT COMMENTS: 5.5.1. FERC did not direct a change in password length. Although eight characters increases security over six characters, 10 characters would increase security more than eight characters and so on. Where does one stop? Retain requirement for six character passwords. Passwords would be applied at the asset level instead of system level. R5.5 REQUIREMENT PROPOSED REVISED TEXT: "For password-based user authentication, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is the lesser of at least six characters or the maximum length supported by the Critical Cyber Asset; 5.5.2. Minimum password complexity of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non- alphanumeric) or the maximum complexity supported by the Critical Cyber Asset; 5.5.3. Password change or an obligation to change the password on an entity-specified time frame based on the impact level of the Critical Cyber Asset, the significance of passwords in the set of controls used to prevent unauthorized access to the Critical Cyber Asset and existing service agreements, warranties or licenses." R5.6 REQUIREMENT COMMENTS: This is a new requirement that is not directed by FERC Order 706 and would generate a lot of TFEs without commensurate improvements to security. It overlaps with the alerting requirement and should be deleted.

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with revisions proposed to the VRFs and requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that "as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…" MidAmerican Energy believes it is possible to have gradated VSLs for many of the CIP-007-5 requirements.

No

GENERAL COMMENTS ON CIP-008-5: Most of the changes made to CIP-008 were not directed by FERC Order 706. These changes do not result in improvements to security, and they increase implementation costs for entities with existing programs. We recommend returning to legacy language and structure for CIP-008-5. Suggested text is included below. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. The proposed applicability of "All Responsible Entities" greatly expands the scope CIP-008, which was not directed by FERC. MidAmerican Energy recommends changing the Applicability for all of the CIP-008-5 requirements to High Impact BES Cyber Systems and Medium Impact BES Cyber Systems. The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. R1.1 REQUIREMENT PROPOSED REVISED TEXT: "Develop, maintain and implement a Cyber Security Incident Response Plan that includes the following: 1.1.1 Procedures to characterize and classify events as Reportable Cyber Security Incidents. 1.1.2 Response actions 1.1.3 Roles and responsibilities of Cyber Security Incident response teams 1.1.4 Cyber Security Incident handling procedures 1.1.5 Communication plans" R1.1 REFERENCE: CIP-008-4 R1, R1.1, R1.2, R1.3 R1.1 RATIONALE: There were no FERC directives for revisions. Wording in version 4 is clear and does not need to be changed. R1.2 REQUIREMENT PROPOSED REVISED TEXT: "Follow requirements in EOP-004 to report Reportable Cyber Security

Incidents." R1.2 REFERENCE: CIP-008-4 R1.3 R1.2 RATIONALE: FERC Order 706, paragraphs 673-677, addresses reporting of Cyber Security Incidents, including coordination between CIP-008 and other standards. Most of these FERC directives are being handled by the EOP-004/CIP-001 project. While the reporting requirement is being moved to EOP-004, a reference in this standard is needed. R1.3 REQUIREMENT PROPOSED REVISED TEXT: "Review the Cyber Security Incident response plan at least annually." R1.3 REFERENCE: CIP-008-4 R1.5 R1.3 RATIONALE: There were no FERC directives for revisions. Wording in version 4 is clear and does not need to be changed. R1.4 REQUIREMENT PROPOSED REVISED TEXT: "Update the Cyber Security Incident response plan within thirty calendar days of any organizational or technology changes that impact the plan." R1.4 REFERENCE: CIP-008-4 R1.4 R1.4 RATIONALE: There were no FERC directives for revisions. Additional words were inserted from version 4 language to clarify what changes are included in the requirement.
No
GENERAL COMMENTS ON CIP-008-5 R2: As mentioned in CIP-008-5 R1 comments, most of the changes made to CIP-008 were not directed by FERC Order 706 and do not result in improvements to security. MidAmerican Energy recommends returning to legacy language and structure for CIP-008-5. Suggested text is included below. The proposed applicability of "All Responsible Entities" greatly expands the scope CIP-008, which was not directed by FERC. MidAmerican Energy recommends changing the Applicability for all of the CIP-008-5 requirements to High Impact BES Cyber Systems and Medium Impact BES Cyber Systems. R2.1 REQUIREMENT PROPOSED REVISED TEXT: "Test the Cyber Security Incident response plan at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident. The test should include verification of the list of entities that must be called pursuant to the plan and that the contact numbers are correct." R2.1 REFERENCE: CIP-008-4 R1.6 R2.1 RATIONALE: FERC Order 706, paragraph 687 states CIP-008 should include verification of the list of entities and contact numbers. R2.2 REQUIREMENT PROPOSED REVISED TEXT: "Review the results of the Cyber Security Incident Response Plan(s) test or actual incident response within thirty calendar days of the execution, documenting any lessons learned associated with the response plan." R2.2 REFERENCE: New requirement R2.2 RATIONALE: FERC Order 706, paragraph 686 directs changes to the requirement to include revisions to the plan to address lessons learned. R2.3 REQUIREMENT PROPOSED REVISED TEXT: "Update the Cyber Security Incident response plan based on any documented lessons learned within sixty calendar days of the completion of the review of that plan." R2.3 REFERENCE: New requirement R2.3 RATIONALE: FERC Order 706, paragraph 686 directs changes to the requirement to include revisions to the plan to address lessons learned.
No
R3 REQUIREMENT COMMENTS: Most of the changes made to CIP-008 were not directed by FERC Order 706 and do not result in improvements to security. MidAmerican Energy proposes returning to the version 4 language and structure for CIP-008-5, which incorporates the R3 requirements into R1 and R2. Therefore, R3 would be deleted under our proposal.
No
The proposed VRFs and VSLs should be revised commensurate with revisions proposed to the requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that "as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…" MidAmerican Energy believes it is possible to have gradated VSLs for CIP-008-5. As an example, the VSLs for R1 could include the following. Lower: The Cyber Security Incident response plan was updated more than 30 calendar days but less than 60 calendar days of organizational or technology changes that impacted the plan. Moderate: The Cyber Security Incident response plan was updated more than 60 calendar days but less than 90 calendar days of organizational or technology changes that impacted the plan. High: The Cyber Security Incident response plan was updated more than 90 calendar days but less than 120 calendar days of organizational or technology changes that impacted the plan. Severe: The Cyber Security Incident response plan was updated more 120 calendar days of organizational or technology changes that impacted the plan.
No
PURPOSE STATEMENT COMMENTS: MidAmerican suggests revising the purpose statement to the following: "Standard CIP-009-5 ensures recovery plan(s) are put in place for Critical Cyber Assets." GENERAL COMMENTS ON CIP-009-5: The revised version 5 structure splits backup media

requirements between R1 (recovery plan) and R2 (implementation and testing). We think the FERC directives for CIP-009 can be more effectively addressed within a structure that is closer to version 4. MidAmerican Energy proposes the following requirements: R1 recovery plan (which includes implement); R2 exercise of the recovery plan; R3 backup media; and R4 maintain the recovery plan. Our suggested text and structure are included below. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. The current draft does not include any guidance. We think it is important to include guidance regarding possible ramifications to other NERC standards. For example, event analysis requirements and IRO-001 R3 must be considered if there is a potential delay of restoration to collect forensic data. The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. Column headers above R1.4 and R3.4 are incorrect. The document currently shows "Part" for each column instead of only the first one. R1.1 REQUIREMENT PROPOSED REVISED TEXT: "Create and implement a recovery plan that addresses at a minimum: R1.1.1. Conditions for activation of the recovery plan, and R1.1.2 Roles and responsibilities of responders" R1.1 RATIONALE: There were no FERC directives for this requirement, except for adding implementation. We suggest V4 legacy language, and incorporate implementation as directed. R1.2 REQUIREMENT COMMENT: Delete since this has been incorporated into R1.1. R1.3 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be moved to R3 backup media, under the revised structure mentioned above. R1.4 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be moved to R3 backup media, under the revised structure mentioned above. R1.5 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be moved to R2 exercise of the recovery plan, under the revised structure mentioned above. See comments under R2.

No

R2 REQUIREMENT COMMENTS: This requirement is about exercises and actual incidents. The use of the term "implement" in this requirement is confusing. We suggest implementation be incorporated into R1 to meet the FERC directive, and change this requirement to be more in line with version 4. R2 REQUIREMENT PROPOSED REVISED TEXT: "Each Responsible Entity shall exercise its documented recovery plan(s) to collectively include each of the applicable items in CIP-009-5 Table R2 – Recovery Plan Exercise [Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]" R2.1 REQUIREMENT PROPOSED REVISED TEXT: "Exercise the recovery plan(s) annually. An exercise can range from a paper drill, to a full operational exercise, to recovery from an actual incident." R2.1 RATIONALE: Maintain the version 3 language. R2.2 REQUIREMENT COMMENT: We suggest moving the requirement for testing backup media to R3. R2.3 REQUIREMENT COMMENT This requirement would become R2.2 under our proposed structure. R2.3 REQUIREMENT PROPOSED REVISED TEXT: "Exercise the recovery plan(s) at least every 39 calendar months through an operational exercise of the recovery plans in a representative environment that reflects the production environment. An actual response may substitute for an operational exercise." R2.3 (which becomes R2.2) RATIONALE: We removed text on "initially upon the effective date." This should be incorporated in the implementation plan. R2.3 (which becomes R2.2) APPLICABILITY: This requirement should apply to High Impact BES Cyber Systems only. Associated assets should not be included. PROPOSED R2.3 REQUIREMENT COMMENT: MidAmerican Energy proposes R1.5 be moved to R2.3, since it is associated with events that trigger the recovery plan. PROPOSED R2.3 PROPOSED REVISED TEXT: Preserve data, when it does not impede or restrict system restoration, if necessary to determine the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1. PROPOSED R2.3 RATIONALE: We removed "technically feasible" because the TFE concept does not work with this requirement due to the 60 day safe harbor in the rules of procedure. We revised the requirement to eliminate any conflicts with other reliability standards and event analysis requirements. The focus should be getting the system back up and operational. See paragraph 708 of FERC Order 706, which states: "should not impede or restrict system restoration." We also incorporated the concept "necessary to determine the cause," which is based on FERC's directive, paragraph 710. In some situations, data preservation may not be needed to determine the cause of an event that triggers the recovery plan. PROPOSED R2.3 APPLICABILITY: This is a burdensome new requirement. Therefore, MidAmerican Energy proposes the applicability be limited to High Impact BES Cyber Systems. PROPOSED R2.3 MEASURES: Measures should be bulleted with "ors" and commas.

No

R3 AND R4 GENERAL COMMENTS: Under our proposed structure, all of the requirements in the draft R3 would be moved to a new requirement, R4. Please see R4 below for comments regarding the draft R3.1 to R3.5. R3 REQUIREMENT COMMENT: MidAmerican Energy proposes R3 be a separate requirement for backup storage. Version 3 had two requirements related to backup storage. These had been incorporated into other requirements in the draft V5. R3 REQUIREMENT PROPOSED TEXT: “Each Responsible Entity shall have one or more documented processes that collectively include each of the applicable items in CIP-009-5 R3 - Recovery Plan Backup Media.” R3.1 REQUIREMENT COMMENT: We have moved R1.3 to be R3.1. R3.1 REQUIREMENT PROPOSED REVISED TEXT: “Back up and store information required to successfully restore BES Cyber System functionality. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.” R3.1 RATIONALE: The revised text is based on V3 language. This removes the word "protection" since this is not a FERC directive. The sentence "For example…" from V3 could be moved to measures. R3.2 REQUIREMENT COMMENT: We have moved R2.2 to be R3.2. R3.2 REQUIREMENT PROPOSED REVISED TEXT: “Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.” R3.2 RATIONALE: We propose the version 4 language, since there were no FERC directives to change it. R3.3 REQUIREMENT COMMENT: We have moved R1.4 to be R3.3. R3.3 REQUIREMENT PROPOSED REVISED TEXT: “Verify after significant changes that the backup process for software, data and information required to successfully restore CCAs completed successfully.” R3.3 RATIONALE: Refer to FERC Order 706, paragraph 740, which refers to "significant changes." R3.3 APPLICABILITY COMMENTS: Limit to High Impact BES Cyber Systems due to the burdensome nature of this new requirement. R4 REQUIREMENT COMMENT: Under our proposed structure, R4 would be Recovery Plan Review, Update and Communication. We propose deleting the draft R3.2, since there were no FERC directives to add this as a requirement. We propose deleting the draft R3.4. This is covered in the suggested text from version 4 for R4.2. R4.1 REQUIREMENT COMMENT: We have moved R3.1 to be R4.1. R4.1 REQUIREMENT PROPOSED REVISED TEXT: “Review the recovery plan annually.” R4.1 RATIONALE: There were no FERC directives to change the requirement. Revert to version 4 language. R4.2 REQUIREMENT COMMENT: We have moved R3.3 to be R4.2 R4.2 REQUIREMENT PROPOSED REVISED TEXT: “Update the recovery plan(s) to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident.” R4.2 RATIONALE: There were no FERC directives to change the requirement. Revert to version 4 language. R4.3 REQUIREMENT COMMENT: We have moved R3.5 to be R4.3. R4.3 REQUIREMENT PROPOSED REVISED TEXT: “Communicate updates to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.” R4.3 RATIONALE: There were no FERC directives to change the requirement. Revert to version 4 language.

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with revisions proposed to the VRFs and requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that “as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…” We think some of the CIP-009-5 requirements could have gradated VSLs for CIP-009-5. As an example, the VSLs for R2 as proposed by MidAmerican Energy could include the following. Lower: The recovery plan was exercised more than 39 calendar months but less than 40 calendar months since the previous exercise. Moderate: The recovery plan was exercised more than 40 calendar months but less than 41 calendar months since the previous exercise. High: The recovery plan was exercised more than 41 calendar months but less than 42 calendar months since the previous exercise. Severe: The recovery plan was exercised more than 42 calendar months since the previous exercise.

No

GENERAL COMMENTS ON CIP-0010-5: CIP-010-5 R1 and R2 greatly expand the scope of change control and configuration management beyond what was directed in FERC Order 706. MidAmerican does not support this scope expansion. MidAmerican Energy does not support organizing these requirements into a separate standard. This was not directed by FERC, does not improve security and increases implementation costs for entities with fully implemented CIP programs. These requirements

could remain within their version 4 standard and preserve the numbering of the requirements within those standards. One exception is that we support removing the vulnerability assessment requirement from CIP-005-4 and combining it with CIP-007-4's vulnerability assessment requirement. The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. R1 RATIONALE COMMENTS: The rationale does not address paragraph 399 of FERC Order 706 – having processes in place that permit a reasonably high level of confidence modifications do not have unintended consequence. R1.1 REQUIREMENT COMMENT: The draft requirement is too prescriptive. CIP-003-4 R6 is closer to a results based requirement and provides more flexibility to achieve the desired results. CIP-010-1 R1.1 greatly expands the scope of change control and configuration management (CIP-003-4 R6) beyond what was directed in FERC Order 706. FERC Order 706 paragraphs 397 and 398 directed "modifications to CIP-003-1 R6 to provide an express acknowledgement of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes." The concern was that some form of verification is performed to detect when authorized changes have been made. CIP-010-1 R2.1 addresses Order 706's concern for some form of verification to detect unauthorized changes. FERC also did "not believe the changes will have burdensome consequences." CIP-010-1 R1.1 requires extensive and burdensome details tracking. Effective automated tools for detecting changes (authorized and unauthorized) are available to address Order 706's concern and some of these tools do not require the burdensome, prescriptive details as proposed in R1.1. R1.1 REQUIREMENT PROPOSED REVISED TEXT: "Establish and document a process of change control and configuration management for adding, modifying, replacing or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process." If industry consensus can be achieved, MidAmerican will support requiring authorization of changes, but without the additional bureaucracy as drafted of authorization by the senior manager or delegate. Entities should be able to use their existing corporate change control authorization processes without having to create a CIP-only variation on their standard processes. R1.1 MEASURES COMMENTS: Change the measure to match the revised requirement, such as documentation of the change control process. R1.2 REQUIREMENT COMMENT: FERC Order 706 did not direct authorization by the senior manager or delegate. It directed "express acknowledgement of the need for the change control," which we believe is achieved with the proposed text below. R1.2 REQUIREMENT PROPOSED REVISED TEXT: "Authorize changes to hardware and software components of Critical Cyber Assets." R1.3 REQUIREMENT COMMENT: This requirement should be deleted with our proposal to remove the burdensome requirement for baseline configurations in R1.1. R1.4 REQUIREMENT COMMENT: MidAmerican Energy proposes this requirement be replaced with CIP-007-4 R1. R1.4 REQUIREMENT PROPOSED REVISED TEXT: Ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of this standard, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware. R1.4.1 Implement and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation. R1.4.2 Document that testing is performed in a manner that reflects the production environment. R1.4.3 Document test results. R1.5 REQUIREMENT COMMENT: With our proposal to create a standard for controls that are only applicable to high impact assets/systems, this requirement would be moved to the new high impact standard with the following suggested changes. Delete "results of the testing" from R1.5.2 because it overlaps with R1.4 for highs. Delete and put in guidance: "including a description of the measures used to account for any differences in operation between the test and production environments." R1.5.2 REQUIREMENT PROPOSED REVISED TEXT: "Document the differences between the test environment and the production environment."

No

R2.1 REQUIREMENT COMMENT: MidAmerican Energy is concerned that this requirement creates the possibility of "double jeopardy" for violations with multiple other requirements. As currently written, if an auditor finds a violation for CIP-010-5 R1, the same situation likely would result in a violation of CIP-010-5 R2. The current draft also overlaps with the alerting that is required in CIP-007-5 R4.2 and the investigation that is required by CIP-008. We have provided proposed revised text that addresses the possibility of double jeopardy. We also deleted the words "and document" since documentation is

not providing any improvements to reliability, but increases implementation costs for entities. Effective automated tools for detecting changes (authorized and unauthorized) are available to address Order 706's concern and some of these tools do not require the burdensome, prescriptive details as proposed in R1.1. R2.1 REQUIREMENT PROPOSED REVISED TEXT: "Where technically feasible, detect unauthorized changes to the configuration that have not been alerted under other CIP standards."

No

CIP-010-5 R3 GENERAL COMMENTS: MidAmerican Energy proposes the draft R3 be replaced with combined legacy language from CIP-005-4 R4 and CIP-007 -4 R8, with the following FERC directed additions: • The addition of an entity imposed timeline for completing the already required action plan. • Active vulnerability assessments every three years. MidAmerican generally supports the inclusion of details in guidelines. However, in this case, the current draft of CIP-010-5 R3 has removed too many details from the standard, thus making it a vague standard that introduces the possibility of significant scope expansion that was not directed by FERC. MidAmerican agrees the FERC directed requirement for active vulnerability assessments should be limited to High Impact Critical Cyber Assets. With our proposal to create a standard for controls that are only applicable to high impact assets/systems, R3.2 would be moved to the new high impact standard. MidAmerican would suggest deleting R3.3 since this is covered by the implementation plan.

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with revisions proposed to the VRFs and requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that "as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…" We think some of the CIP-0010-5 requirements could have gradated VSLs.

No

CIP-011 GENERAL COMMENTS: MidAmerican Energy does not support organizing these requirements into a separate standard. This was not directed by FERC, does not improve security and increases implementation costs for entities with fully implemented CIP programs. These requirements could remain within their version 4 standard and preserve the numbering of the requirements within those standards. While we have not provided comments on applicability and measures for every requirement due to the large scale of this project, these would also need revisions to be more in line with our proposed changes to the requirements. The "canned" C.1.2 Evidence Retention section in this standard should be reviewed and revised, as necessary to correspond to the current obligation in version 4. R1 GENERAL COMMENTS: The only FERC directive for information protection was prompt revocation of access to protected information (paragraph 386), which is addressed in CIP-004. There was no FERC directive to move the information protection requirement to a separate standard or to make other changes that increase implementation costs for entities with implemented programs, without any improvements to security. MidAmerican proposes going back to version 4 language and structure for information protection, with two parts instead of three. Proposed text is listed below. R1 REQUIREMENT PROPOSED REVISED TEXT: "Each Responsible Entity shall have one or more documented processes that collectively include each of the applicable items in CIP-011-1 Table R1 – Information Protection. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]" R1.1 APPLICABILITY COMMENTS: Remove Associated Protected Cyber Assets. This was not directed by FERC and is an expansion of scope that does not improve security. R1.1 REQUIREMENT COMMENT: MidAmerican Energy proposes going back to text that is more in line with version 4 language. The SDT is proposing to remove the explicit requirement for classification. The SDT states this does not prevent having multiple levels of classification. However, the legacy language does not require multiple levels of classification. R1.1 REQUIREMENT PROPOSED REVISED TEXT: "Implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets. R1.1.1 The information to be protected shall include the following: Critical Cyber Information operational procedures; lists as required in Standard CIP-002-5; Critical Cyber Information network topology or similar diagrams; floor plans of computing centers that contain Critical Cyber Assets; equipment layouts of Critical Cyber Assets; disaster recovery and incident response plans for Critical Cyber Assets; and Critical Cyber Asset security configuration information. R1.1.2 Information shall be classified based on the sensitivity of the Critical Cyber Asset information." R1.1 MEASURES

PROPOSED REVISED TEXT: “Evidence may include, but is not limited to: (following should be bullets, separated by commas and “ors”) * evidence that physical media is stored in secured locations to prevent unauthorized access, or * evidence that technical measures are in place to prevent unauthorized access to electronic information, or *records of training on information handling procedures” R1.2 APPLICABILITY COMMENTS: Remove Associated Protected Cyber Assets. This was not directed by FERC and is an expansion of scope that does not improve security. R1.2 REQUIREMENT COMMENT: MidAmerican Energy proposes going back to text that is more in line with version 4 language for assessment of the program. R1.2 REQUIREMENT PROPOSED REVISED TEXT: “At least annually assess adherence to the Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.”

No

R2.1 REQUIREMENT COMMENTS: We suggest some minor wording changes to begin the requirement with a verb and clarify that information is being retrieved from the asset. R2.1 REQUIREMENT PROPOSED REVISED TEXT: “Prevent the unauthorized retrieval of Critical Cyber System Information from Critical Cyber Asset media prior to the release of Critical Cyber Asset media for reuse.” R2.2 REQUIREMENT COMMENTS: We suggest some minor wording changes to begin the requirement with a verb and clarify that information is being retrieved from the asset. We suggest incorporating footnote #2 into the requirement or a definition, since a footnote can easily get overlooked. R2.2 REQUIREMENT PROPOSED REVISED TEXT: “Destroy the Critical Cyber Asset media prior to disposal or prevent the unauthorized retrieval of Critical Cyber System Information from Critical Cyber Asset media prior to disposal.”

No

This standard has a medium VRF that applies to requirements for both high and medium impact asset categories. We recommend a lower VRF for the medium impact assets to recognize the difference between asset impact categories. The proposed VSLs should be revised commensurate with revisions proposed to the VRFs and requirements. As recommended in the NERC document VSL_Guidelines_20090817, references should include the Part number. FERC Order RR08-4-000, paragraph 27, states that “as a general rule, gradated VSLs, wherever possible, would be preferable to binary VSLs…” We think some of the CIP-0011-5 requirements could have gradated VSLs.

No

MidAmerican Energy does not believe it is possible to complete the implementation plan in 18 months given the scope and depth of changes contained in the current draft version 5. MidAmerican Energy, like many other entities, has found it complicated and confusing to apply the changes proposed in CIP-002-5. It is not possible to commit to an implementation plan when not sure of the entire scope of proposed changes. The number of changes required for CIP-003 through CIP-011 also makes it difficult to achieve the proposed implementation timeline. About 80 percent of the changes are not directed by FERC Order 706. Several of these changes are administratively burdensome with limited, if any, security improvement. The proposed changes for existing definition terms, such as Physical Security Perimeter and Critical Cyber Assets, also extends the time it takes to implement the number of changes needed in procedure documents, training materials, facility diagrams, etc. MidAmerican Energy suggests an alternative approach to create the opportunity to achieve a quicker implementation, particularly for high and medium impact Critical Cyber Assets. The approach builds on the work completed by the drafting team and on the CIP-002-4 standard already approved by the industry. MidAmerican Energy recommends retaining CIP-002-4 as approved by the industry in 2010. This version is filed with FERC. Industry and NERC comments on the FERC NOPR recommend FERC approval. This will eliminate the confusing and complicated process to identify BES Cyber Systems proposed in version 5. Retaining CIP-002-4 will meet FERC Order 706 directives regarding CIP-002. FERC 706 directives for CIP-002 are met by using industry approved guidance documents for identifying Critical Assets and Critical Cyber Assets, see paragraphs 253-258 and 270-273. CIP-002-4 aligns with FERC’s affirmation that the applicable responsible entities are responsible for identifying Critical Assets, see paragraphs 319-321. Also, CIP-002-2 added senior manager approval of risk-based methodology, see paragraphs 294-297. Excerpts from paragraphs 284 and 285 indicate FERC is not looking for changes to CIP-002. Paragraph 284 states, “…there is no formally accepted method for identifying critical cyber assets before us at this time … we decline to direct that such a method be incorporated into the CIP Reliability Standards at this time.” Paragraph 285 says, “CIP-002-1 provides that a critical cyber asset must either have routable protocols or dial up access … We do not find

sufficient justification to remove this provision at this time." Building on the categorization concept, we recommend development of two new standards, one for those requirements applicable only to high impact assets and one for those requirements applicable only to low impact assets. The new standards would use CIP-002-4 to categorize Critical Assets and Critical Cyber Assets into the high and low impact levels. The new "high only" standard would group the eight extra protections for only high impact assets (not medium or low) identified in the current draft of version 5. This separate standard on requirements applicable only to high impact assets provides an opportunity for a separate implementation timeline for the additional controls that apply only to high impact assets. This new standard provides flexibility in adjusting controls on high impact assets. In the future, only one standard has to be modified for these extra requirements on high impact assets. Also, entities that do not have high impact assets will not have to sort through this new standard and reliability standard audit worksheet to assure compliance and security. CIP version 5 introduces several new controls for low impact assets not directed by FERC Order 706 or included in the standard authorization request. The resulting scope expansion is not supported by many in the industry and will likely slow down the process to approve the new CIP 5 standards. A new "low only" standard would group those requirements applicable only to low impact assets (not high or medium.) This new separate standard can be commented and voted on in parallel with the efforts listed above without impacting the schedule to meet FERC Order 706. The new standard provides full transparency in the stakeholder process. It allows separate discussion on the cost and compliance concerns with low impact assets. Also the standard allows for a separate implementation schedule for low impact assets so changes for high and medium impact assets can be completed first. The vast majority of the drafted requirements in CIP-003 through CIP-011 remain in place. However, they should be adjusted to meet the changes described in the requirements comments to: 1 - include any changes necessary to address all of the applicable FERC directives and 2 - include security improvements not directed by FERC that are known to have significant industry support. Retain version 4 language for requirements that do not meet one of these two criteria (not a directive or not an industry established security improvement). Additional implementation notes: When the time comes, MidAmerican would propose an implementation date different than Jan. 1 due to resource issues at year-end. There are 36 references to "initially upon the effective date of the standard and at least once each calendar year" (or similar language) throughout the draft standards. All of these references should be eliminated from within the standard and incorporated into the implementation plan. This ensures the effective dates of the requirements are clearly spelled out for the initial implementation of the standard, as well as for newly identified assets. The industry (not this drafting team) should consider a standard authorization request to create a NERC Glossary term for the definition of annual and retire CAN-010. There could be another opportunity to positively impact the timeframe. Any improvements to TFEs prior to implementing version 4 and version 5 would lessen the impact of these transitions. NERC's first annual TFE report to FERC was filed in September 2011. It identified 3,998 approved TFEs of which 2,814 or 71 percent were approved on the basis of "not technically possible." Industry (not an expectation for this drafting team) working with NERC and FERC should determine if a NERC Rules of Procedures revision for TFEs can be supported. Could a rules of procedure change be achieved in time to alleviate some implementation burden for both registered entities and regional entities for version 4? For example, could some administrative overhead be reduced for the 71 percent that are not technically possible?

On an 11/15/2100 NERC webinar regarding V5, a presenter indicated Large Control Centers were those owned by an RC, BA, or TOP but not by a GO or GOP. Slides 18 and 29 seem to support this. However, Attachment 1, Section 1.4 seemingly contradicts the webinar information by indicating a GOP's Control Center can be a High Rating. Suggest deleting Section 1.4 and let GOP Control Centers get picked up in Section 2.13. Also, please clarify in Attachment 1, Section 1.4 (if not deleted) and 2.13 that a generating station's Control Room is not considered a Control Center in accordance with Version 5.

No
Recommend consistency with R2 and do it annually not-to-exceed 15 months.

BES Cyber System – Maintenance Cyber Asset is not defined, suggest changing to Transient Cyber Asset. BES Cyber System Information – (1) Security procedures should not be on the list because it creates a conflict between CIP-011-1 that restricts access to the information and CIP-003-5 and CIP-004-5 that require general training and dissemination of those procedures. (2) BES Cyber System Impact is not defined. BES Reliability Operating Services – under Dynamic Response to BES Conditions, suggest adding Excitation Response. Under Balancing Load and Generation – suggest removing unit commitment since it will not meet the 15 minute window and it is an operations planning function and not a real-time operating service. CIP Exceptional Circumstance should include imminent danger to a BES Facility as a condition. CIP Senior Manager – the definition should exclude CIP-001, at least until it is retired with Project 2009-01 Control Center – (1) We assume that a Control Center is only a Control Center as used by a BA, TOP, GOP or RC. The definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” For clarity, we suggest adding this clarity to the definition. (2) The use of the word “facilities” in a fashion that does not mean “Facilities” will lead to confusion and ambiguity, especially since “facilities” is used later in the same sentence as meaning “Facilities”. I suggest: “One or more sites hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation Facilities or transmission Facilities, at two or more locations”. Facilities should also be capitalized in the first bullet. Defined Physical Border is ambiguous. Specifically, are all spacial dimensions, horizontal and vertical, to be established as part of the boundary? In other words, it seems like the “roof” may no longer be required, e.g., 5 walls instead of 6 walls, but, vertical dimension requirements of walls / fences are ambiguous.
No
I believe that a fourth category of risk impact be developed, a “De Minimus Impact” category that would consist of otherwise Low Impact BES Cyber Assets but that do not have routable protocol or dial-up access. I understand that there is concern about Low Impact BES Cyber Assets due to the risk of a coordinated attack. A coordinated attack is much more likely to BES Cyber Assets that have routable protocol or dial-up access than to those BES Cyber Assets with no connectivity. It is much more difficult and impractical to attempt a coordinated attack on BES Cyber Assets without connectivity. Recognizing this difference in both difficulty level and Low Impact (in other words, it wouldn’t be worth the effort because other attack vectors with similar levels of difficulty would have more impact), we propose adding a fourth impact category, De Minimus Impact. I would propose that these De Minimus Risk BES Cyber Assets would not need to comply with the CIP standards because the costs would be unjustified. Bullet 1.2, a Control Center for any BA, even very small ones, being High risk is inappropriate. For instance, the entire load or supply of a small BA would fit into the “noise” of a large BA for supply and demand mismatch. Suggest changing 1.2 to parallel 1.3, e.g., a BA Control Center that includes control of one or more of the assets identified in criteria 2.1, 2.3, 2.4 and 2.12. Bullet 2.13 could then be used to accommodate smaller BAs Bullet 1.3, Transmission

Owners do not have Control Centers and should be struck from the bullet, e.g., the definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” Bullet 2.5, “Facilities” should be changed to “Elements”. The cranking path is not necessarily part of the BES. Bullet 2.6, is an autotransformer of 500 kV to 230 kV included? Bullet 2.7 is inconsistent in its terminology, switching between “Facility” and “Lines”. It seems that “Line” is intended. The focus also seems to be “at a single station or substation” where the focus ought to be a single BES Cyber Asset / System that controls multiple Lines. I suggest changing the first sentence of 2.7 to read: “Multiple Transmission Lines operating at 200 kV or higher, but less than 500 kV, where the total weighted value of all BES Transmission Lines whose Reliability Operating Services would be adversely impacted within 15 minutes if a single BES Cyber Asset / System is rendered unavailable, degraded or misused exceeds a value of 3,000.” Bullets 2.8 and 2.9, the phrase “at a single station or substation location” does not seem to add any value and can be a source of ambiguity. I suggest striking the phrase. Bullet 2.12, the 300 MW bright-line seems arbitrary (albeit carried over from prior versions). In general, the system is more tolerant to loss of load than loss of generation and the 300 MW seems out of proportion with 2.1 of 1500 MW. The reasoning applied in the Application Guideline is flawed. UVLS and UFLS are only last ditch efforts if other events have already caused the system to be on the edge. So, how is that different from 2.1 if the system is already on the edge? The focus should be on how a malicious user can cause an Adverse Reliability Impact; hence, I suggest 1500 MW instead of 300 MW. Bullet 2.13, (1) Transmission Owners do not have Control Centers and should be struck from the bullet, e.g., the definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” (2) The term “control centers” should be capitalized in the phrase “generation control centers” to make it clear that it refers to the defined term “Control Center” In the application guidelines, when discussing the BES Reliability Operating Services, the bullets have associated with them the functional entity that typically provides those services. However, there are exceptions and the guidelines ought to reflect those exceptions; for instance, a TO may also provide UFLS. Also in the application guidelines, the word “facilities” is used in a fashion that does not mean “Facilities”, which creates ambiguity and confusion (e.g., Facilities by definition is part of the BES, whereas assets owned and operated by DPs and LSEs are typically not BES). Suggest using “elements”. The Application guideline discussion of bullet 2.13 of Attachment 1 is not consistent with the actual bullet.
Yes
I agree with the requirement but question whether the standards actually meet the stated goal of the requirement to “not require discrete identification” of Low Impact BES Cyber Assets / Systems. There are numerous examples which seem to contradict this stated goal as described later in these comments and specifically to this requirement. How does one distinguish between a BES Cyber System and a non-BES Cyber System? Does this mean that we need to inventory all of our cyber assets and develop a test to distinguish between “Low” and “non-BES”, even though R1 says that “Low” does not “require discrete identification”? How are entities to prove to auditors that the identification and categorization was done without having an inventory, i.e., discrete identification? The VSLs seem to seem to imply that “Low Impact” needs to be discretely identified, e.g., what happens if an entity categorizes a Medium Impact as a Low Impact? In order to review correct categorization, doesn’t the auditor need to review Low Impact to see if they should have been categorized Medium or High Impact?
Yes
Yes
The Evidence Retention section of the standard should not refer to Rules of Procedure language that is subject to change. The sentence that states: “For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit” should instead reference the Rules of Procedure, Attachment 4C on the CMEP, Paragraph 3.1.4.2, e.g., “also refer to the Rules of Procedure, Attachment 4C … Paragraph 3.1.4.2”. In this way, it is possible to accommodate changes to the ROP language without needing the change to the standard.

Yes
No
“Implemented” is not the right word because it creates double jeopardy with the rest of the CIP standards, e.g., a violation of another standard could mean that the policy was not implemented. Suggest changing to use the phrase “in force”, meaning that the policy is in force and able to be enforced, but not requiring enforcement of the policies in this requirement (implement includes enforcement), but rather enforcement is contained in ensuing standards. I suggest rephrasing to: “Each Responsible Entity shall have in force one or more documented cyber security policies …” The standards are inconsistent in its use of BES Cyber Assets /Systems, e.g., R2, to be consistent with CIP-002-5, should use the phrase “BES Cyber Assets and BES Cyber Systems”. Alternatively, CIP-002-5 could just use BES Cyber Systems. The bullets are incorrectly numbered; they should be 2.1 through 2.10 and not 1.1 through 1.10
Yes
The grammar of the sentence is a bit off and it is not clear whether the CIP Senior Manager needs to approve each of the policies or not. Suggest moving the phrase “each of its cyber security policies” to after the word “Manager”, e.g., “Each Responsible Entity shall review and obtain the approval from its CIP Senior Manager for each of its cyber security policies …”
Yes
Yes
“Cyber Security Policy” should be “cyber security policies” to be consistent with R2 and R3.
Yes
There is an extra “2” at the end of the sentence within the standard.
Yes
See the discussion of Evidence Retention in response to Question 3 VSL to R5, should there be a time frame applied, e.g., failed to document … two delegations within the audit period, within a year? If three failures are spread over 30 years, e.g., one failure each 10 years, is that a severe violation?
Yes
“Implement” is ambiguous. If a process in “in force” but in one instance is not followed, is that a violation? The process has been implemented. Merriam-Webster’s has two definitions of “implement”, one of which is probably intended: 1: carry out, accomplish; especially: to give practical effect to and ensure of actual fulfillment by concrete measures 2: to provide instruments or means of expression for A process can meet both of these definitions. If enforced, a process can meet the first definition; if not enforced, the process can meet the second definition. I assume the SDT intends the first definition. I suggest adding a footnote to specifically identify which definition of “implement” is intended.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. Bullet 2.1, the measure and the requirement do not match. The requirement is to “define the roles”, the measure includes “and the training needed for each role”. Suggest adding this phrase from the Measure to the Requirement.
Yes
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. The phrasing of requirements that refer to tables is ambiguous with ambiguous reference of prepositional phrases. For instance, in this requirement, it is unclear if an entity that only has Low Impact BES Cyber Systems needs to develop training or not, i.e., does the prepositional phrase “that includes …” refer to “training program” or to “Responsible Entity” or to both? I suggest rephrasing: “Each Responsible Entity that owns applicable systems described in the Applicability column of Table ___ shall ___ in accordance with the applicable terms of Table ___” Such rephrasing should be done to all requirements that refer to a table associated with that requirement. In addition, measures should not include the word “must”. Measures are not enforceable but are instead examples of evidence.

No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. Bullet 4.2, the phrase “up to the current time” is problematic since it infers that 7 year criminal background checks need to be updated on at least a daily basis to cover “up to the current time”, This should be reworded to seven years prior to the last background check.
Yes
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. The flow of the bullets seems backwards and missing a job function analysis step. In addition, the word “minimum” implies an optimization that is impractical to achieve, e.g., do we want every individual account to be optimized to that individual, which is very difficult to administer and prone to error, or rather do we want to establish account groups based on job functional analysis with associated, appropriate levels of permission and assign individuals to these groups. The latter is easier to administer and less prone to errors, and follows established practices such as security clearance levels. I suggest the following “flow”: 1. Job function analysis 2. “Account group” establishment with appropriate levels of permissions based on job function analysis with associated permissions 3. Assignment of individuals to the appropriate “account group” based on their position
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 7.1 is impossible for resignations. How is it possible for an entity to revoke access at the same time they receive a resignation? Footnote 2 does not help because it only applies to termination. For termination, the entity should know about the termination before the employee; however, for a resignation the reverse is true. I propose we create a new bullet specific to resignation and require revocation of access by the end of the next calendar day. Bullet 7.2, the urgency is out of alignment with the risk. Next calendar day means that if a re-assignment occurs on a Friday, that weekend work is required when that level of urgency is not justified by the situation / risk. I suggest end of the next calendar week.
No
See the discussion of Evidence Retention in response to Question 3 The Severe VSL for R3 includes the phrase “The Responsible Entity did not fully implement its cyber security training program” which makes it a binary VSL and eliminates the High VSL described. For counts, e.g., R6, R7, should there be a time frame identified? E.g., 2 individuals within a year, within the audit period?
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. The requirement does not describe the overall purpose of the processes required. Are these processes to deny unauthorized access? Bullet 1.1 is over-ridden by the word “implement” in the parent requirement. In other words, 1.1 says that entities are to define technical and procedural controls. However, the parent requirement states that these are to be implemented. This means that the entity will need to have device-by-device evidence that the procedural and technical controls were implemented thereby not meeting the goals stated by the SDT that for Low Impact, the requirements are to be programmatic in nature and not require device-by-device compliance evidence. Suggest using a different word in the parent requirement than “implement” and then re-insert the word “implement” in the bullets as appropriate. Bullet 1.2 is ambiguous and implies another requirement. First, one does not “use” EAPs to control and secure, rather, EAPs are controlled and secured through use of some other means. Second, the requirement is to secure only identified EAPs,, e.g., is it a non-compliance if an entity misses an EAP, e.g., did not identify it? Third, the Measures are all to support the identification of EAPs and not to “secure and control” EAPs as required by the Requirement. And fourth, the ensuing bullets (1.3, 1.4) seem to be requirements to secure and control EAPs; and hence, bullet 1.2 seems to create double jeopardy. I suggest rewording bullet

1.2 to require identification of EAPs and not “secure and control”.
Yes
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13.
No
See the discussion of Evidence Retention in response to Question 3 The VSLs are binary, so, it seems that if one EAP is missed, it is a severe violation. Is this appropriate? I encourage the SDT to develop non-binary VSLs.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 1.1 is ambiguous. How can physical access be restricted without a Defined Physical Boundary? Does this imply that Low Impact assets need to be enclosed in both horizontal and vertical dimensions? Does a fence of xx height suffice? Bullet 1.1 is over-ridden by the word “implement” in the parent requirement. In other words, 1.1 says that entities are to define operational and procedural controls. However, the parent requirement states that these are to be implemented. This means that the entity will need to have device-by-device evidence that the controls were implemented thereby not meeting the goals stated by the SDT that for Low Impact, the requirements are to be programmatic in nature and not require device-by-device compliance evidence. Suggest using a different word in the parent requirement than “implement” and then re-insert the word “implement” in the bullets as appropriate. The application guidelines act to embed a de facto standard requirement of 96 square inches that, if desired to actually be a requirements, must be specified in the actual Requirements of the standard and not in an application guideline that is not enforceable. Alternatively, a definition of a Physical Access Point could be developed with established thresholds that may vary between High, Medium and Low Impact and then the defined term used in the standard. FMPA is aware of challenges made by auditors to entity compliance surrounding issues like how thick does dry-wall need to be to constitute a wall. To avoid disputes between auditors and entities over what constitutes a Defined Physical Boundary, and what constitutes access points, FMPA encourages the SDT to develop bright-line criteria. Such criteria could be different for different risk impacts, e.g., for illustration purposes only: • High Impact might require 6 wall enclosure with every access of 96 square inches or larger opening defined as an access point with wall material of metal, concrete, or drywall of xx inches • Medium Impact may not require a roof, but, requires a fence or wall height of xx inches topped with a climbing deterrent such as barbed wire. • Low Impact video surveillance is sufficient. The standard is very ambiguous as to what is a sufficient physical boundary and will be open to debate between compliance and entities if such bright line criteria are not developed.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. The note to bullet 2.2 that says “there is no need to document the escort or handoff between escorts” is inconsistent with the requirement of bullet 1.1 which states that visitors need “continuous” escort. How would one prove that escort was continuous without documenting the hand-offs? On bullet 2.2, what does the phrase “on a per 24 hour basis” mean? Does this mean that a visitor must be logged in and out on the same day and that if a visitor is there at midnight, then the visitor must be logged out at midnight on the prior day and logged back in the following day, or does this mean that military time is to be used when annotating the log?
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 3.1 is not limited to Medium and High Impact with the term “Locally mounted hardware or devices associated with Defined Physical Boundaries since Defined Physical Boundaries is not limited to only Medium and High Impact assets through its definition. This implies that all physical access controls, even those to Low Impact, are to be tested. Presumably, this includes padlocks used to control gates to fences, non-electronic door locks that control access to substation control houses that contain Low Impact digital relays, etc. Such an interpretation would

then require an inventory of those access controls, and presumably, to ensure a complete set, an inventory of Low Impact assets and their Defined Physical Boundaries. I suggest adding to the end of the phrase “Defined Physical Boundaries associated with Medium or High Impact …”
Yes
See the discussion of Evidence Retention in response to Question 3 R1 has both a Long Term Planning and a Same Day Operations time frame listed because the separate bullets are different time frames. If a non-compliance occurs, wouldn’t Same Day Operations always trump Long Term Planning? If that is not the desired outcome, consider separating the bullets into separate requirements or apply the time frame on a bullet by bullet basis.
Yes
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. On bullet 2.2. - (1) Suggest adding the phrase “addressed by the security related patches or updates” after the word “vulnerabilities” as clarification. (2) “Remediation” implies compensatory measures; the standard should not require compensatory measures because such measures may reduce reliability. Consider another term such as “palliative plan”, “alleviation plan”, or “assuagement plan”. On bullet 2.3, “A process for” is redundant with the parent Requirement and should be deleted and just start the sentence with “Remediate as identified in the plans of 2.2 …”
Yes
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 4.2 allows the entity to establish its own threshold criteria for what unauthorized electronic access or malware activity results in a real-time alert, is that a desired state? Bullet 4.3 implies redundancy, e.g., how will we know that event logging failed unless a redundant system tells us? Bullet 4.4 is a data retention requirement and does not belong as a requirement, but rather in the Evidence Retention section of the standard.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 5.4, if “implement” as used in R5 means to “carry out, accomplish; especially: to give practical effect to and ensure of actual fulfillment by concrete measures”, then, this bullet 5.4 would require a complete inventory of all Low Impact BES Cyber Assets to ensure that default passwords were changed …. To solve this, implement could be removed from the parent requirement and replaced with “have”, e.g., “have processes”, and then the bullets that require asset by asset / system by system implementation could re-insert the word implement. As such, what would likely need to happen is two bullets would need to be created for default passwords, one for High and Medium which would use the phrase “implement procedural controls” and another for Low Impact which would use the phrase “have procedural controls” to distinguish between a system by system approach for Medium and High and a programmatic approach for Low. Bullet 5.5.3 allows the entity to specify the amount of time between password changes, is this appropriate or should a bright-line be developed? For instance, High – 3 months, Medium – 6 months, Low – 12 months Bullet 5.6 allows the entity to specify the number of unsuccessful login attempts before an alert is issued, is this appropriate or should a bright-line be developed?
No
See the discussion of Evidence Retention in response to Question 3.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures

described in Question 15. This Requirement essentially implies that Low Impact assets need to have in place systems to monitor potential cyber incidents that are required of High and Medium Impact in CIP-007-5 in order to detect and respond to cyber security incidents. Otherwise, how is one to "identify, classify and respond to BES Cyber Security Incidents" on Low Impact systems? This "hidden" requirement is inappropriate. I recommend making R1 only applicable to Medium and High Impact systems, especially since EOP-004 requires entities to respond and report to cyber security incidents that they are aware of, even for Low Impact systems.
No
See comment on ambiguous reference to tables and improper use of the word "must" in Measures described in Question 15. See discussion of the ambiguity of the word "implement" discussed in response to Question 13. This Requirement essentially implies that Low Impact assets need to have in place systems to monitor potential cyber incidents that are required of High and Medium Impact in CIP-007-5 in order to detect and respond to cyber security incidents. Otherwise, how is one to know "when a BES Cyber Se4curity Incident occurs". This "hidden" requirement is inappropriate. I recommend making R2 only applicable to Medium and High Impact systems, especially since EOP-004 requires entities to respond and report to cyber security incidents that they are aware of, and hence this is duplicative for Low Impact systems. Bullet 2.2, "implement" is not the correct term and is duplicative with the parent requirement. How would one "implement" the entire response for a table top drill since no IT systems would be involved? "Exercise" or equivalent term is more appropriate, e.g., "R2 … implement a process for … 2.2 an Exercise …" Bullet 2.3 is an Evidence Retention requirement and should not be a requirement.
No
First, the question does not match the posted Requirement. The Requirement actually states: "Each Responsible Entity shall implement one or more documented processes that collectively include the applicable items in CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update, and Communication". See comment on ambiguous reference to tables and improper use of the word "must" in Measures described in Question 15. See discussion of the ambiguity of the word "implement" discussed in response to Question 13. See comments to Questions 34 and 35. I believe that in order to make this requirement applicable to Low Impact systems, which implies that CIP-007 become applicable to Low Impact systems and this "hidden" requirement is inappropriate. Instead, standard CIP-008-5 should not be applicable to Low Impact systems, especially in consideration of the requirements of EOP-004-1 which require entities to analyze and report cyber security incidents.
Yes
See the discussion of Evidence Retention in response to Question 3.
No
See comment on ambiguous reference to tables and improper use of the word "must" in Measures described in Question 15. Bullet 1.4, what does the word "verified" mean, than the data is "retrievable", or that all the data is verified? The intent seems to be that the data is retrievable, otherwise 2.2 seems duplicative.
No
See comment on ambiguous reference to tables and improper use of the word "must" in Measures described in Question 15. See discussion of the ambiguity of the word "implement" discussed in response to Question 13. Bullet 2.1, "implement" is not the correct term and is duplicative with the parent requirement. How would one "implement" the entire recovery for a table top drill since no IT systems would be involved? "Exercise" or equivalent term is more appropriate, e.g., "R2 … implement a process for … 2.1 an Exercise …" Bullet 2.2 "current configuration" is not accurate. The back-up will not reflect the "current configuration" but the configuration at the time of the back-up.
Yes

response to Question 13. The CIP Senior Manager (or delegate) should approve the baseline (1.1). Presumably, the baseline would be “reset” periodically to reduce the number of changes that need to be tracked, and the CIP Senior Manager (or delegate) should approve the new baseline (1.3). Bullet 1.3, the phrase “as necessary” does not seem to add anything and creates ambiguity. Suggest deleting the phrase.
No
Having to monitor all the assets associated under the Applicability section of Table R2 is a huge TFE generator based on the requirement. If the intent is to make sure that there have been no modifications to the device, it would seem appropriate that one could monitor other items and not just the configurations in order to meet the requirements of FERC Order 706, paragraph 397. I suggest that there are methods, such as documented monitoring of logins, wherein if a device has not been logged into, the configurations need not be constantly monitored. Having a yearly requirement to verify configurations (via MD5 hash matching, for example) is an acceptable requirement, but having to constantly monitor the devices for any configuration change is going to be impossible for many devices, and create an unnecessary burden on entities. See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. Bullet 3.2, what is an “active” vulnerability assessment? The term is ambiguous.
Yes
See the discussion of Evidence Retention in response to Question 3.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. See discussion of the ambiguity of the word “implement” discussed in response to Question 13. There should be recognition of law, e,.g., unauthorized people are only granted access in cases where the law requires divulging that information, such as public records acts, or a discovery process order by a judge. It would seem that access to BES Cyber Security Information should be approved by the CIP Senior Manager as a separate bullet under R1.
Yes

