- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments: Since IRO-013 is not approved, then IRO-004-1 R7 should not be deleted until replaced. The redlined IRO-004-2 shows the entire standard to be retired.

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

## Comment Form — IROL Standards

---

Comments: FAC-011-1 R1 (which is effective 10/01/2007) requires the Reliability Coordinator to have a documented methodology for use in developing SOLs within its Reliability Coordinator Area. TOP-007-0 R4 requires the Reliability Coordinator to evaluate actions taken to resolve SOL violation, and if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits. Existing IRO-002-1 R5 and R8 (which still exist in the proposed IRO-002-2 as R4 and R6) require the Reliability Coordinator to have detailed real-time monitoring to ensure that potential or actual SOL violations are identified. These requirements require the Reliability Coordinator to be aware of all SOLs. We agree with the concept to clarify the accountabilities between the Transmission Operator and the Reliability Coordinator for real-time actions relative to SOLs, but it is inaccurate to state that the Reliability Coordinator is not required to see all SOLs. The Transmission Operator should be proactive in mitigating SOL violations (real-time and calculated first contingency), in coordination with the Reliability Coordinator. The Reliability Coordinator must be aware of all SOL violations in order to direct action when needed to do so.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: See comment in # 8,

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: IRO-004-1 R2 should be included in the Technical Reference. The Technical Reference document should be provide (for information purposes) as part of the document package for this review of proposed requirement changes.

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2

## Comment Form — IROL Standards

---

- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: The modification of IRO-005-2 R14 to retire part 1, as stated on page 14 (in the Notes section) is not reflected in the redlined version of IRO-005-3. This change should be made in the redlined version.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: Agree to retire IRO-005-2 R2, however redlined version of IRO-005-3 does not show deletion of the entire R2 (which become R1 in IRO-005-3.)

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

**Comment Form — IROL Standards**

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

**Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

**1. Modified the format of the “Proposed Effective Dates”**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

**2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

ISO New England agree with the VRFs for IRO-008, IRO-009 and -010.

ISO New England suggests that for IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to potential unreliable operation.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

ISO New England agrees with the mitigation time horizons for IRO-007, -008 and -010.

For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

ISO New England agrees with the violation severity levels for IRO-007 and -008.

For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?

To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.

Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.

For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:
- IRO-002-1 — RC – Facilities; Retire R6
  - IRO-003-2 — RC – Wide Area View; Retire R1 and R2

## Comment Form — IROL Standards

---

- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

EOP-001 R2 requires that a TOP have an emergency load reduction plan for all identified IROLs. The intent of this requirement is for the TOP to be ready to implement load reduction as directed by the RC to mitigate IROL violation when other control actions have been or are in parallel being implemented. Unless this requirement is covered elsewhere, it needs to be retained to assure TOP's readiness, which is in a different context than what the requirements in IRO-009 implies. The RC does not own or operate any load reduction scheme. It must rely on the operators of these schemes - the TOP and DP, as directed by the TOP, to implement load reduction.

ISO New England agrees with retiring R6 of IRO-004-1, but suggest that a part of R3 in IRO-004-1 which requires that the RC develop action plans in conjunction with the TOPs, be reflected in this standard.

ISO New England believes the key requirement in R3 and R5 is for the RC to correct an IROL violation as soon as possible and within 30 minutes. This needs to be retained somewhere, preferably in this standard. Not having a time limit to correct IROL violation can result in an IROL being exceeded for an indefinite period of time, subjecting the system to prolonged risks of instability and potential cascade tripping. The 30 minutes also serves as the threshold that if an IROL violation cannot be corrected by adjusting generation and interchange, reconfiguration, reducing interruptible load, voltage reduction, etc. within that time frame, curtailment of firm load must also be implemented to correct the violation immediately.

ISO New England believes the concept of the RC approving outages needs to be retained somewhere in the standards, retiring R9 should be conditional on having this coordination/approval requirement covered by this (IRO-009) or another standard.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(i) We agree with retiring R2 of IRO-002-1.

(ii) We do not agree with removing R1.2 from TOP-003-2. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that may affect interconnected system reliability. There should not be any prejudgment as to which outage has an impact on SOL only.

(iii) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

**Comment Form — IROL Standards**

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

R2 of IRO-008 requires clarification or the definition of Real-Time Assessments needs to be revised to capture that an assessment needs to be done every thirty minutes and specific made as to how far into the future the assessments must cover.

R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct" be inserted after "...the Reliability Coordinator shall share its results with" in R3. This may clarify the IRO-008 standard but may introduce some redundancy with IRO-009 R3 and R4.

Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?

In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay perhaps specifying a timeframe in the Requirements section R4. Also missing is the requirement to document, with a complete violation report, whenever an IROL violation has been exceeded beyond Tv.

In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document IROL violation incidents. This requirement is missing in the new version. NPCC Participating members believe that this requirement should be stated in this standard.

We also have concern about these same standards appearing in NERC's Reliability Coordinator SAR project. Coordination of the comments is a major concern especially when the standards will be under revision here and also in that project concurrently.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

7. The latest version of the Reliability Standards Development Procedure requires that each standard include “violation severity levels” rather than “levels of non-compliance.” “Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

## Comment Form — IROL Standards

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: PHI supports the comments of the IRC Standards Review Committee. In support of the drafting team, they will not be repeated in this comment form.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: PHI supports the comments of the IRC Standards Review Committee. In support of the drafting team, they will not be repeated in this comment form.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

## Comment Form — IROL Standards

---

I do not agree with the drafting team's approach

Comments: PHI supports the comments of the IRC Standards Review Committee. In support of the drafting team, they will not be repeated in this comment form.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

**Comment Form — IROL Standards**

---

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: PHI supports the comments of the IRC Standards Review Committee. In support of the drafting team, they will not be repeated in this comment form.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2

**Comment Form — IROL Standards**

---

IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: PHI supports the comments of the IRC Standards Review Committee. In support of the drafting team, they will not be repeated in this comment form.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments: MH endorses the MRO comments: While the description of requirements captures the essence of preventing and mitigating IROLs, it would be helpful for clarity to change the title of the revised IRO-009-1 to Reliability Coordinator actions to operate within IROLs and plans to prevent/mitigate IROLs.

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments: MH endorses MRO comments: Project 2007-02 should have been included with this package for us to consider. The MRO is also concerned that there is a general trend to develop too many requirements and measures, which would become administratively burdensome to the ERO and the entities that must comply.

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments: MH endorses MRO comments: It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments: MH endorses MRO comments: It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: Mitigation Time Horizons are described near the top of this comment form.

The description of the Mitigation Time Horizons states: The ERO Rules of Procedure include the use of mitigation time horizons as one element used to determine the size of sanctions.

Can the drafting team inform the Registered Ballot Body where the ERO definition of Mitigation Time Horizons can be found along with documentation describing how the mitigation time horizons will be used in determining penalties. Mitigation Time Horizons are not listed as a Performance Element of a Reliability Standard in the Reliability Standards Development Procedure Version 6 adopted by the NERC BOT on November 1, 2006. As such, it does not seem appropriate to include them in any Reliability Standards.

The comment form description of Mitigation Time Horizons further states The drafting team used the following guidelines in developing mitigation time horizons for each requirement, whereas the final statement in the description of the Violation Risk Factors states The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure. Like the Violation Risk Factors, the categories of Mitigation Time Horizons should also be approved and incorporated into the Reliability Standards Development Procedure in order to ensure that the definitions are consistent for all NERC Reliability Standards.

The MH cannot vote to approve a standard that includes Mitigation Time Horizons until the drafting team can produce ERO documented definitions and the documented manner in which the Mitigation Time Horizons will be used to determine penalties.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include “violation severity levels” rather than “levels of non-compliance.” “Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: endorses the MRO comments: The way the Violation Severity levels are spelled out, it again appears to be arbitrary cut offs, and especially the High and Severe Violation Severity Levels have to be tightly defined so that the entities would know what actions to take to be compliant.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

Comments: However, the drafting team should ensure that where the RC's accountability has been limited or removed regarding real-time actions relative to SOLs, the accountability of the appropriate entity, e.g. transmission operator is covered by or added to another standard. This will ensure no reliability gaps are created.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

## Comment Form — IROL Standards

---

Comments: If we are removing the monitoring of SOL from the RC's responsibility how can IRO-005-0 R11 be true. The RC can not make known to Transmission Service Providers all SOLs. This Requirement needs to be edited. Possibly along the lines of:

R11. Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, all IROLs and known SOLs within its wide-area view. The Transmission Service Providers shall respect IROLs and all known SOLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

Also, MH endorses the MRO comments: The MRO agrees with the SDT in striking the first part of IRO-005-2 since it is already covered in FAC-014-R5.1. However, the MRO does not agree with the proposed revision to the second part that states: The Transmission Service Providers shall respect SOLs and IROLs in accordance with filed tariffs..... Since the RC may not know all SOLs and IROLs, it is not possible for the RC to make the TSP aware of what the RC itself does not know. The MRO recommends the SDT amend the proposed revision to state: The Transmission Service Provider shall respect all KNOWN SOLs and IROLs in accordance with.....

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: General agreement with the approach, however, the new definition, Operational Planning Analysis, is a very high level definition such that R1 in IRO-008 may be very difficult to measure.

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: MH does not agree with the removal of required coordination between the RC and the Transmission Operator and Balancing Authority. This approach is moving in a direction to undermine reliability.

**Comment Form — IROL Standards**

---

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2

**Comment Form — IROL Standards**

---

	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: MH appreciates the effort the drafting team put into the development of these standards and that the material has been organized to facilitate review and comment.

MH also endorses the MRO comments: The MRO requests clarification as to why the following two definitions were added in IRO-009-1 and never used: Interconnection Reliability Operating Limit Event, and Interconnection Reliability Operating Limit Event Duration. If terms are specifically added to a standard, it is expected that the terms will be used in the standard. If the new terms are not to be used in the standard where they are originally defined, it would appear that the new terms are not needed and should be struck from the standard until a such time that they are to be used.

The MRO requests the definition of the term Delay, as it is used in in IRO-009-1-R4. Is the RC considered in violation if it does not act with in one minute? If it does not act with in two-minutes. Leaving this term undefined will result in arbitrary enforcement of this standard

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

**Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

**1. Modified the format of the “Proposed Effective Dates”**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

**2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

We agree with the VRFs for IRO-008, IRO-009 and -010.

We suggest that for IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to potential unreliable operation.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

We agree with the mitigation time horizons for IRO-007, -008 and -010.

For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

We agree with the violation severity levels for IRO-007 and -008.

For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?

To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.

Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.

For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:
- IRO-002-1 — RC – Facilities; Retire R6
  - IRO-003-2 — RC – Wide Area View; Retire R1 and R2

## Comment Form — IROL Standards

---

- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

EOP-001 R2 requires that a TOP have an emergency load reduction plan for all identified IROLs. The intent of this requirement is for the TOP to be ready to implement load reduction as directed by the RC to mitigate IROL violation when other control actions have been or are in parallel being implemented. Unless this requirement is covered elsewhere, it needs to be retained to assure TOP's readiness, which is in a different context than what the requirements in IRO-009 implies. The RC does not own or operate any load reduction scheme. It must rely on the operators of these schemes - the TOP and DP, as directed by the TOP, to implement load reduction.

We agree with retiring R6 of IRO-004-1, but suggest that a part of R3 in IRO-004-1 which requires that the RC develop action plans in conjunction with the TOPs, be reflected in this standard.

We believe the key requirement in R3 and R5 is for the RC to correct an IROL violation as soon as possible and within 30 minutes. This needs to be retained somewhere, preferably in this standard. Not having a time limit to correct IROL violation can result in an IROL being exceeded for an indefinite period of time, subjecting the system to prolonged risks of instability and potential cascade tripping. The 30 minutes also serves as the threshold that if an IROL violation cannot be corrected by adjusting generation and interchange, reconfiguration, reducing interruptible load, voltage reduction, etc. within that time frame, curtailment of firm load must also be implemented to correct the violation immediately.

We believe the concept of the RC approving outages needs to be retained somewhere in the standards, retiring R9 should be conditional on having this coordination/approval requirement covered by this (IRO-009) or another standard.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(i) We agree with retiring R2 of IRO-002-1.

(ii) We do not agree with removing R1.2 from TOP-003-2. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that may affect interconnected system reliability. There should not be any prejudgment as to which outage has an impact on SOL only.

(iii) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

**Comment Form — IROL Standards**

---

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

R2 of IRO-008 requires clarification or the definition of Real-Time Assessments needs to be revised to capture that an assessment needs to be done every thirty minutes and specific made as to how far into the future the assessments must cover.

R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct" be inserted after "...the Reliability Coordinator shall share its results with" in R3. This may clarify the IRO-008 standard but may introduce some redundancy with IRO-009 R3 and R4.

Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?

In IRO-009, we question the need of both R1 and R2 since the difference is very subtle. R1 is to "prevent exceeding an IROL" and R2 is to "mitigate magnitude and duration of exceeding an IROL". Combining the two requirements would seem more practical since they are both in the same time frame of "in advance of Real-time". In the same way, R3 and R4 might be combined also.

In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay perhaps specifying a timeframe in the Requirements section R4. Also missing is the requirement to document, with a complete violation report, whenever an IROL violation has been exceeded beyond Tv.

In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document IROL violation incidents. This requirement is missing in the new version. We believe that this requirement should be stated in this standard.

We also have concern about these same standards appearing in NERC's Reliability Coordinator SAR (project 2006-06). Coordination of the comments is a major concern especially when the standards will be under revision here and also in that project concurrently.

**Comment Form — IROL Standards**

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments: It appears that R1 of IRO-013 would be more appropriately contained in the IRO standards. R1 of IRO-013 states: The BA, IA, and TOP shall each follow its RC's directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances the BA, IA or TOP shall immediately inform the RC of its inability to perform the directive so that the RC can implement alternate remedial actions. The directives covered by this requirement shall be those that:

R1.1. Prevent instances of exceeding interconnection reliability operating limits (IROLs).

R1.2. Mitigate the magnitude and duration of instances of exceeding IROLs.

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do

## Comment Form — IROL Standards

---

you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments: Does regulatory approvals only include FERC or does it also include the NERC Board?

A standard approved by the NERC Board, for example, on September 30<sup>th</sup> would be implemented on January 1, which is too soon to prepare for. It might also be too soon even if it meant only FERC, since the NERC Board could approve September 29<sup>th</sup> followed by FERC approval on September 30<sup>th</sup>. In these instances, 6 months might be more appropriate.

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments: Since the VRFs are being addressed through other ballots or procedures, and by the fact that this standard drafting team has no control over the VRFs, this question may be of no value to Industry.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: The time horizon of Operations Planning related to Mitigation Time Horizons (day-ahead up to and including seasonal) is different from the time horizon used in the definition of IRO-008-1 Operational Planning Analysis (which is the next day's operation and up to 12 months ahead). Additionally, some utilities interpret Operations Planning as real time up to day ahead studies. This creates confusion with the term Operations Planning and Southern seeks clarification for the term.

Secondly, since each requirement's time horizon appears to be contemplated within the standard itself and reflected in the assignment of the Violation Risk Factor and Violation Severity Level, Southern believes including this characteristic in the penalty adjustment process is not necessary. Therefore, we believe the Mitigation Time Horizons should NOT be a penalty adjustment factor in determining monetary penalties for non compliance.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: Let's say a Reliability Coordinator (RC) who performs admirably throughout the year has only one identifiable IROL for the year. However, due to one reason or

another, the RC does not have a procedure in advance that identifies actions to prevent the instance from exceeding the IROL. This results in a SEVERE violation level.

Now, let's say a RC who does less than an admirable job throughout the year and has multiple (50) identifiable IROLs for the year. This RC is allowed approximately 8 instances of not having a procedure which identified actions to prevent exceeding the IROL, and this RC only achieves a MODERATE violation level. There needs to be some type of rewarding mitigation factor for those RCs who have very few identifiable IROLs.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: One can never tell when an SOL will turn into an IROL. In fact, there may be several SOLs occurring at the same time which may turn into an IROL. What the drafting team is recommending in this standard is for the RC to no longer monitor or study SOLs even though NERC standards currently require them to. This seems contradictory to NERC's goal of maintaining a reliable BES.

Also, there are contradictory statements throughout the standard which require the RC to coordinate and communicate SOLs to the TSPs. However, according to the changes recommended in this standard, the RC will no longer be required to monitor SOLs. One such occurrence is in IRO-005-3, in which R11 states the RC shall make known to the TSPs in its wide-area view all SOLs and IROLs. How does the drafting team expect the RCs to make the TSPs aware of all SOLs when the RC is not expected to monitor or study the SOLs?

Southern Co. Transmission recommends that the RC continue to monitor and study SOLs as the current standards require. The August 2003 Blackout resulted, in part, from the RCs not monitoring and studying SOLs within its wide-area view. To move away from this concept will make the BES more vulnerable to a possible future blackouts.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:
- IRO-002-1 — RC – Facilities; Retire R6
  - IRO-003-2 — RC – Wide Area View; Retire R1 and R2
  - IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
  - TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

## Comment Form — IROL Standards

---

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: Southern Co. believes that the RC should monitor BES elements that could result in SOLs and IROLs. We believe the RC should know the current status of critical facilities whose failure could result in an SOL and IROL.

Therefore, we recommend keeping all the requirements being recommended for retirement.

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: Southern Co. believes the RC should conduct contingency analysis studies that would identify SOLs and IROLs. We recommend keeping both R1 and R2.

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: The RC has no knowledge of SOLs based on the SDT's recommended changes. So how will the RC coordinate SOL violations as the (new) R6 states in IRO-005-3? The new R11 in IRO-005-3 states the RC shall make known to the TSP all SOLs and IROLs in its area. How does the RC do this when they are NOT expected to study or monitor SOLs?

We do agree that EOP-001-0, R2 should be retired.

Recommend keeping R3 and R6 of IRO-004-1. The RC should develop action plans to return transmission loading to within acceptable SOL or IROLs.

Southern also recommends keeping R3, R5, R9, R13, R14, R16, and R17 of IRO-005-2.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: While we agree with the SDT's recommendations on TOP-003-0 and TOP-005-1, we disagree with the remainder of the retirement recommendations and suggest keeping the requirements as they are.

It is ironic that while the SDT is recommending the removal of requirements which specifically state that the TO, GO, GOP and LSE are to provide the RC with information required for system studies by 1200 noon each day, the Blackout Report stated a concern about the NERC standards' lack of requirements for providing reliability information to the RC.

In particular, under the heading of "Data Exchanged for Operational Reliability" in the Blackout Final Report, the Report states that "a variety of up-to-date information on the elements of the system must be collected and exchanged for modeled topology to be accurate in real time."

The Report states "there is no current requirement for how quickly asset owners must report changes in element status (such as a line outage) to the SDX. NERC is now developing a requirement for regular information update submittals that is scheduled to take effect in the summer of 2004." [Reference Page 51 of the Report]

We are approaching the third anniversary of the publishing of this Report and still have no requirement in any NERC Standard for submitting data to the NERC System Data Exchange.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

**Comment Form — IROL Standards**

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments: By balloting these standards in 4 separate ballots, certain problems arise. For example, Ballot 4 (IRO-010) says to retire R2 of IRO-002-1. Ballot 1 (IRO-007) says to retire R6 of IRO-002-1.

## Comment Form — IROL Standards

---

IF one ballot fails and the other passes, Standard IRO-002-1 cannot be approved by the Board because one requirement passed the ballot voting while the other requirement did not.

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

(i) We agree with the VRFs for IRO-008 and -010.

(ii) For IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to potential unreliable operation.

(iii) For IRO-009, the VRFs for R1 and R2 should both be HIGH. The absence of pre-determined control actions that need to be made available to operation personnel to prevent and mitigate IROL violation can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (b), above.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

(i) We agree with the mitigation time horizons for IRO-007, -008 and -010.

(ii) For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

(i) We agree with the violation severity levels for IRO-007 and -008.

(ii) For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?

To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.

Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times that, for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.

(iii) For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when a SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3. On the other hand, we feel that while the RC is not required to monitor these SOLs, they need to continue to be provided the information on the results of SOL determination and assessment as currently stipulated

## Comment Form — IROL Standards

---

in R11 of TOP-002-2 since SOLs may become IROLs under certain conditions as determined by the RC.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(j) EOP-001 R2 requires that a TOP have an emergency load reduction plan for all identified IROLs. The intent of this requirement is for the TOP to be ready to implement load reduction as directed by the RC to mitigate IROL violations when other control actions have been implemented or are being implemented in parallel. Unless this

requirement is covered elsewhere, it needs to be retained to assure a TOP's readiness, which is in a different context than what the requirements in IRO-009 imply. Note that the RC does not own or operate any load reduction scheme. It must rely on the operators of these schemes - the TOP (and DP, as directed by the TOP), to implement load reduction.

(ii) We agree with retiring R6 of IRO-004-1, but suggest that a part of R3 in IRO-004-1 which requires that the RC develop the action plans in conjunction with the TOPs be reflected in this standard. This should be a requirement, not just an understanding, and hence needs to be stated explicitly herein.

(iii) We agree that R3, R5 and R9 of IRO-005-2 can be retired. However, the key requirement in R3 and R5 for the RC to correct an IROL violation as soon as possible and within 30 minutes needs to be retained somewhere, preferably in this standard. Not having a time limit to correct IROL violations can result in an IROL being exceeded for an indefinite period of time, subjecting the system to prolonged risks of instability and cascade tripping. The 30 minute also serves as the threshold for curtailing firm load to correct the violation immediately if an IROL violation cannot be corrected by adjusting generation and interchange, reconfiguration, reducing interruptible load, voltage reduction, etc. within that time frame.

(iv) Similar to our comment on IRO-004-1, that part in R9 of IRO-005-2 which requires the RC to coordinate transmission and generation outages needs to be stipulated somewhere, perhaps in the context of the RC approving outages. Hence, retiring R9 should be condition on halaving this coordination/approval requirement covered by this (IRO-009) or another standard.

(v) We agree that part 1 of R13, and R16 and R17 of IRO-005-2 can be deleted.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(i) We agree with retiring R2 of IRO-002-1.

(ii) We agree with retiring R4 and R5 of IRO-004-1. However, the time frame for the RC to complete day-ahead assessment as stipulated in R5 should be retained somewhere as otherwise, there could be mis-coordination, delays and even failure to complete the assessment in time for other operating entities to prepare the system for next day operations.

**Comment Form — IROL Standards**

(iii) We do not agree with removing R1.2 from TOP-003-1. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that may affect interconnected system reliability. There should not be any prejudgment as to which outage has an impact on SOL only.

(iv) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5

## Comment Form — IROL Standards

---

	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

(i) The requirement to monitor, or at least be aware of the impacts on, critical parameters in other RC's areas, as proposed for IRO-007 (M2.1) and IRO-008 (R1) in the previous draft set of standards posted on March 1, 2004, is missing. This monitoring capability is essential for identifying potential reliability impact on other RC areas due to operation plans and real-time operations in one RC area. Note that IRO-010 has this requirement (implicit in R3).

(ii) R2 of IRO-008 requires that Real-Time Assessments be performed at least every 30 minutes. The definition of Real-Time Assessment leaves open how far into the future the assessments must cover. Please clarify.

Using the current definition for Real-Time Assessments, R2 of IRO-008 would require that a complete study for the remainder of the operating day be performed at least every 30 minutes.

We believe it is more appropriate to consider Real-Time Assessment to mean the use of real-time information to assess system conditions for the current minute up to a certain time period, say, next hour. Operations Planning Analysis, which includes day at hand, should cover the remaining hours for the current day and beyond, up to about a year. We suggest the SDT consider revising the definitions in this manner to add clarity to R2 (and R1 as well) of IRO-008.

(iii) R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct as deemed necessary" be inserted after "...the Reliability Coordinator shall share its results with" in R3.

(iv) Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?

(v) In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action.

The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay.

(vi) In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. This requirement is currently stipulated in EOP-004, with cross reference to TOP-007. We feel it's more appropriate for the RC to make this report and hence this requirement should be added to IRO-009.

(vii) We do not have any comments on the proposed measures. However, from a process viewpoint, none of the questions asked in this comment form seek concurrence or comments on any of the measures proposed. Since these measures did not exist in any of the current standards, and have been revised since the last draft versions (posted on March 1, 2004), the industry needs to have an opportunity to offer its view.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments: This is a step in the right direction, and the revised IRO-010-1 captures the relevant information related to data collection as reflected in R1.1, R1.3, R1.4, R3. A fewer number of standards to deal with is always better.

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments: While the description of requirements captures the essence of preventing and mitigating IROLs, it would be helpful for clarity to change the title of the revised IRO-009-1 to Reliability Coordinator actions to operate within IROLs and plans to prevent/mitigate IROLs.

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments: Project 2007-02 should have been included with this package for us to consider. The MRO is also concerned that there is a general trend to develop too many requirements and measures, which would become administratively burdensome to the ERO and the entities that must comply.

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments: It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments: For many requirements, the VRFs are overstated. ERO has not given correct directives on how to assign VRFs. In addition, one cannot assign a single VRF for a requirement such as IRO-008-1 R3 that covers both Operational Planning Analysis, and real time assessment. In such instances, IRO -008-1 R3 should be split into two separate requirements, one dealing with Operational Planning Analysis, for which the VRF would be Medium and the other, addressing real time assessment for which the VRF would be High. For IRO-007-1 R2, the VRF should be Medium since not adopting the most conservative value for IROL or its Tv would not result in cascading outages. For IRO-010-1 Requirement R2, the VRF should be Low since it is an administrative item, and all that is needed is that the RC receives the status information.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: Mitigation Time Horizons are described near the top of this comment form.

The description of the Mitigation Time Horizons states: The ERO Rules of Procedure include the use of mitigation time horizons as one element used to determine the size of sanctions.

Can the drafting team inform the Registered Ballot Body where the ERO definition of Mitigation Time Horizons can be found along with documentation describing how the mitigation time horizons will be used in determining penalties. Mitigation Time Horizons are not listed as a Performance Element of a Reliability Standard in the Reliability Standards Development Procedure Version 6 adopted by the NERC BOT on November 1, 2006. As such, it does not seem appropriate to include them in any Reliability Standards.

The comment form description of Mitigation Time Horizons further states The drafting team used the following guidelines in developing mitigation time horizons for each requirement, whereas the final statement in the description of the Violation Risk Factors states The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure. Like the Violation Risk Factors, the categories of Mitigation Time Horizons should also be approved and incorporated into the Reliability Standards Development Procedure in order to ensure that the definitions are consistent for all NERC Reliability Standards.

## Comment Form — IROL Standards

---

The MRO cannot vote to approve a standard that includes Mitigation Time Horizons until the drafting team can produce ERO documented definitions and the documented manner in which the Mitigation Time Horizons will be used to determine penalties.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include “violation severity levels” rather than “levels of non-compliance.” “Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: The way the Violation Severity levels are spelled out, it again appears to be arbitrary cut offs, and especially the High and Severe Violation Severity Levels have to be tightly defined so that the entities would know what actions to take to be compliant.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

Comments:

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

## Comment Form — IROL Standards

---

I do not agree with the following conforming changes:

Comments: The MRO agrees with the SDT in striking the first part of IRO-005-2 since it is already covered in FAC-014-R5.1. However, the MRO does not agree with the proposed revision to the second part that states: The Transmission Service Providers shall respect SOLs and IROLs in accordance with filed tariffs..... Since the RC may not know all SOLs and IROLs, it is not possible for the RC to make the TSP aware of what the RC itself does not know. The MRO recommends the SDT amend the proposed revision to state: The Transmission Service Provider shall respect all KNOWN SOLs and IROLs in accordance with.....

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

**Comment Form — IROL Standards**

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: The MRO reviewed the implementation plan and it is clear that IRO-010-1 gives the flexibility to specify the data requirements in R1 and the requirement that the functional entities follow them in R3.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning

## Comment Form — IROL Standards

---

	- Retire R4, R5
IRO-005-2 — RC – Current Day Operations	- Retire R2
TOP-003-0 — Planned Outage Coordination Modify R1.2	
TOP-005-1 — Operational Reliability Information	- Retire R1, R1.1; Convert Attachment A to a Reference
TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control	- Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: The MRO requests clarification as to why the following two definitions were added in IRO-009-1 and never used: Interconnection Reliability Operating Limit Event, and Interconnection Reliability Operating Limit Event Duration. If terms are specifically added to a standard, it is expected that the terms will be used in the standard. If the new terms are not to be used in the standard where they are originally defined, it would appear that the new terms are not needed and should be struck from the standard until a such time that they are to be used.

The MRO requests the definition of the term Delay, as it is used in in IRO-009-1-R4. Is the RC considered in violation if it does not act with in one minute? If it does not act with in two-minutes. Leaving this term undefined will result in arbitrary enforcement of this standard

**Comment Form — IROL Standards**

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

**6. Added 'Associated Documents' where applicable**

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: IRO-009-1 Violation Severity Level 2.3.2 should read as follows "... delay of 5 minutes or greater before acting or directing ..."

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

## Comment Form — IROL Standards

---

Comments:

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: The revised IRO-005 requirement 10 (formerly Requirement 13) should be moved to TOP-004 Transmission Operations since it now only pertains to Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities.

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: IRO-005-2 Requirement 9 does not appear to be marked for deletion as proposed above in the files provided with this posting.

**Comment Form — IROL Standards**

---

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2

**Comment Form — IROL Standards**

---

	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments: IRO-007-1 R1: VRF should be high not medium.

IRO-008-1 R1: VRF should be high not medium.

IRO-008-1 R3: VRF should be high not medium.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: IRO-008-1 R3: MTH should be: same day operations; real-time operations.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: IRO-008-1: Change the Moderate Violation Severity Level to: Not Applicable

IRO-008-1: Add to the High Violation Severity Level: Shared the results with some but not all of the entities that were required to take action.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause

## Comment Form — IROL Standards

---

of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: Exempting Reliability Coordinators from all SOLs is inappropriate. Most of the TLRs that the Reliability Coordinators call today are for relieving SOLs not IROLs, therefore, exempting them from knowing and taking action on those SOLs is in direct conflict with current practices and does not improve the reliability practices from what we have today. At a minimum, Reliability Coordinators need to monitor and know the EHV system SOLs and ensure operation within those SOLs and to monitor and operate to other SOLs as specified in the agreements between the RC and TOPS and BA (see ORG-021-1 R3).

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: We agree with the development of IRO-007-1. We don't agree to retiring IRO-002-1 R6, IRO-003-2 R1, IRO-003-2 R2, TOP-006-1 R2 if the Reliability Coordinator Operational Analysis and Real-Time Assessment standard (IRO-008-1) does not require the Balancing Authority to monitor and take action for an agreed upon set of SOLs as discussed in response to question 8.

IRO-005-2 R1.1-R1.10 sets a minimum threshold (and clearly states it is not an exhaustive list) of requirements for all Reliability Coordinators to monitor. We feel that these requirements if moved should be included in IRO-008-1 rather than IRO-007-1 R1. Furthermore IRO-007-1 R1 and IRO-008-1 is too vague and does not set a minimum set of requirements as a baseline. If IRO-005-2 R1.1-R1.10 is retired we suggest that the associated requirements are put into the appropriate standard as follows "Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:

Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.

## Comment Form — IROL Standards

---

Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.

Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.

System real and reactive reserves (actual versus required).

Capacity and energy adequacy conditions.

Current ACE for all its Balancing Authorities.

Current local or Transmission Loading Relief procedures in effect.

Planned generation dispatches.

Planned transmission or generation outages.

Contingency events."

We fail to see how this is an improvement from how things are today. The technical reference document has yet to be created therefore leaving a gap in visibility of responsibility and accountability.

IRO-005-2 R13 should not remove the Reliability Coordinator from the list of parties that need to operate the Bulk Electric system to the most limiting parameter.

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: We don't agree to retiring IRO-004-1 R1 if IRO-008-1 R1 does not require the Balancing Authorities to monitor and taking action based on an agreed upon set of SOL as discussed in response to question 8.

Furthermore IRO-008-1 R1 is too vague and does not set a minimum set of analysis or data requirements as a baseline. We fail to see how this is an improvement from how things are today.

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6

## Comment Form — IROL Standards

---

- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: EOP-001-0 R2 should not be retired because Transmission Operators still need to have an emergency load reduction plan for all identified IROLs. We do agree that this plan needs to be coordinated with the plan(s) for the Reliability Coordinator referenced in proposed requirement IRO-009-1 R1. The Reliability Coordinator will need to make the determination whether or not load needs to be dropped to relieve an IROL, but based on the plan determination of what loads and required actions to drop that load needs to be developed and carried out by the Transmission Operator.

IRO-004-1 Should not be removed. The comment in the Implementation Plan notes (page 8) "under some conditions, the Reliability Coordinator may not have time to 'coordinate' the development of these plans with all of its transmission Operators and Balancing Authorities. IRO-004-1 is, by definition of the standard, for activities that were a day ahead or more in their performance and did not deal with any current day analysis. Therefore, the rationale of not having time to coordinate is not valid.

To address our concerns with the retirement of some of the existing requirements, IRO-009-1 R1 & R3 needs to be modified to say each IROL "or each EHV SOL" for each reference of IROL in the requirements.

We understand that IRO-005-2 R9 is to be modified not retired as stated in the comment form. We concur with the modification, but do not agree with retirement of this requirement.

IRO-005-2 R13 should not be modified as drafted since IRO-008 R1 does not require the Balancing Authority to monitor and taking action for an agreed upon set of SOL as discussed in response to question 8. IRO-005-2 R13 should be reworded to ensure that Reliability Coordinators, Balancing Authorities and Transmission Operators operate to the agreed upon SOLs per the agreements.

IRO-005-2 R14 we agree with the comments in the implementation plan, but the red-lined version does not agree with the recommended changes in the implementation plan.

IRO-005-2 R16 & R17 we can agree to retire these requirements to the extent that IRO-008 is modified with the changes we have stated.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2

## Comment Form — IROL Standards

---

- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: While we agree with limiting the cross references in the standards, we don't agree with changes to IRO-010-1 and the modifications/retirement of many existing standards/requirements.

For example, we disagree with the modification to IRO-010-1 R1.3 allowing the Reliability Coordinator specifying the reporting time frame opposed to a universal time reporting period. We support the timing requirement that is currently in place in IRO-004-1 R4.

IRO-010-1 needs to require the Reliability Coordinator to share the results of its system studies with other entities as required in IRO-004-1 R5.

IRO-008-1 R3 is also not adequate for this purpose as it only requires the Reliability Coordinator to share results of studies that indicate the possibility of exceeding the limits of an IROL. The Reliability Coordinator needs to perform studies and if EHV SOLs have the potential of being violated, the Reliability Coordinator needs to share these results with the Transmission Operators and Balancing Authorities.

TOP-003-0 R1.2 we feel that is a mistake to remove the Reliability Coordinator from a standard labeled "Planned Outage Coordination".

Retiring TOP-005-1 R1 & R1.1 is acceptable

TOP-006-1 R2 we do not agree with the changes. IRO-007-1 only referenced IROL monitoring not the monitoring of EHV SOL.

TOP-006-1 R4 there is no point in removing the Reliability Coordinator from this requirement rather than implying it.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of

**Comment Form — IROL Standards**

standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

## Comment Form — IROL Standards

---

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: We believe that this draft has significantly diluted the responsibilities of the Reliability Coordinator in the operation planning and real-time horizons. The proposed standards/requirements are completely off track with where they were before. As was mentioned in number 8 of the comment form, this draft seems to be heavily focused on monitoring IROLs, which is one of many of their responsibilities, but not their only responsibility.

The IROL Standard Drafting Team thanks all commenters who submitted comments on the seventh draft of the IROL Standards. The drafting team extends its thanks and gratitude to the commenters. This has been a complex effort for the industry. Your comments have added clarity and improved the consistency of the output of this team. The set of standards addressed includes the following:

- IRO-007-1 — Monitoring the Reliability Coordinator Wide Area
- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010-1 — Reliability Coordinator Data Specification and Collection

These standards were posted for a 45-day public comment period from January 2 through February 15, 2007. The IROL Standard Drafting Team (IROL SDT) and the Compliance Elements Drafting Team (CEDT) working on this set of standards asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 15 sets of comments, including comments from more than 59 different people from more than 39 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

The IROL SDT and the CEDT working on this set of standards considered the comments submitted, and made the following conforming changes:

- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
  - Modified the Time Horizon for R3 to include **both** Real-time Operations and Same-day Operations.
    - R3 requires the Reliability Coordinator, under certain conditions, to share the results of some of its Operational Planning Analyses and Real-Time Assessments with those entities that are expected to take those actions.
    - The Time Horizon had been 'Same Day Operations' which is defined as, 'routine actions required within the timeframe of a day, but not real-time.' The addition of the 'Real-time Operations' Time Horizon, which is defined as, 'actions required within one hour or less to preserve the reliability of the bulk electric system' is an improvement since it reflects that the Reliability Coordinator may need to act very quickly, in 'real-time' to share this information.
- IRO-009-1 — Reliability Coordinator Actions to Operate Within IROLs
  - Deleted the definitions for the two terms that are no longer used in the standards
    - Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration
  - Modified the Time Horizon for R1 to include **both** Operations Planning or Same Day Operations
    - R1 requires that the Reliability Coordinator have Operating Processes, Procedures, or Plans for each IROL that is identified in advance of Real-time to prevent exceeding the IROL.
    - The Time Horizon had been 'Operations Planning' which is defined as, 'operating and resource plans from day-ahead up to and including seasonal'. The addition of the 'Same Day Operations' Time Horizon, which is defined as, 'routine actions required within the timeframe of a day, but not real-time' is an improvement since it reflects that the Reliability Coordinator may need to develop some of these action plans the same day the potential IROL is identified.

- Modified the Time Horizon for R2 to include **both** Operations Planning or Same Day Operations
  - R2 requires that the Reliability Coordinator have Operating Processes, Procedures, or Plans for each IROL that is identified in advance of Real-time to mitigate an instance of exceeding the IROL within that IROL's T<sub>v</sub>.
  - The Time Horizon had been 'Operations Planning' which is defined as, 'operating and resource plans from day-ahead up to and including seasonal'. The addition of the 'Same Day Operations' Time Horizon, which is defined as, 'routine actions required within the timeframe of a day, but not real-time' is an improvement since it reflects that the Reliability Coordinator may need to develop some of these action plans the same day the potential IROL is identified.
- Modified the violation severity level for R1 to omit the use of percentages and to show that violation of any of these requirements is 'Severe'
- IRO-010-1
  - Modified the Violation Risk Factor for R1 and R2 from 'Medium' to 'Low'
  - R1 and R2 require the Reliability Coordinator to have and distribute a specification for the reliability-related data it needs and a failure to accomplish these tasks wouldn't necessarily have an impact on the bulk electric system and are more appropriately labeled as 'Low'.
  - Corrected the perceived gaps in the percentages used for violation severity levels by adding the phrase, 'greater than or equal to' so that rather than saying '95% to 99%' the revised language says, 'greater than or equal to 95% but less than 100%'.
- IRO-005-3
  - Modified R12 by deleting the parenthetical reference to SOL to clarify that the Reliability Coordinator is not assigned primary responsibility for responding to SOLs. R12 now states:
    - Each Reliability Coordinator who foresees a transmission problem (such as an ~~SOL~~ IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay.

Based on the comments received and the conforming changes made based on those comments, the drafting team is recommending that the Standards Committee authorize moving the standards forward to ballot.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

<http://www.nerc.com/~filez/standards/Relay-Loadability.html>

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at

609-452-8060 or at [gerry.adamski@nerc.net](mailto:gerry.adamski@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedures: <http://www.nerc.com/standards/newstandardsprocess.html>.

**Consideration of Comments on Draft 7 of the IROL Standards**

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

**Index to Questions, Comments and Responses:**

1. The drafting team consolidated the requirements for IRO-010— Reliability Coordinator Data Specification and Collection and IRO-011— Providing Data to the Reliability Coordinator into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain. .... 9

2. The drafting team consolidated the requirements for IRO-009 — Reliability Coordinator Actions to Operate within IROLs and IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain..... 10

3. The drafting team recommends moving the requirements from IRO-013 —Reliability Coordinator Directives Relative to IROLs into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single Project 2007-02 – Operating Personnel Communication Protocols. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain..... 12

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain. .... 15

5. The Drafting Team added a Violation Risk Factor for each requirement. Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect. .... 17

6. The Drafting Team added a Mitigation Time Horizon for each requirement. Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect..... 21

7. The latest version of the Reliability Standards Development Procedure Manual requires that each standard include ‘violation severity levels’ rather than ‘levels of non-compliance’. ‘Violation severity levels’ identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the ‘Violation Risk Factor’ appended to each requirement.) Note that these severity levels are ‘guidelines’ and variations from the above categories are acceptable. .... 25

Do you agree with the Violation Severity Levels for each of the proposed standards? If you disagree with any of the Violation Severity Levels for the proposed standards, please identify the standard and requirement you feel has an incorrect Violation Severity Level. .... 25

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits – yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with ..... 29

9. The Drafting Team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards: ..... 34

IRO-002-1 — RC – Facilities; Retire R6 ..... 34

IRO-003-2 — RC – Wide Area View; Retire R1 and R2..... 34

IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 ..... 34

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2 ..... 34

**Consideration of Comments on Draft 7 of the IROL Standards**

---

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect. .... 34

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard: ..... 40

IRO-004-1 — RC – Operations Planning; Retire R1 and R2..... 40

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect. .... 40

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards: ..... 42

EOP-001-0 — Emergency Operations Planning; Retire R2 ..... 42

IRO-004-1 — RC – Operations Planning; Retire R3 and R6..... 42

IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17 ..... 42

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect. .... 42

12. The Drafting Team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards: ..... 51

IRO-002-1 — RC – Facilities; Retire R2 ..... 51

IRO-004-1 — RC – Operations Planning; Retire R4, R5..... 51

IRO-005-2 — RC – Current Day Operations; Retire R2 ..... 51

TOP-003-0 — Planned Outage Coordination; Modify R1.2..... 51

TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference ..... 51

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4 ..... 51

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect. .... 51

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here. .... 54

14. The drafting team is recommending that these standards be balloted with four separate ballots, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc. .... 55

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here. .... 57

1. The drafting team consolidated the requirements for IRO-010— Reliability Coordinator Data Specification and Collection and IRO-011— Providing Data to the Reliability Coordinator into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

**Summary Consideration:** All commenters agreed with consolidating the requirements in IRO-010 and IRO-011.

Question #1			
Commenter	Yes	No	Comment
MRO	x		This is a step in the right direction, and the revised IRO-010-1 captures the relevant information related to data collection as reflected in R1.1, R1.3, R1.4, R3. A fewer number of standards to deal with is always better.
ATC	x		ATC agrees with the decision to combine standards IRO-010 and IRO-011 into a single standard.

2. The drafting team consolidated the requirements for IRO-009 — Reliability Coordinator Actions to Operate within IROLs and IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

**Summary Consideration:** All commenters agreed with consolidating the requirements in IRO-009 and IRO-012.

Question #2			
Commenter	Yes	No	Comment
MRO	x		While the description of requirements captures the essence of preventing and mitigating IROLs, it would be helpful for clarity to change the title of the revised IRO-009-1 to Reliability Coordinator actions to operate within IROLs and plans to prevent/mitigate IROLs.
<b>Response:</b> The drafting team struggled with the exact title necessary for this standard, but in the end felt that keeping the current as posted title will better assist the industry in comprehending the scope of the requirements. The development of plans is one of the Reliability Coordinator’s actions to operate within IROLs.			
Manitoba Hydro	x		MH endorses the MRO comments: While the description of requirements captures the essence of preventing and mitigating IROLs, it would be helpful for clarity to change the title of the revised IRO-009-1 to Reliability Coordinator actions to operate within IROLs and plans to prevent/mitigate IROLs.
<b>Response:</b> The drafting team struggled with the exact title necessary for this standard, but in the end felt that keeping the current as posted title will better assist the industry in comprehending the scope of the requirements. The development of plans is one of the Reliability Coordinator’s actions to operate within IROLs.

**Consideration of Comments on Draft 7 of the IROL Standards**

---

<b>Question #2</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
ISO-NE	x		
Hydro-Québec TransÉnergie	x		
MISO SSC	x		

- The drafting team recommends moving the requirements from IRO-013 —Reliability Coordinator Directives Relative to IROLs into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single Project 2007-02 – Operating Personnel Communication Protocols. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

**Summary Consideration:** Several commenters indicated that the description of Project 2007-02 should have been posted for review with the comment form. A full description of the Reliability Standards Work Plan 2007-2009 can be downloaded from the following site: [ftp://www.nerc.com/pub/sys/all\\_updl/standards/sar/FERC\\_Filing\\_Volumes\\_I-II-III\\_Reliability\\_Standards\\_Development\\_Plan\\_30Nov06.pdf](ftp://www.nerc.com/pub/sys/all_updl/standards/sar/FERC_Filing_Volumes_I-II-III_Reliability_Standards_Development_Plan_30Nov06.pdf)

The work plan includes a description of the project that will address communications protocols. The brief description (see page 114 of the work plan) of Project 2007-02 states:

This is a new project that was identified in support of a blackout recommendation #26. This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers.

Question #3			
Commenter	Yes	No	Comment
MRO		x	Project 2007-02 should have been included with this package for us to consider. The MRO is also concerned that there is a general trend to develop too many requirements and measures, which would become administratively burdensome to the ERO and the entities that must comply.
<b>Response:</b> Agreed. The project is described in the Long-range Plan for Development of Standards. The intent of the Operating Personnel Communication Protocols project is to eliminate redundant requirements, and to define a set of communication protocols for real-time use to improve situational awareness and reduce response time.			
MISO SSC		x	The project in question should have been posted with the package. The quality of responses to this item will likely be impaired as many will not have reviewed the intent of the plan.  We agree that clear communications are important and should be part of an operators overall training program. We have some concern about developing measures for the sake of having measures, particularly when they appear to require significant administration to track.
<b>Response:</b> Agreed. The project is described in the Long-range Plan for Development of Standards.			

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #3</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
Southern Co		x	It appears that R1 of IRO-013 would be more appropriately contained in the IRO standards. R1 of IRO-013 states: The BA, IA, and TOP shall each follow its RC's directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances the BA, IA or TOP shall immediately inform the RC of its inability to perform the directive so that the RC can implement alternate remedial actions. The directives covered by this requirement shall be those that:  R1.1. Prevent instances of exceeding interconnection reliability operating limits (IROLs). R1.2. Mitigate the magnitude and duration of instances of exceeding IROLs.
<b>Response:</b> Standard IRO-001-1 Requirement 8 has a requirement that mandates that Transmission Operators, Balancing Authorities, Generator Operators Transmission Service Providers Load-serving Entities and Purchasing-selling Entities comply with Reliability Coordinator directives. Including the requirement in both standards would be redundant.			
Manitoba Hydro		x	MH endorses MRO comments: Project 2007-02 should have been included with this package for us to consider. The MRO is also concerned that there is a general trend to develop too many requirements and measures, which would become administratively burdensome to the ERO and the entities that must comply.
<b>Response:</b> Agreed. The project is described in the Long-range Plan for Development of Standards.			
TVA		x	Since IRO-013 is not approved, then IRO-004-1 R7 should not be deleted until replaced. The redlined IRO-004-2 shows the entire standard to be retired.
<b>Response:</b> Standard IRO-001-1 Requirement 8 has a requirement that mandates that Transmission Operators, Balancing Authorities, Generator Operators Transmission Service Providers Load-serving Entities and Purchasing-selling Entities comply with Reliability Coordinator directives. This requirement does not have any limits on the time frame within which the Reliability Coordinator's directives must be followed – therefore IRO-004 R7 is redundant. Good observation.

**Consideration of Comments on Draft 7 of the IROL Standards**

---

<b>Question #3</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
Hydro-Québec TransÉnergie	x		

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

**Summary Consideration:** Most commenters supported the proposed effective dates and these were not changed.

Question #4			
Commenter	Yes	No	Comment
MRO		x	It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.
<b>Response:</b> The three month window was proposed specifically for this set of standards by the drafting team – each drafting team proposes a unique implementation plan. This set of standards does not require any equipment installation.			
ATC		x	ATC believes that all standards and conforming changes should become effective the first day of the first quarter, six months after regulatory approvals.
<b>Response:</b> Some requirements in some other standards may require the acquisition and installation of equipment that isn't feasible in a six month time period.			
Southern Co		x	Does regulatory approvals only include FERC or does it also include the NERC Board?  A standard approved by the NERC Board, for example, on September 30 <sup>th</sup> would be implemented on January 1, which is too soon to prepare for. It might also be too soon even if it meant only FERC, since the NERC Board could approve September 29 <sup>th</sup> followed by FERC approval on September 30 <sup>th</sup> . In these instances, 6 months might be more appropriate.
<b>Response:</b> The NERC Board is not a regulatory agency, however only standards that have been approved by their ballot pool and by the NERC Board will be submitted to FERC and Canadian regulatory authorities. If a standard were approved by the NERC Board on September 30 <sup>th</sup> , the standard would be submitted to FERC and the Canadian regulatory authorities within a couple weeks (by mid October), and FERC and the Canadian regulatory authorities would take about 2 or 3 months to determine whether to approve the standards (by mid Jan)– and then the standard would become effective on the first calendar day of the first quarter 3 months after that – (the first day of the first quarter 3 months after mid Jan would be July 1). So – with the proposed implementation plan, the standards wouldn't become enforceable for almost a year after being approved by their Ballot Pool.			

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #4</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
MISO SSC		x	Since the drafting team is not yet formed and has not seen the final product, it is premature to set a short implementation date.
<p><b>Response:</b> We assume your comment is in response to the nomination form that was posted asking for additional members of the IROL Standard Drafting Team. This set of standards has been developed by the existing IROL Standard Drafting Team that has been in place for several years. While there was a posting asking for nominations for the IROL Standard Drafting Team, the posting was 'adding' members to the existing drafting team, not to develop a totally new drafting team.</p>			
Manitoba Hydro		x	MH endorses MRO comments: It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.
<p><b>Response:</b> The three month window was proposed specifically for this set of standards by the drafting team – each drafting team proposes a unique implementation plan. This set of standards does not require any equipment installation.</p>

Hydro-Québec TransÉnergie	x		

5. The Drafting Team added a Violation Risk Factor for each requirement. Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

**Summary Consideration:** While most of the Violation Risk Factors were acceptable to most commenters, the drafting team did modify violation risk factor associated with IRO-010-1 R2. None of the other proposed changes were supported by the drafting team because they did not match the definitions provided for distinguishing between High, Medium and Lower Violation Risk Factors.