Pacific Northwest Small Public Power Utility Comment Group
Steve Alexanderson P.E.
Yes
We continue to see problems with the definitions. We note that the definition of Control Center now applies to “facilities” with a lower case f and with five widely differing definitions in the online dictionary we consulted. Consider a System Operator’s smart phone. It is programmable, so it is a Cyber Asset per the definition. If set up to receive automatically generated emails or texts regarding BES status or alarms from two BES locations, it “facilitates” the System Operator in doing his job, meeting one of the five definitions of “facility”. If misused, the operator might act on the false information within the fifteen minute window causing a negative impact to the BES (using the list of BES Reliability Operating Services). Therefore it is a both a BES Cyber Asset and a Control Center per the proposed definitions. This phone will carry either a Medium or High Impact rating from CIP-002 making it subject to most of the CIP standard requirements. We continue to believe the SDT did not mean to capture tools such as a smart phone in the definitions, since they do not very easily fit into

the CIP requirements. But they do get caught as we have demonstrated, so the unintended consequence is these tools will be abandoned resulting in possible negative effects to the reliability of the BES. As a start, we suggest that “Control Center” should be limited to rooms or buildings dedicated to controlling BES assets. We also note that the definition of Control Center depends on the NERC term System Operator, the definition of which uses the phrase “control center”; creating a circular definition. The definition of Cyber Asset hinges on whether or not the electronic device in question is “programmable.” Again consulting our online dictionary we see that programmable means capable of receiving working instructions for automatic operation. Therefore a simple static electronic UF relay set only by way of dials and switches and with no communication of any kind will be considered a Cyber Asset and also a BES Cyber Asset because of the function it performs. A Q&A during the webinar confirmed this assessment. Even if low impact, numerous CIP requirements now apply to the device and the entity that owns it. The entity owning this device will need to: 1. document and implement cyber security policies including the 10 sub-requirement subjects, 2. annually review the cyber security policies, 3. ensure employee awareness of the cyber security policies, 4. implement a Security Awareness Program conveying security awareness concepts with quarterly reinforcement of the concepts for the relay in question, 5. define operational or procedural controls to restrict physical access to the relay in question, 6. go through the TFE process for CIP-007 R5 since the relay in question has no password capability, 7. create a Cyber Security Response Plan for the relay in question, 8. implement and perform drills of the Cyber Security Response Plan for the relay in question, 9. and annually review the Cyber Security Plan for the relay in question. All of the above is in addition to the five CIP-002 and CIP-003 requirements that would apply whether the relay was electronic or electro-mechanical. The nine additional requirements represent a huge burden on UFLS owning DP/LSEs with no corresponding improvement in reliability. We suggest that Cyber Asset be limited to electronic devices that are programmable via a communication medium such as RS232, USB, Ethernet, Bluetooth, removable media, etc. BES Cyber System uses Maintenance Cyber Asset in its definition, although this term remains undefined. We believe the SDT intended to use the defined term Transient Cyber Asset here.
No
Yes
Thank you for taking our recommendation to exclude temporary changes.
Yes
We agree with the changes.
No
We note that most of the subject topics align with other CIP standard titles. In particular, sub-requirements 1.7, 1.8, and 1.9 align with CIP-009, 010, and 011. These three standards have no requirements for Low Impact BES Cyber Assets. Likewise CIP-003 R1.7 through R1.9 should not apply to entities that have no Medium or High Impact BES Cyber Assets. All of the sub-requirements should be renumbered to 2.1, 2.2... etc. This would match the mapping document and the Guideline section of CIP-003.
No
We believe this training program would more properly be included in CIP-004. Since security awareness and policy should be closely related, we believe the two subjects should both be addressed by CIP-004 R1.1.
No
“...at least a quarterly basis” may be stated contrary to the SDT’s intent. Since a quarter (1/4) is the smallest interval allowed, more frequent reinforcement would be considered a violation while less frequent would not be, since no upper interval limit was established. And like other intervals, quarter

is subject to interpretation as to whether a calendar quarter is intended, or any random three month period measured to the day. We suggest: "… at least once every calendar quarter." Also, please see our comment under Question 9 above.
Yes
Thank you for removing low impact from this requirement.
No
5.4 contains the magic words "where technically feasible", which will require TFEs for items that cannot meet strict compliance. Contrary to the statement regarding inventory, the TFE process will require a detailed inventory of those items an entity is requesting an exception for. We suggest substituting "possible" for "technically feasible."
The comment form provided no room for comments not addressing particular requirements, so we are listing our more general comments here. From the webinar we understand that where the requirements refer to tables where none of the table entries applies to an entity, the requirement itself is not applicable. Since this is not the general case for the relationship between requirements and sub-requirements in NERC standards, we suggest explicitly stating that this is how it works in the CIP standards. We find the Applicability-Facilities Section (4.2) in CIP-003 to be confusing, since all the requirements of this standard appear to apply to the applicable entities and not to facilities.

Suggest removing the 4.2.1 through 4.2.3, or stating more clearly how the facilities affect the requirements. The background section of CIP-003 goes into great detail regarding the table format while CIP-003 itself does not follow this format. Please remove or rewrite this section. The very last statement of the guideline section of CIP-005 references a document we are not familiar with. Please provide a complete reference or link to its location.

Owensboro Municipal Utilities
Yes
The definition of “Control Center” needs to be very clear. It should be explicitly stated that a Control Center must have control functions over 2 or more BES facilities and that these BES facilities must be located in 2 or more separate geographic locations. If this definition is not clear, smaller entities that might otherwise be considered low impact may be labeled inappropriately as medium impact. The SDT should consider the addition of voltage criteria so that Control Centers are more easily identified. For example, a Control Center could be defined as supporting the real time operation of 2 or more BES facilities operated at 200kv & above or 3 or more BES facilities operated at 100kv & above. In addition, wording should include the following: Control rooms located at generation facilities should be excluded unless they perform the functions of a System Operator as a TOP, BA, or RC and perform control for the above mentioned BES Facilities.
Yes
“Control Center” in section 2.13 should be capitalized.
No
The wording of R1.1 is confusing. It may be more effective if this is divided into two separate requirements. For example: R1.1. Responsible Entities shall update the identification and categorization within 30 calendar days of a modification to BES Elements or Facilities if the modification is intended to be in effect for more than 6 calendar months and causes a change in the identification or categorization of the associated BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category. R1.2. Responsible Entities shall update the identification and categorization within 30 calendar days of a BES Element or Facility being placed into operation if it is intended that the BES Element or Facility will be in operation for more than 6 calendar months and causes a change in the identification or categorization of the associated BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category.
Yes
No
“And” needs to be struck from moderate and high VSL in the phrase “High and Medium Impact and BES Cyber Assets”.
Yes
Yes
Yes
Yes
Yes
Yes
Yes
No

Quarterly reinforcement of security awareness concepts will be difficult to implement and burdensome to document in order to sufficiently demonstrate compliance. The periodicity of on-going reinforcement should be at the discretion of the responsible entities. Annual training on security awareness concepts may be more practically implemented and more easily documented.

Responsible Entities need to be allowed some discretion in evaluating the effectiveness of security-related patches or updates and in determining the potential threat posed by an identified vulnerability. There may be circumstances when unintended effects of a patch or update are more debilitating to a Responsible Entity's Cyber System than the vulnerability being addressed. This may be implied within the requirement since the remediation plan is to be created by the Responsible Entity, but probably needs to be more explicitly defined if the requirement is going to be similarly applied by Compliance Enforcement Authorities throughout the various regions.
Yes
Yes
Yes
Yes

No
If not read in conjunction with the rationale, it may not be understood that an incident is reportable per the terms established by the DOE and by NERC in EOP-004. Perhaps R1.2 should state: A process to determine if an identified BES Cyber Security Incident is a Reportable BES Cyber Security Incident as defined in NERC Reliability Standard EOP-004 Attachment 2-EOP-004.

Control Center – (1) We assume that a Control Center is only a Control Center is used by an BA, TOP, GOP or RC. The definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” For clarity, we suggest adding this clarity (RC, BA, TOP, and GOP entities only) to the definition. (2) The use of the word “facilities” in a fashion that does not mean “Facilities” will lead to confusion and ambiguity, especially since “facilities” is used later in the same sentence as meaning “Facilities”. We suggest: “One or more sites hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation Facilities or transmission Facilities, at two or more locations”. Facilities should also be capitalized in the first bullet. (3) "support" needs to be better clarified, and limited to only control centers that provide electronic support (specifically exclude any control center that does not provide

continuos electronic data to System Operators, otherwise any control center that receives any verbal instructions or inquiries from a System Operator could be drawn into the Medium impact, as supporting operations by System Operators) BES Cyber System – Maintenance Cyber Asset is not defined, suggest changing to Transient Cyber Asset. BES Cyber System Information – (1) Security procedures should not be on the list because it creates a conflict between CIP-011-1 that restricts access to the information and CIP-003-5 and CIP-004-5 that require general training and dissemination of those procedures. (2) BES Cyber System Impact is not defined. CIP Exceptional Circumstance should include imminent danger to a BES Facility as a condition. CIP Senior Manager – the definition should exclude CIP-001, at least until it is retired with Project 2009-01
Yes
Attachment I - Bullet 1.3, Transmission Owners do not have Control Centers and should be struck from the bullet, e.g., the definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” Attachment I - Bullet 2.13, (1) Transmission Owners do not have Control Centers and should be struck from the bullet, e.g., the definition of System Operator in the Glossary is: “An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” (2) The term “control centers” should be capitalized in the phrase “generation control centers” to make it clear that it refers to the defined term “Control Center” In the application guidelines, when discussing the BES Reliability Operating Services, the bullets have associated with them the functional entity that typically provides those services. However, there are exceptions and the guidelines ought to reflect those exceptions; for instance, a TO may also provide UFLS. Also in the application guidelines, the word “facilities” is used in a fashion that does not mean “Facilities”, which creates ambiguity and confusion (e.g., Facilities by definition is part of the BES, whereas assets owned and operated by DPs and LSEs are typically not BES). Suggest using “elements”. The Application guideline discussion of bullet 2.13 of Attachment 1 is not consistent with the actual bullet. Attachment I - Bullet 2.7 is inconsistent in its terminology, switching between “Facility” and “Lines”. It seems that “Line” is intended. The focus also seems to be “at a single station or substation” where the focus ought to be a single BES Cyber Asset / System that controls multiple Lines. We suggest changing the first sentence of 2.7 to read: “Multiple Transmission Lines operating at 200 kV or higher, but less than 500 kV, where the total weighted value of all BES Transmission Lines whose Reliability Operating Services would be adversely impacted within 15 minutes if a single BES Cyber Asset / System is rendered unavailable, degraded or misused exceeds a value of 3000.”
Yes
OUS agrees with the requirement but questions whether the standards actually meet the stated goal of the requirement to “not require discrete identification” of Low Impact BES Cyber Assets / Systems. There are numerous examples which seem to contradict this stated goal as described later in these comments and specifically to this requirement. How does one distinguish between a BES Cyber System and a non-BES Cyber System? Does this mean that we need to inventory all of our cyber assets and develop a test to distinguish between “Low” and “non-BES”, even though R1 says that “Low” does not “require discrete identification”? How are entities to prove to auditors that the identification and categorization was done without having an inventory, i.e., discrete identification? The VSLs seem to imply that “Low Impact” needs to be discretely identified, e.g., what happens if an entity categorizes a Medium Impact as a Low Impact? In order to review correct categorization, doesn’t the auditor need to review Low Impact to see if they should have been categorized Medium or High Impact?
Yes
Yes
Yes
No
“Implemented” is not the right word because it creates double jeopardy with the rest of the CIP standards, e.g., a violation of another standard could mean that the policy was not implemented.

Suggest changing to use the phrase “in force”, meaning that the policy is in force and able to be enforced, but not requiring enforcement of the policies in this requirement (implement includes enforcement), but rather enforcement is contained in ensuing standards. OUS suggest rephrasing to: “Each Responsible Entity shall have in force one or more documented cyber security policies …” The standards are inconsistent in its use of BES Cyber Assets /Systems, e.g., R2, to be consistent with CIP-002-5, should use the phrase “BES Cyber Assets and BES Cyber Systems”. Alternatively, CIP-002-5 could just use BES Cyber Systems. The bullets are incorrectly numbered; they should be 2.1 through 2.10 and not 1.1 through 1.10
Yes
Yes
Yes
“Cyber Security Policy” should be “cyber security policies” to be consistent with R2 and R3.
Yes
Yes
Yes
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. Bullet 2.1, the measure and the requirement do not match. The requirement is to “define the roles”, the measure includes “and the training needed for each role”. Suggest adding this phrase from the Measure to the Requirement.
Yes
The phrasing of requirements that refer to tables is ambiguous with ambiguous reference of prepositional phrases. For instance, in this requirement, it is unclear if an entity that only has Low Impact BES Cyber Systems needs to develop training or not, i.e., does the prepositional phrase “that includes …” refer to “training program” or to “Responsible Entity” or to both? We suggest rephrasing: “Each Responsible Entity that owns applicable systems described in the Applicability column of Table ___ shall ___ in accordance with the applicable terms of Table ___” Such rephrasing should be done to all requirements that refer to a table associated with that requirement. In addition, measures should not include the word “must”. Measures are not enforceable but are instead examples of evidence.
No
See comment on ambiguous reference to tables and improper use of the word “must” in Measures described in Question 15. Bullet 4.2, the phrase “up to the current time” is problematic since it infers that 7 year criminal background checks need to be updated on at least a daily basis to cover “up to the current time”, This should be reworded to seven years prior to the last background check.
Yes
No
The flow of the bullets seems backwards and missing a job function analysis step. In addition, the word “minimum” implies an optimization that is impractical to achieve, e.g., do we want every individual account to be optimized to that individual, which is very difficult to administer and prone to error, or rather do we want to establish account groups based on job functional analysis with associated, appropriate levels of permission and assign individuals to these groups. The latter is easier to administer and less prone to errors, and follows established practices such as security clearance levels. FMPA suggests the following “flow”: 1. Job function analysis 2. “Account group” establishment with appropriate levels of permissions based on job function analysis with associated permissions 3. Assignment of individuals to the appropriate “account group” based on their position
No

Bullet 7.1 is impossible for resignations. How is it possible for an entity to revoke access at the same time they receive a resignation? Footnote 2 does not help because it only applies to termination. For termination, the entity should know about the termination before the employee; however, for a resignation the reverse is true. OUS proposes to create a new bullet specific to resignation and require revocation of access by the end of the next calendar day. Bullet 7.2, the urgency is out of alignment with the risk. Next calendar day means that if a re-assignment occurs on a Friday, that weekend work is required when that level of urgency is not justified by the situation / risk. OUS suggest end of the next calendar week.
No
The Severe VSL for R3 includes the phrase “The Responsible Entity did not fully implement its cyber security training program” which makes it a binary VSL and eliminates the High VSL described. For counts, e.g., R6, R7, should there be a time frame identified? E.g., 2 individuals within a year, within the audit period?
No
The requirement does not describe the overall purpose of the processes required. Are these processes to deny unauthorized access? Bullet 1.1 is over-ridden by the word “implement” in the parent requirement. In other words, 1.1 says that entities are to define technical and procedural controls. However, the parent requirement states that these are to be implemented. This means that the entity will need to have device-by-device evidence that the procedural and technical controls were implemented thereby not meeting the goals stated by the SDT that for Low Impact, the requirements are to be programmatic in nature and not require device-by-device compliance evidence. Suggest using a different word in the parent requirement than “implement” and then re-insert the word “implement” in the bullets as appropriate. Bullet 1.2 is ambiguous and implies another requirement. First, one does not “use” EAPs to control and secure, rather, EAPs are controlled and secured through use of some other means. Second, the requirement is to secure only identified EAPs, e.g., is it a non-compliance if an entity misses an EAP, e.g., did not identify it? Third, the Measures are all to support the identification of EAPs and not to “secure and control” EAPs as required by the Requirement. And fourth, the ensuing bullets (1.3, 1.4) seem to be requirements to secure and control EAPs; and hence, bullet 1.2 seems to create double jeopardy. OUS suggests rewording bullet 1.2 to require identification of EAPs and not “secure and control”.
Yes
No
The VSLs are binary, so, it seems that if one EAP is missed, it is a severe violation. Is this appropriate? OUS encourages the SDT to develop non-binary VSLs.
No
Bullet 1.1 is ambiguous. How can physical access be restricted without a Defined Physical Boundary? Does this imply that Low Impact assets need to be enclosed in both horizontal and vertical dimensions? Does a fence of xx height suffice? Does video surveillance suffice? Bullet 1.1 is over-ridden by the word “implement” in the parent requirement. In other words, 1.1 says that entities are to define operational and procedural controls. However, the parent requirement states that these are to be implemented. This means that the entity will need to have device-by-device evidence that the controls were implemented thereby not meeting the goals stated by the SDT that for Low Impact, the requirements are to be programmatic in nature and not require device-by-device compliance evidence. Suggest using a different word in the parent requirement than “implement” and then re-insert the word “implement” in the bullets as appropriate. The application guidelines act to embed a de facto standard requirement of 96 square inches that, if desired to actually be a requirement, must be specified in the actual Requirements of the standard and not in an application guideline that is not enforceable. Alternatively, a definition of a Physical Access Point could be developed with established thresholds that may vary between High, Medium and Low Impact and then the defined term used in the standard. FMPA is aware of challenges made by auditors to entity compliance surrounding issues like how thick does dry-wall need to be to constitute a wall. To avoid disputes between auditors and entities over what constitutes a Defined Physical Boundary, and what constitutes physical access points, OUS encourages the SDT to develop bright-line criteria. Such criteria could be different for different risk impacts, e.g., for illustration purposes only: • High Impact might require 6 wall enclosure with every access of 96 square inches or larger opening defined as an access point with wall

material of metal, concrete, or drywall of xx inches • Medium Impact may not require a roof, but, requires a fence or wall height of xx inches topped with a climbing deterrent such as barbed wire. • Low Impact video surveillance is sufficient. The standard is very ambiguous as to what is a sufficient physical boundary and will be open to debate between compliance and entities if such bright line criteria are not developed.
No
The note to bullet 2.2 that says “there is no need to document the escort or handoff between escorts” is inconsistent with the requirement of bullet 1.1 which states that visitors need “continuous” escort. How would one prove that escort was continuous without documenting the hand-offs? On bullet 2.2, what does the phrase “on a per 24 hour basis” mean? Does this mean that a visitor must be logged in and out on the same day and that if a visitor is there at midnight, then the visitor must be logged out at midnight on the prior day and logged back in the following day, or does this mean that military time is to be used when annotating the log?
No
Bullet 3.1 is not limited to Medium and High Impact with the term “Locally mounted hardware or devices associated with Defined Physical Boundaries since Defined Physical Boundaries is not limited to only Medium and High Impact assets through its definition. This implies that all physical access controls, even those to Low Impact, are to be tested. Presumably, this includes padlocks used to control gates to fences, non-electronic door locks that control access to substation control houses that contain Low Impact digital relays, etc. Such an interpretation would then require an inventory of those access controls, and presumably, to ensure a complete set, an inventory of Low Impact assets and their Defined Physical Boundaries. OUS suggests adding to the end of the phrase “Defined Physical Boundaries associated with Medium or High Impact …”
Yes
Yes
No
On bullet 2.2. - (1) Suggest adding the phrase “addressed by the security related patches or updates” after the word “vulnerabilities” as clarification. (2) “Remediation” implies compensatory measures; the standard should not require compensatory measures because such measures may reduce reliability. Consider another term such as “palliative plan”, “alleviation plan”, or “assuagement plan”.
Yes
No
Bullet 4.3 implies redundancy, e.g., how will we know that event logging failed unless a redundant system tells us? Bullet 4.4 is a data retention requirement and does not belong as a requirement, but rather in the Evidence Retention section of the standard.
No
Bullet 5.4, if “implement” as used in R5 means to “carry out, accomplish; especially: to give practical effect to and ensure of actual fulfillment by concrete measures”, then, this bullet 5.4 would require a complete inventory of all Low Impact BES Cyber Assets to ensure that default passwords were changed …. To solve this, implement could be removed from the parent requirement and replaced with “have”, e.g., “have processes”, and then the bullets that require asset by asset / system by system implementation could re-insert the word implement. As such, what would likely need to happen is two bullets would need to be created for default passwords, one for High and Medium which would use the phrase “implement procedural controls” and another for Low Impact which would use the phrase “have procedural controls” to distinguish between a system by system approach for Medium and High and a programmatic approach for Low.
No
No
This Requirement essentially implies that Low Impact assets need to have in place systems to monitor potential cyber incidents that are required of High and Medium Impact in CIP-007-5 in order to detect

and respond to cyber security incidents. Otherwise, how is one to “identify, classify and respond to BES Cyber Security Incidents” on Low Impact systems? This “hidden” requirement is inappropriate. OUS recommends making R1 only applicable to Medium and High Impact systems, especially since EOP-004 requires entities to respond and report to cyber security incidents that they are aware of, even for Low Impact systems.
No
This Requirement essentially implies that Low Impact assets need to have in place systems to monitor potential cyber incidents that are required of High and Medium Impact in CIP-007-5 in order to detect and respond to cyber security incidents. Otherwise, how is one to know “(w)hen a BES Cyber Se4curity Incident occurs”. This “hidden” requirement is inappropriate. OUS recommends making R2 only applicable to Medium and High Impact systems, especially since EOP-004 requires entities to respond and report to cyber security incidents that they are aware of, and hence this is duplicative for Low Impact systems. Bullet 2.2, “implement” is not the correct term and is duplicative with the parent requirement. How would one “implement” the entire response for a table top drill since no IT systems would be involved? “Exercise” or equivalent term is more appropriate, e.g., “R2 … implement a process for … 2.2 (an) Exercise …” Bullet 2.3 is an Evidence Retention requirement and should not be a requirement.
No
See comments to Questions 34 and 35. OUS believes that in order to make this requirement applicable to Low Impact systems, which implies that CIP-007 become applicable to Low Impact systems and this “hidden” requirement is inappropriate. Instead, standard CIP-008-5 should not be applicable to Low Impact systems, especially in consideration of the requirements of EOP-004-1 which require entities to analyze and report cyber security incidents.
Yes
No
Bullet 1.4, what does the word “verified” mean, that the data is “retrievable”, or that all the data is verified? The intent seems to be that the data is retrievable, otherwise 2.2 seems duplicative.
No
Bullet 2.1, “implement” is not the correct term and is duplicative with the parent requirement. How would one “implement” the entire recovery for a table top drill since no IT systems would be involved? “Exercise” or equivalent term is more appropriate, e.g., “R2 … implement a process for … 2.1 (an) Exercise …” Bullet 2.2 “current configuration” is not accurate. The back-up will not reflect the “current configuration” but the configuration at the time of the back-up.
Yes
Yes
Yes
The CIP Senior Manager (or delegate) should approve the baseline (1.1). Presumably, the baseline would be “reset” periodically to reduce the number of changes that need to be tracked, and the CIP Senior Manager (or delegate) should approve the new baseline (1.3).
No
Having to monitor all the assets associated under the Applicability section of Table R2 is a huge TFE generator based on the requirement. If the intent is to make sure that there have been no modifications to the device, it would seem appropriate that one could monitor other items and not just the configurations in order to meet the requirements of FERC Order 706, paragraph 397. OUS suggests that there are methods, such as documented monitoring of logins, wherein if a device has not been logged into, the configurations need not be constantly monitored. Having a yearly requirement to verify configurations (via MD5 hash matching, for example) is an acceptable requirement, but having to constantly monitor the devices for any configuration change is going to be impossible for many devices, and create an unnecessary burden on entities.
No
Bullet 3.2, what is an “active” vulnerability assessment? The term is ambiguous.

Yes
No
There should be recognition of law, e,.g., unauthorized people are only granted access in cases where the law requires divulging that information, such as public records acts, or a discovery process order by a judge. It would seem that access to BES Cyber Security Information should be approved by the CIP Senior Manager as a separate bullet under R1.
Yes
Yes
Yes

Tracy Richardson
Springfield Utility Board
Yes
SUB suggests the addition of a definition for the term “BES Cyber System Impact”. SUB assumes that it is in reference to CIP-002—5 Attachment 1 “Impact Categorization of BES Cyber Assets and BES Cyber Systems,” but other entities may not have the same assumption(s). Based on information received during NERC’s November 11, 2011 Electronic Security Perimeter (ESP) webinar, SUB would recommend adding clarification similar to the following language to “BES Cyber Systems”: “If an entity has determined that it has no Critical Cyber Assets, then it is not possible to have an Electronic Security Perimeter, and no BES Cyber Systems.”
Yes
SUB is concerned with the inclusion of Distribution Providers (DPs) in the Version 5 CIP Standards, as well as with the qualifiers proposed for Load-Serving Entities in the Applicability section of CIP-002-5. This inclusion will draw in small entities with no operational capabilities and cause them to go through an administrative burden of proving they either do not provide BES Reliability Operating Services or they do not have cyber assets associated with this equipment. SUB recommends that a bright line criteria method for Registered Entities to demonstrate “no impact” and be given an outright exemption from CIP-003-5 through CIP-011-5.
No
CIP-002-5 Attachment 1 – Impact Categorization of BES Cyber Assets and Cyber Systems addresses Impact Categorization, but there appears to be no guidance in the actual identification of BES Cyber Assets and BES Cyber Systems. In the Background statement of each of the Version 5 CIP Standards, it is noted that, “Standard CIP-00X-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the Version 5 CIP Cyber Security Standards.” However, CIP-002-5 is titled BES Cyber Asset and BES Cyber System Categorization, with no mention of identification. Measure 1 for Requirement 1 of CIP-002-5 requires physical lists for High and Medium categorization; however there is no list requirement for Low Impact. The following Version 5 CIP (CIP-003 through CIP-011) Standard Requirements imply or assume that all Responsible Entities (regardless of impact) have created a list identifying BES Cyber Assets and BES Cyber Systems. SUB recommends either adding a Low Impact BES Cyber Assets and BES Cyber Systems list requirement, or altogether removing the Requirement for those with a Low-Impact (or no impact) categorization. SUB believes more guidance and clarity should be provided for the actual identification of BES Cyber Assets and BES Cyber Systems, and suggests general guidelines be provided on how Registered Entities would identify demarcation points where a BES Cyber Asset and/or BES Cyber System begin and end. It is also SUB’s recommendation that a bright-line criteria method for Registered Entities to demonstrate “no impact” and be given an outright exemption from Standards CIP-003-5 through CIP-011-5.

Yes
SUB agrees with Requirement 2, believing this is not a change from previous versions of the CIP Cyber Security Standards, and understands this to already be a part of an entity's annual Self-Certification process.
No
SUB is concerned that an entity will need to produce a list of Low-Impact BES Cyber Assets to demonstrate that they have correctly (or incorrectly) categorized BES Cyber Assets in the "Low-Impact" category. This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
Yes
SUB does not see this as a new requirement, based on previous versions of CIP-003.
Yes
SUB does not see CIP-003-5 R2 as a new requirement(s), but just as a consolidation of requirements spelled out in previous versions of the CIP-002 through CIP-009 Standards.
Yes
SUB does not view this as a new requirement, based on previous versions of the CIP-003 Standard.
Yes
SUB does not view this as a new requirement, based on previous versions of the CIP-003 Standard.
Yes
SUB does not view this as a new requirement, based on previous versions of the CIP-003 Standard.
Yes
No comment.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
No
SUB agrees with this programmatic approach to a culture of cyber security by requiring entities to have a Security Awareness Program. However, SUB sees a quarterly requirement as too severe, particularly for entities with Low Impact BES Cyber Systems. SUB proposes separating the applicability based on impact and providing different time basis for each.
Yes
SUB agrees with CIP-004-5 R2 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with CIP-004-5 R3 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with CIP-004-5 R4 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with CIP-004-5 R5 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with CIP-004-5 R6 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
In Part 7.2 Requirements for reassignments or transfers, "by the end of the next calendar day" does not take into consideration weekend days. SUB would recommend "by the end of the next business day" for High and Medium Impact. SUB agrees with CIP-004-5 R7 not being applicable to Low Impact BES Cyber Assets and Cyber Systems.

No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
No
Based on information received during NERC's November 11, 2011 Electronic Security Perimeter (ESP) webinar, SUB would see value in adding clarification similar to the following language: "If an entity has determined that it has no Critical Cyber Assets, or BES Cyber Systems, then it is not possible to have an Electronic Security Perimeter." Requirement 1 of CIP-005-5 again implies that a listing of BES Cyber Systems, including those for Low Impact BES Cyber Systems, has been or would need to be created. Many of the Requirements of the Version 5 CIP Standards can be interpreted to require a listing of BES Cyber Systems. SUB recommends either adding a Low Impact BES Cyber Systems Identification List requirement in CIP-002-5, or removing the Low Impact BES Cyber Systems Electronic Security Perimeter requirement from CIP-005-5. SUB believes this requirement or non-requirement for a listing should be addressed in CIP-002-5, and SUB's preference is the removal of the requirement.
Yes
SUB agrees with CIP-005-5 R2 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
Yes
There's a typo in M1. "Evidence must includes…" SUB suggests, "Evidence must include each of the documented physical security plan(s)…" SUB does not disagree with requiring operational and procedural controls to restrict physical access to be defined. However, as previously commented in CIP-002-5, SUB is concerned that an entity will need to produce a list of Low-Impact BES Cyber Assets to demonstrate that they have correctly (or incorrectly) categorized BES Cyber Assets in the "Low-Impact" category. As also noted in CIP-005-5 comments, the CIP-006-5, Part 1.1 Requirements apply to Low Impact BES Cyber Systems, which assumes that a list of these systems has been created. SUB recommends either adding a Low Impact BES Cyber Systems Identification List requirement to CIP-002-5, or removing the Low Impact BES Cyber Systems Physical Security Plan requirement from CIP-006-5. SUB's preference is the removal of the requirement.
Yes
SUB agrees with CIP-006-5 R2 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees CIP-006-5 R3 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
Yes
SUB agrees with CIP-007-5 R1 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB appreciates the extended time period to allow for documentation of implementation.
Yes
SUB agrees with CIP-007-5 R3 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes

SUB agrees with CIP-007-5 R4 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with APPA's comments that point out that when requirements are applicable to All Responsible Entities including Low Impact BES Cyber Systems, these requirements must address "programmatic protection controls". SUB agrees that this approach to a culture of cyber security requiring facilities with Low Impact BES Cyber Systems to be covered by programmatic plans or procedures will improve cyber security. However, Table R5, Part 5.4 calls for "Procedural controls for initially changing default passwords," in the Requirements, but in the Measures the first bullet says; "Demonstration showing default vendor passwords have been changed, sampled on a locational basis." SUB agrees with APPA's recommended language changes. Requirement 5 of CIP-007-5 again implies that a listing of BES Cyber Systems, including those for Low Impact BES Cyber Systems, has been or would need to be created. Many of the Requirements of the Version 5 CIP Standards can be interpreted to require a listing of BES Cyber Systems. SUB recommends either adding a Low Impact BES Cyber Systems Identification List requirement in CIP-002-5, or removing the Low Impact BES Cyber Systems Electronic Security Perimeter requirement from CIP-005-5. SUB believes this requirement or non-requirement for a listing should be addressed in CIP-002-5.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
No
SUB is concerned that the Requirements of CIP-008-5 create potential conflict with the Requirements of EOP-004-2. The development of the two Standards appears to be in parallel with one another, rather than working together. SUB recommends more coordination between the Version 5 CIP SDT and the EOP-004-2 SDT. SUB understands CIP-008-5 to be the "Incident Response Plan" and EOP-004-2 requires the development of an "Operating Plan for Event Reporting." However, CIP-008-5 Table R1, Part 1.1 requires a process to "identify, classify, and respond to BES Cyber Security Incidents" while EOP-004-2 R1.1 requires; "A process for identifying events listed in Attachment 1." SUB recommends the SDT revise the CIP-008-5 Requirement and Measure in Table R1, Part 1.1 to remove the terms "identify" and "classify." Table R1, Part 1.2 requirement of a process to determine if an incident is a "Reportable BES Cyber Security Incident" is in direct conflict with Event Reporting Reliability Standard EOP-004-2. SUB suggests Part 1.2 be removed and coordinated with the EOP-004-2 SDT. Table R1, Part 1.3.3 requires definition of "Internal staff and external organizations that should receive communications of the incident." EOP-004-2 R1.3 requires "A process for communicating events in Attachment 1 to the ERO, the RC… and other appropriate entities." APPA suggests Part 1.3.3 be removed and coordinated with the EOP-004-2 SDT.
Yes
No comment.
No
Table R3, Part 3.2, 3.3, and 3.4 requires different times for updates, both 30 and 60 calendar days. For consistency and clarity, SUB again recommends coordinating with the EOP-004-2 SDT, which allows 90 calendar days for update of the plan.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
Yes
SUB agrees with CIP-009-5 R1 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes
SUB agrees with CIP-009-5 R2 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
Yes

SUB agrees with CIP-009-5 R3 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
No
The definition of the term “configuration” is unclear. Configuration is not clearly defined in the Glossary of Terms Used in NERC Reliability Standards, Definitions of Terms Used in Version 5 CIP Cyber Security Standards, nor in the CIP-010-1 Cyber Security – Configuration Management and Vulnerability Assessments Standard. Are “configuration management”, “configuration change management”, and “asset management” intended to be synonymous in the way they are used in the CIP-010-1 Standard? Configuration is only mentioned in terms of “security configurations”. SUB recommends that a specific definition be provided for Configuration, Configuration Management, Configuration Change Management, and/or Asset Management. Perhaps, based on the extensive changes to definitions in Version 5 of the CIP Standards, it would be appropriate to create a CIP-specific glossary of terms used in the CIP Standards. SUB agrees CIP-010-5 R1 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
SUB agrees with CIP-010-1 R2 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
SUB agrees with CIP-010-1 R3 not being applicable to Low Impact BES Cyber Assets and BES Cyber Systems.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
Yes
No comment.

No comment.
No
This overall proposal is not substantive enough to objectively assess VSRs and VSLs. SUB recommends that VSRs and VSLs be proposed after Standard Requirements are better clarified, perhaps in a separate, next-phase process.
No
As previously stated, SUB believes that an entity must identify all BES Cyber Systems and Cyber Assets, push systems through the Medium / High impact filter, and come out at the end of the process with a “Low Impact” (or No Impact) list of systems and assets (which may be a “null” list). While there are no requirements to specifically identify Low Impact systems, this does not remove applicability for the Low Impact BES Cyber Systems from the Version 5 CIP Standards. In the Background statement of each of the Version 5 CIP Standards, it is noted that, “Standard CIP-00X-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the Version 5 CIP Cyber Security Standards.” However, CIP-002-5 is titled BES Cyber Asset and BES Cyber System Categorization, with no mention of identification. Measure 1 for Requirement 1 of CIP-002-5 requires physical lists for High and Medium categorization; however, there is no list requirement for Low Impact. The following Version 5 CIP (CIP-003 through CIP-011) Standard Requirements imply or assume that all Responsible Entities (regardless of impact) have created a list identifying BES Cyber Assets and BES Cyber Systems. SUB recommends either adding a Low Impact BES Cyber Assets and BES Cyber Systems list requirement, or altogether

removing the Requirement for those with a Low-Impact (or no impact) categorization. SUB would also recommend that a simple method for DPs and LSEs to demonstrate “no impact” and be given an outright exemption from Standards CIP-002-5 through CIP-011-5.
Individual

Yes
Definition of BES Cyber Asset – The second line where it states “, when required,” is out of place and as used does not make sense; please remove, or remove the comma. Definition of BES Cyber System – The proposed definition of BES Cyber System contains a reference to a “Maintenance Cyber Asset.” This should be replaced with the term “Transient Cyber Asset.” Definition of BES Reliability Operating Services – Inclusion of Dynamic Response to BES Conditions, the inclusion of Governor response provides for a wide array of systems. Consider listing the systems that should be included. Definition of BES Reliability Operating Services – Inclusion of Controlling Voltage, the inclusion of AVR does not define if it is for voltage control from the generator terminals or from the high side of the GSU. This service can create some jurisdictional problems where part of the system is owned by transmission, and the other part is owned by generation. Definition of BES Reliability Operating Services – Inclusion of Restoration of BES in the list of BES Reliability Operating Services is too broad without clarifying language that only those systems absolutely necessary for the restoration of the BES must be considered as BES Cyber Systems. Definition of BES Reliability Operating Services – Inclusion of Situational Awareness in the list of BES Reliability Operating Services is too broad without clarifying language that only those systems absolutely necessary for the continuing operation of the BES must be included as BES Cyber Systems. For example, there are visualization tools used purely for market participation purposes which serve a situational awareness function but which do not enhance reliability operations in any way and which do not pose any threat to the BES if compromised; those should not be included as BES Cyber Systems. Definition of Control Center – As constructed, the inclusion of the bullet beginning with “Providing information” would cause a facility containing a communications processing node which received information from multiple BES facilities to be classified incorrectly as a control center. For example, a substation containing a MUX which received RTU readings from multiple other substations or a satellite data node in a distributed EMS system located in an unattended communications hub would qualify their locations as control centers. This would have a chilling effect; removing from consideration some otherwise preferable communication systems designs. This clause does not bring in any facilities which would not be covered by the other items in the bullet list; it should be removed. Definition of Cyber Assets - Need to retain "and communication networks". We believe that without keeping the communications as part of the definition, any programmable device at a location, for example, within a substation, is a cyber asset regardless of whether we communicate to it or is used for communications. Our understanding is that this does not follow the original intended purpose of the CIP standards which is to secure remote communications to devices used to control the system. Definition of Electronic Access Control or Monitoring Systems – Remove the words "or BES Cyber Systems" at the end of the sentence. This is related to our comments above. Unless the BES Cyber Systems is not removed, the existing definition of Cyber Assets may require a need to put physical security around each location, for example substation, depending on interpretation. Definition of Electronic Access Point – While the need for a broad definition which allows for the wide range of real-world situations is appreciated, this definition does not properly capture the nature of an access point. The use of “Cyber Assets”, rather than any inclusion of “BES Cyber Assets”, implies that any barrier device anywhere within an Entity is in scope. The use of “restricts” rather than “allows but restricts” logically implies that even an Asset which is not connected to a BES network could be considered as an access point. The use of “interface” adds nothing to the definition and will lead to unnecessary confusion. Proposed replacement definition: “A Cyber Asset which allows but restricts routable or dial-up communication between a BES Cyber Asset and another Cyber Asset.” Definition of Interactive Remote Access – The second sentence adds nothing to the definition and could leave some unintended gaps; it should be removed or it should be clarified that the three items are examples.
Yes
In the application guidelines on page 18 of 30, the table at the bottom of the page needs to include the LSE Function Registration type and LSE needs to be referenced throughout the application guidelines. In the first bullet under Overall Application, the verb tense for “support” and “supports”

switches back and forth. “Supports” is correct. Under High Impact in the 5th line, a word is missing from “it must be noted that there may "be" agreements”.
No
Requirement 1.1 as stated is confusing. Suggested replacement: “Update the identification and categorization within 30 calendar days of the date when a change to BES Elements and Facilities is placed into operation, if the change is intended to be in service for more than 6 calendar months and causes a change in the identification or categorization of any related BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category.” M1: It is impossible to create a categorized list of High and Medium impact assets without a resultant Low Impact list. For version 3, auditors have pointed out that you cannot have a CCA list unless you have a list of all Cyber Assets at a location. A similar situation exists in version 5 here as the last sentence to R1 and M1 are in conflict with each other. In R1, the phrase "do not require discrete identification" implies that Low impact BES Cyber Systems do not require categorization at all; but, in M1 it asks for evidence of categorizing of Low Impact BES Cyber Assets and BES Cyber Systems. Thus, R1 and M1 are contradictory and we suggest the last line of M1 should be removed.
No
M2 – Need to change the words after CIP Senior Manager to "or delegate approve" after CIP Senior Manager on the 3rd line of the paragraph for M2 and remove the words "review and update".
Yes
No
R1 Requirement – Change R1 to R2 to match legacy numbering in previous CIP versions.
No
R2 Requirement – Change R2 to R1 to match legacy numbering in previous CIP versions. Also, update numbering of sub-requirements to match requirement number.
Yes
No
R4 Requirement – Add the words "Medium or High Impact" in front of the words "BES Cyber Systems" on the first line.
Yes
Yes
R6 Requirement - The description of this requirement [on page 14 of 22] appears to have a typo, in that a "2" is included at the end of the first sentence.
Yes
Yes
Yes
Yes
Yes
Yes
Yes
R6.6 Requirement - This requirement contains a grammatical error in the form of an extraneous “of” at the end of line 3.
No