Question #5			
Commenter	Yes	No	Comment
MRO		x	<p>For many requirements, the VRFs are overstated. ERO has not given correct directives on how to assign VRFs. In addition, one cannot assign a single VRF for a requirement such as IRO-008-1 R3 that covers both Operational Planning Analysis, and real time assessment. In such instances, IRO -008-1 R3 should be split into two separate requirements, one dealing with Operational Planning Analysis, for which the VRF would be Medium and the other, addressing real time assessment for which the VRF would be High.</p> <p>For IRO-007-1 R2, the VRF should be Medium since not adopting the most conservative value for IROL or its Tv would not result in cascading outages.</p> <p>For IRO-010-1 Requirement R2, the VRF should be Low since it is an administrative item, and all that is needed is that the RC receives the status information.</p>
<p><b>Response:</b> Under the current, in-effect version of the Reliability Standards Development Procedure, drafting teams are assigned the responsibility of developing Violation Risk Factors using the definitions of High Medium and Lower Violation Risk Factors that were provided in the manual.</p> <p>The intent of IRO-008-1 R3 is to share the results – and the reliability-related impact to the interconnection is the same whether the results are from the Real-Time Assessment or the Operational Planning Analysis. This requirement doesn't concern taking actions to mitigate or prevent exceeding an IROL.</p> <p>Most commenters agreed with the rating for IRO-007-1 R2. The failure to respect what may be the accurate value of IROL or the IROL Tv could result in exceeding an IROL and the definition of an IROL is: A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading Outages that adversely impact the reliability of the Bulk Electric System. The High rating is correct.</p> <p>The rating for IRO-010 R2 was modified to 'Lower' as suggested.</p>			
Southern Co	x	x	<p>Since the VRFs are being addressed through other ballots or procedures, and by the fact that this standard drafting team has no control over the VRFs, this question may be of no value to Industry.</p>
<p><b>Response:</b> Under the current, in-effect version of the Reliability Standards Development Procedure, drafting teams are</p>			

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #5</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
assigned the responsibility of developing Violation Risk Factors as the standard is developed. Until the process is formally modified, drafting teams will develop these VRFs and will collect stakeholder feedback on those VRFs.			
IRC Standards Review Committee NPCC CP9 ISO-NE Hydro-Québec TransÉnergie		x	(i) We agree with the VRFs for IRO-008, IRO-009 and IRO-010.  (ii) For IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to unreliable operation.
<b>Response:</b> Making the distinction between High and Medium is a challenge – however failure to monitor does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures. Flows in excess of limits and voltages outside limits can cause bulk power system instability, separation, or a cascading sequence of failures. Monitoring does not preclude the requirement to assess the system to determine whether you have a stable system. The drafting team agrees that monitoring is of ‘high’ importance – but the VRFs are based on impact to the interconnected system, not on the importance of the activity. Monitoring is a supporting task that is essential to operating within IROLs – but the most critical requirements in this set are the requirements that address preventing or mitigating instances of exceeding IROLs.			
IESO		x	(i) We agree with the VRFs for IRO-008 and -010.  (ii) For IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to potential unreliable operation.  (iii) For IRO-009, the VRFs for R1 and R2 should both be HIGH. The absence of pre-determined control actions that need to be made available to operation personnel to prevent and mitigate IROL violation can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (b), above.
<b>Response:</b> Making the distinction between High and Medium is a challenge – however failure to monitor does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures. Flows in excess of limits and voltages outside limits can cause bulk power system instability, separation, or a cascading sequence of failures. Monitoring does not preclude the requirement to assess the system to determine whether you have a stable system. <p>the activity. Monitoring is a supporting task that is essential to operating within IROLs – but the most critical requirements in this set are the requirements that address preventing or mitigating instances of exceeding IROLs.</p> <p>Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.</p>													
MISO SSC		x	<p>We strongly disagree with the violation severity levels of attribute (yes/no go/no-go) requirements being arbitrarily placed in the Severe category. This places late reports in the same category as failure to correct an IROL. We don't treat jaywalking the same as grand theft. The sanctions matrix needs to be changed to have another level for attribute requirements. The sanctions need to be based on impact to reliability.</p> <p>We also disagree with the default approach to assigning severity levels to scalable standards (only 5% in the Low area, 70% of observations in the Severe category). This is the equivalent as applying the following highway speeding rules to cars that have a typical top end of 100MPH:</p> <table border="0"> <tr> <td>65 MPH or less</td> <td>Pass</td> </tr> <tr> <td>66 MPH</td> <td>Low</td> </tr> <tr> <td>67-69 MPH</td> <td>Moderate</td> </tr> <tr> <td>70-74 MPH</td> <td>High</td> </tr> <tr> <td>75-100 MPH or higher</td> <td>Severe</td> </tr> </table> <p>Scalable standards should be assigned severity levels that approach quartiles of the observed or expected range of performance.</p> <p>This approach to assigning violation severity levels to attribute and scalable requirements doesn't appear to have been presented for official comment in any stakeholder forum.</p>	65 MPH or less	Pass	66 MPH	Low	67-69 MPH	Moderate	70-74 MPH	High	75-100 MPH or higher	Severe
65 MPH or less	Pass												
66 MPH	Low												
67-69 MPH	Moderate												
70-74 MPH	High												
75-100 MPH or higher	Severe												
<p><b>Response:</b> We will share your recommendations with the Standards Committee but making changes to these guidelines is outside the control of the drafting team.</p> <p>The drafting team put great deliberation into the proposed VRFs.</p> <p>Violation Severity Levels are not the same as Violation Risk Factors. Violation Severity Levels measure the degree to which the entity 'missed' full compliance and is not a measure of the associated risk to reliability. Violation Risk Factors assess the reliability-related impact of violating a requirement.</p>													
Manitoba Hydro		x	<p>MH endorses MRO comments: It is difficult to prescribe one time window such as, three months after regulatory approvals. Different Standards might require different implementation times to allow the responsible entities to become fully compliant. For example, for those Standards that require equipment installation, it would take more than 3 months to satisfy the compliance requirements. Moreover, the Standards</p>										

Consideration of Comments on Draft 7 of the IROL Standards

Question #5			
Commenter	Yes	No	Comment
			drafting team is the appropriate body to stipulate how much time is needed after regulatory approvals to become compliant.
<b>Response:</b> These comments appear to be in response to question 4 and were addressed there.			
Entergy		x	<p>IRO-008-1 R3 has two conditions: one the results of an Operational Planning Analysis, and one the results of a Real-Time Assessment. The Violation Risk Factor should be different for each of these two conditions. The VRF for the results of an Operational Planning Analysis should be MEDIUM, while the VRF for the results of a Real-Time Assessment should be HIGH.</p> <p>IRO-010-1 R1 requires the development of a documented specification for data and information while R2 requires distribution of that specification. Both R1 and R2 have VRFs of Medium. We suggest these two requirements be changed to LOWER. The development and distribution of a data specification is not a High or Medium risk factor.</p>
<b>Response:</b> The intent of IRO-009-1 R3 is to share the results – and the reliability-related impact to the interconnection is the same whether the results are from the Real-Time Assessment or the Operational Planning Analysis. This requirement doesn't concern taking actions to mitigate or prevent exceeding an IROL.			
For IRO-010-1 R2, the drafting team deliberated between Medium and Low and changed the rating to Low as you suggested.

6. The Drafting Team added a Mitigation Time Horizon for each requirement. Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

**Summary Consideration:** Many commenters indicated a lack of familiarity with 'mitigation time horizons'. These were introduced in the ERO Rules of Procedure as one of the elements used to determine the size of a sanction. Requirements that must be mitigated in real-time operations would have a larger sanction than those that could be mitigated over a longer time period. The comment form provided a list of possible mitigation time horizons. The latest version of the Reliability Standards Development Procedure did not include mitigation time horizons – this was an omission in bringing the manual into conformance with the latest ERO Rules of Procedure and this omission should be corrected with the next (normal) revision to the manual. In the meantime, stakeholders will be asked to comment on and approve time horizons as they are developed with standards. The alternative is to have these time horizons identified outside the standard development process, and stakeholders indicated they wanted a voice in the selection of all the compliance elements within standards. *(Note that the term, 'mitigation time horizons' was modified by the Standards Committee and is now called, 'time horizons'.)*

Most commenters supported the proposed time horizons. However, based on stakeholder comments the drafting team did modify three of the time horizons:

- IRO-008-1 R3 was revised to include both Real-time Operations and Same-day Operations
- IRO-009-1 R1 was revised to include both Operations Planning or Same Day Operations
- IRO-009-1 R2 was revised to include both Operations Planning or Same Day Operations

Question #6			
Commenter	Yes	No	Comment
MRO Manitoba Hydro		x	<p>Mitigation Time Horizons are described near the top of this comment form.</p> <p>The description of the Mitigation Time Horizons states: The ERO Rules of Procedure include the use of mitigation time horizons as one element used to determine the size of sanctions.</p> <p>Can the drafting team inform the Registered Ballot Body where the ERO definition of Mitigation Time Horizons can be found along with documentation describing how the mitigation time horizons will be used in determining penalties. Mitigation Time Horizons are not listed as a Performance Element of a Reliability Standard in the Reliability Standards Development Procedure Version 6 adopted by the NERC BOT on November 1, 2006. As such, it does not seem appropriate to include them in any Reliability Standards.</p> <p>The comment form description of Mitigation Time Horizons further states The drafting</p>

Consideration of Comments on Draft 7 of the IROL Standards

Question #6			
Commenter	Yes	No	Comment
			<p>team used the following guidelines in developing mitigation time horizons for each requirement, whereas the final statement in the description of the Violation Risk Factors states The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure. Like the Violation Risk Factors, the categories of Mitigation Time Horizons should also be approved and incorporated into the Reliability Standards Development Procedure in order to ensure that the definitions are consistent for all NERC Reliability Standards.</p> <p>The MRO cannot vote to approve a standard that includes Mitigation Time Horizons until the drafting team can produce ERO documented definitions and the documented manner in which the Mitigation Time Horizons will be used to determine penalties.</p>
<p><b>Response:</b> Time horizons were introduced in the ERO Rules of Procedure (Sanctions Guidelines) as one of the elements used to determine the size of a sanction. Requirements that must be mitigated in real-time operations would have a larger sanction than those that could be mitigated over a longer time period. The comment form provided a list of possible mitigation time horizons. The latest version of the Reliability Standards Development Procedure did not include mitigation time horizons – this was an omission in bringing the manual into conformance with the latest ERO Rules of Procedure and this omission should be corrected with the next (normal) revision to the manual. In the meantime, stakeholders will be asked to comment on and approve time horizons as they are developed with standards. The alternative is to have these time horizons identified outside the standard development process, and stakeholders indicated they wanted a voice in the selection of all the compliance elements within standards. The drafting team is obligated to use the definitions for time horizons that were posted with the comment form.</p>			
Southern Co		x	<p>The time horizon of Operations Planning related to Mitigation Time Horizons (day-ahead up to and including seasonal) is different from the time horizon used in the definition of IRO-008-1 Operational Planning Analysis (which is the next day's operation and up to 12 months ahead). Additionally, some utilities interpret Operations Planning as real time up to day ahead studies. This creates confusion with the term Operations Planning and Southern seeks clarification for the term.</p> <p>Secondly, since each requirement's time horizon appears to be contemplated within the standard itself and reflected in the assignment of the Violation Risk Factor and Violation Severity Level, Southern believes including this characteristic in the penalty adjustment process is not necessary. Therefore, we believe the Mitigation Time Horizons should NOT be a penalty adjustment factor in determining monetary penalties for non compliance.</p>
<p><b>Response:</b> The drafting team is obligated to use the definitions for time horizons that were posted with the comment form. The time horizons are part of the ERO Rules of Procedure (Sanctions Guidelines) and the drafting team cannot change these.</p>			

Consideration of Comments on Draft 7 of the IROL Standards

Question #6			
Commenter	Yes	No	Comment
Entergy		x	<p>IRO-008-1 R3 has two conditions: one the results of an Operational Planning Analysis, and one the results of a Real-Time Assessment. The Mitigation Time Horizon should be different for each of these two conditions. The MTH for the results of an Operational Planning Analysis should be Operations Planning, while the MTH for the results of a Real-Time Assessment should be Real-Time Operations.</p> <p>IRO-010-1 R1 requires the development of a documented specification for data and information while R2 requires distribution of that specification. Both R1 and R2 have MTHs of Operations Planning. We suggest these two requirements be changed to Long-term Planning. The development and distribution of a specification should be developed and distributed long before it is needed.</p>
<p><b>Response:</b> The drafting team adopted your suggestion as a technical improvement to the time horizons – the information is shared as you suggest in two different time horizons.</p> <p>For IRO-010-1 R1: The time horizon is the time frame in which a violation could be corrected – and the operations planning horizon is the correct time frame for R1. The data and information are expected to be used within a year of receipt.</p>			
IRC Standards Review Committee Pepeco Holdings, Inc. IESO NPCC CP9 ISO-NE Hydro-Québec TransÉnergie		x	<p>(i) We agree with the mitigation time horizons for IRO-007, -008 and -010.</p> <p>(ii) For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.</p>
<p><b>Response:</b> The drafting team modified the time horizons of IRO-009-1 R2 and R3 to include both same day and operations planning as suggested.</p>			
MISO SSC		x	<p>The meaning of Operations Assessment needs to be clarified. There is no indication of the relative impacts the drafting team considered for each mitigation time horizon. I would assume that a violation of a standard in the Real-Time Operations horizon would be considered worst than a violation in the Operations Planning Horizon. If this is the case, the standard needs to specify this. How does the team see Operations Assessment horizon fitting in?</p>
<p><b>Response:</b> The 'operations assessment' time horizon is looking at the 'post operations' time frame. The drafting team looked at each requirement and tried to identify the timeframe available to mitigate a violation. According</p>

<b>Question #6</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			to the sanctions guidelines, the violation of a requirement with a real-time operations horizon would be subject to a larger fine than the violation of a requirement with an operations planning horizon. The ERO Rules of Procedure include information on how sanctions will be calculated.
First Energy Corp	x		
TVA	x		
PSC of SC	x		

7. The latest version of the Reliability Standards Development Procedure Manual requires that each standard include ‘violation severity levels’ rather than ‘levels of non-compliance’. ‘Violation severity levels’ identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the ‘Violation Risk Factor’ appended to each requirement.) Note that these severity levels are ‘guidelines’ and variations from the above categories are acceptable.

Do you agree with the Violation Severity Levels for each of the proposed standards? If you disagree with any of the Violation Severity Levels for the proposed standards, please identify the standard and requirement you feel has an incorrect Violation Severity Level.

**Summary Consideration: (This question was asked by the Compliance Elements Drafting Team (CEDT) and the responses were provided by the CEDT)**

Many of the commenters agreed that the use of a percentage of how many identified IROLs had Operating Processes, Procedures, or Plans to prevent or mitigate the IROL seemed inappropriate when determining how severe a violation was. The drafting teams also agree there is no justifiable reason for a known IROL not to have Operating Processes, Procedures, or Plans to prevent or mitigate the IROL. Based on this, IRO-009 was modified so that if a Reliability Coordinator has any identified IROLs that do not have Operating Processes, Procedures, or Plans to prevent or mitigate the IROL, it will be a severe violation. Some commenters were concerned about the measurability of the term, ‘without delay’ and the CEDT modified the violation severity levels to allow some short period of time between the recognition that an IROL has been exceeded (an alarm) and the time that the Reliability Coordinator either takes a control action or issues a directive to others. As revised, if the Reliability Coordinator does not either take a control action or issue a directive 5 minutes after exceeding an IROL, that is a Severe violation. The 5 minutes is not intended as a ‘grace period’ in which the Reliability Coordinator can delay taking any action – the 5 minutes recognizes that the Reliability Coordinator may need a couple of minutes to collect data, and the data collection doesn’t necessarily result in actions that can be independently confirmed. Analyzing data from dynamic wall board displays, exchanging verbal information, scanning screen displays are typical methods of collecting data to assess the situation before taking a control action but don’t result in log entries or voice recordings that can be measured.

In addition, IRO-010 was modified to remove a perceived “gap” in the percentage ranges.

Question #7			
Commenter	Yes	No	Comment
MRO		x	The way the Violation Severity levels are spelled out, it again appears to be arbitrary cut offs, and especially the High and Severe Violation Severity Levels have to be tightly defined so that the entities would know what actions to take to be compliant.
<b>Response:</b> IRO-009 was modified to remove the percentage cutoffs. In addition, IRO-010 was modified to eliminate a			

Question #7			
Commenter	Yes	No	Comment
perceived "gap" in the percentage range. The percentages attempt to identify lower level violations up to severe level violations according to how much the entity missed the requirement.			
Entergy			The VSLs in IRO-009 and IRO-010 have gaps between the low end of LOW (e.g. 95%) and the high end of MODERATE (e.g. 94%) with a similar gap in other VSLs. Why is there this gap? If the argument is that the ranges are whole numbers then it may be OK. However, it seems there should not be a gap and we suggest closing those gaps by writing the VSL with - greater than and equal to - and - less than - specifications.
<b>Response:</b> IRO-009 was modified to remove the percentages. IRO-010 was modified to close the gaps with greater than and equal to – and – less than – specifications per your suggestion			
Southern Co		x	Let's say a Reliability Coordinator (RC) who performs admirably throughout the year has only one identifiable IROL for the year. However, due to one reason or another, the RC does not have a procedure in advance that identifies actions to prevent the instance from exceeding the IROL. This results in a SEVERE violation level.  Now, let's say a RC who does less than an admirable job throughout the year and has multiple (50) identifiable IROLs for the year. This RC is allowed approximately 8 instances of not having a procedure which identified actions to prevent exceeding the IROL, and this RC only achieves a MODERATE violation level. There needs to be some type of rewarding mitigation factor for those RCs who have very few identifiable IROLs.
<b>Response:</b> Agreed – every instance of failure to fully meet these requirements is severe.  There is no acceptable justification for identifying a limit that could cause instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection and not having a plan to either prevent or mitigate the IROL.			
Manitoba Hydro		x	endorses the MRO comments: The way the Violation Severity levels are spelled out, it again appears to be arbitrary cut offs, and especially the High and Severe Violation Severity Levels have to be tightly defined so that the entities would know what actions to take to be compliant.
<b>Response:</b> IRO-009 was modified to remove the percentage cutoffs. In addition, IRO-010 was modified to eliminate a perceived "gap" in the percentage range. The percentages attempt to identify lower level violations up to severe level violations according to how much the entity missed the requirement.			
ATC		x	Many of the requirements need to be clarified before we can determine the appropriateness of the violation severity levels.  See our comments under question 15.

Question #7			
Commenter	Yes	No	Comment
<p><b>Response:</b> The Compliance Elements Drafting Team believes the severity levels are correct as modified and do support the requirements.</p>			
<p>IRC Standards Review Committee Pepco Holdings, Inc. IESO NPCC CP9 ISO-NE Hydro-Québec TransÉnergie</p>		x	<p>(i) We agree with the violation severity levels for IRO-007 and IRO-008.</p> <p>(ii) For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?</p> <p>To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.</p> <p>Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times that, for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.</p> <p>(iii) For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).</p>
<p><b>Response:</b>                      (i) Thank you                      (ii) IRO-009 was modified to remove the percentages.                      (iii) IRO-010 was modified to close the gaps with greater than and equal to – and – less than – specifications, but kept the original percentages.</p>			

Consideration of Comments on Draft 7 of the IROL Standards

Question #7			
Commenter	Yes	No	Comment
First Energy Corp		x	IRO-009-1 Violation Severity Level 2.3.2 should read as follows "... delay of 5 minutes or greater before acting or directing ..."
<p><b>Response:</b> The Compliance Elements Drafting Team (CEDT) agrees that a time needs to be spelled out for delay, and also agrees that some time needs to be given so that the Reliability Coordinator can think through the plan and ensure that the actions they are implementing are correct and will not cause other issues in the system. However, this timeframe for delay can not be open ended lest someone try and claim that a failure to act until three hours had passed was simply a delay, and not a failure to take action. The CEDT believes that a 5 minute upper limit is appropriate in this case and has modified the standard accordingly.</p>			
MISO SSC		x	The compliance percentage leaves gaps from 94-95% and from 84-85%. What is the justification for these percentages?
<p><b>Response:</b> IRO-009 was modified to remove the percentages. IRO-010 was modified to close the gaps with greater than and equal to – and – less than – specifications.</p>			
TVA	x		
PSC of SC	x		

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits – yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

**Summary Consideration:** While several commenters disagree with this change, most of the comments provided indicate a misunderstanding of the intent of the proposed change. The intent of the change is not to remove the Reliability Coordinator’s accountability for responding to any SOLs but to clearly identify that the **primary** responsibility for resolving SOLs rests with the Transmission Operator. The Reliability Coordinator does not monitor all facilities in its area that are subject to SOLs, but the Reliability Coordinator does monitor some of the facilities within each Transmission Operator’s area. The Reliability Coordinator is expected to monitor the SOLs associated with facilities that are within each Transmission Operator’s area that have been identified as potentially becoming IROLs. If a Reliability Coordinator has data that shows there is an operating problem, the Reliability Coordinator is not obligated **under these standards** to take action – however the Reliability Coordinator’s obligation **under all conditions** is to take action to preserve the reliability of the interconnection.

Based on stakeholder comments, the drafting team did modify IRO-005-3 R12 by deleting the parenthetical reference to SOL.

Question #8			
Commenter	Yes	No	Comment
Entergy		x	We agree that the RC should not be held responsible to identify the cause of any actual or potential SOL for which he is not monitoring the information. However, if he is monitoring the parameters associated with a SOL he does have an obligation to act on that information and should be held accountable. Therefore, a blanket reprieve for not acting on known information is not acceptable.
<p><b>Response:</b> There is a Transmission Operator with responsibility for every SOL and the Transmission Operator is accountable for acting to resolve its SOLs.                      If a Reliability Coordinator has data that shows there is a problem, the Reliability Coordinator is not obligated under these standards to take action – however the Reliability Coordinator’s obligation is to take action to preserve the reliability of the interconnection.</p>			
Southern Co		x	One can never tell when an SOL will turn into an IROL. In fact, there may be several SOLs occurring at the same time which may turn into an IROL. What the drafting team is recommending in this standard is for the RC to no longer monitor or study SOLs even though NERC standards currently require them to. This seems contradictory to NERC’s goal of maintaining a reliable BES.

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #8</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			<p>Also, there are contradictory statements throughout the standard which require the RC to coordinate and communicate SOLs to the TSPs. However, according to the changes recommended in this standard, the RC will no longer be required to monitor SOLs. One such occurrence is in IRO-005-3, in which R11 states the RC shall make known to the TSPs in its wide-area view all SOLs and IROLs. How does the drafting team expect the RCs to make the TSPs aware of all SOLs when the RC is not expected to monitor or study the SOLs?</p> <p>Southern Co. Transmission recommends that the RC continue to monitor and study SOLs as the current standards require. The August 2003 Blackout resulted, in part, from the RCs not monitoring and studying SOLs within its wide-area view. To move away from this concept will make the BES more vulnerable to a possible future blackouts.</p>
<p><b>Response:</b>                      There is a Transmission Operator with responsibility for every SOL and the Transmission Operator is accountable for acting to resolve its SOLs. The Reliability Coordinator isn't required to monitor all facilities within each Transmission Operator's area that has an SOL. The Reliability Coordinator does monitor some but not all of the facilities within each Transmission Operator's area. The Reliability Coordinator is expected to monitor the SOLs associated with facilities that are within each Transmission Operator's area that have been identified as potentially becoming IROLs.</p> <p>Under FAC-014, the Reliability Coordinator is obligated to ensure that SOLs are developed according to the Reliability Coordinator's SOL Development Methodology. Under most cases, the Transmission Operator develops the SOLs and submits them to the Reliability Coordinator and then the Reliability Coordinator submits the applicable SOLs (and IROLs) to the Transmission Service Provider.</p>			
ATC		x	<p>ATC does not agree with the proposed modifications to existing NERC standards. It's our opinion that Reliability Coordinators should monitor both SOLs and IROLs within their area. The Reliability Coordinators provide an additional level of system oversight that ensures the reliable operations of the bulk power system. A strict interpretation by Reliability Coordinators would lead them to only monitor pre-determined IROLs and they would be unable to determine if an SOL becomes an IROL in real-time.</p> <p>ATC does not believe that the proposed changes to existing standards have anything to do with these standards. The proposed standards are not replacing the requirements in the existing standards but are only adding on new requirements that address IROLs. The SDT is overstepping the spirit of the IROL SAR and seems to be adjusting existing standards for some unexplained reason. If the SDT believes that these changes are appropriate then they should sponsor a SAR and allow for full industry participation.</p> <p>It's our opinion that the propose changes to existing standards will leave that bulk power</p>

Consideration of Comments on Draft 7 of the IROL Standards

Question #8			
Commenter	Yes	No	Comment
			<p>system in a less reliable state, and we ask that the SDT abandon this effort and move the proposed changes to a SAR. Once in a SAR the industry will be able to better exam the effects of the changes.</p> <p>Lastly ATC believes that changes in monitoring of SOL may impact the ability of Reliability Coordinators to call TLRs. If they are not required to monitor SOLs then identification will be the sole responsibility of Transmission Operators with no confirmation from RCs before a TLR is started.</p>
<p><b>Response:</b> There is a Transmission Operator with responsibility for every SOL and the Transmission Operator is accountable for acting to resolve its SOLs. The Reliability Coordinator isn't required to monitor all facilities within each Transmission Operator's area that has an SOL. The Reliability Coordinator does monitor some but not all of the facilities within each Transmission Operator's area. The Reliability Coordinator is expected to monitor the SOLs associated with facilities that are within each Transmission Operator's area that have been identified as potentially becoming IROLs. Nothing in these standards precludes the Reliability Coordinator from calling a TLR.</p>			
TVA		x	<p>FAC-011-1 R1 (which is effective 10/01/2007) requires the Reliability Coordinator to have a documented methodology for use in developing SOLs within its Reliability Coordinator Area.</p> <p>TOP-007-0 R4 requires the Reliability Coordinator to evaluate actions taken to resolve SOL violation, and if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits.</p> <p>Existing IRO-002-1 R5 and R8 (which still exist in the proposed IRO-002-2 as R4 and R6) require the Reliability Coordinator to have detailed real-time monitoring to ensure that potential or actual SOL violations are identified. These requirements require the Reliability Coordinator to be aware of all SOLs.</p> <p>We agree with the concept to clarify the accountabilities between the Transmission Operator and the Reliability Coordinator for real-time actions relative to SOLs, but it is inaccurate to state that the Reliability Coordinator is not required to see all SOLs. The Transmission Operator should be pro-active in mitigating SOL violations (real-time and calculated first contingency), in coordination with the Reliability Coordinator. The Reliability Coordinator must be aware of all SOL violations in order to direct action when needed to do so.</p>
<p><b>Response:</b> Although FAC-011-1 does require the Reliability Coordinator to have a methodology for developing SOLs, FAC-014-1 does not require the Reliability Coordinator to develop SOLs – FAC-014-1 R1 requires the Reliability Coordinator to 'ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL</p>			

Consideration of Comments on Draft 7 of the IROL Standards

Question #8			
Commenter	Yes	No	Comment
<p>Methodology. '</p> <p>TOP-007-0 R4 is referring to the SOLs identified in TOP-007-0 R1 which are identified by the Transmission Operator. TOP-007 R1 states, "R1. A Transmission Operator shall inform its Reliability Coordinator when an IROL or SOL has been exceeded and the actions being taken to return the system to within limits."</p> <p>TOP-007 R4 states, "R4. The Reliability Coordinator shall evaluate actions taken to address an IROL or SOL violation and, if the actions taken are not appropriate or sufficient, direct actions required to return the system to within limits."</p> <p>The drafting team did recommend in its implementation plan that IRO-002-1 R4 and R6 be retired to eliminate the confusion associated with assigning the same requirement to different functional entities.</p> <p>There is a Transmission Operator with responsibility for every SOL and the Transmission Operator is accountable for acting to resolve its SOLs. The Reliability Coordinator isn't required to monitor all facilities within each Transmission Operator's area that has an SOL. The Reliability Coordinator does monitor some but not all of the facilities within each Transmission Operator's area. The Reliability Coordinator is expected to monitor the SOLs associated with facilities that are within each Transmission Operator's area that have been identified as potentially having IROLs.</p> <p>Under TOP-007-0 R1, the Reliability Coordinator should be informed of actions the Transmission Operator has taken in response to exceeding its SOLs.</p>			
Manitoba Hydro	X		However, the drafting team should ensure that where the RC's accountability has been limited or removed regarding real-time actions relative to SOLs, the accountability of the appropriate entity, e.g. transmission operator is covered by or added to another standard. This will ensure no reliability gaps are created.
<p><b>Response:</b> The drafting team left in place the Transmission Operator's requirements for responding to SOLs to ensure that there is a clear accountability for resolving SOLs.</p>			
IRC Standards Review Committee Pepco Holdings, Inc. ISO-NE Hydro-Québec TransÉnergie NPCC CP9	X		There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when a SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.
<p><b>Response:</b> The drafting team found 4 instances in the subject standard where a requirement still references an 'SOL' in</p>

Question #8			
Commenter	Yes	No	Comment
<p>association with a Reliability Coordinator.                      For R6 – the requirement is for the Reliability Coordinator to coordinate with the Transmission Operator to resolve the SOL.                      For R9 – the objective of the requirement is clear, but the wording needs modification. The revision is outside the scope of the SAR assigned to this drafting team. Modifications to IRO-005 are included in the draft SAR for Reliability Coordination.                      For R11- the Reliability Coordinator gives SOLs to the Transmission Service Provider. As envisioned, these are SOLs that the Reliability Coordinator receives from the Transmission Operator. This supports the same responsibilities for distribution of SOLs as required in FAC-014.                      For R12, the drafting team modified the parenthetical to omit the reference to SOL. This supports your suggestion.</p>			
IESO	x		<p>There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when a SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.</p> <p>On the other hand, we feel that while the RC is not required to monitor these SOLs, they need to continue to be provided the information on the results of SOL determination and assessment as currently stipulated in R11 of TOP-002-2 since SOLs may become IROLs under certain conditions as determined by the RC.</p>
<p><b>Response:</b> The drafting team found 4 instances in the subject standard where a requirement still references an 'SOL' in association with a Reliability Coordinator.                      For R6 – the requirement is for the Reliability Coordinator to coordinate with the Transmission Operator to resolve the SOL.                      For R9 – the objective of the requirement is clear, but the wording needs modification. The revision is outside the scope of the SAR assigned to this drafting team. 9. The Drafting Team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:  
 IRO-002-1 — RC – Facilities; Retire R6  
 IRO-003-2 — RC – Wide Area View; Retire R1 and R2  
 IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2  
 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2  
 Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

**Summary Consideration:** While many commenters did indicate support for these changes, several other commenters indicated they don't support these changes and a variety of reasons were provided. The drafting team is hopeful that the explanations provided will improve consensus on this issue.

Question #9			
Commenter	Yes	No	Comment
MRO		x	The MRO agrees with the SDT in striking the first part of IRO-005-2 since it is already covered in FAC-014-R5.1. However, the MRO does not agree with the proposed revision to the second part that states: The Transmission Service Providers shall respect SOLs and IROLs in accordance with filed tariffs..... Since the RC may not know all SOLs and IROLs, it is not possible for the RC to make the TSP aware of what the RC itself does not know. The MRO recommends the SDT amend the proposed revision to state: The Transmission Service Provider shall respect all KNOWN SOLs and IROLs in accordance with.....
<b>Response:</b> Note that the proposed revision is outside the scope of work assigned to this drafting team. The drafting team can only make conforming changes to standards that are needed to support the work done with the new set of standards.			
Entergy		x	IRO-007-1 R1 contains the requirement that the RC - ... perform Real-Time Monitoring of system operating parameters ... Given the propensity of industry participants to re-interpret meanings to their own interpretation, we strongly suggest the term CONTINUOUS be added to the requirement so R1 would read - ... perform CONTINUOUS Real-Time Monitoring of system operating parameters ...  We believe there should be a minimum set of information required to be monitored by the Reliability Coordinator and that minimum set should be specified in the standards. This version, V7, of these IRO standards would remove all specification of any

Question #9			
Commenter	Yes	No	Comment
			<p>parameters to be monitored by the RC and place a list of some information in a Technical Reference. In addition, it is our understanding that Technical References and information contained in those References are not mandatory on the industry. The reason given for not including the list in the standard is "The list of parameters to monitor (IRO-005-2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading." The wording in IRO-005-2 R1 contains the phrase INCLUDING BUT NOT LIMITED TO THE FOLLOWING. A person must have some objective in mind other than conforming to the standard if he claims to not understand the meaning of, or can be misled by, the phrase INCLUDING BUT NOT LIMITED TO THE FOLLOWING.</p> <p>Therefore, we suggest deleting the Technical Reference and adding the following list and common English usage phrases back into the standards at the end of IRO-007-1 R1:</p> <p>THOSE SYSTEM OPERATING PARAMETERS INCLUDE, BUT ARE NOT LIMITED TO THE FOLLOWING:</p> <p>R1.1 Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.</p> <p>R1.2 Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.</p> <p>R1.3 Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.</p> <p>R1.4 System real and reactive reserves (actual versus required).</p> <p>R1.5 Capacity and energy adequacy conditions.</p> <p>R1.6 Current ACE for all its Balancing Authorities.</p> <p>R1.7 Current local or Transmission Loading Relief procedures in effect.</p> <p>R1.8 Planned generation dispatches.</p> <p>R1.9 Planned transmission or generation outages.</p> <p>R1.10 Contingency events.</p>

Consideration of Comments on Draft 7 of the IROL Standards

Question #9			
Commenter	Yes	No	Comment
<p><b>Response:</b></p> <p>The drafting team assumes that you are concerned that there be a person at a console that is monitoring system conditions. There are other requirements in other standards that require 24/7 staffing of the real-time system operating position with a certified system operator.</p> <p>Most stakeholders seemed to support moving the list of possible elements to a technical reference.</p>			
Southern Co		x	<p>Southern Co. believes that the RC should monitor BES elements that could result in SOLs and IROLs. We believe the RC should know the current status of critical facilities whose failure could result in an SOL and IROL.</p> <p>Therefore, we recommend keeping all the requirements being recommended for retirement.</p>
<p><b>Response:</b> The requirement in IRO-007-1 for the Reliability Coordinator to monitor parameters says:</p> <ul style="list-style-type: none"> <li>- The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their <b>associated</b> Interconnection Reliability Operating Limits (IROLs).</li> </ul> <p>There is a Transmission Operator with responsibility for every SOL and the Transmission Operator is accountable for acting to resolve its SOLs. The Reliability Coordinator isn't required to monitor all facilities within each Transmission Operator's area that has an SOL. The Reliability Coordinator is expected to monitor parameters associated with facilities that have been identified as potentially having IROLs.</p>			
Manitoba Hydro		x	<p>If we are removing the monitoring of SOL from the RC's responsibility how can IRO-005-0 R11 be true. The RC can not make known to Transmission Service Providers all SOLs. This Requirement needs to be edited. Possibly along the lines of:</p> <p>R11. Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, all IROLs and known SOLs within its wide-area view. The Transmission Service Providers shall respect IROLs and all known SOLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p>Also, MH endorses the MRO comments: The MRO agrees with the SDT in striking the first part of IRO-005-2 since it is already covered in FAC-014-R5.1. However, the MRO does not agree with the proposed revision to the second part that states: The Transmission Service Providers shall respect SOLs and IROLs in accordance with filed tariffs..... Since the RC may not know all SOLs and IROLs, it is not possible for the RC to make the TSP aware of what the RC itself does not know. The MRO recommends the SDT amend the proposed revision to state: The Transmission Service Provider shall respect all KNOWN</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #9</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			SOLs and IROLs in accordance with.....
<p><b>Response:</b> The proposed changes do not remove the Reliability Coordinator’s responsibility for monitoring system parameters that lead to all SOLs – we are removing the RC as the entity with <b>primary</b> responsibility for monitoring parameters that lead to SOLs. The Reliability Coordinator isn’t required to monitor <b>all</b> facilities that could have an SOL. The Reliability Coordinator is expected to monitor parameters associated with facilities that have been identified as potentially having IROLs.</p> <p>Under FAC-014, the Reliability Coordinator is obligated to ensure that SOLs are developed according to the Reliability Coordinator’s SOL Development Methodology. Under most cases, the Transmission Operator develops the SOLs and submits them to the Reliability Coordinator and then the Reliability Coordinator submits the applicable SOLs (and IROLs) to the Transmission Service Provider.</p> <p>The drafting team can only make conforming changes to the standards that are related to the work of the SAR assigned to this drafting team.</p>			
ATC		x	<p>IRO-007 states that Reliability Coordinators should monitor IROLs within their area.</p> <p>ATC does not believe that the changes to the four listed requirements have anything to do with IRO-007. In other words IRO-007 is not replacing the existing requirements, therefore the SDT has no authority to delete these requirements.</p> <p>It's ATC opinion that the SDT should only modify existing requirements that are in direct alignment with their work. In other words they should only alter those existing requirements that are being replaced with new requirements.</p> <p>If the SDT disagrees with ATC then they need to explain how IRO-007 is replacing the above listed requirements.</p>
<p><b>Response:</b></p> <p>The implementation plan provides an explanation of the drafting team’s justification for retiring or revising the associated requirements.</p> <ul style="list-style-type: none"> <li>When IRO-007-1 becomes effective, IRO-002-1 R6 should be retired.</li> </ul> <p>IRO-002-1 R6 identifies some, but not all of the parameters to be monitored by the Reliability Coordinator and can be misleading. A list of elements to be monitored (from IRO-005-2) has been converted into a Technical Reference.</p> <ul style="list-style-type: none"> <li>When IRO-007-1 becomes effective, IRO-003-2 should be retired.</li> </ul> <p>The Transmission Operator, not the Reliability Coordinator, is responsible for operating within System Operating Limits. The Reliability Coordinator is responsible for operating within IROLs.</p> <p>When IRO-008-1 becomes effective, IRO-005-2 R1 should be retired and R1.1 through R1.10 should be converted into a Technical Reference.</p>			

Consideration of Comments on Draft 7 of the IROL Standards

Question #9			
Commenter	Yes	No	Comment
<p>IRO-005-2 R1 is duplicated with IRO-007-1 R1. The list of parameters to monitor (IRO-005 -2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading.</p> <ul style="list-style-type: none"> <li>When IRO-007-1 and IRO-009-1 become effective, IRO-005-2 R13 should be retired.</li> <li>IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.</li> </ul> <p>The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-007-1 R2 has a similar requirement that is applicable totally to the Reliability Coordinator.</p>			
First Energy Corp		x	The revised IRO-005 requirement 10 (formerly Requirement 13) should be moved to TOP-004 Transmission Operations since it now only pertains to Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities.
<p><b>Response:</b> Agreed. Moving the requirements as proposed is outside the scope of this drafting team – this should be addressed as part of the Three-year Plan for Standards Development under the Project 2007-03.  <a href="ftp://www.nerc.com/pub/sys/all_updl/standards/sar/FERC_Filing_Volumes_I-II-III_Reliability_Standards_Development_Plan_30Nov06.pdf">ftp://www.nerc.com/pub/sys/all_updl/standards/sar/FERC_Filing_Volumes_I-II-III_Reliability_Standards_Development_Plan_30Nov06.pdf</a></p>			
MISO SSC		x	Requirement R11 in Standard IRO-005-3 contradicts question 8 in the comment form. It requires the RCs to notify TPs of "SOLs and IROLs within its wide-area view". Question 8 recognizes that RCs may not have all the information for SOLs so how can they be held accountable to communicate it? This requirement needs to be eliminated.
<p><b>Response:</b> Under FAC-014, the Reliability Coordinator is obligated to ensure that SOLs are developed according to the Reliability Coordinator's SOL Development Methodology. Under most cases, the Transmission Operator develops the SOLs and submits them to the Reliability Coordinator and then the Reliability Coordinator submits the applicable SOLs (and IROLs) to the Transmission Service Provider.                      Question 8 indicated that the Reliability Coordinator may not have all the information to 'see' all the SOLs.</p>

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:  
 IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

**Summary Consideration:** Most commenters agreed with the drafting team’s proposed retirement of IRO-004-1 R1 and R2.

Question #10			
Commenter	Yes	No	Comment
Southern Co		x	Southern Co. believes the RC should conduct contingency analysis studies that would identify SOLs and IROLs. We recommend keeping both R1 and R2.
<p><b>Response:</b> The drafting team used different words to address the same requirement. The drafting team believes the proposed IRO-008-1 R1 is a better requirement because it specifically requires the Reliability Coordinator to look at its ‘Wide Area’ rather than its ‘Reliability Coordinator Area’ in conducting its Operational Planning Analyses.</p> <p>The drafting team recommended retiring IRO-004-1 R2 because it has been identified as ‘unmeasurable’ by the Missing Measures drafting team, and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008, IRO-009, and IRO-010 become effective.</p>			
ATC		x	If Reliability Coordinators only have to monitor IROLs then they will have no ability to identify a SOL that becomes an IROL is real-time. It is the responsibility of the Reliability Coordinators to provide oversight of the bulk power system, therefore insuring reliable operations.
<p><b>Response:</b> The proposed standards and implementation plan limit the Reliability Coordinator’s requirements for monitoring to those parameters associated with facilities that have been identified as potentially having IROLs.</p>			
Manitoba Hydro		x	General agreement with the approach, however, the new definition, Operational Planning Analysis, is a very high level definition such that R1 in IRO-008 may be very difficult to measure.
<p><b>Response:</b> The drafting team believes that the proposed standard’s R1 is better than the requirement it is replacing. The proposed R1 requires the Reliability Coordinator to look at a wider system and doesn’t mislead the responsible entity into thinking that the list of examples provided in the original standard’s R1 (including overloaded transmission lines and transformers, voltage and stability limits, etc.) is all-inclusive.</p>			
TVA		x	IRO-004-1 R2 should be included in the Technical Reference. The Technical Reference document should be provide (for information purposes) as part of the document package for this review of proposed requirement changes.
<p><b>Response:</b> The drafting team recommended retiring IRO-004-1 R2 because it has been identified as ‘unmeasurable’ by the Missing Measures drafting team, and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008, IRO-</p>

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

EOP-001-0 — Emergency Operations Planning; Retire R2

IRO-004-1 — RC – Operations Planning; Retire R3 and R6

IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

**Summary Consideration:** While several commenters did indicate support for the proposed retirements and revisions, other commenters identified concerns with the proposed changes. Several commenters were concerned that a requirement that forced the Reliability Coordinator to ‘coordinate’ its plans for preventing and mitigating instances of exceeding IROLs was not included in the proposed set of IROL standards. In some cases, the Reliability Coordinator doesn’t have time to ‘coordinate’ with all the entities that may need to take action as part of a plan to prevent or mitigate an instance of exceeding an IROL. The Reliability Coordinator ‘may’ coordinate with the entities that are expected to take action but this coordination is not a requirement. The Reliability Coordinator has ultimate responsibility for having these processes, procedures and plans – not the Balancing Authority or Transmission Operator. Other commenters indicated that they thought the requirement to coordinate outages had been removed, but this is not among the proposed changes.

Some commenters indicated that because the requirements for the Reliability Coordinator to monitor all SOLs have been proposed for retirement, the Reliability Coordinator will not have access to SOLs. Under FAC-014, the Reliability Coordinator does have SOLs and does distribute them to the TSP as well as to other entities. The proposed standards clarify that the primary responsibility for taking action to resolve SOLs rests with the Transmission Operator. If the Transmission Operator needs assistance, the Transmission Operator can ask for assistance when it informs the Reliability Coordinator that it has exceeded an SOL or IROL.

The drafting team is hopeful that the explanations provided will improve consensus on this issue.

Question #11			
Commenter	Yes	No	Comment
Entergy		x	1. IRO-009-1 R1 requires the RC to develop one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. IRO-004-1 R3 (to be deleted) requires the RC to develop action plans –  IN CONJUNCTION WITH ITS TRANSMISSION OPERATORS AND BALANCING AUTHORITIES - (IRO-004-1 R3: Each Reliability Coordinator shall, in conjunction with its

Question #11			
Commenter	Yes	No	Comment
			<p>Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.)</p> <p>2. IRO-005-2 R16 (to be retired) requires the RC to discuss options to mitigate IROLs which also is not include in these revised draft standards.</p> <p>The reasoning given in the Implementation Plan for not requiring the RC to develop - in conjunction - the Operating Process, Procedures or Plans with TOPs and BAs is that - under some conditions the Reliability Coordinator may not have time to 'coordinate' the development of these plans with all of its Transmission Operators and Balancing Authorities -. We suggest the RC be required to coordinate the development of all Operating Process, Procedures or Plans with TOPs and BAs. Only in the rarest of instances when a sudden system change requires the RC to develop a new Operating Process, Procedure or Plan in real-time may RCs be exempt from developing these Operating Process, Procedures or Plans in conjunction with TOPs and BAs.</p> <p>3. In addition, there are several requirements on TOPs and BAs (for example see TOP-002-2, TOP-004-1 R1, TOP-008-1 R1 and R2) for them to plan and operate to meet all IROLs. The TOPs and BAs must be informed of the IROLs in order to plan and operate around them.</p> <p>4. RCs should continue to develop processes, procedures or plans in conjunction with TOPs and BAs as required in the existing IRO-004 R3, and discuss options to mitigate IROLs as required in IRO-005-2 R16. The requirement to develop in - conjunction with - should be put into IRO-009-1 R1.</p> <p>Therefore we suggest IRO-009-1 R1 be changed from - ... PLANS THAT .. - to - ... PLANS DEVELOPED IN CONJUNCTION WITH TRANSMISSION OPERATORS AND BALANCING AUTHORITIES THAT ... - .</p> <p>IRO-009-1 R2 requires the RC to develop one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to mitigate the magnitude and duration of exceeding all IROLs. The discussion above for IRO-009-1 R1 applies here. Therefore we suggest IRO-009-1 R2 be changed from - ... PLANS THAT .. - to - ... PLANS DEVELOPED IN CONJUNCTION WITH TRANSMISSION</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #11</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			<p>OPERATORS AND BALANCING AUTHORITIES THAT ... - .</p> <p>5. IRO-005-2 R5 (to be deleted) requires the RC to identify the cause of any potential or actual IROL violations. That requirement is not in these new IROs. We suggest that requirement be added back in to IRO-009-1 R3 (addressing an assessment of actual or expected system conditions) by changing - .. shall implement one or more .. - to - .. shall IDENTIFY THE CAUSE OF ANY POTENTIAL OR ACTUAL IROL VIOLATIONS and shall implement one or more ...</p> <p>6. IRO-005-2 R5 (to be deleted) requires the RC to identify the cause of any potential or actual IROL violations. That requirement is not in these new IROs. We suggest that requirement be added back in to IRO-009-1 R4 (addressing actual system conditions) by changing - .. shall, without delay, act or direct others .. - to - .. shall, without delay, IDENTIFY THE CAUSE OF EXCEEDING AN IROL, AND SHALL act or direct others ...</p>
<p><b>Response:</b></p> <p>1. 2. In some cases, the Reliability Coordinator doesn't have time to 'coordinate' with all the entities that may need to take action as part of a plan to prevent or mitigate an instance of exceeding an IROL. The Reliability Coordinator 'may' coordinate with the entities that are expected to take action but this coordination is not a requirement.</p> <p>3. Note that FAC-014 requires the Reliability Coordinator to distribute SOLs and IROLs to the Transmission Operators. The distribution of SOLs and IROLs is not included in the proposed set of standards.</p> <p>4. As noted above in response to the first two comments, the Reliability Coordinator may not have time to coordinate this activity.</p> <p>5. There are other standards that require event analysis.</p> <p>6. The proposed addition is not practical as sometimes it takes a great deal of analysis to identify the cause of exceeding an IROL.</p>			
Southern Co		x	<p>The RC has no knowledge of SOLs based on the SDT's recommended changes. So how will the RC coordinate SOL violations as the (new) R6 states in IRO-005-3?</p> <p>The new R11 in IRO-005-3 states the RC shall make known to the TSP all SOLs and IROLs in its area. How does the RC do this when they are NOT expected to study or monitor SOLs?</p> <p>We do agree that EOP-001-0, R2 should be retired.</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #11</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			<p>Recommend keeping R3 and R6 of IRO-004-1. The RC should develop action plans to return transmission loading to within acceptable SOL or IROLs.</p> <p>Southern also recommends keeping R3, R5, R9, R13, R14, R16, and R17 of IRO-005-2.</p>
<p><b>Response:</b> Under FAC-014, the Reliability Coordinator does have SOLs and does distribute them to the TSP as well as to other entities. The proposed standards clarify that the primary responsibility for taking action to resolve SOLs rests with the Transmission Operator. If the Transmission Operator needs assistance, the Transmission Operator can ask for assistance when it informs the Reliability Coordinator that it has exceeded an SOL or IROL. The responsibility for resolving SOLs is assigned to the Transmission Operator.</p> <p>TOP-002-2 R1 does require the Transmission Operator to maintain a set of current plans designed to evaluate options and set procedures for reliable operation through a reasonable future time period.</p> <p>TOP-004-1 R6 requires: the Transmission Operator to have and implement formal policies and procedures to provide for transmission reliability including having plans to respond to IROL and SOL violations.</p> <p>TOP-002 R10 requires: Each Balancing Authority and Transmission Operator shall plan to meet all System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs).</p> <p>IRO-009-1 R1 and R2 require the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – In some cases, the Reliability Coordinator doesn't have time to 'coordinate' with all the entities that may need to take action as part of a plan to prevent or mitigate an instance of exceeding an IROL. The Reliability Coordinator 'may' coordinate with the entities that are expected to take action but this coordination is not a requirement. The Reliability Coordinator has ultimate responsibility for having these processes, procedures and plans – not the Balancing Authority or Transmission Operator.</p> <p>IRO-009-1 R2 includes language that is more explicit than the language in IRO-004-1 R6: 'results of these studies' is not as specific as 'when an assessment of actual or expected system conditions'.</p> <p>The implementation plan identifies the reasoning for recommending the retirements in IRO-005-2. There is no supporting justification to indicate that these recommendations are not correct, and without significant comments from other stakeholders indicating that these requirements should be retained.</p>			
<p>IESO NPCC CP9 ISO-NE Hydro-Québec TransÉnergie</p>		x	<p>EOP-001 R2 requires that a TOP have an emergency load reduction plan for all identified IROLs. The intent of this requirement is for the TOP to be ready to implement load reduction as directed by the RC to mitigate IROL violations when other control actions have been implemented or are being implemented in parallel. Unless this requirement is covered elsewhere, it needs to be retained to assure a TOP's readiness, which is in a different context than what the requirements in IRO-009 imply. Note that the RC does</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #11</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
			not own or operate any load reduction scheme. It must rely on the operators of these schemes - the TOP (and DP, as directed by the TOP), to implement load reduction.
<p><b>Response:</b> Under IRO-009-1 R2, the Reliability Coordinator is required to have plans to prevent or mitigate IROLs. The Reliability Coordinator's plan is expected to include actions assigned to other entities, including the Transmission Operator. Note that EOP-001-0 R3 does require each Transmission Operator to develop, maintain, and implement a set of plans for load shedding.</p> <p>TOP-008 R1 requires the Transmission Operator to take steps to relieve various operating conditions, including shedding firm load. In preparation for TOP-008 R1, the Transmission Operator is expected to have a load shedding plan ready to execute.</p>			
IESO		x	<p>1. We agree with retiring R6 of IRO-004-1, but suggest that a part of R3 in IRO-004-1 which requires that the RC develop the action plans in conjunction with the TOPs be reflected in this standard. This should be a requirement, not just an understanding, and hence needs to be stated explicitly herein.</p> <p>2. We agree that R3, R5 and R9 of IRO-005-2 can be retired. However, the key requirement in R3 and R5 for the RC to correct an IROL violation as soon as possible and within 30 minutes needs to be retained somewhere, preferably in this standard. Not having a time limit to correct IROL violations can result in an IROL being exceeded for an indefinite period of time, subjecting the system to prolonged risks of instability and cascade tripping. The 30 minute also serves as the threshold for curtailing firm load to correct the violation immediately if an IROL violation cannot be corrected by adjusting generation and interchange, reconfiguration, reducing interruptible load, voltage reduction, etc. within that time frame.</p> <p>3. Similar to our comment on IRO-004-1, that part in R9 of IRO-005-2 which requires the RC to coordinate transmission and generation outages needs to be stipulated somewhere, perhaps in the context of the RC approving outages. Hence, retiring R9 should be condition on halaving this coordination/approval requirement covered by this (IRO-009) or another standard.</p> <p>We agree that part 1 of R13, and R16 and R17 of IRO-005-2 can be deleted.</p>
<p><b>Response:</b></p> <p>1. In some cases, the Reliability Coordinator doesn't have time to 'coordinate' with all the entities that may need to take action as part of a plan to prevent or mitigate an instance of exceeding an IROL. The Reliability Coordinator 'may' coordinate with the entities that are expected to take action but this coordination is not a requirement. The Reliability Coordinator has</p>

does require that the IROL be relieved within the IROL's T <sub>v</sub> .)			
3. The only change to IRO-005-2 R9 was to remove the reference to IROLs.			
ATC		x	ATC does not believe that a Reliability Coordinator will be able to identify an SOL that becomes an IROL in real-time if they are not required to monitor SOLs. Additionally ATC does not see the connection between IRO-009 and these three existing standards. IRO-009 is not replacing these requirements therefore they should not be changed.
<p><b>Response:</b> The implementation plan provided an explanation for retiring or revising each of these requirements.</p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.                             <ul style="list-style-type: none"> <li>- The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's T<sub>v</sub>, which can be shorter than 30 minutes.</li> </ul> </li> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.                             <ul style="list-style-type: none"> <li>- IRO-009-1 R1 requires the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to 'coordinate' the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>- IRO-009-1 R2 includes language that is more explicit than the language in IRO-004-1 R6: 'results of these studies' is not as specific as 'when an assessment of actual or expected system conditions'.</li> </ul> </li> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.                             <ul style="list-style-type: none"> <li>- IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes. IRO-005 R5 can lead the Compliance Monitor to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.</li> <li>- IRO-005 R9 is recommended to be modified (remove reference to IROLs) when IRO-009-1 becomes effective because: IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul> </li> <li>▪ When IRO-007-1 and IRO-009-1 become effective, IRO-005-2 R13 should be retired.                             <ul style="list-style-type: none"> <li>- IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.</li> </ul> </li> </ul>			

Consideration of Comments on Draft 7 of the IROL Standards

Question #11			
Commenter	Yes	No	Comment
			<ul style="list-style-type: none"> <li>- The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-007-1 R2 has a similar requirement that is applicable totally to the Reliability Coordinator.</li> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.               <ul style="list-style-type: none"> <li>- IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect 'either' SOLs or IROLs.</li> <li>- IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>- IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul> </li> </ul>
Manitoba Hydro		x	MH does not agree with the removal of required coordination between the RC and the Transmission Operator and Balancing Authority. This approach is moving in a direction to undermine reliability.
<p><b>Response:</b> In some cases, the Reliability Coordinator doesn't have time to 'coordinate' with all the entities that may need to take action as part of a plan to prevent or mitigate an instance of exceeding an IROL. The Reliability Coordinator 'may' coordinate with the entities that are expected to take action but this coordination is not a requirement. The Reliability Coordinator has ultimate responsibility for having these processes, procedures and plans – not the Balancing Authority or Transmission Operator.</p>			
TVA		x	The modification of IRO-005-2 R14 to retire part 1, as stated on page 14 (in the Notes section) is not reflected in the redlined version of IRO-005-3. This change should be made in the redlined version.
<p><b>Response:</b> Corrected. Good Catch!</p>			
First Energy Corp	x		IRO-005-2 Requirement 9 does not appear to be marked for deletion as proposed above in the files provided with this posting.
<p><b>Response:</b> Corrected. Good Catch!</p>			
IRC Standards Review Committee	x	x	<p>We agree that R3, R5 and R9 of IRO-005-2 can be retired. Note that R2 in IRO-009-1 stipulates that "...such that the IROL is relieved within the IROL's T<sub>v</sub>." For consistency, we suggest that "within the IROL's T<sub>v</sub>" be inserted in R4 to reiterate the time limit requirement of an IROL.</p> <p>We agree that part 1 of R13, and R16 and R17 of IRO-005-2 can be deleted.</p>
<p><b>Response:</b> IRO-009-1 R4 was modified as suggested.</p>

<b>Question #11</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
MISO SSC	x		
PSC of SC	x		
MRO	x		

12. The Drafting Team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

IRO-002-1 — RC – Facilities; Retire R2

IRO-004-1 — RC – Operations Planning; Retire R4, R5

IRO-005-2 — RC – Current Day Operations; Retire R2

TOP-003-0 — Planned Outage Coordination; Modify R1.2

TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

**Summary Consideration:** While several commenters did indicate support for the proposed changes, several other commenters listed a variety of reasons for disagreement with the proposed changes. The most frequently cited reason for disagreeing with the proposed changes was a concern that data wouldn't be provided to the Reliability Coordinator in time to meet the Reliability Coordinator's needs. The proposed standards do include requirements for entities to provide data to their Reliability Coordinator. Each Reliability Coordinator can add as much specificity to its data specification requirements as it needs to support reliability – and the new requirement indicates that the Reliability Coordinator's data specification must include the timing and periodicity as well as other criteria (IRO-010-1 R1) related to the submittal of that data.

The drafting team is hopeful that the explanations provided will improve consensus on this issue.

Question #12			
Commenter	Yes	No	Comment
MRO	x		The MRO reviewed the implementation plan and it is clear that IRO-010-1 gives the flexibility to specify the data requirements in R1 and the requirement that the functional entities follow them in R3.
ATC		x	Please see our comments to question 8.
<a href="#">Response: Please see our response to your comments on question 8.</a>			
Entergy		x	IRO-010-1 R3 contains the requirement that the RC provide data and information to other RCs. However, IRO-015-1 R3 already contains that requirement: IRO-015-1 R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators.  Therefore either the Reliability Coordinator should be deleted from the list of entities specified in IRO-010-1 R3, or, IRO-015 -1 R3 should be deleted from that standard.

Consideration of Comments on Draft 7 of the IROL Standards

Question #12			
Commenter	Yes	No	Comment
<p><b>Response:</b> The requirement in IRO-010 is for entities within the Reliability Coordinator Area to provide data to the Reliability Coordinator and the requirement in IRO-015 is for exchange of data between Reliability Coordinators.</p>			
Southern Co		x	<p>While we agree with the SDT's recommendations on TOP-003-0 and TOP-005-1, we disagree with the remainder of the retirement recommendations and suggest keeping the requirements as they are.</p> <p>It is ironic that while the SDT is recommending the removal of requirements which specifically state that the TO, GO, GOP and LSE are to provide the RC with information required for system studies by 1200 noon each day, the Blackout Report stated a concern about the NERC standards' lack of requirements for providing reliability information to the RC.</p> <p>In particular, under the heading of "Data Exchanged for Operational Reliability" in the Blackout Final Report, the Report states that "a variety of up-to-date information on the elements of the system must be collected and exchanged for modeled topology to be accurate in real time."</p> <p>The Report states "there is no current requirement for how quickly asset owners must report changes in element status (such as a line outage) to the SDX. NERC is now developing a requirement for regular information update submittals that is scheduled to take effect in the summer of 2004." [Reference Page 51 of the Report]</p> <p>We are approaching the third anniversary of the publishing of this Report and still have no requirement in any NERC Standard for submitting data to the NERC System Data Exchange.</p>
<p><b>Response:</b> The proposed standards do include requirements for entities to provide data to their Reliability Coordinator. Each Reliability Coordinator can add as much specificity to its data specification requirements as it needs to support reliability – and note that the new requirement adds timing and periodicity as well as other criteria (IRO-010-1 R1) Note that under the implementation plan, there will never be a time when there isn't a requirement in effect for entities to provide data to the Reliability Coordinator.</p>			
TVA		x	<p>Agree to retire IRO-005-2 R2, however redlined version of IRO-005-3 does not show deletion of the entire R2 (which become R1 in IRO-005-3.)</p>
<p><b>Response:</b> This typographical error has been corrected so that the revised document shows R2 as being totally retired.</p>			
IRC Standards Review Committee Pepeco Holdings, Inc.		x	<p>(i) We agree with retiring R2 of IRO-002-1. (ii) We do not agree with removing R1.2 from TOP-003-1. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #12</b>			
<b>Commenter</b>	<b>Yes</b>	<b>No</b>	<b>Comment</b>
NPCC CP9 ISO-NE Hydro-Québec TransÉnergie IESO			may affect interconnected system reliability. There should not be any prejudgment as to which outage has an impact on SOL only. (iii) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.
<b>Response:</b> TOP-003-1 R1.2 was not removed, it was revised to eliminate the obligation to submit data to the Reliability Coordinator because IRO-010 requires entities to provide data to the Reliability Coordinator, and as envisioned, this would include outage schedules and other outage information.			
IESO		x	We agree with retiring R4 and R5 of IRO-004-1. However, the time frame for the RC to complete day-ahead assessment as stipulated in R5 should be retained somewhere as otherwise, there could be mis-coordination, delays and even failure to complete the assessment in time for other operating entities to prepare the system for next day operations.
<b>Response:</b> The proposed standards do include requirements for entities to provide data to their Reliability Coordinator. Each Reliability Coordinator can add as much specificity to its data specification requirements as it needs to support reliability – and note that the new requirement adds timing and periodicity as well as other criteria (IRO-010-1 R1)			
MISO SSC		x	Transmission operators will not have to communicate outage information to the RC with these changes. The requirement to communicate the outage to the RC should not be removed from the transmission operator.
<b>Response:</b> TOP-003-1 R1.2 was not removed, it was revised to eliminate the obligation to submit data to the Reliability Coordinator because IRO-010 requires entities to provide data to the Reliability Coordinator, and as envisioned, this would include outage schedules and other outage information.

14. The drafting team is recommending that these standards be balloted with four separate ballots, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

**Summary Consideration:** Most commenters supported having four ballots for the standards.

Question #14			
Commenter	Yes	No	Comment
ATC		x	These four standards should be voted on in a single ballot. The nature of this set of standards and the proposed modification to existing standards are such that a failure of one would cause a major disconnection in NERC standards. For this reason ATC strongly requests that the four standards be balloted as one.
<p><b>Response:</b> Most commenters supported the subdivision as proposed. Each of the subdivisions is a 'stand alone' set that could be implemented without the need to have approval of the other ballots.</p>			
Southern Co		x	By balloting these standards in 4 separate ballots, certain problems arise. For example, Ballot 4 (IRO-010) says to retire R2 of IRO-002-1. Ballot 1 (IRO-007) says to retire R6 of IRO-002-1.  IF one ballot fails and the other passes, Standard IRO-002-1 cannot be approved by the Board because one requirement passed the ballot voting while the other requirement did not.
<p><b>Response:</b> If one ballot is approved and others aren't, then only the requirements identified in the approved ballot would be changed. For example – if Ballot 4 (IRO-010) is approved and Ballot 1 is not, then IRO-002-2 would include only the approved change to R2 it would not include a change to R6, which would remain in effect.</p>

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

Question #15	
Commenter	Comment
MRO	<p>The MRO requests clarification as to why the following two definitions were added in IRO-009-1 and never used: Interconnection Reliability Operating Limit Event, and Interconnection Reliability Operating Limit Event Duration. If terms are specifically added to a standard, it is expected that the terms will be used in the standard. If the new terms are not to be used in the standard where they are originally defined, it would appear that the new terms are not needed and should be struck from the standard until a such time that they are to be used.</p> <p>The MRO requests the definition of the term Delay, as it is used in in IRO-009-1-R4. Is the RC considered in violation if it does not act with in one minute? If it does not act with in two-minutes. Leaving this term undefined will result in arbitrary enforcement of this standard</p>
<p><b>Response:</b> These definitions were used in earlier versions of the standard but aren't needed and have been deleted.</p> <p>The drafting team has been advised not to define terms that use the common 'Webster' dictionary definition. Webster says delay means 'to postpone until a later time, to defer, to procrastinate, tarry or linger.</p>	
Entergy	<p>1. The industry has determined that NERC reliability standards need to be more definitive as to which entities the standards are Applicable. Therefore, Entergy strongly suggests that all Applicability assignments in ALL standards and requirements be changed to be very specific. Therefore, we suggest the Applicability of each standard be changed to - ALL REGISTERED xxx, NO ADDITIONAL CONDITIONS NOR LIMITATIONS WILL BE ADDED TO THE APPLICABILITY OF THIS STANDARD, where xxx is the functional entity to whom the standard applies. Therefore, the Applicability of IRO-007-1 should not be Reliability Coordinator but should be changed to - ALL REGISTERED RELIABILITY COORDINATORS, NO ADDITIONAL CONDITIONS NOR LIMITATIONS WILL BE ADDED TO THE APPLICABILITY OF THIS STANDARD. The Applicability of all other standards should be configured in a similar manner for all entities to whom that particular standard applies.</p> <p>2. Version 6 of IRO-009 contained the requirement:</p> <p style="padding-left: 40px;">R1.4. The reliability coordinator shall document each instance of exceeding an IROL and shall document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. The reliability coordinator shall file each IROL violation report with its compliance monitor within five business days of the initiation of the event.</p>

**Consideration of Comments on Draft 7 of the IROL Standards**

<b>Question #15</b>	
<b>Commenter</b>	<b>Comment</b>
	<p>3. This requirement that a RC must document exceeding an IROL and report each IROL violation has not been included in the current draft, V7, of any of these drafts IRO-007 - 010 and does not seem to be required in any other NERC standards. We suggest it be included in IRO-009-1 as R5 along with appropriate Measures, Compliance requirements, VSL, VRF, and MTH.</p>
<p><b>Response:</b></p> <p>1. Regarding Applicability- drafting teams were given the following guidance – if the standard will be applicable to all who register to perform a specific function, then there is no need to add more words to the applicability section – in other words, the ‘default’ is ‘all registered Balancing Authorities.’ The applicability section will only include additional clarification when the applicability is ‘other than all’.</p> <p>2. As written, the Reliability Coordinator provides a data specification to any entity from which it needs reliability-related data.</p> <p>3. The drafting team eliminated these reporting requirements as sanctionable requirements but retained the form and the submission of the form as a tool to use for self-reporting by exception. The act of reporting is not critical to reliability. In addition, the ERO’s Sanctions Guidelines penalize entities that don’t report violations so there is no incentive to ‘not report’ when there is an IROL violation.</p>	
Manitoba Hydro	<p>MH appreciates the effort the drafting team put into the development of these standards and that the material has been organized to facilitate review and comment.</p> <p>MH also endorses the MRO comments: The MRO requests clarification as to why the following two definitions were added in IRO-009-1 and never used: Interconnection Reliability Operating Limit Event, and Interconnection Reliability Operating Limit Event Duration. If terms are specifically added to a standard, it is expected that the terms will be used in the standard. If the new terms are not to be used in the standard where they are originally defined, it would appear that the new terms are not needed and should be struck from the standard until a such time that they are to be used.</p> <p>The MRO requests the definition of the term Delay, as it is used in in IRO-009-1-R4. Is the RC considered in violation if it does not act with in one minute? If it does not act with in two-minutes. Leaving this term undefined will result in arbitrary enforcement of this standard</p>
<p><b>Response:</b> These definitions were used in earlier versions of the standard but aren’t needed and have been deleted.</p> <p>The drafting team has been advised not to define terms that use the common ‘Webster’ dictionary definition. Webster says delay means ‘to postpone until a later time, to defer, to procrastinate, tarry or linger.</p>	
MISO SSC	<p>1. IRO-007-1 - Tv is a term that is not defined. Measures do not specify if temporary loss of ICCP or telemetry is an exception or if it is still considered a violation. It should not be considered a violation.</p>

Question #15	
Commenter	Comment
	<p>2. IRO-008-1 - R2 requires that Real-Time Assessments be performed at least every 30 minutes. The definition of Real-Time Assessment leaves open how far into the future the assessments must cover. R3 requires sharing of results to prevent or mitigate exceeding an IROL. It seems like this should require an RC directive to correct the situation. Violation severities do not address temporary loss of ICCP, telemetry or state estimation. They should not be violations.</p> <p>3. IRO-009-1 - Two new terms are defined for inclusion in the glossary: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in the standard.</p> <p>4. Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. Delay is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay. Additionally, we wonder how will the ERO track a given percent of "IROLs identified in advance of real-time" against the number of operating procedures?</p> <p>5. IRO-010-1 - Does R3 create the requirement for a entity to add metering if it does not already exist at a location, if a measurement is requested? This needs to be made clear. Data anomalies such as those caused by a bad RTU are not addressed and need to be made exceptions in the violations severity section.</p> <p>6. While we agree with the concept of consolidating the IROL-related standards, there is more work to do. Requirements regarding IROLs can be boiled down to:</p> <ol style="list-style-type: none"> <li>1. Have IROLs pre-defined (preparedness).</li> <li>2. Train and prepare for IROLs (preparedness).</li> <li>3. Update limits based on conditions (performance).</li> <li>4. Monitor for and respond quickly to IROLs and correct them within 30 minutes (performance).</li> <li>5. Communicate reaching IROLs to others (performance).</li> <li>6. Report violations of the IROL standard (administrative).</li> </ol> <p>The acronym IROL shows up 168 times in the present standards. The vast majority of these are restatements of the 6 core requirements in different standards or explanatory information that should</p>

Question #15

Question #15	
Commenter	Comment
	<p>the reason for having these terms defined?</p> <p>5. In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay.</p> <p>6. In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. This requirement is missing in the new version. We feel that this requirement should be stated in this standard.</p> <p>7. We do not have any comments on the proposed measures. However, from a process viewpoint, none of the questions asked in this comment form seek concurrence or comments on any of the measures proposed. Since these measures did not exist in any of the current standards, and have been revised since the last draft versions (posted on March 1, 2004), the industry needs to have an opportunity to offer its view.</p>
<p><b>Response:</b></p> <p>1. IRO-007 does require the Reliability Coordinator to monitor its 'Wide Area' which is an approved, defined term – the definition of Wide Area is: The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.</p> <p>2. There are justifiable reasons for different Reliability Coordinators to use different time periods when looking into the future. The requirement to direct entities to take actions is addressed in IRO-009-1. Loss of telemetry is not addressed within this standard. The ERO Sanctions Guidelines allow the Compliance Monitor to consider mitigating factors when assessing compliance.</p> <p>3. IRO-009-1 includes the Reliability Coordinator's directives.</p> <p>4. These definitions were used in earlier versions of the standard but aren't needed and have been deleted.</p> <p>5. The violation severity levels were revised to eliminate use of percentages. Note that the drafting team was advised to avoid defining terms such as 'delay' that have the same definition as that found in a Webster Dictionary.</p>	

Question #15	
Commenter	Comment
	<p>6. The drafting team eliminated these reporting requirements because they aren't needed to support reliability. The drafting team expects that any violation of an IROL will have an associated event investigation.</p> <p>7. This 'open-ended' question was intended to collect all comments that weren't provided elsewhere. If anyone has a comment on measures this was the place to provide them.</p>
IESO	<p>1. The requirement to monitor, or at least be aware of the impacts on, critical parameters in other RC's areas, as proposed for IRO-007 (M2.1) and IRO-008 (R1) in the previous draft set of standards posted on March 1, 2004, is missing. This monitoring capability is essential for identifying potential reliability impact on other RC areas due to operation plans and real-time operations in one RC area. Note that IRO-010 has this requirement (implicit in R3).</p> <p>2. R2 of IRO-008 requires that Real-Time Assessments be performed at least every 30 minutes. The definition of Real-Time Assessment leaves open how far into the future the assessments must cover. Please clarify.</p> <p>Using the current definition for Real-Time Assessments, R2 of IRO-008 would require that a complete study for the remainder of the operating day be performed at least every 30 minutes.</p> <p>3. We believe it is more appropriate to consider Real-Time Assessment to mean the use of real-time information to assess system conditions for the current minute up to a certain time period, say, next hour. Operations Planning Analysis, which includes day at hand, should cover the remaining hours for the current day and beyond, up to about a year. We suggest the SDT consider revising the definitions in this manner to add clarity to R2 (and R1 as well) of IRO-008.</p> <p>4. R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct as deemed necessary" be inserted after "...the Reliability Coordinator shall share its results with" in R3.</p> <p>5. Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?</p> <p>6. In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay.</p>

Question #15	
Commenter	Comment
	<p>7. In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. This requirement is currently stipulated in EOP-004, with cross reference to TOP-007. We feel it's more appropriate for the RC to make this report and hence this requirement should be added to IRO-009.</p> <p>8. We do not have any comments on the proposed measures. However, from a process viewpoint, none of the questions asked in this comment form seek concurrence or comments on any of the measures proposed. Since these measures did not exist in any of the current standards, and have been revised since the last draft versions (posted on March 1, 2004), the industry needs to have an opportunity to offer its view.</p>
<p><b>Response:</b></p> <p>1. IRO-007 does require the Reliability Coordinator to monitor its 'Wide Area' which is an approved, defined term – the definition of Wide Area is: The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnection Reliability Operating Limits.</p> <p>2. The definition of Real-time Assessments doesn't require a complete study for the remainder of the operating day.</p> <p>3. The drafting team got consensus on these definitions with a prior posting.</p> <p>4. IRO-009-1 includes the Reliability Coordinator's directives.</p> <p>5. These definitions were used in earlier versions of the standard but aren't needed and have been deleted.</p> <p>6. The violation severity levels were revised to eliminate use of percentages. Note that the drafting team was advised to avoid defining terms such as 'delay' that have the same definition as that found in a Webster Dictionary.</p> <p>7. The drafting team eliminated these reporting requirements because they aren't needed to support reliability. The drafting team expects that any violation of an IROL will have an associated event investigation.</p> <p>8. This 'open-ended' question was intended to collect all comments that weren't provided elsewhere. If anyone has a comment on measures this was the place to provide them.</p>	
<p>NPCC CP9 ISO-NE Hydro-Québec TransÉnergie</p>	<p>1. R2 of IRO-008 requires clarification or the definition of Real-Time Assessments needs to be revised to capture that an assessment needs to be done every thirty minutes and specific made as to how far into the future the assessments must cover.</p> <p>2. R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that</p>

Question #15	
Commenter	Comment
	<p>this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct" be inserted after "...the Reliability Coordinator shall share its results with" in R3. This may clarify the IRO-008 standard but may introduce some redundancy with IRO-009 R3 and R4.</p> <p>3. Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?</p> <p>4. In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay perhaps specifying a timeframe in the Requirements section R4. Also missing is the requirement to document, with a complete violation report, whenever an IROL violation has been exceeded beyond Tv.</p> <p>5. In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document IROL violation incidents. This requirement is missing in the new version. NPCC Participating members believe that this requirement should be stated in this standard.</p> <p>6. NPCC participating members have also expressed concern about these same standards appearing in NERC's Reliability Coordinator SAR project. Coordination of the comments is a major concern especially when the standards will be under revision here and also in that project concurrently.</p>
	<p><b>Response:</b></p> <ol style="list-style-type: none"> <li>1. There are justifiable reasons for different Reliability Coordinators to use different time periods when looking into the future.</li> <li>2. IRO-009-1 includes the Reliability Coordinator's directives.</li> <li>3. These definitions were used in earlier versions of the standard but aren't needed and have been deleted.</li> <li>4. The violation severity levels were revised to eliminate use of percentages. Note that the drafting team was advised to avoid defining terms such as 'delay' that have the same definition as that found in a Webster Dictionary.</li> <li>5. The drafting team eliminated these reporting requirements because they aren't needed to support reliability. The drafting team expects that any violation of an IROL will have an associated event investigation.</li> </ol>

Question #15	
Commenter	Comment
<p>6. The Reliability Coordination SAR was modified to remove the proposed IROL Standards from the set of standards included in its scope.</p>	
ATC	<p>This effort must produce a clear definition of what an IROL is and the outcome being avoided by classifying an SOL as an IROL. The definition should include both Real-Time Operations and planning horizon perspectives. There is wide discretion between what everyone believes an IROL is and what events could reasonably be predicted to identify a triggering event that should be classified as an IROL. A clear definition is required in order to identify an IROL in Real-Time Operations and planning studies.</p> <p>IRO-007 Requirement R2 - Has the group discussed the possible situation in which the RCs do not agree that an IROL exists? This requirement gives the impression that an IROL has been agreed to by the RCs but the limit and/or Tv is in dispute. Because the definition of IROL is subjective two RCs could have variations of what SOLs should be classified as IROLs in Real-time.</p> <p>IRO-010 - Requirements 1.1, 1.3 and 1.4 seem to be a fill in the blank requirements for the RCs. This group should develop the data specification requirements.</p> <p>Requirement 1.2 should be deleted and replaced with the following:</p> <ul style="list-style-type: none"> <li>- Industry standard protocol or mutually agreeable format</li> </ul>
<p><b>Response:</b>                      The term, 'IROL' does have an approved definition. The definition of an IROL was addressed with FAC-010 and FAC-011.                      If Reliability Coordinators don't agree on an operating value, then the resolution of the disagreement is addressed by the requirement that says both Reliability Coordinators will use the most conservative of the values under consideration.                      Because each Reliability Coordinator has unique requirements based on the facilities within its boundaries and the tools it has under its control, each Reliability Coordinator should have the right to customize its data specification including the protocol and format in which the data must be provided.</p>	

January 9, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement: Comment Period Opens for Transmission Relay Loadability Standard;  
Nomination Period Opens for IROL Standard Drafting Team**

**The Standards Committee (SC) announces the following standards actions:**

**Transmission Relay Loadability Standard (January 9–February 7, 2007)**

The [Transmission Relay Loadability](#) Standard Drafting Team posted the second draft of its standard for a 30-day comment period from January 9 through February 7, 2007. This standard codifies the relay loadability criteria embodied in the NERC Recommendation 8a, *Improve System Protection to Slow or Limit the Spread of Future Cascading Outages*, and U.S.–Canada Power System Outage Task Force Recommendation 21A, *Make More Effective and Wider Use of System Protection Measures*. Please use the [comment form](#) to provide comments on this standard.

**Nominations for Operate within Interconnection Reliability Operating Limits  
Standard Drafting Team (January 9–19, 2007)**

The Standards Committee is seeking additional industry experts to serve on the existing Operate within [Interconnection Reliability Operating Limits](#) (IROLs) Standard Drafting Team. This set of standards addresses the Reliability Coordinator's preparations and actions relative to IROLs. If you are interested in serving on this team, please complete this [nomination form](#) and return it to Richard Schneider ([Richard.schneider@nerc.net](mailto:Richard.schneider@nerc.net)) no later than January 19, 2007.

**Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

## A. Introduction

1. **Title:** **Emergency Operations Planning**
2. **Number:** **EOP-001-1**
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- R2. Each Transmission Operator and Balancing Authority shall:
  - R2.1. Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - R2.2. Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - R2.3. Develop, maintain, and implement a set of plans for load shedding.
  - R2.4. Develop, maintain, and implement a set of plans for system restoration.
- R3. Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R3.1. Communications protocols to be used during emergencies.
  - R3.2. A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.
  - R3.3. The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.
  - R3.4. Staffing levels for the emergency.
- R4. Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.

- R5. The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.
- R6. The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:
  - R6.1. The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.
  - R6.2. The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.
  - R6.3. The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)
  - R6.4. The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

### C. Measures

- M1. The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2. The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

##### 1.3. Data Retention

Current plan available at all times.

**1.4. Additional Compliance Information**

Not specified.

**2. Levels of Non-Compliance**

- 2.1. Level 1:** One of the applicable elements of Attachment 1-EOP-001-0 has not been addressed in the emergency plans.
- 2.2. Level 2:** Two of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.
- 2.3. Level 3:** Three of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.
- 2.4. Level 4:** Four or more of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans or a plan does not exist.

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

**Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system's own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** **Reliability Coordination — Facilities**
2. **Number:** IRO 002-2
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.
- R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.
- R3. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.
- R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.
- R5. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.
- R6. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.

- R7.** Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

**C. Measures**

- M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 3.
- M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 3.
- M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.
- M4.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 5.
- M5.** Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 6)
- M6.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 7 Part 1.
- M7.** Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 7 Part 2.

**D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### **1.3. Data Retention**

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1 through 7.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

### **1.4. Additional Compliance Information**

None.

## **2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in R2.

**2.3. Level 3:** Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (R5) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in R7.

**2.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

**2.4.1** Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and R3)

**2.4.2** Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in R4.

**2.4.3** Does not have a documented procedure for the use of its backup monitoring facilities. (R6)

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

## A. Introduction

1. **Title:** ~~Reliability Coordination — Wide Area View~~
2. **Number:** ~~IRO-003-2~~
3. **Purpose:** ~~The Reliability Coordinator must have a wide-area view of its own Reliability Coordinator Area and that of neighboring Reliability Coordinators.~~
4. **Applicability**  
~~4.1. Reliability Coordinators.~~
5. **Effective Date:** ~~January 1, 2007~~ When IRO-007-1 becomes effective.

## B. Requirements

- ~~R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~
- ~~R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.~~

## C. Measures

- ~~M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~
  - 1.2. **Compliance Monitoring and Reset Time Frame**

~~One or more of the following methods will be used to assess compliance:~~

    - ~~– Self-certification (Conducted annually with submission according to schedule.)~~
    - ~~– Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~

- ~~–Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~–Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case by case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

### **1.3. Data Retention**

~~Each Reliability Coordinator shall have current in force documents used to show compliance with Measure 1.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

### **1.4. Additional Compliance Information**

~~None.~~

## **2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** ~~Not applicable.~~

**2.2. Level 2:** ~~Not applicable.~~

**2.3. Level 3:** ~~Not applicable.~~

**2.4. Level 4:** ~~Did not produce acceptable evidence to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## **E. Regional Differences**

~~None identified.~~

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>

2	November 1, 2006	Adopted by Board of Trustees	Revised

Retire Entire Standard

**A. Introduction**

1. **Title:** ~~Reliability Coordination — Operations Planning~~
2. **Number:** ~~IRO-004-1~~
3. **Purpose:** ~~Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.~~
4. **Applicability**
  - ~~4.1. Reliability Coordinators.~~
  - ~~4.2. Balancing Authorities.~~
  - ~~4.3. Transmission Operators.~~
  - ~~4.4. Transmission Service Providers.~~
  - ~~4.5. Transmission Owners.~~
  - ~~4.6. Generator Owners.~~
  - ~~4.7. Generator Operators.~~
  - ~~4.8. Load-Serving Entities.~~
5. **Effective Date:** First day of first quarter, three months after regulatory approvals~~November 1, 2006~~

**B. Requirements**

- ~~**R1.** Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.~~
- ~~**R2.** Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.~~
- ~~**R3-R1.** \_\_\_\_\_ Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.~~
- ~~**R4.** Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.~~

~~R5.~~ Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.

~~R6.R2.~~ If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.

~~R7.~~ Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.

### C. Measures

~~M1.~~ Evidence that the Reliability Coordinator conducted next day contingency analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System could be operated reliably in anticipated normal and Contingency conditions.

### D. Compliance

#### 1. Compliance Monitoring Process

~~Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on-site audit, Reliability Coordinators will be asked to provide documentation showing that next-day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits; etc.~~

##### 1.1. Compliance Monitoring Responsibility

~~Self-Certification: Each Reliability Coordinator must annually self-certify compliance to its Regional Reliability Organization with the completion of the studies and action plans in Requirements R1, R2 and R3.~~

~~Exception Reporting: Reliability Coordinators will prepare a monthly report to the Regional Reliability Organization for each month that system studies were not conducted, indicating the dates that studies were not done and the reason why.~~

##### 1.2. Compliance Monitoring Period and Reset Time Frame

~~One year without a violation from the time of the violation.~~

##### 1.3. Data Retention

~~Documentation shall be available for 3 months to provide verification that system studies were performed as required.~~

##### 1.4. Additional Compliance Information

~~None identified.~~

#### 2. Levels of Non-Compliance

~~2.1. Level 1: System studies were not conducted for one day in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.2.2.1. Level 2: System studies were not conducted for 2–3 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.3.2.2. Level 3: System studies were not conducted for 4–5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.4.2.3. Level 4: System studies were not conducted for more than 5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

**E. Regional Differences**

~~None identified.~~

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** **Reliability Coordination — Current Day Operations**
2. **Number:** IRO-005-3
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. Each Reliability Coordinator shall be aware of all Interchange Transactions.
- R2. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

- R6.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.
- R7.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- R8.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- R9.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
- R10.** In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R11.** Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs and IROLs within its wide-area view. The Transmission Service Providers shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
- R12.** Each Reliability Coordinator who foresees a transmission problem (such as an IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

### **C. Measures**

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Historical Tag Archive information, Interchange Transaction records, computer printouts, voice recordings or transcripts of voice

recordings or equivalent evidence that will be used to confirm that it was aware of Interchange Transaction information as specified in Requirement 1.

- M2.** If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 2 Part 2 and Requirement 7)
- M3.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 3)
- M4.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 4.
- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 5 Part 1.
- M6.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 5 Part 2)
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 6 Part 1)
- M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic

communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 8 Part 1)

- M9.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 9)
- M10.** If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Requirement 10)
- M11.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it provided SOL and IROL information to Transmission Service Providers within its Reliability Coordinator Area. (Requirement 11, Part 1)
- M12.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 11 Part 2)
- M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 12 Part 1.
- M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 12 Part 2.
- M15.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice

recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated.  
(Requirement 12 Part 3)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### **1.3. Data Retention**

For Measure 9, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures 1–8, Measure 11, and Measures 13 through 15, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 6, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 10, the Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 12, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance for a Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

**2.4.1** Did not follow the Reliability Coordinator's directives in accordance with R5 Part 2).

**2.4.2** Did not operate to the most limiting parameter when a difference in derived limits existed. (R10)

**3. Levels of Non-Compliance for a Reliability Coordinator:**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

**3.3. Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:

**3.3.1** Did not communicate to each of its Balancing Authorities and Transmission Operators to make them aware of GMD forecast information or did not assist in the development of any required response plans to a predicted GMD. (Requirement 3)

**3.3.2** Did not disseminate information within its Reliability Coordinator Area. (Requirement 4)

**3.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

**3.4.1** Did not direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 2 Part 2)

**3.4.2** Did not monitor the system frequency or each of its Balancing Authorities performance or did not direct rebalancing to return to DCS and CPS compliance. (Requirement 5 Part 1)

- 3.4.3 Did not coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. (Requirement 6)
- 3.4.4 When it identified a source of large Area Control Errors, it did not initiate corrective actions with the appropriate Balancing Authority if the problem was inside its Reliability Coordinator Area. (Requirement 8 part 1)
- 3.4.5 Did not provide evidence that it was aware of the impact of the operation of a Special Protection System on inter-area flows. (Requirement 9)
- 3.4.6 Did not issue alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area. (Requirement 12)

**4. Levels of Non-Compliance for a Transmission Service Provider**

- 4.1. **Level 1:** Not applicable.
- 4.2. **Level 2:** Not applicable.
- 4.3. **Level 3:** Not applicable.
- 4.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:
  - 4.4.1 Did not operate to the most limiting parameter when a difference in derived limits existed. (R10)
  - 4.4.2 Did not respect the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 141)

**E. Regional Differences**

None identified.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** **Monitoring the Reliability Coordinator Wide Area**
2. **Number:** IRO-007-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations*)
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have Real-Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.
- M2. For an IROL or its  $T_v$  without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Entity
  - 1.2. **Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Reliability Coordinator shall have evidence of compliance with M1 upon request.

The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years

The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** A severe violation occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL or its  $T_v$  and the most conservative limit under consideration was not used.

**E. Regional Differences**

None

**F. Associated Documents**

None

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### **Description of Current Draft:**

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### **Future Development Plan:**

#### **Anticipated Actions**

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### **Anticipated Date**

March 15–April 13, 2007  
April 16–25, 2007  
May 1–10, 2007  
To be determined  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## **A. Introduction**

- 1. Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
- 2. Number:** IRO-008-1
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
- 4. Applicability**
  - 4.1.** Reliability Coordinator.
- 5. Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## **B. Requirements.**

- R1.** The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2.** The Reliability Coordinator shall perform Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3.** When the results of the Reliability Coordinator's Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## **C. Measures**

- M1.** The Reliability Coordinator shall have, and provide upon request, the results of its latest Operational Planning Analysis.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to computer output, operator logs, checklists, or other evidence to show it conducted a Real-Time Assessment at least once every 30 minutes.
- M3.** The Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used to confirm that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information.

## **D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

**1.3. Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

The Reliability Coordinator shall keep its latest day-ahead Operational Planning Analysis.

The Reliability Coordinator shall keep evidence for M2 for the most recent two days.

The Reliability Coordinator shall keep evidence for M3 for one month.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Shared the results with some but not all of the entities that were required to take action (R3).

**2.3. High:** Real-Time Assessments were conducted but not as frequently as required (R2).

**2.4. Severe:** A severe violation exists if any of the following conditions are present:

**2.4.1** Did not perform an Operational Planning Analysis for the next day in accordance with R1.

**2.4.2** Did not perform any Real-time Assessments for any continuous eight-hour period (R2).

**2.4.3** Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

**E. Regional Differences**

To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Occurrence Period:** The time period in which performance is measured and evaluated.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1.** For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2.** For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shed) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3.** When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R4.** When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

## C. Measures

- M1.** The Reliability Coordinator shall have, and provide upon request, one or more documented Operating Processes, Procedures, or Plans that that will be used to confirm that it has Operating Processes, Procedures or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement 1 and Requirement 2.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice

recordings, or other equivalent evidence that will be used to confirm that it acted or directed others to act in accordance with Requirement 3 and Requirement 4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.

The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

### 2. Violation Severity Levels

**2.1. Low:** Not applicable.

**2.2. Moderate** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** **There shall be a severe violation severity level if any of the following conditions exist:**

**2.4.1** One or more IROLs identified in advance of real-time do not have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

- 2.4.2 An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)
- 2.4.3 Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five<sup>1</sup> minutes or more before taking a control action or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)
- 2.4.4 Actual system conditions showed that there was an instance of exceeding an IROL, and no actions or directions were given to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

**E. Regional Differences**

None

**F. Associated Documents**

IROL Violation Report

**Version History**

Version	Date	Action	Change Tracking

---

<sup>1</sup> The five minutes is not a ‘grace period’ before taking any action – the five minutes recognizes that the first actions taken may not result in an action that can be independently confirmed.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:**           **Reliability Coordinator Data Specification and Collection**
2. **Number:**       IRO-010-1
3. **Purpose:**        To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**   The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information
  - R1.2. Mutually agreeable format
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.
- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and

Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### **C. Measures**

- M1.** The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement 1.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.
- M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used to confirm that it provided data and information, as specified in Requirement 3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

##### **1.3. Data Retention**

The Reliability Coordinator shall keep its most current data specification.

The Reliability Coordinator shall keep evidence to show compliance with Measure 2

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Measure 3 for 3 months.

The Compliance Monitor shall keep audited data for three calendar years.

##### **1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

1.4.1 Data specification(s).

1.4.2 Proof of distribution of the data specification(s).

**2. Violation Severity Levels for the Reliability Coordinator**

**2.1. Lower: There shall be a lower violation severity level if any of the following conditions exist:**

2.1.1 Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.1.2 Provided greater than or equal to 95%- but less then 100% of the data and information to other Reliability Coordinators as specified. (R3)

**2.2. Moderate: There shall be a moderate violation severity level of any of the following conditions exist:**

2.2.1 Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.2.2 Provided greater than or equal to 85%, but less than 95% of the data and information to other Reliability Coordinators as specified. (R3)

**2.3. High: There shall be a high violation severity level of any of the following conditions exist:**

2.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)

2.3.2 Distributed its data specification to greater than or equal to 70%- but less then 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.3.3 Provided greater than or equal to 70%- but less then 85% of the data and information to other Reliability Coordinators as specified. (R3)

**2.4. Severe: There shall be a severe violation severity level of any of the following conditions exist:**

2.4.1 No data specification (R1)

2.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)

**3. Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner**

3.1. **Lower:** Provided greater than or equal to 95%- but less then 100% of the data and information to the Reliability Coordinator as specified. (R3)

3.2. **Moderate:** Provided greater than or equal to 85%, but less than 95% of the data and information to the Reliability Coordinator as specified. (R3)

3.3. **High:** Provided greater than or equal to 70%, but less than 85% of the data and information to the Reliability Coordinator as specified. (R3)

3.4. **Severe:** Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)

**E. Regional Differences**

None

**F. Associated Documents**

None

Version	Date	Action	Change Tracking

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-1
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.
- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.
- R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

## C. Measures

- M1.** Evidence that the Generator Operator, Transmission Operator, and Balancing Authority reported and coordinated scheduled outage information as indicated in the requirements above.

## D. Compliance

### 1. Compliance Monitoring Process

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

#### 1.1. Compliance Monitoring Responsibility

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year without a violation from the time of the violation.

#### 1.3. Data Retention

One calendar year.

#### 1.4. Additional Compliance Information

Not specified.

### 2. Levels of Non-Compliance

**2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 and R3 has a process in place to provide information to their Reliability Coordinator but does not have a process in place (where permitted by legal agreements) to provide this information to the neighboring Balancing Authority or Transmission Operator.

**2.2. Level 2:** N/A.

**2.3. Level 3:** N/A.

- 2.4. Level 4:** There is no process in place to exchange outage information, or the entity responsible for reporting information under Requirements R1 to R3 does not follow the directives of the Reliability Coordinator to cancel or reschedule an outage.

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** **Operational Reliability Information**
2. **Number:** TOP-005-2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Purchasing Selling Entities.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”
- R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.
- R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

## C. Measures

- M1. Evidence that the Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

Not specified.

**1.4. Additional Compliance Information**

Not specified.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 to R3 is providing the requesting entities with the data required, in specified time intervals and format, but there are problems with consistency of delivery identified in the measuring process that need remedy (e.g., the data is not supplied consistently due to equipment malfunctions, or scaling is incorrect).

**2.2. Level 2:** N/A.

**2.3. Level 3:** N/A.

**2.4. Level 4:** Each entity responsible for reporting information under Requirements R1 to R3 is not providing the requesting entities with data with the specified content, timeliness, or format. The information missing is included in the requesting entity's list of data.

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata

**Attachment 1-TOP-005-0**  
**Electric System Reliability Data**

This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.

1. The following information shall be updated at least every ten minutes:
  - 1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:
    - 1.1.1 Status.
    - 1.1.2 MW or ampere loadings.
    - 1.1.3 MVA capability.
    - 1.1.4 Transformer tap and phase angle settings.
    - 1.1.5 Key voltages.
  - 1.2. Generator data.
    - 1.2.1 Status.
    - 1.2.2 MW and MVAR capability.
    - 1.2.3 MW and MVAR net output.
    - 1.2.4 Status of automatic voltage control facilities.
  - 1.3. Operating reserve.
    - 1.3.1 MW reserve available within ten minutes.
  - 1.4. Balancing Authority demand.
    - 1.4.1 Instantaneous.
  - 1.5. Interchange.
    - 1.5.1 Instantaneous actual interchange with each Balancing Authority.
    - 1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.
    - 1.5.3 Interchange Schedules for the next 24 hours.
  - 1.6. Area Control Error and frequency.
    - 1.6.1 Instantaneous area control error.
    - 1.6.2 Clock hour area control error.
    - 1.6.3 System frequency at one or more locations in the Balancing Authority.
2. Other operating information updated as soon as available.
  - 2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.

- 2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.
- 2.3. Forecast peak demand for current day and next day.
- 2.4. Forecast changes in equipment status.
- 2.5. New facilities in place.
- 2.6. New or degraded special protection systems.
- 2.7. Emergency operating procedures in effect.
- 2.8. Severe weather, fire, or earthquake.
- 2.9. Multi-site sabotage.

## A. Introduction

1. **Title:** **Monitoring System Conditions**
2. **Number:** **TOP-006-2**
3. **Purpose:**  
To ensure critical reliability parameters are monitored in real-time.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Generator Operators.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.
  - R1.1. Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
  - R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
- R2. Each, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.
- R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.
- R4. Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.
- R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.
- R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.

- R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

**C. Measures**

- M1. The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### **1.3. Data Retention**

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.

Each Reliability Coordinator shall have current documents as evidence for Measure 5 and 6.

Each Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

### **1.4. Additional Compliance Information**

None.

## **2. Levels of Non-Compliance for Reliability Coordinators:**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

- 2.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:
  - 2.4.1 Not applicable.
  - 2.4.2 Not applicable.
  - 2.4.3 Did not bring to the attention of its operators, important deviations in operating conditions and the need for corrective actions. (Requirement 5)
  - 2.4.4 No evidence it monitors system frequency. (Requirement 7)

**3. Levels of Non-Compliance for Generator Operators:**

- 3.1. **Level 1:** Not applicable.
- 3.2. **Level 2:** Not applicable.
- 3.3. **Level 3:** Not applicable.
- 3.4. **Level 4:** Did not inform its Host Balancing Authority and/or the Transmission Operator of all generation resources available for use. (R1.1)

**4. Levels of Non-Compliance for Transmission Operators and Balancing Authorities:**

- 4.1. **Level 1:** Not applicable.
- 4.2. **Level 2:** Not applicable.
- 4.3. **Level 3:** Not applicable.
- 4.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:
  - 4.4.1 Did not inform the Reliability Coordinator and/or other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use in accordance with R1.2.
  - 4.4.2 Does not monitor all the applicable items listed in R2.
  - 4.4.3 Did not have the information specified in R4.
  - 4.4.4 Does not have monitoring to bring to the attention of operating personnel important deviations in operating conditions and the need for corrective actions as specified in R5.
  - 4.4.5 No evidence it monitors system frequency. (R7).

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective	Errata

**Standard TOP-006-2 — Monitoring System Conditions**

---

		Date	
1	November 1, 2006	Adopted by Board of Trustees	Revised

## A. Introduction

1. **Title:** Emergency Operations Planning
2. **Number:** EOP-001-~~0~~1
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1. First day of first quarter, three months after regulatory approvals April 1, 2005

## B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.

~~R2. The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.~~

~~R3.R2.~~ Each Transmission Operator and Balancing Authority shall:

~~R3.1.R2.1.~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.

~~R3.2.R2.2.~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.

~~R3.3.R2.3.~~ Develop, maintain, and implement a set of plans for load shedding.

~~R3.4.R2.4.~~ Develop, maintain, and implement a set of plans for system restoration.

~~R4.R3.~~ Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:

~~R4.1.R3.1.~~ Communications protocols to be used during emergencies.

~~R4.2.R3.2.~~ A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.

~~R4.3.R3.3.~~ The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.

~~R4.4.R3.4.~~ Staffing levels for the emergency.

~~R5.R4.~~ Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.

~~R6.R5.~~ The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.

~~R7.R6.~~ The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:

~~R7.1.R6.1.~~ The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.

~~R7.2.R6.2.~~ The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.

~~R7.3.R6.3.~~ The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)

~~R7.4.R6.4.~~ The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

## C. Measures

- M1. The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2. The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

**1.3. Data Retention**

Current plan available at all times.

**1.4. Additional Compliance Information**

Not specified.

**2. Levels of Non-Compliance**

**2.1. Level 1:** One of the applicable elements of Attachment 1-EOP-001-0 has not been addressed in the emergency plans.

**2.2. Level 2:** Two of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.

**2.3. Level 3:** Three of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.

**2.4. Level 4:** Four or more of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans or a plan does not exist.

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## Attachment 1-EOP-001-0

### Elements for Consideration in Development of Emergency Plans

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system's own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.

15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** Reliability Coordination — Facilities
2. **Number:** IRO 002-~~12~~
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:** ~~January 1, 2007~~ The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1. First day of first quarter, three months after regulatory approvals.

## B. Requirements

**R1.** Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.

~~**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.~~

**R3.R2.** Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.

**R4.R3.** Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.

**R5.R4.** Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.

~~**R6.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and~~

~~the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.~~

**R7.R5.** Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.

**R8.R6.** Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.

**R9.R7.** Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

### C. Measures

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 4.3.

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 4.3.

~~**M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a letter to Transmission Operators, Balancing Authorities, Transmission Owners, Generator Owners, Generator Operators, and Load-Serving Entities, or adjacent Reliability Coordinators, or other equivalent evidence that will be used to confirm that the Reliability Coordinator has requested the data required to support its reliability coordination tasks. (Requirement 2)~~

**M4.M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.

**M5.M4.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other

equivalent evidence to show that it has analysis tools in accordance with Requirement 57.

M6:M5. Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 86)

M7:M6. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 9-7 Part 1.

M8:M7. Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 9-7 Part 2.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1 through 87.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in ~~R3R2~~.

~~**2.3. Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~**2.3.1** Has not requested the data required to support its reliability coordination tasks. (Requirement 2)~~

~~**2.3.2.3.** Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (~~R7R5~~) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in ~~R9R7~~.~~

**2.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

**2.4.1** Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and ~~R4R3~~)

**2.4.2** Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in ~~R5R4~~.

**2.4.3** Does not have a documented procedure for the use of its backup monitoring facilities. (~~R8R6~~)

**E. Regional Differences**

None identified.

Retire entire standard

## A. Introduction

1. **Title:** ~~Reliability Coordination — Wide Area View~~
2. **Number:** ~~IRO-003-2~~
3. **Purpose:** ~~The Reliability Coordinator must have a wide-area view of its own Reliability Coordinator Area and that of neighboring Reliability Coordinators.~~
4. **Applicability**  
~~4.1. Reliability Coordinators.~~
5. **Effective Date:** ~~January 1, 2007~~ When IRO-007-1 becomes effective.

## B. Requirements

- ~~R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~
- ~~R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.~~

## C. Measures

- ~~M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~
  - 1.2. **Compliance Monitoring and Reset Time Frame**

~~One or more of the following methods will be used to assess compliance:~~

    - ~~– Self-certification (Conducted annually with submission according to schedule.)~~
    - ~~– Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~

- ~~–Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~–Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case by case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

### **1.3. Data Retention**

~~Each Reliability Coordinator shall have current in force documents used to show compliance with Measure 1.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

### **1.4. Additional Compliance Information**

~~None.~~

## **2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** ~~Not applicable.~~

**2.2. Level 2:** ~~Not applicable.~~

**2.3. Level 3:** ~~Not applicable.~~

**2.4. Level 4:** ~~Did not produce acceptable evidence to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## **E. Regional Differences**

~~None identified.~~

0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	February 7, 2006	Adopted by Board of Trustees	Revised
2	November 1, 2006	Adopted by Board of Trustees	Revised

Retire Entire Standard

**A. Introduction**

1. **Title:** ~~Reliability Coordination — Operations Planning~~
2. **Number:** ~~IRO-004-1~~
3. **Purpose:** ~~Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.~~
4. **Applicability**
  - ~~4.1. Reliability Coordinators.~~
  - ~~4.2. Balancing Authorities.~~
  - ~~4.3. Transmission Operators.~~
  - ~~4.4. Transmission Service Providers.~~
  - ~~4.5. Transmission Owners.~~
  - ~~4.6. Generator Owners.~~
  - ~~4.7. Generator Operators.~~
  - ~~4.8. Load-Serving Entities.~~
5. **Effective Date:** First day of first quarter, three months after regulatory approvals~~November 1, 2006~~

**B. Requirements**

- ~~**R1.** Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.~~
- ~~**R2.** Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.~~
- ~~**R3-R1.** \_\_\_\_\_ Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.~~
- ~~**R4.** Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.~~

~~R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.~~

~~R6.R2. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.~~

~~R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.~~

### C. Measures

~~M1. Evidence that the Reliability Coordinator conducted next day contingency analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System could be operated reliably in anticipated normal and Contingency conditions.~~

### D. Compliance

#### 1. Compliance Monitoring Process

~~Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on-site audit, Reliability Coordinators will be asked to provide documentation showing that next-day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits; etc.~~

##### 1.1. Compliance Monitoring Responsibility

~~Self-Certification: Each Reliability Coordinator must annually self-certify compliance to its Regional Reliability Organization with the completion of the studies and action plans in Requirements R1, R2 and R3.~~

~~Exception Reporting: Reliability Coordinators will prepare a monthly report to the Regional Reliability Organization for each month that system studies were not conducted, indicating the dates that studies were not done and the reason why.~~

##### 1.2. Compliance Monitoring Period and Reset Time Frame

~~One year without a violation from the time of the violation.~~

##### 1.3. Data Retention

~~Documentation shall be available for 3 months to provide verification that system studies were performed as required.~~

##### 1.4. Additional Compliance Information

~~None identified.~~

#### 2. Levels of Non-Compliance

~~2.1. Level 1: System studies were not conducted for one day in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.2.2.1. Level 2: System studies were not conducted for 2–3 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.3.2.2. Level 3: System studies were not conducted for 4–5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.4.2.3. Level 4: System studies were not conducted for more than 5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

**E. Regional Differences**

~~None identified.~~

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-~~23~~
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.

**5. Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1. First day of first quarter, three months after regulatory approvals January 1, 2007

## B. Requirements

- ~~R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:~~
- ~~R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.~~
  - ~~R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.~~
  - ~~R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.~~
  - ~~R1.4. System real and reactive reserves (actual versus required).~~
  - ~~R1.5. Capacity and energy adequacy conditions.~~
  - ~~R1.6. Current ACE for all its Balancing Authorities.~~
  - ~~R1.7. Current local or Transmission Loading Relief procedures in effect.~~
  - ~~R1.8. Planned generation dispatches.~~

~~R1.9.Planned transmission or generation outages.~~

~~R1.10.Contingency events.~~

~~R2.Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.~~

~~R3.As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.~~

R4.R1. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.

~~R5.Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.~~

R6.R2. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.

R7.R3. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.

R8.R4. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

R9.R5. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.

**R10.R6.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.

**R11.R7.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.

**R12.R8.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.

**R10.R9.** ~~Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection.~~ In instances where there is a difference in derived limits, the **Reliability Coordinator and its** Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.

**R11.R10.** ~~Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view.~~ The Transmission Service Providers shall respect **these** SOLs ~~or and~~ IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

**R15.R11.** Each Reliability Coordinator who foresees a transmission problem (such as an ~~SOL or~~ IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

~~**R16.** Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.~~

~~R17. When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.~~

### C. Measures

~~M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.~~

M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Historical Tag Archive information, Interchange Transaction records, computer printouts, voice recordings or transcripts of voice recordings or equivalent evidence that will be used to confirm that it was aware of ~~and made~~ Interchange Transaction information ~~available to all other Reliability Coordinators,~~ as specified in Requirement ~~2~~1.

~~M3. If a potential or actual IROL violation occurs, the Reliability Coordinator involved in the event shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, system event logs, operator action notes or equivalent evidence that will be used to determine if it initiated control actions or emergency procedures to relieve that IROL violation within 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~

M2. If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement ~~4~~2 Part 2 and Requirement ~~10~~7)

M3. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement ~~6~~3)

M4. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice

recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement ~~7~~4.

- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement ~~8~~5 Part 1.
- M6.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement ~~8~~5 Part 2)
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement ~~9~~6 Part 1)
- M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement ~~11~~8 Part 1)
- M9.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement ~~12~~9)
- M10.** If there is an instance where there is a disagreement on a derived limit, the ~~Reliability Coordinator~~, Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (~~Part 2 of~~ Requirement ~~13~~10)

**M13.M11.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it provided SOL and IROL information to Transmission Service Providers within its Reliability Coordinator Area. (Requirement 14.11, Part 1)

**M14.M12.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14.11 Part 2)

**M15.M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 15.12 Part 1.

**M16.M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 15.12 Part 2.

**M17.M15.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 15.12 Part 3)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)

- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### 1.3. Data Retention

For Measures ~~1-9~~ and ~~11~~, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures ~~21-10-8~~ and ~~1311~~, and Measures ~~15-13~~ through ~~1615~~, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure ~~68~~, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure ~~1210~~, the ~~Reliability Coordinator~~, Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure ~~1412~~, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

### 1.4. Additional Compliance Information

None.

## 2. Levels of Non-Compliance for a Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 Did not follow the Reliability Coordinator's directives in accordance with ~~R8-R5~~ Part 2).

2.4.2 Did not operate to the most limiting parameter when a difference in derived limits existed. (~~R13-R10~~Part 2)

3. **Levels of Non-Compliance for a Reliability Coordinator:**

3.1. **Level 1:** Not applicable.

3.2. **Level 2:** ~~Did not make Interchange Transaction information available to all other Reliability Coordinators in the Interconnection. (Requirement 2)~~Not applicable.