R7 Applicability – This section needs to be revised to: Associated Electronic Access Control or Monitoring Systems, Associated Protected Cyber Assets, and Associated Physical Access Control Systems of: High Impact BES Cyber Systems or Medium Impact BES Cyber Systems. R7 Rationale - The third paragraph could be interpreted to mean that all authentication credentials must be revoked for personnel to be considered as having their access revoked, rather than revocation being accomplished by revoking only the credentials which can allow the terminated individual to gain access to the Asset in question. If revoking "all" is the intended interpretation, it should be clarified; but, we believe that it would require a substantial amount of resources for no additional security gain and would cause unnecessary enforcement actions. If "all" is not the intended interpretation, the paragraph should be re-drafted to better clarify the intent. Suggested replacement text: Access is considered to be physical, logical, and remote permissions granted to all Cyber Assets comprising or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e.: physical access control system, remote access system, directory services), although revocation can be accomplished by revoking all permissions which could allow the terminated individual to gain access to a given Cyber Asset. R7.1 Requirement – The words “at the time of” is poorly-defined, and many possible interpretations of it cannot be technically enforced as there is no threshold. R7.2 and R7.3 Requirements – There is no security benefit to using a one-day requirement for revocation as opposed to a seven-day revocation. In the entire span of UA 1200 and CIP versions 1 through 3, there have been no known incidents where a shorter revocation requirement would have prevented an incident. Consider stating “by the end of the next business day” in circumstances where a transfer may take place on a weekend or holiday. Consider changing all “calendar day” statements to “business day” statements to account for weekends and holidays. Application Guideline - We hesitate to call for more stringent wording, but In the Application Guidelines it seems to indicate that no action is required to revoke access in the case of the death of an employee. Given that unused accounts represent a small but real security risk with no corresponding benefit, the table should be changed to require removal of access in a reasonable timeframe.
No
The VSLs for R1, R2, and R3 should be should be progressive instead of binary. Also, the VSL for R6 has too many “or” clauses. Consider labeling VSLs for sub requirements to eliminate the multiple or statements.
No
R1.1 Requirement - In the requirement “define” should be replaced with “define and implement” for clarity. R1.1 Measure - The requirement states “technical or procedural controls” while the measure states “documented technical and procedural controls.” Please match language of the Requirement and Measure to their intended purpose. R1.2 Requirement - In cases where only one connectivity method exists, please state in the requirement “routable and/or dial-up” R1.3 Applicability - Change applicability for High Impact BES Cyber systems by adding the wording "with External Routable Connectivity." R1.4 Applicability - Why are these controls in place for “non-Interactive” or read only remote access? Would suggest removing this language out of the Applicability section.
No
Application Guideline - Requirement R2, If the Secure Remote Access Reference Document is going to be referenced in the Application Guidelines, then it needs to be included in the ballot packet and voted on along with the rest of the package because auditors may use content of this referenced document for the audit which is not the intended purpose of the referenced document. R2.3 Requirement - Need to define "multi-factor authentication" by adding this term to the definitions document.
No
(1) All the VSLs should be progressive instead of binary. (2) VSL for R1 should be split out into sub-requirements because they do not match the BES Cyber System classification. For example, if a Responsible Entity did not define any technical or procedural controls to restrict unauthorized electronic access for a Low Impact BES Cyber System this should not be a Severe VSL.
No
The Application Guidelines do not sufficiently allow for the development of new types of technology which could provide improved controls. R1.4 and R1.5 Requirements – We have concerned about the term "real-time" as it is not defined. Irrespective of the definition, these requirements should have

the possibility of a Technical Feasibility Exception; to preclude that possibility may hinder mitigating an emergency to issue an alert. We further suggest that, the alert language should be changed from issuing real-time alerts to issuing alerts within 15 minutes along with an option for TFE. R1.6 Requirement - Remove “of” after “entry” on the second line of the paragraph.
No
R2.2 Requirement – Need to remove the words "on a 24-hour basis". This could become an issue if the visitor crosses the midnight time-line. Suggest inserting words to allow a visitor turnover process in cases where the visitor begins work on shift 1 but continues through shift 2. This way the escorts can change without the visitor having to log in and out of the system.
No
R3.1 Requirement – Wording needs to be added to this requirement to prevent systems that are in place prior to version 5 to be forced to perform pre-commissioning testing for version 5. We suggest adding clarification to the Application Guideline on the reasons for a 24 calendar month M&T period and also provide some examples of M&T programs used in the industry.
No
VSL for R1 should be split out into sub-requirements because they do not match the BES Cyber System classification. For example, if a Responsible Entity did not document operational and procedural controls to restrict physical access for a Low Impact BES Cyber System this should not be a Severe VSL.
No
R1 Applicability – This section needs to be revised to: Associated Electronic Access Control or Monitoring Systems, Associated Protected Cyber Assets, and Associated Physical Access Control Systems of: High Impact BES Cyber Systems or Medium Impact BES Cyber Systems. Other tables should include similar clarity.
No
R2.1 Requirement – Add the words "security related" in front of the words "software and firmware". R2.1 Measure – Remove the last sentence of the measure as we do not see a reason for it in reference to meeting the requirement.
No
R3.1 Requirement – This requirement should allow for the possibility of an Asset which requires no action, such as a vendor-hardened security appliance. R3.3 Applicability – This requirement should be limited to High Impact BES Cyber Systems and to Medium Impact BES Cyber Systems with External Routable Connectivity. R3.4 and R3.5 Applicability – This requirement should be limited to High Impact BES Cyber Systems, Medium Impact BES Cyber Systems, and Associated Protected Cyber Assets. Transient Cyber Assets (stated in the Measure) do not include Physical Access Control Systems or Electronic Access Control or Monitoring Systems per the definition of a Transient Cyber Asset.
No
R4.1 Requirement – As a clarification, at the end of the requirement, add the words "Devices that cannot log a particular event do not require a TFE to be generated" to cover devices that cannot produce logs. R4.2 Requirement – Remove the words "necessitate a real-time alert" at the end of the requirement and replace with "be necessary". R4.2 Measure – Remove the end of the sentence starting with "necessitate a real-time alert" and replace with the word "necessary". R4.3 Requirement – Replace the words "calendar day" with "business day after notification". Suggest making High Impact the next business day and the remaining categories 7 calendar days. R4.4 Requirement – Remove the word "consecutive". R4.4 Measures – Remove the last part of the sentence starting with the words "and records of disposition". R4.5 Requirement – We do not see a reason to rectify deficiency before the end of the next calendar day in every case. We suggest to remove the last sentence or change rectification period to certain number of business days.
No
R5.4 Requirement - would require a massive effort to change passwords for devices already in place in Low Impact locations (for an average mid-sized utility, for example, 200 Low Impact substations with an average of 25 Assets per substation would represent at least 5000 password changes during the implementation phase) with no noticeable benefit to security, given the required physical protections and the unimportance of the Facilities involved. This represents the single point currently

at which the v5 standards treat Low Impact BES Cyber Systems on an individual basis rather than on a programmatic basis, and that substantially changes the nature of the work required to comply with the standards, that is removing resources from the much more important work of securing the High Impact Assets. Also, suggest restating the requirement to simply "Procedural controls for initially removing, disabling, or changing default passwords, where technically feasible. For the purpose of this requirement an inventory of Cyber Assets is not required". R5.5 Requirement – Since the passwords are changed at the Asset level not the System level, add the word "Assets" after the words BES Cyber System" in the requirement.
No
(1) VSL R1 through R5 – For Medium Impact Assets, the VSL level should be changed to Medium and High from High and Severe. For Low Impact Assets the VRF should be changed to Low and the VSL should be changed to Low. (2) The VSL for R1 and R2 should be progressive opposed to binary.
No
R1.1, R1.2, and R1.3 Applicability – Include removal of Low Impact BES Cyber Systems from the Applicability section because security incidents have to do with incidents to the Electronic Security Perimeters and the Defined Physical Boundaries that Low Impact BES Cyber Systems would not have.
No
R2.1 Requirement – Remove the words "or test" from the end of the sentence. R2.2 Requirement – The initial timing required by 2.2 is confusing. A literal interpretation would require that the Entity be conducting the test implementation of the plan on the day that the standard goes into effect. The boilerplate wording used here should be replaced with a statement that the plan be tested before the implementation date of the standard and then repeated within 15 months of the pre-implementation test. R2.3 Requirement – Propose deletion of this sub requirement as this sub requirement is only a documentation issue that is already stated in the compliance section (1.2) of the standard. R2.1, R2.2, and R2.3 Applicability – Include removal of Low Impact BES Cyber Systems from the applicability section because security incidents have to do with incidents to the Electronic Security Perimeters and the Defined Physical Boundaries that Low Impact BES Cyber Systems would not have.
No
R3.1 Applicability – Include removal of Low Impact BES Cyber Systems from the applicability section because security incidents have to do with incidents to the Electronic Security Perimeters and the Defined Physical Boundaries that Low Impact BES Cyber Systems would not have. R3.4 Requirement – Need to remove the comma in the requirement section of 3.4.
No
VSL - Make the VSL for R2 progressive opposed to binary.
No
The column headings above 1.4 are incorrect. Suggest adding an Application Guideline for all of CIP-009 as a guideline would be very helpful. R1.3 Requirement – This requirement needs to be reworded to "One of more processes for the backup, storage, and restoration of information required to restore BES Cyber System functionality". R1.4 Requirement – This requirement needs to be reworded to "Ensure that backup processes are completed successfully for Information essential to BES Cyber System recovery".
No
R2.1 Requirement - The initial timing required by R2.1 is confusing. A literal interpretation would require that the Entity be conducting the test implementation of the plan on the day that the standard goes into effect. The boilerplate wording used here should be replaced with a statement that the plan be tested before the implementation date of the standard and then repeated within 15 months of the pre-implementation test. R2.2 Requirement – On lines 3 and 4, remove the words "initially and". R2.3 Requirement – Change the words "39 months" to "3 years not to exceed 39 months" to match other requirements on a 39 month schedule.
No
R3.1 Requirement and Measure – Remove the phrase "when BES Cyber Systems are replaced". R3.2 Requirement and Measure – Add the words "or incident" after the word "exercise". R3.4 Requirement – Suggest the deletion of Requirement 3.4 as is a new requirement for the CIP standards with no security benefit and it does not align with FERC Order 706.

Yes
No
R1.1.4 Requirement – Add the words "installed on the BES Cyber Asset" to the end of the sentence. R1.1.5 Requirement – Reword requirement to "Any network accessible ports and services; and". R1.2 Requirement – Reword requirement to "Document approved changes to the BES Cyber System that deviate from the existing baseline configuration". R1.5.2 Requirement – Remove the end of the sentence after the words "production environment" as it is too burdensome and unnecessary to document all the insignificant differences between test and production environments.
Yes
No
Application Guideline – The Application Guidelines for R3 needs an editorial correction, “not” rather than “note”. Also, the phrase “Strongly encouraged” is vague and subject to different interpretations, so suggest removing it.
Yes
No
R1.1 Requirement– Add the word "implement" at the beginning of the requirement. R1.2 Requirement – Correct the column header labels. Add the word "Establish" at the beginning of the requirement.
Yes
Yes
No
The implementation schedule needs to be modified to allow different time frames for Low, Medium, and High BES Cyber Systems. Recommend an implementation schedule of 36 months for High and Medium Impact BES Cyber Systems and 48 months for Low Impact BES Cyber Systems.

ATCO Power Canada Ltd.
Yes
Section 2.13 of Attachment 1 contains a 300 MW threshold for generation control centers. The application guideline suggests that the 300 MW value was used because the same value is used for UVLS and UFLS. The rationale for this threshold is flawed as generation control centers have no control over load-shedding. In addition there is a significant difference between a loss in generation and the loss of load. If the intention is that shedding load and loss of generation are to be treated the same, then the 300 MW threshold should apply to all generating units over 300 MW. The 300 MW threshold for generation control centers is far below the 1500 MW threshold for generating units with common mode vulnerabilities set out in section 2.1. In addition, the 1500 MW was approved by industry in the Version 4 consultation. As 1500 MW was derived from the single largest contingency criteria, the principle behind that value is acceptable. ATCO Power suggests that the SDT consider removing generating control centers from section 2.13. If this is done, generation control centers that control 1500 MW or more of generation will be covered under section 2.1, and all generation will be handled consistently.

Yes
1) Control Center: We recommend the definition be modified as follows, in order to add clarity: A facility hosting BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for more than one BES generation facility or transmission facility, at more than one location: 2) Routable Protocol: We recommend that

a Routable Protocol definition be created and added using criteria in the "Security Guideline for the Electricity Sector: Identifying Critical Cyber Assets" version 1.0, dated June 17, 2010. For example, this would maintain the listing of example non-routable protocols shown on page 27 of this NERC guidance document. 3) Electronic Security Perimeter (“ESP”): Please clarify what is meant by the phrase “collection of Electronic Access Points”. Discussions within a NERC webinar on 11/18/11, “Establishing an Electronic Security Perimeter”, indicated that the general meaning of network based controls would not be impacted.
Yes
1) There appears to be an error in category 1.4 where it references 2.12 (which is UFLS and UVLS). To match version 4 the cross-reference should be to 2.11 (Special Protection Systems). 2) The meaning of 'adversely impact' is unclear. We recommend that the preambles in Appendix I, for high and medium control level facilities, be modified to read: “Each BES Cyber Asset or BES Cyber System that if rendered unavailable, degraded, or misused would, within 15 minutes, cause one or more of the following BES Reliability Operating Services to malfunction, preventing operation within prescribed reliability limits.” It is well understood that 'prescribed reliability limits' are those routine or situational operating requirements for the listed services, and ‘malfunction’ means the inability to respond to reliability needs as expected.
Yes
Yes
Yes
Yes
Yes
No
1) We feel that the requirement should reference cyber security policies created to satisfy CIP-003-5 R2. The wording could be modified as follows: “Each Responsible Entity shall review each of its cyber security policies created to satisfy CIP-003-5 R2 and obtain the approval of its CIP Senior Manager . . . “
Yes
Yes
Yes
Yes
No
1) Table R1, Part 1.1: The quarterly awareness is too frequent, considering many other critical aspects of reliability task execution are successfully and consistently implemented with a longer reinforcement period. A suggested change: Table R1, Part 1.1: "A security awareness program that conveys security awareness concepts and provides on-going reinforcement of such concepts on an established interval, not to exceed a calendar year." 2) Table R1, Part 6.4: The quarterly verification of accurate access provisioning requires more effort than needed if the initial provisioning event is properly executed. A too frequent interval allows for complacency and potential 'process escapes' between quarters. A better process would require continuous verification (lists updated at the time access is granted). This ensures day to day control. The periodic verification should be used to confirm proper execution of this process. Recommended change: "Verify at least once each calendar year that individuals provisioned for unescorted physical or electronic access to BES Cyber Systems were authorized for such access."

Yes
Yes
Yes
Yes
No
1) The requirement parts 6.1-6.3 states “Access permission shall be the minimum necessary for performing assigned work functions.” We would like to ask for clarification on the meaning of “the minimum necessary” and how this is to be measured. While someone may not access a CIP facility or BES Cyber System on a regular basis, their job description or the location of an asset/system may require access only infrequently. If access, electronic or physical, is only used occasionally will a violation be considered under the minimal verbiage? 2) We believe the approach of quarterly verification of physical or virtual access to listed BES Cyber assets is too frequent. It assumes the ongoing, as needed verification process for a personnel status change (requires access, now does not require access) may not be executed properly. We believe that a process that requires quarterly reconciliation to ensure secure physical and virtual access is broken. We propose instead that the process for day to day management of personnel status changes for access be reviewed at least annually, and then, based on the results of that review, the frequency modified commensurate with conditions found. For example, a good on-going process should show no 'process escapes' for the previous period, and not require quarterly reviews. A process that shows errors should then be reviewed quarterly until two consecutive error-free verification reviews are performed.
No
CIP-004 R7.1 states, “For resignations or terminations, revoke the individual’s unescorted physical access and Interactive Remote Access to BES Cyber Systems at the time of the resignation or termination.” R7.2 states, “For reassignments or transfers, revoke the individual’s unneeded electronic and physical access to BES Cyber Systems by the end of the next calendar day.” Finally, R7.3 states, “For resignations or terminations, revoke the individual’s access to BES Cyber System Information by the end of the next calendar day following the resignation or termination.” The “same day” and “next calendar day” requirements do not allow for normal business flow especially in the case of holidays, vacations or weekends. Most databases update nightly (or on a 24 hour schedule) so the notification to revoke access, unless done manually every time, would be behind the requirement. If done manually, this would require an unprecedented amount of labor from management, Human Resources and in the case of access, Security. Additionally, for transfers, “the next calendar day” does not allow for the review of new role descriptions and required access reviews. It is recommended that the verbiage for the revocation within 24 hours for “for cause” situations and 7 days for those who no longer require access be re-established for requirements R7.1, R7.2 and R7.3. If not 7 days, a period of time that would allow for notification to management and the necessary databases to be updated.
Yes
Yes
No

1) Part 2.2 from Table R2 requires encryption for all Interactive Remote Access sessions. Some entities still use dial-up access, for any number of reasons such as cost, lack of infrastructure, etc. and encryption is not an option with dial-up access. This section should be modified so as not to require entities to redesign their entire system. The modification could read something like “Require encryption for all Interactive Remote Access sessions, where supported by available technology, to protect the confidentiality and integrity of each Interactive Remote Access session.” 2) In addition, Part 2.3 from Table R2 requires multi-factor authentication, with the additional note that a UserID is not considered an authentication factor. Under many instances, this multi-factor authentication will be difficult to achieve, and by removing a UserID as an authentication factor, it becomes even more difficult. We recommend this be modified to allow for UserID as an authentication factor.
Yes
Yes
1) CIP-006 R1.4 states, “Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary.” Please clarify if the standard of “real-time” allows for any system delay? While the time between the alarm and the notification is minimal, there may be a short delay. 2) In regards to the Application Guidelines for CIP-006-5 R1 which state, “Protective measures such as bars, wire mesh or other permanently installed metal barrier could be used to reduce the opening size as long as it is leaves no opening greater 96 square inches or no more than six inches on its shortest side.” Xcel Energy provided comments related to protective measures in CAN-0031. Our comments are, “While we appreciate NERC providing some flexibility in how compliance with the six-wall border requirement is met, we feel this is going beyond the scope of what can be discerned from the standard. Furthermore, the source documents seem to introduce even more ambiguity as to what type of materials might be acceptable for construction of your PSP. Instead, we propose that NERC provide clarification on what threat(s) an entity should be protecting against. Then an entity's chosen protective measures/materials could be tested against those threats. This method would be more effective in ensuring a secure environment, and would allow for the introduction of new materials and defense strategies as the industry and vendor products develop/mature.” While the language has been changed from PSP to Defined Physical Boundary the need for clarification on what the threat we are trying to protect from is still needed.
Yes
Yes
Yes
The Table of Compliance Elements, R1 under High VSL states, “The Responsible Entity has documented and implemented physical access controls, but does not initiate a response within 15 minutes of a detected unauthorized physical access into a Defined Physical Boundary.” Please clarify what constitutes an appropriate level of “initiation” of a response. For example, if a response is in motion, such as personnel on their way to the site, does that meet the intent of “initiation” of a response? Additionally, the lower VSL for R1 states, “The Responsible Entity has documented and implemented physical access controls, but logging of authorized physical entry through any Defined Physical Boundary does not provide sufficient information to uniquely identify the individual and date of entry”, while the secondary, Severe VSL (as indicated by the OR) states, “The Responsible Entity has documented and implemented physical access controls, but two or more different and complementary methods do not exist to restrict access to High Impact BES Cyber Systems.” These two VSLs seem to be reversed. Would it not be a greater risk to the BES to have unidentified individuals accessing an area at unknown times than to have a documented and functioning access control system without a secondary measure?
No
Part 1.1 of Table R1 requires that the entity disable or restrict access to unnecessary logical network accessible ports. From the wording of the proposed requirement, it is unclear what a necessary port would include; is it only ports used during normal operations, does it include ports used to access the asset during maintenance, etc. In addition, it is unclear what is meant by “disable or restrict access”. One could argue that location within a PSP and ESP would “restrict access”. This requirement should

be clarified to address this ambiguity.

CIP-002-5 makes great strides to remove ambiguity and categorize the potential impacts of Cyber Assets. However, the standard should be modified by one of the following: 1) plainly state those entities with no Bulk Electric System (BES) assets per the definition included in the NERC Project 2010-17, Definition of Bulk Electric System, are not required to comply with this standard or, alternatively, the Senior Manager must annually certify that the entity has no BES assets per the definition thus no BES Cyber Assets/Systems or; 2) create a fourth category of “No Impact”, thus no further action required which can be certified annually by the Senior Manager. As the standard is currently stated, smaller entities with non-critical assets of the BES appear not to be involved with this standard, but that is dependent on the interpretation of “Transmission Protection System”. Concurring with the thoughts implied in comment 27.b by PNGC (et al) and considering the recent interpretation of PRC-004 and PRC-005 regarding the interruption of electric current fed from the BES, electronic relays with no communication to the “world” could be considered a Cyber Asset even though the relay has no impact on the BES if it were to fail or was lost or compromised. But regardless, the relay would be forced into the Low category because a “No Impact” or “Non-Critical” category does not exist. The Standard, as written, tends to assume that an entity does have Cyber Assets that can impose a risk to the BES. This assumption should be removed. Furthermore, in the context of protective relays, a small entity may be required by their Transmission Provider to own and maintain Under Frequency Load Shedding (UFLS) relays or a relay system. In the standard, the UFLS threshold is established at 300MW. The small entity may not have 300 MW of total load on their electric system, but their relaying is included in an UFLS system that is much greater than 300 MW. Thus the Standard needs to clarify how the 300MW threshold applies. For example, this small entity’s relay may not be critical to the BES and if degraded or destroyed would not compromise the total capability of the Transmission Provider’s UFLS system as this system is sufficiently small to be encapsulated by the window of design of the parent system. In many cases, the two systems are not integrated and do not have communications across a wide are network. The breaker controlled from the relay in this example may be monitored by SCADA through the use of a dry contact, but the relay itself does not have any other connections to the “world” other than the leads to sense frequency, provide relay power, and to control breaker operation.. Therefore, does the small entity own a Cyber Asset due to the 300 MW level, or is it still exempt? The Standard Drafting Team should work to clearly identify the entities not included by the BES definition. As the standard is currently written, an assumption is implied that all entities own Cyber Assets and all entities’ assets impact the BES. Left to the determination of what would or would not degrade the BES, the Standard Drafting Team has created a series of interpretations and clarifications that will be required from NERC regarding smaller DPs and LSEs. The assumptions and resultant ambiguity of interpretations and clarifications should be removed.

Make certain all terms are formally and clearly defined so that it does not rely on any interpretation outside the version 5 documents. Also, where definitions have been altered, there should be a clear statement as to what former interpretation is no longer valid.
Yes
It is not directly clear if equipment providing operational communications between BES facilities is now in scope as being classified as subject to categorization under the standards. The previous standard clearly excluded this specifically. The version 5 standard does not directly state this positively or negatively. Does this lack of mention mean communications (whether private or commercial) between facilities are in scope if it can effect BES Reliability Operating Services? The standard should be clear on this point as it previously excluded such communications from the scope of the standards. It is common for regional entities to place communications equipment at member entity facilities and mandate connection terms and 3rd party management of equipment. This is typical for Inter-Entity Coordination and Control applications such as ICCP. This practice puts the member in the position of being physically responsible for infrastructure it cannot control. Is it valid for the member to exclude the regional infrastructure from its compliance program? Is it acceptable

for a region to place such potentially critical infrastructure beyond the bounds of their physical control (and CIP program)? If the regional WAN infrastructure is not treated as critical, how can a member/entity's Inter-Entity Coordination and Control system be presumed to be critical (as it is in Attachment 1)?

The Summary of Changes for R1 states in reference to in reference to R1.2 "The non-routable protocol exclusion no longer exists; therefore there is no need for this requirement." It appears that "no longer exists" means that routable/non-routable/dial-up is no longer a criteria for CIP-002 classification. It is presumed that this reference to R1.2 means CIP-005-3:R1.2 has been removed. It is confusing that CIP-005-5 also has a requirement R1.2 that specifically addresses routable and dial-up electronic access points, which excludes non-routable. In the Applicability section on page 8, Electronic Access Point has a description that excludes non-routable from its scope. Also, the "Definition of Terms used in Version5 CIP Security Standards" document defines Electronic Access Points are either routable or dial-up. In the Guidelines and Technical basis section on page 20, in

discussing applicability of trust zones and deny by default, it states “Direct serial, non-routable connections are not included.” Is the Summary of Changes in conflict with other sections of this standard? Does the standard intend that non-routable electronic access points will not be allowed? Does it intend that externally connected non-routable (serial, hard-wired I/O, etc) devices are allowed as cyber assets, but not classified as Electronic Access Points? This should be defined clearly in the standard.

Requirement 1.5 categorically requires all changes to be implemented first in a test environment. There should be a requirement to have a test system, but there should also be allowance that not all implemented changes can be effectively performed on a test system. Further, those entities with Legacy systems may have no practical means of providing test equipment to meet this requirement.

Does this make these entities non-compliant?
No
The idea of monitoring for unauthorized baseline changes is good. The implementation for many systems may be very difficult. Common modern operating systems put up a multitude of ephemeral logical ports—how to automate finding the difference between ephemeral and unauthorized? “Where technically feasible” keeps this from being a compliance issue, but seems to reduce this from a “requirement” to a “guideline”.
No
This requirement needs to me specific as to what controls are required to be tested. Does this mean all controls related to CIP-005 and CIP-007? Does it mean all standards (including personnel security or information protection)? This requirement should be clear.
Yes
Yes
Yes
No
A “Medium” VRF for R1 seems very high, when the details for this requirement seem so general/non-specific. If this item is this important, there should be more specificity as to what is required for information protection.
Yes
The implementation plan should also allow for entities who would like to transition their CIP program to version 5 at an earlier date.

General comment: There has been a significant change in the framework from version 4 to version 5 regarding definitions and core concepts such as Critical Assets, Critical Cyber Assets, etc. These proposed changes are not a requirement of FERC Order 706, do not enhance cyber security controls and create administrative burdens when migrating to version 5. There should be a correlation between BES Cyber Systems and the facilities that these systems serve. The current version of the CIP standards provides the correlation and recognize that systems (CCAs) do not operate independently of facilities (CAs). Therefore, applying physical and electronic controls is more transparent. We propose maintaining the current Critical Asset and Critical Cyber Asset definitions and concepts. High, Medium and Low categorizations can still be utilized with the legacy CA and CCA concepts. Regarding the use of the term “annual” throughout the standards, we suggest that the registered entity be allowed to maintain it’s own definition of “annual” based on CAN-0010 guidelines. 1) For all definitions please include the old term that the new term is replacing, as applicable 2) The time periods included in the first and second sentence of the definition of “BES Cyber Asset” are confusing. The 15 minutes discussed in the first sentence and the “delay” discussed in the second sentence are unclear. Suggest re-wording as follows: A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. The 15-minute period begins to run when the asset is operated, mis-operated, or fails to operate when necessary, regardless of the time period between the asset was degraded or misused and the time the asset is then operated, mis-operated or fails to operate when necessary. 3) BES Cyber System Definition - Maintenance Cyber Asset needs to be defined or if appropriate changed to Transient Cyber Asset

No
We recommend eliminating this requirement and moving it into CIP-004 R2 and include policy as part of the training required. This way, all awareness and training would be in CIP-004.
No
We propose retaining the current language in CIP-003-3 R2.
Yes
There should not be a foot note in the standard – make this part of the requirement.
No
R.2 – we suggest a "Lower" VSL for "The Responsible Entity has implemented the required cyber security policy or policies but has failed to adequately document the policy or policies." R.4 – We suggest Lower to Severe VSLs be based on a failure to take action, rather than a specific number of employees who are aware. As drafted, it would be a "high" violation to miss one single employee. That seems overly strict and does not match well with the requirement and measures, particularly when measures suggested includes making an internet posting. We suggest the following: "Lower" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but has not adequately documented the measures"; "Moderate" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 30% -50% of individuals who have access"; "High" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 50% -70% of individuals who have access"; and "Severe" VSL = "Registered entity has taken no measures to make any individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function OR Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 70% or more of individuals who have access" R.5 - Why do the VSLs begin at medium for the failure of one delegation? We recommend "Lower" VSL = failure of one delegation; Moderate = failure of two delegations; High = failure of three, and Severe = failure of "four or more". R.6 – We suggest VSLs structured similarly to CIP-002 - Lower = Change to one delegation was not documented within 30 days, but was documented within 31-41 calendar days of the effect vive date ; Moderate = Change to two-three delegations was not documented within 30 days OR change to one delegation was not documented within 30 days, but was documented within 42-52 days of the effective date; High = Change to three-four delegations was not documented within 30 days OR Change to one delegation was not documented within 30 days, but was documented within 53-63 days of the effective date; Severe = Change to more than four delegations was documented within 30 days of the effective date OR Change to one delegation was not documented within 74 days of the effective date.
Yes
No
We do not believe that role based training is necessary. The personnel performing the job functions are familiar with the various controls due to their job requirements. General training on CIP, as required under current version, is all that should be required.

Yes
Yes
Yes
No
There is no added security by requiring the CIP Senior Manager or delegate to authorize access. We suggest using legacy wording that only requires access to be authorized.
Yes
No
R.1: It seems harsh to include the failure to document a security awareness program as a severe VSL. We recommend the following as a "Lower" VSL "The Responsible Entity implemented, but failed to document a security awareness program" and change the Severe VSL to "The Responsible Entity failed to implement and document a security awareness program." Additional comments around adding “Missed a quarter and/or target audience (authorized physical or authorized electronic)?” R.2: No comments. R.3: The annual training requirement assumes that the initial training was completed before access was granted, therefore, missing a small number of employees with the subsequent annual training does not necessarily indicate high risk to the bulk electric system because these employees presumably had received prior training when their access was granted. We recommend a tiered approach to the VSLs for missing the annual training requirement so that failing to meet the annual requirement for a low percentage of employees (like 10% or less) is a lower VSL, failing annual requirement for between 11-20% is moderate, failing the annual requirement for 21-30% is high, and failing to meet the annual requirement for over 30% OR failing to do the initial training is severe. R.4: No comment R.5: A documentation error should not be a "severe" VSL. Delete the "OR/documentation" part from the Severe VSL and make a Lower VSL that reads "The Responsible Entity implemented, but failed to document a process for personnel risk assessments." R.6: For most utilities, there could be 100s of employees with access, and it seems unrealistic to base the VSLs on one failure with regard to one or two employees. We recommend changing the values in the Moderate - Severe to percentages of employees 10%, 20%, 30%or more. R.7: Same comment as R.6 - change values of one to three employees to percentages.
Yes
No
Requirement 2.2 specifies encryption for all Interactive Remote Access sessions, but does not specify where the encryption is required. If the intent is to require encryption from the user to the Intermediate Device the requirement should specify that clearly. Not all assets currently support encryption, so requiring encryption from the Intermediate Device to the Asset is not practical nor necessary if encryption is being employed outside of the ESP.
No
R.1 and R.2: There should be lower VSL where the processes listed on the table are implemented but not documented.
Yes
Yes
Yes
No
R.1: There should be lower VSL where the processes listed on the tables are implemented but not documented. Add to the Lower VSL: "OR the Registered entity has implemented but failed to document the required physical access controls" R.2: There should be lower VSL where the processes

listed on the table are implemented but not documented.
Yes
Yes
No
Requirement 3.5 requires logging of each Transient Cyber Asset connection. This is not practical as many assets do not have the capability of logging when someone makes a direct physical connection to the asset. Many assets are not capable of logging to centralized logging systems. Also, in a typical day, and engineer in the field may connect a Transient Cyber Asset to many different assets and it would be impractical for one to log each connection.
No
4.1 - The intent of 4.1 as written in the Guidelines and Technical Basis section is inconsistent with the requirement. The guidance states that “It is not the intent that if a device cannot log a particular event that a TFE must be generated”. If the intent is to not be out of compliance when a device cannot log certain events, it should be stated as such in the requirement. 4.3 - The activity level of some devices is such that they may not generate a logged event every day. Therefore, responding to an event failure with a day may not be possible. 4.3 & 4.5 – there is a conflict between these two. 4.3 requires a response to logging failures before the end of the next day. But, 4.5 requires bi-weekly sampling of logged events which would uncover logging failures. If the logs are being reviewed bi-weekly then logging failures may not be detected and responded to within the next day.
No
Items 5.4 & 5.6 in Table R5 includes the phrase “where technically feasible”. Does that mean a TFE will be allowed? If so, we believe that phrase should be removed and replaced with “as supported by the BES Cyber System” to eliminate need for TFE.
No
R.1 We have the same comment here about percentages for open ports (similar theme from above). What is written in high should be in moderate. What’s in severe should be broken down by percentages/numbers. R.2 Consider severity of patch as recommended by the vendor and the percentage of assets that may not have had a remediation plan associated with that patch. R.3 Consider putting some wording in here around the percentage.
No
There is some concern that multiple plans would prevent one single entry point into the Cyber Security Incident Response Process. We’d like to make the argument that only one plan is necessary and supporting documentation can be created as necessary that supports that plan.
No
The Applicability section of the tables refers to “All responsible entities”. We suggest using the same wording that all the other standards use (High Impacts, Medium Impact, Associated, etc) In R 2.2 In the first sentence, we recommend replacing the word “implement” with “exercise.” This is really about exercising the plan on a regular basis as the plan is already implemented. In 2.3, the "measure" for "relevant documents" does not give adequate guidance to the industry regarding what documents may be acceptable to demonstrate compliance. The "measure" indicates any "dated documentation related to" the reportable incident may be accepted. Please give some additional examples of the specific types of dated materials could be considered acceptable.
No
3.1 The terms “accuracy” and “completeness” are referenced but in terms of completeness there’s not a specific benchmark to compare the document again what should be quantified as complete. The suggestion is again to define a minimum set of information that would be expected in an Incident Response Plan. 3.2 - We recommend that clarity be added to ensure that language represents that review occurs 30 days after closure of the incident rather than invocation; rationale is that you might still be remediating and won't have learnt all lessons. We recognize the importance of the requirements to review the lessons learned, update the Incidence Response plan, and communicate the updates. However under the current structure it creates a rolling compliance effort following each incident. That is, an auditor will require that after each incident one has recorded lessons learned

review, changes to the response plan or that none were necessary and updated communications or that none were necessary. It would be easier to update the plan on a quarterly basis based on the previous quarter's incidents and not have so many auditable events to track.
Yes
No
1.5 – The requirement to preserve data for analysis or diagnosis may slow down the recovery process. There are times when recovery is urgent and must be done in a timely fashion. Is your intent to include this when you say "where technically feasible"? If so, language should be added spelling it out.
No
2.2 – We recommend removal of the phrase "and reflects current configurations" from the requirement. It is acceptable to have backup information that is less than current configuration and still perform a successful recovery. If this phrase is not removed, it will require a backup to be taken and tested for even the most minor configuration changes which is unnecessary.
Yes
No
We recommend the following VSLs for number of days until plan is reviewed in R3: 31-41 days = Lower, 42-53 days = Moderate, 53 plus is High and Severe for never updating plan. We also recommend the following VSLs for number of responsible personnel that the plan updates have not been communicated to: 1 person missed = Moderate, 2-4 = high and 5 or more is severe. We like the VSLs in CIP-010 R3. These recommendations attempt to make CIP-009 R3 consistent to CIP-010 R3.
Yes
Yes
No
We recommend considering emergency equipment replacement (partial outage) as "Exceptional Circumstances" . Based on the nature of our typical outages we would consider this practice to hinder the restoration efforts and bringing systems back on-line in a timely manner. We would certainly be good with language that allowed us to bring systems back on-line, ensure they are stable and then run a scan.
No
We recommend the following VSLs for number of days until documentation is updated in R1: 31-41 days = Lower, 42-53 days = Moderate, 53 plus is High and Severe for never updating documentation. R3 We like this structure. We've suggested this approach a number of times We aren't talking about whether or not this is violation, but rather about the severity of the violation and then rating the severity. We think this is a really good approach.
Yes
No
The footnote here should be part of the requirement.
No
We recommend the following VSLs on R 2: If the process to prevent unauthorized retrieval wasn't done on 1 device that would be low 2-5 moderate, more than 5 is high.
No
Due to the current status of version 4 (not FERC approved), there is potential for overlap of implementation with version 5 that could create extensive rework in a short period of time. This will cause an unnecessary expense to entities while not providing any additional cyber security benefit.

Comments: Page 3 – under the Balancing Load and Generation section, “Unit commitment” section the word “know” should be “known”. Page 5 – Monitoring & Control – recommend that you include “situational awareness” into the definition. There is a separate definition for it, but including it here ties the two together better. Example: “… provide monitoring, situational awareness, and control of….” Page 6 – Control Center – include “situational awareness” in the fourth item. Example: “Alarm monitoring, situational awareness and processing specific…” Page 8 – Transient Cyber Asset – I believe it would be good to have examples on what these can be. There will be too much guessing and possible CEA leeway here to make in-consistent application of the definition. This is my major issue with this document.
No
Page 9 – M1. The last sentence that starts with “Evidence of categorization of Low Impact BES…”. What does this mean – it did not may a sense to me. Examples would be a help here. Attachment I – for items 1.4 and 2.1 it would be good to include some reference or example that relates to a Registered Entity that does not own generation, but provides services to those who do. Our business model is a SCADA SaaS provider – we connect generators to the ISO, so the loss of our systems could have significant impact on a regions capability to see what their generation is (situation awareness) and impact the BES if conditions change and the ISO could not see those changes in sufficient time to react to them. I have asked the SDT about our situation and it is felt that 1.4 and 2.1 would cover us, but it would be helpful if it was clearer. For 1.4 suggested modification could be “that includes control or situational awareness of one or more….” For 2.1 suggested modification could be “Generation or Control Center with an ….” I believe the above ties together independent references to Control Centers and Situation Awareness to make it clearer on their importance and impact to the BES .

This will be very difficult to implement for Service Vendor where the individual executing the service will not necessarily be the same person. This happens with hardware issues and the dispatch of the first Technician who can respond to the ticket. Getting vendors to agree to training would be almost

impossible for large service vendors like DELL, HP, IBM. I would like to suggest that the Guidelines include examples for exceptions to having this type of training that does not include an “emergency”. We can get around this by declaring everything an “emergency”, but that is not the spirit of the requirement. If we have hardware in a remote data center a service Tech may be brought into the facility and then left with the hardware while the work is being performed. The personnel bring the person into the facility are not employees of our company and we are charged for each 25 minutes they can not do other tasks. Would like to see provisions for exceptions that are documented with some type of mitigation. I do not have a suggestion on what they could be, but would be will to help the SDT define what the mitigations are.

MPW is recommending that since CIP version 4 has been approved by the NERC BOT and is awaiting approval from FERC, that CIP-002-5 be placed on hold. Our industry has approved CIP-002-4 and the terms Critical Assets and Critical Cyber Assets are well known terms within our current cyber security plans. The following supporting information outlines a superior solution to the proposed version 5 standards that meets the main FERC goal of including more critical assets without requiring a reduction in reliability by forcing entities to retool their existing programs from scratch. The proposed solution below allows entities to start from a firm industry approved base (CIP-002 version 4) and modify its controls (CIP-003 through CIP-011). This approach also appropriately maintains an ultimate focus on protecting the BES elements, which is the fundamental reason all NERC standards exist. The proposed CIP version 5 approach inappropriately drifts towards an Information Technology based approach. While this is understandable, given the fact cyber security is involved, any solution must remain focused on protecting the BES from instability, uncontrolled separation, and cascading as a whole from a relatively large coordinated attack. If the SDT does not take this recommendation,

then the following comments are submitted concerning Version 5 CIP Standards. Significant work needs to be performed on the definitions. Many times new definitions are proposed in version 5 that aren't an absolute necessity. This would require entities to unnecessarily revise documentation and drawings just to meet new wording in a definition when the old definition or a change to the definition itself, rather than the term/phrase, would suffice. For example, instead of changing Critical Cyber Asset to BES Cyber Asset, retain the term Critical Cyber Asset and change the definition of Critical Cyber Asset to include "within 15 minutes". Definitions may also confuse and unnecessarily expand the scope of compliance. This will likely generate the need for Compliance Application Notices and Standard Interpretations. The CIP Rev 5 definitions and requirements are confusing in that they require entities to carefully align separate definitions and requirements to understand the full impact. They also unnecessarily expand the compliance scope into assets not currently covered by CIP Rev 4. This expansion will increase the burden on almost all entities. One example is, a BES Cyber Asset is defined as a "Cyber Asset that if rendered unavailable, degraded or misused would, within 15 minutes of its operation, mis-operation or non-operation, when required, adversely impact one or more BES Reliability Operating Services". The use of "adversely impact " is ambiguous and will lead to people applying their own interpretation to what "adversely impact" means. An entity may have generation connected at the distribution level that when unavailable may adversely impact any one of a number of items listed in the definition of BES Reliability Operating Services. MPW recommends the SDT update BES Cyber Asset to be: "A Cyber Asset that if rendered unavailable, degraded or misused would, within 15 minutes of its operation, mis-operation or non-operation, when required, would impact the reliable operation of the BES within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance". This recommend definition is based on and is aligned with Section 215, Electric Reliability, (a), (4) of the Federal Powers Act. The above recommended definition would also allow for the definition of BES Reliability Operating Services to be deleted, since BES Cyber Asset is clearly identified. The definition of BES Reliability Operating Services includes several items that a non-BES user or owner does in real-time. Other examples and opportunities for improvement: 1) BES Cyber Asset: Contains multiple references to other definitions. It is unclear as to the "within 15 minutes of its operation" inclusion. The redundancy of devices should be taken into consideration if there is a totally isolated redundant system providing the same functions or in a supervisory role. In protection schemes, there are primary and secondary relays which protect the same lines and a good practice recommends the relays have different logic/hardware to avoid common mode failures (totally independent of each other). 2) BES Cyber System: Need to correct reference to Maintenance Cyber Asset 3) BES Cyber System Information: This begs a definition of "BES Cyber System Impact" (is this based on section 215 of the Federal powers Act?). 4) Situational Awareness: Definition includes the term "Situation Awareness Operating Service" that is not defined. The Current day and Next Day Planning functions can normally be performed on a corporate PC. Does this bring the entire corporate network into scope? 5) Control Center: Based on this definition, a Control Center could be a building at a substation with 2 RTU's that monitor a 345 KV substation with multiple transmission facilities (lines) and a 115 KV substation with multiple transmission facilities (lines) in two different yards (locations) but geographically adjacent. Need to clarify that the two or more locations refers to some type of geographical separation. If not, the control building could meet the bulleted items under the Control Center definition. 6) Transient Cyber Asset: Break up the 3rd qualifier based on the intention of the SDT as such: "3) capable of altering the configuration, or (and) 4) capable of introducing malicious code to the BES Cyber System." A second example of where definitions may also confuse and unnecessarily expand the scope of compliance is shown just below: 1) CIP-002-4 requires cyber controls on: Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection. (Emphasis added) Whereas: 2) CIP-002-5 requires cyber controls on: Control Center One or more facilities hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation facilities or transmission facilities, at two or more locations: • Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems, • Inter-utility exchange of BES reliability or operability data, • Providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES, • Alarm monitoring and processing specific to the reliable operation of the BES and BES

restoration function, • Presentation and display of BES reliability or operability data for monitoring, operating, and control of the BES • Coordination of BES restoration activities. 3) Medium Impact Rating (M) Each BES Cyber Asset or BES Cyber System, not included in Section 1, above, that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services for: 4) 2.13. Control Centers not included in High Impact Rating (H), above, that perform (1) the functional obligations of Transmission Operators or Transmission Owners; or (2) generation control centers that control 300 MW or more of generation (emphasis added) The concern here is that every Distributed Control System (DCS) that controls two or more generators or substations with a total output of more than 300 MW will now be subject to the CIP Standards. Even if the DCS is not externally connected by serial or routable protocols it will be subject to the CIP standards.