3.3. **Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:

3.3.1 Did not communicate to each of its Balancing Authorities and Transmission Operators to make them aware of GMD forecast information or did not assist in the development of any required response plans to a predicted GMD. (Requirement ~~6~~3)

3.3.2 Did not disseminate information within its Reliability Coordinator Area. (Requirement ~~7~~4)

3.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

~~3.4.1 Does not meet one or more of the requirements as specified in requirement 1 (Requirements 1.1 through R1.9)~~

~~3.4.2 Did not make Interchange Transaction information available to all other Reliability Coordinators. (Requirement 2)~~

~~3.4.3 Did not initiate control actions or emergency procedures to relieve an IROL violation without delay, and no longer than 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~

~~3.4.4.1~~ Did not direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement ~~4~~2 Part 2)

~~3.4.5.4.2~~ Did not monitor the system frequency or each of its Balancing Authorities performance or did not direct rebalancing to return to DCS and CPS compliance. (Requirement ~~8~~5 Part 1)

~~3.4.6.3.4.3~~ Did not coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. (Requirement ~~9~~6)

~~3.4.7.3.4.4~~ When it identified a source of large Area Control Errors, it did not initiate corrective actions with the appropriate Balancing Authority if the

problem was inside its Reliability Coordinator Area. (Requirement ~~11-8~~ part 1)

~~3.4.83.4.5~~ Did not provide evidence that it was aware of the impact of the operation of a Special Protection System on inter-area flows. (Requirement ~~129~~)

~~3.4.9~~ Did not operate to the most limiting parameter when a difference in derived limits existed. (Requirement ~~13 Part 2~~)

~~3.4.10~~ Did not provide Transmission Service Providers with SOLs or IROLs (within the Reliability Coordinator’s wide-area view) (Requirement ~~14 Part 1~~)

~~3.4.113.4.6~~ Did not issue alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area. (Requirement ~~1512~~)

**4. Levels of Non-Compliance for a Transmission Service Provider**

4.1. Level 1: Not applicable.

4.2. Level 2: Not applicable.

4.3. Level 3: Not applicable.

4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

4.4.1 Did not operate to the most limiting parameter when a difference in derived limits existed. (~~R13-R10~~Part 2)

4.4.2 Did not respect the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14-~~Part 12~~)

**E. Regional Differences**

None identified.

**Version History**

0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

March 15–April 13, 2007  
April 16–25, 2007  
May 1–10, 2007  
To be determined  
To be determined

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** **Monitoring the Reliability Coordinator Wide Area**
2. **Number:** IRO-007-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator

**B.5. Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements.

- R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Real-time Operations)
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)

## C. Measures

- M1. The Reliability Coordinator shall have Real-Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.
- M2. For an IROL or its  $T_v$  without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

~~Electric Reliability Organization Regional Entity~~

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall have evidence of compliance with M1 upon request.

The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years

The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** A severe violation occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL or its  $T_v$  and the most conservative limit under consideration was not used.

**E. Regional Differences**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |  |                         |
|--|-------------------------|
| 1. Post for 30-day pre-ballot period.    | March 15–April 13, 2007 |
| 2. First ballot of standards.            | April 16–25, 2007       |
| 3. Recirculation ballot of standards.    | May 1–10, 2007          |
| 4. 30-day posting before board adoption. | To be determined        |
| 5. Board adopts standards.               | To be determined        |

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (~~Mitigation-Time Horizon: Operations Planning~~)
- R2. The Reliability Coordinator shall perform Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (~~Mitigation-Time Horizon: Real-time Operations~~)
- R3. When the results of the Reliability Coordinator's Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (~~Mitigation-Time Horizon:~~ Real-time Operations or Same Day Operations)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, the results of its latest Operational Planning Analysis.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to computer output, operator logs, checklists, or other evidence to show it conducted a Real-Time Assessment at least once every 30 minutes.
- M3. The Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used to confirm that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information.

## D. Compliance

1. **Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

**1.3. Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

The Reliability Coordinator shall keep its latest day-ahead Operational Planning Analysis.

The Reliability Coordinator shall keep evidence for M2 for the most recent two days.

The Reliability Coordinator shall keep evidence for M3 for one month.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Shared the results with some but not all of the entities that were required to take action (R3).

**2.3. High:** Real-Time Assessments were conducted but not as frequently as required (R2).

**2.4. Severe:** A severe violation exists if any of the following conditions are present:

**2.4.1** Did not perform an Operational Planning Analysis for the next day in accordance with R1.

**2.4.2** Did not perform any Real-time Assessments for any continuous eight-hour period (R2).

**2.4.3** Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

**E. Regional Differences**

None

**F. Associated Documents**

None

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

~~**Interconnection Reliability Operating Limit Event:** Any instance of exceeding an Interconnection Reliability Operating Limit for a minimum of 30 continuous seconds.~~

~~**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point in time where the limit is first exceeded for at least 30 continuous seconds and ends at the beginning of the continuous 30 seconds in which the value returns to within the Interconnection Reliability Operating Limit.~~

**Occurrence Period:** The time period in which performance is measured and evaluated.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Operations Planning or Same Day Operations)
- R2. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shed) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Operations Planning or Same Day Operations)
- R3. When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)
- R4. When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, one or more documented Operating Processes, Procedures, or Plans that that will be used to confirm that it has Operating Processes, Procedures or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement 1 and Requirement 2.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice

recordings, or other equivalent evidence that will be used to confirm that it acted or directed others to act in accordance with Requirement 3 and Requirement 4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.

The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

### 2. Violation Severity Levels

**2.1. Low:** ~~Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)Not applicable.~~

**2.2. Moderate** ~~Between 85% to 94% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)Not applicable.~~

**2.3.High:** ~~There shall be a high violation severity level if any of the following conditions exist:~~

~~2.4. Between 70% to 84% of the IROLs identified in advance of real time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)~~

~~2.3.2.3. Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4) Not applicable.~~

**2.4. Severe: There shall be a severe violation severity level if any of the following conditions exist:**

**2.4.1** ~~Less than 70% of the~~**One or more** -IROLs identified in advance of real-time **do not** have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.4.2** An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)

~~2.4.3 Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five<sup>1</sup> minutes or more before taking a control action or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)~~

~~2.4.3.2.4.4~~ **2.4.3.2.4.4** Actual system conditions showed that there was an instance of exceeding an IROL, and no actions or directions were given to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

**E. Regional Differences**

None

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1.~~First day of first quarter, three months after regulatory approvals.~~

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: MediumLow*) (~~*Mitigation*~~ *Time Horizon: Operations Planning*)
  - R1.1. List of required data and information
  - R1.2. Mutually agreeable format
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.
- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: MediumLow*) (~~*Mitigation*~~ *Time Horizon: Operations Planning*)

- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (~~Mitigation~~ *Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement 1.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.
- M3. The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used to confirm that it provided data and information, as specified in Requirement 3.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep its most current data specification.

The Reliability Coordinator shall keep evidence to show compliance with Measure 2

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Measure 3 for 3 months.

The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

1.4.1 Data specification(s).

1.4.2 Proof of distribution of the data specification(s).

## 2. Violation Severity Levels for the Reliability Coordinator

### 2.1. Lower: There shall be a lower violation severity level if any of the following conditions exist:

2.1.1 Distributed its data specification to ~~greater than or equal to 95% but less than-99 100%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.1.2 Provided ~~greater than or equal to 95%- but less then 100% 95-99%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.2. Moderate: There shall be a moderate violation severity level of any of the following conditions exist:

2.2.1 Distributed its data specification to ~~greater than or equal to 85% but less than-9495%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.2.2 Provided ~~greater than or equal to 85%, but less than 95% 85-94%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.3. High: There shall be a high violation severity level of any of the following conditions exist:

2.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)

2.3.2 Distributed its data specification to ~~greater than or equal to 70%- but less then 85% 70-84%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.3.3 Provided ~~greater than or equal to 70%- but less then 85% 70-84%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.4. Severe: There shall be a severe violation severity level of any of the following conditions exist:

2.4.1 No data specification (R1)

2.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)

## 3. Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner

- 3.1. **Lower:** Provided greater than or equal to 95%- but less than 100% ~~95-99%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.2. **Moderate:** Provided greater than or equal to 85%, but less than 95% ~~85-94%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.3. **High:** Provided greater than or equal to 70%, but less than 85% ~~70-84%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.4. **Severe:** Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

Version	Date	Action	Change Tracking

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-~~0~~1
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.

**5. Proposed Effective Date:** ~~April 1, 2005~~ The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1. First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.
- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.

- R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

### C. Measures

- M1. Evidence that the Generator Operator, Transmission Operator, and Balancing Authority, ~~and Reliability Coordinator~~ reported and coordinated scheduled outage information as indicated in the requirements above.

### D. Compliance

#### 1. Compliance Monitoring Process

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

#### 1.1. Compliance Monitoring Responsibility

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

#### 1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year without a violation from the time of the violation.

#### 1.3. Data Retention

One calendar year.

#### 1.4. Additional Compliance Information

Not specified.

#### 2. Levels of Non-Compliance

- 2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 and R3 has a process in place to provide information to their Reliability Coordinator but does not have a process in place (where permitted by legal agreements) to provide this information to the neighboring Balancing Authority or Transmission Operator.
- 2.2. Level 2:** N/A.
- 2.3. Level 3:** N/A.
- 2.4. Level 4:** There is no process in place to exchange outage information, or the entity responsible for reporting information under Requirements R1 to R3 does not follow the directives of the Reliability Coordinator to cancel or reschedule an outage.

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** **Operational Reliability Information**
2. **Number:** TOP-005-~~1~~2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - ~~4.3. Reliability Coordinators.~~
  - ~~4.4.3.~~ Purchasing Selling Entities.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1, November 1, 2006~~First day of first quarter, three months after regulatory approvals.~~

## B. Requirements

~~R1. Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.~~

~~R1.1. Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.~~

R2.R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”

R3.R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.

R4.R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

**C. Measures**

- M1. Evidence that the ~~Reliability Coordinator~~, Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

Not specified.

**1.4. Additional Compliance Information**

Not specified.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 to ~~R5-R3~~ is providing the requesting entities with the data required, in specified time intervals and format, but there are problems with consistency of delivery identified in the measuring process that need remedy (e.g., the data is not supplied consistently due to equipment malfunctions, or scaling is incorrect).

**2.2. Level 2:** N/A.

**2.3. Level 3:** N/A.

**2.4. Level 4:** Each entity responsible for reporting information under Requirements R1 to ~~R5-R3~~ is not providing the requesting entities with data with the specified content, timeliness, or format. The information missing is included in the requesting entity’s list of data.

**E. Regional Differences**

None identified.

**Version History**

## Attachment 1-TOP-005-0

### Electric System Reliability Data

This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.

1. The following information shall be updated at least every ten minutes:
  - 1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:
    - 1.1.1 Status.
    - 1.1.2 MW or ampere loadings.
    - 1.1.3 MVA capability.
    - 1.1.4 Transformer tap and phase angle settings.
    - 1.1.5 Key voltages.
  - 1.2. Generator data.
    - 1.2.1 Status.
    - 1.2.2 MW and MVAR capability.
    - 1.2.3 MW and MVAR net output.
    - 1.2.4 Status of automatic voltage control facilities.
  - 1.3. Operating reserve.
    - 1.3.1 MW reserve available within ten minutes.
  - 1.4. Balancing Authority demand.
    - 1.4.1 Instantaneous.
  - 1.5. Interchange.
    - 1.5.1 Instantaneous actual interchange with each Balancing Authority.
    - 1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.
    - 1.5.3 Interchange Schedules for the next 24 hours.
  - 1.6. Area Control Error and frequency.
    - 1.6.1 Instantaneous area control error.
    - 1.6.2 Clock hour area control error.
    - 1.6.3 System frequency at one or more locations in the Balancing Authority.
2. Other operating information updated as soon as available.
  - 2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.

- 2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.
- 2.3. Forecast peak demand for current day and next day.
- 2.4. Forecast changes in equipment status.
- 2.5. New facilities in place.
- 2.6. New or degraded special protection systems.
- 2.7. Emergency operating procedures in effect.
- 2.8. Severe weather, fire, or earthquake.
- 2.9. Multi-site sabotage.

## A. Introduction

1. **Title:** Monitoring System Conditions
2. **Number:** TOP-006-~~1~~2
3. **Purpose:**  
To ensure critical reliability parameters are monitored in real-time.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Generator Operators.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1, January 1, 2007~~First day of first quarter, three months after regulatory approvals.~~

## B. Requirements

- R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.
  - R1.1. Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
  - R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
- R2. Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.
- R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.
- R4. Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.
- R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.
- R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.

- R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

### C. Measures

- M1. The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

##### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### 1.3. Data Retention

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.:

Each Reliability Coordinator, shall have current documents as evidence for Measure 5 and 6.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

### 1.4. Additional Compliance Information

None.

## 2. Levels of Non-Compliance for Reliability Coordinators:

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 ~~Does not monitor all of the applicable items listed in Requirement 2. Not applicable.~~

2.4.2 ~~Did not have the information specified in R4. Not applicable.~~

2.4.3 Did not bring to the attention of its operators, important deviations in operating conditions and the need for corrective actions. (Requirement 5)

2.4.4 No evidence it monitors system frequency. (Requirement 7)

3. **Levels of Non-Compliance for Generator Operators:**

3.1. **Level 1:** Not applicable.

3.2. **Level 2:** Not applicable.

3.3. **Level 3:** Not applicable.

3.4. **Level 4:** Did not inform its Host Balancing Authority and/or the Transmission Operator of all generation resources available for use. (R1.1)

4. **Levels of Non-Compliance for Transmission Operators and Balancing Authorities:**

4.1. **Level 1:** Not applicable.

4.2. **Level 2:** Not applicable.

4.3. **Level 3:** Not applicable.

4.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

4.4.1 Did not inform the Reliability Coordinator and/or other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use in accordance with R1.2.

4.4.2 Does not monitor all the applicable items listed in R2.

4.4.3 Did not have the information specified in R4.

4.4.4 Does not have monitoring to bring to the attention of operating personnel important deviations in operating conditions and the need for corrective actions as specified in R5.

4.4.5 No evidence it monitors system frequency. (R7).

**E. Regional Differences**

None identified.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

March 15–April 13, 2007  
April 16–25, 2007  
May 1–10, 2007  
To be determined  
To be determined

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** **Monitoring the Reliability Coordinator Wide Area**
2. **Number:** IRO-007-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations*)
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have Real-Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.
- M2. For an IROL or its  $T_v$  without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Entity
  - 1.2. **Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Reliability Coordinator shall have evidence of compliance with M1 upon request.

The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years

The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** A severe violation occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL or its  $T_v$  and the most conservative limit under consideration was not used.

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

Version	Date	Action	Change Tracking

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### **Description of Current Draft:**

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### **Future Development Plan:**

#### **Anticipated Actions**

#### **Anticipated Date**

- |  |                         |
|--|-------------------------|
| 1. Post for 30-day pre-ballot period.    | March 15–April 13, 2007 |
| 2. First ballot of standards.            | April 16–25, 2007       |
| 3. Recirculation ballot of standards.    | May 1–10, 2007          |
| 4. 30-day posting before board adoption. | To be determined        |
| 5. Board adopts standards.               | To be determined        |

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## **A. Introduction**

- 1. Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
- 2. Number:** IRO-008-1
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
- 4. Applicability**
  - 4.1.** Reliability Coordinator.
- 5. Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## **B. Requirements.**

- R1.** The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2.** The Reliability Coordinator shall perform Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3.** When the results of the Reliability Coordinator's Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## **C. Measures**

- M1.** The Reliability Coordinator shall have, and provide upon request, the results of its latest Operational Planning Analysis.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to computer output, operator logs, checklists, or other evidence to show it conducted a Real-Time Assessment at least once every 30 minutes.
- M3.** The Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used to confirm that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information.

## **D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

**1.3. Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

The Reliability Coordinator shall keep its latest day-ahead Operational Planning Analysis.

The Reliability Coordinator shall keep evidence for M2 for the most recent two days.

The Reliability Coordinator shall keep evidence for M3 for one month.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Shared the results with some but not all of the entities that were required to take action (R3).

**2.3. High:** Real-Time Assessments were conducted but not as frequently as required (R2).

**2.4. Severe:** A severe violation exists if any of the following conditions are present:

**2.4.1** Did not perform an Operational Planning Analysis for the next day in accordance with R1.

**2.4.2** Did not perform any Real-time Assessments for any continuous eight-hour period (R2).

**2.4.3** Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

March 15–April 13, 2007

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Occurrence Period:** The time period in which performance is measured and evaluated.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1.** For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2.** For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shed) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3.** When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R4.** When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

## C. Measures

- M1.** The Reliability Coordinator shall have, and provide upon request, one or more documented Operating Processes, Procedures, or Plans that that will be used to confirm that it has Operating Processes, Procedures or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement 1 and Requirement 2.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice

recordings, or other equivalent evidence that will be used to confirm that it acted or directed others to act in accordance with Requirement 3 and Requirement 4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.

The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

### 2. Violation Severity Levels

**2.1. Low:** Not applicable.

**2.2. Moderate** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** **There shall be a severe violation severity level if any of the following conditions exist:**

**2.4.1** One or more IROLs identified in advance of real-time do not have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

- 2.4.2 An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)
- 2.4.3 Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five<sup>1</sup> minutes or more before taking a control action or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)
- 2.4.4 Actual system conditions showed that there was an instance of exceeding an IROL, and no actions or directions were given to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

**E. Regional Differences**

Version	Date	Action	Change Tracking

---

<sup>1</sup> The five minutes is not a 'grace period' before taking any action – the five minutes recognizes that the first actions taken may not result in an action that can be independently confirmed.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

March 15–April 13, 2007  
April 16–25, 2007  
May 1–10, 2007  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:**           **Reliability Coordinator Data Specification and Collection**
2. **Number:**       IRO-010-1
3. **Purpose:**        To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**   The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information
  - R1.2. Mutually agreeable format
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.
- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and

Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### **C. Measures**

- M1.** The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement 1.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.
- M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used to confirm that it provided data and information, as specified in Requirement 3.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

##### **1.3. Data Retention**

The Reliability Coordinator shall keep its most current data specification.

The Reliability Coordinator shall keep evidence to show compliance with Measure 2

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Measure 3 for 3 months.

The Compliance Monitor shall keep audited data for three calendar years.

##### **1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

1.4.1 Data specification(s).

1.4.2 Proof of distribution of the data specification(s).

## 2. Violation Severity Levels for the Reliability Coordinator

**2.1. Lower: There shall be a lower violation severity level if any of the following conditions exist:**

2.1.1 Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.1.2 Provided greater than or equal to 95%- but less than 100% of the data and information to other Reliability Coordinators as specified. (R3)

**2.2. Moderate: There shall be a moderate violation severity level of any of the following conditions exist:**

2.2.1 Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.2.2 Provided greater than or equal to 85%, but less than 95% of the data and information to other Reliability Coordinators as specified. (R3)

**2.3. High: There shall be a high violation severity level of any of the following conditions exist:**

2.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)

2.3.2 Distributed its data specification to greater than or equal to 70%- but less than 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.3.3 Provided greater than or equal to 70%- but less than 85% of the data and information to other Reliability Coordinators as specified. (R3)

**2.4. Severe: There shall be a severe violation severity level of any of the following conditions exist:**

2.4.1 No data specification (R1)

2.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)

**3. Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner**

3.1. **Lower:** Provided greater than or equal to 95%- but less then 100% of the data and information to the Reliability Coordinator as specified. (R3)

3.2. **Moderate:** Provided greater than or equal to 85%, but less than 95% of the data and information to the Reliability Coordinator as specified. (R3)

3.3. **High:** Provided greater than or equal to 70%, but less than 85% of the data and information to the Reliability Coordinator as specified. (R3)

3.4. **Severe:** Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |  |                         |
|--|-------------------------|
| 1. Post for 30-day pre-ballot period.    | March 15–April 13, 2007 |
| 2. First ballot of standards.            | April 16–25, 2007       |
| 3. Recirculation ballot of standards.    | May 1–10, 2007          |

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** Monitoring the Reliability Coordinator Wide Area
2. **Number:** IRO-007-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator

**B.5. Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements.

- R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Real-time Operations)
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)

## C. Measures

- M1. The Reliability Coordinator shall have Real-Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.
- M2. For an IROL or its  $T_v$  without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

~~Electric Reliability Organization Regional Entity~~

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall have evidence of compliance with M1 upon request.

The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years

The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** A severe violation occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL or its  $T_v$  and the most conservative limit under consideration was not used.

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (~~Mitigation-Time Horizon: Operations Planning~~)
- R2. The Reliability Coordinator shall perform Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (~~Mitigation-Time Horizon: Real-time Operations~~)
- R3. When the results of the Reliability Coordinator's Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (~~Mitigation-Time Horizon: Real-time Operations or Same Day Operations~~)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, the results of its latest Operational Planning Analysis.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to computer output, operator logs, checklists, or other evidence to show it conducted a Real-Time Assessment at least once every 30 minutes.
- M3. The Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used to confirm that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information.

## D. Compliance

1. **Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Electric Reliability Organization

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

**1.3. Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

The Reliability Coordinator shall keep its latest day-ahead Operational Planning Analysis.

The Reliability Coordinator shall keep evidence for M2 for the most recent two days.

The Reliability Coordinator shall keep evidence for M3 for one month.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Shared the results with some but not all of the entities that were required to take action (R3).

**2.3. High:** Real-Time Assessments were conducted but not as frequently as required (R2).

**2.4. Severe:** A severe violation exists if any of the following conditions are present:

**2.4.1** Did not perform an Operational Planning Analysis for the next day in accordance with R1.

**2.4.2** Did not perform any Real-time Assessments for any continuous eight-hour period (R2).

**2.4.3** Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

**E. Regional Differences**

None

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

~~**Interconnection Reliability Operating Limit Event:** Any instance of exceeding an Interconnection Reliability Operating Limit for a minimum of 30 continuous seconds.~~

~~**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point in time where the limit is first exceeded for at least 30 continuous seconds and ends at the beginning of the continuous 30 seconds in which the value returns to within the Interconnection Reliability Operating Limit.~~

**Occurrence Period:** The time period in which performance is measured and evaluated.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1.

## B. Requirements

- R1. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Operations Planning or Same Day Operations)
- R2. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shed) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (~~Mitigation~~-Time Horizon: Operations Planning or Same Day Operations)
- R3. When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)
- R4. When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (~~Mitigation~~-Time Horizon: Real-time Operations)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, one or more documented Operating Processes, Procedures, or Plans that that will be used to confirm that it has Operating Processes, Procedures or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement 1 and Requirement 2.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice

recordings, or other equivalent evidence that will be used to confirm that it acted or directed others to act in accordance with Requirement 3 and Requirement 4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.

The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

### 2. Violation Severity Levels

**2.1. Low:** ~~Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)Not applicable.~~

**2.2. Moderate** ~~Between 85% to 94% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)Not applicable.~~

**2.3.High:** ~~There shall be a high violation severity level if any of the following conditions exist:~~

~~2.4. Between 70% to 84% of the IROLs identified in advance of real time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)~~

~~2.3.2.3. Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4) Not applicable.~~

**2.4. Severe: There shall be a severe violation severity level if any of the following conditions exist:**

**2.4.1** ~~Less than 70% of the~~One or more -IROLs identified in advance of real-time do not have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.4.2** An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)

**2.4.3** Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five<sup>1</sup> minutes or more before taking a control action or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

~~**2.4.3.2.4.4** Actual system conditions showed that there was an instance of exceeding an IROL, and no actions or directions were given to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)~~

**E. Regional Differences**

None

**F. Associated Documents**

IROL Violation Report

**Version History**

Version	Date	Action	Change Tracking

<sup>1</sup> The five minutes is not a ‘grace period’ before taking any action – the five minutes recognizes that the first actions taken may not result in an action that can be independently confirmed.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team has asked the Standards Committee for authorization to post the standards and implementation plan for a 30-day, pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

#### Anticipated Date

March 15–April 13, 2007  
April 16–25, 2007  
May 1–10, 2007  
To be determined  
To be determined

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:** The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1.~~First day of first quarter, three months after regulatory approvals.~~

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: MediumLow*) (~~*Mitigation*~~ *Time Horizon: Operations Planning*)
  - R1.1. List of required data and information
  - R1.2. Mutually agreeable format
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.
- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: MediumLow*) (~~*Mitigation*~~ *Time Horizon: Operations Planning*)

- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (~~Mitigation~~ *Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement 1.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.
- M3. The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used to confirm that it provided data and information, as specified in Requirement 3.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep its most current data specification.

The Reliability Coordinator shall keep evidence to show compliance with Measure 2

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Measure 3 for 3 months.

The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

1.4.1 Data specification(s).

1.4.2 Proof of distribution of the data specification(s).

## 2. Violation Severity Levels for the Reliability Coordinator

### 2.1. Lower: There shall be a lower violation severity level if any of the following conditions exist:

2.1.1 Distributed its data specification to ~~greater than or equal to 95% but less than-99 100%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.1.2 Provided ~~greater than or equal to 95%- but less then 100% 95-99%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.2. Moderate: There shall be a moderate violation severity level of any of the following conditions exist:

2.2.1 Distributed its data specification to ~~greater than or equal to 85% but less than-9495%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.2.2 Provided ~~greater than or equal to 85%, but less than 95% 85-94%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.3. High: There shall be a high violation severity level of any of the following conditions exist:

2.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)

2.3.2 Distributed its data specification to ~~greater than or equal to 70%- but less then 85% 70-84%~~ of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.3.3 Provided ~~greater than or equal to 70%- but less then 85% 70-84%~~ of the data and information to other Reliability Coordinators as specified. (R3)

### 2.4. Severe: There shall be a severe violation severity level of any of the following conditions exist:

2.4.1 No data specification (R1)

2.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)

2.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)

## 3. Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner

- 3.1. **Lower:** Provided greater than or equal to 95%- but less than 100% ~~95-99%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.2. **Moderate:** Provided greater than or equal to 85%, but less than 95% ~~85-94%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.3. **High:** Provided greater than or equal to 70%, but less than 85% ~~70-84%~~ of the data and information to the Reliability Coordinator as specified. (R3)
- 3.4. **Severe:** Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)

March 22, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement: Pre-ballot Window and Ballot Pool Open March 22, 2007**

The Standards Committee (SC) announces the following standards actions:

**Pre-ballot Window and Ballot Pool for Interconnection Reliability Operating Limit Standards Open March 22, 2007**

The following [Operate within Interconnection Reliability Operating Limit](#) standards are posted for a 30-day pre-ballot review:

- IRO-007-1 — Monitoring the Reliability Coordinator Wide Area
- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1 — Reliability Coordinator Actions to Operate Within IROs
- IRO-010-1 — Reliability Coordinator Data Specification and Collection

This set of Version 1 standards requires the Reliability Coordinator to monitor its wide area, to have plans in place to prevent and mitigate instances of exceeding IROs, to direct actions in support of operating within IROs, and to specify and collect reliability-related data needed to prevent instability, uncontrolled separation or cascading outages.

The ballot for the above set of standards also includes the Interconnection Reliability Operating Limits [Implementation Plan](#).

A new [ballot pool](#) to vote on this set of standards has been formed and will remain open up until 8 a.m. (EDT) Monday, April 23, 2007. During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." The list server for this ballot pool is called: [bp-IROL\\_in@nerc.com](mailto:bp-IROL_in@nerc.com)

The initial ballot for this set of standards will be conducted from 8 a.m. (EDT) on Monday, April 23 through 8 p.m. (EDT) Friday, May 4, 2007.

**Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

    TOP-005-1 ..... 16  
    TOP-006-1 ..... 19  
Functions that Must Comply with the Requirements in the Standards ..... 20  
Effective Dates ..... 20

### **Prerequisite Approvals**

Reliability Standard FAC-014-1 — Establish and Communicate System Operating Limits, needs to be approved by applicable regulatory authorities before this set of standards becomes effective:

IRO-007 — Monitoring the Wide Area

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

### **Conforming Changes to Requirements in Already Approved Standards**

Many elements contained in the set of proposed ‘Operate within IROL Standards’ address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the following requirements in Version 0 Standards should be revised or retired when the proposed standards are implemented. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2 and R6

IRO-003-2 — Reliability Coordination – Wide Area View

- Retire entire standard (R1 and R2)

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire entire standard (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R1, convert most of R1 into a reference; retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Convert Attachment 1 into a reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify R2 and R4

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>EOP-001-0</b></p> <p><b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's <math>T_v</math>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall specify and collect the data and information it needs to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. The Reliability Coordinator shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Coordinator, and from entities that provide Real-Time Facility status to the Reliability Coordinator. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>R1.1 Balancing Authorities</li> <li>R1.2 Generator Owners</li> <li>R1.3 Generator Operators</li> <li>R1.4 Interchange Authority</li> <li>R1.5 Load-Serving Entities</li> <li>R1.6 Reliability Coordinators</li> <li>R1.7 Transmission Operators</li> <li>R1.8 Transmission Owners</li> </ul>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 R1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirement is more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p>R6. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.</p>	<p><b>IRO-007-1</b></p> <p>R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-002-1 R6 should be retired.</li> <li>▪ IRO-002-1 R6 identifies some, but not all of the parameters to be monitored by the Reliability Coordinator and can be misleading. A list of elements to be monitored (from IRO-005-2) has been converted into a Technical Reference.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-003-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.</p> <p><b>R2.</b> Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-003-2 should be retired.</li> <li>▪ The Transmission Operator, not the Reliability Coordinator, is responsible for operating within System Operating Limits. The Reliability Coordinator is responsible for operating within IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008 becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within Tv up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 requires the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R2 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R4.</b> Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p><b>R5.</b> Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p><b>IRO-005-2</b></p> <p><b>R2.</b> Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information</p> <p><b>R1.2.</b> Mutually agreeable format</p> <p><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</p> <p><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-004-1 R4 and R5 should be retired.</li> <li>▪ IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4 and R5.</li> <li>▪ When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R1.</b> Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:</p> <ul style="list-style-type: none"> <li><b>R1.1</b> Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.</li> <li><b>R1.2</b> Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.3</b> Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.4</b> System real and reactive reserves (actual versus required).</li> <li><b>R1.5</b> Capacity and energy adequacy conditions.</li> <li><b>R1.6</b> Current ACE for all its Balancing Authorities.</li> <li><b>R1.7</b> Current local or Transmission Loading Relief procedures in effect.</li> <li><b>R1.8</b> Planned generation dispatches.</li> <li><b>R1.9</b> Planned transmission or generation outages.</li> <li><b>R1.10</b> Contingency events.</li> </ul>	<p><b>IRO-007-1</b>  <b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-005-2 R1 should be retired and R1.1 through R1.10 should be converted into a Technical Reference. IRO-005-2 R1 is duplicated with IRO-007-1 R1. The list of parameters to monitor (IRO-005 -2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.</li> <li>▪ IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> <li>▪ IRO-005 R5 can lead the Compliance Monitor to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.  <b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.  <b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p> <p><b>IRO-007-1</b>  <b>R2.</b> If unanimity cannot be reached on the value for an IROL or its <math>T_v</math>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 and IRO-009-1 become effective, IRO-005-2 R13 should be retired.</li> <li>▪ IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.</li> <li>▪ The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-007-1 R2 has a similar requirement that is applicable totally to the Reliability Coordinator.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these</del> SOLs <del>or</del> and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-003-0</b></p> <p><b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information</p> <p><b>R1.2.</b> Mutually agreeable format</p> <p><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</p> <p><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-003-0 R1.2 should be modified.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to provide data to other Reliability Coordinators in accordance with the data specifications it has received from those other Reliability Coordinators. Daily outage data is one of the types of data that is expected to be identified on the Reliability Coordinator’s documented data specification since this is data needed to maintain real-time models.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-005-1</b>  <b>R1.</b> Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.</p> <p><b>R1.1</b> Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information  <b>R1.2.</b> Mutually agreeable format  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments..</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-005-1 R1 and R1.1 should be retired.</li> <li>▪ Under IRO-010-1 each Reliability Coordinator must document what data and information it needs and entities must provide that data. The data needed by the Reliability Coordinator is needed for more than just reliability assessments – some of the data is used for real-time monitoring. Several entities, beyond the Transmission Operator and Balancing Authority (the only responsible entities identified in R1 of TOP-005-1) have data and information needed by the Reliability Coordinator.</li> </ul>	

Version 0 Standards	Proposed Replacement
<p><b>TOP-005-1 Attachment 1-TOP-005-0 - Electric System Reliability Data</b></p> <p>This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.</p> <ol style="list-style-type: none"> <li>1. The following information shall be updated at least every ten minutes:               <ol style="list-style-type: none"> <li>1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:                   <ol style="list-style-type: none"> <li>1.1.1 Status.</li> <li>1.1.2 MW or ampere loadings.</li> <li>1.1.3 MVA capability.</li> <li>1.1.4 Transformer tap and phase angle settings.</li> <li>1.1.5 Key voltages.</li> </ol> </li> <li>1.2. Generator data.                   <ol style="list-style-type: none"> <li>1.2.1 Status.</li> <li>1.2.2 MW and MVAR capability.</li> <li>1.2.3 MW and MVAR net output.</li> <li>1.2.4 Status of automatic voltage control facilities.</li> </ol> </li> <li>1.3. ## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

**Notes:**

- When IRO-010-1 becomes effective, 'Attachment 1-TOP-005-0 Electric System Reliability Data' should be translated into a Technical Reference. This data is only a partial list of data and information that the Reliability Coordinator needs to support reliable operations.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-006-1</b></p> <p><b>R2.</b> Each <a href="#">Reliability Coordinator</a>, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.</p> <p><b>R4.</b> Each <a href="#">Reliability Coordinator</a>, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system’s near-term load pattern.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p> <p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information</li> <li><b>R1.2.</b> Mutually agreeable format</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 and IRO-010-1 become effective, TOP-006-1 R2 and R4 should be modified.</li> <li>▪ The Reliability Coordinator’s monitoring requirements are addressed more globally in IRO-007-1. The Reliability Coordinator may not have access to all the transmission data identified in TOP-006-1 R2.</li> <li>▪ The information identified in TOP-006-1 R4 is not inclusive, and is addressed more globally in IRO-010-1 R1 and R3.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Functions that Must Comply with the Requirements in the Standards**

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-007-1 Monitoring the Wide Area	X							
IRO-008-1 Analyses & Assessments	X							
IRO-009-1 Actions to Operate within IROLs	X							
IRO-010-1 Data Specification & Collection	X	X	X	X	X	X	X	X

**Effective Dates**

The standards should all become effective the latter of the first day of the first quarter, three months after regulatory approvals **or** coincident with the effective date for FAC-014-1 — Establish and Communicate System Operating Limits.

Effective Dates.....	20

### Prerequisite Approvals

~~Reliability Standard FAC-014-1 — Establish and Communicate System Operating Limits, needs to be approved. There are no SARs or standards in progress that need to be approved by applicable regulatory authorities~~ before this set of standards ~~can become approved effective~~:

IRO-007 — Monitoring the Wide Area

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

### Conforming Changes to Requirements in Already Approved Standards

Many elements contained in the set of proposed ‘Operate within IROL Standards’ address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the following requirements in Version 0 Standards should be revised or retired when the proposed standards are implemented. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2 and R6

IRO-003-2 — Reliability Coordination – Wide Area View

- Retire entire standard (R1 and R2)

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire entire standard (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R1, convert most of R1 into a reference; retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Convert Attachment 1 into a reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify R2 and R4

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>EOP-001-0</b></p> <p><b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's <math>T_v</math>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall specify and collect the data and information it needs to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. The Reliability Coordinator shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Coordinator, and from entities that provide Real-Time Facility status to the Reliability Coordinator. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>R1.1 Balancing Authorities</li> <li>R1.2 Generator Owners</li> <li>R1.3 Generator Operators</li> <li>R1.4 Interchange Authority</li> <li>R1.5 Load-Serving Entities</li> <li>R1.6 Reliability Coordinators</li> <li>R1.7 Transmission Operators</li> <li>R1.8 Transmission Owners</li> </ul>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 R1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirement is more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p>R6. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.</p>	<p><b>IRO-007-1</b></p> <p>R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-002-1 R6 should be retired.</li> <li>▪ IRO-002-1 R6 identifies some, but not all of the parameters to be monitored by the Reliability Coordinator and can be misleading. A list of elements to be monitored (from IRO-005-2) has been converted into a Technical Reference.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-003-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.</p> <p><b>R2.</b> Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-003-2 should be retired.</li> <li>▪ The Transmission Operator, not the Reliability Coordinator, is responsible for operating within System Operating Limits. The Reliability Coordinator is responsible for operating within IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008, <del>IRO-009, and IRO-010</del> becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROs and mitigation of instances of exceeding its IROs within Tv up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 requires the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R2 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R4.</b> Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p><b>R5.</b> Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p><b>IRO-005-2</b></p> <p><b>R2.</b> Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information</p> <p><b>R1.2.</b> Mutually agreeable format</p> <p><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</p> <p><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-004-1 R4 and R5 should be retired.</li> <li>▪ IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4 and R5.</li> <li>▪ When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R1.</b> Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:</p> <ul style="list-style-type: none"> <li><b>R1.1</b> Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.</li> <li><b>R1.2</b> Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.3</b> Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.4</b> System real and reactive reserves (actual versus required).</li> <li><b>R1.5</b> Capacity and energy adequacy conditions.</li> <li><b>R1.6</b> Current ACE for all its Balancing Authorities.</li> <li><b>R1.7</b> Current local or Transmission Loading Relief procedures in effect.</li> <li><b>R1.8</b> Planned generation dispatches.</li> <li><b>R1.9</b> Planned transmission or generation outages.</li> <li><b>R1.10</b> Contingency events.</li> </ul>	<p><b>IRO-007-1</b>  <b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-005-2 R1 should be retired and R1.1 through R1.10 should be converted into a Technical Reference. IRO-005-2 R1 is duplicated with IRO-007-1 R1. The list of parameters to monitor (IRO-005 -2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.</li> <li>▪ IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> <li>▪ IRO-005 R5 can lead the Compliance Monitor to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 <del>focuses</del> includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.  <b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.  <b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p> <p><b>IRO-007-1</b>  <b>R2.</b> If unanimity cannot be reached on the value for an IROL or its <math>T_v</math>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 and IRO-009-1 become effective, IRO-005-2 R13 should be retired.</li> <li>▪ IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.</li> <li>▪ The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-007-1 R2 has a similar requirement that is applicable totally to the Reliability Coordinator.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these</del> SOLs <del>or</del> and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-003-0</b></p> <p><b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information</p> <p><b>R1.2.</b> Mutually agreeable format</p> <p><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</p> <p><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-003-0 R1.2 should be modified.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to provide data to other Reliability Coordinators in accordance with the data specifications it has received from those other Reliability Coordinators. Daily outage data is one of the types of data that is expected to be identified on the Reliability Coordinator’s documented data specification since this is data needed to maintain real-time models.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-005-1</b>  <b>R1.</b> Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.</p> <p><b>R1.1</b> Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information  <b>R1.2.</b> Mutually agreeable format  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments..</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-005-1 R1 and R1.1 should be retired.</li> <li>▪ Under IRO-010-1 each Reliability Coordinator must document what data and information it needs and entities must provide that data. The data needed by the Reliability Coordinator is needed for more than just reliability assessments – some of the data is used for real-time monitoring. Several entities, beyond the Transmission Operator and Balancing Authority (the only responsible entities identified in R1 of TOP-005-1) have data and information needed by the Reliability Coordinator.</li> </ul>	

Version 0 Standards	Proposed Replacement
<p><b>TOP-005-1 Attachment 1-TOP-005-0 - Electric System Reliability Data</b></p> <p>This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.</p> <ol style="list-style-type: none"> <li>1. The following information shall be updated at least every ten minutes:               <ol style="list-style-type: none"> <li>1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:                   <ol style="list-style-type: none"> <li>1.1.1 Status.</li> <li>1.1.2 MW or ampere loadings.</li> <li>1.1.3 MVA capability.</li> <li>1.1.4 Transformer tap and phase angle settings.</li> <li>1.1.5 Key voltages.</li> </ol> </li> <li>1.2. Generator data.                   <ol style="list-style-type: none"> <li>1.2.1 Status.</li> <li>1.2.2 MW and MVAR capability.</li> <li>1.2.3 MW and MVAR net output.</li> <li>1.2.4 Status of automatic voltage control facilities.</li> </ol> </li> <li>1.3. ## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

**Notes:**

- When IRO-010-1 becomes effective, 'Attachment 1-TOP-005-0 Electric System Reliability Data' should be translated into a Technical Reference. This data is only a partial list of data and information that the Reliability Coordinator needs to support reliable operations.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-006-1</b></p> <p><b>R2.</b> Each <a href="#">Reliability Coordinator</a>, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.</p> <p><b>R4.</b> Each <a href="#">Reliability Coordinator</a>, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system’s near-term load pattern.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p> <p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information</li> <li><b>R1.2.</b> Mutually agreeable format</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 and IRO-010-1 become effective, TOP-006-1 R2 and R4 should be modified.</li> <li>▪ The Reliability Coordinator’s monitoring requirements are addressed more globally in IRO-007-1. The Reliability Coordinator may not have access to all the transmission data identified in TOP-006-1 R2.</li> <li>▪ The information identified in TOP-006-1 R4 is not inclusive, and is addressed more globally in IRO-010-1 R1 and R3.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

**Functions that Must Comply with the Requirements in the Standards**

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-007-1 Monitoring the Wide Area	X							
IRO-008-1 Analyses & Assessments	X							
IRO-009-1 Actions to Operate within IROLs	X							
IRO-010-1 Data Specification & Collection	X	X	X	X	X	X	X	X

**Effective Dates**

The standards should all become effective the latter of ~~on~~ the first day of the first quarter, three months after regulatory approvals or ~~;~~ coincident with the effective date for FAC-014-1 — Establish and Communicate System Operating Limits.

### A. Introduction

1. **Title:**        **Emergency Operations Planning**
2. **Number:**    EOP-001-0
3. **Purpose:**     Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Dates:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

### B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- R2. Deleted
- R3. Each Transmission Operator and Balancing Authority shall:
  - R3.1. Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - R3.2. Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - R3.3. Develop, maintain, and implement a set of plans for load shedding.
  - R3.4. Develop, maintain, and implement a set of plans for system restoration.
- R4. Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R4.1. Communications protocols to be used during emergencies.
  - R4.2. A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.
  - R4.3. The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.

- R4.4.** Staffing levels for the emergency.
- R5.** Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.
- R6.** The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.
- R7.** The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:
  - R7.1.** The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.
  - R7.2.** The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.
  - R7.3.** The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)
  - R7.4.** The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

**C. Measures**

- M1.** The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2.** The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization.

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

**1.3. Data Retention**

Current plan available at all times.

**1.4. Additional Compliance Information**

Not specified.

## Standard EOP-001-1 — Emergency Operations Planning

### 1.5. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for less than 25% of the adjacent BAs. Or less than 25% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 25% to 50% of the adjacent BAs. Or 25 to 50% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 50% to 75% of the adjacent BAs. Or 50% to 75% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 75% or more of the adjacent BAs. Or more than 75% of those agreements do not contain provisions for emergency assistance.
R2 Deleted				
R3	The Transmission Operator or Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator or Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with four (4) of the sub-components.
R3.1	The Transmission Operator or Balancing Authority's emergency plans to mitigate insufficient generating capacity are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of emergency plans to mitigate insufficient generating capacity emergency plans but the plans are not maintained.	The Transmission Operator or Balancing Authority's emergency plans to mitigate insufficient generating capacity emergency plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop emergency mitigation plans for insufficient generating capacity.
R3.2	The Transmission Operator or Balancing Authority's plans to mitigate transmission system emergencies are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of transmission system emergency plans but are not maintained.	The Transmission Operator or Balancing Authority's transmission system emergency plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement operating emergency mitigation plans for emergencies on the transmission system.

**Standard EOP-001-1 — Emergency Operations Planning**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R3.3	The Transmission Operator or Balancing Authority's load shedding plans are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of load shedding plans but are not maintained.	The Transmission Operator or Balancing Authority's load shedding plans are partially compliant with the requirement but are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement load shedding plans.
R3.4	The Transmission Operator or Balancing Authority's system restoration plans are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's system restoration plans are partially compliant with the requirement but are not maintained.	The Transmission Operator or Balancing Authority's restoration plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement operating emergency mitigation plans for system restoration.
R4	The Transmission Operator or Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator or Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with all four (4) of the sub-components.
R4.1	The Transmission Operator or Balancing Authority's communication protocols included in the emergency plan are missing minor program/procedural elements.	N/A	N/A	The Transmission Operator or Balancing Authority has failed to include communication protocols in its emergency plans to mitigate operating emergencies.
R4.2	The Transmission Operator or Balancing Authority's list of controlling actions has resulted in meeting the intent of the requirement but is missing minor program/procedural elements.	N/A	The Transmission Operator or Balancing Authority provided a list of controlling actions, however the actions fail to resolve the emergency within NERC-established timelines.	The Transmission Operator or Balancing Authority has failed to provide a list of controlling actions to resolve the emergency.

**Standard EOP-001-1 — Emergency Operations Planning**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R4.3	The Transmission Operator or Balancing Authority has demonstrated coordination with Transmission Operators and Balancing Authorities but is missing minor program/procedural elements.	N/A	N/A	The Transmission Operator or Balancing Authority has failed to demonstrate the tasks to be coordinated with adjacent Transmission Operator and Balancing Authorities as directed by the requirement.
R4.4	The Transmission Operator or Balancing Authority's emergency plan does not include staffing levels for the emergency	N/A	N/A	N/A
R5	The Transmission Operator and Balancing Authority's emergency plan has complied with 90% or more of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with 70% to 90% of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with between 50% to 70% of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with 50% or less of the number of sub-components
R6	The Transmission Operator and Balancing Authority is missing minor program/procedural elements.	The Transmission Operator and Balancing Authority has failed to annually review one of it's emergency plans	The Transmission Operator and Balancing Authority has failed to annually review two of its emergency plans or communicate with one of it's neighboring Balancing Authorities.	The Transmission Operator and Balancing Authority has failed to annually review and/or communicate any emergency plans with its Reliability Coordinator, neighboring Transmission Operators or Balancing Authorities.
R7	The Transmission Operator and/or the Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator and/or the Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator and/or the Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator and/or the Balancing Authority has failed to comply with four (4) or more of the sub-components.

**Standard EOP-001-1 — Emergency Operations Planning**

Requirement	Lower	Moderate	High	Severe
R7.1	The Transmission Operator or Balancing Authority has failed to establish and maintain reliable communication between interconnected systems.	N/A	N/A	N/A
R7.2	The Transmission Operator or Balancing Authority has failed to arrange new interchange agreements to provide for emergency capacity or energy transfers with required entities when existing agreements could not be used.	N/A	N/A	N/A
R7.3	The Transmission Operator or Balancing Authority has failed to coordinate transmission and generator maintenance schedules to maximize capacity or conserve fuel in short supply.	N/A	N/A	N/A
R7.4	The Transmission Operator or Balancing Authority has failed to arrange for deliveries of electrical energy or fuel from remote systems through normal operating channels.	N/A	N/A	N/A

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

**Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system’s own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** Reliability Coordination — Facilities
2. **Number:** IRO 002-2
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.
- R2. (Deleted)
- R3. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.
- R4. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.
- R5. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.
- R6. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator

shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.

- R7.** Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.
- R8.** Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.
- R9.** Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

**C. Measures**

- M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 4.
- M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 4.
- M3.** (Deleted)
- M4.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.
- M5.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 7.
- M6.** Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 8)

- M7. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 9 Part 1.
- M8. Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 9 Part 2.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### **1.3. Data Retention**

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1, 2 and 4 through 8.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

#### **1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator has demonstrated communication facilities for both voice and data exist to all appropriate entities and that they are staffed and available but they are less than adequate.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with one appropriate entity or 2) Data links with one appropriate entity.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with two appropriate entities or 2) Data links with two appropriate entities.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with more than two appropriate entities or 2) Data links with more than two appropriate entities or 3) Communication facilities are not staffed or 4) Communication facilities are not ready.
R2 (Deleted)				
R3	N/A	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with one of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with two of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with three of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.

**Standard IRO-002-2 — Reliability Coordination — Facilities**

R4	N/A	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to one of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to two or more of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to all of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with all neighboring Reliability Coordinators.
R5	The Reliability Coordinator's monitoring systems provide information in a way that is not easily understood and interpreted by the Reliability Coordinator's operating personnel or particular emphasis was not given to alarm management and awareness systems, automated data transfers and synchronized information systems.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that one potential or actual SOL or IROL violation is not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that two or more potential and actual SOL and IROL violations are not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that all potential and actual SOL and IROL violations are identified.

<p>R6</p>	<p>The Reliability Coordinator failed to monitor:                      1) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in one SOL violations or                      2) or operating reserves for a small portion of the Reliability Authority Area.</p>	<p>The Reliability Coordinator failed to monitor:                      1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or to system restoration,                      2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations, or                      3) operating reserves.</p>	<p>The Reliability Coordinator failed to monitor:                      1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing two or more IROLs; or one IROL and to system restoration,                      2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations and operating reserves, or                      3) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or system restoration and operating reserves.</p>	<p>The Reliability Coordinator failed to monitor:                      1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all IROLs and to system restoration, or                      2) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all SOL violations and operating reserves.</p>
<p>R7</p>	<p>The Reliability Coordinator failed to demonstrate that it has:                      1) analysis tools capable of assessing all pre-contingency flows,                      2) analysis tools capable of assessing all post-contingency flows, or                      3) all necessary wide-area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has:                      1) analysis tools capable of assessing the majority of pre-contingency flows,                      2) analysis tools capable of assessing the majority of post-contingency flows, or                      3) the majority of necessary wide-area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has:                      1) analysis tools capable of assessing a minority of pre-contingency flows,                      2) analysis tools capable of assessing a minority of post-contingency flows, or                      3) a minority of necessary wide-area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has:                      1) analysis tools capable of assessing any pre-contingency flows,                      2) analysis tools capable of assessing any post-contingency flows, or                      3) any necessary wide-area overview displays exist.</p>

R8	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored SOLs when the main monitoring system was unavailable or</li> <li>2) it has provisions to monitor SOLs when the main monitoring system is not available.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored one IROL when the main monitoring system was unavailable or</li> <li>2) it has provisions to monitor one IROL when the main monitoring system is not available.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored two or more IROLs when the main monitoring system was unavailable,</li> <li>2) it or a delegated entity monitored SOLs and one IROL when the main monitoring system was unavailable</li> <li>3) it has provisions to monitor two or more IROLs when the main monitoring system is not available, or</li> <li>4) it has provisions to monitor SOLs and one IROL when the main monitoring system was unavailable.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that it continuously monitored its Reliability Authority Area.</p>

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Deleted R2, M3 and associated compliance elements Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	Revised

## A. Introduction

1. **Title:** **Reliability Coordination — Current Day Operations**
2. **Number:** IRO-005-3
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.

5. **Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.

- R1.6.** Current ACE for all its Balancing Authorities.
- R1.7.** Current local or Transmission Loading Relief procedures in effect.
- R1.8.** Planned generation dispatches.
- R1.9.** Planned transmission or generation outages.
- R1.10.** Contingency events.
- R2.** Deleted
- R3.** Deleted
- R4.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- R5.** Deleted
- R6.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- R7.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R8.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.
- R9.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.
- R10.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- R11.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.

- R12.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
- R13.** In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R14.** The Transmission Service Provider shall respect SOLs or and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
- R15.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.
- R16.** Deleted
- R17.** Deleted

**C. Measures**

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.
- M2.** Deleted
- M3.** Deleted
- M4.** If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2 and Requirement 10)

- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 6)
- M6.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 7.
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 8 Part 1.
- M8.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 8 Part 2)
- M9.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 9 Part 1)
- M10.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 11 Part 1)
- M11.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 12)

- M12.** If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Part 2 of Requirement 13)
- M13.** Deleted
- M14.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 14 Part 2)
- M15.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 15 Part 1.
- M16.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 15 Part 2.
- M17.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 15 Part 3)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### **1.3. Data Retention**

For Measures 1 and 11, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures 4–10 and Measures 15 through 16, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 8, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 12, the Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 14, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

### **1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.
R1.1	The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.	N/A	N/A	N/A
R1.2	The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.3	The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A
R1.4	The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).	N/A	N/A	N/A
R1.5	The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.	N/A	N/A	N/A
R1.6	The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.	N/A	N/A	N/A
R1.7	The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.	N/A	N/A	N/A
R1.8	The Reliability Coordinator failed to monitor planned generation dispatches.	N/A	N/A	N/A
R1.9	The Reliability Coordinator failed to monitor planned transmission or generation outages.	N/A	N/A	N/A

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.10	The Reliability Coordinator failed to monitor contingency events.	N/A	N/A	N/A
R2 Deleted				
R3 Deleted				
R4	N/A	The Reliability Coordinator failed to direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities.	The Reliability Coordinator failed to issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	The Reliability Coordinator failed to monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves was provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements.
R5 Deleted				
R6	N/A	N/A	The Reliability Coordinator ensured its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information, but failed to assist, when needed, in the development of any required response plans.	The Reliability Coordinator failed to ensure its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R7	N/A	N/A	N/A	The Reliability Coordinator failed to disseminate information within its Reliability Coordinator Area, when required.
R8	N/A	N/A	The Reliability Coordinator monitored system frequency and its Balancing Authorities' performance but failed to direct any necessary rebalancing to return to CPS and DCS compliance.	The Reliability Coordinator failed to monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance or the responsible entity failed to utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R9	N/A	The Reliability Coordinator coordinated with Transmission Operators, Balancing Authorities, and Generator Operators, as needed, to develop action plans to mitigate potential or actual SOL, CPS, or DCS violations but failed to implement said plans, or the Reliability Coordinator coordinated pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in the real-time reliability analysis timeframe but failed to coordinate pending generation and transmission maintenance outages in the next-day reliability analysis timeframe.	The Reliability Coordinator failed to coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations, or the Reliability Coordinator failed to coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real-time and next-day reliability analysis timeframes.	The Reliability Coordinator failed to coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations and the Reliability Coordinator failed to coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real-time and next-day reliability analysis timeframes.
R10	N/A	N/A	N/A	The Reliability Coordinator failed to assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities, when necessary.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R11	N/A	The Reliability Coordinator identified sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange and discussed corrective actions with the appropriate Balancing Authority but failed to direct the Balancing Authority to comply with CPS and DCS.	The Reliability Coordinator identified sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange but failed to discuss corrective actions with the appropriate Balancing Authority.	The Reliability Coordinator failed to identify sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange.
R12	N/A	N/A	N/A	The Reliability Coordinator failed to be aware of the impact on inter-area flows of an inter-Balancing Authority or inter-Transmission Operator, following the operation of a Special Protection System that is armed (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation), or the Transmission Operator failed to immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R13	N/A	N/A	N/A	The responsible entity failed to operate the Bulk Electric System to the most limiting parameter in instances where there was a difference in derived limits.
R14	N/A	N/A	N/A	The Transmission Service Provider failed to respect SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
R15	N/A	The Reliability Coordinator failed to notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.	N/A	The Reliability Coordinator who foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area failed to issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area, or the receiving Reliability Coordinator failed to disseminate this information to its impacted Transmission Operators and Balancing Authorities.

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-1
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.
- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.

- R3.** Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4.** Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

**C. Measures**

- M1.** Evidence that the Generator Operator, Transmission Operator, and Balancing Authority reported and coordinated scheduled outage information as indicated in the requirements above.

**D. Compliance**

**1. Compliance Monitoring Process**

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

**1.1. Compliance Monitoring Responsibility**

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

**1.2. Compliance Monitoring Period and Reset Timeframe**

One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

One calendar year.

**1.4. Additional Compliance Information**

Not specified.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The Generator Operator failed to provide outage information, in accordance with its Transmission Operators established outage reporting requirements, to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW).
R1.1	N/A	N/A	N/A	The Transmission Operator failed to provide outage information, in accordance with its Reliability Coordinators established outage reporting requirement, to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.

**Standard-TOP-003-1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.2	The responsible entity failed to provide the information by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	N/A	N/A	N/A
R1.3	N/A	N/A	N/A	The responsible entity failed to plan or coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators when required.

**Standard-TOP-003-1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R2	The responsible entity planned and coordinated scheduled outages of telemetering and control equipment and associated communication channels with its Reliability Coordinator, but failed to coordinate with affected neighboring Transmission Operators, Balancing Authorities, and Generator Operators.	N/A	N/A	The responsible entity failed to plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
R3  R4	N/A  The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 30 minutes but less than or equal to 35 minutes.	N/A  The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 35 minutes but less than or equal to 40 minutes.	N/A  The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 40 minutes but less than or equal to 45 minutes.	The Reliability Coordinator failed to resolve any scheduling of potential reliability conflicts.  The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 45 minutes.

  - 4.2. Balancing Authorities.
  - 4.3. Deleted
  - 4.4. Purchasing Selling Entities.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Deleted
  - R1.1. Deleted
- R2. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”
- R3. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.
- R4. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

## **C. Measures**

- M1.** Evidence that the Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

#### **1.3. Data Retention**

Not specified.

#### **1.4. Additional Compliance Information**

Not specified.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1 Deleted				
R1.1 Deleted				
R2	N/A	N/A	N/A	The ISN data recipient failed to sign the NERC Confidentiality Agreement for “Electric System Reliability Data”.
R3	The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.	N/A	N/A	The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.
R4	The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.	N/A	N/A	The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.

### E. Regional Differences

### Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1		Removed the Reliability Coordinator from the list of responsible functional entities Deleted R1 and R1.1 Modified M1 Deleted VSLs for R1 and R1.1	Revised

## A. Introduction

1. **Title:** Monitoring System Conditions

2. **Number:** TOP-006-2

3. **Purpose:**

To ensure critical reliability parameters are monitored in real-time.

4. **Applicability**

4.1. Transmission Operators.

4.2. Balancing Authorities.

4.3. Generator Operators.

4.4. Reliability Coordinators.

5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

**R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.

**R1.1.** Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.

**R1.2.** Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.

**R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**R3.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.

**R4.** Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.

**R5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important

deviations in operating conditions and to indicate, if appropriate, the need for corrective action.

- R6.** Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
- R7.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

**C. Measures**

- M1.** The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

**D. Compliance**

- 1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.

Each Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

**1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The responsible entity failed to know the status of all generation and transmission resources available for use, even though said information was reported by the Generator Operator, Transmission Operator, or Balancing Authority.
R1.1	N/A	N/A	N/A	The Generator Operator failed to inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
R1.2	N/A	N/A	N/A	The responsible entity failed to inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
R2	N/A	The responsible entity monitors the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, but is not aware of the status of rotating and static reactive resources.	The responsible entity fails to monitor all of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of all rotating and static reactive resources.	The responsible entity fails to monitor any of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**Standard TOP-006-2 — Monitoring System Conditions**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R3	The responsible entity failed to provide any of the appropriate technical information concerning protective relays to their operating personnel.	N/A	N/A	The responsible entity failed to provide all of the appropriate technical information concerning protective relays to their operating personnel.
R4	N/A	N/A	The responsible entity has either weather forecasts or past load patterns, available to predict the system's near-term load pattern, but not both.	The responsible entity failed to have both weather forecasts and past load patterns, available to predict the system's near-term load pattern.
R5	N/A	N/A	The responsible entity used monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions, but does not have indication of the need for corrective action.	The responsible entity failed to use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions.
R6	N/A	N/A	N/A	The responsible entity failed to use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
R7	N/A	N/A	N/A	The responsible entity failed to monitor system frequency.

0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Modified R4 Modified M4 Modified Data Retention for M4 Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)	Revised

## A. Introduction

1. **Title:** **Emergency Operations Planning**
2. **Number:** EOP-001-0
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Dates:** ~~April 1, 2005~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- ~~R2. The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.~~
- R3. Each Transmission Operator and Balancing Authority shall:
  - R3.1. Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - R3.2. Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - R3.3. Develop, maintain, and implement a set of plans for load shedding.
  - R3.4. Develop, maintain, and implement a set of plans for system restoration.
- R4. Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R4.1. Communications protocols to be used during emergencies.

- R4.2.** A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.
- R4.3.** The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.
- R4.4.** Staffing levels for the emergency.
- R5.** Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.
- R6.** The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.
- R7.** The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:
  - R7.1.** The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.
  - R7.2.** The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.
  - R7.3.** The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)
  - R7.4.** The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

### **C. Measures**

- M1.** The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2.** The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization.

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

## Standard EOP-001-~~0~~1 — Emergency Operations Planning

### 1.3. Data Retention

Current plan available at all times.

### 1.4. Additional Compliance Information

Not specified.

### ~~2. Levels of Non-Compliance~~

~~2.1. Level 1: One of the applicable elements of Attachment 1 EOP-001-0 has not been addressed in the emergency plans.~~

~~2.2. Level 2: Two of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans.~~

~~2.3. Level 3: Three of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans.~~

~~1.5. Level 4: Four or more of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans or a plan does not exist.~~

Violation Severity Levels (VSLs) for this standard were not approved by their ballot pool but were approved by the BOT on February 28, 2008 and the VSLs replace the Levels of Non-compliance.

When the BOT approves new VSLs for this standard, the new VSLs will replace those shown below. The new VSLs for R2 will be retired when EOP-001-1 becomes effective.

**Standard EOP-001-0.1 — Emergency Operations Planning**

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for less than 25% of the adjacent BAs. Or less than 25% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 25% to 50% of the adjacent BAs.  Or 25 to 50% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 50% to 75% of the adjacent BAs.  Or 50% to 75% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 75% or more of the adjacent BAs.  Or more than 75% of those agreements do not contain provisions for emergency assistance.

**Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system’s own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** Reliability Coordination — Facilities
2. **Number:** IRO 002-~~12~~
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:** ~~January 1, 2007~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.
- ~~R2. Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities, or adjacent Reliability Coordinators.~~
- R3. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.
- R4. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.
- R5. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.

- R6. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.
- R7. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.
- R8. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.
- R9. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

### C. Measures

- M1. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 4.
- M2. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 4.
- ~~M3. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a letter to Transmission Operators, Balancing Authorities, Transmission Owners, Generator Owners, Generator Operators, and Load Serving Entities, or adjacent Reliability Coordinators, or other equivalent evidence that will be used to confirm that the Reliability Coordinator has requested the data required to support its reliability coordination tasks. (Requirement 2)~~
- M4. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.

- M5. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 7.
- M6. Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 8)
- M7. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 9 Part 1.
- M8. Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 9 Part 2.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1, 2 and 4 through 8.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

#### 1.4. Additional Compliance Information

None.

### ~~2. Levels of Non-Compliance for a Reliability Coordinator~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in R3.~~

~~2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~2.3.1 Has not requested the data required to support its reliability coordination tasks. (Requirement 2)~~

~~2.4. Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (R7) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in R9.~~

~~2.5. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.5.1 Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and R4)~~

~~2.5.2 Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in R5.~~

~~2.5.31.4.1 Does not have a documented procedure for the use of its backup monitoring facilities. (R8)~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator has demonstrated communication facilities for both voice and data exist to all appropriate entities and that they are staffed and available but they are less than adequate.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with one appropriate entity or 2) Data links with one appropriate entity.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with two appropriate entities or 2) Data links with two appropriate entities.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with more than two appropriate entities or 2) Data links with more than two appropriate entities or 3) Communication facilities are not staffed or 4) Communication facilities are not ready.

Requirement	Lower	Moderate	High	Severe
R2	<p>The Reliability Coordinator demonstrated that it</p> <p>1) determined its data requirements and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators with a material impact on the Bulk Electric System in its Reliability Coordination Area but did not request the data from Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators with minimal impact on the Bulk Electric System in its Reliability Coordination Area or</p> <p>2) determined its data requirements necessary to perform its reliability functions with the exceptions of data that may be needed for administrative purposes such as data reporting.</p>	<p>The Reliability Coordinator demonstrated that it determined the majority but not all of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator demonstrated that it determined</p> <p>1) some but less than the majority of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators or</p> <p>2) all of its data requirements necessary to support its reliability coordination functions but failed to demonstrate that it requested data from two of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator failed to demonstrate that it</p> <p>1) determined its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators or</p> <p>2) requested the data from three or more of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>

Requirement	Lower	Moderate	High	Severe
R3	N/A	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with one of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with two of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with three of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.
R4	N/A	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to one of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to two or more of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to all of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with all neighboring Reliability Coordinators.
R5	The Reliability Coordinator's monitoring systems provide information in a way that is not easily understood and interpreted by the Reliability Coordinator's operating personnel or particular emphasis was not given to alarm management and awareness systems, automated data transfers and synchronized information systems.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that one potential or actual SOL or IROL violation is not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that two or more potential and actual SOL and IROL violations are not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that all potential and actual SOL and IROL violations are identified.

Requirement	Lower	Moderate	High	Severe
R6	<p>The Reliability Coordinator failed to monitor:</p> <ol style="list-style-type: none"> <li>1) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in one SOL violations or</li> <li>2) or operating reserves for a small portion of the Reliability Authority Area.</li> </ol>	<p>The Reliability Coordinator failed to monitor:</p> <ol style="list-style-type: none"> <li>1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or to system restoration,</li> <li>2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations, or</li> <li>3) operating reserves.</li> </ol>	<p>The Reliability Coordinator failed to monitor:</p> <ol style="list-style-type: none"> <li>1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing two or more IROLs; or one IROL and to system restoration,</li> <li>2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations and operating reserves, or</li> <li>3) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or system restoration and operating reserves.</li> </ol>	<p>The Reliability Coordinator failed to monitor:</p> <ol style="list-style-type: none"> <li>1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all IROLs and to system restoration, or</li> <li>2) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all SOL violations and operating reserves.</li> </ol>
R7	<p>The Reliability Coordinator failed to demonstrate that it has:</p> <ol style="list-style-type: none"> <li>1) analysis tools capable of assessing all pre-contingency flows,</li> <li>2) analysis tools capable of assessing all post-contingency flows, or</li> <li>3) all necessary wide-area overview displays exist.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that it has:</p> <ol style="list-style-type: none"> <li>1) analysis tools capable of assessing the majority of pre-contingency flows,</li> <li>2) analysis tools capable of assessing the majority of post-contingency flows, or</li> <li>3) the majority of necessary wide-area overview displays exist.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that it has:</p> <ol style="list-style-type: none"> <li>1) analysis tools capable of assessing a minority of pre-contingency flows,</li> <li>2) analysis tools capable of assessing a minority of post-contingency flows, or</li> <li>3) a minority of necessary wide-area overview displays exist.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that it has:</p> <ol style="list-style-type: none"> <li>1) analysis tools capable of assessing any pre-contingency flows,</li> <li>2) analysis tools capable of assessing any post-contingency flows, or</li> <li>3) any necessary wide-area overview displays exist.</li> </ol>

Requirement	Lower	Moderate	High	Severe
R8	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored SOLs when the main monitoring system was unavailable or</li> <li>2) it has provisions to monitor SOLs when the main monitoring system is not available.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored one IROL when the main monitoring system was unavailable or</li> <li>2) it has provisions to monitor one IROL when the main monitoring system is not available.</li> </ol>	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> <li>1) it or a delegated entity monitored two or more IROLs when the main monitoring system was unavailable,</li> <li>2) it or a delegated entity monitored SOLs and one IROL when the main monitoring system was unavailable</li> <li>3) it has provisions to monitor two or <del>or</del> more IROLs when the main monitoring system is not available, or</li> <li>4) it has provisions to monitor SOLs and one IROL when the main monitoring system was unavailable.</li> </ol>	<p><b>R10.</b> The Reliability Coordinator failed to demonstrate that it continuously monitored its Reliability Authority Area.</p>
R9	<p>Reliability Coordinator has approval rights for planned maintenance outages of analysis tools but does not have approval rights for work on analysis tools that creates a greater risk of an unplanned outage of the tools.</p>	<p>Reliability Coordinator has approval rights for planned maintenance but does not have plans to mitigate the effects of outages of the analysis tools.</p>	<p>Reliability Coordinator has approval rights for planned maintenance but does not have plans to mitigate the effects of outages of the analysis tools and does not have approval rights for work on analysis tools that creates a greater risk of an unplanned outage of the tools.</p>	<p>Reliability Coordinator approval is not required for planned maintenance.</p>

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

Retire Entire Standard

A. Introduction

1. **Title:** ~~Reliability Coordination — Operations Planning~~
2. **Number:** ~~IRO-004-1~~
3. **Purpose:** ~~Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.~~
4. **Applicability**
  - ~~4.1. Reliability Coordinators.~~
  - ~~4.2. Balancing Authorities.~~
  - ~~4.3. Transmission Operators.~~
  - ~~4.4. Transmission Service Providers.~~
  - ~~4.5. Transmission Owners.~~
  - ~~4.6. Generator Owners.~~
  - ~~4.7. Generator Operators.~~
  - ~~4.8. Load-Serving Entities.~~
5. **Proposed Effective Date:** ~~November 1, 2006~~

~~In those jurisdictions where no regulatory approval is required, the standard shall be retired on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.~~

~~In those jurisdictions where regulatory approval is required, the standard shall be retired effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.~~

B. Requirements

- ~~R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.~~
- ~~R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.~~
- ~~R3-R1. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.~~

~~R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.~~

~~R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.~~

~~R6-R2. \_\_\_\_\_ If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.~~

~~R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.~~

## C. Measures

~~M1. Evidence that the Reliability Coordinator conducted next day contingency analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System could be operated reliably in anticipated normal and Contingency conditions.~~

## D. Compliance

### 1. Compliance Monitoring Process

~~Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on-site audit, Reliability Coordinators will be asked to provide documentation showing that next day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits, etc.~~

#### 1.1. Compliance Monitoring Responsibility

~~Self-Certification: Each Reliability Coordinator must annually self-certify compliance to its Regional Reliability Organization with the completion of the studies and action plans in Requirements R1, R2 and R3.~~

~~Exception Reporting: Reliability Coordinators will prepare a monthly report to the Regional Reliability Organization for each month that system studies were not conducted, indicating the dates that studies were not done and the reason why.~~

#### 1.2. Compliance Monitoring Period and Reset Time Frame

~~One year without a violation from the time of the violation.~~

#### 1.3. Data Retention

~~Documentation shall be available for 3 months to provide verification that system studies were performed as required.~~

**1.4. Additional Compliance Information**

~~None identified.~~

**2. Levels of Non-Compliance**

~~2.1. Level 1: System studies were not conducted for one day in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.2. Level 2: System studies were not conducted for 2–3 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.3. Level 3: System studies were not conducted for 4–5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.4. Level 4: System studies were not conducted for more than 5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

**E. Regional Differences**

~~None identified.~~

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-~~23~~
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Effective Date:** ~~January 1, 2007~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.
  - R1.6. Current ACE for all its Balancing Authorities.

**R1.7.** Current local or Transmission Loading Relief procedures in effect.

**R1.8.** Planned generation dispatches.

**R1.9.** Planned transmission or generation outages.

**R1.10.** Contingency events.

~~**R2.** Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.~~

~~**R3.** As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.~~

**R4.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.

~~**R5.** Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.~~

**R6.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.

**R7.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.

**R8.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

**R9.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.

**R10.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.

- R11.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- R12.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
- R13.** ~~Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection.~~ In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R14.** ~~Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide area view.~~ The Transmission Service Providers shall respect these SOLs or and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
- R15.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.
- R16.** ~~Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.~~
- R17.** ~~When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.~~

### **C. Measures**

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.

## Standard IRO-005-~~2~~3 — Reliability Coordination — Current Day Operations

---

- ~~M2. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Historical Tag Archive information, Interchange Transaction records, computer printouts, voice recordings or transcripts of voice recordings or equivalent evidence that will be used to confirm that it was aware of and made Interchange Transaction information available to all other Reliability Coordinators, as specified in Requirement 2.~~
- ~~M3. If a potential or actual IROL violation occurs, the Reliability Coordinator involved in the event shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, system event logs, operator action notes or equivalent evidence that will be used to determine if it initiated control actions or emergency procedures to relieve that IROL violation within 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~
- M4. If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2 and Requirement 10)
- M5. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 6)
- M6. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 7.
- M7. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 8 Part 1.
- M8. The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 8 Part 2)
- M9. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 9 Part 1)

- M10.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 11 Part 1)
- M11.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 12)
- M12.** If there is an instance where there is a disagreement on a derived limit, the **Reliability Coordinator**, Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Part 2 of Requirement 13)
- ~~**M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it provided SOL and IROL information to Transmission Service Providers within its Reliability Coordinator Area. (Requirement 14, Part 1)~~
- M14.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 14 Part 2)
- M15.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 15 Part 1.
- M16.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 15 Part 2.
- M17.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified

all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 15 Part 3)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

For Measures 1 and 11, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures ~~24~~-10 and ~~Measure 13~~, and Measures 15 through 16, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 8, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 12, the ~~Reliability Coordinator~~, Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 14, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

~~**2. Levels of Non-Compliance for a Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider**~~

~~**2.1. Level 1:** Not applicable.~~

~~**2.2. Level 2:** Not applicable.~~

~~**2.3. Level 3:** Not applicable.~~

~~**2.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**2.4.1** Did not follow the Reliability Coordinator's directives in accordance with R8 Part 2).~~

~~**2.4.2** Did not operate to the most limiting parameter when a difference in derived limits existed. (R13 Part 2)~~

~~**3. Levels of Non-Compliance for a Reliability Coordinator:**~~

~~**3.1. Level 1:** Not applicable.~~

~~**3.2. Level 2:** Did not make Interchange Transaction information available to all other Reliability Coordinators in the Interconnection. (Requirement 2)~~

~~**3.3. Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~**3.3.1** Did not communicate to each of its Balancing Authorities and Transmission Operators to make them aware of GMD forecast information or did not assist in the development of any required response plans to a predicted GMD. (Requirement 6)~~

~~**3.3.2** Did not disseminate information within its Reliability Coordinator Area. (Requirement 7)~~

~~**3.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~**3.4.1** Does not meet one or more of the requirements as specified in requirement 1 (Requirements 1.1 through R1.9)~~

~~**3.4.2** Did not make Interchange Transaction information available to all other Reliability Coordinators. (Requirement 2)~~

- ~~3.4.3 Did not initiate control actions or emergency procedures to relieve an IROL violation without delay, and no longer than 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~
- ~~3.4.4 Did not direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2)~~
- ~~3.4.5 Did not monitor the system frequency or each of its Balancing Authorities performance or did not direct rebalancing to return to DCS and CPS compliance. (Requirement 8 Part 1)~~
- ~~3.4.6 Did not coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. (Requirement 9)~~
- ~~3.4.7 When it identified a source of large Area Control Errors, it did not initiate corrective actions with the appropriate Balancing Authority if the problem was inside its Reliability Coordinator Area. (Requirement 11 part 1)~~
- ~~3.4.8 Did not provide evidence that it was aware of the impact of the operation of a Special Protection System on inter-area flows. (Requirement 12)~~
- ~~3.4.9 Did not operate to the most limiting parameter when a difference in derived limits existed. (Requirement 13 Part 2)~~
- ~~3.4.10 Did not provide Transmission Service Providers with SOLs or IROLs (within the Reliability Coordinator's wide-area view) (Requirement 14 Part 1)~~
- ~~3.4.11 Did not issue alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area. (Requirement 15)~~

#### ~~4. Levels of Non-Compliance for a Transmission Service Provider~~

~~4.1. Level 1: Not applicable.~~

~~4.2. Level 2: Not applicable.~~

~~4.3. Level 3: Not applicable.~~

~~4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~4.4.1 Did not operate to the most limiting parameter when a difference in derived limits existed. (R13 Part 2)~~

~~1.4.1 Did not respect the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14 Part 2)~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.
R1.1	The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.	N/A	N/A	N/A
R1.2	The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A

**Standard IRO-005-~~2.3~~ — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.3	The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A
R1.4	The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).	N/A	N/A	N/A
R1.5	The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.	N/A	N/A	N/A
R1.6	The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.	N/A	N/A	N/A
R1.7	The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.	N/A	N/A	N/A
R1.8	The Reliability Coordinator failed to monitor planned generation dispatches.	N/A	N/A	N/A
R1.9	The Reliability Coordinator failed to monitor planned transmission or generation outages.	N/A	N/A	N/A

Standard IRO-005-~~2~~3 — Reliability Coordination — Current Day Operations

Requirement	Lower	Moderate	High	Severe
R1.10	The Reliability Coordinator failed to monitor contingency events.	N/A	N/A	N/A
<del>R2</del>	<del>N/A</del>	<del>N/A</del>	<del>The Reliability Coordinator was aware of all Interchange Transactions that wheeled through, sourced, or sunked in its Reliability Coordinator Area, but failed to make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</del>	<del>The Reliability Coordinator failed to be aware of all Interchange Transactions that wheeled through, sourced, or sunked in its Reliability Coordinator Area, and failed to make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</del>

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-~~0~~1
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** ~~April 1, 2005~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.
- R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

### C. Measures

- M1. Evidence that the Generator Operator, Transmission Operator, and Balancing Authority, ~~and Reliability Coordinator~~ reported and coordinated scheduled outage information as indicated in the requirements above.

### D. Compliance

#### 1. Compliance Monitoring Process

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

#### 1.1. Compliance Monitoring Responsibility

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

#### 1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year without a violation from the time of the violation.

#### 1.3. Data Retention

One calendar year.

**1.4. Additional Compliance Information**

Not specified.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

**~~2.~~ Levels of Non-Compliance**

~~2.1. Level 1: Each entity responsible for reporting information under Requirements R1 and R3 has a process in place to provide information to their Reliability Coordinator but does not have a process in place (where permitted by legal agreements) to provide this information to the neighboring Balancing Authority or Transmission Operator.~~

~~2.2. Level 2: N/A.~~

~~2.3. Level 3: N/A.~~

**1.5. Level 4:** — There is no process in place to exchange outage information, or the entity responsible for reporting information under Requirements R1 to R3 does not follow the directives of the Reliability Coordinator to cancel or reschedule an outage.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The Generator Operator failed to provide outage information, in accordance with its Transmission Operators established outage reporting requirements, to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW).

**Standard-TOP-003-0-1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.1	N/A	N/A	N/A	The Transmission Operator failed to provide outage information, in accordance with its Reliability Coordinators established outage reporting requirement, to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.
R1.2	The responsible entity failed to provide the information by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	N/A	N/A	N/A

**Standard-TOP-003-0.1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.3	N/A	N/A	N/A	The responsible entity failed to plan or coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators when required.
R2	The responsible entity planned and coordinated scheduled outages of telemetering and control equipment and associated communication channels with its Reliability Coordinator, but failed to coordinate with affected neighboring Transmission Operators, Balancing Authorities, and Generator Operators.	N/A	N/A	The responsible entity failed to plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
R3	N/A	N/A	N/A	The Reliability Coordinator failed to resolve any scheduling of potential reliability conflicts.

**Standard-TOP-003-0.1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R4	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 30 minutes but less than or equal to 35 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 35 minutes but less than or equal to 40 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 40 minutes but less than or equal to 45 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 45 minutes.

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1		Modified R1.2 Modified M1 Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)	Revised

## A. Introduction

1. **Title:** **Operational Reliability Information**
2. **Number:** TOP-005-~~1~~2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - ~~4.3. Reliability Coordinators.~~
  - 4.4. Purchasing Selling Entities.

5. **Proposed Effective Date:** ~~November 1, 2006~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

~~R1.— Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.~~

~~R1.1.— Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.~~

- R2. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”
- R3. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.

R4. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

### C. Measures

M1. Evidence that the ~~Reliability Coordinator~~, Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

##### 1.3. Data Retention

Not specified.

##### 1.4. Additional Compliance Information

Not specified.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

#### ~~2. Levels of Non-Compliance~~

~~2.1. Level 1:— Each entity responsible for reporting information under Requirements R1 to R5 is providing the requesting entities with the data required, in specified time intervals and format, but there are problems with consistency of delivery identified in the measuring process that need remedy (e.g., the data is not supplied consistently due to equipment malfunctions, or scaling is incorrect).~~

~~2.2. Level 2: N/A.~~

~~2.3. Level 3: N/A.~~

1.5. **Level 4:**— Each entity responsible for reporting information under Requirements R1 to R5 R3 is not providing the requesting entities with data with the specified content, timeliness, or format. The information missing is included in the requesting entity's list of data.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
<del>R1</del>	<del>The responsible entity failed to provide all of the data requested by its Reliability Coordinator.</del>	<del>N/A</del>	<del>N/A</del>	<del>The responsible entity failed to provide all of the data requested by its Reliability Coordinator.</del>

**Attachment 1-TOP-005-0**

**Electric System Reliability Data**

This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.

~~1. The following information shall be updated at least every ten minutes:~~

~~1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:~~

~~1.1.1 Status.~~

~~1.1.2 MW or ampere loadings.~~

~~1.1.3 MVA capability.~~

~~1.1.4 Transformer tap and phase angle settings.~~

~~1.1.5 Key voltages.~~

~~1.2. Generator data.~~

~~1.2.1 Status.~~

~~1.2.2 MW and MVAR capability.~~

~~1.2.3 MW and MVAR net output.~~

~~1.2.4 Status of automatic voltage control facilities.~~

~~1.3. Operating reserve.~~

~~1.3.1 MW reserve available within ten minutes.~~

~~1.4. Balancing Authority demand.~~

~~1.4.1 Instantaneous.~~

~~1.5. Interchange.~~

~~1.5.1 Instantaneous actual interchange with each Balancing Authority.~~

~~1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.~~

~~1.5.3 Interchange Schedules for the next 24 hours.~~

~~1.6. Area Control Error and frequency.~~

~~1.6.1 Instantaneous area control error.~~

~~1.6.2 Clock hour area control error.~~

~~1.6.3 System frequency at one or more locations in the Balancing Authority.~~

~~2. Other operating information updated as soon as available.~~

~~2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.~~

~~2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.~~

~~2.3. Forecast peak demand for current day and next day.~~

~~2.4. Forecast changes in equipment status.~~

~~2.5. New facilities in place.~~

~~2.6. New or degraded special protection systems.~~

~~2.7. Emergency operating procedures in effect.~~

~~2.8. Severe weather, fire, or earthquake.~~

~~2.9. Multi-site sabotage.~~

## A. Introduction

1. **Title:** Monitoring System Conditions

2. **Number:** TOP-006-~~1~~2

3. **Purpose:**

To ensure critical reliability parameters are monitored in real-time.

4. **Applicability**

4.1. Transmission Operators.

4.2. Balancing Authorities.

4.3. Generator Operators.

4.4. Reliability Coordinators.

5. **Proposed Effective Date:** ~~January 1, 2007~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

**R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.

**R1.1.** Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.

**R1.2.** Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.

**R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**R3.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.

**R4.** Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.

**R5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important

deviations in operating conditions and to indicate, if appropriate, the need for corrective action.

- R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
- R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

### C. Measures

- M1. The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

### D. Compliance

- 1. Compliance Monitoring Process

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

**1.4. Additional Compliance Information**

None.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

~~2. Levels of Non-Compliance for Reliability Coordinators:~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Not applicable.~~

~~2.3. Level 3: Not applicable.~~

~~2.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.4.1 Does not monitor all of the applicable items listed in Requirement 2.~~

~~2.4.2 Did not have the information specified in R4.~~

~~2.4.3 Did not bring to the attention of its operators, important deviations in operating conditions and the need for corrective actions. (Requirement 5)~~

~~2.4.4 No evidence it monitors system frequency. (Requirement 7)~~

~~3. Levels of Non-Compliance for Generator Operators:~~

~~3.1. Level 1: Not applicable.~~

~~3.2. Level 2: Not applicable.~~

~~3.3. Level 3: Not applicable.~~

~~3.4. Level 4: Did not inform its Host Balancing Authority and/or the Transmission Operator of all generation resources available for use. (R1.1)~~

~~4. Levels of Non-Compliance for Transmission Operators and Balancing Authorities:~~

~~4.1. Level 1: Not applicable.~~

~~4.2. Level 2: Not applicable.~~

~~4.3. Level 3: Not applicable.~~

~~4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~4.4.1 Did not inform the Reliability Coordinator and/or other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use in accordance with R1.2.~~

~~4.4.2 Does not monitor all the applicable items listed in R2.~~

~~4.4.3 Did not have the information specified in R4.~~

~~4.4.4 Does not have monitoring to bring to the attention of operating personnel important deviations in operating conditions and the need for corrective actions as specified in R5.~~

~~4.4.5 No evidence it monitors system frequency. (R7).~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The responsible entity failed to know the status of all generation and transmission resources available for use, even though said information was reported by the Generator Operator, Transmission Operator, or Balancing Authority.
R1.1	N/A	N/A	N/A	The Generator Operator failed to inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
R1.2	N/A	N/A	N/A	The responsible entity failed to inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
R2	N/A	The responsible entity monitors the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, but is not aware of the status of rotating and static reactive resources.	The responsible entity fails to monitor all of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of all rotating and static reactive resources.	The responsible entity fails to monitor any of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**Standard TOP-006-1.2— Monitoring System Conditions**

Requirement	Lower	Moderate	High	Severe
R3	The responsible entity failed to provide any of the appropriate technical information concerning protective relays to their operating personnel.	N/A	N/A	The responsible entity failed to provide all of the appropriate technical information concerning protective relays to their operating personnel.
R4	N/A	N/A	The responsible entity has either weather forecasts or past load patterns, available to predict the system's near-term load pattern, but not both.	The responsible entity failed to have both weather forecasts and past load patterns, available to predict the system's near-term load pattern.
R5	N/A	N/A	The responsible entity used monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions, but does not have indication of the need for corrective action.	The responsible entity failed to use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions.
R6	N/A	N/A	N/A	The responsible entity failed to use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
R7	N/A	N/A	N/A	The responsible entity failed to monitor system frequency.

**E. Regional Differences**

None identified.

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### **Description of Current Draft:**

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team delayed balloting pending the outcome of the FAC-010, FAC-011, and FAC-014 standards. During the waiting period, the drafting team modified the set of IROL standards to bring them into conformance with the latest guidelines for drafting standards. The IROL SDT is posting the revised set of IROL standards and a revised implementation plan for a 30-day comment period through April 25, 2008.

### **Future Development Plan:**

#### **Anticipated Actions**

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### **Anticipated Date**

May 12–June 10, 2008  
June 11–20, 2008  
June 30–July 9, 2008  
July 29, 2008  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3. When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, the results of its Operational Planning Analyses.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence to show it conducted a Real-Time Assessment at least once every 30 minutes. This evidence could include, but is not limited to, dated computer log showing times the assessment was conducted, dated checklists, or other evidence.
- M3. The Reliability Coordinator shall have and provide upon request, evidence to confirm that it shared the results of its Operational Planning Analyses or Real-Time

Assessments with those entities expected to take actions based on that information. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated transcripts of voice records, dated facsimiles, or other evidence.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

#### **1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

The Reliability Coordinator shall retain evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days. The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months.

#### **1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except one of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except two of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except three of 30 days. (R1)	Missed performing an Operational Planning Analysis that covers all aspects of the requirement for four or more of 30 days. (R1)
<b>R2</b>	A Real-time Assessment was not conducted for one 30-minute period within a 24-hour period (R2)	Real-time Assessments were not conducted for two 30-minute periods within a 24-hour period (R2)	Real-time Assessments were not conducted for three 30-minute periods within a 24-hour period (R2)	Real-time Assessments were not conducted for more than three 30-minute periods within a 24-hour period (R2)
<b>R3</b>		Shared the results with some but not all of the entities that were required to take action (R3)		Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts drafts and implementation plan for pre-ballot review (March 15 – April 13, 2007)

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team delayed balloting pending the outcome of the FAC-010, FAC-011, and FAC-014 standards. During the waiting period, the drafting team modified the set of IROL standards to bring them into conformance with the latest guidelines for drafting standards. The IROL SDT is posting the revised set of IROL standards and a revised implementation plan for a 30-day comment period through April 25, 2008.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.

#### Anticipated Date

May 12–June 10, 2008  
June 11–20, 2008  
June 30–July 9, 2008

4. Submit to BOT for adoption.
5. File for regulatory approvals.

July 29, 2008

To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. The IROLs covered in this standard are limited to those associated with contingencies studied under FAC-011 and FAC-014.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2. For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3. When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R4. When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

- R5.** If unanimity cannot be reached on the value for an IROL or its  $T_v$ , each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

**C. Measures**

- M1.** Each Reliability Coordinator shall have, and provide upon request, evidence to confirm that it has Operating Processes, Procedures, or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement R1 and Requirement R2. This evidence shall include a list of any IROLs (and each associated  $T_v$ ) identified in advance, along with one or more dated Operating Processes, Procedures, or Plans that that will be used.
- M2.** Each Reliability Coordinator shall have, and provide upon request, evidence to confirm that it acted or directed others to act in accordance with Requirement R3 and Requirement R4. This evidence could include, but is not limited to, dated operating logs, dated voice recordings, dated transcripts of voice recordings, or other evidence.
- M3.** For a situation where Reliability Coordinators disagree on the value of an IROL or its  $T_v$  the Reliability Coordinator shall have, and provide upon request, evidence to confirm that it used the most conservative of the values under consideration, without delay. Such evidence could include, but is not limited to, dated computer printouts, dated operator logs, dated voice recordings, dated transcripts of voice recordings, or other equivalent evidence. (R5)

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

Exception Reporting

#### 1.4. Data Retention

The Reliability Coordinator, shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain evidence of Requirement R1, Requirement R2, and Measure M1, for a rolling 12 months.

The Reliability Coordinator shall retain evidence of Requirement R3, Requirement R4, Requirement R5, Measure M2, and Measure M3 for a rolling 12 months.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records, and all IROL Violation Reports submitted since the last audit.

#### 1.5. Additional Compliance Information

**Exception Reporting:** For each instance of exceeding an IROL for time greater than IROL  $T_v$ , the Reliability Coordinator shall submit an IROL Violation Report to its Compliance Enforcement Authority within 30 days of the initiation of the event.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>				An IROL was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to prevent exceeding that IROL. (R1)
<b>R2</b>				An IROL identified one or more days in advance does not have an Operating Process, Procedure, or Plan that identifies actions to mitigate exceeding that IROL within the IROL's T <sub>v</sub> . (R2)
<b>R3</b>			An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but the Operating Processes, Procedures, or Plans that were implemented did not prevent exceeding the IROL. (R3)	An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures, or Plans were implemented. (R3)
<b>R4</b>			Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five minutes or more before acting or directing others to act to mitigate the	Actual system conditions showed that there was an instance of exceeding an IROL, and a delay before acting or directing others to act resulted in a failure to mitigate the magnitude and

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team delayed balloting pending the outcome of the FAC-010, FAC-011, and FAC-014 standards. During the waiting period, the drafting team modified the set of IROL standards to bring them into conformance with the latest guidelines for drafting standards. The IROL SDT is posting the revised set of IROL standards and a revised implementation plan for a 30-day comment period through April 25, 2008.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### Anticipated Date

May 12–June 10, 2008  
June 11–20, 2008  
June 30–July 9, 2008  
July 29, 2008  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:**           **Reliability Coordinator Data Specification and Collection**
2. **Number:**       IRO-010-1
3. **Purpose:**        To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information.
  - R1.2. Mutually agreeable format.
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.

- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement R1.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. This evidence could include, but is not limited to, dated paper or electronic notice used to distribute its data specification showing recipient, and data or information requested or other equivalent evidence. (R2)
- M3. The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence to confirm that it provided data and information, as specified in Requirement R3. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated computer printouts, dated SCADA data, or other equivalent evidence.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

##### 1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner, shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force data specification for Requirement R1, Measure M1.

The Reliability Coordinator shall keep evidence of its most recent distribution of its data specification and evidence to show the data supplied in response to that specification for Requirement R2, Measure M2 and Requirement R3 Measure M3.

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Requirement R3 Measure M3 for the Reliability Coordinator's most recent data specification.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.5. Additional Compliance Information**

**1.5.1** None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	Data specification is complete with the following exception – no process for data provision when automated Real-Time system operating data is unavailable. (R1)	Data specification is complete with the following exception: Missing the mutually agreeable format (R1)	Data specification incomplete (missing either the list of required data, or the timeframe for providing data, (R1)	No data specification (R1)
<b>R2</b>	Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status.	Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)	Distributed its data specification to greater than or equal to 75% - but less than 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)	Data specification distributed to less than 75% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
<b>R3</b>	Provided greater than or equal to 95% but less than 100% of the data and information as specified. (R3)	Provided greater than or equal to 85% but less than 95% of the data and information as specified. (R3)	Provided greater than or equal to 75% but less than 85% of the data and information as specified. (R3)	Provided less than 75% of the data and information as specified. (R3)

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

~~**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.~~

~~**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.~~

~~**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.~~

The IROL SDT deleted R1 and moved R2 into IRO-009.

## **A. Introduction**

~~1. Title: Monitoring the Reliability Coordinator Wide Area~~

~~2. Number: IRO-007-1~~

~~3. Purpose: To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.~~

### **4. Applicability**

~~4.1. Reliability Coordinator~~

~~5. Proposed Effective Date: First day of first quarter, three months after regulatory approvals.~~

## **B. Requirements**

~~R1. The Reliability Coordinator shall perform Real Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (Violation Risk Factor: Medium) (Mitigation Time Horizon: Real-time Operations)~~

~~R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (Violation Risk Factor: High) (Mitigation Time Horizon: Real-time Operations)~~

## **C. Measures**

~~M1. The Reliability Coordinator shall have Real Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.~~

~~M2. For an IROL or its  $T_v$ , without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.~~

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

~~Electric Reliability Organization~~

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

~~The Performance Reset Period shall be 12 months from the last violation.~~

#### **1.3. Data Retention**

~~The Reliability Coordinator shall have evidence of compliance with M1 upon request.~~

~~The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years~~

~~The Compliance Monitor shall keep audited data for three calendar years.~~

#### **1.4. Additional Compliance Information**

~~The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.~~

~~The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:~~

~~1.4.1 Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.~~

~~2. Violation Severity Levels~~

~~2.1. Lower: — Not applicable.~~

~~2.2. Moderate: — Not applicable.~~

~~2.3. High: — Not applicable.~~

~~2.4. Severe: — A severe violation occurs if either of the following conditions are present:~~

~~2.4.1 System operating parameters not monitored in Real-Time and compared against IROLs.~~

~~2.4.2 There was a disagreement on the IROL or its T<sub>v</sub> and the most conservative limit under consideration was not used.~~

~~E. Regional Differences~~

~~None~~

~~F. Associated Documents~~

~~None~~

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)

### **Description of Current Draft:**

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team delayed balloting pending the outcome of the FAC-010, FAC-011, and FAC-014 standards. During the waiting period, the drafting team modified the set of IROL standards to bring them into conformance with the latest guidelines for drafting standards. The IROL SDT is posting the revised set of IROL standards and a revised implementation plan for a 30-day comment period through April 25, 2008.

### **Future Development Plan:**

#### **Anticipated Actions**

#### **Anticipated Date**

- |   |                        |
|---|------------------------|
| 1. Post for 30-day pre-ballot period.         | May 12 – June 10, 2008 |
| 2. Conduct initial ballot of standards.       | June 11-20, 2008       |
| 3. Conduct recirculation ballot of standards. | June 30 – July 9, 2008 |
| 4. Submit to BOT for adoption.                | July 29, 2008          |
| 5. File for regulatory approvals.             | To be determined       |

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

~~5. The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC 014-1.~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. ~~The Each~~ Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2. ~~The Each~~ Reliability Coordinator shall perform a Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3. When a Reliability Coordinator determines that the results of an ~~the results of the Reliability Coordinator's~~ Operational Planning Analyses Analysis or Real-Time Assessments indicates the need for specific operational actions to prevent or mitigate an instances of exceeding an IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, the results of its ~~latest~~ Operational Planning Analyses Analyses.

M2. The Reliability Coordinator shall have, and provide upon request, evidence ~~that could include, but is not limited to computer output, operator logs, checklists, or other evidence~~ to show it conducted a Real-Time Assessment at least once every 30 minutes. This evidence could include, but is not limited to, dated computer log showing times the assessment was conducted, dated checklists, or other evidence.

D. The Reliability Coordinator shall have and provide upon request, evidence ~~that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used~~ to confirm that it shared the results of its Operational Planning Analyses ~~and or~~ Real-Time Assessments with those entities expected to take actions based on that information. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated transcripts of voice records, dated facsimiles, or other evidence.

M3.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

~~Electric Reliability Organization~~

**1.2. Compliance Monitoring Period and Reset Time Frame**

~~The Performance Reset Period shall be 12 months from the last violation~~ Not applicable.

**1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

**1.3.1.4. Data Retention**

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Compliance ~~Monitor~~ Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

~~audited data for three calendar years.~~

~~6.~~ The Reliability Coordinator shall ~~keep~~retain ~~its latest day ahead Operational Planning Analysis evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days.~~

~~The Reliability Coordinator shall keep evidence for M2 for the most recent two days.~~

The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months.

~~one month.~~

**1.4.1.5. Additional Compliance Information**

~~The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.~~

None.

2. Violation Severity Levels

~~2.1. Lower: — Not applicable.~~

~~2.2. Moderate: Shared the results with some but not all of the entities that were required to take action (R3).~~

~~2.3. High: Real-Time Assessments were conducted but not as frequently as required (R2).~~

~~2.4. Severe: — A severe violation exists if any of the following conditions are present:~~

~~2.4.1 — Did not perform an Operational Planning Analysis for the next day in accordance with R1.~~

~~2.4.2 — Did not perform any Real-time Assessments for any continuous eight hour period (R2).~~

~~2.4.3 — Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).~~

<u>Requirement</u>	<u>Lower</u>	<u>Moderate</u>	<u>High</u>	<u>Severe</u>
<u>R1</u>	<u>Performed an Operational Planning Analysis that covers all aspects of the requirement for all except one of 30 days. (R1)</u>	<u>Performed an Operational Planning Analysis that covers all aspects of the requirement for all except two of 30 days. (R1)</u>	<u>Performed an Operational Planning Analysis that covers all aspects of the requirement for all except three of 30 days. (R1)</u>	<u>Missed performing an Operational Planning Analysis that covers all aspects of the requirement for four or more of 30 days. (R1)</u>
<u>R2</u>	<u>A Real-time Assessment was not conducted for one 30-minute period within a 24-hour period (R2)</u>	<u>Real-time Assessments were not conducted for two 30-minute periods within a 24-hour period (R2)</u>	<u>Real-time Assessments were not conducted for three 30-minute periods within a 24-hour period (R2)</u>	<u>Real-time Assessments were not conducted for more than three 30-minute periods within a 24-hour period (R2)</u>
<u>R3</u>		Shared the results with some but not all of the entities that were required to take action (R3)		Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Occurrence Period:** ~~The time period in which performance is measured and evaluated.~~

~~None introduced in this standard.~~

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. The IROLs covered in this standard are limited to those associated with contingencies ~~that were~~ studied under FAC-011 and FAC-014.
5. **Proposed Effective Date:** ~~The latter of either the first day of the first quarter, six~~  
In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.  
In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. For ~~each all~~ IROLs ~~that is~~ identified one or more days prior to the current day ~~in advance of Real-time~~, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2. For each IROL that is identified one or more days prior to the current day ~~in advance of Real-time~~, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3. When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R4. When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

R5. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (Violation Risk Factor: High) (Time Horizon: Real-time Operations)

### C. Measures

- M1.** ~~The Each~~ Reliability Coordinator shall have, and provide upon request, evidence to confirm that it has Operating Processes, Procedures, or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement R1 and Requirement R2. This evidence shall include a list of any IROLs (and each associated  $T_v$ ) identified in advance, along with one or more ~~documented~~ dated Operating Processes, Procedures, or Plans that that will be used.
- M2.** ~~The Each~~ Reliability Coordinator shall have, and provide upon request, evidence ~~that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence that will be used~~ to confirm that it acted or directed others to act in accordance with Requirement R3 and Requirement R4. This evidence could include, but is not limited to, dated operating logs, dated voice recordings, dated transcripts of voice recordings, or other evidence.
- M3.** For a situation where Reliability Coordinators disagree on the value of an IROL or its  $T_v$ , the Reliability Coordinator shall have, and provide upon request, evidence to confirm that it used the most conservative of the values under consideration, without delay. Such evidence could include, but is not limited to, dated computer printouts, dated operator logs, dated voice recordings, dated transcripts of voice recordings, or other equivalent evidence. (R5)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority

~~Electric Reliability Organization For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.~~

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

~~The Performance-Reset Period shall be 12 months from the last violation. Not applicable.~~

##### 1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3.Exception Reporting

#### **1.4. Data Retention**

The Reliability Coordinator, shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

~~The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.~~

The Reliability Coordinator shall retain evidence of Requirement R1, Requirement R2, and Measure M1, for a rolling 12 months.

The Reliability Coordinator shall retain evidence of Requirement R3, Requirement R4, Requirement R5, Measure M2, and Measure M3 for a rolling 12 months.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records, and all IROL Violation Reports submitted since the last audit.

##### **1.4.1.5. Additional Compliance Information**

~~**Exception Reporting:** The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.~~

~~The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.~~

~~The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:~~

~~**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.~~

~~**1.4.2** IROL Violation Reports.~~

For each instance of exceeding an IROL for time greater than IROL  $T_v$ , the Reliability Coordinator shall submit an IROL Violation Report to its Compliance Enforcement Authority within 30 days of the initiation of the event.

**2. Violation Severity Levels**

~~1.5.Low: Not applicable.~~

~~1.6.Moderate Not applicable.~~

~~1.7.High: Not applicable.~~

~~1.8.Severe: There shall be a severe violation severity level if any of the following conditions exist:~~

~~1.8.1 One or more IROLs identified in advance of real time do not have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)~~

~~1.8.2 An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)~~

~~1.8.3 Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five<sup>+</sup> minutes or more before taking a control action or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)~~

~~1.8.4 Actual system conditions showed that there was an instance of exceeding an IROL, and that IROL was not resolved within the IROL’s T<sub>v</sub>. (R4)~~

<u>Requirement</u>	<u>Lower</u>	<u>Moderate</u>	<u>High</u>	<u>Severe</u>
<u>R1</u>				<u>An IROL was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to prevent exceeding that IROL. (R1)</u>
<u>R2</u>				<u>An IROL identified one or more days in advance does not have an Operating</u>

<sup>1</sup> The five minutes is not a ‘grace period’ before taking any action – the five minutes recognizes that the first actions taken may not result in an action that can be independently confirmed.

<u>Requirement</u>	<u>Lower</u>	<u>Moderate</u>	<u>High</u>	<u>Severe</u>
				<u>Process, Procedure, or Plan that identifies actions to mitigate exceeding that IROL within the IROL's T<sub>v</sub>. (R2)</u>
<u>R3</u>			<u>An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but the Operating Processes, Procedures, or Plans that were implemented did not prevent exceeding the IROL. (R3)</u>	<u>An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures, or Plans were implemented. (R3)</u>
<u>R4</u>			<u>Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five minutes or more before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL, however the IROL was mitigated within the IROL T<sub>v</sub> (R4)</u>	<u>Actual system conditions showed that there was an instance of exceeding an IROL, and a delay before acting or directing others to act resulted in a failure to mitigate the magnitude and duration of the instance of exceeding that IROL within T<sub>v</sub> (R4)</u>  <u>OR</u> <u>Actual system conditions showed that there was an instance of exceeding an IROL, and that IROL was not resolved within the IROL's T<sub>v</sub>. (R4)</u>
<u>R5</u>	<u>Not applicable.</u>	<u>Not applicable.</u>	<u>Not applicable.</u>	<u>There was a disagreement</u>

<u>Requirement</u>	<u>Lower</u>	<u>Moderate</u>	<u>High</u>	<u>Severe</u>
				<u>on the IROL or its <math>T_v</math> and the most conservative limit under consideration was not used. (R5)</u>

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007).

### Description of Current Draft:

This draft reflects conforming changes made to the standards based on comments submitted during the January 2–February 15, 2007 comment period. The drafting team delayed balloting pending the outcome of the FAC-010, FAC-011, and FAC-014 standards. During the waiting period, the drafting team modified the set of IROL standards to bring them into conformance with the latest guidelines for drafting standards. The IROL SDT is posting the revised set of IROL standards and a revised implementation plan for a 30-day comment period through April 25, 2008.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### Anticipated Date

May 12 – June 10, 2008  
June 11-20, 2008  
June 30 – July 9, 2008  
July 29, 2008  
To be determined

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

| None. ~~introduced in this standard.~~

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**

~~5. The latter of either the first day of the first quarter, three months after regulatory approvals or coincident with the effective date for FAC-014-1.~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information.
  - R1.2. Mutually agreeable format.
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

- R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.
- R2.** The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
- R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### C. Measures

- M1.** The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement [R1](#).
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. This evidence could include, but is not limited to, dated paper or electronic notice used to distribute its data specification showing recipient, and data or information requested or other equivalent evidence. (R2)
- M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence ~~that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used~~ to confirm that it provided data and information, as specified in Requirement [R3](#). This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated computer printouts, dated SCADA data, or other equivalent evidence.