Yes

MPW is recommending that since CIP version 4 has been approved by the NERC BOT and is awaiting approval from FERC, that CIP-002-5 be placed on hold. Our industry has approved CIP-002-4 and the terms Critical Assets and Critical Cyber Assets are well known terms within our current cyber security plans. The following supporting information outlines a superior solution to the proposed version 5 standards that meets the main FERC goal of including more critical assets without requiring a reduction in reliability by forcing entities to retool their existing programs from scratch. The proposed solution below allows entities to start from a firm industry approved base (CIP-002 version 4) and modify its controls CIP-003 through CIP-011. This approach also appropriately maintains an ultimate focus on protecting the electric grid elements which is the fundamental reason all NERC standards exist. The proposed CIP version 5 approach inappropriately drifts towards an Information Technology based approach. While this is understandable, given the fact cyber security is involved, any solution must remain focused on protecting the Bulk Electric System from instability, uncontrolled separation, and cascading as a whole from a relatively large coordinated attack. Issue: As currently drafted Version 5 of the CIP standards: • Would significantly increase cost without a commensurate increase in the reliability, safety, or security of the BES. • Create significant complexity, confusion, and administrative burden regarding the identification of Critical Cyber Assets, the definition of terms, and implementation of Cyber Controls. • Does not consider that smaller Entities have a much lower impact on the BES • Greatly exceeds FERC's 706 order without justification. Proposed Solution: 1) Retain CIP-002-4 as approved by the industry in 2010. It is filed with FERC; industry and NERC comments on the FERC NOPR recommended FERC approval. This will: • Eliminate the confusing and complicated process developed to identify BES Cyber Systems proposed by the drafting team in Rev 5 • Meet FERC's 706 for CIP-002-1: o Industry approved guidance documents for identifying Critical Assets and for identifying Critical Cyber Assets. ¶253-258, 270-273 o CIP-002-4 replaces the Critical Asset guidance and aligns with FERC's affirmation that the applicable responsible entities are responsible for identifying Critical Assets. ¶319-321 o CIP-002-2 added senior manager approval of risk-based methodology. ¶294-297 • Not exceed FERC Order 706: • ¶284: "… there is no formally accepted method for identifying critical cyber assets before us at this time … we decline to direct that such a method be incorporated into the CIP Reliability Standards at this time." • ¶285: "CIP-002-1 provides that a critical cyber asset must either have routable protocols or dial up access … We do not find sufficient justification to remove this provision at this time." 2) Develop a new standard for High Impact Assets: • That identifies which assets in CIP-004-2 are High Impact and • Clearly states the extra protection required for High Impact Assets: o The Draft version 5 identifies eight extra protections, most are in response to FERC Order 706. o Provides opportunity for a separate implementation timeline for the additional controls that apply only to High Impact assets. o Provides flexibility in adjusting controls on High Impact assets. In the future only one standard has to be modified. o Entities that do not have High Impact assets will not have to sort through all the standards and RSAWs to assure compliance and security. 3) Develop a separate standard for the Low Impact assets or abandon this concept. • Lows were not directed by FERC Order 706 nor included in the SAR. o A separate standard provides full transparency in the stakeholder process. o This is a scope expansion not supported by many in the industry. o Cost and compliance concerns with lows include whether lows have to be listed. This is a derivative of which controls are selected and how they are designed and audited. 4) Revise CIP-003-5 through CIP-011-5 and Definitions to reflect changes described in this paper and meet FERC Directives in order 706 If the SDT does not take this recommendation of maintain CIP-002-4, then MPW submits the following comments. Keep the "bright-line" criteria thresholds defined in CIP-002-4 in the CIP-002-5 standard. There was much industry input into developing these thresholds and it does not seem appropriate to modify them

again. It is difficult for utilities to keep up with the changing thresholds in the changing CIP versions and associated implementation plans, with no BES reliability improvement Issue - 1 high Impact, bullet 1.2, states: Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority. MPW does not understand how this can be applied to every BA, regardless of size. Upon review bullet 1.2 has qualifiers for a TOP in order to be a High Impact category (notwithstanding that a TO should not be included since TO's are not required to have primary or backup control centers). We can easily see that there is some stratification afforded to TOP and GOP Control Centers, based on voltage levels, total MW, total MVAR, number of lines, Blackstart Resources, etc, for being considered High Impact or Medium Impact. While the SDT has acknowledged there are some distinct differences between larger and smaller TOP's and GOP's, we want to point out that not all Balancing Authorities are created equally. Does anyone think that the smallest BA in North America, serving 38 MW of load, has the same Reliability Impact as a BA serving 10,000 MW, or more, of load? Does it really improve the reliability of the BES to have ALL those smaller BA Control Centers carry the same High Impact Rating? Issue - Criterion 2.7 in Attachment I describes the "weight value" to be applied to transmission lines. There is no guidance given for transformers. Many entities may treat a facility that has multiple voltages as separate substations, with separate control houses, and may be assessing the independent Impact Level of each voltage as separate facilities. Therefore, there must be some guidance on how to deal with transformers. Furthermore, it is suggested that the weight value given a transformer (if transformers are to be included in the calculation) be the weight value of the secondary, not primary side. For example, a 345kV substation may have a single 345kV transmission line out of it, weighted at 1300. That same substation may then have two 345kV/230kV transformers. It is not obvious from criterion 2.7 what the total weight of the substation would be. It is suggested that the secondary voltage be used (if transformers are to receive a weighting value) making each of these transformers valued at 700, for a total of 2700 at this substation, making it Low Impact. However, if the primary voltage level was used to determine the weight, the transformers would each count for 1300, making the total weight value of this substation 3900, and a Medium Impact facility. It is suggested, if transformers are to be included, that the secondary voltage be used because, from the 345kV bus in this example, its two additional outlets (the transformers) are only capable of 230kV outlet flows, even though they are connected to the 345kV bus. Issue - Criterion 2.8 – (1) Use the term 'Planning Coordinator' rather than 'Planning Authority" to be consistent with the rest of the standard and current NERC practice. (2) Replace the less clear wording of '. . . as critical to the derivation of IROLs and their associated contingencies' with wording of, '. . . as Facilities that if destroyed, degraded, misused, or otherwise rendered unavailable, would cause one or more IROL violations', like the wording using in Criterion 2.11. Issue - Criterion 2.11 in Attachment I states "Each SPS, RAS or automated switching scheme that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more IROL violations." It is unclear whether the phrase "that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more IROL violations" refers to the SPS itself or the BES elements that the SPS operates. It is possible (and likely) for an SPS to be a higher Impact Level than the BES elements that it operates. Assuming the phrase is meant to apply to the SPS, a suggested re-wording of this phrase is the following. "Each SPS, RAS or automated switching scheme that operates BES Elements and is capable of causing one or more IROL violations if the SPS is destroyed, degraded, misused or otherwise rendered unavailable. MPW proposes the following: Criterion 2.9 – (1) Use the term 'Planning Coordinator' rather than 'Planning Authority" to be consistent with the rest of the standard and current NERC practice. (2) Replace the less clear wording of '. . . as critical to the derivation of IROLS and their associated contingencies' with wording of, '. . . as FACTS that if destroyed, degraded, misused, or otherwise rendered unavailable, could cause the violation of one or more IROLs', like the wording using in Criterion 2.11. Criterion 2.12 – (1) Replaced the word, 'system' with 'common control system' to clarify that this criterion applies to a system triggered by a single (common) control, rather than a program (system) of many independent relays set to trip at the same frequency

No

Issue - What is the NERC basis for 30 days? Many Utility reviews are performed annually. NERC has not provided any technical justification for a 30 day update. An annual update is sufficient based upon the low probability of a serious cyber or physical attack. Issue - The text "all other BES Cyber Assets and BES Cyber Systems … shall be deemed to be Low Impact." This text appears to include all BES Cyber Assets in CIP scope. This has NOT been directed by FERC Order 706.

No
Issue - With recent guidance on the term “annual” provided by NERC, it may be prudent to replace the phrase “and at least once each calendar year thereafter, not to exceed 15 calendar months between approvals” with the word “annually”.
No
Issue – MPW believes the VSLs recognize the fact that entities of different sizes are taken into account in the severity levels and associated impacts to the BES.
Issue - Most of the changes made to CIP-003, in general, were not directed by FERC Order 706. These changes do not result in improvements to security, but do result in increased bureaucracy and implementation costs for 241 entities in North America with existing programs. MPW suggests the FERC directives be addressed within the structure and language of CIP version 4. MPW proposes the following requirements for CIP003-5: R1: Cyber Security R2: Leadership R3: Exceptions R4: Information Protection
No
Issue - This is an administrative task and once implemented does not add to BES security.
No
Issue - With recent guidance on the term “annual” provided by NERC, it may be prudent to replace the phrase “and at least once each calendar year thereafter, not to exceed 15 calendar months between approvals” with the word “annually”. Issue – MPW suggests changing to annual “review” and NOT approval. Entities need not “approve” the same security policy if there are no changes or updates.
Yes
Yes
No
Issue: What is the justification for documentation within 30 days?
Yes
No
Issue - Many of the changes made to CIP-004, in general, were not directed by FERC Order 706. These changes do not result in improvements to security, and they increase implementation costs for the 241 entities in North America with existing programs. MPW suggests the FERC directives be addressed within a structure and language that is more in line with CIP version 4. We propose the following requirements for CIP-004-5: R1: Awareness R2: Training R3: Personnel Risk Assessment R4: Access
Yes
Yes
No
Issue – MPW recommends adding clarification to R4.4 in terms of vendor support from foreign companies. Also, please clarify when an Entity or contractor is initially in the CIP Standards then they are removed (for some reason) then they are brought back into CIP compliance responsibility. Is the risk assessment previously obtained still valid if obtained within 7 year period?
Yes
No
Issue – MPW wants to point out that in FERC Order 706, paragraph 381, the Commission stated its intent is to ensure there is a clear line of authority. Order 706 did not direct making the Senior Manager authorize every individual change down to the account level. The version 5 draft is an additional administrative burden that does not commensurately improve security of the BES and

creates a disproportionate amount of administrative bureaucratic work.
No
Issue - For reassignments requiring a different level of access, there may be the need for a large amount of work in setting up new user accounts, modifying user accounts, changing firewall and router rules, etc, that cannot be accomplished by the end of the next calendar day without jeopardizing reliability. This is also an issue for BES Cyber System information for entities which are using document management systems with individual accounts to restrict access to information. It is typically easier for most Entities to “remove” an account than it is to “modify” an account, yet the modification of these accounts is subject to a single calendar day while the removal of these accounts is allowed for 30 calendar days. Due to the amount of reconfiguration needed for these types of changes, MPW suggests to allow at least 7 calendar days for modifications in access levels. Issue - FERC Order 706 did not direct a change. MPW recommends retaining CIP-004-4 where revocation already is covered. Issue - The time requirements are exceedingly restrictive for Medium Impact BES Cyber Systems. Allowing 7 calendar days for R7.1 and R7.2 would be more acceptable and practical for systems that may not be controlled centrally. Issue - MPW values how the SDT tried to give treatment to the “immediate revocation” requirement of the FERC order in Part 7.1. However, MPW feels the current language is broad, vague and considerably open for interpretation. Even with the footnote qualification, an auditor could still interpret “at the time” to mean literally “to the minute”. Complicating matters is the fact that there is often no way to determine specifically when a person resigned or is terminated. MPW suggests for Part 7.1 to restate as: “Develop and implement a program to revoke an individual’s unescorted physical access and Interactive Remote Access to BES Cyber Systems at the time of resignation or termination”. This way, the Entity is measured for compliance to their own program and not struggling to provide time-stamped comparisons that may not exist. For Part 7.5, it is possible that Entities use shared accounts for remote access. Suggest adding “...if shared accounts are used for Interactive Remote Access to BES Cyber Systems, passwords must be changed at the time of resignation or termination per Part 7.1”.
Yes
No
Issue - R1.1. To MPW, this appears to require that Entities document Low Impact Cyber Systems. This requirement should not be required for Low Impact BES Cyber Systems; otherwise, Entities would have to prove to auditors that external routable connectivity is not used at EVERY Low Impact BES Cyber System.
No
Issue - This Requirement disregards the fact that some Entities have their own (unique) communication network from the Control Centers to the Substations. Adding encryption devices and additional devices adds additional points of failure without increasing security. Exceptions should be made for interactive remote access across company-owned and operated communication links.
Yes
No
Issue - In the “Measures” column of Table R1, Part 1.1, it states the need for documented “operational and procedures controls”, while the Requirement states “operational or procedural controls.” MPW highly recommends to correct the Measures column to be consistent. If the error was in the Requirements column, MPW disagrees that operational physical access control systems should be required for Low Impact BES Cyber Systems. Issue - The Requirement in Table R1, Part 1.2 and Part 1.3, should define whether or not these physical access controls are to be operational, procedural, either, or both for Medium Impact and high Impact Cyber Systems as was done in Part 1.1 for Low Impact Cyber Systems. If operational controls are required, is a separate operational physical access control system needed to monitor the primary physical access control system or is it allowed for a system to monitor access to itself? Issue - For CIP-006, in general, MPW disagrees with changing the definition name from Physical Security Perimeter to Defined Physical Boundaries because it unnecessarily creates the need to update numerous procedure documents and physical security drawings, etc. MPW wants to be clear that changing the term does not, in any way, improve security, but increases confusion and adds costs for the 241 entities in North America that have Physical Security Perimeters.

No
Issue - R2.2 does not seem applicable to Medium Impact Substations. The logging of entry and exit of visitors will be tedious without bringing much value. R2.2. should only be applicable to Medium Impact Control Centers.
No
Issue - R3.1 and R3.2 will be exceedingly troublesome for Low Impact Facilities that use procedural controls for Physical Access Control. MPW wants to know what hardware or devices would be included? R3.1 and R3.2 should only be for applicable electronic physical access control systems.
Yes
Yes
No
Issue – MPW suggests changing the term “remediation” to “mitigation.” R2.3 appears to require the installation of the patches, where some Entities may mitigate the vulnerability through procedural controls.
No
Issue - R3.1. Allows the Responsible Entity to choose which approach they want to take to “deter, detect, or prevent.” If a Responsible Entity chooses to deter or prevent malicious code by procedural controls on isolated control systems (i.e. non-routable serial links), MPW wants to point out that requirement R3.2 and R3.3 are impossible to achieve compliance. Furthermore, R3.3 requires modifying a tested and working control system at a substation with the possibility of inadvertently introducing malicious software with manual updates (e.g. using thumb drives to install signature updates on non-networked systems). MPW recommends excluding Medium Impact BES Cyber Systems that do not have external routable connectivity. (Most AV or malicious code software cannot recognize new malicious code such as Stuxnet until the signatures are discovered anyway.)
No
Issue - FERC Order 706 does NOT direct these changes. CIP-007-5 R4.1 - The enumerated list is too prescriptive for the requirement. Add to guidelines. CIP-007-5 R4.2 – Some assets can log, but not alert. Remove “real-time”. CIP-007-5 R4.3 – MPW requests a clarification on timing. MPW proposes revised text, “Activate a response to event logging or alerting failures before the end of the next calendar day after identification.” MPW appreciates that the SDT allowed entities to develop their own system events related to cyber security, but this leaves an open door for auditors to apply their own approach (and interpretations) to what the THEY believe is acceptable. MPW believes R4.1. will be troublesome for Entities to prove compliance with Medium Impact BES Cyber Systems with no external routable connectivity, unless the auditors accept the configuration files and not the actual logs. Issue - R4.2. This Requirement also leaves a large audit hole for the Entity determining what events necessitate a real-time alert and the auditors having differing opinions of what they feel the entity should include.
No
Issue – MPW recommends to delete R5.2 because it replicates the CIP-004 access authorization requirements and could create a double jeopardy situation. Issue - R5.5.1 – FERC Order 706 did NOT direct a change to password length. Although an increase in password length from six to eight characters improves security, an increase to ten would improve it more and so on. This begs the question “Where does one stop?” Not all assets have capability for longer passwords. MPW recommends retaining the six-character password. Issue – MPW recommends that R5.4. be limited to Entities having a policy in place that all default passwords should be changed. Proving compliance at a sampled location opens up the door in an audit to have Entities having to prove compliance on all their BES cyber systems if there is 1 finding. That 1 finding would require the Entity to have to inventory all Low Impact Cyber Systems and show that every system had the default password changed. The requirement also leaves open the auditor’s interpretation of what is considered a Low Impact Cyber System at a sampled location, since there is not an inventory required by the Standard.
Yes

No
Issue – MPW recommends the SDT to coordinate more closely with EOP-004-2, SDT
Yes
Yes
Yes
No
Issue - R1.5 states, “Preserve data, where technically feasible, for analysis or diagnosis of the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1.” As FERC Order 706, paragraph 708 states, “should not impede or restrict system restoration”, MPW recommends this proposed revised text: “Preserve data, when it does not impede or restrict system restoration, if necessary to determine the cause of any event that triggers activation of the recovery plan(s) as required by Requirement R1.
No
Issue - The wording in the Requirement Column of Table R2, Part 2.2, implies that all backup media must be tested annually. If an Entity, for example, has 25 Windows Servers – that entity should be able to annually test a Windows backup without having to test the backup for each system, especially if the same backup system is being used for all Servers. This is even more extreme in the case of substation cyber assets, such as protective relays. MPW recommends changing the language from “Test any information used in the recovery …” to “Test information, for each type of Cyber Asset, used in the recovery …”
No
Issue - In Table R3, Part 3.4, the language “Update recovery plan(s) to address any organization or technology changes…” is exceedingly vague with regards to technology changes. MPW recommends wording as “Update recovery plan(s) to address any organization or implemented technology changes…” Issue - R3.1. Is not clear on how soon the recovery plan has to be updated “when BES Cyber Systems are replaced”. MPW suggests to include “or within 30 days of when BES Cyber Systems are replaced.” Additionally, MPW recommends that “Update recovery plan(s) to address any organization or implemented technology changes that would prevent a successful implementation of the recovery plan”
Yes
No
Issue - The draft requirement is excessively prescriptive, which was not directed by FERC. Move these details to guidelines. MPW recommends limiting the applicability to High Impact Critical Cyber Assets, which will allow Entities to focus security improvement efforts on the highest priorities. Issue - R1.1. Will be tedious and extremely time-consuming for Medium Impact BES Cyber Systems at substations/plants. The number of IED’s and programmable devices is quite large and some of these devices may have multiple modules or add-on boards with different software versions. Issue - R1.2. and R1.4. will create many problems when making emergency repairs in the field that require replacing a “card” or “module” with different software versions and obtaining CIP Senior Manager approval without any security benefits for the BES. MPW suggestion: Provide a separate requirement for Medium Impact Control Centers and Medium Impact Systems excluding Control Centers which allow more flexibility for the type of environments and equipment. For Medium Impact BES Cyber Systems excluding Control Centers could require documenting baseline configurations on only a subset of the cyber assets (e.g. HMI’s, EAP’s, etc.) not including meters, gauges, battery chargers, electronic programmable thermostats, relays, modules, PLC’s, etc
No
Issue - MPW recommends that the applicability of Table R2, Part 2.1 include only “Medium Impact BES Cyber Systems with Routable Connectivity."
No
Issue - Annual vulnerability assessments on Medium Impact Cyber Systems will prove to be very

costly and resource intensive for utilities with multiple substations in this category that are geographically dispersed. MPW recommends allowing Medium Impact Cyber Systems to have 2 years between vulnerability assessments. Issue - Though FERC directed guidance for Vulnerability Assessments, the rewritten Standard's general reference to "security controls" could result in varying interpretations and likely expansion of assessment scope. Issue - R3.1. Needs to be reworded to more clearly define if the assessment is a vulnerability assessment or only an "assessment of the security controls", such as the EAP and Physical Access Controls. Issue - R3.2. Should allow entities to perform an active vulnerability assessment on either the production system or the test environment to meet the requirement. This will allow entities to make the choice on which environment to use and not require the documentation of differences between the test environments and production environments that leave entities open for interpretation of differences by auditors. Issue - For Part 3.2, please clarify whether all cyber assets need to be included in the assessment, or a subset, or representative sampling, or entity defined. There are certain cyber asset categories where "test" systems just aren't economically feasible. What is the acceptable deviation between test and production the auditors will allow? As written, and without explicit language in the requirement, our entity fears this will be a topic of a CAN later. Issue - For Part 3.3, please clarify whether "new Cyber Asset" means literally that or, more reasonably, could mean "new Cyber Asset category" or a new make/model, or a new function. It would be reasonable to test something that brings net-new functionality to a BES Cyber System, but if when replacing an end-of-life or failed component, it wouldn't make sense.
Yes
No
Issue - R2.1. Needs to include additional clarification of devices that are included. Where do protective relays or devices that have flash memory or other on-board memory media fall? Does this apply when reusing the device from a Medium Impact BES Cyber System to a Low Impact BES Cyber System? The application guideline does not distinguish if there is a difference between impact levels and only refers to reuse outside of a BES Cyber System (e.g. could go from High-Medium-Low without being erased.)
Yes
No
Issue - It is imperative for the industry to know whether or not Version 5 will supersede Version 4 well in advance of any implementation plan. If Version 4 has a short implementation period before Version 5 is in effect, entities will view their efforts to comply with Version 4 as "wasted" in many cases because the infrastructure required for a Version 4 Critical Asset is more than that of a Version 5 Medium Impact facility. It would be irresponsible to ask entities to "over-protect" facilities that will not be High Impact with Version 5 right around the corner. In addition, this could also have a drastic impact on decreasing reliability as many entities may elect to remove all routable protocols and dialup access to cyber assets within Version 4 "Critical Assets", to bide them time until Version 5 becomes effective. During this time, engineers would not have access to troubleshoot protection systems, retrieve fault data, and perform multiple other duties without having to travel to a remote site – this could result in prolonged customer outages, and possible instability with known defects in design taking longer to correct. Entities realize that NERC has made an effort to do this, however, there is still risk associated with version 5 not passing in time to supersede version 4. This could be catastrophic to the standards development process.

Yes
CIP-002-5 makes great strides to remove ambiguity and categorize the potential impacts of Cyber Assets. However, the standard should be changed in one of the following: 1) plainly state those entities with no BES assets per the definition are not required to adhere to this standard or,

alternatively, the Senior Manager must annually certify that the entity has no BES assets per the definition thus no Cyber Assets; or, 2) create a fourth category stating No Impact, thus no further action required which can be certified annually by the Senior Manager. As the standard is currently stated, smaller entities with non-critical assets of the BES appear not to be involved with this standard, but that is dependent on the interpretation of “Transmission Protection System”. Concurring with thought implied in comment 27.b by PNGC (et al) and considering the recent interpretation of PRC-004 and PRC-005 regarding the interruption of current fed from the BES, electronic relays with no communication to the “world” could be considered as a Cyber Asset even though the relay has no impact on the BES if lost, but the relay would be forced into the Low category because a “No Impact” or “Non-Critical” category does not exist. The Standard, as written, tends to assume that an entity does have Cyber Assets that can impose a risk to the BES. This assumption should be removed. Furthermore, in the context of relays, a small entity may be required to own and maintain UFLS relay or relay system by the Transmission Provider. In the standard, the UFLS threshold is at 300MW. The small entity may not have 300 MW of load, but their relaying is part of the design of an UFLS system that is much greater than 300 MW. This small entity’s relay is not critical to the BES and if degraded or destroyed would not compromise the capability of the Transmission Provider’s UFLS system as the two systems are not integrated and do not communicate. Therefore, does the small entity own a Cyber Asset due to the 300 MW level, or is it still exempt? The Standard Drafting Team should work to clearly define the entities not included by the definition. As the standard is currently written, an assumption is implied that all entities own Cyber Assets and all entities assets impact the BES. Left to the determination of what would or would not degrade the BES, the Standard Drafting Team has created a series of interpretations and clarifications that will be required from NERC regarding smaller DPs and LSEs. The assumptions and then the created ambiguity for interpretations and clarifications should be removed.
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, R1 will not apply to those utilities.
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, R2 will not apply to those utilities.
Yes
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, CIP-003-5 will not apply to those utilities.
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, CIP-003-5 R2 will not apply to those utilities.
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, CIP-003-5 R3 will not apply to those utilities.
Yes
No
The assumtion is that CIP-002-5 will be changed so that utilities that do not have any BES will not have any Critical Cyber Assets or Systems and therefore, CIP-003-5 R5 will not apply to those utilities.

The word “any” in the definition of “External Routable Connectivity” can be a bit misleading, and could be mis-interpreted as being similar to the “any” rule commonly found on a firewall. Recommend the SDT change “any” to “a”. The definition of “Interactive Remote Access” seems to refer to a person having interactive access to the operating system of the cyber system, but what about at the application layer? How does an entity give CIP-005 treatment to an EMS/DMS system in a control center that is accessed via a fat-client application via “remote” employees? The SDT should strongly consider adding a definition for the word “Access” (from a cyber perspective), or specifically state that an entity can make their own definition of access such that different treatment can be given to high-risk access versus low-risk access. High-risk meaning the ability to interact with, operate, modify, or cause availability issues with a BES Reliability Operating Service. Other examples where “access”, if left undefined, could cause problems for an entity are: VMWare hypervisors, Oracle database clusters, or NAS systems that contain both BES and non-BES data/systems. Is the entity required to give CIP-004 treatment to an accounting clerk who has “access” to a receivables data table on an Oracle cluster that also hosts the backend database to a (BES) load control or EMS system? The definitions of “Physical Access Control System” and “Locally Mounted Hardware of Devices Associated with Defined Physical Boundaries” (the latter defined within the CIP-006-5 standard) do not specifically define workstations used by guards to monitor Defined Physical Boundaries, nor do they define physical security panels which control (usually many) door readers and alarms. Are these two types of assets in scope for CIP-006-5 or not? The definition of Electronic Access Control or Monitoring Systems is still too vague. For Access Control, specifically, does this mean every cyber system that might contribute to the authentication, authorization, and accounting (“AAA”) of a person crossing an EAP? If an entity uses Windows Active Directory for firewall authentication, for instance, this could be interpreted to mean every domain controller in the company is in scope. Extending that argument,

the Help Desk PC that is used to grant access to the Windows Active Directory could be interpreted as being part of the AAA process, and therefore an Electronic Access Control cyber asset. Likewise, a PC in the Security Operations Center that is used to monitor alerts from the EAP could be considered a Cyber Asset used for Monitoring. Recommend the SDT provide a comprehensive list of cyber asset examples or "bright-line" set of criteria for Electronic Access Control or Monitoring Systems. (The same concern applies to Physical Access Control Systems as well). Lastly, the definition of "Transient Cyber Asset" leads one to believe that this only applies to devices directly plugged into other Cyber Assets, as opposed to those temporarily plugged into the ESP network. We ask that the SDT review this definition against CIP-007-5-R3.5 to ensure this was the intention.
Yes
Blackstart plans for resources used for load restoration purposes may be inadvertently included in the existing definition, specifically criteria 2.4. The Cranking Path diagram on Page 26 implies that Blackstart resources are only included where used to start a unit. Suggest criteria 2.4 be modified to read "Each Blackstart Resource identified in its Transmission Operator's restoration plan used to provide power for remote start of another generation unit(s)". Criteria 2.11 contains the words "…if destroyed, degraded, misused". (Twice). This appears to be a carryover from version 4, but it now is redundant and perhaps conflicting with the "15 minutes" qualification as defined at the top of the Medium Impact Rating section. Criteria 2.12 refers to a "system" – as in "Each system or Facility…" – that implies something of a cyber nature. The rest of the bright-line criteria refer to or describe hard assets, not cyber assets. This seems like an odd exception. Recommend removing "Each system or". Lastly, page 30 of the draft standard contains an example methodology or process flow for categorizing BES Cyber Assets and BES Cyber Systems. We realize that this graphically illustrates the overall intent of the SDT for CIP-002-5, but in reality we still have a standard that an entity will interpret as: Step One – list all my High and Medium facilities ("critical assets"). Step Two – list all my High and Medium cyber assets ("critical cyber assets"). This point of view is further supported by the fact that when you boil down all the security controls in CIP-003-5 through CIP-011-5, there really isn't any appreciable difference between High and Medium requirements. Therefore, the additional paperwork burden of stratifying High and Medium facilities and High and Medium cyber assets doesn't seem to be worth the effort. We understand that there is pressure to expand the scope of CIP to more hard assets, but let's not hide behind this High/Medium smokescreen and instead be honest with industry. Modify items 1.1 through 2.13 on Attachment I to be "All these assets have a Critical Impact Rating". Requirement 1 should therefore be "For all cyber assets including associated physical and electronic access control and/or monitoring systems and associated protected cyber assets, that support one or more BES reliability operating services at a Critical facility, apply the controls as specified in CIP-003 through CIP-011". If there are cases (like CIP-010-5-R3.2) where specific "High Impact" systems are intended, then say so in the requirement: "For Control Centers, perform an active vulnerability assessment every 39 months…".
No
What constitutes a "change to BES Elements…" per part 1.1? Suggest modifying this language to simply state that new or retired assets be added or removed from the list within 30 days of commission or decommission. For M1, we believe the intention is that entities are not specifically required to list their Low Impact systems, therefore we would recommend the last sentence be changed to "Evidence of categorization of Low Impact BES Cyber Assets and BES Cyber Systems is not required, but instead may be demonstrated by the application of the required controls". (New words are "is not required, but").
No
Recommend that this requirement and all others that use the words "…initially upon the effective date of the standard…" have this phrase stricken. The implementation plan that accompanies the final approved draft should include the requirements for first time iteration of periodic activities. It's not reasonable to assume that every entity is capable of executing all procedures "upon the effective date". Minor point, but this is the first time "CIP Senior Manager" is used in the standards. Perhaps add a cross-reference to the appropriate requirement in CIP-003-5. In section "B. Compliance", under sub-section "1.2 Evidence Retention", there is a typo in the second to last line. Please change "complaint" to "compliant". I'm sure this was unintentional, even though it sort of fits either way.
Yes

Yes
Yes
Yes
Yes
No
Are the measures listed under M5 actually examples of compliance, meant to be prescriptive? These are very specific and imply requirements. On this point, throughout the standards, measurements are now tightly tied to requirements and are much more prominent. We feel this is rightly so. However, we need to be very (very) careful that examples are stated as examples, lest “measures” become “requirements” themselves. Please state (somewhere) the compliance applicability of Measures. In the second bullet under M5, CIP-002-5 R3 is mentioned. There is no R3 in CIP-002-5. In the last sentence in the last bullet under M5, the words “…of the plant managers…” is mentioned. I don’t think it was the intention of the SDT to be this specific. In fact, this entire bullet is one huge run-on sentence, confusing, and should be redrafted for clarity.
Yes
Yes
Yes
No
Parts 2.2 and 2.4 seem somewhat redundant. If there was a specific distinction intended by the SDT, please rewrite to make this more clear. Part 2.10 needs a bit more clarity to understand what was intended. Was this meant to be technical training on how systems talk to each other over a network? Or is it for general knowledge on risks and controls of routable networks? Please add more clarity here.
No
One potential oversight in all versions of the CIP-004 standard is guidance on the training requirements for “transient” workers. By transient, we mean persons whose access is either temporary, or perhaps is granted and revoked on a periodic basis due to project work. We request that the drafting team add some words to R3 (or Part 3.2) to make clear the requirements for this category of worker.
No
One potential oversight in all versions of the CIP-004 standard is guidance on the PRA requirements for “transient” workers. By transient, we mean persons whose access is either temporary, or perhaps is granted and revoked on a periodic basis due to project work. We request that the drafting team add some words to R4 to make clear the requirements for this category of worker. The Applicability sections of R4 and R5 are different. This appears to be an oversight by the SDT, as it doesn’t make sense to design a PRA process for one set of assets, but implement it for a different set.
No
The Applicability sections of R4 and R5 are different. This appears to be an oversight by the SDT, as it doesn’t make sense to design a PRA process for one set of assets, but implement it for a different set.
No
Parts 6.1, 6.2, and 6.3 seem to imply that the CIP Senior Manager must specifically delegate persons who have the authority to authorize electronic/physical access. If it was the intention of the SDT that a signed list of authorizers is required, then please make this a specific requirement – either in CIP-004-5 or CIP-003-5. Parts 6.1, 6.2, and 6.3 state that “access permissions shall be the minimum necessary…” We feel this to be an aspirational statement that entities will be hard-pressed to prove at audit time. Recommend this sentence be moved to the Rationale or Guidelines section. Part 6.3

should include a cross-reference to CIP-011-1-R1.2, as in "…as documented in the entities information protection access control procedures in CIP-011-1-R1.2." Parts 6.1, 6.2, and 6.3 include the qualifier "…except for CIP Exceptional Circumstances". For consistency, we feel this language should either be stricken, or amended to include a reference back to the entities CIP Exceptional Circumstances policy per CIP-003-5-R2. Please clarify whether Part 6.5 applies to cyber access or physical access, or both. The notion of "groups" can theoretically apply to physical access control systems as well as cyber. Part 6.6 appears to be redundant to the annual information protection review performed per CIP-011-1-R1.3. Per earlier comment, the "minimum necessary" language throughout R6 will be difficult for entities to prove to an auditor and should be moved to the Rationale or Guidelines section.
No
We appreciate how the SDT tried to give treatment to the "immediate revocation" requirement of the FERC order in Part 7.1. However, we feel the current language is too open for interpretation. Even with the footnote qualification, an auditor could still interpret "at the time" to mean literally "to the minute". Complicating matters is the fact that there is often no way to measure specifically when a person resigned or is terminated. Our suggestion for Part 7.1 is to restate as: "Develop and implement a program to revoke an individual's unescorted physical access and Interactive Remote Access to BES Cyber Systems at the time of resignation or termination". This way, the entity is measured for compliance to their own program and not struggling to provide time-stamped comparisons that may not exist. For Part 7.5, it is possible that entities use shared accounts for remote access. Suggest adding "...if shared accounts are used for Interactive Remote Access to BES Cyber Systems, passwords must be changed at the time of resignation or termination per Part 7.1".
No
In the Guidelines section of CIP-004-5, the last sentence under Requirements R3 (and again under R4) states "…by the single senior management official identified in Requirement R1". This should be re-written to say "…by the CIP Senior Manager or delegate identified in CIP-003-5-R1". In the Requirement R4 section of the Guidelines the reference to CIP-011 is a typo and should state CIP-004 instead. In the Requirement R6 section of the Guidelines, the last sentence of the first paragraph should be modified to state "Best practice recommends that access authorization and provisioning should not be performed by the same individual". Some entities are too small for strict separation of duties to be feasible.
No
How does an entity demonstrate compliance to Part 1.1 if CIP-002-5 does not require that entities document their Low Impact cyber assets? Please revise the Measures section to provide clear guidance on recommended artifacts for compliance that do not pre-suppose lists of Low Impact cyber assets. Please provide a technical basis for the requirement that outbound access permissions are necessary per Part 1.3. If no technical basis can be defined that can be uniformly applicable to all BES entities, then please qualify "outbound" to be "…inbound and, where implemented by the entity, outbound access permissions". In Part 1.5, the term "malicious communications" is too vague. Recommend changing 1.5 to say "A documented method for malicious traffic inspection at each EAP". The Guidelines section provides good information and a technical basis for R1, and the SDT should be complimented on their well-reasoned analysis, but we have concerns about Guidelines and Technical Basis language being included within the Standards themselves. The third paragraph, for example, states "This requirement applies only to communications for which 'deny by default' type requirements can by universally applied…". This sort of language, while useful, should more properly be included in the requirements. The SDT should make very (very) clear the intent of the Guidelines and Technical Basis section of the standards, and the expectations of the entity - and of the compliance enforcement authority – on how this information should be used.
No
We recommend that "where technically feasible" qualifiers be added to Parts 2.1, 2.2, and 2.3.
Yes
No
How does an entity demonstrate compliance to Part 1.1 if CIP-002-5 does not require that entities document their Low Impact cyber assets? Please revise the Measures section to provide clear guidance on recommended artifacts for compliance that do not pre-suppose lists of Low Impact cyber assets. Retention requirements for Part 1.6 are not made clear. Perhaps it was intentionally left

undefined by the SDT? If this is true, should the entity therefore assume they will need to retain three years of Logs per the Evidence Retention portion of the standard?
No
Retention requirements for Part 2.2 are not made clear. Perhaps it was intentionally left undefined by the SDT? If this is true, should the entity therefore assume they will need to retain three years of Logs per the Evidence Retention portion of the standard?
Yes
Yes
No
For Part 1.1, SDT should acknowledge the use of dynamic ports/ranges used by a wide variety of cyber systems. The documentation requirement seems a bit redundant to the configuration management documentation requirements of CIP-010-1-R1.1.
No
For Part 2.1, suggest the language be rewritten as “Identify and implement a process to monitor for the release of security patches…” As it’s currently written, “identifying sources” might be interpreted as writing down a bunch of third-party URL’s that may change without warning. Recommend revising Part 2.2 to say “Identify applicable security-related patches or security-related updates…” As written, a person could interpret “updates” to mean security-related or not. The words “…that addresses the vulnerabilities within a defined timeframe” should be separated from the end of the sentence and rewritten as its own sentence for clarity. Part 2.3 is not clear on what is actually required. The requirement talks about a process, yet the Measures suggest evidence that the remediation took place. Should Part 2.3 say “Execute the remediation plan documented in Part 2.2”?
No
For Part 3.5, need to add “where technically feasible” qualifier here. If we serial-connect a laptop into a router or a relay, the device may not be capable of detecting and logging that connection. The Change Rationale for Parts 3.4 and 3.5 mention the term “ESP”. Beyond just that typo, the definition of Transient Cyber Asset implies that this requirement only applies when such devices are directly connected to other BES Cyber Assets, not the “ESP” itself. In the Guidelines section under Requirement R3, the second paragraph states “…the entity must specify how those updates are tested”. Yet, there is no specific requirement for malware signature testing in R3 of the standard.
No
Parts 4.1, 4.2, and 4.3 are concerning in that no accommodation for “where technically feasible” is mentioned. Yet, the last paragraph on Page 41 – the Guidelines section – states that the SDT does not intend for TFE’s to be required. Does the Guidelines section carry any weight when an entity is being held to the letter of the standard? Or are the Guidelines to be read as part of the Standard? For Part 4.4, please clarify the contradictory requirements for 90-day log retention versus the three-year evidence retention specified in Part C Section 1.2 of the Standard (page 32). The Measures for Part 4.4 are a good start, but “records of disposition” is too vague.
No
This is a bit nit-picky, but Part 5.1 could be wrongly interpreted as “Show me your driver’s license before I provision an account for you on the BES Cyber System”. Recommend using language similar to CIP-006-5-R1.2 “Utilize at least one electronic access control that restricts access to only those individuals that are authorized”. Part 5.2 implies, but does not state, that a signed and approved list of delegates is required. Please clarify. Also, this requirement talks about the “use of” shared accounts. This could be interpreted as either the initial creation of, or day to day use of, those ID’s. We believe the SDT meant the former, but we request that you please clarify. Parts 5.2 and 5.3 imply, but do not explicitly state, that there must be a procedure to authorize individuals having access to shared/administrative accounts. Please clarify. For Part 5.4, please simplify by stating “Procedural controls for initially changing default passwords, where technically feasible”. All the rest can be stricken, and the asset types moved to the Applicability column.
Yes

No
For Part 1.2, need to have a cross-reference to the applicable EOP standard and requirement.
No
Part 2.1 the words "…when incidents occur" is redundant. The requirement is a bit contradictory in that the incident response plans MUST be used, yet deviations allowed. (emphasis mine). Recommend rewording this requirement to say "When a suspected BES Cyber Security Incident occurs, the incident response plans shall be executed. Should deviations from the plan be necessary, those shall be documented for later review". Part 2.2 should state simply "Test the BES Cyber Security Incident Response Plan at least once every calendar year", and include the three bullets.
No
The Change Description field mentions "DHS Controls". What are these? Also, due to the complexity of the testing and review of the BES Cyber Security incident response plans, recommend including a timeline/graphic in the Guidelines section to visually demonstrate the lifecycle of the plan.
Yes
No
General question about the scope of CIP-009 that has never been addressed – is the intent of the standard the recovery of the function of an asset or system, or the recovery of the actual asset itself? This would be a good opportunity to clarify. For Part 1.4, what does "verified initially" mean? Each time the backup runs, or the first time after the asset was commissioned? (Could be years ago). If the latter, evidence retention might be an issue for long-life assets.
No
Part 2.1 should state simply "Test the Recovery Plans at least once every calendar year", and include the three bullets. It also needs to be made clear whether ALL cyber assets need to be included in the annual test, or a subset, or representative sampling, or entity defined. For Part 2.2, the same question on scope applies. The language needs to be made clear whether ALL cyber assets need to be included in the annual test, or a subset, or representative sampling, or entity defined. Need to also allow for the fact that not all cyber assets can be "backed up" in a traditional IT sense. For Part 2.3, it was commented earlier, but an operational exercise "initially upon the effective date of the standard" will make for an exciting day on the North American bulk power system. Please remove all instances of such language from all the standards, and make this part of the implementation plan and allow for staggered and entity defined rollouts.
Yes
Yes
No
For Part 1.1.4, the word "scripts" is too generic and thereby problematic. Scripts that are used for key functionality of the system would make sense to include in the baseline, but scripts for administration, backups, maintenance or troubleshooting, for instance, may be too dynamic by nature to be included in the baseline. Please either clarify, or strike, the words "and scripts". For Parts 1.1 and 1.2 there is a potential problem with dynamic port ranges. Perhaps sub-Part 1.1.5 could be written as "Any static logical network accessible ports". Part 1.2 seems to imply that the CIP Senior Manager must approve a list of delegates who have the authority to authorize changes. If this was the intent, please add a specific requirement.
No
Requirement R2 needs a lot of work and justification. Perhaps unintentionally, this requirement as written will result in another massive filing of TFE's, since I can't install Tripwire on my Router. While the purpose of the requirement is well-intentioned, with good reference to best practices, the application doesn't work outside traditional IT server-based cyber assets. This is a net-new requirement within CIP that, if retained, will require major initial and ongoing investment by entities for little reliability benefit. We recommend striking R2, or vastly limiting its scope (Server-type assets at Control Centers, for instance).
No

For Part 3.2, please clarify whether all cyber assets need to be included in the assessment, or a subset, or representative sampling, or entity defined. There are certain cyber asset categories where “test” systems just aren’t economically feasible. What is the acceptable deviation between test and production the auditors will allow? As written, and without explicit language in the requirement, our entity fears this will be a topic of a CAN later. For Part 3.3, please clarify whether “new Cyber Asset” means literally that or, more reasonably, could mean “new Cyber Asset category” or a new make/model, or a new function. It would be reasonable to test something that brings net-new functionality to a BES Cyber System, but if when replacing an end-of-life or failed component, it wouldn’t make sense.
Yes
Yes
No
For Part 2.1, please add language that allows for re-use or redeployment within a similar BES Cyber System.
Yes
No
The SDT should modify the Implementation plan to identify requirements that are net-new (like CIP-010-1-R2) and might require capital investment, and provide an additional 12 months to implement. The justification being the reality of capital/budgeting cycles within an organization. Depending on the timing of the regulatory approval, it may be twelve months before capital can be obtained, thus leaving three calendar quarters to design, test, and implement these technologies to meet the “seven calendar quarters” implementation date. Secondly, every instance in the standards where “initially upon the effective date of the standard” is written needs to be removed from the standard and added to the Implementation Plan. For each of those specific requirements, a staggered table should be developed that allows entities the flexibility to perform their first iterations of cyclical events in a phased manner.

Yes
We are concerned with the exclusion of the “Intermediate Device” from the definition of “Interactive Remote Access”. As specified in the definition of “Intermediate Device”, this “Intermediate Device” can be located outside the ESP, and by excluding the this device from the interactive remote access rules defined in CIP-005-5, part 2.1 through 2.3, we feel that this may be a weakness that may opens up the danger of opening up potential, unprotected path to BES Cyber Assets.
Yes
1. IROLs may be based on dynamic system phenomena such as instability or voltage collapse. Derivation of these IROLs and their associated contingencies often considers the effect of generation inertia and AVR response. We suggest an additional criterion that captures this important impact: ‘Generation Facilities at a single station that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies’ 2. Currently our risk-based methodology includes a criterion to protect transmission stations that act as data hubs critical for monitoring and control of the BES. There appears to be no criterion in CIP-002-5 that recognizes this critical role. We suggest an additional criterion (similar to CIP-002-3 R1.2.7) in the Medium category to capture these self-identified impacts: ‘Any additional facilities that support BES Reliability Operating Services that the Responsible Entity deems appropriate.’
Yes
Yes

Yes
Yes
We are agreeing with this proposal; however, we feel that defining NERC senior manager to a role rather than to an individual may be more practical, especially when personnel changes are more frequent.
Yes
We agree that organizations shall have security policies to cover all of those elements described from 1.1 to 1.10 under R2 of this standard. However, we want clarification on the term “policy” that does not necessarily have to be represented or tied up with a “policy” documents, but should also includes other type of governing documents, such as “security standard” type of enforcement document that an organization already accustomed to.
Yes
Yes
Yes
Yes
Yes
We agree to all VRFs, except for the “medium” VRF proposal for R2. We suggest this should be a “high” VRF, because the security policy is the main driver from and the means from top level authority of the organization to enforce overall security and without one the overall security posture will not follow through, including the NERC standard requirements outlined.
Yes

"Preserve data, where technically feasible, for analysis or diagnosis of the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1." This could require TFEs in a very ad-hoq manner. For example if data could not be preserved due to the nature of the technical damage (level or nature of coruption) of the media, this requirement would force the entity to file for a TFE because it was not techincally feasable to preserve the data. We suggest that this would not be a practical or effective use of TFEs. We suggest that the wording "where technically feasible" be replaced with "to the extent possible". We believe this would allow for situations where it is not possible to preserve the data without having to invoke a TFE for every instance that this occurs.
Yes
R2.3 states in part: "Test each of the recovery plans referenced in Requirement R1, initially upon the effective date of the standard,". We suggest that this would be impossible to test each plan on the recovery date. We suggest that the wording be revised: "Test each of the recovery plans referenced in Requirement R1, initially within 12 calendar months of the effective date of the standard,"
Yes
Yes
Yes
Yes

We suggest that the wording of “technically feasible” should not be included in R2, part 2.1 as this term is contradicting with R1, part 1.1 as the baseline configuration should already been created as required by this requirement.

In Section "1. High Impact Rating (H)" of Attachment 1, the phrase in the first paragraph "within 15 minutes adversly impact..." is vague. More guidance and clarity are needed on how to determine adverse impacts.
No
R3.2 defines "annual" training as being completed within 15 months. This is a change from the NERC current definition as described in CAN-0010. Entities need more leeway in being able to define "annual" training and other "annual" requirements. It is extremely difficult to track and manage training of thousands of employees based on a 15 month time frame. Entities need to be allowed to complete training over an entire calendar year.
No
The time limits for revoking access upon terminations and transfers being proposed for the next calendar day present extreme challenges. More time needs to be given - the next calendar day for terminations and 72 hours for transfers to make these processes manageable.

No
R1.1 defines operational or procedures controls to restrict physical access to Low Impact BES Cyber Systems. Need to remove applicability of this requirement for Low Impact BES Cyber Systems. Existing Standard Operating Procedures address and restrict physical access to Low Impact BES Cyber Systems. Demonstration of existing procedures should be sufficient to meet the intent of this requirement. R1.3 requires utilization of two or more different and complementary physical access controls. This presents technical challenges and may not create additional security. One control is preferred. Depth of defense already exits through gates, security personnel and card reader systems. The current requirement of one or more physical access methods has been implemented with little or no problems encountered. The increase to two or more physical access controls may bring about unintended consequences and complexity. NERC should provide compliance feedback to the industry demonstrating that the one or more physical access methods have been ineffective. Additionally, High Impact Control Center typically emply stringent physical security controls and monitoring. In addition, the language under Measures in R1.3 describes how ingress and egress are controlled by one or more different methods. The requirement for egress has not been explicitly defined as a requirement. Preference is for ingress only. Egress requirement has been alluded to in the language stated in the Measure. Access controls for egress present a number of safety issues and concerns. R1.6 does not address access log retention. Preferenece is to maintain a log retention of ninety calendar days. A log retention of ninety calendar days maintains status status quo as far as log retention.
No
R3.1 requires maintenance and testing every 24 months. We prefer a maintenance and testing cycle to be no longer than three years. Equipment failure rates do not support the need for maintenance and testing every two years. Manufacturer Mean time before failure rates are in excess of three years. We believe maintaining the three year cycle is reasonable and effective. Additionally, equipment is monitored and malfunctions are reported immediately thus negating the need for a two year maintenance and test cycle.
No
R1.2 requires to "disable" unused physical ports. Given the age of some equipment, this may not be technically feasible and there are no provisions for exceptions. There is a designation for "signage" being acceptable. What is meant by "signage"? There needs some exception for physical ports that can not be disabled.
No
R4.5 The requirement that the time frame of documenting a response to rectify before the end of the next calendar day presents a very short time frame to come up with a way to rectify an issue that may require extended investigation. 30 days is preferred.
No
In R5.1, it is not clear if alternatives to password authentication can be used. There are many new forms of technology for validating credentials before granting electronic access such as biometrics, IRS scans, finger print scans, etc.
No
R2.3 states "test each of the recovery plans... through an operational exercise." The requirement

needs to allow for recovery plans which are representative of similar or like Applicable Cyber Assets which would achieve the same goal as individually testing each recovery plan. Excessive operational exercises when numerious recovery plans are available may potentially disrupt operations.
No
R3.3 states that prior to adding a new Cyber Asset to a BES Cyber System, the entity is to perform an active vulnerability assessment of the cyber asset. It is problematic to perform an active vulnerability assessment prior to installing a new Cyber Asset. "Active vulnerability assessment" is not defined. There are sufficient controls in place that any "active vulnerability assessment" would be unnecessary.

Yes
The SDT should consider the following changes to the defined terms. BES Cyber System - One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services. A Transient Cyber Asset is not considered part of a BES Cyber System. BES Cyber System Impact – Need definition. CIP Senior Manager - A single senior management official with overall authority and responsibility for leading and managing implementation of the requirements within the NERC CIP-002 – CIP-011 Standards.
Yes
The impact rating of control centers needs to be tied in with the facilities controlled by the control center. CIP-002-5 -Attachment I attempts to classify all Transmission Owner, Transmission Operator, and Generator Operator control centers as either High Impact or Medium Impact. There is a slight exception offered for Generator Operator control centers only. The SDT has for the most part adopted the Version 4 criteria; however, Version 4 was intended to identify an entity's facilities as either "critical or not critical." It is unreasonable that a control center determined to be "not critical" under Version 4 is then determined to have a Medium Impact Rating in Version 5. Yet this is exactly what criteria 2.13 will do. The SDT has attempted to lessen the harshness for generator control centers by adding a limit of 300 MW but has not provided any such "ceiling" for transmission control centers. The STD needs to be made aware that there are some Transmission Operators and Transmission Owners that operate small systems that have no practical impact on the reliability of the BES. Some of these utilities operate systems from dispatch centers that meet the definition of Control Center in CIP-002-5. Many of these entities have no real-time balancing capabilities and no frequency or voltage control (other than notifying the Balancing Authority in the event of an alarm). Also with no blackstart generation or cranking paths, system restoration consists of clearing of loads from distribution busses and then the re-establishment of load upon the restoration of the transmission system voltage by the Balancing Authority. If a utility has only electric facilities that have a Low Impact Rating, it is reasonable to expect that the center used to control these facilities would also have a Low Impact Rating. A similar argument can be made for control centers that control Medium Impact Rating electric facilities and High Impact Rating electric facilities. The SDT should further develop the criterion so that a reasonable boundary exists between the High and Medium Impact Rating and between the Medium and Low Impact Rating. Control centers should be rated based on the facilities controlled.
No
The SDT uses a number of different calendar days for reporting throughout the CIP standards. Clark recommends one consistent time of 90 calendar days.

Yes
No
Part 1.2 states “Control and secure all routable and dial-up connectivity through the use of identified Electronic Access Points (EAPs)”. The Measures for 1.2 do not address the demonstration of “control and secure”, only the identification of EAPs. Perhaps 1.2 should only address the use and identification of EAPs while Parts 1.3 addresses “control and secure”. Additionally, the requirement doesn’t specifically require the protection of a BES Cyber System. “Control and secure all routable and dial-up connectivity” to…? We suggest revising the language for Part 1.1 as followings, “Identify Electronic Access Points (EAPs) used to control and secure all routable and dial-up connectivity to applicable BES Cyber Systems.” Part 1.3, the term “access permissions” is unclear. We suggest revising the term to match the language in Part 1.2 using “access controls” instead. Part 1.4 still uses the term “where technically feasible.” We were under the impression that the drafting team was going to do away with TFEs.
No
CIP-005-2 Table R2 is labeled “Remote Access Management”. All the Parts contained within deal specifically with “interactive” access. We suggest renaming the table to “Remote Interactive Access Management”.
No
Part 1.4 states “Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary.” We don’t believe it’s possible to issue real-time alerts for successful but unauthorized physical access. The system cannot distinguish between an unauthorized person using valid credentials and an authorized person using valid credentials. We suggest revising the requirement as follows, “Issue real-time alerts (to individuals responsible for response) in response to failed physical access attempts at any access point in a Defined Physical Boundary or to physical access control system alarms. Part 1.5 - Please see previous comment.
Yes
Yes
No
Part 1.1 – We are assuming this applies to the Asset level although it’s not clear. The applicability is defined per “BES Cyber System”, “Access Control System”, or “Associated Protected Cyber Asset”. We suggest revising as follows: “Disable or restrict access to unnecessary BES Cyber Asset logical network accessible ports and document the need for any remaining logical network accessible ports.”
No
Part 2.2 – The requirement isn’t written clearly. We suggest revising as follows “Assess security-related patches or updates for applicability within 30 days of release from the identified source and create a remediation plan, or revise an existing remediation plan that addresses the vulnerabilities within a defined timeframe.”
No
Part 3.1 & 3.4 – We feel the word “or” makes the Requirement unclear. Are we to deter or detect or prevent malicious code? Or are we to deploy method to do all or a combination of the three. We suggest replacing “or” with “and” or “and/or”.
No
Part 4.1.4 states “Any detected potential malicious activity.” Is this code for “all activity”? Isn’t all

activity “potentially” malicious? We suggest removing the word “potential” from 4.1.4.
No
Part 5.1 – It’s unclear in the requirement whose credentials require validation. We suggest rewording as follows, “Validate user credentials before granting electronic access to each BES Cyber System. “ Part 5.2 and 5.3 deal with access authorization and identification. We suggest moving them to CIP-004-5 R6. Part 5.5.3 – Changing passwords based on an “entity-specified time frame” may lead to questions around time frame adequacy. We suggest specifying a minimum time frame and allowing the entity to shorten as needed. For example use “Change annually or more often as needed”.
Yes
No
Part 2.1 – Please consider revising as follows, “The incident response plans must be used when BES Cyber Security incidents occur and include recording of deviations taken from the plan during the incident or test.
Yes
Yes
No
Part 2.2 – We feel the phrase “reflects current configurations” is unrelated to testing if the information is usable. We think the test is valid and should be moved to Part 2.3.
Yes
Yes
Yes
No
Part 3.1 – We feel the reference to “security controls” is unclear. We ask that the drafting team list the minimum set of Requirements that require assessment.
Yes
Yes
Yes
Individual
Nathan Smith
Southern California Edison
Yes
-BES Cyber Security Incident An attempt to compromise an electronic access control system is not included in this definition and should be. -BES Cyber System Maintenance Cyber Asset should be rephrased to say Transient Cyber Asset. Also, as it is currently worded, the means by which the clustering of BES Cyber Assets into BES Cyber Systems is to be done is not clear. -BES Cyber System Information The definition does not address information artifacts where BES Cyber Systems or BES Cyber Assets are depicted but not marked as such. For instance a substation network diagram

showing relays not specially marked as BES CA or BES CS could be classified as not being a BES Cyber System Information artifact since an uninformed user of that information would not be able to distinguish them as such. -BES Reliability Operating Services The term is too broadly defined. There are many systems involved in distribution that would not degrade the BES if they malfunctioned, but none the less are programed to respond to changes on the BES. The suggested improvement is to specifically note that distribution assets are not in scope. -Should all of the BES services be in scope? Order 706 did not order controls on all BES services. -Control Center There is no verbiage to clarify geographically dispersed centers. -Electronic Access point ("EAP") Based on how this term is defined a Level 2 switch is not considered an access point. An EAP should be defined such that it is required only for devices that are accessible by dial-up or routable channels. -Cyber Systems Please provide a definition for Cyber Systems -Defined Physical Boundary This concept is an improvement over the current 'Physical Security Perimeter', is expected to increase security of the BES, and provides more flexibility for compliance. -Electronic Security Perimeter ("ESP") The definition should state that ESPs are valid only for dial up accessible or routable access points. For instance a fully serial HMI cannot be provided with an ESP because there is no access point other than the device itself. -Intermediate Device Does the word "and" just before (3) imply that an intermediate device has to meet all three of the noted criteria? -Reportable BES Cyber Security Incident Please clarify what the term "compromised" could mean, or elaborate on what a "compromised" system looks like. -Reportable BES Cyber Security Incident The compromise of an ESP without an appreciable loss in BES Reliability Operating Services capability would not be reportable based on this definition. It is not in line with the requirements of Order 706. For further suggestions regarding Definitions see comments provided by EEI

Yes

SCE provides these specifc comments for the SDT's consideration. For further suggestions regarding CIP 002 see comments provided by EEI. Attachment I Paragraph 2.5 Please clarify the requirements for the Cranking Path. The third graph on page 26 of 30 seems incorrect. Paragraph 2.12 What is the phrase "without human intervention" mean? The subject of the paragraph is automated load shedding. Could the intent of the paragraph be to identify automated load shedding systems that start load shedding without human intervention or could the intent of the paragraph be to identify automated load shedding systems to continue to shed load once initiated by a human? This requirement assumes that the entity already knows which Cyber assets are BES Cyber assets / BES Cyber systems and which are not based on the impact categorization prior to the application of the methodology. There is no requirement that entities first collect a candidate list that is then subject to the criteria listed in CIP 002. High Impact – A data acquisition node or protection relay that is essential to for monitoring or control functions performed by an EMS which are located at a BES facility that is not a control center would result in the BES facility housing such a node or relay being classified as a control center. Suggest including this sentence: A data acquisition node or protection relay that is essential for monitoring or control functions performed by an EMS which are located at a BES facility that is not a control center do not result in the BES facility housing such a node or relay being classified as a control center.

No

002-R1 Suggest adding this sentence to the end of R1: Justification of Low Impact BES Cyber Assets is not required. If a Low Impact BES Cyber Asset is not identified discretely is there a need to justify why it is not considered a High or Medium Impact BES Cyber Asset? R1.1 uses the word "intended to be in service". This does not account for scenarios where a system or facility is not intended to be in service for more than 6 months but due to planned or unplanned outage days, the total period where the system or facility is connected is greater than 6 months (although it was not actually in service for the entire period). For instance a pilot project that is intended for a 6 month test period is removed from service for 30 days for modifications, and the pilot project is run for 7 months to "make up" for the lost 30 days of testing would be considered in scope per this requirement.

No

002 R2 "Upon the effective date" should be restated to read "on or (within 30 days) prior to. A list of Low impact BES facilities is not required to be maintained, however, certain standards require controls to be enforced at these facilities. At the very minimum, the standard should require that the RE's approval of High and Medium lists should include a list of facilities and systems considered as potential candidates for the evaluation.

No

No
For further suggestions regarding CIP-004-5 R3 see comments provided by EEI
No
SCE provides these specifc comments for the SDT’s consideration. For further suggestions regarding CIP 004-5 see comments provided by EEI R4.1 – Suggest current PRA’s already in place be grandfathered, such that those with a PRA need not meet the new requirements for the PRA until the initial one expires. R4.2 – Suggest providing flexibility not to cover the full scope of the PRA for those that are in states that impose limits on how much personal information can be assessed. Retention of records of 7 year background checks is not clearly stated. Also there is no consideration of existing background checks under NERC CIP standards that are currently in effect. Can a PRA under the current CIP requirements be used to validate R4.2 under Version 5? R4.3 The application guideline provides guidance where it is ‘not possible to perform a full seven year criminal history check.’ How is ‘not possible’ measured? Propose a clearer delineation to frame instances in which personal records are not readily available – vs. impossible to obtain.
No
For suggestions regarding CIP-004-5 R5 see comments provided by EEI
No
CIP 004-5 R6 Propose use of ‘legacy’ language where access is appropriate for the roles and responsibility over ‘minimum necessary’
No
CIP-004-5 R7 R7.1. Suggest requiring access be revoked within 24 hours, or “as soon as possible”. “At the time of termination or resignation” is vague and difficult to define. R7.5. Some Medium Impact assets that are programmable and have shared passwords are deployed in the field and have no network connectivity. Given these assets are distributed in a wide geographical area, many in difficult to reach places, it is not technically feasible to get to all the distributed assets and change their passwords within 30 calendar days; especially assets that are in or near hydro facilitates. Suggest modifying the standard to exclude medium impact assets in the Applicability section. R7.1 - There are questions in instances where resignations and/or terminations may be retroactive, which would

introduce a challenge with revocation 'at the time of' events. R7.3 – Propose use of 'approved BES Cyber System Information repositories,' to frame an appropriate location in which information can be managed and controlled. Access revocation to protected information repositories is enforceable but revocation to hardcopies is difficult to prove. A control that acknowledges the difficulty of proving that access to hardcopies (Especially those in the possession of the person, not just those documents that are located in a locked cabinet or other storage areas) has been revoked should be added. A sign off form is an acceptable measure but not within the timeframe suggested. An outside limit of what is considered "at time of" should be provided. Language such as "access revocation should be completed within 24 hours" can be used.
No
Violation Risk Factors and Violation Severity Levels for CIP-004-5 Across all VSLs there is no consideration for the impact level of a particular violation. The Lower and Moderate VSL's should be made applicable to Medium Impact BES Cyber systems and their associated Cyber assets. For instance if a role is such that access is provisioned only to associated cyber assets and not to High or Medium or those assets deployed for protection, the violation should be a Lower or Medium VSL. R1, R2, R6 – Scale VSLs appropriately. R3, R7 - <1% of individuals for Medium Impact and associated cyber assets should be Lower VSL, 1-5% for Medium Impact and associated cyber assets should be moderate, 5-10% of any applicable BES cyber asset should be high, and any number greater than 10% of any applicable BES Cyber asset can be treated as severe.
Yes
SCE provides these specific comments for the SDT's consideration. For further suggestions regarding CIP 005-5 see comments provided by EEI R1.1 Should the measures read "documented technical or procedural controls that exist…" in order to match the requirement? Please confirm the Low Impact assets do not have to be protected by an Electronic Access Point? R1.3 Although security wise this requirement adds protections, explicit outbound access permissions places a load on processors that slows down the computing capability, and therefore may make the grid operate slower. Please be aware of the trade-offs. R1.5 This requirement is dictating the need for an intrusion detection system at all High Impact and Medium Impact Electronic Access Points (with external routable connectivity at control centers). This is a high cost investment for industry to make in a short period of time,, and may not be accomplishable for field deployed programmable assets. Are the measures aligned with the requirement here, since the Requirement requires a method but the measures point to a system or systems? Please define "malicious communications"
Yes
For suggestions regarding CIP-005-5 R2 see comments provided by EEI
Yes
Violation Risk Factors and Violation Severity Levels for CIP-005-5 R1 – R1.1 A procedural or technical control for a low impact system should be scaled in and not bundled with violations for high of medium impact systems. Proposed change could state that a violation of R1.1 for <5% of low impact is moderate, greater than 5% is High and not a severe VSL for Low impact.
Yes
SCE provides these specific comments for the SDT's consideration. For further suggestions regarding CIP 006 see comments provided by EEI R1.1 Suggest stating whether or not there is a requirement to implement the operational or procedural controls. R1.4. Suggest clarifying that issuing real time alerts for events at Medium Impact assets does not include pole top devices.
Yes
For further suggestions regarding CIP-006-5 R2 see comments provided by EEI
Yes
For suggestions regarding CIP 006 -5 R3 see comments provided by EEI
Yes
For further suggestions regarding CIP 006 Violation Risk Factors and Violation Severity Levels see comments provided by EEI
No
SCE provides these specific comments for the SDT's consideration. For further suggestions regarding CIP 007 see comments provided by EEI R1.1 Suggest revising the requirement to provide an

exception related to dynamic ports and the inability to disable them. If a dynamic port is closed, the service that is needed by the BES system may not be available. Furthermore, it is not always known which ports and services vendors are using. R1.2 Restricting the use of physical USB ports may not be accomplishable. There are so many devices with physical ports it is impossible to monitor each one. In addition, because a USB port is in use by a mouse, and therefore not required to have access restricted to it, someone could easily remove the mouse from the USB port and install malicious software. This requirement creates a huge burden and is easily circumvented.
No
CIP 007-5 R2.1 Suggest revising the standard to say “security updates”, not just “updates”. R2.2 Suggest revising the requirement to allow for 30 days to identify applicable security updates or patches and 30 days to draft a remediation plan. R2.3 This requirement is not clear and does not match the measures. Please revise it. A TFE option for unsupported devices should be added. Also the standard does not specify a timeline within which a remediation should be completed or a scheduled review of the status of the remediation plan.
No
CIP 007-5 R3.2 Suggest revising the requirement to include quarantine of the malicious code. R3.4 Should this standard be applicable to Transient Cyber Assists? If so it should stated in the “Applicability Column” R3.1 and R3.2 Should allow for applicability at the system level or on a per asset level. Whitelisting of applications could be stated as a requirement rather than a measure. The requirement thus stated would add to the robustness of documenting BES Cyber Systems since the hardware of a “cyber system” cannot conceivably perform any functions without some onboard software. The standard language as currently stated seems to apply to the hardware and deviates from Order 706.
No
CIP 007-5 R4.1.4 Please define “Malicious Activity” R4.5 Reviewing logged events every two weeks is burdensome and can be expensive to automate, and there is little improvement in BES security from this activity. Please consider re-thinking this requirement. A TFE option should be provided within this requirement since devices that do not support functions as listed. The language of the standard assumes automated logging for each BES Cyber Asset.
No
CIP 007-5 R5.4 Should the applicability here be noted as High Impact and Medium Impact assets?
No
CIP 007-5 R1 – Moderate or High VSL for undocumented ports on Medium Impact Cyber assets. R2 – Moderate or High VSL for failure to identify source. Failure to identify source and failure to implement should not be treated the same way.
Yes
For suggestions regarding CIP 008-5 R1 see comments provided by EEI
Yes
SCE provides these specific comments for the SDT’s consideration. For further suggestions regarding CIP 008-5 see comments provided by EEI R2.1 Suggest removing consideration of a test from the requirement.
Yes
For suggestions regarding CIP 008-5 R3 see comments provided by EEI
Yes
CIP 008-5 R2 – Failure to annually test an IR plan should be a high VSL not severe. Failure to use a IR plan and failure to test an existing IR plan should be treated differently.
Yes
SCE provides these specific comments for the SDT’s consideration. For further suggestions regarding CIP 009 see comments provided by EEI R1.1 Should the standard note what conditions should apply to the recovery plans? If so what type of conditions should be planned for? R1.3 Suggest replacing the word “protection” with the word “handling” or please explain what is intended by the word “ protection”
Yes

CIP 009-5 R2.3 Are there suppose to be specific recovery plans that need to be in place and tested?
Yes
CIP 009-5 R3.2 Suggest adding “or recovery” after “exercise” R3.3 Suggest adding “completion of” before “review”
Yes
CIP 009-5 For suggestions regarding Violation Risk Factors and Violation Severity Levels for CIP-009-5 see comments provided by EEI
No
SCE provides these specific comments for the SDT’s consideration. For further suggestions regarding CIP 010 see comments provided by EEI R1. We recommend the CIP SDT consider removing physical location from Baseline Configuration in CIP010 R1, or replace it with logical location (logical placement within the control systems architecture.) • R1.1.1 requires Physical Location be part of a Baseline Configuration. In the Guidelines and Technical Basis, Physical Location is explained as follows: The physical location referred to in the baseline configuration is geographically where the BES Cyber Asset is located (e.g. Pine Valley Control Room, Generator X, Substation Y) and should be used to ensure that BES Cyber Systems receive the controls that are applicable to the environment in which the components are located (e.g. control center, transmission facility, generation facility). The underlined phrase seems to imply that controls are applicable to the environment in which the cyber assets are located, whereas Controls are required by CIP004, CIP005, and CIP006, by categorization of BES Cyber System, as required in CIP020. The Applicability Section of each requirement clearly requires the categorization of assets to be protected by the controls required by CIP040, CIP050, and CIP060, and not the Environment in which the assets reside. • CIP002 R1requires Responsible Entities to identify and categorize High and Medium Impact BES cyber asset and cyber system. Asset identification includes an asset inventory, or list(s) as described in CIP002 R1 M1. Asset Identification, per NIST SP800-128 titled "Guide for Security Focused Configuration Management of information Systems", includes an asset Inventory of systems and system components in which one of the data elements may include "phyiscal location (e.g., building/room number, see Page 27 of this document)". Both CIP002 M1 and NIST SP800-128 point to an asset inventory that should be kept, and includes Physical Location where the asset resides. • CIP002 R1.1 requires "Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities..." A change of physical location where the BES Elements resides would require an update to the Asset Inventory or list. If the physical location is changed such that the BES Elements and Facilities are now outside of the already established controls, these controls will need to be re-established to comply with CIP004, CIP005, and CIP006. • CIP010 1.1 Change Rationale includes the following text: The baseline configuration requirement was incorporated from the DHS Catalog for Control Systems Security. DHS Catalog for Control Systems Security Section 2.6.2.2 includes the following text: The baseline configuration provides information about a particular component’s makeup (e.g., the standard software load for a workstation or notebook computer including updated patch information) and the component’s logical placement within the control system architecture. and The inventory of control system components includes information (e.g., manufacturer, type, serial number, version number, and location) that uniquely identifies each component. Section 2.6.2.2 makes a distinction between a Baseline Configuration and an (Asset) Inventory of control systems components, and location is part of the inventory. Given this distinction in DHS Catalog for Control Systems, location (physical) should not be required to be part of a baseline configuration in CIP010. R1.1 Developing a baseline configuration is a huge task and should probably only apply to High Impact assets. R1.2 Please re-word the requirement – the meaning is not clear.
No
CIP 010-1 R2.1 Detecting unauthorized changes is burdensome. If the process is automated then that puts another load on processors and slows down computing. Please consider re-thinking this requirement only making it applicable to High Impact assets, and exclude serial devices.
No

SCE provides these specific comments for the SDT's consideration. For further suggestions regarding Implementation Plan see comments provided by EEI Schedule should be revised from 18 months to 24 months given the breadth of the increase in scope under version 5.
Individual
Barry Lawson
National Rural Electric Cooperative Association (NRECA)
Yes
BES Cyber System Information Define "BES Cyber System Impact" as it is a capitalized term used in this definition and it is not currently defined. CIP Senior Manager Replace: "NERC CIP Standards" with "NERC CIP-002 – CIP-011 Standards." The CIP-001 Reliability Standard is not part of this set of standards and has not yet been approved for inclusion in EOP-004-2. This will give clarity to the limit of the definition. Control Center NRECA is concerned with the broadness of this definition. The SDT should consider the impact on small entities that will be drawn in by an overly broad definition of Control Center. In this definition the SDT uses the defined term: System Operators which from the NERC glossary is: "An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time." If the SDT's intent was to limit Control Centers to buildings that house a System Operator with 24/7 staffing and include BA, TOP, GOP and RC functions, then NRECA could support the definition (if other changes in our comments related to CIP-002-5 Appendix 1 are also satisfactorily addressed) and requests that the SDT make this limitation clear in the definition. If this is not the intent of the SDT then NRECA does not support the proposed definition of Control Center.
Yes
3. Purpose NRECA requests the SDT to use consistent language in this section. On line 2 the phrase "reliable operation of the BES" is used and on line 5 the phrase "reliability of the BES" is used. The same phrase should be used in both locations. 4. Applicability 4.1.2 Distribution Provider 4.1.6 Load-Serving Entity NRECA is concerned with the new inclusion of DPs in the version 5 standards and with the qualifiers proposed for LSE in the Applicability section. NRECA believes that inclusion of this broad group of DP entities will draw in many small entities with no BES operational capabilities or responsibilities and cause them to go through a paperwork drill of proving they either do not provide BES Reliability Operating Services or they do not have cyber assets associated with this equipment. NRECA recommends that the SDT develop a simple method for DPs and LSEs to prove "No Impact" and be clearly exempt from CIP-002-5 – CIP-011-5. Attachment 1 1. High Impact Rating On line 2 the word "adversely" is used. This term can mean many things to many parties. Please provide additional clarity so that auditors and responsible entities have a better understanding of its use. 1.2 Add the following text to the end of the current 1.2: "for generation equal or greater than an aggregate of 1500 MW in a single Interconnection." NRECA strongly recommends the SDT to make this revision in order to stay as close to the CIP-002-4 criteria and to minimize cost impacts on entities that do not have a significant impact on the BES. 1.3 NRECA strongly opposes including "Transmission Owner" in this provision. Inclusion of RC, BA and TOP are appropriate, but the TO function does not rise to this same level of responsibility. NRECA requests that the TO function be removed from this section. Including the TO function here will make it very difficult for NRECA to change its vote to "affirmative" in the next ballot. If this is not changed for the next ballot, NRECA will likely recommend that its members vote "negative" on CIP-002-5. 2. Medium Impact Rating On line 2 the word "adversely" is used. This term can mean many things to many parties. Please provide additional clarity so that auditors and responsible entities have a better understanding of its use. 2.13 NRECA recommends that the proposed 2.13 language be deleted and replaced with the following: "TOP and GOP Control Centers not included in High Impact Rating and controlling 1500 MW or greater

of load or generation." Making this change will appropriately assign these control centers to the "medium" level and others not captured in the "high" or "medium" levels will be captured in the "low" level. Add new 2.14 Add: "2.14. Control Centers, not previously included in High Impact Rating (H) or Medium Impact Rating (M), above, that perform the functional obligations of Balancing Authority, Transmission Operators or Transmission Owners, and that do not implement protected data connections with other Control Centers in a manner as to prevent themselves from being used as cyber-attack vectors into other Medium Impact or High Impact Rating Control Centers." Making this change will ensure that other appropriate Control centers will be categorized in either the Medium or Low level.
No
R1 Replace "30 calendar days" with "90 calendar days." The SDT uses a number of different calendar days for reporting throughout the CIP standards. NRECA recommends one consistent time of 90 calendar days.
No
R6 NRECA recommends changing "30 calendar days" to "90 calendar days" to be consistent throughout the CIP standards.
No
R4 On line 2 after "unescorted physical access" add "to BES Cyber Systems" to clarify what this requirement applies to. R4.2 Clarity is needed to understand if the phrase "six months or more" applies to the entire sentence or just to "attended school."
No
R5.2 The phrase "once every seven calendar years" may create confusion on exactly what it means. In order to minimize such confusion, please be more explicit on how often personnel risk assessments must be updated.
No
R6.4 The phrase "once each calendar quarter" could be interpreted to mean almost a 6 month time period. Please provide further clarification on what the phrase means so all parties understand its meaning. In addition, please provide clarification in this requirement on what the difference is between "provisioned" and "authorized."
No
R7.1 Footnote 2 does not help to clarify what "at the time" means. Please provide more explicit language in this requirement regarding what "at the time" means. It may be appropriate to treat resignations and termination differently. This requirement could allow access for a resignation to continue until the individual's employment ends. For terminations this requirement could require access to be disabled at the same time the individual is notified of termination. R7.2 Replace "by the end of the next calendar day" with "within 30 days." NRECA believes that this requirement is excessive when compared to the threat of cyber attack on the system by someone being transferred or reassigned for reasons other than disciplinary action. R7.5 In the second paragraph of this requirement the word "extenuating" is used and could be interpreted in many different ways. Please provide more explicit language so that all parties have a better understanding of what is meant here.
No

R1.1 and 1.2 In R1.1 the word “restrict” is used and in R1.2 the words “control and secure” are used in such a way that for auditing purposes these words could mean many different things to different parties. Please provide additional clarity in these requirements as to the meaning of these words to minimize confusion.
No
R2.2 The way this is currently written it leaves open interpretation concerning the extent of encryption required. NRECA believes that the data encryption requirement should only pertain to the portion of the data path that is transmitted over public networks. We are afraid if you have to provide data encryption from the specific cyber device on the critical network you would create overhead that could result in communications failures, software conflicts, and unnecessary latency. NRECA requests that this be clarified as requested to avoid auditor and registered entity confusion in demonstrating compliance.
No
R1 On line 1 after the words “physical security plans” insert “for BES Cyber Systems.” R1.4 and 1.5 More clarity is needed to better understand what is meant by the phrase “Issue real-time alerts.” Real-time related to what? The time of the unauthorized access? As currently written, this requirement appears to be unrealistic. Please modify this requirement to provide clarity regarding what is necessary to comply with this requirement. R1.6 The word “sufficient” in this requirement is very subjective. Please provide greater clarity as to what is required for compliance with this requirement.
No
R1.5.1. and 1.5.2. If an entity’s model includes differences between the test environment and the production environment, would that be a violation of R1.5.1.? NRECA requests clarification that this would not be a violation.
No
R3.2 If an entity’s model includes differences between the test environment and the production environment, would that be a violation of R3.2? NRECA requests clarification that this would not be a violation.
No
R1.3 NRECA requests clarification regarding whether “deficiencies identified during the assessment” are considered violations of the standard. NRECA believes these deficiencies should not be considered violations of the standard and asks the SDT to address this.

No
Implementation Plan: On page 1 in the “Compliance with Standards” section, the applicable functions are listed. NRECA requests that this be revised to match the “Applicability” sections of the CIP V5 standards which include qualifiers to a number of the functions.
Individual
William O Thompson
NIPSCO Northern Indiana Public Service Company
Yes
-BES Cyber Asset: NIPSCO requests that further clarification is needed for the phrase “unavailable, degraded, or misused.” Clarification is also requested in the phrase, “when required” in sentence one, because it is ambiguous and confusing and as it is applied to other CIP reliability standards proposed. In addition, NIPSCO does not know if there needs to be a 15 minute test to “verify” the impact of the BES? And if so, how would an entity show compliance? Furthermore, NIPSCO recommends removal of the second and third sentence, because they do not provide any clarity to the time frame stated above. In addition, the third sentence regarding redundancy appears to conflict with the first sentence, therefore it is recommended that the fourth sentence be removed. The last sentence regarding “transient cyber asset” be removed because it is considered not appropriate as a cyber asset. [NIPSCO recommends that these CIP reliability standards should not exist.] -BES Cyber Security Incident: NIPSCO requests further clarification on what is meant by an, “intent to disrupt” and an “intent to compromise” as it is applied to an event and how to show evidence of such intent. NIPSCO recommends to use either “compromises” or “confirmed attempt to disrupt,” to replace intent to disrupt and intent to compromise. In addition, NIPSCO requests that the word, “suspicious” be removed. If the phrase “suspicious” is not changed, NIPSCO requests the removal of the third bullet point be removed and how to show compliance. NIPSCO recommends that compromise and disrupt be included in the first and second bullet items and recommends removal of the third bullet point, because as it currently is written, this sentence creates a confilict with the visitor escort event, and recommends removal of the third bullet point. -BES Cyber System: “typically”? This doesn’t seem appropriate for a standard. NIPSCO recommends that this definition be eliminated, because the BES Cyber System definition is too similar to the BES Cyber Asset and creates further confusion between what is a System or an Asset. The classification of an item as a “system” or an “asset,” is a huge problem, because each entity could make up and classify whatever they want and be exempted from all. The entities should not be deciding what is required as a system as a whole and what is required for individuals. Furthermore the CIP is inconsistent of what is a BES Cyber System and what is a BES Cyber Asset throughout the proposed reliability standards. NIPSCO requests clarification and a definition of “Maintenance cyber” and how it is applied and show to show compliance or use “transient cyber” consistently throughout the CIP reliability standards. -BES Cyber System Information: NIPSCO requests further clarification on the phrases “security procedures” and “impact designations.” In addition, NIPSCO requests clarification that the listed items not be a complete list, but a partial list that is not exhaustive. The word “similar” is vague and request removal of the phrase “similar diagrams.” Furthermore, patch levels on the system needs to be defined and should not include “data in transit” and “data at rest.” In addition, further clarification needs to be made how it is applied and how to show compliance. Based on the scope of cyber assets included in CIP Version 5, the cyber information is over burdensome to the whole system. Since significantly more devices are identified in CIP Version 5, the information associated with those devices impose more items to meet CIP standards that are overly burdensome. -Is it BES Cyber System disaster or can it be BES Cyber System or Asset disaster…? -BES Reliability Operating Services: The use of the word “All”, is not appropriate within monitoring and control. The responsibilities listed in the operating services list are already defined in the NERC Glossary definition of terms and should not be included in the CIP reliability standards. The CIP committee does not have authority to create these definitions, because it incorrectly creates definitions, when the appropriate party to create these definitions is NERC. -CIP Exceptional Circumstance: It is unclear what is a “risk of injury or death,” and should be clarified. NIPSCO recommends to add the word “imminent” risk of injury or death. The term “exceptional circumstance” is provided as a NERC defined, however, this is inconsistent with the CIP standards, which allow entities to define what an exceptional circumstance is in their own policy. The CIP

standard should define what is an “emergency condition.” NIPSCO recommends to change the phrase from a “CIP Exceptional Circumstance” to a NERC standard to be used generally. -CIP Senior Manager – no comments -Control Center – NIPSCO requests clarification what is meant by a “BES facility” and a “control facility.” In addition, the definition of “control room” needs to be defined in order for the definition of “control center” can be better understood and defined. In addition, further clarification is requested as to what is meant by “two or more BES generation facilities or transmission facilities.” -Cyber Assets: NIPSCO requests what is the definition of “programmable” electronic device and what is included in such device. In addition, it is recommended that the word “data in those devices” be removed from the description. -Defined Physical Boundary (DPB): NIPSCO requests clarification of the phrase “physical border” and discuss what is appropriate to show DPB that meets compliance. It is also recommended that the change rationale be excluded from the DPB. -Electronic Access Control or Monitoring Systems: NIPSCO requests definitions of both “electronic access control” and “monitoring system,” because both of these terms seem to be the same thing and including both would be redundant. In the alternative, further explanation is requested as to how each of the control or monitoring systems are applied. Furthermore, the reference to the defined term, “Electronic access control” in CIP-006 appears to conflict with the Electronic Security definition here. Electronic Access Point (EAP): Could an internal switch be categorized as an electronic access point if it is restricting any type of traffic? NIPSCO requests further clarification as to what devices or items fall under restricted routable or dial-up data communications, therefore it is recommended to remove the word “restricts” from the description. As it currently is written, it assumes the routable or dial-up restricts access. Furthermore, NIPSCO requests whether the term interface on a cyber asset was meant to apply to local hosts. Finally, NIPSCO recommends that the language be changed to state, “a routable communication through an ESP.” -Electronic security perimeter (ESP): NIPSCO recommends that the description should not be scoped to BES cyber systems, but should apply to BES cyber assets. Would the ESP include the trusted and untrusted EAP’s? -External Connectivity: NIPSCO recommends that the description should not be scoped to just BES cyber assets, and should remove the word “BES,” from cyber asset. -External Routable Connectivity: NIPSCO requests that the term “cyber system” be changed to a “cyber asset,” and further clarification as to what is an external routable connectivity. As the statement currently reads, it appears to be more of a recommendation instead of a standard. In addition, the definition as it stands is unclear and provides little guidance as to its purpose in the CIP reliability standards and more explanation or discussion should be made to this definition. -Interactive Remote Access : NIPSCO requests elimination of “Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity, 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors, or consultants.” -Intermediate Device: Based on the external routable connectivity and external connectivity definitions, would this be sufficient if outside the ESP? NIPSCO requests clarification at “termination point” and whether it is meant to also include end points, such as a work station, and how and where it applies and how to show compliance. In addition, NIPSCO requests elimination of “Intermediate devices are sometimes called proxy systems. The functions of an intermediate device may be implemented on one or more cyber assets. The intermediate device may be located outside the Electronic Security Perimeter, as part of the Electronic Access Point, or in a DMZ network.” -Physical Access Control System: NIPSCO requests further review of the description and recommends that the description should include a defined list of what is included in the defined physical boundary. -Protected Cyber Asset: No comment -Reportable BES Cyber Security Incident: No comment -Transient Cyber Asset: Is this 30 days consecutively or collective, need clarification. -Define directly connected (Is this meant to answer the roaming laptop scenario?) NIPSCO requests that the term “maintenance” be defined and explained. NIPSCO recommends to remove the phrase, “or introducing malicious code,” and change “cyber system” to “cyber assets.” It is also recommended to add, “Assets used in vulnerability assessment.” NIPSCO also requests clarification whether removable media is included as a transient cyber asset.

Yes

Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -How does an entity show that a System or Asset falls or does not fall with the 15 minute window? Would one need to show results that support that the asset/system can be down longer with no adverse effects to the BES? NIPSCO recommends that the CIP cyber assets clarify whether Attachment 1 applies to any BES that affects the BES or whether only a high risk or something that would critically affect the BES and classifies something as “high impact.” In addition, further clarification is requested whether Attachment 1 applies to high risk physical assets or high risk cyber assets. NIPSCO will have a better understanding of its position once the actual rules are

created.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -“Evidence of categorization of Low Impact BES Cyber Assets and BES Cyber Systems may be demonstrated by the application of the required controls.” What does that mean? R1 does not require discrete identification of Low Impact. Does this mean an entity does require a list of the low impact assets/systems? -In 1.1 define BES Elements and Facilities. NIPSCO states that generally that the CIP reliability standards should be made up of requirements and measures and should not be inclusive of application guidelines, rationale, and technical background.
No
Comments: -Should it not read delegate(s) instead of just delegate? There could be more than one delegate. -The measure makes no mention of the delegate(s) approval? Need consistency between the Requirement and the measure. -1.2 Evidence Retention: Please explain what “Other evidence” would be required.
No
Comments: NIPSCO recommends that the high VRFs and VSLs are extreme and the definition of what is high, medium, or low violations are unclear and need to be clearly defined in order to show how entities can fully comply. -No mention of BES Cyber Systems throughout the VRF/VSL, only mentions BES Cyber Assets. -R2: There is no mention of the delegate(s) completing the annual review. Delegate is called out in the requirement.
No
Comments: NIPSCO states that generally that the CIP reliability standards should be made up of requirements and measures and should not be inclusive of application guidelines, rationale, and technical background.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -The requirement states one may delegate by position, yet the measures make no reference to position as being the only thing being listed. Does the documentation need to be updated when personnel change but the title/position doesn’t?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Under the purpose, should it read, “...physical access to BES Cyber Assets OR BES Cyber Systems”, instead of “and”? -Rationale states all personnel, yet in the table R1.1 has applicability to “All Responsible Entities”.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Should this requirement include Cyber Assets as well as Cyber Systems?
No

Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Upon reading requirement 3.1 in the table, does it imply that all personnel who access the systems during a CIP Exceptional Circumstance require training after the fact? When reading the measures it appears that that is the case.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -With modifications to this standard, do current personnel with access have to undergo another background check, or will they be grandfathered in? -How are you going to audit to ensure it includes all the residency requirements? It will be difficult to be 100% sure of a “full seven year criminal check”. In addition, many schools are online now and how does an entity determine location from those? -Setting a hard line of when employee’s “fail” a PRA is difficult, as it may determine on what role the individual is performing. It might even be more difficult to have “fails” defined for each role within the organization. Could the registered entity have criteria that include HR using judgmental decision making? -Part 4.2 Requirements will need to negotiate with applicable unions and labor agreements.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. - 6.2, measure (i) introduces “sampling”, where is this defined and what would be acceptable “sampling”? -6.3 also includes the word “sampling”. -6.4 may be overly onerous on entities. Is a list of the exceptions sufficient to meet the measurement?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Provide more definition/clarification of “at the time of the resignation or termination” and what is the timeframe allowed in order to meet compliance. -The measures for Part 7.1 (i) measure seem unattainable. While terminated employees should be immediately removed from the system, or as the text suggestions, even “prior to”; this seems like a very high goal. For instance, if one is terminated and they walk off the site with their badge at 10:00pm on Saturday night. How is the evidence of removal going to be captured the date of the termination action? -R7.2 It seems unreasonable to revoke all unneeded electronic and physical access to BES Cyber Systems by the end of the next calendar day, next business day would be more appropriate. Most transfers usually involve employees having possible dual roles for numerous days/weeks, this could be problematic for those type of employees and employees transferred on Fridays/Saturdays. -R7.3 Calendar day instead of business day. Calendar day could pose problems for all sizes of entities. -R7.1, R7.2 and R7.3 Reasonable time is required to allow for inter-company communications. Recommendation for 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require access. -R7.5 Clarify “extenuating circumstances”. Is this something that can be critiqued by an auditor?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1 – Provide a more granular break out if you only forget one quarter. Maybe a moderate vsl? -R1.1- Why does R1.1 apply to low assets when R1 only applies to high risks. -R3 – Provide a more granular break out also, possibly by percentage of total employees. As listed an entity could get a high vsl for “one” individual missing their training or for “200” individuals missing it. -R7 – Companies may have 10,000 employees or 100. It seems unreasonable if you miss 1 employee it can move either way (moderate-high or high-moderate), should this not go by percentages?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1.5 Measure – when it asks for config files of an IDS deployed at an EAP, should it not read “for” an EAP. The Rationale mention IPS; however, the requirement only mentions IDS through-out. -Change rational for R1.5 states intrusion detection systems/intrusion protection systems. Does the “/” mean “and”, or “or”?
No

Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Verification that this does not include system to system communications in to the ESP. -R2.2 Clarification on where the encryption is required to start and stop? -R2.3 Where is the multi-factor authentication required?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1.2 addresses restricting access to only those individuals that are authorized; however, the measures address egress badging. The requirements do not mention egress badging, but the measures do. -Requirements 1.4 and 1.5 address issuing alerts, but there is nothing about the response. -R1.4 – What is the definition of access point? (Window, hatch, door or all)
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. - Clarification of the definition of continuous.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1 – High VSL lists a response within 15 minutes of a detected unauthorized physical access into a Defined Physical Boundary. There is no mention of a time requirement within the standard. -R2 – Moderate VSL – The vsl states “each” however the requirement does NOT have the word each included. Is it implied? -R2 – High VSL – What are the requirements of “continuous escort”? Continuous escort is not defined, but it’s listed here. -Why does it apply to low but issues severe penalties?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1 – Screenshots as evidence for large companies could be overly onerous.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R2.1 – Clarification that the “updates for all software and firmware…” only applies to security related patches/updates. -R2.2 – Doesn’t define when a patch MUST be deployed, only that it has to be within a defined timeframe. Request clarification on what is an appropriate timeframe. -Does each patch require a remediation plan? (Or can there be generalized… Windows Tuesday update, etc...) -R2.3 – No mention of the 30 day requirement. Is this an oversight? It is mentioned in the “Change Rationale.” This should provide for a TFE.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. - R3.3 Provide clarification of availability. In requirement 2, it asks when an entity gets notified. Should this not follow the same process? Provide clarification of, “Update malicious code protections within 30 calendar days of signature or pattern update availability”. -R3.5 Provide clarification on where these logs can be kept. Can this be manual?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R4.1 – No TFE’s are allowed on this requirement. Concerned that not all devices can satisfy this requirement. -R4.1.4 – Very general statement, how would an entity define this? NIPSCO recommends removal of the word “potential” from the description. -R4.5 – Two week window with sampling is very tedious and time consuming. It is unclear what is defined as sampling? Is that one log, two logs, etc…? Would once a month or quarter be more appropriate?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R5.1 Measures – Define internal and remote paths. -R5.5.3 – There is no mention of a

measure for this requirement. Request to provide further clarification on the appropriate timeframe to change the password.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Request clarification on why the word “dated” has been added to the measures used throughout this requirement. -Do the suggested modifications in CIP-008 take into consideration Project 2009-01?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1.5 –How does this address reliability or recovery of the BES? Even though you can TFE this requirement, this will be difficult to implement enterprise wide when individuals are concerned about recovery and not “mirroring drives”. How long do you keep this data (extra drives)? Protection of this additional drives/data could also become an issue.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R3.1 – Should this mean BES Cyber Assets or BES Cyber Systems? How many of the assets of the system?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1.1.4 – Scripts could be anything from a customized startup script to a detailed script required for operations. Script is very vague and needs to be either removed or further detailed. -R1.1.5 and R1.1.6 – Request removal of the word “any” from the description. -R1.2 – A change advisory board is too large for many organizations and they don’t have them implemented. Provide a different example so entities won’t read that they are required to have CAB’s. -R1.4 – Determining security controls that could be impacted, where is the measure for this requirement?
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -Why is wireless review and scanning mentioned in the Guidelines section, but it’s not mentioned in the requirements? -Requesting clarification of “on the effective date,” and how to show compliance. -Request clarification of “vulnerability assessment” in a test environment.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on

this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R1.2 – Formatting issue at the Headers of columns CIP-011-1 Table R1, in which they all say “Part”
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard. -R2.1 – This requirement appears vague and request to review the description for more clarification. The word “cleared” appears to be essentially the same as “destroyed,” and request clarification on the appropriate method of clearing media and destroyed media that shows compliance. -The last paragraph in the Guidelines section actually still refers to “erased” and not “cleared”.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on this standard.
No
Comments: Until the proposed definitions are clarified, NIPSCO cannot provide an affirmative vote on these standards, therefore NIPSCO cannot provide an affirmative vote on the implementation plan.