### D. Compliance

#### **M4.1. Compliance Monitoring Process**

##### **M4.11.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority**

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority. \_\_\_\_\_

~~Electric Reliability Organization~~

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

~~The Performance Reset Period shall be 12 months from the last violation. Not applicable.~~

### 1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### 1.3.1.4. Data Retention

~~The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner, shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

~~The Reliability Coordinator shall retain its current, in force data specification for Requirement R1, Measure M1. keep its most current data specification.~~

~~1.4.—The Reliability Coordinator shall keep evidence of its most recent distribution of its data specification and evidence to show the data supplied in response to that specification to show compliance with for Requirement R2, Measure M2 and Requirement R3 Measure M3.~~

~~—For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Requirement R3 Measure M3 for 3 months. the Reliability Coordinator's most recent data specification.~~

~~The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.~~

~~The Compliance Monitor shall keep audited data for three calendar years.~~

#### 1.4.1.5. Additional Compliance Information

~~—The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.~~

~~—The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:~~

~~5.2.1 Data specification(s).~~

~~5.2.2 Proof of distribution of the data specification(s).~~

1.5.1 None.

**1.2. Violation Severity Levels for the Reliability Coordinator**

**~~1.1. Lower: There shall be a lower violation severity level if any of the following conditions exist:~~**

~~1.1.1 Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)~~

~~1.1.2 Provided greater than or equal to 95% but less than 100% of the data and information to other Reliability Coordinators as specified. (R3)~~

**~~1.2. Moderate: There shall be a moderate violation severity level if any of the following conditions exist:~~**

~~1.2.1 Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)~~

~~1.2.2 Provided greater than or equal to 85%, but less than 95% of the data and information to other Reliability Coordinators as specified. (R3)~~

**~~1.3. High: There shall be a high violation severity level if any of the following conditions exist:~~**

~~1.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)~~

~~1.3.2 Distributed its data specification to greater than or equal to 70% but less than 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)~~

~~1.3.3 Provided greater than or equal to 70% but less than 85% of the data and information to other Reliability Coordinators as specified. (R3)~~

**~~1.4. Severe: There shall be a severe violation severity level if any of the following conditions exist:~~**

~~1.4.1 No data specification (R1)~~

~~1.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)~~

~~1.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)~~

**~~2. Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner~~**

- ~~2.1. Lower: Provided greater than or equal to 95% but less than 100% of the data and information to the Reliability Coordinator as specified. (R3)~~
- ~~2.2. Moderate: Provided greater than or equal to 85%, but less than 95% of the data and information to the Reliability Coordinator as specified. (R3)~~
- ~~2.3. High: Provided greater than or equal to 70%, but less than 85% of the data and information to the Reliability Coordinator as specified. (R3)~~
- ~~2.4. Severe: Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)~~

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	<u>Data specification is complete with the following exception – no process for data provision when automated Real-Time system operating data is unavailable. (R1)</u>	<u>Data specification is complete with the following exception: Missing the mutually agreeable format (R1)</u>	<u>Data specification incomplete (missing either the list of required data, or the timeframe for providing data, (R1)</u>	<u>No data specification (R1)</u>
<b>R2</b>	<u>Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status.</u>	<u>Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)</u>	<u>Distributed its data specification to greater than or equal to 75% - but less than 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)</u>	<u>Data specification distributed to less than 75% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)</u>
<b>R3</b>	<u>Provided greater than or equal to 95% but less than 100% of the data and information as specified. (R3)</u>	<u>Provided greater than or equal to 85% but less than 95% of the data and information as specified. (R3)</u>	<u>Provided greater than or equal to 75% but less than 85% of the data and information as specified. (R3)</u>	<u>Provided less than 75% of the data and information as specified. (R3)</u>

## Standards Announcement

Comment Period Opens

March 26–April 25, 2008

**Now available at:** <http://www.nerc.com/~filez/standards/IROL.html>

### **Comment Period for IROL Standards Opens March 26, 2008**

The following Interconnection Reliability Operating Limit (IROL) standards, the associated IROL Implementation Plan, and proposed conforming revisions to already-approved standards are all posted for a 30-day comment period through April 25, 2008:

- IRO-008-1 Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1 Reliability Coordinator Actions to Operate Within IROLs
- IRO-010-1 Reliability Coordinator Data Specification and Collection

This set of Version 1 standards requires the Reliability Coordinator to have plans in place to prevent and mitigate instances of exceeding IROLs, to direct actions in support of operating within IROLs, and to specify and collect data needed to support these activities to prevent instability, uncontrolled separation, or cascading outages.

Please use this [electronic form](#) to submit comments on the IROL standards and the associated implementation plan.

If you need an off-line, unofficial copy of the questions in the comment form, there is a copy of the comment form posted at the following site:

<http://www.nerc.com/~filez/standards/IROL.html>

Please use only the electronic form to submit comments by **April 25, 2008**. If you experience any difficulties in using the electronic form, please contact Barbara Bogenrief at 609-452-8060.

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

*For more information or assistance, please contact Maureen Long, Standards Process Manager, at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or at (813) 468-5998.*

The logo for NERC (North American Electric Reliability Corporation) features the letters "NERC" in a bold, black, sans-serif font. Below the letters is a horizontal blue bar with a white gradient.

# Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards (IRO-008–IRO-10)

## Introduction

This implementation plan is associated with the following Interconnection Reliability Operating Limit (IROL) standards:

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

These three standards are “new” standards, not revisions to Version 0 standards. These standards do, however address some of the same topics as addressed in some of the Version 0 standards.

The ballot for each of the IROL standards includes the retirement of associated requirements from some already approved standards and effective dates identified in this implementation plan.

# Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

## Implementation Plan Contents:

Prerequisite Approvals .....	3
Conforming Changes to Requirements in Already Approved Standards .....	3
Revisions or Retirements to Already Approved Standards .....	5
EOP-001-0 .....	5
IRO-002-1 .....	6
IRO-004-1 .....	7
IRO-005-2 .....	9
TOP-003-0 .....	16
TOP-005-1 .....	17
TOP-006-1 .....	20
Functions that Must Comply with the Requirements in the Standards.....	21
Effective Dates .....	21

## **Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

### **Prerequisite Approvals**

Reliability Standard FAC-014-1 — Establish and Communicate System Operating Limits, needs to be effective before this set of standards becomes effective:

- IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection

### **Conforming Changes to Requirements in Already Approved Standards**

Many elements contained in the set of proposed ‘Operate within IROL Standards’ address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the IROL SDT recommends that the retirement or revision of the following requirements in Version 0 Standards coincident with the implementation of the proposed standards. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire entire standard (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Convert Attachment 1 into a reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify R4

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

<p align="center"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p align="center"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>EOP-001-0</b></p> <p><b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p><b>R1.</b> For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's <math>T_v</math>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirements are more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008 becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL’s <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 and R2 require the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R3 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R4.</b> Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p><b>R5.</b> Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p><b>IRO-005-2</b></p> <p><b>R2.</b> Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-010-1 becomes effective, IRO-004-1 R4 and R5 should be retired.
- IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4 and R5.
- When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p align="center"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p align="center"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.</li> <li>▪ IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> <li>▪ IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, <del>IROL</del>, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For all IROLs identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p> <p><b>R5.</b> If unanimity cannot be reached on the value for an IROL or its <math>T_v</math>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration.</p>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-009-1 becomes effective, IRO-005-2 R13 should be retired.
- IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.
- The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-009-1 R5 has a similar requirement that is applicable totally to the Reliability Coordinator and focused solely on IROLs.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b></p> <p>(text in blue is recommended for deletion or retirement – the red text is an addition to the text that already exists in the requirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROs within its wide-area view. The Transmission Service Providers shall respect <del>these SOLs or</del> and IROs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IRO violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IRO or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IRO in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IRO or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IRO will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IRO.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IRO, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IRO within the IRO's T<sub>v</sub>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IRO violation – but some IROs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-003-0</b></p> <p><b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p style="padding-left: 20px;"><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p style="padding-left: 20px;"><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. ## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards (IRO-008–IRO-10)

### Introduction

This implementation plan is associated with the following Interconnection Reliability Operating Limit (IROL) standards:

[IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments](#)

[IRO-009 — Reliability Coordinator Actions to Operate Within IROLs](#)

[IRO-010 — Reliability Coordinator Data Specification and Collection](#)

These three standards are “new” standards, not revisions to Version 0 standards. These standards do, however address some of the same topics as addressed in some of the Version 0 standards.

The ballot for each of the IROL standards includes the retirement of associated requirements from some already approved standards and effective dates identified in this implementation plan.

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Prerequisite Approvals

Reliability Standard FAC-014-1 — Establish and Communicate System Operating Limits, needs to be ~~effective~~approved by applicable regulatory authorities before this set of standards becomes effective:

~~IRO-007 — Monitoring the Wide Area~~

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

### Conforming Changes to Requirements in Already Approved Standards

Many elements contained in the set of proposed ‘Operate within IROL Standards’ address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the IROL SDT recommends that the retirement or revision of the following requirements in Version 0 Standards coincident with the implementation of~~should be revised or retired when~~ the proposed standards ~~are implemented~~. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2 ~~and R6~~

~~IRO-003-2 — Reliability Coordination — Wide Area View~~

- ~~Retire entire standard (R1 and R2)~~

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire entire standard (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire ~~R1, convert most of R1 into a reference; retire~~ R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Convert Attachment 1 into a reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify ~~R2 and~~ R4

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

<p><b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i></p>	<p><b>Proposed Replacement Requirement(s)</b></p>
<p><b>EOP-001-0</b> <b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b> <b>R1.</b> <u>For all IROLs identified one or more days prior to the current day, each</u>The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, <u>for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within T<sub>v</sub></u>, up to and including load shedding <u>that can be implemented in time to prevent exceeding those IROLs.</u></p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's T<sub>v</sub>, which can be shorter than 30 minutes.</li> </ul>	

<b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i>	<b>Proposed Replacement Requirement(s)</b>
---	--

**IRO-002-1**

**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.

**IRO-010-1**

**R1.** The Reliability Coordinator shall have a documented data specification for data ~~specify and collect the data~~ and information to build and maintain models ~~it needs~~ to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Time Assessments. The specification shall include the following:

R1.1. List of required data and information.

R1.2. Mutually agreeable format.

R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

R1.4. Process for data provision when automated Real-Time system operating data is unavailable.

**R2.** The Reliability Coordinator shall distribute its data specification to collect this data from the ~~entities performing functions~~ that have Facilities monitored by the Reliability Coordinator, and ~~to from~~ entities that provide Real-Time Facility status to the Reliability Coordinator. ~~This includes specifying and collecting data from the following:~~

~~R1.1 Balancing Authorities~~

~~R1.2 Generator Owners~~

~~R1.3 Generator Operators~~

~~R1.4 Interchange Authority~~

~~R1.5 Load-Serving Entities~~

~~R1.6 Reliability Coordinators~~

~~R1.7 Transmission Operators~~

~~R1.8 Transmission Owners~~

**Notes:**

- When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.
- IRO-010-1 ~~R1~~ requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed ~~requirements are~~ requirement is more explicit than the associated requirement in IRO-002-0.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p><del>R6. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.</del></p>	<p><b>IRO-007-1</b></p> <p><del>R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</del></p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>• When IRO-007-1 becomes effective, IRO-002-1 R6 should be retired.</li> <li>▪ IRO-002-1 R6 identifies some, but not all of the parameters to be monitored by the Reliability Coordinator and can be misleading. A list of elements to be monitored (from IRO-005-2) has been converted into a Technical Reference.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<b>Already Approved Standard</b>	<b>Proposed Replacement Requirement(s)</b>
<p><b>IRO-003-2</b></p> <p><del>R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.</del></p> <p><del>R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.</del></p>	<p><b>IRO-007-1</b></p> <p><del>R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</del></p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>• <del>When IRO-007-1 becomes effective, IRO-003-2 should be retired.</del></li> <li>▪ <del>The Transmission Operator, not the Reliability Coordinator, is responsible for operating within System Operating Limits. The Reliability Coordinator is responsible for operating within IROLs.</del></li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform <u>an</u> Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008 becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> <u>For all IROLs identified one or more days prior to the current day, each</u>The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, <del>for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within Tv</del> up to and including load shedding <u>that can be implemented in time to prevent exceeding those IROLs.-</u></p> <p><b>R2.</b> <u>For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's Tv.</u></p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 <del>and R2 require</del><u>requires</u> the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 <del>R3 R2</del> includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

<p style="text-align: center;"><b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R4.</b> Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p><b>R5.</b> Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p><b>IRO-005-2</b></p> <p><b>R2.</b> Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: <del>(Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</del></p> <p><b>R1.1.</b> ___-List of required data and information.</p> <p><b>R1.2.</b> ___-Mutually agreeable format.</p> <p><b>R1.3.</b> ___-Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p><b>R1.4.</b> ___-Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R2.</b> <u>The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</u></p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>

**Notes:**

- When IRO-010-1 becomes effective, IRO-004-1 R4 and R5 should be retired.
- IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4 and R5.
- When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<b>Already Approved Standard</b> <i>(text in blue is recommended for retirement)</i>	<b>Proposed Replacement Requirement(s)</b>
---	--

**IRO-005-2**

**R3.** As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.

**R5.** Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.

**IRO-009007-1**

**R1.** For all IROLs identified one or more days prior to the current day, each The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take up to and including load shedding, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within  $T_v$ , up to and including load shedding that can be implemented in time to prevent exceeding those IROLs.

**R2.** For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ .

**R3.** When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.

**R3R4.** When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ .

**Notes:**

- When IRO-~~009008~~-1 becomes effective, IRO-005-2 ~~R3, and R5~~R1 should be retired.
- IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.
- IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits. ~~and R1.4 through R1.10 should be converted into a Technical Reference. IRO-005-2 R1 is duplicated with IRO-007-1 R1. The list of parameters to monitor (IRO-005-2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading.~~

<p style="text-align: center;"><b>Already Approved Standard</b> <i>(text in blue is recommended for deletion)</i></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b> R9. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, <del>IROL</del>, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b> <b>R1.</b> <u>For all IROLs identified one or more days prior to the current day, each</u> <del>The</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, <del>for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within T<sub>v</sub></del>, up to and including load shedding <u>that can be implemented in time to prevent exceeding those IROLs.</u> <b>R2.</b> <u>For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</u> <b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL. <b>R4R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL <u>within the IROL's T<sub>v</sub>.</u></p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

<p style="text-align: center;"><b>Already Approved Standard</b> <i>(text in blue is recommended for deletion)</i></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> <u>For all IROLs identified one or more days prior to the current day, each</u> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, <del>for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within T<sub>v</sub></del>, up to and including load shedding <u>that can be implemented in time to prevent exceeding those IROLs.</u>  <b>R2.</b> <u>For each IROL that is identified one or more days prior to the current day, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</u>   <b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.   <b>R4R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL <u>within the IROL's T<sub>v</sub>.</u>   <b>IRO-007-4</b>  <b>R2.</b> If unanimity cannot be reached on the value for an IROL or its T<sub>v</sub>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration.</p>

**Notes:**

- When IRO-~~007-1~~ and IRO-009-1 becomes s effective, IRO-005-2 R13 should be retired.
- IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.
- The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-~~009007-1~~ R5R2 has a similar requirement that is applicable totally to the Reliability Coordinator and focused solely on IROLs.

<p style="text-align: center;"><b>Already Approved Standard</b></p> <p style="text-align: center;"><u>(text in blue is recommended for deletion or retirement – the red text is an addition to the text that already exists in the requirement)</u></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these</del> SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b><del>R3.R2.</del></b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans to prevent exceeding that IROL.</p> <p><b><del>R4.R3.</del></b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL <u>within the IROL's T<sub>v</sub>.</u></p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul>	

<p style="text-align: center;"><b><u>Already Approved Standard</u></b>                      (text in blue is recommended for deletion)<b>Version-0</b>  <b>Standards</b></p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-003-0</b></p> <p><b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p style="padding-left: 40px;"><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p style="padding-left: 40px;"><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. **Notes:**

- When IRO-010-1 becomes effective, 'Attachment 1-TOP-005-0 Electric System Reliability Data' should be translated into a Technical Reference. This data is only a partial list of data and information that the Reliability Coordinator needs to support reliable operations. The reference should include the operational status of special protection systems and the operational status of power system stabilizers to comply with one of the FERC directives in Order 693.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<p><b><u>Already Approved Standard</u></b> <small>(text in blue is recommended for deletion)</small><b>Version-0</b> <b>Standards</b></p>	<p><b>Proposed Replacement Requirement(s)</b></p>
---	---

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

**TOP-006-1**

~~R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load tap changer settings, and status of rotating and static reactive resources.~~

R4. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.

**IRO-007-1**

~~R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).~~

**IRO-010-1**

R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: ~~(Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)~~

R1.1. \_\_\_-List of required data and information.

R1.2. \_\_\_-Mutually agreeable format.

R1.3. \_\_\_-Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

R1.4. \_\_\_-Process for data provision when automated Real-Time system operating data is unavailable.

R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.

R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**Notes:**

- When IRO-~~007-1~~ and IRO-010-1 becomes effective, TOP-006-1 ~~R2 and~~ R4 should be modified.
- ~~The Reliability Coordinator's monitoring requirements are addressed more globally in IRO-007-1. The Reliability Coordinator may not have access to all the transmission data identified in TOP-006-1 R2.~~
- The information identified in TOP-006-1 R4 is not inclusive, and is addressed more globally for the Reliability Coordinator in IRO-010-1 R1 and R3.

**Functions that Must Comply with the Requirements in the Standards**

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
<del>IRO-007-1</del> Monitoring the Wide Area	X							
IRO-008-1 Analyses & Assessments	X							
IRO-009-1 Actions to Operate within IROs	X							
IRO-010-1 Data Specification & Collection	X	X	X	X	X	X	X	X

**Effective Dates**

~~In those jurisdictions where no regulatory approval is required, the~~The standards ~~shall~~should all become effective ~~on~~ the latter of ~~either April 1, 2009 or~~ the first day of the first ~~calendar~~ quarter, three months after ~~BOT adoption~~.

~~In those jurisdictions where regulatory approval is required, the standards shall all become regulatory approvals or coincident with the effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval date for FAC-014-1 — Establish and Communicate System Operating Limits.~~

## Comment Form for IROL Standards (IRO-008, IRO-009, IRO-010)

### Background Information:

The Interconnection Reliability Operating Limits Standards Drafting Team (IROL SDT) paused its work while waiting for a final ruling on the Facility Ratings Standards (FAC-010-1, FAC-011-1, and FAC-014-1). The FAC standards were approved by FERC at the end of 2007. Following that, the IROL SDT modified the set of IROL standards to conform to the latest guidelines for drafting standards. The compliance elements of the standard were modified to use the same language as used in the ERO Sanctions Guidelines, and Violation Severity Levels were modified to comply with the VSL Guidelines Criteria document developed by the VSL Drafting Team. In making these changes, the drafting team discovered opportunities to improve the set of standards by combining the set of requirements into a fewer number of standards, and by eliminating a requirement that was focused more on “how” than on “what”. The team also made some wording changes to improve the alignment between requirements, measures, and associated violation severity levels.

The drafting team encourages you to review the clean and redline versions of the standards and then to complete this comment form.

1. The drafting team eliminated IRO-007-1 Requirement R1, the requirement for the Reliability Coordinator to “monitor” its wide area. Monitoring is a “how” – staying within the IROLs is the “required performance.” Do you agree with this change?

- Yes  
 No  
 No comment

Comments:

2. The drafting team moved IRO-007-1 Requirement R2 (from IRO-007 R2 to IRO-009 R5), the requirement for the Reliability Coordinator to use the most conservative value under consideration when there is a disagreement amongst Reliability Coordinators on the value of an IROL or its  $T_v$ . This move seemed to put the related requirements together in a single standard and allowed the elimination of IRO-007. Do you agree with this change?

- Yes  
 No  
 No comment

Comments:

3. The drafting team modified the Violation Severity Levels for IRO-008. Do you agree with the new VSLs?

- Yes  
 No  
 No comment

Comments:

4. The drafting team modified IRO-009-1 R1 and R2 by replacing the phrase, “in advance of real-time” with the phrase, “one or more days prior to the current day” to clarify the intent and measurability of these requirements. Do you agree with the change made to R1 and R2 in IRO-009-1?

- Yes  
 No  
 No comment

Comments:

5. The drafting team modified the Violation Severity Levels for IRO-009. Do you agree with the new VSLs?

- Yes  
 No  
 No comment

Comments:

6. The drafting team modified the Violation Severity Levels for IRO-010. Do you agree with the new VSLs?

- Yes  
 No  
 No comment

Comments:

7. The drafting team modified the implementation plan to reflect the modifications made based on the elimination of IRO-007-1 Requirement R1. Do you agree with the modifications made to the implementation plan?

- Yes  
 No  
 No comment

Comments:

8. If you have any other comments on this set of standards that you haven't already provided, please provide them here.

**Status**

The NERC Board of Trustees will consider the IROL standards for adoption in October 2008.

**Purpose/Industry Need**

The purpose of this standard is to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system.

### Comments on draft 9 IROL Standards — IRO-008–010 — Pre-2006

The IROL Standard Drafting Team thanks all commenter's who submitted comments on draft 9 of the Interconnection Reliability Operating Limit standards. These standards were posted for a 30-day public comment period from March 26, 2008 through April 25, 2009. The stakeholders were asked to provide feedback on the SAR through a special Standard Comment Form.

<http://www.nerc.com/~filez/standards/IROL.html>

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at [gerry.adamski@nerc.net](mailto:gerry.adamski@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedures:  
<http://www.nerc.com/standards/newstandardsprocess.html>.

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

1. The drafting team eliminated IRO-007-1 Requirement R1, the requirement for the Reliability Coordinator to “monitor” its wide area. Monitoring is a “how” – staying within the IROLs is the “required performance.” Do you agree with this change?

Organization/Group	Question 1:	Question 1 Comments:
Northeast Utilities	Yes	
NPCC Regional Standards Committee, RSC	Yes	
Hydro-Québec TransEnergie	Yes	
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group		
Manitoba Hydro	Yes	
Operating Reliability Working Group	Yes	
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	Yes	
San Diego Gas and Electric Co.	Yes	
Ontario IESO	No	The IESO agrees that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal may leave a void in this aspect. We suggest the Standard Drafting Team consider the impact of removing this requirement on the other standards.
ISO RTO Council Standards Review Committee	No	On the one hand, the IRC agrees that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 1:	Question 1 Comments:
		may leave a void in this aspect. We are therefore unable to indicate a preference. We suggest the Standard Drafting Team consider the impact of removing this requirement on other standards.
FirstEnergy	Yes	
Hydro One Networks	Yes	We believe it is ok to eliminate IRO-007-1 R1, as IRO-008-1 R2 requiring the RC to perform "Real-Time Assessments" (every 30 minutes) to determine if any IROL is exceeded, covers off the intent of IRO-007-1 R1. In addition, IRO-008-1 R2 has, at a minimum, a Violation Risk Factor and Time Horizon at least equal to or stricter than IRO-007-1 R1.
ISO New England Inc	No	We understand that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal may leave a void in this aspect. We suggest the SDT consider the ramifications of removing this requirement on other standards.
American Transmission Company LLC	Yes	ATC is okay with dropping IRO-007 R1 because it is covered in IRO-002-1 R5 and R6. IRO-002-1 R5 and R6 require the RC to monitor BES elements that could result in SOL or IROL violations.

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

- The drafting team moved IRO-007-1 Requirement R2 (from IRO-007 R2 to IRO-009 R5), the requirement for the Reliability Coordinator to use the most conservative value under consideration when there is a disagreement amongst Reliability Coordinators on the value of an IROL or its  $T_v$ . This move seemed to put the related requirements together in a single standard and allowed the elimination of IRO-007. Do you agree with this change?

<b>Organization/Group</b>	<b>Question 2:</b>	<b>Question 2 Comments:</b>
Northeast Utilities	Yes	Please define $T_v$ in the standard.
NPCC Regional Standards Committee, RSC	Yes	
Hydro-Québec TransEnergie	Yes	
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	Yes	
Manitoba Hydro	Yes	
Operating Reliability Working Group	Yes	
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	Yes	
San Diego Gas and Electric Co.	Yes	
Ontario IESO	Yes	
ISO RTO Council Standards Review Committee	Yes	
FirstEnergy	Yes	
Hydro One Networks	Yes	Since IRO-007-1 R2 describes an action with respect to IROLs, it is appropriate to move that requirement to the IRO-009-1 standard Reliability Coordinator Actions to Operate within IROLs. In addition, the VRF, Time Horizon and VSL (severe) have all been kept the same. Therefore elimination of IRO-007-1 is also appropriate

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 2:	Question 2 Comments:
		at this time.
ISO New England Inc	Yes	
American Transmission Company LLC	Yes	

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

3. The drafting team modified the Violation Severity Levels for IRO-008. Do you agree with the new VSLs?

<b>Organization/Group</b>	<b>Question 3:</b>	<b>Question 3 Comments:</b>
Northeast Utilities	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
NPCC Regional Standards Committee, RSC	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
Hydro-Québec TransEnergie	No	HQT agree with the changes to the VSLs for R2 and R3, but is unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	No	R2 - does this real time assessment only mean state estimator or if state estimator is unavailable, can the RC use other tools to make a real time assessment to meet this requirement? If we can not use other tools then we do not agree with the VSL. If we can use other tools, then we agree with the VSL.
Manitoba Hydro	Yes	
Operating Reliability Working Group	No	As proposed the VSLs do not allow any Real-time Assessments to be missed within a 24-hour period. However, in EOP-008-0, R1.8, the Reliability Coordinator is allowed a one-hour transition period to its backup site. It would seem appropriate that an allowance should be made for this transition in the VSLs for R2.
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	No	We feel that the Violation Severity Levels for IRO-008-1, R2, if applied as currently proposed, are unduly restrictive in measuring the impact of violating the requirement to run a real-time assessment every thirty (30) minutes for the following reasons: 1. During a large portion of the time, system conditions do not change within a thirty (30) minute period and the risk to the interconnection is not the same for every thirty (30) minute period. When violations are not commensurate with the risk to the Interconnection or where there is no real harm, the penalties should be waived or reduced accordingly. Another way of saying this is that the Violation Severity Level and measurement criteria of IRO-008-1 do not measure the potential risk to the interconnection due to violation of these criteria. In fact, no strictly time based criteria can. The best criteria would be the

Organization/Group	Question 3:	Question 3 Comments:
		<p>determination of risk to the interconnection (or change in the level of risk in a positive or higher risk direction) that was not properly detected and acted upon by the Reliability Coordinator. One potential way that this could actually be measured during "after the fact audits" is by choosing a set of specific occurrences during the previous year that impacted interconnection reliability within the RC area and reviewing the RC's documented responses to them. This would greatly enhance the ability of auditors to measure actual RC performance rather than just measuring how often the RC went through the motions of performing an analysis. 2. The requirements do not allow for scheduled maintenance or unplanned down time of EMS systems, thereby requiring a perfect compliance performance for 17,520 study periods in a year. This doesn't allow for any down time for EMS or assessment applications (State Estimator) and this imposes impossible criteria on EMS operations and guarantees that every system will have one or more violations each year. This places an emphasis on or actually measures the performance of tools rather than on the performance of the Reliability Coordinators<sup>3</sup>. The drafting team may want to seriously reconsider the thirty (30) minute requirement for running real time assessments. Hourly assessments would be more practical for assessing system conditions and for compliance requirements. Systems generally conduct continuous assessments during peak load or abnormal conditions and Reliability Coordinators and Operators should be allowed the flexibility to make reasoned judgments based on their knowledge of the system during normal conditions or during failures of assessment tools. Our support for an hourly interval is also based upon the recommendations of the NERC Real-time Tools Best Practices Task Force. On pages 156-158 of section 2 of their report, the RTBPTF proposes that a new requirement for "look-ahead analyses" be added to standards TOP-002 and IRO-004. Since IRO-008 is intended to replace IRO-004, the recommendation is applicable to IRO-008. Specifically, the recommendation as it pertains to RCs is paraphrased as follows: In order to assess approaching IROL violations, each Reliability Coordinator shall, at a minimum, perform one-hour-ahead Power Flow simulations during the following: + Occurrence of critical system event + Extreme load conditions + Large power transactions + Major planned outages. This recommended requirement would address the "expected" system conditions component of the proposed (and so-called) "Real Time" Assessment. The "existing" system conditions component should be covered by requirements for monitoring found elsewhere in the standards. The rationale for the RTBPTF recommendation came from a deficiency identified in the Blackout Report. Specifically, the report stated: "FE did not perform adequate hour-ahead operations planning studies after Eastlake 5 tripped off-line at 13:31 to ensure that FE could maintain a 30-minute response capability for the next contingency. The FE system was not within single contingency limits from 15:06 to 16:06. In addition to day-ahead planning, the system should have been restudied after the forced outage of Eastlake 5."The recommendation is supported by the findings of the RTBPTF based upon responses received from the task force's survey of RCs and TOPs. The survey showed that 47% of all respondents performed look-ahead studies at intervals less than one hour, and 80% perform such studies at intervals from one hour to one day. Also, 83% of the respondents perform these studies as needed. The survey results indicate that performing look-ahead studies when needed on at least an hourly basis is a prevailing practice. We suggest that the</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 3:	Question 3 Comments:
		Standards Drafting Team work with the RTBPTF to incorporate their recommendation into IRO-008 in lieu of the proposed requirement R2.) We are also concerned about the requirements for evidence to validate compliance with the IRO-008-1 Standard as well as other standards. The compliance program seems to define the window of compliance being the 3 years between compliance audits. However, the IRO-008-1 standard only requires data be retained to demonstrate compliance for a rolling 30 day period. There appears to be a disconnect between the compliance program and the standard, which exposes the Reliability Coordinators to being found non-compliant. In other words, there appears to be a considerable window of time between an audit and the previous audit during which an entity would not have data to demonstrate that they met compliance expectations.] In many cases, the data retention sections in individual standards talk about a much shorter data retention expectation. For example, IRO-008-1 states, "The Reliability Coordinator shall retain evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days. The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months. The question is which data retention expectation is the entity going to be held to with regards to compliance and compliance audits? More clarity needs to be provided on what evidence must be provided in audits.
San Diego Gas and Electric Co.	Yes	
Ontario IESO	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This question also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis. We asked the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.
ISO RTO Council Standards Review Committee	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This question also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis. We ask the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.
FirstEnergy	Yes	You may want to remove the parenthetical reference to the requirement numbers at the end of each VSL. This is not needed since the requirement number is shown in the VSL table in column 1.
Hydro One Networks	No	For VSL requirement R1 we suggest the following: High: Missed performing an Operational Planning Analysis that covers all aspects of the requirement for one of 30 days; Severe: Missed performing an Operational Planning Analysis that covers all aspects of the requirement for two or more of 30 days. As well, for VSL

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 3:	Question 3 Comments:
		requirement R2 we suggest changing the phrase "within a 24-hour period" to "within a 30-day period". This will prevent daily occurrences of violations.
ISO New England Inc	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This question also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours as being the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis. We ask the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.
American Transmission Company LLC	Yes	

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

4. The drafting team modified IRO-009-1 R1 and R2 by replacing the phrase, “in advance of real-time” with the phrase, “one or more days prior to the current day” to clarify the intent and measurability of these requirements. Do you agree with the change made to R1 and R2 in IRO-009-1?

<b>Organization/Group</b>	<b>Question 4:</b>	<b>Question 4 Comments:</b>
Northeast Utilities	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
NPCC Regional Standards Committee, RSC	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
Hydro-Québec TransEnergie	No	HQT understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	Yes	
Manitoba Hydro	Yes	
Operating Reliability Working Group	Yes	
SERC OC	Yes	

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 4:	Question 4 Comments:
Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1		
San Diego Gas and Electric Co.	Yes	
Ontario IESO	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hour prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
ISO RTO Council Standards Review Committee	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", with the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
FirstEnergy	No	It should be clear that the main intent is to have IROL mitigation plans in place for the current operating day. For clarity, we suggest the following replacements for requirements R1 and R2.R1 For the current day operating conditions, each Reliability Coordinator shall have Operating Processes, Procedures or Plans that identify mitigation actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding any of its IROL conditions. The mitigation actions shall be available one or more days prior to the current operating day.R2 For the current day operating conditions, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify mitigation actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding any of its IROL conditions, such that the IROL is relieved within the IROL's Tv. The mitigation actions shall be available one or more days prior to the current operating day.
Hydro One Networks	Yes	
ISO New England Inc	No	With this change one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time," which (we believe) is not the intent. We therefore suggest the "in advance of real-time" be replaced with "one or more hours prior to real-time", with real-time being defined as the current hour.

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 4:	Question 4 Comments:
American Transmission Company LLC	Yes	ATC agrees that the phrase "one or more days prior to the current day" provides additional clarity.

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

5. The drafting team modified the Violation Severity Levels for IRO-009. Do you agree with the new VSLs?

<b>Organization/Group</b>	<b>Question 5:</b>	<b>Question 5 Comments:</b>
Northeast Utilities	No	We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform either one, its violation is deemed to be high. If it fails to perform both, then it is deemed to have fully violated the requirement which is severe.
NPCC Regional Standards Committee, RSC	No	We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform either one, its violation is deemed to be high. If it fails to perform both, then it is deemed to have fully violated the requirement which is severe.
Hydro-Québec TransEnergie	No	HQT agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform either one, its violation is deemed to be high. If it fails to perform both, then it is deemed to have fully violated the requirement which is severe.
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	No	R4 High- in the VSL does "acting and directing" include contacting the entity and gathering information and data or does it strictly mean issuing a directive?R5 Severe - eliminate the top VSL, this describes how a failure to mitigate occurred, the issue is there was a failure to mitigate. Also, if an RC issues a directive to mitigate an IROL and the entity fails to comply or is unable to comply is the RC in violation of this requirement?
Manitoba Hydro	Yes	
Operating Reliability Working Group	No	The High VSL for R4 contains an additional requirement that is not in R4. The VSL defines 'without delay' as being five minutes or less. The 'five minute' requirement should be deleted from the VSL.
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	No	The Violation Security Levels for R3 and R4 impose additional requirements that are not in the standard. For R3, it seems inappropriate that the Violation Severity Level should be based upon the effectiveness of the plan to prevent the system from entering an IROL in real-time. The dynamics topology and unit commitment/dispatch of an electric system are constantly changing and no specific occurrence of an SOL or IROL can be accurately represented in planning case studies. It is thus impractical or impossible to devise a perfect process for mitigating each and every instance during which a known IROL may manifest and persist

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 5:	Question 5 Comments:
		<p>as conditions change during the IROL Tv. In R4, if the trigger limit for initiating action is five (5) minutes, then that limit should be explicitly included in the requirements and not introduced for the first time in the measurement criteria. Furthermore, we feel that a time of five (5) minutes is arbitrary and implementation of correct action is the primary requirement. Operators will be under tremendous pressure to work out a solution when an IROL is exceeded and satisfy the five minute requirement. We feel that it is more important to 1) recognize that an IROL has been violated, 2) determine the correct process or procedure required to mitigate the identified IROL, 3) modify the identified generic process or procedure to meet specific real time system conditions as required and, 4) implement the modified process or procedure while at the same time maintaining continuous communications with all parties involved and simultaneously documenting actions being taken as required for NERC audits. It is not clear to us exactly how the five (5) minute trigger adds any value to this process. If the goal is to mitigate the IROL within the IROL Tv, and the actions are successful, what impact does a five (5) minute trigger requirement add to the process? WE STRONGLY SUGGEST THAT THE "HIGH" SEVERITY LEVEL SHOULD BE ELIMINATED FOR R3 AND R4.</p>
San Diego Gas and Electric Co.	Yes	
Ontario IESO	No	<p>We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a) take actions without delay (within 5 minutes) and b) correct the situation of IROL being exceeded. Hence, if an RC fails to perform one of the two requirements, its violation is deemed to be High. If it fails to perform both, then it is deemed to have fully violated the requirement and hence should be deemed a Severe violation.</p>
ISO RTO Council Standards Review Committee	No	<p>We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC who did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform one of the two requirements, its violation is deemed to be High. If it fails to perform both, then it is deemed to have fully violated the requirement and hence should be deemed a Severe violation.</p>
FirstEnergy	Yes	<p>For R4, Severe VSL - We recommend retaining only the text below the "OR" statement. The text above is duplicative and adds no additional value since the end result is that the IROL is not mitigated within the allowable Tv timeframe.</p>
Hydro One Networks	No	<p>We agree with the VSLs for requirements 1 and 2. However the high VSL for requirement 3 is not appropriate because it tries to judge the effectiveness of the Operating Processes, Procedures or Plans. Requirement 4 provides for judgment of the effectiveness of the Processes, Procedures or Plans on a basis of being able to</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 5:	Question 5 Comments:
		mitigate the exceeded IROL within the its Tv. As well, R4 includes two requirements: 1) act or direct, without delay, to mitigate the instance of exceeding the IROL; 2) mitigate this instance within the Tv. We suggest that if the RC does not meet both requirements the violation level should be severe and if the RC does not meet one of the requirements the violation level should be high.
ISO New England Inc	No	We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC who did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and b. correct the situation of IROL being exceeded. Hence, if an RC fails to perform one of the two requirements, its violation is deemed to be High. If it fails to perform both, then it is deemed to have fully violated the requirement and hence should be deemed a Severe violation.
American Transmission Company LLC	No	Severe VSL for R4ATC does not agree with the language in the Severe VSL for Requirement 4. The purpose of this VSL is for a Tv violation. ATC recommends that the first description be deleted and only the second description be kept. If the SDT does not agree they should provide a reason for the two descriptions.

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

6. The drafting team modified the Violation Severity Levels for IRO-010. Do you agree with the new VSLs?

<b>Organization/Group</b>	<b>Question 6:</b>	<b>Question 6 Comments:</b>
Northeast Utilities	Yes	
NPCC Regional Standards Committee, RSC	Yes	
Hydro-Québec TransEnergie	Yes	
Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	No	What is the expectation for the process when your automated data is not available? Does freezing the State Estimator value and then getting data via phone and fax suffice?
Manitoba Hydro	No	R1 - What constitutes a "complete data specification"? TOP-005-0 Attachment 1, which will become a Technical Reference, needs a tune up. What is the determining factors when identifying transmission and other facilities as "key"? What size of generator is the RC concerned with in regards to on/off status, AVR status, PPS status, MW & Mvar output?
Operating Reliability Working Group	No	The Lower and Moderate VSLs for R1 should be reversed. We believe that it is more important to have a process for obtaining real-time operating data when it becomes unavailable than having the data in the wrong format. At least you have the data.
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	Yes	
San Diego Gas and Electric Co.	No	In the revised IRO-010 Violation Severity Levels Table, there is no provision for less than 100% compliance for real-time data sent by the TO/TOP to the RC. Providing data at a level greater than 95% but less than 100% is cause for a "Lower" Violation Severity Level. That level rises as less data is provided, to a maximum of "Severe" when less than 75% of the requested data is sent to the RC. Real time data typically has some level of availability associated with it that allows for the inherent nature of real time data being less than 100% complete. Examples may include the failure of field equipment such as RTUs, communication circuits, instrumentation, and other events that could impact 100% data availability such as missed RTU scans, loss of data when systems are being shifted to backup EMS systems, etc. Requirement R3 and the Violation Severity Level Violation table need to be re-written to correlate with Requirement 1.4 that would include an exemption for short-term real time data failures or outages when determining the Violation Severity Level, perhaps with

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 6:	Question 6 Comments:
		language such as "excluding unavailable real-time data (R1.4)."
Ontario IESO	Yes	
ISO RTO Council Standards Review Committee	Yes	
FirstEnergy	Yes	
Hydro One Networks	No	We agree with VSLs for R2 and R3 however, we disagree with the VSLs for R1. Example, failing to specify a process for data provision when the automated Real-time system operating data is unavailable could result in the RC being "blind" to what is going on in the system and render them unable to act or direct others to act. We suggest that missing any one of R1's sub-requirements is a High VSL and having no data specification is a Severe VSL.
ISO New England Inc	Yes	
American Transmission Company LLC	No	VSL for R3: The VSLs do not seem to take into account the frequency of not sending the data. The SDT should provide additional detail within each VSL. How will the percentage be determined over time?

**Consideration of Comments on Draft 9 of IROL Standards — Pre-2006**

7. The drafting team modified the implementation plan to reflect the modifications made based on the elimination of IRO-007-1 Requirement R1. Do you agree with the modifications made to the implementation plan?

Organization/Group	Question 7:	Question 7 Comments:
Northeast Utilities	No	<p>We agree with some but not all of the proposed changes to the other standards. (1) EOP-001 R2: We do not agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes." This requirement does not equate to the Transmission Operator developing plans for mitigating IROLs, which is the role of the RC. In fact, this requirement holds the TOP responsible for having the load reduction plan in place ahead of real time so that when directed by the RC, it can execute the plan to assist in mitigating the IROL violation. While the IRO-008 to IRO-010 standards give the RC the authority and the flexibility to direct the TOP to do so, having the plan in advance and be ready for execution is not covered by these IRO standards. Further, the amount and timing that the TOP is able to achieve with load reduction must be known to the RC ahead of real time for it to consider the effectiveness of the plan's execution in support of the mitigating action.(2) IRO-002 R2: We agree with retiring this requirement.(3) IRO-004-1 ? Reliability Coordination? Operations Planning: retire entire standard (R1 through R6). We agree with retiring this standard since all requirements are covered elsewhere except R4. This requirement is intended to provide system information not just for the RC within whose area the BA, TOP, etc. reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses. This requirement needs to be incorporated in an appropriate standard. (4) IRO-005-2? Reliability Coordination? Current Day Operations: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.(b) For R13, the Implementation Plan says "retiring" but it should read "revising". We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection." R13 actually contains two requirements that are not covered by the new IRO-009: (a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change. (b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence. (5) TOP-003-0? Planned Outage Coordination Modify R1.2. We agree with this change. (6) TOP-005-1? Operational Reliability Information: Retire R1 and</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 7:	Question 7 Comments:
		<p>R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 and R1.1 and the proposed conversion of Attachment 1 into a reference. But there doesn't seem to be a draft reference document posted. When the new IRO standards go into effect, the reference documents will need to be available. Please elaborate on the timing and the process for posting and implementing the reference. (7) TOP-006-1? Monitoring System Conditions Voltage and Reactive Control: Modify R4. We agree with this change.</p>
<p>NPCC Regional Standards Committee, RSC</p>	<p>No</p>	<p>We agree with some but not all of the proposed changes to the other standards. Entergy Services	Yes	
RCCWG - reliability coordinator comments working group	Yes	
Manitoba Hydro	Yes	
Operating Reliability Working Group	No	The retirement of IRO-004-1, R4 and R5 and replacement by IRO-010-1, R1, R2 and R3 seem to be focused on the front-end data sharing requirements. IRO-004-1, R5 specifically addresses sharing the results of the Reliability Coordinator's studies. We can not find a comparable replacement in IRO-010-1, or elsewhere, for this requirement. The SDT should consider moving IRO-005-2, R13 and R14 since these requirements are no longer directed toward the Reliability Coordinator. They don't fit in the IRO standards. We can't seem to find an entry for the retirement of R7 of IRO-004-1. Attachment 1 to TOP-005-2 is shown in the redline version as being deleted apparently due to the proposed retirement of R1. However, Attachment 1 is also referenced in R3 and therefore should not be deleted.
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	Yes	We indicated "Yes" but are really unsure if we are sufficiently aware of what the impacts of the modifications are to system operations. We appreciate the extraordinary amount of effort by individuals involved in developing and revising standards, but we find the implementation plan confusing. This is not the fault of the drafting team, but the fault of the process. There have been innumerable changes to existing standards and to the Functional Model, coupled with FERC requirements to make changes in order to receive their approval. Revisions to standards are being promulgated too rapidly for members to have time to review or keep abreast of proposed changes. The Implementation Plan appears to justify the proposed revisions to, and retirement of, existing standards. we can only trust that the drafting team is using the currently approved version of each identified standard and has stayed abreast of any proposed changes to those standards.
San Diego Gas and Electric Co.	Yes	
Ontario IESO	No	We agree with some but not all of the proposed changes to the other standards. (1) EOP-001 R2: We do not

Organization/Group	Question 7:	Question 7 Comments:
		<p>agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes." This requirement does not equate to the Transmission Operator developing plans for mitigating IROLs, which is the role of the RC. In fact, this requirement holds the TOP responsible for having the load reduction plan in place ahead of real time so that when directed by the RC, it can execute the plan to assist in mitigating the IROL violation. Current Day Operations: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.</p> <p>(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.</p> <p>(b) For R13, the Implementation Plan says "retiring" but it should read "revising". We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection" actually contains two requirements that are not covered by the new IRO-009: (a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change. (b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence.</p> <p>(5) TOP-003-0? Planned Outage Coordination Modify R1.2. We agree with this change.</p> <p>(6) TOP-005-1? Operational Reliability Information: Retire R1 and R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 and R1.1 and the proposed conversion of Attachment 1 into a reference. But there doesn't seem to be a draft reference document posted. When the new IRO standards go into effect, the reference documents will need to be available. Please elaborate on the timing and the process for posting and implementing the reference.</p> <p>(7) TOP-006-1? Monitoring System Conditions Voltage and Reactive Control:</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 7:	Question 7 Comments:
ISO RTO Council Standards Review Committee	No	<p>Modify R4. We agree with this change.</p> <p>We do not agree with all of the proposed changes. (1) EOP-001 R2: We do not agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes." This requirement does not equate to the Transmission Operator developing plans for mitigating IROLs, which is the role of the RC. In fact, this requirement holds the TOP responsible for having the load reduction plan in place ahead of real time so that when directed by the RC, it can execute the plan to assist in mitigating the IROL violation. While the IRO-008 to IRO-010 standards give the RC the authority and the flexibility to direct the TOP to do so, having the plan in advance and be ready for execution is not covered by these IRO standards. Further, the amount and timing that the TOP is able to achieve with load reduction must be known to the RC ahead of real time for it to consider the effectiveness of the plan's execution in support of the mitigating action.(2) IRO-002 R2: We agree with retiring this requirement.(3) IRO-004-1 ? Reliability Coordination? Operations Planning: retire entire standard (R1 through R6). We agree with retiring this standard since all requirements are covered elsewhere except R4. This requirement is intended to provide system information not just for the RC within whose area the BA, TOP, etc. reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses. This requirement needs to have a "home". (4) IRO-005-2? Reliability Coordination? Current Day Operations: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.(b) For R13, the Implementation Plan says "retiring" but it should read "revising". We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection." actually contains two requirements that are not covered by the new IRO-009: (a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change. (b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence. (5) TOP-003-0? Planned Outage Coordination Modify R1.2. We agree with this change. (6) TOP-005-1? Operational Reliability Information: Retire R1 and R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 ad R1.1 and the proposed conversion of Attachment 1 into a reference. But there doesn't seem to be a draft reference document posted. When the new IRO standards go into effect, the reference</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 7:	Question 7 Comments:
		documents will need to be available. Please elaborate on the timing and the process for posting and implementing the reference. (7) TOP-006-1? Monitoring System Conditions Voltage and Reactive Control: Modify R4. We agree with this change.
FirstEnergy	Yes	The effective dates correctly follow the end of the implementation schedule for FAC-014.
Hydro One Networks	No	We do not agree with the elimination of EOP-001-0 R2 as the RC and TOP must work together in planning how to implement load reduction. We do not agree with retiring R3 of IRO-004-1. Where SOLs and IROLs are known at least a day prior to the current day, the RC should have enough time to "coordinate" the development of action plans required to return transmission loading to within acceptable SOLs and IROLs with its Transmission Operators and Balancing Authorities. Otherwise how does the RC know if their plan is feasible or effective? Developing "effective" plans to mitigate SOLs and IROLs are a operation planning function and therefore belong in the IRO-004-1 Reliability Coordination - Operations Planning standard. We do not agree with the retirement of IRO-005-2 R5. We agree that the RC may not be the responsible entity for SOLs violations however; it would be more prudent to modify the requirement instead of retiring it completely. Perhaps take "SOL" out of the requirement and create a new requirement having the TOP responsible for SOL violations. There is confusion on whether you want to retire or modify IRO-005-2 R13 (page 3 verses page 20). We suggest modifying R13 by separating it into two separate requirements. The first having the RC responsible for ensuring all entities operate to prevent actions in their Reliability Coordinator Area that results in IROL violations in another area of the interconnection. The second requirement to have these same entities excluding the RC, to always operate the BES to the most limiting parameter. For TOP-003, TOP-005 and TOP-006, we believe a SAR should be initiated to "clean-up" standards & requirements that may be redundant or incorrect as apposed to retiring them within an implementation plan which pertains to a different set of standards.
ISO New England Inc	No	We do not agree with all of the proposed changes. (1) EOP-001 R2: We do not agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes." This requirement does not equate to the Transmission Operator developing plans for mitigating IROLs, which is the role of the RC. In fact, this requirement holds the TOP responsible for having the load reduction plan in place ahead of real time so that when directed by the RC, it can execute the plan to assist in mitigating the IROL violation. While the IRO-008 to IRO-010 standards give the RC the authority and the flexibility to direct the TOP to do so, having the plan in advance and be ready for execution is not covered by these IRO standards. Further, the amount and timing that the TOP is able to achieve with load reduction must be known to the RC ahead of real time for it to consider the effectiveness of the plan's execution in support of the mitigating action. (2) IRO-002 R2: We agree with retiring this requirement. (3) IRO-004-1: We agree with retiring this standard since all requirements are covered elsewhere except R4. This requirement is intended to provide system

		<p>information not just for the RC within whose area the BA, TOP, etc. reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses. This requirement needs to have a "home". (4) IRO-005-2: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.(b) For R13, the Implementation Plan says "retiring" but it should read "revising". We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection." actually contains two requirements that are not covered by the new IRO-009: (a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change. (b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence. (5) TOP-003-0: Modify R1.2. We agree with this change. (6) TOP-005-1: Retire R1 and R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 ad R1.1 and the proposed conversion of Attachment 1 into a reference. (7) TOP-006-1: Modify R4. We agree with this change.</p>
American Transmission Company LLC	No	<p>Issue 1: The implementation plan states that all of IRO-004-1 will be deleted when IRO-008, 009 and 010 are approved. Requirement 7 in IRO-004-1 is not being covered in any of the proposed new standards. The SDT needs to document the justification behind the deletion of R7 in IRO-004-1 before the entire standard can be deleted. Issue 2: ATC does not agree that IRO-005-1 R2 is duplicative of IRO-010-1 R1 and R2. IRO-005-1 R2 requires monitoring but IRO-010-1 R1 and R2 are data specification requirements for study purposes. ATC believes that the RC should be required to monitor Interchange Transactions. Issue 3: Requirement 14 of IRO-005-1: The SDT has proposed to remove the language that requires the RC to provide the TSP with SOL and IROL limits. We were unable to locate any requirements in IRO-008, 009 and 010 that requires the RC to share SOL and IROL limits with the TSP. It should be the obligation of the RC to provide these limits to the TSP. IRO-002-1 R5 and R6 require the RC to monitor SOLs and FAC-014 R1 requires the RC to ensure that SOLs and IROLs are consistent with its SOL Methodology. Issue 4: ATC does not agree with the changes to TOP-005-1. Although TOP-005 Requirement 1 may be a duplicate of IRO-010, TOP-005 obligates that the RC to identify the data requirements for the "Electric System Reliability Data". TOP-005-1 requirements 2 and 3 still address the "Electric System Reliability Data" section so making it a reference document does not remove it from the mandatory realm. In addition, the RC should be required to sign the "NERC Confidentiality Agreement" identified in TOP-005-1 because the TOP, BA and PSE still have to supply the data specified by the "Electric System Reliability Data" requirements. Issue 5: TOP-006-1 R4: ATC does not agree with the Set's</p>

Organization/Group	Question 7:	Question 7 Comments:
		<p>changes to R4 in TOP-006-1. We believe that the RC should be required to purchase their own weather forecasting service. Since most utilities purchase weather forecasting services from third party vendors, which have restrictions about sharing that information, this change would require ATC to purchase and maintain a weather forecasting license for our RC. ATC believes that the above statement is true because the SDT is recommending in its implementation plan that the RC would specify in IRO-010 R1 and R2 the required weather forecasting information. If this is not the case then the SDT should provide information as to why the RC is being removed from Requirement 4 in TOP-006-1.</p>

8. If you have any other comments on this set of standards that you haven't already provided, please provide them here?

Organization/Group	Question 8 Comments:
Northeast Utilities	<p>(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"):High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. Please provide examples of those RCs that work for an RE. The latter, as a standard developer and compliance monitor per the functional model, does not have any operating and planning tasks assigned to them that require it to employ an RC. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.</p>
NPCC Regional Standards Committee, RSC	<p>(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. Entergy Services	
RCCWG - reliability coordinator comments working group	RSAWS need to be developed in parallel with standard revisions to they maintain the intention of the standard for the audit team.
Manitoba Hydro	There needs to be coordination between IRO-010-1, TOP-005-0 Attachment 1, and VAR-002-1. Is it the intention of IRO-010-1 to ensure the RC has real-time data to monitor the state of the bulk electric system? TOP-005-0 Attachment 1 which is to become a Technical Reference states "1. The following information shall be updated at least every 10 minutes." VAR-002-1 R3 states "Each Generator Operator shall notify its associated Transmission Operator as soon as practical, but within 30 minutes of any of the following: R3.1. A

Organization/Group	Question 8 Comments:
	<p>status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability.R3.2. A status or capability change on any other Reactive Power resources under the Generator Operator's control and the expected duration of the change in status or capability." This does not give the impression that real time status is required. For BES reliability, we ultimately think there should be real-time status from the AVR, PSS or SPS into the entity's Control Centre EMS and simultaneously through an ICCP link to the RC EMS. This approach would be the most robust with the least amount of chance of a communication break down attributed to human error. For an entity with over 100 generators, a project to bring real time AVR, PSS and SPS status into the Control Centre EMS and transfer the data via ICCP to the RC EMS would be very time consuming and costly. We would suggest a period of grace (dependent on number of RTU points required (up to several years)) for entities to reach this goal. During this grace period we suggest that knowledge of AVR, PSS, and SPS status by default is sufficient. In other words the device is considered "in service/on auto" unless the system operator is notified differently. The system operator manually toggles into SCADA the status of the device. The device's status change is communicated to the RC "without delay" either electronically or verbally. The device status in the RC EMS would be updated at this time. Both the entity's and the RC's EMS Real Time Contingency Analyses would be utilizing the latest known AVR, PSS and SPS status. As I see it, this approach, if agreed to by the RC, would satisfy IRO-010-1 R1 - R1.3 and R1 Violation Severity Levels "Lower" through to "Severe".</p>
<p>Operating Reliability Working Group</p>	<p>The Applicability section of IRO-009-1 includes more than a list of entities to which the standard applies. In this situation, a 'what' the standard applies to be included. We've never seen this before and question it's applicability in this case. Add parenthesis around the phrase 'up to and including load shedding' in R1 of IRO-009-1. The same phrase already exists in R2 in parenthesis. In the Compliance Section D, Item 1.4 Data Retention of IRO-010-1 the third paragraph states that the BA, GO, GOP, LSE, RC, TOP and TO shall keep evidence used to show compliance with R3 and M3. How much evidence is required? Prior versions of IRO-010 indicated that 3 months of evidence would be sufficient. Not including a specific reference leaves the standard vague. A specific reference should be included. We suggest returning to the 3 month requirement. Also in this same Item 1.4 the phrase "in advance of real-time" shows up. If it was replaced in IRO-009-1, it should also be replaced here as well.</p>
<p>SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1</p>	<p>We feel that the Implementation Plan should not set different implementation dates for jurisdictional and non-jurisdictional entities. This puts an additional burden on Reliability Coordinators to resolve problems involving entities subject to different standards. Our recommendation is that the standard should become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval. One concern certain members have involves data retention requirements for IRO-10-1 at R3 and M3 when a system is part of an ISO or RTO and is required by its Reliability Coordinator to input its data into the ISO or RTO business system. For instance, a Reliability Coordinator may require generator operators to periodically update generator operating limits in support of R1-R3 citing two (2) horizons for such entries: (1) the</p>

Consideration of Comments on Draft 9 of IROL Standards — Pre-2006

Organization/Group	Question 8 Comments:
	day prior to the operating day and (2) as changes occur in real time. Members agree with the requirements, however data is manually entered into the business system and the member does not have the ability to retain the data or verify that it was entered. Given that the requirements call for the Reliability Coordinator to be provided the data, the measures should require that the RC retain the data provided.
San Diego Gas and Electric Co.	
Ontario IESO	(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"):High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. Please provide examples of those RCs that work for an RE. The latter, as a standard developer and compliance monitor per the functional model, does not have any operating and planning tasks assigned to them that require it to employ an RC. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly. (3) For R2/M2 of IRO-008, it is not possible to keep records of 30 minute IROL analysis for 30 days. Such time-logged analysis which are probably the only evidence of 30 minute analysis and these can only be located on the security analysis software and we do not believe that such software have the capability of keeping such extended records. We believe that the evidence retention for R2/M2 should be a couple of days at the most. in other words, the previous documentation retention requirement for this requirement should be retained.
ISO RTO Council Standards Review Committee	(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on

Organization/Group	Question 8 Comments:
	<p>"planning time frame"):High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.</p>
FirstEnergy	<p>FE has the following additional comments and suggestions: (1) IRO-010 - Requirement R1 - Remove the word "data" between documented and specification to improve clarity and readability. (2) The last sentence of R3 contains a phrase that was previously proposed to be a new term in IRO-007-1, but is now being deleted. If this intended to be retained as a new definitional term within the Glossary it will need to be added to IRO-010.When revised R1.1 and R3 should read as follows: (3) IRO-010 - Presumably the last sentence of R3 is designed to limit the data that the Reliability Coordinator may request from the various responsible entities listed. However, in its current state, the requirement seems to limit what the affected entities can provide. We suggest that it may be clearer to remove the last sentence of R3 and append it to the existing R1.1 requirement. The new R1.1 and R3 are proposed as follows:"R1.1. List of required data and information. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.""R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified by R1 above, to the Reliability Coordinator(s) with which it has a reliability relationship."(4) With regard to Attachment 1 of TOP-005-2, this information in this attachment is to be transferred to a "Reference" document. However, it is not clear when this reference document is to be developed since a draft of this proposed reference is not available for comment. We suggest this reference document be developed and posted along with these new IROL standards so that it is all completed at the same time. The reference document will be a valuable tool to be used in conjunction with the standards and should be developed in conjunction with these standards.(5) In some of the revised standards, references to previous IROL requirements have been removed as they are now covered in the proposed IRO standards. In some cases, these revisions have led to entire requirements being deleted. It is brought to the attention of the SDT</p>

Organization/Group	Question 8 Comments:
	that requirement re-numbering was not correctly shown in the red-line standards provided for review and will need to be corrected in final changes. (e.g. EOP-001, TOP-005, etc.)(6) In IRO-009-1 the Applicability section contains 4.2 stating "The IROLs covered in this standard are limited to those associated with contingencies studied under FAC-011 and FAC-014." The NERC Standard Development Procedure indicates that the Applicability Section is intended to describe the 1) entities responsible for complying with the standard and 2) if needed, the portion of the bulk power system for which the standard is applicable. The 4.2 item may introduce an unintended use of the Applicability section and it may be better to move this item to a new requirement R1 in the standard worded as follows:"R1 Each Reliability Coordinator shall manage its current day system against IROL conditions identified in a manner consistent with the requirements of standards FAC-011 and FAC-014."
Hydro One Networks	We believe a SAR should be initiated to "clean-up" standards & requirements that may be redundant or incorrect as apposed to retiring them within an implementation plan which pertains to a different set of standards. As well, for IRO-009, the VRFs for R1 and R2 should both be High.
ISO New England Inc	
American Transmission Company LLC	Operational Planning Analysis (Definition): The phrase "next day's operation and up to 12 months ahead" (See definition of Operational Planning Analysis) is too broad when used in the context of requirement 1. The definition should be broken into two independent definitions one to address the "next day study" and a second to address the "up to 12 months study". Requirement 1 states that the RC has to perform an Operational Planning Analysis which, we have identified above, means "next day and up to 12 months" for the next operating day. By including the "up to 12 months" in the definition we believe that for every next day study the RC has to perform two independent studies. 1) One for the next day and 2) One for some other day that is up to 12 months It is for this reason that we suggest that the definition be broken into two distinct terms.IRO-008-1: ATC believe that IRO-008-1 R1 and R2 should be expanded to include SOLs in the Operational Planning Analysis and Real-Time Assessment. IRO-009-1The applicability section of that standard is to be used to identify the functional entity that must comply with the standard. The SDT is using this section to place an exception on the requirements. Any exception should be identified in the requirements. (Solution could be with a footnote) Standard IRO-009-1 needs two additional requirements: 1) Require the RC has to coordinate their plans with entities that are expected to perform an action in the plan. 2) Distribute and share those plans with entities that are expected to perform an action. R3 ATC is concern that compliance is based on following the plan and what is more important is if the RC prevented the IROL from exceeding the Tv. The requirement should specify that the RC prevents the IROL not that they follow their plan. IRO-010-1 Data Retention rule A more specific data retention period should be established. The current language would require ATC to keep data anywhere from one month to seven years or more. "For data that is requested in advance of real-time the TOP shall keep evidence used to show compliance with R3 for the RC's most recent data specifications." (If the RC updated their data specifications once every seven years all entities must retain their data for seven years.) General Comment: ATC suggest that this SDT work closely with the Reliability Coordinator SDT in order to ensure a comprehensive set of standards.