CenterPoint Energy
John.Brockhan@CenterPointEnergy.com
Yes
CenterPoint Energy suggests the following changes to the definitions: Page 1 – 2 – BES Cyber System/BES Cyber Asset/ BES Reliability Operating Services CenterPoint Energy does not agree with the introduction of these new terms and prefers the existing and familiar terms, Critical Asset and Critical Cyber Assets. The Company believes that the new terms and approach to determine covered assets lacks clarity, will be difficult to apply and audit, and creates ambiguity as to where the process ends. This is especially a concern considering the exhaustive list of BES Reliability Operating Services. If the SDT insists on retaining the BES Reliability Operating Services, CenterPoint Energy also suggests that the term not be added to the NERC Glossary, but be kept local to the CIP-002 Standard. The definition for BES Cyber Asset states that “Redundancy shall not be considered when determining availability.” CenterPoint Energy requests clarification on whether this concept has been reasoned for application in a substation environment, specifically in the instance of primary/backup relays and identical redundant systems. In the definition of BES Cyber System, the term “Maintenance” should be replaced with “Transient” in the definition of BES Cyber System to reflect changes in the terms and new definitions made available. Page 2 – BES Cyber Security Incident CenterPoint Energy believes “was an attempt” is vague and seeks clarification on how such an attempt will be determined. An alternative would be to delete the phrases “or was an attempt to compromise” and “or was an attempt to disrupt”. CenterPoint Energy also recommends that the 3rd bullet be deleted as it does not fit the term BES (Cyber) Security Incident. Page 2 – BES Cyber System Information CenterPoint Energy suggests that “computer” be added in front of network topology for clarification. The Company also suggests that the word “disaster” be deleted to be consistent with the way that recovery plans have been labeled in the current version. Disaster adds a qualification to recovery plans that could be limited to such situations (disasters). Additionally, CenterPoint Energy recommends that “Impact” be changed to begin with a lowercase “i” since a definition of BES Cyber System Impact has not been proposed. Page 2 – BES Reliability Operating Services Under Dynamic Response to BES Conditions, should “systems” be capitalized like the other items in the series (Elements, Facilities)? Please clarify. The criteria “Under and Over Voltage relay protection (includes automatic load shedding) -Sensors, relays & breakers” should be deleted as it is duplicated. Under Inter-Entity Real-Time Coordination and Communication, CenterPoint Energy questions the use of the term “operational directive” and would like to ensure that the SDT has considered NERC’s efforts underway to define “reliability directive”. Page 6 – CenterPoint Energy recommends that “or other, similar incident” be added to the definition of CIP Exceptional Circumstance to add some flexibility and “BES” be added in front of “Cyber Security Incident”. Page 6 – The Company proposes that the definition of CIP Senior Manager is not needed as a glossary term,

but is acceptable in the requirement description. Page 7 – CenterPoint Energy views the change in term to Defined Physical is unnecessary. Could not the definition of Physical Security Perimeter be updated with the meaning given to Defined Physical Boundary as seen with other existing terms? Page 7 – CenterPoint Energy requests clarification on the relationship between the EAP and ESP. Page 7 – CenterPoint Energy requests that the SDT use the definition from CAN-0024 for this term, External Routable Connectivity. Page 8 – CenterPoint Energy proposes that "consecutive" be added in front of calendar days for clarification. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
Yes
CenterPoint Energy is concerned that the language (as stated in 2.7) will result in identifying substations as critical/medium impact when, in fact, they are not. Line count does not necessarily mean that issues at particular substation will have a significant impact on the BES. Such impact can only be determined by studies and risk-based analysis of an entity's assets. Thus, CenterPoint Energy is in support of language similar to that in CIP-002-3/CIP-002-4 for identifying substations that are critical to the reliable operation of the BES. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy suggests that the SDT consider continuing the concept of starting with assets as an alternative approach. CenterPoint Energy proposes that the approach be based on an identification of High, Medium, and Low assets and then proceed with identifying Critical Cyber Assets at those facilities. Page 19 - 21 - "Operations Service" should be "Operating Service". CenterPoint Energy would like to request the removal of the extra bullet under Managing Constraints as it appears that criteria may be missing. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
Yes
CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy proposes that documentation errors should rarely if ever be deemed high/severe. Only violations that could have an immediate impact on the reliability of the BES should be considered high/severe. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy supports the concept of assigning a senior manager as outlined in the existing standards/requirements. However, the rationale for changing the language and numbering of this requirement is not obvious as the changes are immaterial and appear to have no effect on the implementation of the requirement. There will be an impact on compliance and compliance tracking for no substantial benefit. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Similar to the previous comment on R1, CenterPoint Energy supports the concept of establishing a cyber security policy as outlined in the existing standards/requirements. However, the rationale for changing the language and numbering of this requirement is not obvious as the changes are immaterial and appear to have no effect on the implementation of the requirement. There will be an impact on compliance and compliance tracking for no substantial benefit. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
See comment for R2. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy recommends that the SDT revert to the CIP Version 3/Version 4 language for this requirement as the changes are immaterial in writing yet could prove moderate in interpretation and implementation. The change is also not supported by a FERC directive. The Company would also like to propose that this requirement should be limited to the applicability of High and Medium impact BES Cyber Systems as it pertains to the categories and formatting. CenterPoint Energy also suggests that "unescorted" be added in front of all references to "access". CenterPoint Energy recommends that the

last 3 bullets under Measures (M4) be deleted as bullet 1 or 2 should be sufficient to prove compliance. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy recommends that the SDT revert to the CIP Version 3/Version 4 language for this requirement as the changes are immaterial in writing yet could prove moderate in interpretation and implementation. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
Yes
The footnote reference should be reformatted. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy views the VRF/VSLs for R4 and R5 as unreasonable and proposes that they be lowered. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests clarification on who should receive the on-going reinforcements. Alternatively, the SDT should revert to the CIP Version 3/Version 4 language. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests clarification on role-based training and suggests that “and the training needed.” Be added to Requirement 2.1. CenterPoint Energy also suggests that 2.2 be deleted and 2.3 and 2.5 be combined for simplification and clarity. Additionally, Requirement 2.7 should also be deleted and its concepts combined with 2.9. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 14 and 15 - R3.1 and R3.2 - CenterPoint Energy requests that “Associated Physical Access Control Systems and Associated Electronic Access Control or Monitoring Systems” be removed from the applicability as it is seen as an expansion in scope that is not supported by a FERC directive or rationale. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy recommends that the applicability for this requirement be set to match that of R5.
Yes
CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy does not agree with this requirement and proposes that the SDT refer to the CIP Version 3/Version 4 language. There are also concerns on the measures and the amount of evidence required to demonstrate compliance. The first measure should be adequate. Also, the description of evidence on the 3rd measure is unclear. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 29 - R7.1, CenterPoint Energy suggests that the SDT change "at the time" to "concurrent or prior to the date of" to minimize the issue of time alluded to in footnote #2. Page 30 - R7.2 – CenterPoint Energy believes that the time limit of “by the end of the next calendar day” is unreasonable for reassignments or transfers and proposes that the SDT consider extending the time limit. CenterPoint Energy understands that access of transferred individuals should be reviewed and updated; however, there is usually a period of transition and such personnel changes are within the same organization. “Accumulating unnecessary authorizations through transfers” usually happens over a time period that is longer than the 7 days which is the current requirement. Page 31 – R7.3 – CenterPoint Energy requests clarification on tracking access to BES Cyber System Information. It appears that removing access to the system and physical facilities would be satisfactory. Page 33 – R7.5 – CenterPoint Energy is concerned with the applicability of this requirement to Medium Impact BES Cyber Systems. Implementation would have a significant impact on substation operational procedures. CenterPoint Energy questions if the removal of physical access for Medium Impact BES

Cyber Systems sufficient. For entities that do not network assets, this is not technically feasible. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Most of the VRF/VSLs are High/Severe. CenterPoint Energy believes that such classifications are not reasonable for most requirements given that minor exceptions would not lead to an interruption to the BES. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy recommends that the words “and monitor” in the Rationale for R1 be deleted as it does not fit with the definition or concept of Electronic Security Perimeter. Under Summary of Changes, “points” should be capitalized. Page 11 - R1.1 – Under Measures, “technical and procedural” should be changed to “technical or procedural” to reflect the language in the requirement. Additionally, CenterPoint Energy proposes the following wording for the measures: Evidence may include, but is not limited to, existing documented technical or procedural controls. Page 11 – R1.2 - CenterPoint Energy requests that “Associated Physical Access Control Systems” be removed from the applicability as it is seen as an expansion in scope that is not supported by a FERC directive or rationale. CNP suggests that “with external routable and dial-up connectivity” be added to “Associated Protected Cyber Assets”. Also, proposed alternative wording for the requirement is as follows: Control and secure all instances of external connectivity through the use of identified Electronic Access Points (EAPs). Page 12 – R1.3 – CenterPoint Energy suggests replacing “granting or denying” with “denying access by default”. Page 13 – R1.5 – CenterPoint Energy seeks clarification on whether this requirement is for host-based or network based intrusion detection systems or is it optional. The Company also suggests that “at each EAP” be changed to “at each ESP”. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy seeks clarification on when encryption initiates and terminates. CNP also requests that the SDT consider splitting this table into specific requirements for dial-up and requirements for routable. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations instead of all being rated, “Severe.” CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 11-12 – R1.2 &1.3 - CenterPoint Energy is concerned that tracking for ingress and egress is not available for many physical access control systems and a TFE might be necessary. This is also a change in scope that is not supported by a FERC directive or rationale. Page 13 - R1.4 – CenterPoint Energy requests clarification or a description of a “real-time alert”. In reference to a “response to an unauthorized physical access”, please clarify if this means real or attempted as a pure population of real or especially attempted events would be hard to track. In the case of unauthorized badge swiped, yet the system does not open the door, is that an “attempt”? Page 14 – R1.6 - CenterPoint Energy requests clarification on the retention required. Will entities be required to have 90 days as in the current standard or 3 years? Storage for three years of logs that are not related to an event could prove costly and burdensome for no benefit. CenterPoint Energy also has concerns regarding implementing this requirement in the substation environment given the group work that occurs under the direction of a crew leader. Does each person have to be identified? CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
Yes
CenterPoint Energy supports the comments submitted by Edison Electric Institute (EEI).
No
Page 18 – R3.1 - CenterPoint Energy requests clarification on what the SDT expects to be done at a door/fence/gate. Page 18 – R3.2 – CenterPoint Energy suggests that “or Monitoring Systems” be deleted under applicability. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy supports the comments submitted by Edison Electric Institute (EEI).

No
Page 10 – R1.1 - CenterPoint Energy foresees a substantial impact given this revised wording and suggests that the SDT consider the CIP Version 3/Version 4 language. Specifically, the change in “documenting compensating measures” (CIP Version 3/Version 4) versus “documenting the need” (CIP Version 5) could prove difficult for dynamic ports with little benefit and may not be technically feasible for all systems. CNP believes that intention and results would be the same if the legacy language was retained. Page 10 R1.2 – This requirement is very broad. Alternate wording could be included as follows: “Protect against the use of unnecessary physical I/O ports”. CenterPoint Energy also requests that the SDT consider provisions for procedural controls. The inclusion of removable media on this requirement is also a concern. CNP suggest that the term, removable media be deleted. The Company also does not believe that signage provides solid security benefit. Logical restriction and placement in a Defined Physical Boundary appears adequate to meet the requirement. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 12 – R2.1 - CenterPoint Energy requests that the SDT clarify that a null list is acceptable or include provisions for a TFE for this requirement as implementation may not be possible for all substation systems or assets. Also, add “security related” in front of updates. CNP also requests that the last sentence of the measures be deleted: “The list could be sorted by BES Cyber System or source.” Page 13 – R2.2 – CenterPoint Energy suggests the following as alternative language: “Identify applicable security-related patches or updates and create a remediation plan, or revise an existing remediation plan, within 60 days of release from the identified source.” Page 14 – R2.3 – CenterPoint Energy believes that the measures go above and beyond the requirement which only calls for a process. Detailed records would depend on the contents of the process. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 17 – R3.1, 3.2 - CenterPoint Energy suggests that the applicability be updated to reflect application to “Medium Impact BES Cyber Systems with External Routable Connectivity”. R3.2 – The measures do not align with the requirement. CNP suggests deleted bullets, 2 and 3. Page 18 – R3.4 – CenterPoint Energy requests that references to Transient Cyber Assets be deleted. The measure regarding logs should be moved to R3.5. Page 19 – R3.5 – CenterPoint Energy requests clarification on the implementation of this requirement as the Company foresees it to be burdensome and unrealistic, especially in a substation environment. Is this intended to be a system or manual log? CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 21 – R4.1 – CenterPoint Energy requests that “BES” be added in front of “Cyber Security Incident” and provisions for a TFE are made. CenterPoint Energy also recommends that the applicability for this requirement be set to match that of R4.4. Page 22 – R4.2 - CenterPoint Energy requests that the SDT revert back to the CIP Version 3/Version 4 language or provide a description for “real-time alert”. Page 23 – R4.3 – Add "after failure is identified or made aware of" in the requirement. Page 23 – R4.4 – CenterPoint Energy requests that the SDT revert back to the CIP Version 3/Version 4 language as there is no substantive change or related FERC directive. CNP also suggest that the measures sentence end before “and”. Page 44 – R4.5 - CNP suggests that the requirement ends before “and”. CNP also suggest that the measures sentence end before “and dated evidence…”. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 27 – R5.1 - CenterPoint Energy recommends the following alternative language: “Authenticate individual and shared account access before granting electronic user access to each BES Cyber System where technically feasible.” Page 28 – 30 - R5.2, 5.3, and 5.5 – CenterPoint Energy recommends that the “Medium Impact BES Cyber Systems” applicability for these requirements be updated to “Medium Impact BES Cyber Systems with External Routable Connectivity”. Page 31 – R5.6 – In regards to the applicability, Medium Impact BES Cyber Systems at Control Centers, CNP requests clarity on the types of devices that fit this description. Consoles only? CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations. CenterPoint

Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 11 - R1.1 – CenterPoint Energy requests that the phrase “or Defined Physical Boundary of BES Cyber System and” be deleted as it should not be included with Cyber Security Incidents. Provisions for physical incidents are covered under CIP-001 and EOP-004. Page 12 – R1.3 – CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 13 – R2.1, 2.2, 2.3 – CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Generally, Page 15 - 17 – R3 – CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. Page 5 – In the Purpose statement, CenterPoint Energy requests that the sentence end before “and” since business continuity and disaster recovery is beyond the scope of this Standard. Page 16 – R3.2 – Thirty calendar days is not enough time. CNP proposes that the requirement be updated to state “within 30 days of determining actual cause”. Page 16 – R3.3 – Add “if necessary” to the end of the sentence. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations. CNP also recommends that the “Requirement R1” paragraph under Guidelines and Technical Basis be deleted as entities should be able to refer to the definitions. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Generally, CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. Page 10 – R1.3 - Delete "protection of information” as it is required in CIP-011. Page 11 – R1.4, R1.5 – Check Table R1 headings. R1.4 - CenterPoint Energy requests that the SDT clarity what “verified” means in the requirement. (ex. A log showing status – “Successful”) CNP also asks that “after significant changes to the system" be added to the end of the sentence. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI). R1.5 – CNP proposes the following alternative language: “Preserve data for analysis or diagnosis of the cause of an event that triggers activation of the recovery plan as required in Requirement R1 when it does not impede or restrict restoration.”
No
Generally, CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. Page 13 – R2.2 – CenterPoint Energy suggests replacing “Test any information” with “Test a sample of information”. Page 14 - R2.3 – Delete “Medium Impact BES Cyber Systems at Control Centers” from applicability. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 15 – R3.1 – Delete “or when BES Cyber Systems are replaced” from the requirement. Page 16 – R3.2 – Delete “incident” from the requirement and the measures. Thirty days is not enough time to perform the exercise and document lessoned learned. CenterPoint Energy suggests 60 days. Page 17 – R3.4 – CenterPoint Energy suggests the following as alternative language: “Update recovery plan(s) within thirty calendar days of any organizational or technology changes that impact that plan.” CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).

No
CenterPoint Energy believes that the R1 requirements would be burdensome, not realistic for every day operations and difficult to implement for every asset, especially in the substation environment. Implementation is complicated further by the details listed in the baseline configuration (R1.1). CNP suggests that this requirement be modified to accommodate general testing and significant changes. Additionally, R1.5 seems to imply that there must be a test environment. Some testing may have to be done in the production environment. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Page 15 - R2.1 - CenterPoint Energy believes this requirement would be overly burdensome especially in a substation environment that is not networked. CNP proposed that the applicability “Medium Impact BES Cyber Systems” be updated to “Medium Impact BES Cyber Systems with External Routable Connectivity. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy proposes that the description does match vulnerability assessment and requests that the SDT clarify or refer to CIP Version 3/Version 4 language. CNP also suggests that “cyber” be added in front of security controls. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Generally, CenterPoint Energy requests that the SDT revert back to CIP Version 3/Version 4 language since only minor wording changes are included that are not related to a FERC directive. CNP also suggests that the applicability for Medium Impact be with the qualifier of “with External Routable Connectivity” or “at Control Centers” and “Associated Protected Cyber Assets” deleted. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy suggests that 2.1 and 2.2 be combined and Associated Protected Cyber Assets be removed from applicability. Additionally, the term media could refer to a long list of devices for which this requirement would be difficult to track and enforce. CNP also requests clarification on the term reuse. (ex. Can assets be reused/redeployed as long as they remain in the Defined Physical Boundary and for the purpose of BES Cyber Assets/Systems?) CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
CenterPoint Energy requests that the SDT consider a more gradual scale for violations. CenterPoint Energy also supports the comments submitted by Edison Electric Institute (EEI).
No
Given the scope expansion and anticipated impact of CIP Version 5, CenterPoint Energy suggests that 18 months is not sufficient time to implement. CNP also requests that the effective date not be set in the month of December or January considering various business processes conducted at the end of the year.

Yes
BES Cyber Asset: This section of the definition is confusing and should be omitted: This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services. The reference to a “Cyber Asset” within the definition includes a number of devices that might need further clarification due to the word “programmable”. Would a relay that is “configured” be considered a Cyber Asset even if the configuration does not involve any kind of network, telecommunication or IP based network connectivity? BES Cyber System Information: Information about a BES Cyber System or Asset could

include vendor provided manuals and should not be included. Cyber Assets: Need to clarify what is meant by the term “Programmable” A Cyber Asset should imply that some form of connectivity is required to access the device otherwise it would simply be an Asset. Electronic Access Point & External Connectivity These definitions do not touch on serial interfaces that are not dial-up. Does this mean that serial communications will not be considered External Connectivity?
Yes
Attachment 1 criterion 2.13 categorizes all Transmission Operator (TOP) and Transmission Owner (TO) Control Centers as Medium impact to the BES. This criterion is too inclusive as it includes Control Centers of low impact Radial Transmission Owners and Operators unnecessarily. This results in the applicability of security controls that are not at all aligned with the risk that these Control Centers could have on the BES. To avoid this situation, Criterion 2.13 could be aligned with criterion 2.7 but instead of focusing on a single station or substation; consider all of the facilities that the Control Center controls. If the “total aggregate value” of all Transmission Facilities does not exceed a value of 3,000; the Control Centers should not be designated as Medium impact. For Example: 2.13. Control Centers not included in High Impact Rating (H), above, that perform (1) the functional obligations of Transmission Operators or Transmission Owners with a “total weighted aggregate value” that exceeds 3,000 for all Transmission Facilities controlled by the Control Center per criterion 2.7; or (2) generation control centers that control 300 MW or more of generation. This modification is well aligned with the NIST risk management framework and the drafting team’s approach to focus on the impact to a shared resource like the BES. Criterion 2.7 must have been developed with an engineering basis that relates to the impact of Transmission Facilities on the BES. With this in mind, the same impact to the BES can only be realized if the sum of all facilities managed by a Control Center exceeds this same criterion. In the NOPR for CIP-002-4 and the subsequent response to the NOPR by NERC the NIST Risk Management Framework is discussed in section 5. In this section the stated goal is to “Categorize BES Cyber Systems based on their function and impact”. In addition, “A tiered approach to security controls which specifies the level of protection appropriate for systems based on their importance to the reliable operation of the Bulk-Power System” is discussed. The drafting team’s approach to categorization is in fact “Based on the “impact” or compromise or of the scope of control of the BES Cyber System”. In this example, it makes sense to modify the criterion to remain consistent with the categorization based on the impact and scope of control of these Low Impact Control Centers. In the NOPR for CIP-002-4 and the subsequent response to the NOPR by NERC, “Potentially unprotected Control Centers” are discussed in section 6. The FERC concern that many Control Centers are left with “No obligation to apply cybersecurity measures” under CIP-002-4 is legitimate. The response however should not be to include all remaining Control Centers as Medium Impact assets as is the current approach in CIP-002-5 criterion 2.13. The best approach is to continue to align security controls with the risk and impact to the BES. Many of the Control Centers that FERC is concerned with will be included as Medium Impact BES Cyber Systems if this change is made while others have cybersecurity measures required as is appropriate for Low Impact Assets.
No
R1.1 This requirement states that documentation needs to be updated within 30 days if BES/Facility changes result in a change to the categorization of BES Cyber Assets or Systems from a lower to a higher category if intended to be in service for more than 6 months. What is the expectation for compliance with the additional standards as a result of this change in categorization? It will be difficult to determine “intent” from an auditing perspective. What happens if there is “intent” but the six months is exceeded or the intent changes? In addition, this requirement doesn’t state what the expectation is for new Cyber Assets or Systems or Cyber Assets or Systems that may move from a High to Medium or Medium to Low Category. Is there any requirement to document these changes other than during the annual review process in R2? Table of Compliance Elements For both R1 & R2 Lower VSL, what is the VSL if less than 30 days for updates in R1 or Review and approval for R2? Is there such a thing as having NO VSL?
Yes
No
Table of Compliance Elements For both R1 & R2 Lower VSL, what is the VSL if less than 30 days for updates in R1 or Review and approval for R2? Is there such a thing as having NO VSL?
Yes

Yes
Yes
Yes
Yes
Yes
Yes

R2.1 The requirement does not call for the identification of training that is needed for each role but this is listed in the measures section of the table. Need to add this to the requirement.
Yes
Yes
Yes
Yes
No
R7.1, R7.3, R7.4, R7.5 Resignation and termination are very different and need to be treated as such. A resignation may take place weeks prior to the last day of service which is when access needs to be revoked.
No
R1.1 This requirement calls for technical or procedural controls for Low Impact BES Cyber Systems with External Routable Connectivity. Since there is no requirement to identify these assets or systems, it will be difficult to audit this.
Yes
Yes
No
R2.1 The requirement for continuous escorted access of visitors makes sense but it is difficult to prove compliance with this requirement. The measures include language in a visitor control program AND additional evidence to demonstrate compliance such as visitor logs. Visitor logs DO NOT demonstrate compliance with this requirement. Recommend removing the AND from the measures section of the table. R2.2 Need to clarify what meant by “point of contact” for the visitor. Cell phone? Office Phone? Email address?
No
3.1 and 3.2 The applicability section is unclear, are the “Associated Physical Access Control or Monitoring Systems” referring to security systems that protect Medium or High Impact Cyber Assets or Systems only?

Yes
Yes
No
R3.1 & R3.4 Need to clarify if this requirement is deter or detect or prevent Or deter and detect or prevent Or deter and detect and prevent The wording is highly subjective and should be clarified. R3.4 & R3.5 Need to clarify if manual logs are acceptable for audit proof or if all systems need to be able to generate a log to show when Transient Cyber Assets have been connected. (Auditors will likely ask for system logs) This may not always be technically feasible for removable media on all assets. In addition, the connection may be via a network connection as opposed to a physical connection.
No
R4.4 Retention of logs for 90 days will not meet the expectation of auditors that will demand to see logs to demonstrate compliance for the entire reporting period. This standard should clearly state that the entity is not required to maintain these logs beyond 90 days and that the auditor should audit the process and/or select a test sample from the population of available logs.
Yes
Yes
No
R1.1 and R1.2 In order to identify, classify and respond to BES Cyber Security Incidents the entity would need to identify all of the Assets or Cyber Systems. This is not a requirement for Low Impact BES Cyber Systems but it is implied by these requirements.
No
See Response to Question 34
No
See response to question 34
No
1.4 Need to clarify what is meant by “verified” initially after backup
No
R2.2 Need to clarify what is meant by “test initially” and at least once each calendar year. Does this imply that a full recovery must be performed for each backup? If so, the best practice of completing more frequent back-ups may be bypassed to achieve compliance. Suggest removing “test initially” from the requirement. Also need to clarify that back-ups will likely not contain the most current configuration unless they are performed frequently.
Yes
Yes
No
R2.1 The “where technically feasible” statement implies that monitoring should be automated in some fashion and that if this is not possible, that a TFE will be generated. This will result in significant TFE’s which do not add value from a security perspective. In addition, the baseline that is referenced in section 1.1 includes the physical location. How will this be monitored without performing a physical inventory and at what cycle?
No
R3.1 This requirement calls for a paper OR active assessment of the security controls to determine

the extent to which the controls are implemented correctly and operating as designed. The terms “implemented correctly” and “operating as designed” seem to imply technical controls which will be difficult to validate with a paper based assessment. The paper review is a good option for entities so I would recommend that the results section of the requirement be rewritten as follows “to determine the extent to which controls are implemented and/or operating as designed.”

The Rationale for R1 appears to imply a two-step process in the identification and categorization of BES Cyber Assets/Systems, i.e. “Once they have been identified, they must be categorized according to their impact…” However, in R1 as currently written, the word “identify” comes after the statement that the requirement applies to Entities that own BES Cyber Assets/Systems. This implies that the identification step has already occurred. So, does the word “identify” refer to identifying High and Medium Impact BES Cyber Assets/Systems,” or does it refer to identifying which Cyber Assets/Systems are BES Cyber Assets/Systems? If the former, it seems that “identify” is redundant with “categorize” since, identifying which BES Cyber Assets/Systems have High or Medium Impact would be the categorization step. If the latter, then “identify” seems to be misplaced in the sentence since, in the introduction to R1, Responsible Entities have already determined that they own BES Cyber Assets or BES Cyber Systems. Suggest rewording R1 to clearly identify the two-step process or adding a new R1 for the identification step: New R1: “Each Responsible Entity shall identify its BES Cyber Assets or BES Cyber Systems by determining which of its Cyber Assets or Cyber Systems perform or support any BES Reliability Operating Service and could impact the reliable operation of the BES.” Evidence could be a list of Cyber Assets or Cyber Systems with a determination of the BES Reliability Operating Service(s) they perform, if any. BES Cyber Assets or BES Cyber Systems would be those Cyber Assets/Systems on the list that could adversely impact the BES Reliability Operating Service, per definition. It seems that this would aid the Entity in audit preparation by having a complete audit trail of its BES Cyber Asset/System identification and categorization processes. New R2: “Each Responsible Entity that owns BES Cyber Assets or BES Cyber Systems shall categorize them according to the criteria contained in CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems. BES Cyber Assets and BES Cyber Systems that it owns that are not categorized as High or Medium Impact shall be deemed to be Low Impact and do not require discrete identification.” Evidence would be the same as the currently written M1. The “BES Reliability Operating Services” paragraph, CIP-002-5 page 8, appears that it should be edited. Sentence 2 states “In order to identify them, Responsible Entities determine whether BES Cyber Assets perform or support any BES Reliability Operating Service.” If it’s a BES Cyber Asset, then it has already been identified and determined. Suggest removing “BES” prefix to Cyber Assets: “In order to identify them, Responsible Entities determine whether Cyber Assets or Cyber Systems perform or support any BES Reliability Operating Service.” Also suggest truncating sentence 4 after BES Cyber Systems to avoid the redundancy of “that perform or support BES Reliability Operating Services,” i.e. “This ensures that the initial scope for consideration includes only BES Cyber Assets and BES Cyber Systems.”

DOPD agrees with the intent of R2, but makes the following suggestions for Part 2.1: (1) “when incidents occur” seems redundant with “When a BES Cyber Security Incident occurs,” (2) “or test” appears to be tacked on to the end without being mentioned earlier in the requirement, and (3) suggest using the word “exercise” instead of “test” to correlate with Part 2.2. Suggested rewording “When a BES Cyber Security Incident occurs or the BES Cyber Security Incident Response Plan is exercised, the incident response plans must be used and include recording deviations taken from the plan during the incident or exercise.” In the Measure for 2.1, suggest adding “or exercise” at the end of the measure: “…deviations taken from the plan during the incident or exercise.”
Yes
Yes
Yes
The column headings for CIP-009-5 Table R1 for Part 1.4 and 1.5 need to be corrected to “Applicability,” “Requirements,” and “Measures,” rather than Part, Part, Part. DOPD agrees with the intent of Part 1.5 as it applies to preserving forensic data for analysis of potential cyber security incidents or cyber events. Many triggers of the recovery plan(s) could be for physical, non-cyber events such as damage or failure due to fire, water, earthquake, power failure, etc. Taking the time to preserve data for these non-cyber events may increase the time it takes to recover the cyber assets. Suggested wording: “Preserve data, where technically feasible, for analysis or diagnosis of the cause of any cyber event that triggers activation of the recovery plan(s) as required in Requirement R1.”
Yes

If the expectation is that delegation of approvals is required down to BES cyber system gate keepers (asset owner), then this requirement is considered overly prescriptive.
Yes
No
For R2: Suggest that a Moderate VSL be added that reads as follows: “The Responsible Entity has implemented at least one cyber security policy, but has failed to address one of the required parts 2.1 to 2.10”. Change the High VSL to read as follows: “The Responsible Entity has implemented at least one cyber security policy, but has failed to address more than one of the required parts 2.1 to 2.10”. Change the Severe VSL to read as follows: “The Responsible Entity has not implemented any cyber

security policy." For R4: Add a Moderate VSL: "The Responsible Entity has made some, but not all, individuals who have access to BES Cyber Systems aware of elements of the cyber security policies appropriate for their job function. Less than 5% of those individuals who have access to BES Cyber Systems were not made aware of the cyber security policies appropriate for their job function." Change the High VSL to read: "The Responsible Entity has made some, but not all, individuals who have access to BES Cyber Systems aware of elements of the cyber security policies appropriate for their job function. Greater than 5% but less than 50% of those individuals who have access to BES Cyber Systems were not made aware of the cyber security policies appropriate for their job function." Change the Severe VSL to read: "The Responsible Entity has made some, but not all, individuals who have access to BES Cyber Systems aware of elements of the cyber security policies appropriate for their job function. Greater than 50% of those individuals who have access to BES Cyber Systems were not made aware of the cyber security policies appropriate for their job function."
No
The Measures section in Table R1 is worded in a way that may cause confusion. The wording "…and additional evidence to demonstrate that this program was implemented such as, but not limited to, the quarterly reinforcement material that has been distributed." may be interpreted to mean that more than the quarterly reinforcement material was necessary. Suggest changing to: "…and additional evidence to demonstrate that this program was implemented and awareness materials were identified and delivered to meet timeframes specified in the regulations." Also, since security awareness may be general in nature and a key contributor to a good corporate security program, it makes sense to add the ability to encourage vendors to provide their own awareness materials to their employees and allow the RE to accept documentation of that vendor awareness as compliance for this requirement relative to contractors and/or vendors with access to BES systems. The specific addition to the Measures section could read: "Documented evidence of awareness for contractor and/or vendor employees with access the BES systems may include evidence of the vendor's documented security awareness program and additional evidence to demonstrate that the vendor's program was implemented and awareness information was identified and delivered to the vendor/contractor employees to meet the content and timeframes specified in the regulations."
No
Delivery of cyber security training to vendor support staff who, most often, are never physically on site at a Registered Entity's facility can be difficult to document. For Table R2 Measures section for sub-requirements R2.2 – 2.10, retain the first paragraph in each sub-requirement as written, but add a second paragraph as follows: "Evidence to support contractor/vendor training may include, but is not limited to, vendor's attestation/certification that Responsible Entity's role-specific training has been delivered to all contractor/vendor employees with access to Responsible Entity's BES Cyber Systems."
No
Delivery of cyber security training to vendor support staff who, most often, are never physically on site at a Covered Entity's facility can be difficult to document. For Table R3 Measures section for sub-requirement R3.1, retain the first paragraph in each sub-requirement as written, but add a second paragraph as follows: "Evidence to support contractor/vendor training may include, but is not limited to, vendor's attestation/certification that Responsible Entity's role-specific training has been delivered to all contractor/vendor employees with access to Responsible Entity's BES Cyber Systems."
Yes
Yes
No
This language appears to change the access granting process significantly by requiring the CIP Senior Manager or delegate to authorize all electronic access. We believe this responsibility is typically job role (specific asset owner) based, and is not based on an individual delegation. Recommend that the language remain as identified in CIP-004-3, with updates as follows to retain the consolidation of access requirements found in CIPs-003, 004, 006, and 007": R6.1: Recommend the following language: "The responsible entity shall authorize electronic access based on minimum necessary work requirements except for those situations meeting the definition of "CIP Exceptional Circumstances". R6.2: Recommend the following language: "The responsible entity shall authorize unescorted physical

access to BES Cyber Systems based on minimum necessary work requirements except for those situations meeting the definition of “CIP Exceptional Circumstances”. R6.3: Recommend the following language: “The responsible entity shall appropriately manage and grant access to BES Cyber System information based on minimum necessary work requirements except for those situations meeting the definition of “CIP Exceptional Circumstances”.
No
R7.2 and R7.3: The language used fails to address issues related to ongoing access requirements during ‘transition periods’ associated with employee transfers. Recommend the following addition to the Requirements Section of Table R7: “For retirements and reassignments, revoke the individual’s unescorted physical access and Interactive Remote Access to BES Cyber Systems by the end of the next calendar day after access is documented as no longer required.
No
There are many administrative requirements where zero tolerance is inappropriate. Missing a re-training date by a day or a week should not be considered a High or Severe violation level.
Yes
Yes
Yes
No
R1.3 needs to clarify the need for multiple access controls vs. multiple physical access layers.
No
Intentions of change are good, however, the change description and justification in table 2 (R2.2) do not seem to reflect the current wording of the requirement.
Yes
Yes
Yes
No
The statement at the bottom of CIP-007-5 Table R2 “This is the same concept as in the current CIP-007 R3.2 wording however a 30 day window was given to allow for documentation of the actual implementation in a less time constrained manner where manual processes are used” confuses the expectation for the implementation vs. the implementation plan needing to be done within 30 days.
No
No definition of transient cyber assets or transient cyber asset connections is provided within the standard, but is needed. Realize that is defined in supporting documents, but terms should be defined in the NERC Glossary, or the standard directly.
Yes
Yes
Yes
Yes
Yes
Yes

Yes
No
CIP-009-5 Table R1 in Part 1.5 requires preserving data, where technically feasible. This suggests that a TFE will be required if preserving data is not technically feasible. Do not understand how a TFE can be completed in its current form (compensating factors) since this would occur post-incident, and if the data is gone, it's gone.
Yes
Yes
Yes

Individual
David Kiguel
Hydro One Networks Inc.
Yes
Refer to additional comments submitted for Question 49. "Suspicious" is not an auditable term, and should be removed. What is an "attempt"? What attempts are serious enough to justify having to be reported? The definition should be made to read: BES Cyber Security Incident: • A malicious act that: Compromises the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or, • Disrupts the operation of a Critical Cyber Asset BES Cyber System, or • Results in unauthorized physical access into a Defined Physical Boundary. Under "BES Reliability Operating Services": • "Identify and monitor flow gates" under "Managing Constraints" appears to be missing its bullet. • Recommend that "Change management" under "Situational Awareness" be clarified to changes in the BES instead of IT change management. • Recommend clarification that "Facility" is the NERC Glossary term--in "facility operational data and status" under "Inter-Entity Real-Time Coordination and "Communication": • Request clarification of the scope of this "Operational Directives". Does it include a company's messaging system? Two-way radios? What is the relationship with the new COM-002? • Request clarification that these Coordination and Communications are limited to Reliability, not Market Systems. • Recommend that each BES Reliability Operating Services have a beginning paragraph that clearly associates that service to the BES like the "Dynamic Response to BES Conditions." • For clarity, recommend stating which Functions are associated with each BES Reliability Operating Services instead of forcing everyone to interpret.

Yes
Recommend that 2.8, 2.9 and 2.11 start with “Applies to all Regions except…” For 2.8, 2.9 and 2.11 request that the SDT clarify whether the exception is all regions, or not WECC. In 2.12, “system” and “Facility” are not the proper terms to use. An operator is responsible for automatic load shedding or the other forms of load relief mentioned. For 2.3, 2.8, and 2.9, need to clarify the role and responsibility of PC, TP, GO, GOP, RC and the PA on impact ratings. Who is responsible for assets being improperly categorized? What avenues are there for appealing?
No
For clarity, request changing R1.1 from “Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation” to “Update the identification and categorization within 30 calendar days when a change to BES Elements and Facilities is placed into operation.” For clarity and consistency with the previous change, request changing M1 from “as required in R1 and list of changes to the BES (” to “as required in R1 and list of changes to the BES Elements and Facilities).” The word “intended” should not be used in the requirement because it is not auditable. Regarding CIP-002-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard. The process to classify and categorize Cyber Assets (CIP-002) and then identify other assets which must be protected (CIP-005 and CIP-007) is excessively complicated. In addition to the BES Cyber Assets that are classified as high, medium and low in CIP-002, the other standards introduce 10 additional categories of assets to protect in various ways: • Associated Physical Access Control Systems • Associated Protected Cyber Assets • Associated Electronic Access Control or Monitoring Systems • Electronic Access Points (with External Routable Connectivity) • Electronic Access Points (with dial-up connectivity) • Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries • Transient Cyber Assets • Medium Impact BES Cyber Systems with External Routable Connectivity • Medium Impact BES Cyber Systems at Control Centers • Low Impact BES Cyber Systems with External Routable Connectivity Some of these assets are defined in the Applicability Section of the standard (which will not be included in the final standard) while some are introduced in the standards themselves and these categories may or may not be included in the definitions document. This approach is overly complicated and does not allow the CIP Standards to stand alone without dependence on other documents. This also leads to the need for future questions, interpretations, CANs, etc. The Standards should be revised so that all assets which need to be protected are defined in CIP-002 rather than introduced throughout the Standards.
No
The last bullet for M4 on page 12 is inconsistent with R4 since M4 requires periodic training instead of R4’s making staff aware of cyber security policies. Request that M4 be updated to be consistent with R4.
Yes
No

The requirement has a typographical error. Footnote 2 is not in superscript. Request clarification that R6 does not require re-delegation when the CIP Senior Manager changes. Request change from “Changes to the CIP Senior Manager and” to “Changes to the CIP Senior Manager or”.
No
The requirement has a typographical error. Footnote 2 is not in superscript. Request clarification that R6 does not require re-delegation when the CIP Senior Manager changes. Request change from “Changes to the CIP Senior Manager and” to “Changes to the CIP Senior Manager or”.
No
Request clarification of whether personnel with access to only protected information need training/awareness. SDT should include this as an additional requirement. Recommend removal of R2.3 and R2.4 since they are redundant to R2.2, or explain the difference between R2.2 and R2.3, R2.4. Request removing “potential” from R2.7 since training should include how to determine whether a BES System Event occurred or not.
Yes
No
For all R4 table entries, recommend changing “documented risk assessment program” to “documented personnel risk assessment program” to avoid confusion with a corporate risk assessment program. For R4.2 recommend adding language to “grandfather” previous seven-year criminal checks executed for the previous version of CIP Standards. The additional language should spell out when this “grandfathering” expires, which is also when a new check will be required.
No
For clarity, recommend changing 5.1 from “authorized electronic or unescorted physical” to “authorized electronic or authorized unescorted physical.”
No
For R6.1 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “authorize electronic access, except…” to “authorize electronic access to BES Cyber Systems, except…” 3. Change “minimum necessary” to “minimum that the responsible entity considers necessary.” For R6.2 similar comments to R6.1, except that this requirement already refers to “BES Cyber Systems.” 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber Systems. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary.” For R6.3 1. The Responsible Entity should be able to determine the approval process for authorization of access to BES Cyber System Information. 2. Change “minimum necessary” to “minimum that the responsible entity considers necessary.” For R6.5, Change “minimum necessary” to “minimum that the responsible entity considers necessary.” For R6.6 1. Change “minimum necessary” to “minimum that the responsible entity considers necessary” in the Requirement. 2. In the measure for 6.6, change “BES Cyber System information” to “BES Cyber System Information” – capitalize the “I” in Information.
No
Request that the footnote for 7.1 be moved into the requirement. Recommend changing 7.2 to "For an individual, no longer acting in a role requiring unescorted physical access or electronic access to BES Cyber Systems, unescorted physical access and Interactive Remote Access will be removed within the next calendar day." Recommend removing the "following the resignation or termination" since it is redundant and inconsistent with the sibling Requirements. Recommend changing 7.4 from "For resignations or terminations," to "For terminations, resignations, reassignments, or transfers,".
No
Request clarification on the scenario where Low Impact BES Cyber Systems are mixed in the ESP with High/Medium BES Cyber Systems. Is this Low Impact BES Cyber System subject to 1.1 or 1.2? Request clarification that the 1.3 Electronic Access Points is the 1.2 identified Electronic Access Points or not? Request clarification that the 1.5 EAP is the 1.2 identified Electronic Access Point or not? Request clarification on 1.5's "at each EAP." Is that inside, outside or both? Regarding CIP-005-5, the

Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard. This would make the CIP standards consistent with the Results Based Standards concept.
No
Recommend changing 2.1 from "Require an Intermediate Device such that the Cyber Asset initiating Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset." to "Do not allow the Cyber Asset initiating Interactive Remote Access direct access to a BES Cyber System or a Protected Cyber Asset." As written, the proposed Requirement is too prescriptive and does not allow new technology. Recommend changing M2.3 from "Note that a UserID is not considered an authentication factor" to "Note that a UserID and password are not considered two authenticating factors" since the existing words are incomplete.
No
Request clarification of 1.1 Applicability since it does not identify which of High/Medium/Low BES Impact these are "Associated" with Request that Measure 1.2 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress." Request that Requirement 1.2 be updated to allow "escorted physical access." Request clarification of Requirement 1.3 "Utilize two or more different and complementary physical access controls." Is this multi-factor authentication such as key, badge, keypad or bio-metric? Request that Measure 1.4 be consistent (not add a Requirement) with Requirement 1.2, specific to "ingress and egress." Request changing Requirement 1.4 from "Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary. to "issue real time alerts for detection of breach through an access point." For consistency, recommend removing "applicable" from "protecting applicable BES Cyber Systems" in Requirement 1.6. Regarding CIP-006-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Recommend removing "continuous" from "Require continuous escorted access of visitors" so that the Requirement is auditable from Requirement 2.1. Recommend changing 2.2 from "the entry and exit on a per 24-hour basis," to "the entry and exit to the Defined Physical Boundary on a per 24-hour basis."
No
Request clarification on what the "Associated" "Applicability" (High/Medium/Low BES Impact) for 3.1 and 3.2 Request capitalization of "locally mounted hardware or devices" in Requirement 3.1 so that it refers back to the defined term "Locally Mounted Hardware or Devices."

No
Request clarification on 1.1. Is this at the BES Cyber System level or at the Asset level or can the Entity choose? Request clarification on 1.1. Why does the Measure refer to BES Cyber Asset while the Applicability refers to Systems? Regarding CIP-007-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard. Screenshots seem to be excessive for this requirement. Documenting the need for each network-accessible port is sufficient.
No
Request clarification of "remediation" in 2.2 since it reads that the patch must be applied, which does not allow having an exception when applying the patch is the worst scenario such as creating a denial of service. For 2.2, suggest wording like "create a remediation plan or a plan to mitigate the vulnerability if it is determined that the patch cannot be safely applied." What is the intent of CIP Exceptional Circumstances in 2.3? Is it intended to mean deviating from the remediation plan in 2.2? Is the "process for remediation" specific to the patch or the overall process? How do we address the risk of the patch affecting the potential reliability of the BES upon testing, prior to release? What is the recourse if not applied within the 30 days when potential issues have been identified?
No
Request allowances in 3.3 for signatures/pattern updates that cause trouble. Recommend changing 3.4 from "Transient Cyber Assets and removable media" to "Transient Cyber Assets or removable media". The Measure for 3.4 does not match the Requirement.
No
Request changing 4.1.4 from "Any detected potential malicious activity" to "Any detected malicious activity" since the scope of potential includes all activities. Request clarification on 4.3. Does the failure need to be detected within a calendar day? Request the rationale of 4.5's "two weeks." We recommend one month as a compromise between the prior version's 90 days and the suggested one week. In 4.5 clarification is needed for the associated protected cyber assets. Are these protected cyber assets associated with only high impact BES cyber systems, or could they be associated with medium impact BES cyber systems?
No
For 5.2, does the CIP Senior Manager or delegate approval policy or procedure for each authorization of access? In 5.2, should the Requirement be interpreted as "each use" as in "The CIP Senior Manager or delegate must authorize the use of each administrator, shared, default, or other generic account types?" Request clarification of 5.5.3, specifically "the significance of passwords in the set of controls used to prevent unauthorized access to the BES Cyber System and existing service agreements, warranties or licenses."
No
Regarding CIP-008-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the

need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.

No

2.1 is a new Requirement. Request the rationale for this new Requirement. Recommend changing from "When a BES Cyber Security Incident occurs, the incident response plans must be used when incidents occur and include recording of deviations taken from the plan during the incident or test." to "When a BES Cyber Security Incident is classified or identified, the Responsible Entity must follow its incident response plan." Recommend removing “initially upon the effective date of the standard” from 2.2 of Table R2 because it unrealistically forces an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered.

No

Recommend removing “initially upon the effective date of the standard” from 3.1 of Table R3 because it unrealistically forces an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Recommend that 3.2 wording be consistent with the 2.2 wording. For 3.3, recommend changing 1) "Update" to "Update as necessary" and 2) "the completion of the review of that plan" to "the completion of the review performed in 3.2".

No

For 1.3, request clarification of the “protection of information.” Is this integrity, availability or other information protection such as access controls, encryption? For 1.4, request clarification, is this a backup media verification process? If not, what is the intent? Recommend removing Requirement 1.5. Reliability's top priority is restoration of service. Forensics in a recovery mode may not support BES reliability and requiring such actions may negatively impact the BES Cyber System restoration process. Regarding CIP-009-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.