## **Consideration of Comments on Draft 9 of the IROL Standards — IRO-008-1 through IRO-010-1**

The IROL Standard Drafting Team thanks all commenters who submitted comments on draft 9 of the Interconnection Reliability Operating Limit standards. These standards were posted for a 30-day public comment period from March 26, 2008 through April 25, 2008. The stakeholders were asked to provide feedback on the SAR through a special Standard Comment Form. There were 15 sets of comments, including comments from more than 100 different people from more than 40 companies representing 7 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders and FERC staff, and the drafting team's consideration of those comments, the drafting team made the following modifications to the standards:

### **IRO-008**

- Added clarifying language to the definition of Operational Planning Analysis to clarify that the analysis may be performed a day ahead or as much as 12 months ahead of real-time.
- Added clarifying language to the VSLs for R2 to identify that the VSLs are based on the review of a specific sample size.

### **IRO-009**

- The drafting team removed 4.2 from the Applicability Section (limited applicability to the IROLs associated with contingencies identified in FAC-010 and FAC-014) of the standard because it duplicated information already included in the requirements.
- Modified R1 – R5 and associated measures and VSLs to clarify that the action plans and actions in this standard are limited to those associated with IROLs in the Reliability Coordinator's own Reliability Coordinator Area. IRO-016 addresses coordination when there is an IROL in another Reliability Coordinator's Area, or when there is a need to coordinate development and execution of action plans involving more than one Reliability Coordinator.
- Added a parenthetical phrase to R3 to clarify that the Reliability Coordinator may use any action plan at its disposal to prevent or mitigate an instance of exceeding an IROL
- Added a parenthetical phrase to R5 to clarify that "the most conservative value" is the value that has the least impact on reliability.
- Eliminated the "high" VSL for R3 in support of stakeholder comments indicating that the requirement is aimed at actions, not at preventing an instance of exceeding an IROL.
- Eliminated one of the two "severe" VSLs for R5 in support of stakeholder comments indicating that the two VSLs were redundant.

### **IRO-010**

- Modified R1 and R1.1 in support of comments from FERC staff and stakeholders by adding words from the purpose and from R3 to clarify the intent of the requirement is to collect data and information needed by the Reliability Coordinator to support

Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments to prevent instability, uncontrolled separation, and cascading outages.

- Added a data retention period for R3 based on stakeholder comments. The data retention period added matches the period recommended by the Compliance Program.
- Revised the VSLs for R1 by reversing the VSLs for “Lower” and “Moderate” based on stakeholder comments indicating that missing the “mutually agreeable format” was less severe than missing the process for data provision when automated Real-Time system operating data is unavailable.

#### **Implementation Plan:**

- Removed the recommendation to retire Attachment 1 in TOP-005-2 because stakeholders identified that the attachment is still needed to support Requirement R3 in TOP-005-2.

#### **Definition of Operational Planning Analysis**

- Added language to clarify that the Operational Planning Analysis can be performed a day ahead or as much as 12 months ahead.

The drafting team believes that the above modifications will satisfy most comments suggesting that the standards or implementation plan need adjustments. There were several places where stakeholders indicated a lack of understanding in the terminology associated with some of the defined terms as well as confusion about some of the terminology associated with the elements in the standard used by the compliance program such as time horizons and violation risk factors. The drafting team believes that the information it provided should satisfy these commenters.

The drafting team did not adopt the following proposed modifications from stakeholders or from FERC staff:

- Some commenters who agreed that monitoring is a supporting activity, indicated a concern that removing the monitoring requirement may impact other requirements in other standards that rely upon monitoring. The drafting team did not return the monitoring requirements to the standards. Entities that do not have real-time system operators actively monitoring the status of the bulk power system cannot achieve the performance-related requirements in this standard and in other standards.
- Some commenters wanted the Severe VSL for failing to resolve an IROL within the IROL’s  $T_v$  to be a “High” VSL when the Reliability Coordinator took action to resolve the IROL but was not successful. The drafting team believes that this change would violate the guidelines for setting VSLs. The intent of the requirement is not met at all if the IROL is not resolved within the IROL  $T_v$ . The guidelines for setting VSLs indicate that if the intent of the requirement is mostly or totally unmet, then the VSL should be “Severe.”
- FERC staff interpreted one of the directives in Order 693 as requiring the Reliability Coordinator to have action plans to implement if a contingency occurs during the system adjustment period following an instance of exceeding an IROL, but before the IROL  $T_v$  has been reached and before the system has been returned to a stable state. The drafting team did not interpret the directive (paragraph 1601 of Order 693) in this manner. The IROL standards require an action plan for all IROLs identified a day or more ahead of the current day for all IROLs within the Reliability Coordinator’s Reliability Coordinator Area. The drafting team does not think it is

practical to develop action plans for all possible contingencies that could occur during the adjustment period while the system is being returned to a stable state.

- There were several commenters who indicated the VRFs for requirements associated with having action plans should be modified from “Medium” to “High.” The drafting team had posted the VRFs for comment in an earlier posting, and the same commenters had earlier agreed that the VRFs should be “Medium.” Because the drafting team had achieved what appeared to be consensus on the VRFs in the earlier posting, the drafting team did not make the requested change. Failure to have an action plan should not, by itself, cause or contribute to uncontrolled separation, instability, or cascading.

The drafting team does not believe that the modifications made are significant enough to warrant posting the revised standards for an additional comment period, and will ask the Standards Committee for authorization to move the standards and the implementation plan forward to ballot.

In this ‘Consideration of Comments’ document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

<http://www.nerc.com/~filez/standards/IROL.html>

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at [gerry.adamski@nerc.net](mailto:gerry.adamski@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

---

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedures: <http://www.nerc.com/standards/newstandardsprocess.html>.

**Index to Commenters, Questions, Comments, and Responses**

Commenters: ..... 5

1. The drafting team eliminated IRO-007-1 Requirement R1, the requirement for the Reliability Coordinator to “monitor” its wide area. Monitoring is a “how” – staying within the IROLs is the “required performance.” Do you agree with this change?..... 8
2. The drafting team moved IRO-007-1 Requirement R2 (from IRO-007 R2 to IRO-009 R5), the requirement for the Reliability Coordinator to use the most conservative value under consideration when there is a disagreement amongst Reliability Coordinators on the value of an IROL or its  $T_v$ . This move seemed to put the related requirements together in a single standard and allowed the elimination of IRO-007. Do you agree with this change? .....10
3. The drafting team modified the Violation Severity Levels for IRO-008. Do you agree with the new VSLs? ..... 11
4. The drafting team modified IRO-009-1 R1 and R2 by replacing the phrase, “in advance of real-time” with the phrase, “one or more days prior to the current day” to clarify the intent and measurability of these requirements. Do you agree with the change made to R1 and R2 in IRO-009-1? ..... 18
5. The drafting team modified the Violation Severity Levels for IRO-009. Do you agree with the new VSLs? .....22
6. The drafting team modified the Violation Severity Levels for IRO-010. Do you agree with the new VSLs? .....27
7. The drafting team modified the implementation plan to reflect the modifications made based on the elimination of IRO-007-1 Requirement R1. Do you agree with the modifications made to the implementation plan?.....30
8. If you have any other comments on this set of standards that you haven’t already provided, please provide them here?..... 45

Observations and Discussions with FERC Staff May 29, 2008 and June 3, 2008 .....54

**Consideration of Comments on Draft 9 of IROL Standards**

1. The drafting team eliminated IRO-007-1 Requirement R1, the requirement for the Reliability Coordinator to “monitor” its wide area. Monitoring is a “how” – staying within the IROLs is the “required performance.” Do you agree with this change?

**Summary Consideration:** Most stakeholders who responded to this question agreed with the removal of Requirement R1 from IRO-007-1.

Organization/Group		Question 1 Comments:
Ontario IESO	No	The IESO agrees that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal may leave a void in this aspect. We suggest the Standard Drafting Team consider the impact of removing this requirement on the other standards.
<p><b>Response:</b> The drafting team has considered the impact of removing this requirement. Other drafting teams (Reliability-based Control SDT, Reliability Coordination SDT, and Real-time Operations SDT) have removed the “monitoring” requirements from other standards for the same reason that the IROL SDT proposed removing this monitoring requirement. Monitoring is a supporting task used to achieve the objective of operating within IROLs. Most stakeholders who provided comments support the drafting team’s position. FERC has said, if you have a plan, by definition you have to implement it – this is a parallel argument – if you must operate within IROLs, you must monitor.</p>		
ISO RTO Council Standards Review Committee	No	On the one hand, the IRC agrees that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal may leave a void in this aspect. We are therefore unable to indicate a preference. We suggest the Standard Drafting Team consider the impact of removing this requirement on other standards.
<p><b>Response:</b> The drafting team has considered the impact of removing this requirement. Other drafting teams (Reliability-based Control SDT, Reliability Coordination SDT, and Real-time Operations SDT) have removed the “monitoring” requirements from other standards for the same reason that the IROL SDT proposed removing this monitoring requirement. Monitoring is a supporting task used to achieve the objective of operating within IROLs. Most stakeholders who provided comments support the drafting team’s position. FERC has said, if you have a plan, by definition you have to implement it – this is a parallel argument – if you must operate within IROLs, you must monitor.</p>		
ISO New England Inc	No	We understand that monitoring is implicit in this set of standards given the RC is held responsible for operating the system within IROLs, and taking corrective actions to prevent and mitigate instances where an SOL or IROL is (or expected to be) exceeded. Nonetheless, the requirement to monitor drives the need for other standards, such as communication and provision of monitoring facilities. Its removal may leave a void in this aspect. We suggest the SDT consider the ramifications of removing this requirement on other standards.
<p><b>Response: Response:</b> The drafting team has considered the impact of removing this requirement. Other drafting teams (Reliability-based Control SDT, Reliability Coordination SDT, and Real-time Operations SDT) have removed the “monitoring” requirements from other standards for the same reason that the IROL SDT proposed removing this monitoring requirement. Monitoring is a supporting task used to achieve the</p>		

Consideration of Comments on Draft 9 of IROL Standards

Organization/Group		Question 1 Comments:
<p>objective of operating within IROLs. Most stakeholders who provided comments support the drafting team’s position. FERC has said, if you have a plan, by definition you have to implement it – this is a parallel argument – if you must operate within IROLs, you must monitor.</p>		
Hydro One Networks	Yes	<p>We believe it is ok to eliminate IRO-007-1 R1, as IRO-008-1 R2 requiring the RC to perform "Real-Time Assessments" (every 30 minutes) to determine if any IROL is exceeded, covers off the intent of IRO-007-1 R1. In addition, IRO-008-1 R2 has, at a minimum, a Violation Risk Factor and Time Horizon at least equal to or stricter than IRO-007-1 R1.</p>
<p><b>Response:</b> The drafting team appreciates your support. This is the philosophy the drafting team used in making the recommendation to retire the requirement.</p>		
American Transmission Company LLC	Yes	<p>ATC is okay with dropping IRO-007 R1 because it is covered in IRO-002-1 R5 and R6. IRO-002-1 R5 and R6 require the RC to monitor BES elements that could result in SOL or IROL violations.</p>
<p><b>Response:</b> Thank you for your support. We advise you to monitor the work of the Reliability Coordination standard drafting team as they are recommending retirement of IRO-002-1 R5 and R6.</p>

## Consideration of Comments on Draft 9 of IROL Standards

2. The drafting team moved IRO-007-1 Requirement R2 (from IRO-007 R2 to IRO-009 R5), the requirement for the Reliability Coordinator to use the most conservative value under consideration when there is a disagreement amongst Reliability Coordinators on the value of an IROL or its  $T_v$ . This move seemed to put the related requirements together in a single standard and allowed the elimination of IRO-007. Do you agree with this change?

**Summary Consideration:** All commenters who responded to this question agreed with moving Requirement R2 from IRO-007-1 to IRO-009.

Organization/Group		Question 2 Comments:
Northeast Utilities	Yes	Please define $T_v$ in the standard.
<b>Response:</b> IROL $T_v$ is an approved definition.		
Hydro One Networks	Yes	Since IRO-007-1 R2 describes an action with respect to IROLs, it is appropriate to move that requirement to the IRO-009-1 standard Reliability Coordinator Actions to Operate within IROLs. In addition, the VRF, Time Horizon and VSL (severe) have all been kept the same. Therefore elimination of IRO-007-1 is also appropriate at this time.
<b>Response:</b> The drafting team appreciates your support.

### 3. The drafting team modified the Violation Severity Levels for IRO-008. Do you agree with the new VSLs?

**Summary Consideration:** None of the commenters who responded to this comment indicated agreement with the proposed VSLs. Some comments indicated misunderstanding of the definition of “Real-time Assessment,” some commenters indicated confusion about the multiple definitions being used for the term, “Time Horizons,” and some commenters asked for more clarity in the use of “sample periods” in the VSLs for R1 and R2.

**Real-time Assessments** – Some commenters suggested that the VSLs in R2 are overly punitive, because they don’t allow any “down time” for the EMS. The term, “Real-time Assessment” is defined as follows and does not have to be performed using only a state estimator – the definition allows the use of other tools and processes:

- An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

The definition was designed so that you could still conduct a Real-time Assessment, if needed, using readily available data collected through manual processes.

**Time Horizons** - The “Time Horizons” used for the Sanctions Guidelines are not the same as the operations and planning periods described in the Functional Model. The *Glossary of Terms Used in Reliability Standards* does not include an approved definition of either the term “Planning Horizon” – or the term, “Operations Horizon.” The Time Horizons (designed for use in determining the size of a penalty or sanction) associated with each requirement in a standard use the following definitions:

- Long-term Planning — a planning horizon of one year or longer.
- Operations Planning — operating and resource plans from day-ahead up to and including seasonal.
- Same-day Operations — routine actions required within the timeframe of a day, but not real-time.
- Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system.
- Operations Assessment — follow-up evaluations and reporting of real time operations.

**Sample Periods** - Commenters asked the drafting team to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. Commenters also asked the drafting team to identify the basis for the use of the 24 hour period for the VSLs for R2 and suggested that there was a conflict with a VSL that described noncompliant performance measured over a 30 day period with the definition of Operational Planning Analysis. These comments indicate a misunderstanding on the use of VSLs as well as a misunderstanding about the definition of “Operational Planning Analysis.” VSLs describe categories of noncompliant performance and are used by the Compliance Enforcement Authority to help determine the size of a penalty or sanction. The VSLs for R1 are based on the Compliance Enforcement Authority using the data retained by the responsible entity to determine if there were noncompliant performance. The Data Retention period for evidence used to show compliance with Requirement R1 is a rolling 30 days. If, after reviewing the 30 days of data, the Compliance Enforcement Authority finds that there were three days that did not have an operational planning analysis, then the noncompliant performance falls into the High Violation Severity Level category. Based on the comments, the drafting team modified the VSLs for R2 to provide clarity by making the following addition to each of the VSLs for R2:

## Consideration of Comments on Draft 9 of IROL Standards

Lower VSL for R2: **For any sample 24 hour period within the 30 day retention period, a** Real-time Assessment was not conducted for one 30-minute period within **a that** 24-hour period

The drafting team added a sentence to the definition of “Operational Planning Analysis” as shown below to clarify that the analysis is for the next day’s operation – but the analysis does not necessarily have to be conducted every day.

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day’s operation. **(The analysis may be performed either a day ahead or as much as ~~and up to~~ 12 months ahead.)** Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

Organization/Group		Question 3 Comments:
Ontario IESO	No	<p>We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period.</p> <p>This question also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis. We asked the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.</p>
<p><b>Response:</b> The 30 days in the VSLs for R1 came from the data retention period for R1 in this standard – which is a rolling 30 days for R1. The data retention period was intended to ensure that there is sufficient data for the Compliance Enforcement Authority to measure compliance, without overwhelming the responsible entity. We do not agree that RCs should retain 12 rolling months of analyses to demonstrate compliance with this requirement since it would be burdensome to retain that much data.</p> <p>The drafting team assumes that the comment about R3 is really about R2 – since the VSL for R2 includes the “24 hour period” and R3’s VSLs do not. The intent of the 24 hour period was to set boundaries on the sample size used to assess compliance. The drafting team modified the VSL to include language to identify that the VSLs are based on a sample 24 hour period within the 30 day retention period.</p> <p>The “Time Horizons” used for the Sanctions Guidelines are not the same as the operations and planning periods described in the Functional Model. The Time Horizons associated with each requirement in the standard, use the following definitions of the various time periods:</p> <ul style="list-style-type: none"> <li>– Long-term Planning — a planning horizon of one year or longer.</li> <li>– Operations Planning — operating and resource plans from day-ahead up to and including seasonal.</li> <li>– Same-day Operations — routine actions required within the timeframe of a day, but not real-time.</li> </ul>		

## Consideration of Comments on Draft 9 of IROL Standards

- Real-time Operations — actions required within one hour or less to preserve the reliability of the bulk electric system.
- Operations Assessment — follow-up evaluations and reporting of real time operations.

Note that the Glossary of Terms Used in Reliability Standards does not include an approved definition of either the “Planning Horizon” – or the term, “Operations Horizon.”

Northeast Utilities	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
<b>Response:</b> Please see the <a href="#">Summary Consideration and the response to IESO</a> .		
NPCC Regional Standards Committee, RSC	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
<b>Response:</b> Please see the <a href="#">Summary Consideration and the response to IESO</a> .		
Hydro-Québec TransEnergie	No	HQT agree with the changes to the VSLs for R2 and R3, but is unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours being a part of the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis.
<b>Response:</b> Please see the <a href="#">Summary Consideration and the response to IESO</a> .		
ISO New England Inc	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. This question also applies to the 24 hour period for the VSLs for R3 except in the context of real-time operation, most would assume the next 24 hours as being the real-time horizon. The 30-day period, however, may not be generalized for the operational planning horizon given a 12 month period already specified in the definition for Operational Planning Analysis. We ask the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.
<b>Response:</b> Please see the <a href="#">Summary Consideration and the response to IESO</a> .		
ISO RTO Council Standards Review Committee	No	We agree with the changes to the VSLs for R2 and R3, but are unable to identify the basis for the VSLs for R1, in particular the 30-day "sample" period. We ask the SDT to extend the sampling period to 12 months in accordance with the general understanding of the time frame for operations planning.
<b>Response:</b> Please see the <a href="#">Summary Consideration and the response to IESO</a> .		
SERC OC Standards	No	We feel that the Violation Severity Levels for IRO-008-1, R2, if applied as currently proposed, are unduly restrictive in

Consideration of Comments on Draft 9 of IROL Standards

<p>Review Group - IROL Standards, IRO-008-1, 009-1, 010-1</p>	<p>measuring the impact of violating the requirement to run a real-time assessment every thirty (30) minutes for the following reasons:</p> <ol style="list-style-type: none"> <li>1. During a large portion of the time, system conditions do not change within a thirty (30) minute period and the risk to the interconnection is not the same for every thirty (30) minute period. When violations are not commensurate with the risk to the Interconnection or where there is no real harm, the penalties should be waived or reduced accordingly. Another way of saying this is that the Violation Severity Level and measurement criteria of IRO-008-1 do not measure the potential risk to the interconnection due to violation of these criteria. In fact, no strictly time based criteria can. The best criteria would be the determination of risk to the interconnection (or change in the level of risk in a positive or higher risk direction) that was not properly detected and acted upon by the Reliability Coordinator. One potential way that this could actually be measured during "after the fact audits" is by choosing a set of specific occurrences during the previous year that impacted interconnection reliability within the RC area and reviewing the RC's documented responses to them. This would greatly enhance the ability of auditors to measure actual RC performance rather than just measuring how often the RC went through the motions of performing an analysis.</li> <li>2. The requirements do not allow for scheduled maintenance or unplanned down time of EMS systems, thereby requiring a perfect compliance performance for 17,520 study periods in a year. This doesn't allow for any down time for EMS or assessment applications (State Estimator) and this imposes impossible criteria on EMS operations and guarantees that every system will have one or more violations each year. This places an emphasis on or actually measures the performance of tools rather than on the performance of the Reliability Coordinators</li> <li>3. The drafting team may want to seriously reconsider the thirty (30) minute requirement for running real time assessments. Hourly assessments would be more practical for assessing system conditions and for compliance requirements. Systems generally conduct continuous assessments during peak load or abnormal conditions and Reliability Coordinators and Operators should be allowed the flexibility to make reasoned judgments based on their knowledge of the system during normal conditions or during failures of assessment tools. Our support for an hourly interval is also based upon the recommendations of the NERC Real-time Tools Best Practices Task Force.             <p>On pages 156-158 of section 2 of their report, the RTBPTF proposes that a new requirement for "look-ahead analyses" be added to standards TOP-002 and IRO-004. Since IRO-008 is intended to replace IRO-004, the recommendation is applicable to IRO-008.</p> <p>Specifically, the recommendation as it pertains to RCs is paraphrased as follows: In order to assess approaching IROL violations, each Reliability Coordinator shall, at a minimum, perform one-hour-ahead Power Flow simulations during the following: + Occurrence of critical system event + Extreme load conditions + Large power transactions + Major planned outages. This recommended requirement would address the "expected" system conditions component of the proposed (and so-called) "Real Time" Assessment.</p> <p>The "existing" system conditions component should be covered by requirements for monitoring found elsewhere in the standards. The rationale for the RTBPTF recommendation came from a deficiency identified in the Blackout Report. Specifically, the report stated: "FE did not perform adequate hour-ahead operations planning studies after Eastlake 5 tripped off-line at 13:31 to ensure that FE could maintain a 30-minute</p> </li> </ol>
---	--

Consideration of Comments on Draft 9 of IROL Standards

	<p>response capability for the next contingency. The FE system was not within single contingency limits from 15:06 to 16:06. In addition to day-ahead planning, the system should have been restudied after the forced outage of Eastlake</p> <p>5."The recommendation is supported by the findings of the RTBPTF based upon responses received from the task force's survey of RCs and TOPs. The survey showed that 47% of all respondents performed look-ahead studies at intervals less than one hour, and 80% perform such studies at intervals from one hour to one day. Also, 83% of the respondents perform these studies as needed. The survey results indicate that performing look-ahead studies when needed on at least an hourly basis is a prevailing practice. We suggest that the Standards Drafting Team work with the RTBPTF to incorporate their recommendation into IRO-008 in lieu of the proposed requirement R2.)</p> <p>We are also concerned about the requirements for evidence to validate compliance with the IRO-008-1 Standard as well as other standards. The compliance program seems to define the window of compliance being the 3 years between compliance audits. However, the IRO-008-1 standard only requires data be retained to demonstrate compliance for a rolling 30 day period. There appears to be a disconnect between the compliance program and the standard, which exposes the Reliability Coordinators to being found non-compliant. In other words, there appears to be a considerable window of time between an audit and the previous audit during which an entity would not have data to demonstrate that they met compliance expectations.] In many cases, the data retention sections in individual standards talk about a much shorter data retention expectation. For example, IRO-008-1 states, "The Reliability Coordinator shall retain evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days. The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months. The question is which data retention expectation is the entity going to be held to with regards to compliance and compliance audits? More clarity needs to be provided on what evidence must be provided in audits.</p>
<p><b>Response:</b></p>	<ol style="list-style-type: none"> <li>1. VSLs are not used to "measure" performance – they are used to categorize the different types of noncompliant performance that might be found. VSLs are intended to provide up to four different descriptions of varying degrees of noncompliant performance – with the lower VSL describing noncompliant performance that is close to fully compliant – and the severe VSL describing noncompliant performance where the performance measured is so far away from being compliant that either the performance is totally noncompliant or the performance is so non-compliant that the intent of the requirement has not been met at all. VSLs are not used to assess the reliability-related risk of the noncompliant performance. The drafting team disagrees that it is acceptable to only apply a penalty when there has been an incident or event. Standards should promote good performance that results in a reliable system – ignoring poor performance because nothing evil occurred to the system due to "luck" is not a concept supported for something as critical as looking at the system to see if an IROL has been exceeded.</li> <li>2. R1 and R2 – The requirements do not prescribe the use of any specific tools. If you don't have access to the EMS, you still have to do the Operational Planning Analysis and the Real-time Assessments – you can use engineering judgment in coordination with previous analyses and the latest available information, if needed.</li> <li>3. The "30 minutes" was selected as the threshold because when an IROL has been exceeded, the Reliability Coordinator must return the system to within the IROL in the IROL's <math>T_v</math> – and the IROL's <math>T_v</math> cannot exceed 30 minutes.</li> <li>4. Monitoring is a "how" not a reliability requirement that, by itself, results in a measurable performance. The drafting team has removed the</li> </ol>

## Consideration of Comments on Draft 9 of IROL Standards

monitoring requirements with the support of most stakeholders. R2 is intended to assure that entities perform assessments at regular intervals, and the drafting team selected 30 minutes because IROLs have to be resolved within their  $T_v$  – and  $T_v$  cannot be longer than 30 minutes.

The RTBPTF did not provide any comments in response to the posting of this set of standards.

The drafting team followed up with one of the commenters to more fully understand the above comments. The concern was really with the idea that R2 would require a mitigation plan for Real-time Assessments. It seems that the commenters did not see the definition of “Real-time Assessments”.

5. Requirements in standards are not designed to support “common practices” – they are designed to support what is needed for reliability. R2 is intended to assure that entities perform assessments at regular intervals, and the drafting team selected 30 minutes (with stakeholder support) because IROLs have to be resolved within their  $T_v$  – and  $T_v$  cannot be longer than 30 minutes.

The ERO Rules of Procedure Appendix 4C specify that the data retention period in the standard supersedes retaining data for the current year and all years since the last audit. See Appendix 4C Section 3.1.4 which states:

### 3.1.4 Scope of Compliance Audits

A Compliance Audit will include all Reliability Standards applicable to the Registered Entity monitored in the NERC Implementation Plans in the current and three previous years, and may include other Reliability Standards applicable to the Registered Entity. If a Reliability Standard does not require retention of data for the full period of the Compliance Audit, the Compliance Audit will be applicable to the data retention period specified in the Reliability Standard.

RC WG - reliability coordinator comments working group	No	R2 - does this real time assessment only mean state estimator or if state estimator is unavailable, can the RC use other tools to make a real time assessment to meet this requirement? If we can not use other tools then we do not agree with the VSL. If we can use other tools, then we agree with the VSL.
--	----	---

**Response:** The term, “Real-time Assessment” is defined as follows and does not have to be performed using only a state estimator – the definition allows the use of other tools and processes:

An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

The definition was designed so that you could still conduct a real-time assessment, if needed, using readily available data collected through manual processes.

Operating Reliability Working Group	No	As proposed the VSLs do not allow any Real-time Assessments to be missed within a 24-hour period. However, in EOP-008-0, R1.8, the Reliability Coordinator is allowed a one-hour transition period to its backup site. It would seem appropriate that an allowance should be made for this transition in the VSLs for R2.
-------------------------------------	----	---

**Response:** The real-time assessment can be conducted using manual data collection, if needed. The Reliability Coordinator is responsible for having processes in place that assure it can meet all its real-time requirements, even while in transition from its primary control facility. For example, responsibility for conducting the real-time assessments can be delegated to the Reliability Coordinator’s Transmission Operators. There is a drafting team working on revisions to EOP-008.

Hydro One Networks	No	For VSL requirement R1 we suggest the following: High: Missed performing an Operational Planning Analysis that covers all aspects of the requirement for one of 30 days; Severe: Missed performing an Operational Planning Analysis
--------------------	----	---

**Consideration of Comments on Draft 9 of IROL Standards**

		that covers all aspects of the requirement for two or more of 30 days. As well, for VSL requirement R2 we suggest changing the phrase "within a 24-hour period" to "within a 30-day period". This will prevent daily occurrences of violations.
		<b>Response:</b> The proposed change would not prevent daily occurrences of violations. If an entity misses doing an Operational Planning Analysis, the responsible entity must self-report the violation. If the entity missed doing the Operational Planning Analysis for three days, then the entity would need to self-report the violation.
		The 30 days in the VSLs for R1 came from the data retention period for R1 in this standard – which is a rolling 30 days for R1. The data retention period was intended to ensure that there is sufficient data for the Compliance Enforcement Authority to measure compliance, without overwhelming the responsible entity. We do not agree that Reliability Coordinators should retain 12 rolling months of analyses to demonstrate compliance with this requirement since it would be burdensome to retain that much data.
		The proposed change also provides fewer variants of noncompliant performance – and limits the amount of “partial credit” an entity can be granted for attempting to meet compliance.
		Please see the revised VSLs for R2 – the drafting team added some language to clarify that the intent was to add boundaries to the amount of data that the compliance enforcement authority will review when determining compliance to support consistency.
FirstEnergy	Yes	You may want to remove the parenthetical reference to the requirement numbers at the end of each VSL. This is not needed since the requirement number is shown in the VSL table in column 1.
		<b>Response:</b> The drafting team left the reference numbers in at the request of NERC staff. The standards will be added to a relational database and the reference numbers will be useful.
Manitoba Hydro	Yes	
American Transmission Company LLC	Yes	
San Diego Gas and Electric Co.	Yes	
Entergy Services	Yes	

**Consideration of Comments on Draft 9 of IROL Standards**

4. The drafting team modified IRO-009-1 R1 and R2 by replacing the phrase, “in advance of real-time” with the phrase, “one or more days prior to the current day” to clarify the intent and measurability of these requirements. Do you agree with the change made to R1 and R2 in IRO-009-1?

**Summary Consideration:** Most commenters, except for those from within the NPCC Region agreed with the change. The commenters from the NPCC Region who disagreed with the change felt that the change may result in arguments over the phrase, “in advance of real-time,” and suggested that real time is ‘understood’ to be the current hour. The drafting team disagrees – the term, “real-time” is a defined term and its definition is, “Present time as opposed to future time,” which is significantly different from the “current hour.” These commenters suggested that the Reliability Coordinator have an action plan for all IROLs identified “one or more hours ahead of real time” or “beyond the current hour.” Because the requirements in the standard are intended to work cooperatively with the requirements to conduct Operational Analyses and Real-time Assessments, the proposed revision wasn’t adopted. The Operational Planning Assessment is looking at least at the day ahead – and the Real-time Assessment is looking at the actual system conditions – the proposed change would require adding a requirement for the Reliability Coordinator to conduct Operational Planning Assessments throughout the day for a look ahead at the remainder of today’s operation and isn’t practical.

The Reliability Coordinator has a responsibility to oversee the reliability of its Reliability Coordinator Area, and take what ever actions necessary to protect the reliability of the interconnection. The drafting team does not believe that the standard needs to tell the Reliability Coordinator to conduct additional studies and develop additional plans if the actual conditions do not match the studied conditions. It isn’t possible to have a plan for every possible instance of exceeding an IROL.

Organization/Group		Question 4 Comments:
Northeast Utilities	No	<p>We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day".</p> <p>And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".</p>
<p><b>Response:</b> The proposed modification was not adopted. The intent of this requirement is to ensure that, in real-time and the day ahead, the Reliability Coordinator is prepared to take whatever actions necessary, to prevent and/or mitigate instances of violating IROLs.</p> <p>There is no hole in the reliability process because if the Operational Planning Analysis does not project the potential IROL violation, then at a minimum, the next Real-time Assessment will detect it. It isn’t possible to have a plan for every possible instance of exceeding an IROL.</p> <p>The term, ‘real-time’ is defined as follows in the NERC Glossary of Terms Used in Reliability Standards: Present time as opposed to future time. Thus, we cannot make an assumption that “real-time” means the current hour.</p>		

**Consideration of Comments on Draft 9 of IROL Standards**

NPCC Regional Standards Committee, RSC	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hours prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
<p><b>Response:</b> The proposed modification was not adopted. The intent of this requirement is to ensure that, in real-time and the day ahead, the Reliability Coordinator is prepared to take whatever actions necessary, to prevent and/or mitigate instances of violating IROLs.</p> <p>There is no hole in the reliability process because if the Operational Planning Analysis does not project the potential IROL violation, then at a minimum, the next Real-time Assessment will detect it. It isn't possible to have a plan for every possible instance of exceeding an IROL.</p> <p>The term, 'real-time' is defined as follows in the NERC Glossary of Terms Used in Reliability Standards: Present time as opposed to future time. Thus, we cannot make an assumption that "real-time" means the current hour.</p>		
Ontario IESO	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. However, this change may result in another argument over the coverage of the time period "beyond next hour to the rest of the current day". And with this change, one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time" or beyond current day. This may leave a hole in reliable operations. To fill this potential "hole", we suggest the "in advance of real time" be replaced with "one or more hour prior to real time", which the real time being understood, or defined, to be current hour. Alternatively, the phrase could be replaced with "beyond the current hour".
<p><b>Response:</b> The proposed modification was not adopted. The intent of this requirement is to ensure that, in real-time and the day ahead, the Reliability Coordinator is prepared to take whatever actions necessary, to prevent and/or mitigate instances of violating IROLs.</p> <p>There is no hole in the reliability process because if the Operational Planning Analysis does not project the potential IROL violation, then at a minimum, the next Real-time Assessment will detect it. It isn't possible to have a plan for every possible instance of exceeding an IROL.</p> <p>The term, 'real-time' is defined as follows in the NERC Glossary of Terms Used in Reliability Standards: Present time as opposed to future time. Thus, we cannot make an assumption that "real-time" means the current hour.</p>		
ISO RTO Council Standards Review Committee	No	We understand that this change is to address possible arguments over what "in advance of real time" really means. Thus, we cannot make an assumption that "real-time" means the current hour.</p>		
FirstEnergy	No	<p>It should be clear that the main intent is to have IROL mitigation plans in place for the current operating day. For clarity, we suggest the following replacements for requirements R1 and R2.</p> <p>R1 For the current day operating conditions, each Reliability Coordinator shall have Operating Processes, Procedures or Plans that identify mitigation actions it shall take or actions it shall direct others to take up to and including load shedding that can be implemented in time to prevent exceeding any of its IROL conditions. The mitigation actions shall be available one or more days prior to the current operating day.</p> <p>R2 For the current day operating conditions, each Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify mitigation actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding any of its IROL conditions, such that the IROL is relieved within the IROL's Tv. The mitigation actions shall be available one or more days prior to the current operating day.</p>
<p><b>Response:</b> The main intent of this standard is to be prepared for identified IROLs in any operating horizon. The proposed language states that you must have a plan for "all" IROLs identified one or more days prior to the current day –it isn't possible to have a plan for every possible IROL.</p>		
ISO New England Inc	No	<p>With this change one could interpret that the RC does not need to prepare for action plans for those IROLs not identified in "real-time," which (we believe) is not the intent. We therefore suggest the "in advance of real-time" be replaced with "one or more hours prior to real-time", with real-time being defined as the current hour.</p>
<p><b>Response:</b> The proposed modification was not adopted. The intent of this requirement is to ensure that, in real time and the day ahead, the Reliability Coordinator is prepared to take whatever actions necessary, to prevent and/or mitigate instances of violating IROLs.</p>		

**Consideration of Comments on Draft 9 of IROL Standards**

<p>There is no hole in the reliability process because if the operational planning analysis does not project the potential IROL violation, then at a minimum, the next real-time assessment will detect it. It isn't possible to have a plan for every possible instance of exceeding an IROL.</p>		
American Transmission Company LLC	Yes	ATC agrees that the phrase "one or more days prior to the current day" provides additional clarity.
<p><b>Response:</b> The drafting team appreciates your support of this modification.</p>

5. The drafting team modified the Violation Severity Levels for IRO-009. Do you agree with the new VSLs?

**Summary Consideration:** Most commenters who disagreed with the proposed VSLs made one of the following recommendations:

Eliminate the “High” VSL for Requirement R3 because the VSL focuses on the quality of the action plan rather than on whether action was taken. The drafting team reviewed the requirement and confirmed that the requirement is focusing on ‘acting’ and eliminated the “High” VSL as proposed.

Eliminate the first of the two conditions for Requirement 4 that could result in a “Severe” VSL. The drafting team did adopt this suggestion as the second condition, by itself, fully described the noncompliant performance that meets the criteria for a “Severe” VSL.

Eliminate the “Severe” VSL for Requirement R4 when the Reliability Coordinator makes an unsuccessful attempt to return the system to within its IROLs within the IROL’s  $T_v$  or move the VSL to “High”. The suggestion to modify the VSLs and make the VSL “High” if the Reliability Coordinator make an attempt to resolve the IROL within the IROL’s  $T_v$  was not adopted because if the Reliability Coordinator does not resolve the IROL within the IROL’s  $T_v$ , then the intent of the requirement has not been met at all – and this type of violation is classified as a “Severe” VSL.

Organization/Group		Question 5 Comments:
Northeast Utilities	No	We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform either one, its violation is deemed to be high. If it fails to perform both, then it is deemed to have fully violated the requirement which is severe.
<p><b>Response:</b> The Reliability Coordinator is the functional entity with the highest level of authority – and the Reliability Coordinator must execute its authority to resolve any IROL with its <math>T_v</math> because of the potential impact on the interconnection if the IROL is exceeded for time greater than IROL <math>T_v</math> - instability, uncontrolled separation, or cascading outages. The suggestion to modify the VSLs and make the VSL “High” if the Reliability Coordinator make an attempt to resolve the IROL within the IROL’s <math>T_v</math> was not adopted because if the Reliability Coordinator does not resolve the IROL within the IROL’s <math>T_v</math>, then the intent of the requirement has not been met at all – and this type of violation is classified as a “Severe” VSL.</p>		
NPCC Regional Standards Committee, RSC	No	We agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. ## Consideration of Comments on Draft 9 of IROL Standards

Organization/Group		Question 5 Comments:
Hydro-Québec TransEnergie	No	HQT agree with all of the VSLs except one. The second Severe condition for R4 appears to be giving no recognition that the RC did take corrective actions without delay (within 5 minutes) but was unable to correct the situation of IROL being exceeded. We suggest that this be moved to High as the second condition. In fact, R4 contains 2 requirements: a. take actions without delay (within 5 minutes) and correct the situation of IROL being exceeded. Hence, if an RC fails to perform either one, its violation is deemed to be high. If it fails to perform both, then it is deemed to have fully violated the requirement which is severe.
<p><b>Response:</b> The Reliability Coordinator is the functional entity with the highest level of authority – and the Reliability Coordinator must execute its authority to resolve any IROL with its <math>T_v</math> because of the potential impact on the interconnection if the IROL is exceeded for time greater than IROL <math>T_v</math> - instability, uncontrolled separation, or cascading outages. The suggestion to modify the VSLs and make the VSL “High” if the Reliability Coordinator make an attempt to resolve the IROL within the IROL’s <math>T_v</math> was not adopted because if the Reliability Coordinator does not resolve the IROL within the IROL’s <math>T_v</math>, then the intent of the requirement has not been met at all – and this type of violation is classified as a “Severe” VSL.</p>		
Hydro One Networks	No	<p>We agree with the VSLs for requirements 1 and 2. However the high VSL for requirement 3 is not appropriate because it tries to judge the effectiveness of the Operating Processes, Procedures or Plans. Requirement 4 provides for judgment of the effectiveness of the Processes, Procedures or Plans on a basis of being able to mitigate the exceeded IROL within the its <math>T_v</math>.</p> <p>As well, R4 includes two requirements: 1) act or direct, without delay, to mitigate the instance of exceeding the IROL; 2) mitigate this instance within the <math>T_v</math>. We suggest that if the RC does not meet both requirements the violation level should be severe and if the RC does not meet one of the requirements the violation level should be high.</p>
<p><b>Response:</b> The team removed the “High” VSL for R3 in support of your comment. The requirement is to “act” not to “prevent”.</p> <p>The Reliability Coordinator is the functional entity with the highest level of authority – and the Reliability Coordinator must execute its authority to resolve any IROL within its <math>T_v</math> because of the potential impact on the interconnection if the IROL is exceeded for time greater than IROL <math>T_v</math> -- instability, uncontrolled separation, or cascading outages. The suggestion to modify the VSLs and make the VSL “High” if the Reliability Coordinator make an attempt to resolve the IROL within the IROL’s <math>T_v</math> was not adopted because if the Reliability Coordinator does not resolve the IROL within the IROL’s <math>T_v</math>, then the intent of the requirement has not been met at all – and this type of violation is classified as a “Severe” VSL.</p>		
RCCWG - reliability coordinator comments working group	No	<p>R4 High- in the VSL does "acting and directing" include contacting the entity and gathering information and data or does it strictly mean issuing a directive?</p> <p>R5 Severe - eliminate the top VSL, this describes how a failure to mitigate occurred, the issue is there was a failure to mitigate. Also, if an RC issues a directive to mitigate an IROL and the entity fails to comply or is unable to comply is the RC in violation of this requirement?</p>
<p><b>Response:</b> The requirement is as stated – acting or directing. Contacting the entity could be evidence of acting, and if there were evidence of the contact, then this would be considered acting “without delay.” There could also be other types of “acting” – such as calling up screen displays to research the problem – or noting in the log that an action already taken just before the instance of exceeding the IROL was expected to resolve the IROL within its <math>T_v</math> and no further action is needed.</p> <p>The drafting team believes you intended to reference Requirement R4 rather than R5 – and the drafting team did eliminate the top VSL. The</p>		

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 5 Comments:
		<p>Reliability Coordinator is the functional entity with the highest level of authority – and the Reliability Coordinator must execute its authority to resolve any IROL within its <math>T_v</math> because of the potential impact on the interconnection - instability, uncontrolled separation, or cascading outages. If a Reliability Coordinator issues a directive that some other entity does not comply with, then the Reliability Coordinator is still responsible for preventing the violation of the IROL for time greater than the IROL's <math>T_v</math>.</p>
Operating Reliability Working Group	No	<p>The High VSL for R4 contains an additional requirement that is not in R4. The VSL defines 'without delay' as being five minutes or less. The 'five minute' requirement should be deleted from the VSL.</p>
		<p><b>Response:</b> The drafting team does not believe that it has added a new requirement. The standard uses the language “without delay” and the measures look for types of evidence that could be reasonably interpreted as evidence that the Reliability Coordinator took some action – making a phone call, acknowledging an alarm, calling up an EMS display – all of these are evidence that the Reliability Coordinator took some recordable action to investigate the situation and respond to remedy the situation. The drafting team did not intend for the “5 minutes” to mean that a directive had to be issued within that 5 minutes.</p>
American Transmission Company LLC	No	<p>Severe VSL for R4ATC does not agree with the language in the Severe VSL for Requirement 4. The purpose of this VSL is for a <math>T_v</math> violation. ATC recommends that the first description be deleted and only the second description be kept. If the SDT does not agree they should provide a reason for the two descriptions.</p>
		<p><b>Response:</b> The drafting team adopted your suggestion to delete the first description of a Severe VSL from R4.</p>
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	No	<p>1. The Violation Security Levels for R3 and R4 impose additional requirements that are not in the standard. For R3, it seems inappropriate that the Violation Severity Level should be based upon the effectiveness of the plan to prevent the system from entering an IROL in real-time. The dynamics topology and unit commitment/dispatch of an electric system are constantly changing and no specific occurrence of an SOL or IROL can be accurately represented in planning case studies. It is thus impractical or impossible to devise a perfect process for mitigating each and every instance during which a known IROL may manifest and persist as conditions change during the IROL <math>T_v</math>.</p> <p>2. In R4, if the trigger limit for initiating action is five (5) minutes, then that limit should be explicitly included in the requirements and not introduced for the first time in the measurement criteria. Furthermore, we feel that a time of five (5) minutes is arbitrary and implementation of correct action is the primary requirement. Operators will be under tremendous pressure to work out a solution when an IROL is exceeded and satisfy the five minute requirement. We feel that it is more important to 1) recognize that an IROL has been violated, 2) determine the correct process or procedure required to mitigate the identified IROL, 3) modify the identified generic process or procedure to meet specific real time system conditions as required and, 4) implement the modified process or procedure while at the same time maintaining continuous communications with all parties involved and simultaneously documenting actions being taken as required for NERC audits. It is not clear to us exactly how the five (5) minute trigger adds any value to this process. If the goal is to mitigate the IROL within the IROL <math>T_v</math>, and the actions are successful, what impact does a five (5) minute trigger requirement add to the process? WE STRONGLY SUGGEST THAT THE “HIGH” SEVERITY LEVEL SHOULD BE ELIMINATED FOR R3 AND R4.</p>
		<p><b>Response:</b></p> <p>1. The drafting team removed the High VSL for R3 based on stakeholder comments indicating that the VSL is inappropriate because it judges the quality of the actions – the Requirement is to “act” not to “prevent.”</p>

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 5 Comments:
		<p>The intent of R4 is for the Reliability Coordinator to act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>. Note that many entities include a default paragraph that is included in all of its operating procedures that clearly gives the real-time system operator the authority to use operating knowledge and experience to deviate from a plan when the actual system conditions don't match the studied or planned conditions. Adding this paragraph allows the system operator to make modifications to the plans, as needed, to achieve the objective of preventing or mitigating the instance of exceeding an IROL.</p> <p>2. The drafting team did not modify the standard to include the reference to the 5 minute delay because this sends a message that it is acceptable to wait before taking action – the intent of the 5 minute period was to provide a boundary prior to which there needed to be some recordable action to demonstrate that action had been taken. The standard uses the language “without delay” and the measures look for types of evidence that could be reasonably interpreted as evidence that the RC took some action – making a phone call, acknowledging an alarm, calling up an EMS display – all of these are evidence that the RC took some recordable action to investigate the situation and respond to remedy the situation. The drafting team did not intend for the “5 minutes” to mean that a directive had to be issued within that 5 minutes.</p>
FirstEnergy	Yes	<p>For R4, Severe VSL - We recommend retaining only the text below the "OR" statement. The text above is duplicative and adds no additional value since the end result is that the IROL is not mitigated within the allowable T<sub>v</sub> timeframe.</p> <p><b>Response:</b> The drafting team adopted this suggestion and deleted the text above the “OR” for the severe VSL for R4. We thank you for your support.</p>
Entergy Services	Yes	
Manitoba Hydro	Yes	
San Diego Gas and Electric Co.	Yes	

**Consideration of Comments on Draft 9 of IROL Standards**

**6. The drafting team modified the Violation Severity Levels for IRO-010. Do you agree with the new VSLs?**

**Summary Consideration:** While most stakeholders who responded to this question indicated agreement with the proposed VSLs, some stakeholders indicated that the VSLs for R1 should be modified to reflect that missing a process for obtaining real-time operating data when it becomes unavailable contributes more to the intent of the requirement than having the data in the wrong format – and the drafting team modified the VSLs for R1 to reflect this.