No

Recommend that 2.1 be implemented 180 days from the effective date of the Standard. For 2.1, request clarification, is “full operational exercise” the same as “functional exercise” as described in the rational? For 2.1 and 2.3 of Table R2 recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. For 2.2, request clarification that “any information” may be a sample and not all or each type of information. Do “backup media” include all media used in the recovery process such as vendor media? What does current configuration mean, as this may never be current? In 2.3, request 1) a definition of “operational exercise” and 2) clarification of “representative environments.” What is the scope? All network devices, systems and items that make up the BES Cyber System? This appears to be a new requirement as paper drill does not appear to be supported. Recommend this shall be implemented 180 days from the effective date of the

Standard.
No
For 3.1 recommend 1) removing “or when BES Cyber Systems are replaced” as it addressed in CIP-009 R3.4 and 2) removing “and document any identified deficiencies or lessons learned” as they are addressed in CIP-009 R3.2 and R3.3. For 3.1 of Table R3, recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Request that 3.3 be updated to be consistent with CIP-008 R3.3 for sixty days. Recommend that 3.4 be referenced by CIP-009 R3.1. Request CIP-008 R3.5 language be consistent with CIP-009 R3.5.
No
Recommend changing 1.3 to avoid double jeopardy from "Update the baseline configuration and other documentation required by a NERC CIP Standard, including identification and categorization of the BES Cyber Systems, as necessary within 30 calendar days of completing the change." to "Update the baseline configuration as necessary within 30 calendar days of completing the change approved in 1.2." For 1.1, 1.2, 1.3 and 1.4, recommend changing the Requirements to be consistent with their Applicability --- from "For a change to the BES Cyber System" to "For a change to the BES Cyber System or Associated Systems or Associated Assets". Recommend removing "High Impact BES Cyber Systems" from 1.4's Applicability since these are covered by 1.5 which is a higher threshold. Regarding CIP-010-1, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.
No
Recommend removing "where technically feasible" from 2.1 since the remaining words should not need an exception.
No
For 3.1 and 3.2 of Table R3 recommend removing “initially upon the effective date of the standard” because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Recommend changing 3.2 from "in a production environment." to "in a production environment or a test environment." to allow Entities more flexibility in meeting this Requirement.
No
Request clarification on 1.1. Some interpret this Requirement as what is the Entity's process for identifying BES Cyber Systems Information. If correct, the Measure should be "show me the methodology (document)." Others interpret these Measures as labeling BES Cyber System Information. Recommend removing “initially upon the effective date of the standard” from 1.3 of Table R1 because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. Grandfathering is not considered. Regarding CIP-011-1, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are

different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5.\ There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.

No

Request that footnote 2 in 2.1 be moved into that Requirement.

No

The table label Scenario of Unplanned Changes is for unplanned changes after the effective date. If true, the surrounding words should explicitly state so. Otherwise, this Scenario table is confusing because it repeatedly uses 12 months while the earlier text uses 18 months. Due to the CIP version 4 and version 5 implementation cycles, there is a lack of understanding as to what needs to be implemented, leading to uncertainty as to how long an implementation period would be needed. It is unrealistic to expect entities to begin implementing Version 4 requirements and then have to implement Version 5 requirements within a very “narrow” window. Since Version 4 has not been yet approved by FERC, there is the possibility of Version 4 being effective while version 5 is in implementation. Version 4 may only be effective for a few months. A summary of comments applicable to more than one standard: • Recommend removing “initially upon the effective date of the standard” from 1.3 of Table R1 because it will lead to forcing an Entity to be compliant with two Versions of the Standard at the same time. The increased demands placed upon Entities to be compliant with Version 5 will make it very difficult to become compliant when going from Version 4 to Version 5 within the time frames specified. • Request that Applicability sections of CIP-002-5 – CIP-011-5 be consistent. Note CIP-005-5 and CIP-006-5 sections 4.2.2 are different from other Standards. • Request clarification of the capitalized term “Facilities.” Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1, and note this question applies to the Applicability sections of CIP-002-5 – CIP-011-5. A fiftieth question should have been included in this comment form asking for general comments or concerns. A question asking general comments should be included as part of every comment form posted to the industry. Regarding CIP-003-5, the Applicability sections of CIP-002-5 through CIP-011-5 should be consistent. Note that CIP-005-5 and CIP-006-5 sections 4.2.2 are different from the other Standards. The capitalized term “Facilities” in Section 4 needs to be clarified. Does this refer to the NERC Glossary of Terms or section 4.2? For example, see CIP-002-5 sections 4.1.2 and 4.2.1. This question applies to the Applicability sections of CIP-002-5 – CIP-011-5. There are potential issues with the implementation of CIP Version 4 versus CIP Version 5. As written, CIP Version 5 appears to have some requirements that would be enforceable on the effective date and there may be a need for an implementation and/or conversion timeframe. The words in the Standards Requirements appear to be at odds with the Implementation Plan and clarity is needed. Additionally, there is concern with the need to be “compliant” with requirements that simply rely on documentation. Documentation is not a mechanism to ensure reliability and/or security of the bulk power system. An approach that should be considered is to have documentation “requirements” in a guidance document rather than in the requirements in the standard.

Michelle Denike

Wolverine Power Supply Cooperative, Inc.

Yes

Definition needed for BES Cyber System Impact.

Yes

High and Medium Impact Ratings use the term "adversely". This needs to be defined. This is too subjective of a term. Under 2.13 what is meant by the term "control" in (2) generation control centers

that "control" 300 MW or more of generation? Does this mean physical control only or does it include verbal commands? Also, does the 300 MW refer to name plate rating or some other method AND is that 300 MW only for BES generation or all generation that generation controls?

Ron Donahey
Tampa Electric Company
No
In general, Tampa Electric supports the Comments from EEI for CIP002 with the following additional clarifications and suggestions: Tampa Electric suggests that SDT provide examples of potential assets for control center, transmission substations, and power generation in each type (BES Cyber System, BES Cyber Assets, Associated Electronic Control & Monitoring, Associated Physical Access Control, Electronic Access Point, etc.) How far does the BES Cyber System extend? EMS is definitely a BES Cyber System; does it extend to the switches, routers, time & frequency devices, Digis, Front End Processors etc.? Tampa Electric recommends that the SDT improve the definition of the BES Cyber Asset related to "adversely impact" one or more BES Reliability Operating Services in order to provide clarity. The SDT may wish to consider the current definition of Adverse Reliability Impact in the NERC Glossary of Terms. Alternatively, adversely impact should be defined as an "impact greater than the Reserve Sharing Group"; otherwise the term is vague. Tampa Electric believes that the definition of Transient Cyber Assets is too broad and could include USB, CD, and external drives. It should be focused on equipment that includes a processor such as a laptop pc or mobile computing device.
No
Tampa Electric supports the Comments from EEI for CIP002 Attachment 1 with the following additional clarifications and suggestions: For Control Centers, substations and generation – Tampa Electric suggests that SDT provide examples of assets in each type of this new breakout/definition (BES Cyber System, BES Cyber Assets, Associated Electronic Control & Monitoring, Associated Physical Access Control, Electronic Access Point, etc.) Tampa Electric also requests that the SDT provide supporting documentation similar to Security Guideline for the Electricity Sector: Identifying Critical Cyber Assets. Tampa Electric also notes that significant effort is required to classify BES CS as High, Medium or Low Impact with very little differentiation within the actual requirements of the standards themselves. At a minimum, all VSLs should be evaluated to determine if the levels of severity should mirror the impact categorization. Tampa Electric also suggests the following for consideration: 2.1. Generation with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection. This language does not address the following: Under Guidelines and Technical Basis, on page 24, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected. Tampa Electric recommends that the item 2.1 be re-worded to incorporate the concept of only generation systems with common mode vulnerabilities. 2.12: Tampa Electric recommends that the Standard Drafting Team review of the Application Guidelines related to 2.12. 2.12 define as Medium Impact the 300 MW UVLS or UFLS; there is a reference to 2.13 for UVLS/UFLS. We believe this is a typo and should be 2.12. 2.13: Tampa Electric recommends SDT review of the Application Guidelines related to 2.13. The criteria includes "generation control centers" (lower case); however, on page 30, the Application Guidelines specifies "Transmission Operators and Owners Control Centers" (upper case). Since Control Center (upper case) is a defined term, it is unclear if "generation control center" (lower case) is a newly introduced term and exactly what this is referring to. For example, is this referring to a single control room at a single generation facility that controls more than 300MW or is it referring to a control center for multiple generation facilities?
No
Tampa Electric agrees with the EEI comments with the exception of their suggestion to add the requirement to identify lows. Tampa Electric proposes the identification of Low Impact BES CS at a Facility level, not by listing all the Cyber Assets associated as this would add administrative burden and not provide additional BES CS security or BES reliability. 1.2. Evidence Retention - For instances where the evidence retention period specified below is shorter than the time since the last audit, Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer. Tampa Electric recommends that the document retention period should follow the requirement; as stated, the evidence retention period is open ended.
No
Tampa Electric agrees with the EEI comments.

No
Tampa Electric is concerned that the time based VSLs for updating documentation are too severe based on the potential risk to the BES. We propose that updating documentation should be categorized to allow a longer period of time before moving from low to moderate VSL.
No
Tampa Electric agrees with the comments submitted by EEI. Additionally we recommend that the following be added to the Measures: or, a corporate level policy naming the CIP Senior Manager.
No
Tampa Electric agrees with the comments submitted by EEI. Additionally Tampa Electric recommends changes to Guidelines and Technical related to Requirement R2: 2.2 3rd bullet: Identification of trusted and untrusted resources – Tampa Electric suggests a clarification of the definition of resources to indicate whether a resource is a person, a device, a system, or something else. 2.3: Are these bullets to be considered as requirements of the standard e.g. CIP005? 2.4: Monitoring and logging of egress will place undue burden upon the responsible entity. These bullets are not included in CIP-006 except for logging for visitor exit which is accomplished via the Visitor Control Program. Should they be including this guidance in CIP-003 or should this be included in the standard to which it is applicable? 2.9: Information Protection bullet 2 notification of unauthorized information disclosure. This does not appear to be a requirement of the standard.
No
Tampa Electric agrees with the comments submitted by EEI.
No
Tampa Electric agrees with the comments submitted by EEI. Additionally we note that the Measures—2nd bullet requires extensive recordkeeping with little security benefits.
No
Tampa Electric agrees with the comments submitted by EEI. Additionally we question whether this implies a signature form. Requiring a signed document for each change of an approver places an undue administrative burden. These updates should go through the Entity's normal approval process. Tampa Electric requests clarification of the first sentence of Requirement R5, specifically does this requirement apply only for those CIP requirements that have a "required approval"? For Measure M5 – 3rd bullet indicates that the CIP Senior Manager approves the delegations for physical security also. We recommend that this measure be re-stated to state that delegations be approved by a member of management or delegated by a member of management but not the CIP Senior Manager. For many organizations, personnel responsible for approvals will span many different departments, many of which may not be under the direct control of the CIP Senior Manager. This requirement places an undue burden on such organizations by requiring CIP Senior Manager's involvement in personnel changes for delegation throughout the organization.
No
Tampa Electric agrees with the comments submitted by EEI. Additionally we note a typo (from change2 to change 2) Please refer to comments in question 10 above related to undue burden.
No
Tampa Electric agrees with the comments submitted by EEI.
Yes
No
Tampa Electric agrees with the EEI comments. In addition, Tampa Electric considers that there will be an administrative burden (may have many versions of training programs tailored to individual roles). Maintaining such training programs, reporting, and compliance will be difficult with little additional security benefit to the Bulk Electric System.
No
Tampa Electric agrees with the EEI comments. Additionally, Tampa Electric is concerned over the statement in the Measures related to the identification of the date access was first granted, particularly for those individuals already in compliance with NERC CIP version 3 requirements since that was not previously tracked.

No
Tampa Electric recommends modification of this requirement to include the use of a National Criminal Research Database which would cover all of these requirements and show reasonable due diligence. Individual background verifications at all locations of residence, employment, and education is less thorough and creates more of an administrative burden for recordkeeping.
No
Tampa Electric recommends modification of this requirement to include the use of a National Criminal Research Database which would cover all of these requirements and show reasonable due diligence. Individual background verifications at all locations of residence, employment, and education is less thorough and creates more of an administrative burden for recordkeeping.
No
Tampa Electric agrees with the comments from EEI. In addition, Tampa Electric offers the following concern: The measures for 6.3 and 6.4 indicate that a Registered Entity needs to verify the list of who has access against a listing of those who have been authorized. The wording is unclear on what this means.
No
Tampa Electric agrees with the EEI Comments. Reassignments may also be processed retroactively, and the requirements should take this into account.
Yes
No
Tampa Electric agrees with the comments submitted by EEI. In addition, for Requirement 1.3 Tampa Electric requests that the SDT provide clarification on what is meant by “explicit access”. Rules can include group objects for cyber assets or port strings. Stating “explicit” could be construed to mean all objects or ports must be explicitly stated. Is it the SDT’s intent that an Entity must explain the specific criteria for each and every Cyber Asset granted access through the access point? Or is it sufficient to provide explanations for groupings of assets? Requirement 1.5 seems to indicate that an Entity would need IDS at each EAP (i.e., host IDS). The “Guidelines and Technical Basis” section has a very good statement concerning communications. The wording excludes serial, non-routable connections. This wording needs to be included in the actual requirement – similar to 1.2 and 1.3. Tampa Electric recommends that the requirement allow for technical feasibility exceptions or deployment of alternative measures of network based IDS where host based IDS may not be possible.
No
Tampa Electric agrees with the comments from EEI.
No
Tampa Electric agrees with the comments from EEI on VRF and VSLs.
No
The language requires significant clarification. Tampa Electric agrees with the EEI comments.
No
Tampa Electric agrees with the EEI comments. The version lacks clarity.
No
Tampa Electric agrees with the EEI comments.
No
Tampa Electric agrees with the comments from EEI.
No
Tampa Electric agrees with the changes proposed by EEI for Requirement 1.1. is a major clarification that greatly reduces the scope of ports that must be included for compliance.
No
Tampa Electric agrees with the comments from EEI for Requirement 2.1.
No
Tampa Electric considers that R3.4 introduces a cyber asset that Entities have not yet had to identify or account for. This will make it difficult to prove compliance. Please also refer to our concerns in the

definitions question 1 related to Transient Cyber Assets.
No
Tampa Electric agrees with the comments submitted by EEI for R4.3 and R4.4. In addition, Tampa Electric shares the following comments: 4.1 Tampa Electric is concerned that there are devices that do not produce the level of event logging that is required. Recommend adding “where technically feasible” to the requirement. 4.2 – Requires alerts for events, but fails to specify alerts for security. Recommend that the requirement state “Generate alerts for security events that…” 4.5-Requires a manual review of sample of logs every two weeks. This requirement provides no security benefit; it is unclear as to what an adequate sampling would be. The requirement is redundant, given the other requirements in R4, and should be removed entirely.
No
Tampa Electric agrees with the comments submitted by EEI. Requirement 5.2 could be interpreted that the CIP Senior Manager must authorize each individual use of administrator and shared default accounts rather than the individuals who have the authority to use those accounts. We suggest that the SDT delete this requirement.
No
Tampa Electric agrees with the comments from EEI.
No
Tampa Electric agrees with the comments from EEI. Additionally Tampa Electric proposes a format change on R 1.3 Measures as follows: Proposed format change o Evidence may include, but is not limited to, dated BES Cyber Security Incident response process(es) or procedure(s) that address roles and responsibilities of; ♣ BES Cyber Security Incident response personnel, ♣ BES Cyber Security Incident handling processes or procedures, ♣ Communications processes or procedures.
No
Tampa Electric agrees with the comments from EEI. For Part 2.2 Tampa Electric recommends that the Standards Drafting Team consider adoption of the Homeland Security Exercise and Evaluation Program described below: Rationale: The homeland Security Exercise and Evaluation Program https://hseep.dhs.gov/pages/1001_About.aspx#TerminologySection1 “There are seven types of exercises defined within HSEEP, each of which is either discussions-based or operations-based. Discussion-based Exercises familiarize participants with current plans, policies, agreements, and procedures, or may be used to develop new plans, policies, agreements, and procedures. Types of Discussion-based Exercises include: Seminar. A seminar is an informal discussion, designed to orient participants to new or updated plans, policies, or procedures (e.g., a seminar to review a new Evacuation Standard Operating Procedure). Workshop. A workshop resembles a seminar but is employed to build specific products, such as a draft plan or policy (e.g., a Training and Exercise Plan Workshop is used to develop a Multi-Year Training and Exercise Plan). Tabletop Exercise (TTX). A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. TTXs can be used to assess plans, policies, and procedures. Games. A game is a simulation of operations that often involves two or more teams, usually in a competitive environment, using rules, data, and procedure designed to depict an actual or assumed real-life situation. Operations-based Exercises validate plans, policies, agreements and procedures; clarify roles and responsibilities; and identify resource gaps in an operational environment. Types of Operations-based Exercises include: Drill. A drill is a coordinated, supervised activity usually employed to test a single specific operation or function within a single entity (e.g., a fire department conducts a decontamination drill). Functional Exercise (FE). A functional exercise examines and/or validates the coordination, command, and control between various multi-agency coordination centers (e.g., emergency operation center, joint field office, etc.). A functional exercise does not involve any "boots on the ground" (i.e., first responders or emergency officials responding to an incident in real time). Full-Scale Exercises (FSE). A full-scale exercise is a multi-agency, multi-jurisdictional, multi-discipline exercise involving functional (e.g., joint field office, emergency operation centers, etc.) and "boots on the ground" response (e.g., firefighters decontaminating mock victims). “
No
Tampa Electric agrees with the comments from EEI.
No
Tampa Electric agrees with the comments from EEI.

No
Tampa Electric is in support of the comments from EEI for CIP-009-5 R1.
No
Tampa Electric is in support of the comments from EEI for CIP-009-5 R2.
No
Tampa Electric is in support of the comments from EEI for CIP-009-5 R3.
Yes
No
Tampa Electric supports the comments from EEI. Additionally, Tampa Electric submits the following comments for consideration: R1.1.3 Recommended language to requirement: “Any commercially available application software (including version) intentionally installed on the BES Cyber Asset for normal and emergency operation.” Measures: Tampa Electric considers that the language is unclear as to what are “required items” – Does this mean based on ports & services or normal/emergency operation of the asset? Suggest the following wording change: “required items as identified in R1.1.1 through 1.1.6 of the baseline configuration” R1.2 Propose that the CIP Senior Manager delegation be addressed. Delegation process as stated in CIP-010 creates an administrative burden for the CIP Senior Manager. Tampa Electric recommends that this measure be re-stated such that delegations be approved by a member of management or delegated by a member of management but not the CIP Senior Manager.
No
Tampa Electric supports the comments from EEI.
No
Tampa Electric supports the comments from EEI.
No
No
Tampa Electric agrees with comments submitted by EEI. In addition, Tampa Electric recommends the following: Add phrase “information protection” as follows: “Each Responsible Entity shall implement one or more documented information protection processes that collectively include each of the applicable…” R1.1 – insert “readily”, e.g., “One or more methods to readily identify…” R1.2 – table headings have typos (Part, Part, Part). Measures – 1st bullet – change to “Records indicating information that is stored, transported, and disposed of in a secure manner, consistent with the documented processes.” 2nd bullet – Current language: Records from an information management system containing electronic copies of BES Cyber System Information with user access implemented on a need-to-know basis; Proposed language: Records demonstrating that access to systems containing protected BES Cyber System information is implemented on a need to know basis. 1.3 - table headings have typos (Part, Part, Part).
No
Tampa Electric agrees with the comments submitted by EEI. In addition, Tampa Electric suggests the following: Insert ‘storage media re-use and disposal’ in front of ‘processes’. Also in the guidelines for R2, an analysis of whether a BES Cyber System can be released is mentioned – does this analysis need to be documented and stored as evidence? R2.1 Insert ‘storage’ in front of ’media’ in the requirement. For Measures, add phrase to sentence: “, or that information residing on the storage media is encrypted.” Definition in footnote should be added to definitions document. 2.2 Insert ‘storage’ in front of ’media’ in the requirement. For Measures, add phrase to sentence: “, or that information residing on the storage media is encrypted.”
No
R2 – lower VSL could be if process not documented but we are performing. Moderate VSL could be if process not followed in certain situations. VSLs should take into account extent of condition, e.g., 1 tape not degaussed – that shouldn’t be high severity.
No
Tampa Electric recommends that any requirements that are to be performed prior to or on the

effective date of the standard (“initially upon the effective date of the standard) be included in the Implementation Plan rather than in the body of the standards/requirements.

Michael Schiavone
Niagara Mohawk (National Grid Company)
Yes
There has been a significant change in the framework from version 4 to version 5 regarding definitions and core concepts such as Critical Assets, Critical Cyber Assets, etc. These proposed changes are not a requirement of FERC Order 706, do not enhance cyber security controls and create administrative burdens when migrating to version 5. There should be a correlation between BES Cyber Systems and the facilities that these systems serve. The current version of the CIP standards provides the correlation and recognize that systems (CCAs) do not operate independently of facilities (CAs). Therefore, applying physical and electronic controls is more transparent. We propose maintaining the current Critical Asset and Critical Cyber Asset definitions and concepts. High, Medium and Low categorizations can still be utilized with the legacy CA and CCA concepts. Regarding the use of the term “annual” throughout the standards, we suggest that the registered entity be allowed to maintain it’s own definition of “annual” based on CAN-0010 guidelines. 1) For all definitions please include the old term that the new term is replacing, as applicable 2) The time periods included in the first and second sentence of the definition of “BES Cyber Asset” are confusing. The 15 minutes discussed in the first sentence and the “delay” discussed in the second sentence are unclear. Suggest re-wording as follows: A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. The 15-minute period begins to run when the asset is operated, mis-operated, or fails to operate when necessary, regardless of the time period between the asset was degraded or misused and the time the asset is then operated, mis-operated or fails to operate when necessary. 3) BES Cyber System Definition - Maintenance Cyber Asset needs to be defined or if appropriate changed to Transient Cyber Asset
No
Yes
Yes
Yes
Yes
Yes
Yes
No
We recommend eliminating this requirement and moving it into CIP-004 R2 and include policy as part of the training required. This way, all awareness and training would be in CIP-004.
No
We propose retaining the current language in CIP-003-3 R2
Yes
There should not be a foot note in the standard – make this part of the requirement.
No
R.2 – We suggest a "Lower" VSL for "The Responsible Entity has implemented the required cyber security policy or policies but has failed to adequately document the policy or policies." R.4 – We suggest Lower to Severe VSLs be based on a failure to take action, rather than a specific number of

employees who are aware. As drafted, it would be a "high" violation to miss one single employee. That seems overly strict and does not match well with the requirement and measures, particularly when measures suggested includes making an internet posting. We suggest the following: "Lower" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but has not adequately documented the measures"; "Moderate" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 30% -50% of individuals who have access"; "High" VSL = "Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 50% -70% of individuals who have access"; and "Severe" VSL = "Registered entity has taken no measures to make any individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function OR Registered entity has taken measures to make individuals who have access to the BES Cyber Systems aware of the cyber security policies appropriate for their job function, but the measures were not designed to target 70% or more of individuals who have access" R.5 - Why do the VSLs begin at medium for the failure of one delegation? We recommend "Lower" VSL = failure of one delegation; Moderate = failure of two delegations; High = failure of three, and Severe = failure of "four or more". R.6 – We suggest VSLs structured similarly to CIP-002 - Lower = Change to one delegation was not documented within 30 days, but was documented within 31-41 calendar days of the effect vive date ; Moderate = Change to two-three delegations was not documented within 30 days OR change to one delegation was not documented within 30 days, but was documented within 42-52 days of the effective date; High = Change to three-four delegations was not documented within 30 days OR Change to one delegation was not documented within 30 days, but was documented within 53-63 days of the effective date; Severe = Change to more than four delegations was documented within 30 days of the effective date OR Change to one delegation was not documented within 74 days of the effective date.
Yes
No
We do not believe that role based training is necessary. The personnel performing the job functions are familiar with the various controls due to their job requirements. General training on CIP, as required under current version, is all that should be required.
Yes
Yes
Yes
No
There is no added security by requiring the CIP Senior Manager or delegate to authorize access. We suggest using legacy wording that only requires access to be authorized.
Yes
No
It seems harsh to include the failure to document a security awareness program as a severe VSL. We recommend the following as a "Lower" VSL "The Responsible Entity implemented, but failed to document a security awareness program" and change the Severe VSL to "The Responsible Entity failed to implement and document a security awareness program." Additional comments around adding “Missed a quarter and/or target audience (authorized physical or authorized electronic)?” R.2: No comments. R.3: The annual training requirement assumes that the initial training was completed before access was granted, therefore, missing a small number of employees with the subsequent annual training does not necessarily indicate high risk to the bulk electric system because these employees presumably had received prior training when their access was granted. We recommend a tiered approach to the VSLs for missing the annual training requirement so that failing to meet the

annual requirement for a low percentage of employees (like 10% or less) is a lower VSL, failing annual requirement for between 11-20% is moderate, failing the annual requirement for 21-30% is high, and failing to meet the annual requirement for over 30% OR failing to do the initial training is severe. R.4: No comment R.5: A documentation error should not be a "severe" VSL. Delete the "OR/documentation" part from the Severe VSL and make a Lower VSL that reads "The Responsible Entity implemented, but failed to document a process for personnel risk assessments." R.6: For most utilities, there could be 100s of employees with access, and it seems unrealistic to base the VSLs on one failure with regard to one or two employees. We recommend changing the values in the Moderate - Severe to percentages of employees 10%, 20%, 30%or more. R.7: Same comment as R.6 - change values of one to three employees to percentages.
Yes
No
Requirement 2.2 specifies encryption for all Interactive Remote Access sessions, but does not specify where the encryption is required. If the intent is to require encryption from the user to the Intermediate Device the requirement should specify that clearly. Not all assets currently support encryption, so requiring encryption from the Intermediate Device to the Asset is not practical nor necessary if encryption is being employed outside of the ESP.
No
R.1 and R.2: There should be lower VSL where the processes listed on the table are implemented but not documented.
Yes
Yes
Yes
No
R.1: There should be lower VSL where the processes listed on the tables are implemented but not documented. Add to the Lower VSL: "OR the Registered entity has implemented but failed to document the required physical access controls" R.2: There should be lower VSL where the processes listed on the table are implemented but not documented.
Yes
Yes
No
Requirement 3.5 requires logging of each Transient Cyber Asset connection. This is not practical as many assets do not have the capability of logging when someone makes a direct physical connection to the asset. Many assets are not capable of logging to centralized logging systems. Also, in a typical day, and engineer in the field may connect a Transient Cyber Asset to many different assets and it would be impractical for one to log each connection.
No
4.1 - The intent of 4.1 as written in the Guidelines and Technical Basis section is inconsistent with the requirement. The guidance states that “It is not the intent that if a device cannot log a particular event that a TFE must be generated”. If the intent is to not be out of compliance when a device cannot log certain events, it should be stated as such in the requirement. 4.3 - The activity level of some devices is such that they may not generate a logged event every day. Therefore, responding to an event failure with a day may not be possible. 4.3 & 4.5 – there is a conflict between these two. 4.3 requires a response to logging failures before the end of the next day. But, 4.5 requires bi-weekly sampling of logged events which would uncover logging failures. If the logs are being reviewed bi-weekly then logging failures may not be detected and responded to within the next day.
No

Items 5.4 & 5.6 in Table R5 includes the phrase “where technically feasible”. Does that mean a TFE will be allowed? If so, we believe that phrase should be removed and replaced with “as supported by the BES Cyber System” to eliminate need for TFE
No
R.1 We have the same comment here about percentages for open ports (similar theme from above). What is written in high should be in moderate. What’s in severe should be broken down by percentages/numbers. R.2 Consider severity of patch as recommended by the vendor and the percentage of assets that may not have had a remediation plan associated with that patch. R.3 Consider putting some wording in here around the percentage.
No
There is some concern that multiple plans would prevent one single entry point into the Cyber Security Incident Response Process. We’d like to make the argument that only one plan is necessary and supporting documentation can be created as necessary that supports that plan
No
The Applicability section of the tables refers to “All responsible entities”. We suggest using the same wording that all the other standards use (High Impacts, Medium Impact, Associated, etc) In R 2.2 In the first sentence, we recommend replacing the word “implement” with “exercise.” This is really about exercising the plan on a regular basis as the plan is already implemented. In 2.3, the "measure" for "relevant documents" does not give adequate guidance to the industry regarding what documents may be acceptable to demonstrate compliance. The "measure" indicates any "dated documentation related to" the reportable incident may be accepted. Please give some additional examples of the specific types of dated materials could be considered acceptable.
No
3.1 The terms “accuracy” and “completeness” are referenced but in terms of completeness there’s not a specific benchmark to compare the document again what should be quantified as complete. The suggestion is again to define a minimum set of information that would be expected in an Incident Response Plan. 3.2 - We recommend that clarity be added to ensure that language represents that review occurs 30 days after closure of the incident rather than invocation; rationale is that you might still be remediating and won't have learnt all lessons. We recognize the importance of the requirements to review the lessons learned, update the Incidence Response plan, and communicate the updates. However under the current structure it creates a rolling compliance effort following each incident. That is, an auditor will require that after each incident one has recorded lessons learned review, changes to the response plan or that none were necessary and updated communications or that none were necessary. It would be easier to update the plan on a quarterly basis based on the previous quarter’s incidents and not have so many auditable events to track.
Yes
No
1.5 – The requirement to preserve data for analysis or diagnosis may slow down the recovery process. There are times when recovery is urgent and must be done in a timely fashion. Is your intent to include this when you say “where technically feasible”? If so, language should be added spelling it out.
No
2.2 – We recommend removal of the phrase “and reflects current configurations” from the requirement. It is acceptable to have backup information that is less than current configuration and still perform a successful recovery. If this phrase is not removed, it will require a backup to be taken and tested for even the most minor configuration changes which is unnecessary.
Yes
No
We recommend the following VSLs for number of days until plan is reviewed in R3: 31-41 days = Lower, 42-53 days = Moderate, 53 plus is High and Severe for never updating plan. We also recommend the following VSLs for number of responsible personnel that the plan updates have not been communicated to: 1 person missed = Moderate, 2-4 = high and 5 or more is severe. We like the

VSLs in CIP-010 R3. These recommendations attempt to make CIP-009 R3 consistent to CIP-010 R3
Yes
Yes
No
We recommend considering emergency equipment replacement (partial outage) as “Exceptional Circumstances” . Based on the nature of our typical outages we would consider this practice to hinder the restoration efforts and bringing systems back on-line in a timely manner. We would certainly be good with language that allowed us to bring systems back on-line, ensure they are stable and then run a scan.
No
We recommend the following VSLs for number of days until documentation is updated in R1: 31-41 days = Lower, 42-53 days = Moderate, 53 plus is High and Severe for never updating documentation. R3 We like this structure. We’ve suggested this approach a number of times We aren’t talking about whether or not this is violation, but rather about the severity of the violation and then rating the severity. We think this is a really good approach.
Yes
No
The footnote here should be part of the requirement
No
We recommend the following VSLs on R 2: If the process to prevent unauthorized retrieval wasn’t done on 1 device that would be low 2-5 moderate, more than 5 is high
No
Due to the current status of version 4 (not FERC approved), there is potential for overlap of implementation with version 5 that could create extensive rework in a short period of time. This will cause an unnecessary expense to entities while not providing any additional cyber security benefit.
Individual
Jonathan Appelbaum
United Illuminating Company
Yes
• BES Cyber Security Incident – Proposed Change o Original Text – A malicious act or suspicious event that: ♣ Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or ♣ Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or ♣ Results in unauthorized physical access into a Defined Physical Boundary. o Proposed Change – A malicious act or suspicious event that: ♣ Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or Defined Physical Boundary ♣ Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System. o Rationale – The revised definition leverages legacy language from NERC’s ‘Glossary of Terms Used in NERC Reliability Standards,’ combining Electronic Security Perimeter and Defined Physical Boundary into the single bullet. It also raises ‘physical attempts to compromise’ into the category of BES Cyber Security Incident. • BES Cyber Security Incident – Proposed Change o Original Text – A malicious act or suspicious event that: ♣ Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or ♣ Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or ♣ Results in unauthorized physical access into a Defined Physical Boundary. o Proposed Change – A malicious act or suspicious event that: ♣ Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or Defined Physical Boundary ♣ Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System. o Rationale – The revised definition leverages legacy language from NERC’s ‘Glossary of Terms Used in NERC Reliability Standards,’ combining Electronic Security Perimeter and Defined Physical Boundary into the single bullet. It also raises ‘physical attempts to compromise’ into the category of BES Cyber Security Incident. o Original Text - Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and

Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain BES Cyber System Impact designations; equipment layouts that contain BES Cyber System Impact designations; BES Cyber System disaster recovery plans; and BES Cyber System incident response plans. o Proposed Change – Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain Medium or High BES Cyber System Impact designations; equipment layouts that contain Medium or High BES Cyber System Impact designations; BES Cyber System recovery plans; and BES Cyber System incident response plans. o Rationale – Information for Medium and High impact Bes cyber Systems location should be protected. This is consistent with the notion of protecting those assets that have greater impact on the BES and also all BES Cyber systems per CIP-002-5 have at a minimum a Low impact. • BES Reliability Operating Services – The services should focus on real time and hour ahead horizons. This horizon presents risk to reliability that requires immediate reaction. A service that occurs in the Current Day horizon can be reacted to in a reasoned and controlled manner. Additionally, what is Change Management as a reliability service? • Other terms which would benefit from definitions • Adverse - The SDT is utilizing the concept of "adverse impact" to properly scope High to control center cyber assets but the term adverse is not defined. UI is concerned that the universe of cyber assets supporting a TOP/BA/RC SCADA or EMS is not limited to the assets supporting the application and may extend into the substation and field RTU and devices. o Annual – Propose use of definition within CAN-0010 o Impact o Security Plan o Associated • Existing definitions that would benefit from alternative wording o Electronic Access Point ♣ EAPs typically have two (or more) access points and control access into an ESP (logical network) from a less trusted network or communication interface. The current wording could be applied to any port on a network switch within an ESP and fails to focus on interfaces where traffic does flow from a less trusted network to a more restricted network within an ESP. o Electronic Security Perimeter ♣ Suggest retaining the concept of logical network. This provides an easier means to identify "Associated Protected Cyber Assets" as they could be any cyber assets on the same logical network which are not identified as a BES Cyber Asset or BES Cyber System.

Yes

• Control Centers should be capitalized at the end of section 2.13 on page 17. • There should also be a column for LSE in the table provided on page 18. • The services should focus on real time and hour ahead horizons. This horizon presents risk to reliability that requires immediate reaction. A service that occurs in the Current Day horizon can be reacted to in a reasoned and controlled manner. • Additionally, what is Change Management as a reliability service? • On page 20, under the category "Balancing Load and Generation," Non-spinning reserve, the use of 'ramp rates' is typically associated with modeling programs not typically used as real time operation information and should be removed. • Restoration of BES – 'coordination' all by itself lacks context and should include additional words to better frame the intent. • UI is concerned that the universe of cyber assets supporting a TOP/BA/RC SCADA or EMS is not limited to the assets supporting the application and may extend into the substation and field RTU and devices. The SDT is utilizing the concept of "adverse impact" to properly scope High to control center cyber assets but the term adverse is not defined.

No

1. Applicability – (4.2.1 and 4.2.2) reference to UFLS and UVLS is a point of concern. Current wording implies that every distribution feeder which is part of a UV or UF load shedding scheme is now in scope, with all distribution level devices now BES Cyber Assets. This may greatly expand the scope greatly into the distribution level. UI proposes Each system or facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) under a common control system as required by its regional load shedding program. 2. CIP-002-5 R1 – Propose content change a. Original Content – Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems. All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification. b. Proposed change - Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and

Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems. Low Impact BES cyber systems support Bulk Reliability Operating Services but are not mentioned in the bright line criteria as noted in Attachment 1. However, failure of these cyber systems may adversely impact (i.e. not remain in the NERC prescribed category ranges) the voltage and/or frequency of the connected Bulk Electric System. Low Impact BES Cyber Systems do not require discrete identification. [Violation Risk Factor: High][Time Horizon: Operations Planning] c. Rationale – The original definition, as worded, creates the impression that all other cyber assets qualify as Low Impact, and does not communicate the criteria within the definition of BES Cyber Asset as a cyber asset that "if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. The proposed rewording contributes towards ensuring only assets which have an impact on the BES are the focus of the CIP Standards (and may ensure a more rapid adoption of the Version 5 Standards). 3. The "Rationale – R1" box uses the term "Cyber Systems," which is not a formal term. Suggest changing the case to avoid confusion. 4. The last sentences of R1 and M1 conflict with each other, providing mixed messages specific to Lower Impact BES Cyber Systems/Assets. While Requirement 1 implies there is no need for discrete identification, Measurement 1 discusses evidence for categorizing Low Impact BES Cyber Assets/Systems. 5. Requirement 1.1 a. There is a missing word – "…within 30 calendar days of <when> a change to BES Elements and Facilities is placed into operation. b. UI proposes that the phrase "BES Cyber Assets and BES Cyber Systems" used in this requirement be changed to "BES Cyber System". A single BES Cyber Asset may comprise a BES Cyber System. The Requirement should be to list the BES Cyber System and the impact categorization. This appears to match the diagram on page 7 that identified BES Cyber Systems. c. The phrase "placed in operation" requires clarification. Facilities (e.g. HVDC Converters, SVC, FACTs, Generators) are often initially tested and commissioned connected to the BES but are not in commercial operation. Being specific such as "placed in operation, post-commissioning testing". d. UI requests clarification on the composition of the list required by this Standard. A BES Cyber system may be composed of multiple BES Cyber Assets. Would this list only contain the single BES Cyber System , or the five BES Cyber assets, or the BES Cyber System with the five BES Cyber assets listed? For example a High impact Control Center has an EMS with 5 BES Cyber Assets in the Control Center (two servers and three workstations). For compliance to this Requirement is the EMS listed, or the 5 BES Cyber assets? e. UI requests on the requirement to update. If a single BES Cyber Asset is added to an existing BES Cyber System does that initiate the 30 day update process for the list? For example if a Control Center with a High Impact adds a single workstation to an existing EMS, does that require a 30 day update to the list? A workstation is not a BES Element or Facility, but is a BES Cyber Asset.

No

1. Rationale R2 – Propose a content change: a. Original Text - The lists required by R1 are reviewed once a year to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. b. Proposed Change - The lists required by R1 are reviewed once a year to ensure that all BES Cyber Systems have been properly identified and categorized. 2. R2 – Proposed Change a. Original Text – The Responsible Entity shall have its CIP Senior Manager or delegate approve the identification and categorization required by R1 initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between approvals, even if it has no identified High or Medium BES Cyber Assets or BES Cyber Systems. b. Proposed Change – The Responsible Entity shall have its CIP Senior Manager or delegate annually approve the identification and categorization required by R1. c. Rationale –Instances in which tasks are required to be completed in advance of the effective date of the standard should be captured within the implementation plan. By adopting the CAN-0010 definition of annual, each entity can focus on ensuring this review is conducted in an entity standardized time-frame. 3. M2 – Proposed Change a. Original Text – Acceptable evidence includes but is not limited to electronic or physical dated and signed records to demonstrate that the Responsible Entity has had its CIP Senior Manager review and update, where applicable, the identification and categorization of BES Cyber Assets and BES Cyber Systems initially upon the effective date of the standard and at least once each subsequent calendar year, not to exceed 15 calendar months between occurrences, even if it has no identified High or Medium BES Cyber Assets or BES Cyber Systems. (R2) b. Proposed Change – Acceptable evidence includes but is not limited to electronic or physical dated and signed records to demonstrate that the Responsible Entity has had its CIP Senior Manager or delegate annually approve, where applicable, the identification and categorization of BES Cyber Assets and BES Cyber Systems. (R2) c. Rationale –

The requirement only asks for Senior Manager (or delegate) approval. Instances in which tasks are required to be completed in advance of the effective date of the standard be captured within the implementation plan. By adopting the CAN-0010 definition of annual, each entity can focus on ensuring this review is conducted in an entity standardized time-frame.
No
1 – The Violation Risk Factors do not intuitively align with Violation Severity Level (VSL). Requirement 1 assigns a 'High" VRF independent of the potential low or no risk associated with instances in which BES Cyber Assets or BES Cyber Systems are assigned risk levels higher than those required. 2 – For the Last Paragraph VSL's within R1 (failed to update its documentation), EEI proposes the following time periods: Lower – More than 30, but less than or equal to 60 calendar days Moderate – More than 60, but less than or equal to 70 calendar days High – More than 70, but less than or equal to 80 calendar days
Yes
Yes
UI supports the Guideline for what a Policy should contain. Sub-numbering (1.1 through 1.10) should be modified to 2.1 through 2.10.
No
Propose content Change 1. Original Content – Each Responsible Entity shall review each of its cyber security policies and obtain the approval of its CIP Senior Manager, initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between reviews and between approvals. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] 2. Proposed change –The cyber security policies require annual review and approval by the senior manager assigned pursuant to R1. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] 3. Rationale – The proposed revision carries forward language from previous versions of the standard (CIP-003 R1.3) which captures the root intent while providing language which has already been vetted and approved within the industry. . Instances in which tasks are required to be completed in advance of the effective date of the standard be captured within the implementation plan. By adopting the CAN-0010 definition of annual, each entity can focus on ensuring this review is conducted in an entity standardized time-frame.
No
1. Draft 1 content – "Each Responsible Entity shall make individuals who have access to BES Cyber Systems aware of elements of its cyber security policies appropriate for their job function." 2. Proposed revision – "The cyber security policy is readily available to all personnel who have electronic access or unescorted physical access to, or are responsible for Medium or High Impact BES Cyber Systems." 3. Rationale –The scope as written would include visitors. UI does not believe that a visitor should be made aware of the CIP Policy or portions appropriate to the visitor's purpose.. Additionally, making individuals who have access 'aware of elements' of the cyber security policy does not provide adequate guidance to ensure said individuals comply with the cyber security policy. An Entity should make the Policy available for viewing. The awareness of the meaning Policy should be conducted in the CIP-004 training.
No
Requirement 5 – propose use of legacy language: • The responsible entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, standards. Rationale – Overall responsibility and authority (from the legacy language) can accomplish "direct and comprehensive responsibility" and "clear authority" (from FERC Order 706) provides flexibility without the prescriptive requirement for the senior manager or delegate to be responsible for all individual detailed approvals and authorizations in the standards. Citing "all approvals and authorizations" as a Senior Manager was identified as a concern as it is open ended. There were concerns of the additional administrative burden which is not commensurate with the security benefits. Neither the Blackout Report Recommendation 43 nor FERC Order 706 identify the need to establish this administrative overhead. For Security and Reliability NERC should be concerned with the outcome of the approval process, that is, the proper authorizations are being granted by the Responsible Entity which is contained in the other CIP Standards.

No
Propose use of legacy language from CIP-003-3 R2.2: Changes to the senior manager must be documented within thirty calendar days of the effective date.
No
R4 VSL 1. This language cites a High VSL when 'not all' individuals have been made aware of elements of the cyber security policy. This seems to contradict the intent described in the R4 rationale in which 'it is not the intent of the SDT for the responsible entity to have the burden of proving that each and every individual can access the document.' 2. Use a more gradual scale rather than a single instance of non-access subject to a High VSL, and total non-access (for all) being a Severe VSL.
No
From the Guidance "The security awareness program is intended to be an informational program, not a formal training program." But the Measure for R1 states "Evidence must include the documented security awareness program." UI observes that requiring a documented program as evidence conflicts with an informal compliance guidance. The Measure should state "Evidence may include a documented security awareness program, and additional evidence to demonstrate that this program was implemented such as, but not limited to, the quarterly reinforcement material that has been distributed."
No
1. The rationale for R2 should be reworded from "…contains the proper policies…" to "…covers the required policies…" 2. This extends beyond the guidance of FERC Order 706. Paragraph 435 of the order calls for identifying what "role and steps should be taken by the ERO to ensure quality and consistency of trainers." This requirement should identify what areas of the standards that the training program must include. 3. EEI members question whether this requirement satisfies paragraph 434 of Order 706 where "any employee with access to an area where his or her actions, or carelessness, could put critical assets at risk, should receive the necessary training to assure that the employee understands how his or her actions could, even inadvertently, affect cyber security. 4. UI proposes the following change to R2 to conform to the rationale box. As written R2 may not be clear that not all topics listed in 2.1 through 2.10 is applicable to each role. Proposed change "Each Responsible Entity shall have a role-based cyber security training program for personnel who need authorized electronic access or authorized unescorted physical access to BES Cyber Systems. For each role identified by the Responsibility Entity only include the topics in CIP-004-5 Table R2 – Cyber Security Training Program that are applicable to that role." 5. R2.6 – Requirement – Proposed word change a. Original - Training on handling of BES Cyber System Information and storage media. b. Proposed Change - Training on handling of BES High and Medium Impact Cyber System Information and storage media. c. Rationale – Rewording supports the applicability section. Since Low Impact Cyber Systems are not applicable, information specific to Low Impact Cyber Systems should not be in scope.
No
Measure 3.1 where it calls for the date access was first granted is a point of concern for both legacy employees (where it may be impossible) as well as new access since existing technology may not adequately capture and retain this information. Requirement 3.2 – Propose content change • Original content – Require completion of the training specified in CIP-004-5, Requirement R2 at least once every calendar year, but not to exceed 15 calendar months. • Proposed change – Require annual completion of the training specified in CIP-004-5, Requirement R2. • Rationale – The wording adopts the CAN-0010 approach for annual as defined within the registered entity.
No
1. R4.1 a. Version 5 standards should indicate whether previous PRA's would be valid for this requirement (especially within the context of 'initial'). b. Provide a clearer delineation to frame instances in which personal records are not readily available – vs. impossible to obtain 2. R4.2 – Retention requirements do not extend beyond 3 years, creating confusion regarding retention of 7 year cycle background checks. 3. R4.3 a. UI favors a process approach over a fixed pass/fail approach independent of the individual or circumstances involved, and propose that the SDT shift away from a criteria based approach. b. The application guideline provides guidance where it is 'not possible to perform a full seven year criminal history check.' 4. R4.4 – Provide language to cover contract employees where I9 verification can only be conducted by employers. Service providers also may have instances where certain individuals may be located in another country, and may access certain

BES Cyber Assets remotely.
No
Version 5 standards should indicate whether previous PRA's would be valid for this requirement
No
1. R6.1-3,6.4-6 – Propose use of language where access is appropriate for the roles and responsibilities rather than 'minimum necessary' a. 'Minimum necessary' as identified as difficult to prove within an audit context 2. 6.3 – Propose content change a. Original content – The CIP Senior Manager or delegate shall authorize access to BES Cyber System Information, except for CIP Exceptional Circumstances. Access permissions shall be the minimum necessary for performing assigned work functions. b. Proposed change – Access to BES Cyber System Information repositories must be authorized, except for CIP Exceptional Circumstances. c. Rationale – Senior Manager authorization (or management of delegations) provides additional resource and response impacts which do not provide enhanced security and may impact reliability efforts when recovery processes are activate. Ensuring access is authorized will satisfy security controls without adding unnecessary overhead.
No
1. R7.1 - There are questions in instances where resignations and/or terminations may be retroactive, which would introduce a challenge with revocation 'at the time of' events. 2. R7.2 – Transfers or reassignments should frame access changes when no longer needed rather than the date of the transfer (as cited in the Measure (i)). 3. R7.3 – a. Propose use of 'approved BES Medium and High Impact Cyber System Information repositories,' to frame an appropriate location in which information can be managed and controlled. b. Propose to include in Guidance that access to BES Cyber System Information is considered revoked for electronic storage is NOT dependent on revocation of user account to electronic files provided remote access has been revoked. Similarly if paper records or electronic access is contained in a controlled physical perimeter access to BES Cyber System Information is considered revoked once the credential to access the physical security perimeter is revoked".
Yes
No
The Version 5 approach (as described within the R1 rationale "Summary of Changes") of focusing on discrete Electronic Access points rather than a logical perimeter adds confusion when determining Associated Protected Cyber Assets. A discrete list fails to recognize the inherent controls and permissions within a logical network. Control of routable protocol should consider the inherent network/host identifiers embedded within the addressing scheme in which all devices with an identical network component of their address are peers within a logical network where access points do not serve as access control. Rationale for R1 – Propose content change • Original Text - The Electronic Security Perimeter serves to control and monitor traffic at the external boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks. • Proposed Change - The Electronic Security Perimeter serves to control traffic at the external boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic according to a specified rule set, and assists in containing any successful attacks • Rationale – Monitoring is not identified within any R1 requirements. Table R1 1. R 1.1 1. Applicability - Propose use of "External Connectivity" instead of "External Routable Connectivity (to include dial-up capability). 2. Propose removal of "and have been implemented" from the end of the measure statement to avoid tracking compliance on a 'per-device' basis, otherwise this would introduce the need for tracking this information for low impact BES Cyber Systems. 2. R 1.2 1. Applicability – modify to frame applicable Cyber Systems/Cyber Assets as those with External Connectivity. 2. Requirements – Propose content change 1. Original content – Control and secure all routable and dial-up connectivity through the use of identified Electronic Access Points (EAPs). 2. Proposed change – Control and secure all External Connectivity through the use of identified Electronic Access Points. 3. Rationale – The focus within CIP-005 should be on EAP devices with External Connectivity. 3. R 1.3 1. Requirements – proposed change 1. Original Text - Require explicit inbound and outbound access permissions at each identified Electronic Access Point using routable protocols, including explicit criteria for granting or denying access permissions. 2. Proposed

Change - Require explicit inbound and outbound access permissions at each identified Electronic Access Point using routable protocols, including explicit criteria for granting access, denying all other access requests by default. 4. R1.4 – There were various interpretations of 'non-Interactive Remote Access,' which implies this requirement may need some additional clarification. This seems to be the only requirement where documentation of authentication measures appears within this standard. Consider removing 1.4 and modifying 1.2 to cover both rows.

No

1. Table R2 1. R2.1 1. Requirements – Request rewording to support placement of an intermediary device that may not be part of an ESP. 2. R2.2 1. Requirements – Propose clarification on viable termination points for encrypted traffic to support unencrypted traffic through Electronic Access Points. 2. Rationale – The ability to filter traffic effectively becomes much more difficult if the traffic is encrypted. Supporting technical implementation where encrypted is decrypted prior to allow for further access controls would benefit security capabilities. 3. Overall – Propose breaking table R2 into a Routable and Dial-Up categories to more effectively frame routable controls and dial-up controls without introducing confusion for the alternate approach.

No

1. Classifying instances where no documentation of compliance exists as severe is appropriate; instances in which a minority of non-compliance controls were identified within a primarily compliant program should be assessed a VSL with respect to the finding (page 17, bottom Severe VSL). 2. VSLs addressing 'each identified EAP' and 'all Interactive Remote Access' should be assessed as a sliding scale to consider whether lower/moderate/high may be more applicable.

No

1. Table R1 a. R1.1 i. Measures – Proposed Rewrite 1. Original Text – Evidence may include, but is not limited to, documented operational and procedural controls exist and have been implemented. 2. Proposed Change – Evidence may include, but is not limited to, documented operational or procedure controls that have been implemented. b. R1.2 i. Measures – Proposed Change 1. Original Text – Evidence may include, but is not limited to, language in the physical security plan that describes the physical boundaries and how ingress and egress is controlled by one or more different methods and proof that access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by card reader logs. 2. Proposed Change – Evidence may include, but is not limited to, language in the physical security plan that describes the physical boundaries and how access is controlled. 3. Rationale – FERC Order 706 did not ask for egress access controls. The additional criteria at the end of the measure extend beyond what FERC has asked for, with minimal security benefit. c. R1.3 i. Requirement – 'different and complementary' may not provide adequate guidance. Measure R1.3 only references 'different.' 1. Propose adding language to support single devices which may provide multiple access control measures (i.e. physical access card with PIN) ii. Measure – only mentions 'different' access control methods with no reference to complementary (as included within the requirement). d. R1.4 i. Requirement – proposed change 1. Original Text – Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary. 2. Proposed Change – Issue alerts within 15 minutes (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary. 3. Rationale – The 15 minute criteria (Referenced in the 'Table of Compliance Elements,' page 21, R1 – High) provides greater clarity to satisfy alerting requirements. ii. Measures – proposed change 1. Original Text – Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access through any access point in a Defined Physical Boundary and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs, or other evidence that documents that these alerts were generated. 2. Proposed Change - Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access through any access point in a Defined Physical Boundary and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs. e. R1.5 i. Applicability – Presently states Associated Physical Access Control Systems. Is it Physical Access Control Systems Associated with all Low, Med, and High Bes Cyber Systems? I understood that wherever the Applicability uses Associated that there would be a Low/medium or High BES cyber system designation also. ii. Requirements – proposed change 1. Original Text – Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access to Physical Access Control Systems. 2. Proposed Change – Issue alerts within 15 minutes (to individuals

responsible for response) in response to unauthorized physical access to Physical Access Control Systems. 3. Rationale – The 15 minute criteria (referenced in the 'Table of Compliance Elements,' page 20, R1 – High) provides greater clarity to satisfy alerting requirements. iii. Measures – proposed change 1. Original Text – Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access to Physical Access Control Systems and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs or other evidence that these alerts were generated. 2. Proposed Change - Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access to Physical Access Control Systems and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs. f. R1.6 i. Requirements – Proposed Change 1. Original Text – Log (through automated means or by personnel who control entry) of physical entry into each Defined Physical Boundary protecting applicable BES Cyber Systems or Electronic Access Control or Monitoring Systems, which records sufficient information to uniquely identify the individual and date of entry. 2. Proposed Change – Log (through automated means or by personnel who control entry) of authorized individual's physical entry into each Defined Physical Boundary protecting applicable BES Cyber Systems or Electronic Access Control or Monitoring Systems, which records sufficient information to uniquely identify the authorized individual and date of entry. 3. Rationale – The addition of authorized provides additional segmentation from R2 (Visitor Control) access requirements.

Yes

No

Table R3 1. R3.1 a. This sub requirement cites tasks to be conducted 'prior to commissioning.' Since many controls are expected to be in place prior to V5 adoption, there should be language within the implementation plan to capture devices in use at the time the standard becomes effective. 2. Compliance a. 1.5.2 – Evidence retention should keep the existing 90 day period for physical access logs as extending this to 3 years can create extensive commitment in storage media, particularly for video monitoring.

Yes

The Table of Compliance Elements cites references to sub requirements that appear to be incorrect: • Lower – Part 1.7 should point to 1.6 • High – Part 1.6 should point to 1.5

No

R1.1 – Requirements – Proposed Content Change 1. Original Content – Disable or restrict access to unnecessary logical network accessible ports and document the need for any remaining logical network accessible ports. 2. Proposed Change – Enable only logical accessible ports needed, including port ranges where required. 3. Rationale – The proposed language incorporates much of the legacy (CIP-007-3 R2.1) language. The additional requirement to document the need for remaining logical ports extends beyond what FERC Order 706 requests without adding security benefits. R1.2 1. Requirements – Content Change a. Original Content - Disable or restrict the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media. b. Proposed Change – Protect against the use of unnecessary physical input/output ports that could be used for network connectivity, console commands, or removable media by disabling, restricting, or use of signage. 2. Measures – Content Change a. Original Content - Evidence may include, but is not limited to, documentation stating specific or types of physical input/output ports to restrict and screen shots or pictures showing the ports restricted either logically through system configuration or physically using a port lock or signage. b. Proposed Change - Evidence may include, but is not limited to, documentation stating specific physical input/output ports to restrict and screen shots or pictures showing the ports restricted either logically through system configuration or physically using a port lock or signage.

No

R2.1 1. Requirements – Content Change a. Original Content - Identify a source or sources that are monitored for the release of security related patches, or updates for all software and firmware associated with BES Cyber System or BES Cyber Assets. b. Proposed Change – Identify a source or sources that are monitored for the release of security related patches, or security updates for all related software and firmware associated with BES Cyber System or BES Cyber Assets. c. Rationale - Only security updates to software and firmware should be sourced. It is possible that at some point

security updates for a product will be sourced from a separate repository from non-security updates. 2. Measures – Propose striking the last sentence “The list could be sorted by BES Cyber System or source.” It introduces additional requirements with no clear security benefit or alignment with FERC Order 706.

No

1. R3.2 – Although CIP-007 v3 currently requires mitigation, UI believes that the actions to respond to a Virus (disarm or remove) is part of the CIP-008 Response Plan. The SDT used this approach in proposed R4.5. 2. R3.3 a. Include testing within both the requirements and measures as alluded to within the Application Guidelines (page 41). b. Measures – Format (i) and (ii) to a bulleted list signifying ‘or’ criteria 3. R3.4 a. Applicability – Propose deletion of Associated Physical Access Control Systems, Associated Electronic Access Control or Monitoring Systems as they do not appear to be Transient Cyber Asset related. b. Requirements – Content Change i. Original Content - Deploy method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets and removable media when connecting them to BES Cyber Assets or Protected Cyber Assets. ii. Proposed Change – Deploy method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets and removable media when connecting them to Medium or High Impact BES Cyber Assets or Protected Cyber Assets. c. Measures – Content Change i. Original Content – Evidence may include, but is not limited to, logs showing when Transient Cyber Assets and removable media were connected to BES Cyber Assets or Protected Cyber Assets, and an inventory of Transient Cyber Assets and the methods used to detect, deter, or prevent malicious code. ii. Proposed Change – Evidence may include, but is not limited to, an inventory of Transient Cyber Assets and the methods used to detect, deter, or prevent malicious code. iii. Rationale – Excised content introduced prescriptive criteria that introduced additional resources without clearly addressing the requirement. 4. R3.5 a. Applicability – Propose deletion of Associated Physical Access Control Systems and Associated Electronic Access Control or Monitoring Systems and Associated and they do not appear to be Transient Cyber Asset related. b. Requirements – Append “to Medium or High Impact BES Cyber Assets or Associated Protected Cyber Assets” to the end of the requirement. c. Measures – Content Change i. Original Text – Evidence may include, but is not limited to, logs showing when Transient Cyber Assets were connected to BES Cyber Assets or Protected Cyber Assets. ii. Proposed Change - Evidence may include, but is not limited to, logs showing when Transient Cyber Assets were connected to Medium or High Impact BES Cyber Assets or Protected Cyber Assets.

No

R4 1. R4.1 a. Requirements – Content Change i. Original Content - Log generated events for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Any detected failed access attempts at Electronic Access Points 4.1.2. Any detected successful and failed login attempts 4.1.3. Any detected malware 4.1.4. Any detected potential malicious activity. ii. Proposed Change – Log generated events for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Any detected failed access attempts at Electronic Access Points 4.1.2. Any detected successful and failed login attempts 4.1.3. Any detected malware 4.1.4. Any detected potential malicious activity. Devices that cannot log a particular event do not require a TFE to be generated. iii. Rationale – Content from the application guidelines has been introduced to promote the guidance that TFE’s are not required in instances in which devices cannot log a particular event. 2. R4.2 a. Applicability – Propose deletion of Associated Physical Access Control Systems and Associated Electronic Access Control Systems as they are out of scope for this requirement. b. Requirements – Content Change i. Original Content – Generate alerts for events that the Responsible Entity determines to necessitate a real-time alert. ii. Proposed Change – Generate alerts for events that the Responsible Entity determines necessary. c. Measures – Content Change i. Original Content – Evidence may include, but is not limited to paper or system generated listing of event classes and conditions which necessitate real-time alerts; Assessment documentation or report showing analysis was performed to determine which events the Responsible Entity determines necessitate a real-time alert; Screenshots showing how real-time alerts are configured. ii. Proposed Change – Evidence may include, but is not limited to paper or system generated listing of event classes and conditions which necessitate alerts; Assessment documentation or report showing analysis was performed to determine which events the Responsible Entity determines necessitate an alert; Screenshots showing how alerts are configured. iii. Rationale – Removed the usage of ‘real-time’ as it presents concerns demonstrating compliance. 3. R4.3 a. Requirements – Content Change i.

Original Text – Detect and activate a response to event logging failures before the end of the next calendar day. ii. Proposed Change – Activate a response to failures of event logging before the end of the next calendar day after identification. iii. Rationale – Some devices generate logs so infrequently that identification of logging failure may extend beyond any calendar day. The spirit of this requirement remains intact as one day remediation is required once the log failure is identified. 4. R4.4 a. Requirements – Content Change i. Measures – Content Change 1. Original Text – Evidence may include, but is not limited to, security-related event logs from the past ninety days and records of disposition of security related event logs beyond ninety days up to the evidence retention period. 2. Proposed Change – Evidence must include, but is not limited to, security-related event logs from the past ninety days. 5. R4.5 a. Requirements – Content Change i. Original Content – Review a summarization or sampling of logged events every two weeks to identify unanticipated BES Cyber Security Incidents and potential event logging failures. Activate a response to rectify any deficiency identified from the review before the end of the next calendar day. ii. Proposed Change - Review a summarization or sampling of logged events every two weeks to identify BES Cyber Security Incidents and potential event logging failures. iii. Rationale – Since CIP-007 R4 should focus on Security Monitoring, ensuring the monitoring is adequately conducted (in advance of any incident response actions) should be at the core. Subsequent incident response actions are addressed within CIP-008. b. Measures – Content Change i. Original Content – Evidence may include, but is not limited to, documentation describing the review, any findings from the review (if any), signed and dated documentation showing the review occurred, and dated evidence showing that personnel were dispatched or a work ticket was opened to rectify the deficiency. ii. Proposed Change – Evidence may include, but is not limited to, documentation describing the review, any findings from the review (if any), and signed and dated documentation showing the review occurred. iii. Rationale – Since CIP-007 R4 should focus on Security Monitoring, ensuring the monitoring is adequately conducted (in advance of any incident response actions) should be at the core. Subsequent incident response actions are addressed within CIP-008.

No

R5 1. R5.1 a. General Comment – The act of being presented a Log-On screen means that a person has accessed the BES Cyber System. The requirement should allow access to a BES Cyber System to perform the log-on/access process. b. Requirements – Content Change i. Original Content – Validate credentials before granting electronic access to each BES Cyber System. ii. Proposed Change – Authenticate user account access before granting electronic to each Medium or High Impact BES Cyber System or Associated Protected Cyber Asset, where technically feasible. iii. Validating credentials was seen as vague specific to technical compliance so authentication is offered as an alternate approach to satisfy the root requirement (and mirrors the language in the change rationale). The addition of technically feasible was made as technical capabilities currently in place may not adequately demonstrate compliance with this. 2. R5.2 – Propose deletion as it replicates the requirements identified within CIP-004-5 R6.1. 3. R5.3 – Propose deletion as it replicates the requirements identified within CIP-004-5 R6.1. 4. R5.4 a. Requirements – Content Change i. Original Text – Procedural controls for initially changing default passwords, where technically feasible, unless the default password is unique to the device or instance of the application, on BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets. For the purposes of this requirement an inventory of Cyber Assets is not required. ii. Proposed Change – Procedural controls for initially removing, disabling, or changing default passwords, where technically feasible. For the purposes of this requirement an inventory of Cyber Assets is not required. iii. Rationale – The additional wording identify the multiple methods which can be used to mitigate default passwords. 5. R5.5 a. Requirements i. Change BES Cyber Systems to BES Cyber Assets throughout as password limitations should be identified to the device level. ii. Add language to 5.5.3 to cover instance where accounts may not be able to support password change to permit the entity specified time frame to be equal to the life-time of the BES Cyber Asset where technically required. 6. Please be consistent with the use of Term BES Cyber System versus BES Cyber Asset.

No

Violation Severity Levels 1. R3 a. Propose switching High and Severe Columns as the High captures instance in which no methods were deployed, Severe captures instances in which incomplete methods were deployed. b. The initial paragraph in Severe is duplicated in High. 2. R4 a. Moderate – delete 'identify and implement methods to' b. High – delete 'identify and' 3. R5 a. High – The initial

paragraph doesn't align with a requirement, propose striking.
No
1. General – Guidance or definitions should be provided to illustrate the expectation of this Standard. An Response Plan may solely contain the organizational structure, roles and responsibilities, and process to respond to an incident; but not include the specific steps required to resolve a specific type of incident on a specific BES Cyber Asset. For example I can describe an incident response for removing malware on a windows machine without being any more specific then contact Information technology group to remove Malware. 2. R1.1 1. Applicability – Content Change 1. Original Applicability ♣ All Responsible Entities 2. Proposed Applicability ♣ High Impact BES Cyber Systems ♣ Medium Impact BES Cyber Systems ♣ Associated Physical Access Control Systems ♣ Associated Electronic Access Control and Monitoring Systems ♣ Associated Protected Cyber Assets 3. Rational – Since the measure frames this sub-requirement to identify, classify, and respond to BES Cyber Security Incidents targeting the ESP or DPB, it is appropriate to frame applicability to environments in which ESPs and DPBs (are required to) exist. 3. R1.2 1. Applicability – Content Change ♣ Original Applicability • All Responsible Entities ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control and Monitoring Systems • Associated Protected Cyber Assets ♣ Rational – Since the measure frames this sub-requirement to identify, classify, and respond to BES Cyber Security Incidents targeting the ESP or DPB, it is appropriate to frame applicability to environments in which ESPs and DPBs (are required to) exist. 2. R1.3 1. Requirements ♣ The initial 'define' should be expanded to provide a complete sentence (i.e. An entities BES Cyber Security Incident Response Plan should include). 2. Measures – Content Change ♣ Original • Evidence may include, but is not limited to, dated BES Cyber Security Incident response process(es) or procedure(s) that address roles and responsibilities of BES Cyber Security Incident response personnel, BES Cyber Security Incident handling processes or procedures, and communications processes or procedures. ♣ Proposed Change • Evidence may include, but is not limited to, dated BES Cyber Security Incident response process(es) or procedure(s) that address roles and responsibilities of; o BES Cyber Security Incident response personnel, o BES Cyber Security Incident handling processes or procedures, o Communications processes or procedures.
No
1. R2.1 1. Applicability – Content Change ♣ Original Applicability • All Responsible Entities ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control and Monitoring Systems • Associated Protected Cyber Assets ♣ Rational – Since the measure frames this sub-requirement to identify, classify, and respond to BES Cyber Security Incidents targeting the ESP or DPB, it is appropriate to frame applicability to environments in which ESPs and DPBs (are required to) exist. 2. Requirements – Content Change ♣ Original Content • When a BES Cyber Security Incident occurs, the incident response plans must be used when incidents occur and include recording of deviations taken from the plan during the incident or test. ♣ Proposed Change • When a BES Cyber Security Incident occurs, the incident response plans must be used and include recording of deviations taken from the plan during the incident. 2. 2.2 1. Applicability – Content Change ♣ Original Applicability • All Responsible Entities ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control and Monitoring Systems • Associated Protected Cyber Assets ♣ Rational – Since the measure frames this sub-requirement to identify, classify, and respond to BES Cyber Security Incidents targeting the ESP or DPB, it is appropriate to frame applicability to environments in which ESPs and DPBs (are required to) exist.. 2. Requirements – Content Change ♣ Original Content • Implement the BES Cyber Security Incident response plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between executions of the plan(s): o by responding to an actual incident, or o with a paper drill or table top exercise, or o with a full operational exercise. ♣ Proposed Change • Test the incident response plan(s) annually. A test of the plan may include: o A response to an incident, or o with a paper drill or table top exercise, or o with a full operational exercise. ♣ Rationale – References to requirements needed upon the effective date should be captured within the implementation plan, allowing the standard to identify requirements (only) in place once the standard is approved. 3. R2.3 – Propose deletion as this sub requirement merely identifies retention requirements already documented within Compliance (C.1.2).
No

1. R3.1 1. Applicability – Content Change ♣ Original Applicability • All Responsible Entities ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control and Monitoring Systems • Associated Protected Cyber Assets ♣ Rational – The formal definition of BES Cyber Security Incident includes attempts to compromise the ESP or DPB, requiring Medium or High Impact BES Cyber Systems/Assets. 2. R3.2 1. Requirements – Propose content change a. Original content – Review the results of BES Cyber Security Incident Response Plan(s) test or actual incident response within thirty calendar days of the execution, documenting any lessons learned associated with the response plan. b. Proposed change – Use lessons learned from incident responses or incident response exercises to update the incident response plan, within sixty days of documenting lessons. c. Rationale – It takes 30 days from the time an exercise is executed to the review and completion of an after action report. The thirty day clock should start once the after action report is completed. This is in line with the proposed 60 day timeline in R3.3. 2. Measures – Content Change ♣ Original Content – Evidence may include, but is not limited to dated documentation of a review of the BES Cyber Security Incident Response Plan(s) test or actual incident response within thirty calendar days of the execution, including dated documentation of any lessons learned associated with the response plan. ♣ Proposed Change – Evidence may include, but is not limited to dated documentation of a review of the BES Cyber Security Incident Response Plan(s) test or incident response within thirty calendar days of the lessons learned associated with the response plan. 3. R3.3 1. Requirements – Content Change ♣ Original Content • Update the BES Cyber Security Incident response plan based on any documented lessons learned within sixty calendar days of the completion of the review of that plan. ♣ Proposed Change • Update the BES Cyber Security Incident response plan based on any documented lessons learned within sixty calendar days of the completion of the review of that test or incident. 2. Measures – Content Change ♣ Original Content – Evidence may include, but is not limited to dated, documented lessons learned from the results of the BES Cyber Security Incident response plan and the dated, revised plan. ♣ Proposed Change – Evidence may include, but is not limited to dated, documented lessons learned from the results of the BES Cyber Security Incident response plan test or incidence response and the dated, revised plan.

No

No

• Overall 1. References to ‘implement’ should be changed to ‘exercise’ regarding recovery plans to better capture activation of the plan vs. ‘release and publish’ efforts. 2. Actions required in advance of the implementation date (2.1, 2.2) should be removed from the standard(s) and included within the implementation plan. Purpose – Proposed Content Change 1. Original Content – Standard CIP-009-5 ensures that recovery plan(s) related to the storing of backup information are put in place for BES Cyber Assets and BES Cyber Systems and that these plans support and follow established business continuity and disaster recovery techniques and practices. 2. Proposed Change – Standard CIP-009-5 ensures that recovery plan(s) are put in place for BES Cyber Assets and BES Cyber Systems. R1.3- Remove protection from requirement because protecting information is covered in CIP-011. Proposed language: One or more processes for the backup, storage, and restoration of information required to restore BES Cyber System functionality. For R1 Suggest additional content supporting mirroring and/or redundancy within the backup/recovery methods such as: Mirroring and/or redundancy can be considered as complementary measure in support of this requirement, but a process must be in place to ensure retrieval of previous versions should current version(s) require reverting to a previous instance R1.4 The current form does not adequately address FERC Order 706, paragraphs 739 and 748, and in fact contradicts the intent that ‘The Commission does not believe that every change will necessitate verification of the backup and restoration processes’ from paragraph 740. ♣ Propose ‘new’ sub requirement applicable to High Impact BES Cyber Systems to require: • Upon implementation of significant changes to High Impact BES Cyber Systems, verify that backups are operational before they are relied upon for recovery purposes. ♣ Propose rewrite • Original – Information essential to BES Cyber System recovery that is stored on backup media shall be verified initially after backup to ensure that the backup process completed successfully. • Proposed Change – Ensure that backup processes are completed successfully for Information essential to BES Cyber System recovery. • Rational – This focuses on successful completion of the backup process which can be done within the routine backup. Verification would be moved to its own requirement applicable to High Impact BES Cyber Systems and limited to significant change instances. R1.5 Original Content – Preserve data,

where technically feasible, for analysis or diagnosis of the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1. ♣ Proposed Change – Document root cause for events that trigger activation of the recovery plan(s) as required in Requirement R1. ♣ Rationale – Root cause documentation should be the focus for this requirement. The current draft language requires potential impediments to restoration efforts and is too vague.
No
1. General Comment: Please provide Guidance: Does the Recovery Plan for each BES Cyber System require to be tested each year, or only one Plan. For example the EMS system will have a Recovery Plan, and the associated Physical Access Control System will have a recovery Plan, so do both plans get exercised each year or only one Plan. R2.1 1. Requirements Original – Implement the recovery plan(s) referenced in R1 initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between executions of the plan: by recovering from an actual incident, or with a paper drill or tabletop exercise, or with a full operational exercise Proposed Change – Implement the recovery plan(s) referenced in R1 annually: • by recovering from an actual incident, or • with a tabletop exercise, or • with a functional exercise Rationale – Use of the functional exercise aligns with the R2 rationale content citing NIST SP 800-84 exercise types. Requirements in advance of the effective date of the standard should be addressed within the implementation plan. 2. Measures – Content Change ♣ Original – Evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with a full operational exercise) of the recovery plan at least once each calendar year, not to exceed 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings. ♣ Proposed Change – Evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a tabletop exercise, or with a functional exercise) of the recovery plan annually. For the table top or functional exercise, evidence may include meeting notices, minutes, or other records of exercise findings. R2.2 Requirements – Content Change ♣ Original Text – Test any information used in the recovery of BES Cyber systems that is stored on backup media initially and at least once each calendar year, not to exceed 15 calendar months between tests, to ensure that the information is useable and reflects current configurations. ♣ Proposed Change – Test information used in the recovery of BES Cyber systems that is stored on backup media annually, to ensure that the information is useable. R2.3 1. Overall ♣ This requirement (to be done every 39 calendar months) appears to overlap considerably with 2.1 (to be done every year). ♣ Every 39 calendar months exceeds the 3 year retention identified within the Compliance section. ♣ How does this differ from current EOP-008 requirements? R2.3 2. Requirements – Content Change ♣ Original – Test each of the recovery plans referenced in Requirement R1, initially upon the effective date of the standard, and at least once every 39 calendar months thereafter through an operational exercise of the recovery plans in a representative environment that reflects the production environment. An actual recovery response may substitute for an operational exercise. ♣ Proposed Change – Exercise the recovery plan(s) at least every 39 calendar months through an operational exercise in a representative environment. An actual recovery response may substitute for an operational exercise. ♣ Rationale – Actions required to take place prior to the effective date of the standard should be captured within the implementation plan.
No
1. R3.1 Requirements – Content Change ♣ Original – Review the recovery plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between reviews, or when BES Cyber Systems are replaced, and document any identified deficiencies or lessons learned. ♣ Proposed Change – Review the recovery plan(s) annually and document any identified deficiencies. ♣ Rationale – Requirements addressing tasks to be done prior to the effective date should be captured within the implementation plan. 2. R3.2 Requirements – Content Change ♣ Original – Review the results of each recovery plan test or actual incident recovery within thirty calendar days of the completion of the exercise, documenting any identified deficiencies or lessons learned. ♣ Proposed Change – Review the results of each recovery plan test or actual incident recovery within thirty calendar days of completion, documenting any identified deficiencies or lessons learned. R3.4 – Propose deletion as the requirement is too broad with no clear alignment with FERC Order 706 or security benefit.
Yes

No
1. R1.1- In General UI does not agree with the addition of the new requirement. The existing Change Management requirement in CIP-003-3 is sufficient. The proposal is too prescriptive. CIP-003-4 R6 is closer to a results based requirement and provides more flexibility to achieve the desired results. CIP-010-1 R1.1 greatly expands the scope of change control and configuration management (CIP-003-4 R6) beyond what was directed in FERC Order 706. FERC Order 706 paragraphs 397 and 398 directed "modifications to CIP-003-1 R6 to provide an express acknowledgement of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes." The concern was that some form of verification is performed to detect when authorized changes have been made. CIP-010-1 R2.1 addresses Order 706's concern for some form of verification to detect unauthorized changes. (CIP-010-1 R2.1 should delete reference to the baseline defined in CIP-010-1 R1.1.) FERC also did "not believe the changes will have burdensome consequences." CIP-010-1 R1.1 requires extensive and burdensome details tracking. Effective automated tools for detecting changes (authorized and unauthorized) are available to address Order 706's concern and some of these tools do not require the burdensome, prescriptive details as proposed in R1.1 And R1.1.4 – Propose content change ♣ Original Text – Any custom software and scripts developed for the entity; ♣ Proposed Change – Any custom software and scripts installed on the BES Cyber Asset that can affect the security posture. ♣ Rationale – The change focuses scope to eliminate software and scripts not in use. 2. R1.2 1. Requirement – Propose content change ♣ Original Text – Authorization, by the CIP Senior Manager or delegate, and document changes to the BES Cyber System that deviate from the existing baseline configuration. ♣ Proposed Change – Document approved changes to the BES Cyber System that deviate from the existing baseline configuration. ♣ Rationale – As documented earlier in this comment form, requiring Senior Manager (or delegate) authorization introduces resource constraints that impede the effective documentation of changes without adding security benefits or alignment with FERC Order 706. 2. Measure ♣ First paragraph – Add 'or,' at the end of the first bulleted paragraph. ♣ Second paragraph – Propose content change • Original Text – A record of each change performed along with the minutes of a "change advisory board" meeting (that indicate authorization of the change) were an individual with the authority to authorize the change was in attendance. • Proposed Change – A record of the change with authorization of the change. • Rationale – Citing a "change advisory board" within the measure overly represents adequate evidence in support of the requirement. 3. R1.3 1. Requirements – Propose content change ♣ Original Text – Update the baseline configuration and other documentation required by a NERC CIP Standard, including identification and categorization of the BES Cyber Systems, as necessary within 30 calendar days of completing the change. ♣ Proposed Change – Update the documented baseline configuration as necessary within 30 calendar days of completing the change. ♣ Rationale – The proposed rewording provides more focus on the root requirements. 4. R1.4 What is the meaning and scope of cyber security controls 5. R1.5 1. Requirements – Propose content change ♣ Original Text • 1.5.1 – Prior to implementing any change in the production environment, test the changes to the BES Cyber System in a test environment that models the baseline configuration of the BES Cyber System to ensure that required cyber security controls are not adversely affected; and • 1.5.2 – Document the results of the testing and the differences between the test environment and the production environment, including a description of the measures used to account for any difference in operation between the test and production environments. ♣ Proposed Change • 1.5.1 – Prior to implementing any change from the existing baseline configuration in the production environment, test the changes to the BES Cyber System in a test environment that models the baseline configuration of the BES Cyber System to ensure that required cyber security controls are not adversely affected; and • 1.5.2 – Document the results of the testing and the differences between the test environment and the production environment. ♣ Rationale – Proposed rewording provide greater focus on the root requirements. 2. Measures – Propose content change ♣ Original Text – Evidence includes, but is not limited to, a list of security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test. ♣ Proposed Change – Evidence includes, but is not limited to, a list of security controls tested along with the date of the test, test results, and a list of differences between the production and test environments.
No
R2.1 1. Applicability – Propose removal of Medium Impact BES Cyber Systems. ♣ Rationale – The

technology required to monitor/detect for changes is relatively new and not aligned to BES Cyber Systems which would be in place within a Medium Impact facility (substations, etc.). 2. Requirements – Propose content change ♣ Original Text – Where technically feasible, monitor for changes to the baseline configuration (as defined per CIP-010_ R1, Part 1.1) and document and investigate the detection of any unauthorized changes. ♣ Proposed change – Where technically feasible, detect and document unauthorized changes to the baseline configuration (as defined per CIP-010 R1, Part 1.1).
No

R3.1 1. Requirements – Proposed content change ♣ Original Text – Initially upon the effective date of the standard and at least every calendar year thereafter, not to exceed 15 calendar months between assessments, conduct a paper or active assessment of the security controls to determine the extent to which the controls are implemented correctly and operating as designed. ♣ Proposed Change – On an annual basis, conduct a paper assessment of the cyber security controls to determine the extent to which the controls are implemented correctly and operating as designed. • Propose the addition (3.1.1) of minimum cyber security controls to be assessed that; o Are referenced within these standards; and o Are not already required to be assessed in other standards (removing double jeopardy implications) ♣ Rational • Annual (as defined within CIP-0010) should be the consistent approach to allow entities to standardize annual requirements on a consistent basis. • Active assessment is cited within Part 3.2 (to be done every 39 months) so we've removed it from this part to avoid overlap. 2. Measures – Propose content change ♣ Overall – There needs to be clear segmentation from ♣ Original Text – Evidence may include, but is not limited to: • A document listing the date of the assessment (performed at least each calendar year, not to exceed 15 calendar months between assessments), the controls assessed for each BES Cyber System along with the method of assessment, and the individuals who performed the assessment; • A document listing the date of the assessment and the output of the tools used to perform the assessment. ♣ Proposed Change – Evidence may include, but is not limited to: • A document listing the date of the assessment, the controls assessed for each BES Cyber System along with the method of assessment, and the individuals who performed the assessment; • A document listing the date of the assessment and the assessment results. ♣ Rational – Annual should align with CAN-0010 definition. Documentation of assessment results focus on the root information in support of vulnerability rather than potentially extensive data (from tools) that may require extensive resources to retain. R3.2 1. General observations ♣ While the application guidelines recognize production devices which may not be capable of modeling within a test environment (ICCP, etc.), this requirement does not provide clear guidance to follow where these instances occur. ♣ The 39 month cycle exceeds the 3 year retention requirements. 2. Requirements – Propose content change ♣ Original Text – Initially upon the effective date of the standard and at least once every 3 calendar years thereafter, not to exceed 39 calendar months between assessments, perform an active vulnerability assessment in a test environment that models the baseline configuration of the BES Cyber System in a production environment. Document the differences between the test environment and the production environment including a description of the measures used to account for any differences in operation between the test and production environments. ♣ Proposed Change – At least once every 3 calendar years thereafter, not to exceed 39 calendar months between assessments, perform an active vulnerability assessment in a test environment that models the baseline configuration of the BES Cyber System in a production environment. Document the differences between the test environment and the production. 3. Measures – Propose content change ♣ Original Text – Evidence may include, but is not limited to, a document listing the date of the assessment (performed within 39 calendar months of the previous assessment), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment. ♣ Proposed Change – Evidence may include, but is not limited to, a document listing the date of the assessment (performed within 39 calendar months of the previous assessment), the output of the tools used to perform the assessment, and a list of differences between the production and test environments. R3.4 1. Requirements – Propose content change ♣ Original Text – Document the results of the assessments and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of that action plan. ♣ Proposed Change – Document the results of the assessments (conducted within 3.1-3.3) and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of that action plan. ♣ Rationale – referencing parts 3.1 – 3.3 provides alignment with the previous parts of the standards.
Yes
No
R1.1 1. Applicability – Proposed Change ♣ Original Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems • Associated Protected Cyber Assets ♣ Proposed

Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems with External Routable Connectivity • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems ♣ Rationale • The additional qualifier of 'external routable connectivity' eliminates Medium Impact BES Cyber Systems that are not accessible outside of the BES facility, so information specific to these devices do not provide a means to compromise given the existing requirements for physical protection. This removes additional resources which could be better leveraged in other compliance efforts. • Associated Protected Cyber assets were removed as they alone cannot (by definition) affect BES Reliability Operating Services without unauthorized access to Medium (or High) BES Cyber Systems. This removes additional resources which could be better leveraged in other compliance efforts. R1.2 Applicability – Proposed Change ♣ Original Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems • Associated Protected Cyber Assets ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems with External Routable Connectivity • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems ♣ Rationale • The additional qualifier of 'external routable connectivity' eliminates Medium Impact BES Cyber Systems that are not accessible outside of the BES facility, so information specific to these devices do not provide a means to compromise given the existing requirements for physical protection. This removes additional resources which could be better leveraged in other compliance efforts. • Associated Protected Cyber assets were removed as they alone cannot (by definition) affect BES Reliability Operating Services without unauthorized access to Medium (or High) BES Cyber Systems. This removes additional resources which could be better leveraged in other compliance efforts. R1.3 Applicability – Proposed Change ♣ Original Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems • Associated Protected Cyber Assets ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems with External Routable Connectivity • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems ♣ Rationale • The additional qualifier of 'external routable connectivity' eliminates Medium Impact BES Cyber Systems that are not accessible outside of the BES facility, so information specific to these devices do not provide a means to compromise given the existing requirements for physical protection. This removes additional resources which could be better leveraged in other compliance efforts. • Associated Protected Cyber assets were removed as they alone cannot (by definition) affect BES Reliability Operating Services without unauthorized access to Medium (or High) BES Cyber Systems. This removes additional resources which could be better leveraged in other compliance efforts. R1.3 Requirements – Proposed content change ♣ Original Text - Initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between assessments, assess adherence to its BES Cyber System Information protection process, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment. ♣ Proposed Change – Annually assess adherence to its BES Cyber System Information protection process, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment. R1.3 Measures – Proposed content change ♣ Original Text – Evidence may include, but is not limited to, documented review, assessment results, action plan, and evidence to demonstrate that the action plan was implemented. ♣ Proposed Change – Evidence may include, but is not limited to, documented review, assessment results, action plan, and evidence of the status of the action. ♣ Rationale – Rewording allows for action plans which may be 'in progress' towards implementation, capturing instance in which remediation may rely on deliverables (not yet received) by vendors.

No

R2.1 Applicability – Proposed Change ♣ Original Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems • Associated Protected Cyber Assets ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems ♣ Rationale • Associated Protected Cyber assets were removed as they alone cannot (by definition) affect BES Reliability Operating Services without unauthorized access to Medium (or High) BES Cyber Systems. This removes additional resources which could be better leveraged in other compliance efforts. R2.1 Requirements – Proposed Change ♣ Original Content – Prior to the release for reuse of

BES Cyber Asset media, the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the media. ♣ Proposed Change – Prevent the unauthorized retrieval of BES Cyber System Information from BES Cyber Asset media prior to the release of BES Cyber Asset media for reuse. ♣ Rationale – While not directly changing the intent of the requirement, this rewording has been suggested to provide greater clarity of the root requirement. R2.2 Applicability – Proposed Change ♣ Original Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems • Associated Protected Cyber Assets ♣ Proposed Applicability • High Impact BES Cyber Systems • Medium Impact BES Cyber Systems • Associated Physical Access Control Systems • Associated Electronic Access Control or Monitoring Systems ♣ Rationale • Associated Protected Cyber assets were removed as they alone cannot (by definition) affect BES Reliability Operating Services without unauthorized access to Medium (or High) BES Cyber Systems. This removes additional resources which could be better leveraged in other compliance efforts.

References to requirements to be conducted in advance of the implementation date should be migrated over into the implementation plan. This ensures any pre-requisites are captured within the implementation plan, freeing this content from the standards to provide clearer guidance. Implementing version 5: The implementation period should be no less than 24 months however it is impossible to propose a likely implementation period until the final basket of requirements take shape. The reasoning to support the minimal 24 months is that certain changes will require a capital expenditures and equipment acquisition. The SDT should consider that new capital expenditures require inclusion with the next budget cycle and then the process to procure and implement/install new equipment. Actions cannot be started until FERC completes its rulemaking process to define the basket of actions to take. Second, the likely addition of numerous Low Impact BES Cyber Systems that may not have been considered in scope for previous versions will require some Entities to create solutions from clean slates. . In the event that Low Impact assets are a component of the enforceable requirements on day 1 it is likely that additional time would be required. Finally, Entities currently subject to CIP standards are managing a zero defect CIP program and possible preparing for audits while implementing version 5. Planned Changes: UI agrees that if when an Entity plans a change the impact on BES Cyber System designation should be considered and any required security upgrades and CIP items should be completed prior to the Change. In some requirements that require periodic activity it would not increase security to force the activity outside the Existing Entities Schedule. For example, many entities rely on a consultant to perform a cyber vulnerability assessment once per year. This implementation plan would require a separate cyber vulnerability assessment on the new asset prior to placement into operation which will result in the additional expense of multiple assessments per year. Unplanned Changes in Impact designation: UI is concerned with unplanned changes. Changes to impact designations may require significant investment in equipment, process documentation, and personnel to implement a cyber security program and the compliance obligations. Every circumstance and situation can not be anticipated in the implementation plan. UI proposes that additional guidance is provided to state that the obligation to be compliant begins 12 months after notification, and an Entity that can not fully meet its compliance obligation will file a single mitigation plan with it Regional Entity providing a plan and timeline to come into compliance with each of the requirements.

Yes

-BES Cyber Asset: Some devices, such as digital relays, may operate independently, and neither send nor receive "instructions". It is unclear that an output contact status change would be considered an "instruction". -BES Cyber System: Maintenance Cyber Asset is not defined. Should this be Transient Cyber Asset? -BES Cyber System Information: The same phrase that applies to floor plans and equipment layouts – “that contain BES Cyber System Impact designations” – should also be added after “network topology or similar diagrams”. It is difficult to know how prescriptive the three examples are within the parentheses. Use the same wording used extensively throughout the CIP

standards: “Examples may include, but are not limited to: network addresses, security patch levels, list of logical network accessible ports.” -Dynamic Response to BES Conditions Operating Service: This definition is complex and inconsistent in approach. Parts of the definition are too specific, such as Protection Systems - Current, frequency, and phase. These are input quantities to Protection Systems, and we suggest that this line be deleted. Parts of the definition are too broad - Monitoring and Control - All methods of operating breakers and switches. Does this include manual operation? For clarity and consistency, we suggest using the NERC definition of Protection System instead of the term relay protection, and also remove the bullets which detail "sensors, relays & breakers". We suggest replacing "x-former" with the word "transformer". -CIP Exceptional Circumstance: Please clarify the meaning and intent of the phrase "an impediment of large scale workforce availability". How would this be measured? -Electronic Access Control and Monitoring Systems: It’s unclear whether only the monitoring of access to ESPs and BES Cyber Systems is meant, or all monitoring of ESPs and BES Cyber Systems (including for example the monitoring for malware). Suggest rewording to “Cyber assets used in the control or monitoring of electronic access to Electronic Security Perimeter(s) or BES Cyber Systems.” -Electronic Access Point (EAP): This definition is too broad and it should focus on BES Cyber Asset Protection. Suggest change for “between Cyber Assets” to be “to BES Cyber Assets”. -External Connectivity: Since the term “external connectivity” is not used anywhere in the standards, delete this definition. -External Routable Connectivity: When determining whether external connectivity is routable, is the Responsible Entity required to check only the parts of the communication system that it administers, or is it also responsible to investigate whether a routable protocol is in use anywhere within the communication systems of its communication service providers, even though those communication systems have been exempted from the CIP standards? This definition is unclear. Suggest the following wording: “The use of a routable protocol through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter.” -Interactive Remote Access: The sentence "Remote access can be initiated from: ... contractors and consultants." is guidance information, and restricts the definition to only applying to Responsible Entity Cyber Assets, employees, vendors, contractors, and consultants. By definition, this would exclude interactive remote access by anyone else (public, non-legitimate users) from scope. We suggest removing the last sentence and providing this information in a guidance document. -Intermediate Device: As currently written, an Intermediate Device may perform none of the functions listed. We suggest “A Cyber Asset that performs one or more of the following functions: provides the required multi-factor authentication for the interactive remote access; or provides a termination point for required encrypted communications; or restricts interactive remote access to only authorized users.” The sentences “Intermediate devices are sometimes called …. Or in a DMZ network…” are examples which should be moved to the guidance section. -Physical Access Control System: This definition should be consistent with Electronic Access Control or Monitoring Systems. Suggest to added “monitoring” into the title and the definition. -Protected Cyber Asset: Protected Cyber Asset: Please clarify to what the Cyber Asset is connected. The BES Cyber System? To a device outside the ESP? To any device in the ESP? -Reportable BES Cyber Security Incident: A BES Cyber Security Incident has already been defined. How BES Cyber Security Incidents should be handled, including whether they should be reported is better described within the standard than in a definition. -Transient Cyber Asset: Please clarify the meaning of "directly connected" is unclear.