<b>Organization/Group6:</b>		<b>Question 6 Comments:</b>
RCCWG - reliability coordinator comments working group	No	What is the expectation for the process when your automated data is not available? Does freezing the State Estimator value and then getting data via phone and fax suffice?
<p><b>Response:</b> Requirement R1.4 states that the Reliability Coordinator’s data specification must include the following:                      Process for data provision when automated Real-Time system operating data is unavailable.                      The standard does not specify “how” to provide the data to the Reliability Coordinator. Freezing the state estimator values and getting the data via phone may be acceptable to the Reliability Coordinator.</p>		
Manitoba Hydro	No	R1 - What constitutes a "complete data specification"? TOP-005-0 Attachment 1, which will become a Technical Reference, needs a tune up. What is the determining factors when identifying transmission and other facilities as "key"? What size of generator is the RC concerned with in regards to on/off status, AVR status, PPS status, MW & Mvar output?
<p><b>Response:</b> Agree that the attachment needs a “tune up” – it is not comprehensive enough to meet the data needs of all Reliability Coordinators. In Order 693, FERC did direct that special protection systems should be added to the list of items in Attachment 1. Note that the revised implementation plan no longer recommends the retirement of Attachment 1. TOP-005 R3 references this Attachment so it is still needed in the standard.                      Each Reliability Coordinator has the authority to identify what data it needs – and the data specification must address all subrequirements in Requirement R1.</p>		
Operating Reliability Working Group	No	The Lower and Moderate VSLs for R1 should be reversed. We believe that it is more important to have a process for obtaining real-time operating data when it becomes unavailable than having the data in the wrong format. At least you have the data.
<p><b>Response:</b> Agreed – the drafting team adopted your suggestion and switched the VSLs.</p>		
San Diego Gas and Electric Co.	No	In the revised IRO-010 Violation Severity Levels Table, there is no provision for less than 100% compliance for real-time data sent by the TO/TOP to the RC. Providing data at a level greater than 95% but less than 100% is cause for a “Lower” Violation Severity Level. That level rises as less data is provided, to a maximum of “Severe” when less than 75% of the requested data is sent to the RC. Real time data typically has some level of availability associated with it that allows for the inherent nature of real time data being less than 100% complete. Examples may include the failure of field equipment such as RTUs, communication circuits, instrumentation, and other events

**Consideration of Comments on Draft 9 of IROL Standards**

<b>Organization/Group</b>		<b>Question 6 Comments:</b>
		<p>that could impact 100% data availability such as missed RTU scans, loss of data when systems are being shifted to backup EMS systems, etc.</p> <p>Requirement R3 and the Violation Severity Level Violation table need to be re-written to correlate with Requirement 1.4 that would include an exemption for short-term real time data failures or outages when determining the Violation Severity Level, perhaps with language such as "excluding unavailable real-time data (R1.4)."</p>
<p><b>Response:</b>                      The VSL is only applied when there has been an identified violation – the VSLs provide up to four categories of noncompliant performance that might have been seen by the Compliance Enforcement Authority when it assessed compliance.</p> <p>Under R1.4 any acceptable tolerance for missing data will be included in the Reliability Coordinator's data specification.</p>		
Hydro One Networks	No	<p>We agree with VSLs for R2 and R3 however, we disagree with the VSLs for R1. Example, failing to specify a process for data provision when the automated Real-time system operating data is unavailable could result in the RC being "blind" to what is going on in the system and render them unable to act or direct others to act. We suggest that missing any one of R1's sub-requirements is a High VSL and having no data specification is a Severe VSL.</p>
<p><b>Response:</b> Based on other comments, the drafting team did modify the Lower and Moderate VSLs so that the failure to comply with R1.2 is now "lower" and failure to comply with R1.4 is "moderate". The drafting team attempted to use all four categories of VSLs to provide the compliance enforcement authority with as many options for categorizing noncompliant performance as practicable.</p>		
American Transmission Company LLC	No	<p>VSL for R3: The VSLs do not seem to take into account the frequency of not sending the data. The SDT should provide additional detail within each VSL. How will the percentage be determined over time?</p>
<p><b>Response:</b> The data specification must identify how often data and information must be supplied – the VSLs only categorize the severity of the violation when the data and information was not provided 'as specified' in the Reliability Coordinator's data specification.</p> <p>The VSL is only applied when there has been an identified violation – the VSLs provide up to four categories of noncompliant performance that might have been seen by the compliance enforcement authority when it assessed compliance.</p>

ISO New England Inc	Yes	

**7. The drafting team modified the implementation plan to reflect the modifications made based on the elimination of IRO-007-1 Requirement R1. Do you agree with the modifications made to the implementation plan?**

**Summary Consideration:** Many stakeholders who responded to this question disagreed with the recommended retirement of EOP-001 R2 and the recommended modification of IRO-005 R13. In each case the drafting team considered the comments provided, but continues to recommend the retirements or revisions for the reasons provided below.

**EOP-001 R2** – The reason stated for objecting to the recommended retirement of EOP-001 Requirement R2 was aimed at concern that eliminating this requirement would eliminate the requirement that the Transmission Operator have load reduction plans in place that can be executed within 30 minutes.

Here are Requirements R2, R3, and parts of R4 from EOP-001:

- R2.** The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.
- R3.** Each Transmission Operator and Balancing Authority shall:
  - R3.1.** Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - R3.2.** Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - R3.3.** Develop, maintain, and implement a set of plans for load shedding.
  - R3.4.** Develop, maintain, and implement a set of plans for system restoration.
- R4.** Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R4.1.** Communications protocols to be used during emergencies.
  - R4.2.** A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.

The drafting continues to recommend the retirement of EOP-001 R2 for the following reasons:

The retirement of the EOP-001 R2 does not resolve the Transmission Operator from having emergency load reduction plans – EOP-001 R3.3 and R4.2 (shown in blue above) still apply to the Transmission Operator and require the Transmission Operator to develop, maintain and implement a set of plans for load shedding that can be executed within the necessary timeline.

The existing EOP-001 R2 gives the impression that all load reduction plans developed to bring the system to within IROLs must be capable of success within 30 minutes – and that doesn't support the new requirements which state the IROL must be resolved within the IROL's  $T_v$ , which can be shorter than 30 minutes.

## Consideration of Comments on Draft 9 of IROL Standards

The existing EOP-001 R2 gives the impression that load reduction plans are the only types of plans that can be developed in advance to resolve IROLs, and that isn't technically correct. Implementing a load reduction plan is one of several different methods that can be used to resolve IROLs.

**IRO-004 R4** – The reason stated for objecting to the retirement of the following requirement from IRO-005 R4 is that the requirement is intended to provide system information not just for the RC within whose area the BA, TOP, etc. reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses.

**R4.** Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

The drafting continues to recommend the retirement of IRO-004 R4 for the following reason:

Although the commenters indicate that the intent of this requirement is to provide data to entities other than the Reliability Coordinator, the drafting team disagrees. The intent of IRO-004 R4 is to provide data to Reliability Coordinators. TOP-002 is focused on requiring the Transmission Operators to collect the data they need for their own analyses.

**IRO-005 R13** – The reason stated for objecting to the retirement of the following text from IRO-005 Requirement R13 is that the same language is not covered in any of the new standards:

**R13.** Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection.

The drafting team continues to recommend the retirement of the first sentence in IRO-005 R13 for the following reason:

The first sentence in IRO-005 R13 assumes that the Reliability Coordinator can see all System Operating Limits and has direct communication with all operating entities. The Reliability Coordinator doesn't necessarily see the actions of the Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities to direct them with respect to operating within SOLs. The Reliability Coordinator sees the effect of their actions, and directs actions for the Generator Operators, Transmission Service Providers, Load-serving Entities and Purchasing-selling Entities through Transmission Operators and Balancing Authorities.

In addition, during the development of the measures and compliance elements for IRO-005, the Missing Measures and Compliance Elements Drafting Team determined that it could not develop a measure for the first sentence in R13 because the Reliability Coordinator cannot ensure that entities will "operate to prevent the likelihood" of something happening.

Consideration of Comments on Draft 9 of IROL Standards

Organization/Group		Question 7 Comments:
Northeast Utilities	No	<p>We agree with some but not all of the proposed changes to the other standards.</p> <p>(1) EOP-001 R2: We do not agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes." This requirement does not equate to the Transmission Operator developing plans for mitigating IROLs, which is the role of the RC. In fact, this requirement holds the TOP responsible for having the load reduction plan in place ahead of real time so that when directed by the RC, it can execute the plan to assist in mitigating the IROL violation. While the IRO-008 to IRO-010 standards give the RC the authority and the flexibility to direct the TOP to do so, having the plan in advance and be ready for execution is not covered by these IRO standards. Further, the amount and timing that the TOP is able to achieve with load reduction must be known to the RC ahead of real time for it to consider the effectiveness of the plan's execution in support of the mitigating action.</p> <p>(2) IRO-002 R2: We agree with retiring this requirement.</p> <p>(3) IRO-004-1 ? Reliability Coordination? Operations Planning: retire entire standard (R1 through R6). We agree with retiring this standard since all requirements are covered elsewhere except R4.</p> <p>This requirement is intended to provide system information not just for the RC within whose area the BA, TOP, etc. reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses. This requirement needs to be incorporated in an appropriate standard.</p> <p>(4) IRO-005-2? Reliability Coordination? Current Day Operations: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.</p> <p>(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.</p> <p>(b) For R13, the Implementation Plan says "retiring" but it should read "revising".</p> <p>We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection." R13 actually contains two requirements that are not covered by the new IRO-009:</p>

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group	Question 7 Comments:
	<p>(a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change.</p> <p>(b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence.</p> <p>(5) TOP-003-0? Planned Outage Coordination Modify R1.2. We agree with this change.</p> <p>(6) TOP-005-1? Operational Reliability Information: Retire R1 and R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 and R1.1 and the proposed conversion of Attachment 1 into a reference. But there doesn't seem to be a draft reference document posted. When the new IRO standards go into effect, the reference documents will need to be available. Please elaborate on the timing and the process for posting and implementing the reference.</p> <p>(7) TOP-006-1? Monitoring System Conditions Voltage and Reactive Control: Modify R4. We agree with this change.</p>

**Response:**

EOP-001 R2 - The drafting team believes that load reduction plans are just one of many tools that can be used to resolve IROLs.

IRO-004 R4 - The requirement does not specify what functional entity receives the data – but the standard is built on the assumption that the data is provided to the Reliability Coordinator – there are no requirements in the standard for any entity to use the data, except the Reliability Coordinator.

The IRO standards are intended to address reliability coordination at the Reliability Coordination level – implying that IRO-004 R4 requires data to be shared with the Transmission Operator and Transmission Service Provider seems to be implying more than what was intended. TOP-002 is focused on requiring the Transmission Operators to collect the data they need for their own analyses.

IRO-005 R13 - The drafting team agrees that the implementation plan should have indicated that drafting team recommends, “revising” R13 and has corrected this typographical error.

IRO-005 R13 - The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs. If the Reliability Coordinator has a System Operating Limit that it knows can become an IROL, then that Reliability Coordinator should be operating so as to preclude exceeding that limit.

The drafting team believes that the second part of R13 that is proposed for deletion is technically incorrect as currently embodied in the standard. The Reliability Coordinator does oversee the actions of the Transmission Operators and Balancing Authorities, and there are requirements that

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 7 Comments:
		<p>address Reliability Coordinator actions to keep these entities operating within limits, but the Reliability Coordinator doesn't necessarily see the actions of the Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities to direct them with respect to operating within SOLs. The Reliability Coordinator sees the effect of their actions, and directs actions for the Generator Operators, Transmission Service Providers, Load-serving Entities and Purchasing-selling Entities through Transmission Operators and Balancing Authorities.</p> <p>TOP-005 – Attachment 1 - The revised implementation plan no longer recommends the retirement of Attachment 1. TOP-005 R3 references this Attachment so it is still needed in the standard.</p>
<p>NPCC Regional Standards Committee, RSC</p>	<p>No</p>	<p>We agree with some but not all of the proposed changes to the other standards.</p> <p>(1) EOP-001 R2: We do not agree with removing this requirement, which says: "The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. Organization/Group		Question 7 Comments:
		<p>reside, but also for other RCs and TOPs, TSPs for system modeling/consideration for their respective specific uses. This requirement needs to have a "home".</p> <p>(4) IRO-005-2: Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17.</p> <p>(a) We agree with retiring R2, R3, R5, R16 and R17, and revising R9 and R14.</p> <p>(b) For R13, the Implementation Plan says "retiring" but it should read "revising". We agree with the proposed revision to the part on operating to the most limiting parameter, but do not agree with retiring that part pertaining to ensuring the SOLs and IROLs are not exceeded. This part, which reads: "Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection." actually contains two requirements that are not covered by the new IRO-009:</p> <p>(a) IRO-009 deals with IROL only; the RC needs also to be aware of the SOL situation since an SOL may become an IROL as system conditions change.</p> <p>(b) the requirement also holds the RC responsible for ensuring that the entities within the RC area operate to prevent situations that could result in a SOL or IROL violation in another area of the Interconnection." This is not covered by the new IRO-009. We therefore suggest that R13 be retained with only the revision to remove "Reliability Coordinator and its" from the second sentence.</p> <p>(5) TOP-003-0: Modify R1.2. We agree with this change.</p> <p>(6) TOP-005-1: Retire R1 and R1.1 and convert Attachment 1 into a reference. We agree with retiring R1 ad R1.1 and the proposed conversion of Attachment 1 into a reference.</p> <p>(7) TOP-006-1: Modify R4. We agree with this change.</p>
<p><b>Response:</b> <a href="#">Please see the Summary Consideration and the Response to Northeast Utilities.</a></p>		
Hydro One Networks	No	<p>We do not agree with the elimination of EOP-001-0 R2 as the RC and TOP must work together in planning how to implement load reduction.</p> <p>We do not agree with retiring R3 of IRO-004-1. Where SOLs and IROLs are known at least a day prior to the current day, the RC should have enough time to "coordinate" the development of action plans required to return transmission loading to within acceptable SOLs and IROLs with its Transmission Operators and Balancing Authorities. Otherwise how does the RC know if their plan is feasible or effective? Developing "effective" plans to mitigate SOLs and IROLs are a operation planning function and therefore belong in the IRO-004-1 Reliability Coordination - Operations Planning standard.</p>

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group	Question 7 Comments:
	<p>We do not agree with the retirement of IRO-005-2 R5. We agree that the RC may not be the responsible entity for SOLs violations however; it would be more prudent to modify the requirement instead of retiring it completely. Perhaps take "SOL" out of the requirement and create a new requirement having the TOP responsible for SOL violations.</p> <p>There is confusion on whether you want to retire or modify IRO-005-2 R13 (page 3 verses page 20). We suggest modifying R13 by separating it into two separate requirements. The first having the RC responsible for ensuring all entities operate to prevent actions in their Reliability Coordinator Area that results in IROL violations in another area of the interconnection. The second requirement to have these same entities excluding the RC, to always operate the BES to the most limiting parameter.</p> <p>For TOP-003, TOP-005 and TOP-006, we believe a SAR should be initiated to "clean-up" standards &amp; requirements that may be redundant or incorrect as apposed to retiring them within an implementation plan which pertains to a different set of standards.</p>
<p><b>Response:</b></p> <p>EOP-001 R2 - The drafting team believes that load reduction plans are just one of many tools that can be used to resolve IROLs.</p> <p>IRO-004 R3 – The requirement does not recognize the authority of the Reliability Coordinator, and therefore the drafting team believes that the new requirements in IRO-009 (R1 and R2) are superior. Requirement R3 in IRO-004 gives the Reliability Coordinator an equal position with Transmission Operators and Balancing Authorities in developing action plans. The requirement is ambiguous because it isn't clear which entity has final authority in developing the action plan if the responsible entities can't agree on the best action to take. In addition, the R3 is aimed solely at "transmission loading" – the intent should be to return the bulk power system to within limits – and this may involve moving generation, modifying VAR flows or reserves, or other actions. Note that the standard does require having a plan for every identified IROL as per R1 and R2 of IRO-009-1.</p> <p>IRO-005 R5 – This requirement is not technically correct – it has multiple tasks embedded in a single requirement, and is written as though the actions should be performed sequentially. First, the Reliability Coordinator may not have the capability of seeing all SOLs. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits. When a limit has been exceeded, if it is an IROL, the Reliability Coordinator needs to focus on relieving the limit, and in some cases this is more important than determining what caused the IROL. In the new FAC standards, it is clear that each IROL must have its own IROL Tv – and the Tv may not be longer than 30 minutes – leaving that language in this requirement would directly conflict with the new standard that requires the IROL to be resolved within Tv – not within 30 minutes.</p> <p>IRO-005 R13 - There was a typographical error in the implementation plan – and this has been corrected. R13 is recommended, as shown in the table and in the red line version of IRO-005 that was posted for review, for revision, not for retirement.</p> <p>For standards that were initiated prior to Version 0, the Standards Committee has authorized drafting teams to recommend the modification/retirement of requirements in Version 0 standards that are replaced/modified by an associated Version 1 requirement. The reason for this authorization is because the Version 1 drafting teams initiated their SARs before the Version 0 effort was started. Note that the recommended</p>	

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 7 Comments:
American Transmission Company LLC	No	<p>modifications are limited to those associated with requirements that are being replaced or revised as a result of the three remaining new IROL standards. The ballot for the IROL standards will include the recommended retirements and revisions. The IROL SDT limited its recommendations for retirements and revisions to those requirements that were technically incorrect based on the proposed IROL standards or were redundant with requirements in the proposed IROL standards.</p> <p>Issue 1: The implementation plan states that all of IRO-004-1 will be deleted when IRO-008, 009 and 010 are approved. Requirement 7 in IRO-004-1 is not being covered in any of the proposed new standards. The SDT needs to document the justification behind the deletion of R7 in IRO-004-1 before the entire standard can be deleted.</p> <p>Issue 2: ATC does not agree that IRO-005-1 R2 is duplicative of IRO-010-1 R1 and R2. IRO-005-1 R2 requires monitoring but IRO-010-1 R1 and R2 are data specification requirements for study purposes. ATC believes that the RC should be required to monitor Interchange Transactions.</p> <p>Issue 3: Requirement 14 of IRO-005-1: The SDT has proposed to remove the language that requires the RC to provide the TSP with SOL and IROL limits. We were unable to locate any requirements in IRO-008, 009 and 010 that requires the RC to share SOL and IROL limits with the TSP. It should be the obligation of the RC to provide these limits to the TSP. IRO-002-1 R5 and R6 require the RC to monitor SOLs and FAC-014 R1 requires the RC to ensure that SOLs and IROLs are consistent with its SOL Methodology.</p> <p>Issue 4: ATC does not agree with the changes to TOP-005-1. Although TOP-005 Requirement 1 may be a duplicate of IRO-010, TOP-005 obligates that the RC to identify the data requirements for the "Electric System Reliability Data". TOP-005-1 requirements 2 and 3 still address the "Electric System Reliability Data" section so making it a reference document does not remove it from the mandatory realm. In addition, the RC should be required to sign the "NERC Confidentiality Agreement" identified in TOP-005-1 because the TOP, BA and PSE still have to supply the data specified by the "Electric System Reliability Data" requirements.</p> <p>Issue 5: TOP-006-1 R4: ATC does not agree with the Set's changes to R4 in TOP-006-1. We believe that the RC should be required to purchase their own weather forecasting service. Since most utilities purchase weather forecasting services from third party vendors, which have restrictions about sharing that information, this change would require ATC to purchase and maintain a weather forecasting license for our RC. ATC believes that the above statement is true because the SDT is recommending in its implementation plan that the RC would specify in IRO-010 R1 and R2 the required weather forecasting information. If this is not the case then the SDT should provide information as to why the RC is being removed from Requirement 4 in TOP-006-1.</p>
<p><b>Response:</b></p> <p>Issue 1: The drafting team agrees and will retain Requirement R7. The drafting team working on the set of real-time standards for the Transmission Operator and Balancing Authority will address the retirement of this requirement.</p> <p>Issue 2: The drafting team did not state that IRO-010 R1 and R2 “duplicate” IRO-005 R2. In addition, the data specification in R1 is for all data that the Reliability Coordinator needs for Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments– and it is not limited to study purposes.</p>		

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 7 Comments:
		<p>Having the Reliability Coordinator monitor the Interchange Transactions would be a modification to the existing R2 and isn't necessary - the e-tag system replaced the need for this requirement. If the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1.</p> <p>Issue 3: The requirement to provide entities with SOLs and IROLs is addressed in FAC-014, Requirement 5.</p> <p>Issue 4: Most entities agreed with having the Reliability Coordinator develop a data specification that includes all data needed to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p> <p>Reference documents do not contain mandatory performance requirements – they may provide information on how to implement a standard, or may explain some aspect of a standard.</p> <p>The drafting team agrees that entities should have to sign the NERC Confidentiality Agreement – but this seems to be a requirement associated with certification rather than in a reliability standard.</p> <p>Issue 5: IRO-010 R1 does not require that the Reliability Coordinator's data specification mandate that entities provide weather forecast data as received from a licensed weather forecasting service.</p> <p>The Reliability Coordinator was removed from TOP-006-2 R4 because the Reliability Coordinator has a requirement to produce a data specification in IRO-010 R1. The SDT is not recommending anywhere that the Reliability Coordinator would specify in IRO-010 R1 and R2 the required weather forecasting information.</p>
Operating Reliability Working Group	No	<p>The retirement of IRO-004-1, R4 and R5 and replacement by IRO-010-1, R1, R2 and R3 seem to be focused on the front-end data sharing requirements.</p> <p>IRO-004-1, R5 specifically addresses sharing the results of the Reliability Coordinator's studies. We can not find a comparable replacement in IRO-010-1, or elsewhere, for this requirement.</p> <p>The SDT should consider moving IRO-005-2, R13 and R14 since these requirements are no longer directed toward the Reliability Coordinator. They don't fit in the IRO standards.</p> <p>We can't seem to find an entry for the retirement of R7 of IRO-004-1.</p> <p>Attachment 1 to TOP-005-2 is shown in the redline version as being deleted apparently due to the proposed retirement of R1. However, Attachment 1 is also referenced in R3 and therefore should not be deleted.</p>
		<p><b>Response:</b> The implementation plan should have recommended retiring IRO-004 R5 because it is replaced with IRO-008 R3 in combination with IRO-010 R3. The team has corrected the implementation plan.</p> <p>In the next round of edits to these standards, we expect that many requirements will be re-sorted so they are in more logical groupings.</p>

**Consideration of Comments on Draft 9 of IROL Standards**

Organization/Group		Question 7 Comments:
		<p>IRO-004-1 R7 - The drafting team agrees that none of the proposed standards addresses this topic and will retain Requirement R7. The drafting team working on the set of real-time standards for the TOP and BA will address the retirement of this requirement.</p> <p>The drafting team returned Attachment 1 to the standard as proposed. It is referenced in R3 as you noted, and will not be deleted by the IROL SDT.</p>
FirstEnergy	Yes	The effective dates correctly follow the end of the implementation schedule for FAC-014.
		<p><b>Response:</b> Thank you for your support.</p>
SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1	Yes	<p>We indicated "Yes" but are really unsure if we are sufficiently aware of what the impacts of the modifications are to system operations. We appreciate the extraordinary amount of effort by individuals involved in developing and revising standards, but we find the implementation plan confusing. This is not the fault of the drafting team, but the fault of the process. There have been innumerable changes to existing standards and to the Functional Model, coupled with FERC requirements to make changes in order to receive their approval. Revisions to standards are being promulgated too rapidly for members to have time to review or keep abreast of proposed changes. The Implementation Plan appears to justify the proposed revisions to, and retirement of, existing standards. we can only trust that the drafting team is using the currently approved version of each identified standard and has stayed abreast of any proposed changes to those standards.</p>
		<p><b>Response:</b> The drafting team is sympathetic – but cannot identify any easy way to manage the number of modifications under development at the same time as we try to comply with the many directives in Order 693 and improve the standards as rapidly as possible. The drafting teams have coordinated their activities to ensure that no critical reliability requirements are dropped, and to ensure that redundant requirements are retired.</p>

**Consideration of Comments on Draft 9 of IROL Standards**

**8. If you have any other comments on this set of standards that you haven't already provided, please provide them here?**

Organization/Group	Question 8 Comments:
Northeast Utilities	<p>(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"):</p> <p>(2) High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.</p> <p>(3) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. Please provide examples of those RCs that work for an RE. The latter, as a standard developer and compliance monitor per the functional model, does not have any operating and planning tasks assigned to them that require it to employ an RC. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.</p>
<p><b>Response:</b> The drafting team posted the VFRs for IRO-009 when it posted Draft 7 of the standard (January 2 – February 15, 2007) and asked stakeholders if the VFRs were acceptable. At that time, most commenters – including a commenter from Northeast Utilities, indicated support for the “Medium” VRF for both R1 and R2. Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.</p>	
<p>The intent of the language identifying which entity will serve as the Compliance Enforcement Authority is intended to ensure that no Regional Entity audits an entity that is responsible to that entity. This occurs in WECC, SPP, and FRCC. The language in this section of the standard supports the ERO Rules of Procedure.</p>	
NPCC Regional Standards Committee, RSC	<p>(1) For IRO-009, the VFRs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"):High Risk Requirement A</p>

**Consideration of Comments on Draft 9 of IROL Standards**

	<p>requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.</p> <p>(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. **Consideration of Comments on Draft 9 of IROL Standards**

	<p>please revise the language accordingly.</p>
<p><b>Response:</b> The drafting team posted the VRFs for IRO-009 when it posted Draft 7 of the standard. At that time, most commenters – including commenters from the NPCC CP-9 (which included comments from Hydro-Quebec TransEnergie ) and comments submitted solely by Hydro-Quebec TransEnergie, indicated support for the Medium VRF for R1 and R2. Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.</p>	<p>The intent of the language identifying which entity will serve as the Compliance Enforcement Authority is intended to ensure that no Regional Entity audits an entity that is responsible to that entity. This occurs in WECC, SPP, and FRCC. The language in this section of the standard supports the ERO Rules of Procedure.</p>
<p>Ontario IESO</p>	<p>(1) For IRO-009, the VRFs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"): High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.</p> <p>(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. Please provide examples of those RCs that work for an RE. The latter, as a standard developer and compliance monitor per the functional model, does not have any operating and planning tasks assigned to them that require it to employ an RC. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.</p> <p>(3) For R2/M2 of IRO-008, it is not possible to keep records of 30 minute IROL analysis for 30 days. Such time-logged analysis which are probably the only evidence of 30 minute analysis and these can only be located on the security analysis software and we do not believe that such software have the capability of keeping such extended records. We believe that the evidence retention for R2/M2 should be a couple of days at the most. In other words, the previous documentation retention requirement for this requirement should be retained.</p>
<p><b>Response:</b> The drafting team posted the VRFs for IRO-009 when it posted Draft 7 of the standard. At that time, most commenters – including commenters from the NPCC CP-9 (which included comments from IESO ) and comments submitted by the IRC Standards Review Committee (which included comments from IESO) indicated support for the Medium VRF for R1 and R2. Comments submitted solely by IESO did recommend that the VRFs for R1 and R2 should both be “high” – but most commenters supported the “Medium” VRFs and the drafting team’s reasoning for recommending the “Medium” VRF - Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.</p>	

**Consideration of Comments on Draft 9 of IROL Standards**

The intent of the language identifying which entity will serve as the Compliance Enforcement Authority is intended to ensure that no Regional Entity audits an entity that is responsible to that entity. This occurs in WECC, SPP, and FRCC. The language in this section of the standard supports the ERO Rules of Procedure.

The evidence required for R2/M2 doesn't have to be the security analysis software – the measure allows for a variety of evidence – one of the types of acceptable evidence is an audit log or a checklist to verify that the analysis was conducted.

<p>ISO RTO Council Standards Review Committee</p>	<p>(1) For IRO-009, the VRFs for R1 and R2 should both be HIGH. The absence of predetermined control actions that need to be made available to operation personnel to prevent and mitigate IROL being exceeded can result in failure to maintain interconnected system reliability. Operating personnel may be faced with having insufficient or no control actions to correct an IROL violation, which can lead to cascade tripping or instability. We believe this comment is consistent with our interpretation of the HIGH risk factor requirement definition (see the text on "planning time frame"): High Risk Requirement A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.</p> <p>(2) We do not understand the distinctions made (under the Compliance Enforcement Authority in the Compliance Monitoring Process of all 3 draft standards) between the RCs that work for the Regional Entity and those that do not. Please provide examples of those RCs that work for an RE. The latter, as a standard developer and compliance monitor per the functional model, does not have any operating and planning tasks assigned to them that require it to employ an RC. However, we do realize that there are REs that are requested by membership in the region through a contractual agreement to perform the RC function for them. In this case, it is the RE that is by contractual arrangement to operate the RC on the membership's behalf, not an employment of an RC by an RE (i.e. an RC working for an RE). If the SDT is referring to this type of set up, please revise the language accordingly.</p>
---	--

**Response:** The drafting team posted the VRFs for IRO-009 when it posted Draft 7 of the standard. At that time, most commenters – including commenters from the IRC Standards Review Committee indicated support for the Medium VRFs for R1 and R2. Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.

The intent of the language identifying which entity will serve as the Compliance Enforcement Authority is intended to ensure that no Regional Entity audits an entity that is responsible to that entity. This occurs in WECC, SPP, and FRCC. The language in this section of the standard supports the ERO Rules of Procedure.

<p>RCCWG - reliability coordinator comments working group</p>	<p>RSAWS need to be developed in parallel with standard revisions to they maintain the intention of the standard for the audit team.</p>
---	--

**Response:** The drafting team's scope does not include development of Reliability Standard Audit Worksheets (RSAWs). The group that develops RSAWs has access to the standard for use in developing RSAWs.

**Consideration of Comments on Draft 9 of IROL Standards**

<p>Manitoba Hydro</p>	<p>There needs to be coordination between IRO-010-1, TOP-005-0 Attachment 1, and VAR-002-1. Is it the intention of IRO-010-1 to ensure the RC has real-time data to monitor the state of the bulk electric system? TOP-005-0 Attachment 1 which is to become a Technical Reference states "1. The following information shall be updated at least every 10 minutes." VAR-002-1 R3 states "Each Generator Operator shall notify its associated Transmission Operator as soon as practical, but within 30 minutes of any of the following:</p> <p style="padding-left: 40px;">R3.1. A status or capability change on any generator Reactive Power resource, including the status of each automatic voltage regulator and power system stabilizer and the expected duration of the change in status or capability.</p> <p style="padding-left: 40px;">R3.2. A status or capability change on any other Reactive Power resources under the Generator Operator's control and the expected duration of the change in status or capability."</p> <p>This does not give the impression that real time status is required. For BES reliability, we ultimately think there should be real-time status from the AVR, PSS or SPS into the entity's Control Centre EMS and simultaneously through an ICCP link to the RC EMS. This approach would be the most robust with the least amount of chance of a communication break down attributed to human error. For an entity with over 100 generators, a project to bring real time AVR, PSS and SPS status into the Control Centre EMS and transfer the data via ICCP to the RC EMS would be very time consuming and costly. We would suggest a period of grace (dependent on number of RTU points required (up to several years)) for entities to reach this goal. During this grace period we suggest that knowledge of AVR, PSS, and SPS status by default is sufficient. In other words the device is considered "in service/on auto" unless the system operator is notified differently. The system operator manually toggles into SCADA the status of the device. The device's status change is communicated to the RC "without delay" either electronically or verbally. The device status in the RC EMS would be updated at this time. Both the entity's and the RC's EMS Real Time Contingency Analyses would be utilizing the latest known AVR, PSS and SPS status. As I see it, this approach, if agreed to by the RC, would satisfy IRO-010-1 R1 - R1.3 and R1 Violation Severity Levels "Lower" through to "Severe".</p>
<p><b>Response:</b> The drafting team is not recommending that VAR-002 R1 should be retired and is no longer recommending the retirement of TOP-005 Attachment 1. VAR-002-1 R3 requires the Generator Operator to provide specific information to the Transmission Operator – not the Reliability Coordinator.</p>	
<p>Operating Reliability Working Group</p>	<p>The Applicability section of IRO-009-1 includes more than a list of entities to which the standard applies. In this situation, a 'what' the standard applies to be included. We've never seen this before and question it's applicability in this case.</p> <p>Add parenthesis around the phrase 'up to and including load shedding' in R1 of IRO-009-1. The same phrase already exists in R2 in parenthesis.</p> <p>In the Compliance Section D, Item 1.4 Data Retention of IRO-010-1 the third paragraph states that the BA, GO, GOP, LSE, RC, TOP and TO shall keep evidence used to show compliance with R3 and M3. How much evidence is required? Prior versions of IRO-010 indicated that 3 months of evidence would be sufficient. Not including a specific reference leaves the</p>

**Consideration of Comments on Draft 9 of IROL Standards**

	<p>standard vague. A specific reference should be included. We suggest returning to the 3 month requirement.</p> <p>Also in this same Item 1.4 the phrase “in advance of real-time” shows up. If it was replaced in IRO-009-1, it should also be replaced here as well.</p>
<p><b>Response:</b> The Applicability Section of the standard may include any information that describes limits on the applicable entities or facilities. The drafting team reviewed the inclusion of the qualifying language and determined that it did not add anything significant to the standard and deleted this.</p> <p>The drafting team adopted your suggestion and added parentheses as proposed to IRO-009 R1.</p> <p>The drafting team added “90 days” as the outside parameter for data retention for R3 M3.</p> <p>The drafting team modified the data retention to include the following phrase, “ in accordance with Requirement R2” in support of the intent of your suggestion.</p>	
<p>SERC OC Standards Review Group - IROL Standards, IRO-008-1, 009-1, 010-1</p>	<p>We feel that the Implementation Plan should not set different implementation dates for jurisdictional and non-jurisdictional entities. This puts an additional burden on Reliability Coordinators to resolve problems involving entities subject to different standards. Our recommendation is that the standard should become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.</p> <p>One concern certain members have involves data retention requirements for IRO-10-1 at R3 and M3 when a system is part of an ISO or RTO and is required by its Reliability Coordinator to input its data into the ISO or RTO business system. For instance, a Reliability Coordinator may require generator operators to periodically update generator operating limits in support of R1-R3 citing two (2) horizons for such entries: (1) the day prior to the operating day and (2) as changes occur in real time. Members agree with the requirements, however data is manually entered into the business system and the member does not have the ability to retain the data or verify that it was entered. Given that the requirements call for the Reliability Coordinator to be provided the data, the measures should require that the RC retain the data provided.</p>
<p><b>Response:</b></p> <p>There are numerous regulatory authorities that need to approve these standards – every Canadian province in Canada – and FERC in the USA. All of the SERC entities are within the USA and are required to comply with standards that are approved by FERC.</p> <p>The compliance program is set up to require the responsible entity to demonstrate that it is compliant. Note that the measure allows the responsible entity great latitude in demonstrating that data was provided. For example, the responsible entity could ask the Reliability Coordinator to provide a letter confirming that it had received the data from the Generator Operator – and the Generator Operator could make this letter available as a method of demonstrating compliance. The measures were changed so that they now say that evidence must be “made available” rather than evidence must “be provided”.</p>	
<p>FirstEnergy</p>	<p>FE has the following additional comments and suggestions:</p> <p>(1) IRO-010 - Requirement R1 - Remove the word “data” between documented and specification to improve clarity and readability.</p>

**Consideration of Comments on Draft 9 of IROL Standards**

	<p>(2) The last sentence of R3 contains a phrase that was previously proposed to be a new term in IRO-007-1, but is now being deleted. If this intended to be retained as a new definitional term within the Glossary it will need to be added to IRO-010.</p> <p>When revised R1.1 and R3 should read as follows:</p> <p>(3) IRO-010 - Presumably the last sentence of R3 is designed to limit the data that the Reliability Coordinator may request from the various responsible entities listed. However, in its current state, the requirement seems to limit what the affected entities can provide. We suggest that it may be clearer to remove the last sentence of R3 and append it to the existing R1.1 requirement. The new R1.1 and R3 are proposed as follows: "R1.1. List of required data and information. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments." "R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified by R1 above, to the Reliability Coordinator(s) with which it has a reliability relationship."</p> <p>(4) With regard to Attachment 1 of TOP-005-2, this information in this attachment is to be transferred to a "Reference" document. However, it is not clear when this reference document is to be developed since a draft of this proposed reference is not available for comment. We suggest this reference document be developed and posted along with these new IROL standards so that it is all completed at the same time. The reference document will be a valuable tool to be used in conjunction with the standards and should be developed in conjunction with these standards.</p> <p>(4) In some of the revised standards, references to previous IROL requirements have been removed as they are now covered in the proposed IRO standards. In some cases, these revisions have led to entire requirements being deleted. It is brought to the attention of the SDT that requirement re-numbering was not correctly shown in the red-line standards provided for review and will need to be corrected in final changes. (e.g. EOP-001, TOP-005, etc.)</p> <p>(6) In IRO-009-1 the Applicability section contains 4.2 stating "The IROLs covered in this standard are limited to those associated with contingencies studied under FAC-011 and FAC-014." The NERC Standard Development Procedure indicates that the Applicability Section is intended to describe the 1) entities responsible for complying with the standard and 2) if needed, the portion of the bulk power system for which the standard is applicable. The 4.2 item may introduce an unintended use of the Applicability section and it may be better to move this item to a new requirement R1 in the standard worded as follows: "R1 Each Reliability Coordinator shall manage its current day system against IROL conditions identified in a manner consistent with the requirements of standards FAC-011 and FAC-014."</p>
<p><b>Response:</b>  <b>1</b> – The drafting team  <b>2</b> – The drafting team  <b>3</b> – IRO-010 R1.1 and R3  <b>4</b> – The IROL drafting</p>	<p>removed the extra word, "data" from IRO-010 - Requirement R1 as proposed.</p> <p>changed the phrase in IRO-010 R1 so that the word, "Monitoring" is no longer capitalized. Note that "Real-time" is a defined term and the drafting team retained the capitalization of this term.</p> <p>The drafting team moved the sentence from R3 to R1.1 as suggested.</p> <p>has removed its recommendation to retire Attachment 1 in TOP-005-2 because the attachment is referenced in Requirement 3 in TOP-005-2 which is not being retired by the IROL drafting team. There is another team that is recommending that TOP-005-2 R3 be retired or revised and that drafting team may recommend retirement of Attachment 1.</p>

**Consideration of Comments on Draft 9 of IROL Standards**

<p>5 – Red line renumbering - Agree – red line numbering doesn't always work because of the auto features in Word.          6 - The drafting team removed 4.2 from the revised standard.</p>	
Hydro One Networks	<p>We believe a SAR should be initiated to "clean-up" standards &amp; requirements that may be redundant or incorrect as opposed to retiring them within an implementation plan which pertains to a different set of standards.</p> <p>As well, for IRO-009, the VRFs for R1 and R2 should both be High.</p>
<p><b>Response:</b> For standards that were initiated prior to Version 0, the Standards Committee has authorized drafting teams to recommend the modification/retirement of requirements in Version 0 standards that are replaced/modified by an associated Version 1 requirement. The reason for this authorization is because the Version 1 drafting teams initiated their SARs before the Version 0 effort was started. Note that the recommended modifications are limited to those associated with requirements that are being replaced or revised as a result of the three remaining new IROL standards. The ballot for the IROL standards will include the recommended retirements and revisions. The IROL SDT limited its recommendations for retirements and revisions to those requirements that were technically incorrect based on the proposed IROL standards or were redundant with requirements in the proposed IROL standards.</p> <p>The drafting team posted the VRFs for IRO-009 when it posted Draft 7 of the standard (January 2 – February 15, 2007) and asked stakeholders if the VRFs were acceptable. At that time, most commenters including a commenter from Hydro One Networks who submitted comments as part of the NPCC CP9 Reliability Standards Working Group indicated support for the "Medium" VRF for both R1 and R2. Having action plans is important – but failure to have an action plan does not, in and of itself, cause bulk power system instability, separation, or a cascading sequence of failures.</p>	
American Transmission Company LLC	<p>Operational Planning Analysis (Definition): The phrase "next day's operation and up to 12 months ahead" (See definition of Operational Planning Analysis) is too broad when used in the context of requirement 1. The definition should be broken into two independent definitions one to address the "next day study" and a second to address the "up to 12 months study". Requirement 1 states that the RC has to perform an Operational Planning Analysis which, we have identified above, means "next day and up to 12 months" for the next operating day. By including the "up to 12 months" in the definition we believe that for every next day study the RC has to perform two independent studies. 1) One for the next day and 2) One for some other day that is up to 12 months It is for this reason that we suggest that the definition be broken into two distinct terms.</p> <p>IRO-008-1: ATC believe that IRO-008-1 R1 and R2 should be expanded to include SOLs in the Operational Planning Analysis and Real-Time Assessment.</p> <p>IRO-009-1The applicability section of that standard is to be used to identify the functional entity that must comply with the standard. The SDT is using this section to place an exception on the requirements. Any exception should be identified in the requirements. (Solution could be with a footnote)</p> <p>Standard IRO-009-1 needs two additional requirements: 1) Require the RC has to coordinate their plans with entities that are expected to perform an action in the plan. 2) Distribute and share those plans with entities that are expected to perform an action. R3 ATC is concern that compliance is based on following the plan and what is more important is if the RC prevented the IROL from exceeding the Tv. The requirement should specify that the RC prevents the IROL not that they follow their plan.</p> <p>IRO-010-1 Data Retention rule A more specific data retention period should be established. The current language would</p>

**Consideration of Comments on Draft 9 of IROL Standards**

	<p>require ATC to keep data anywhere from one month to seven years or more. “For data that is requested in advance of real-time the TOP shall keep evidence used to show compliance with R3 for the RC’s most recent data specifications.” (If the RC updated their data specifications once every seven years all entities must retain their data for seven years.) General Comment: ATC suggest that this SDT work closely with the Reliability Coordinator SDT in order to ensure a comprehensive set of standards.</p>
<p><b>Response:</b></p>	<p>Definition of Operational Planning Analysis - The drafting team modified the definition to clarify that there needs to be an analysis for each day, but the analysis does not need to be done once a day – and the analysis does not have to look at every day from the next day up to a year ahead.</p> <p>Expansion of IRO-008-1 R1 and R2 to include SOLs - The drafting team did not adopt this suggestion. The Reliability Coordinator may not have the ability to see all SOLs. This set of standards has focused on those SOLs that have greatest impact on the bulk electric system – the IROLs. The RTO SDT is working on specific requirements related to SOLs that are not IROLs.</p> <p>IRO-009-1 Applicability Section - The drafting team removed 4.2 from the Applicability Section of the standard because it duplicates information already included in the requirements. Note that the applicability section of the standard can also be used to identify other limitations on the applicability of the standard – such as limiting applicability to a specific type of facility or to a specific geographic location, etc.</p> <p>Standard IRO-009-1 – proposal to add requirements for the Reliability Coordinator to “coordinate” and “distribute” its plans - The drafting team did not adopt this suggestion. Under IRO-008, the Reliability Coordinator has to share the results of its analyses and assessments if they indicate the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL. IRO-009 requires the Reliability Coordinator to direct entities to follow specific action plans to prevent/mitigate instances of exceeding IROLs. The Reliability Coordinator is responsible for acting or directing others to act – the word, “coordination” doesn’t convey the same meaning.</p> <p>The drafting team added a phrase to R3 to clarify that the Operating Processes, Procedures and Plans used to prevent exceeding an IROL are not limited to those identified in R1 but did not modify the requirement to change the emphasis- the drafting team thinks that it will not always be possible to prevent exceeding an IROL.</p> <p>IRO-010-1 Data Retention - The drafting team added “for a rolling 90 days” to the data retention requirement for R3.</p> <p>The drafting team is working closely with the Reliability Coordination SDT to ensure coordination.</p>

**Observations and Discussions with FERC Staff May 29, 2008 and June 3, 2008**

The following notes were developed from a combination of two conference calls conducted on May 29, 2008 and on June 3, 2008 with members of FERC Staff, members of the IROL Standard Drafting Team, and members of NERC's staff. There were no formal agendas for the meetings, but the purpose was to review the FERC directives from Order 693 applicable to the IROL Standards and identify any areas where FERC staff had concerns about meeting the directives.

**The following people were in attendance during the call on May 29, 2008:**

IROL Standard Drafting Team:

- Ellis Rankin, chair
- Jim Case
- Al DiCaprio
- Mike Hardy
- Steve Myers

FERC Staff:

- Keith O'Neal
- Bob Snow

NERC Staff:

- Gerry Adamski
- Maureen Long
- David Taylor

**The following people were in attendance during the call on June 3, 2008:**

IROL Standard Drafting Team:

- Ellis Rankin, chair
- Jim Case
- Al DiCaprio
- Mike Hardy
- Tony Jankowski
- Seamus McGovern
- Al Miller
- Jamie Murphy
- Steve Myers

FERC Staff:

- Bob Snow

NERC Staff:

- Maureen Long

**There were nine issues discussed during the two conference calls:**

Issue 1 – Vetting a drafting team’s products against FERC directives

Issue 2 - Reliability-related impact of removing “monitoring SOL” requirements

Issue 3 - Acceptable uses of firm load shedding

Issue 4 – Intent of IRO-010 – R1

Issue 5 - Reliability-related impact of removing Attachment 1 from TOP-005

Issue 6 - Advance notice of planned outages

Issue 7 – Reliability Coordinator tools

Issue 8 - Providing operators with action plans for n-1-1 conditions

Issue 9 – Reliability-related impact of retiring EOP-001 R2

### Issue 1 – Vetting a drafting team’s products against FERC directives

**FERC:** What is NERC process for vetting SDT products against applicable FERC Order Directives and how is the result documented or indicated in public NERC postings?

**Discussion:** The IROL SDT has not posted its SDT products against the FERC directives, but did conduct a review amongst the SDT members to verify that their work would meet the directives. Does the SDT want to post a table showing the directives & how it met the directives when its posts its work for pre-ballot review?

**SDT Resolution:** This document is not needed. When the IROL documents are submitted to the Standards Committee for approval to move forward, the Standards Committee should be asked if it wants a list of the FERC directives and the team’s consideration of those directives posted for review.

### Issue 2 - Reliability-related impact of removing “monitoring SOL” requirements

**FERC:** SOLs have been removed – focus is on IROLs only – what happened to SOLs?

Make sure the filing identifies what happened to activities that were there before – where are they now, identify where they went – need to show that the ‘check and balance’ is still there. Identify how the requirements address the time spectrum.

**Discussion:** How should SDT indicate that SOLs are still to be monitored etc with an appropriate ‘oversight’ role for RC and what timing implications need to be addressed between IROL standard effective date vs other still pending standards? IE FERC's concern that revised or new standards coordinate etc with current FERC approved standards and do not lead to less reliable BES.

Note - FERC staff looked at the latest posted version of the Implementation Plan – which still recommended retirement of requirements for the RC to “monitor”. Because we decided not to include any new requirements for monitoring, our latest version of the implementation plan does not include recommendations to retire the monitoring requirements.

**SDT Resolution:** No adjustments are needed to the standards or to the implementation plan. Use the advice when filing the standards for approval with regulatory authorities.

### Issue 3 - Acceptable uses of firm load shedding

**FERC:** Look at the transmission themes section of Order 693 – expectation is that load can be served when there are no contingencies on the system –

If you have a single contingency (whatever equipment taken out of service – the protective zone of the fault is a single contingency) there can be some consequential load loss

**Discussion:** Clarify the use of Firm Load Shed action as part of any operating time frame emergency plan (and not as a substitute for utilization of all physical resources available within the time frame).

**SDT Resolution:** No adjustments are needed to the standards or to the implementation plan. Document the team’s approach when filing the standards for approval with regulatory authorities.

**Issue 4 – Intent of IRO-010 – R1**

**FERC:** IRO-010 – Requirement R1 - Consider moving the purpose statement into the requirement

**Discussion:** The drafting team agreed that the proposed modification would clarify the intent of R1.

**SDT Resolution:** Modify IRO-010 R1 to add key words from the purpose to the requirement to clarify the intent of the requirement.

**Issue 5 - Reliability-related impact of removing Attachment 1 from TOP-005**

**FERC:** The Implementation plan states that the list of data will be moved into a tech reference – but there is no tech reference posted . . .

What is the advantage of moving the attachment into a reference – does this result in a better standard than you would achieve if the attachment were a set of “minimums” that must be met?

**Discussion:** We need some key words we can use when we file this standard for regulatory approval to show that we haven’t degraded reliability by requiring the Reliability Coordinator to have a data specification. The team felt that having a set of minimum elements to address would allow some entities to default into a position of thinking that these are the only elements that need to be addressed – and felt that forcing the Reliability Coordinator to document what it needs would result in a better product.

**SDT Resolution:** One of the stakeholder comments submitted during the public posting period identified that the attachment is referenced in TOP-005 Requirement R3 (that requirement is not being retired by the IROL SDT) and the attachment needs to be retained. The drafting team modified its Implementation Plan so that it no longer recommends retirement of Attachment 1 in TOP-005.

**Issue 6 - Advance notice of planned outages**

**FERC:** Consideration of Order 693 Paragraph 1621 regarding planned outage lead times isn’t reflected in the implementation plan’s recommendation to revise TOP-003 R1

The change proposed for TOP-003 R1 is:

**R1.** Generator Operators and Transmission Operators shall provide planned outage information.

**R1.1** Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.

**R1.2** Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~

Directives in Order 693 relative to TOP-003:

1. Include a new requirement to communicate longer term outages well in advance to ensure reliability and accuracy of ATC calculation
2. Make any facility below the voltage thresholds that, in the opinion of the transmission operator, balancing authority, or reliability coordinator, will have a direct impact on the operation of Bulk-Power System, subject to Requirement R1 for planned outage coordination
3. Incorporate an appropriate lead time for planned outages as discussed above.

Some of the discussion in Order 693 for TOP-003:

1620. In Order No. 890, the Commission directed that information concerning ATC calculations be consistent and transparent. The timing of facility outages is one important piece of information in ATC calculations. In Order No. 890, the Commission directed that specific data be exchanged among transmission providers, including transmission planned and contingency outages, for the purpose of ATC modeling.

Consistent with this determination in Order No. 890, [the Commission directs the ERO to develop a modification to TOP-003-0 that requires the communication of scheduled outages to all affected entities well in advance to ensure reliability and accuracy of ATC calculations.](#) We believe this addresses LPPC's concern regarding the interplay between reliability and business practices.

1621. Several commenters raised concerns regarding the Commission's proposal to require outage information well in advance. Specifically, they argue that the term "well in advance" is vague, that the requirement would reduce flexibility and that it would cause entities to postpone needed maintenance work, thereby reducing reliability. In response to the Commission's request for comments on lead time for planned outages, entities provide information on current lead time practices indicating that lead times range from one week to 45 days. We direct the ERO to modify the Reliability Standard to incorporate an appropriate lead time for planned outages. The ERO should utilize the information filed by commenters in the Reliability Standards development process. In doing so the ERO should take into consideration the need for flexibility, as well the lead time required for coordination with other entities and outage assessments. Proper coordination will ensure that priority is given to needed maintenance work for critical facilities to ensure reliability.

**Discussion:** There are three FERC directives, the first one applies to the ATC standards – and seems to be addressed in the proposed ATC standards in the requirements for calculating TTC, ATC, and AFC. The second directive should be addressed by the Real-time BA/TOP SDT and the third directive should be addressed in our data spec requirement. Should we consider adding some language to the tech reference to indicate that the RC should request that the TOP/GO/GOP provide outage data as soon as it is known so the RC can incorporate this data in its Operational Planning Analyses?

R3. When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R3.1. For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

R3.1.1. Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

R3.1.2. Load forecast for the applicable period being calculated.

R3.1.3. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

R3.2. For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

R3.2.1. Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

R3.2.2. Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

R3.2.3. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

The latest draft of MOD-030 includes the following:

R5. When calculating AFCs, the Transmission Service Provider shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R5.1. Use the models provided by the Transmission Operator.

R5.2. Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the period calculated for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

R5.3. For external Flowgates, identified in R2.1.3, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

Note that the third standard for calculating ATC, MOD-029 doesn't have references to outages.

**SDT Resolution:** No adjustments are needed to the standards or to the implementation plan.

NERC staff will ask the Certification Subcommittee to add the following to the certification process:

- Require the prospective Reliability Coordinator to have a procedure for coordination of planned generation and transmission outages that includes the following:
  - Identification of a lead time for planned outages that provides sufficient time for reliability-related coordination
  - Identification of the criteria used to determine which outages to approve when there are multiple requests for outages and they can't all be approved

### Issue 7 – Reliability Coordinator tools

**FERC:** If the drafting team is expecting that Order 693 Paragraph 1660 regarding minimum tools for the Reliability Coordinator will be addressed through the certification process, the filing for the standard should indicate that the alternate is providing an “equally effective and efficient” method of meeting this directive.

**Discussion:** Should the IROL standards (or any other standard) specify any minimum tool requirements? The SDT wrote the standards with the expectation that facility requirements would be addressed in certification.

FERC staff looked at the latest posted version of the Implementation Plan – which still recommended retirement of requirements for the RC to “monitor”. Because we decided not to include any new requirements for monitoring, our latest version of the implementation plan does not include recommendations to retire the monitoring requirements.

**SDT Resolution:** No adjustments are needed to the standards or to the implementation plan. The drafting team’s set of standards do not include any for “monitoring” – and the implementation plan does not recommend retirement of any “monitoring” requirements.

### Issue 8 - Providing operators with action plans for n-1-1 conditions

**FERC:** Review paragraph 1601 in the Order – this suggests that if the next evil thing occurs before the system is returned to a stable state, then there should be a pre-defined plan in place for the system operator to use. This should include a plan for every possible second contingency and should include control actions.

1601. . . Therefore, we direct the ERO to modify Reliability Standard TOP-002-2 to require the next-day analysis for all IROLs to identify and communicate control actions to system operators that can be implemented within 30 minutes following a contingency to return the system to a reliable operating state and prevent cascading outages.

**Clarification:** FERC staff advised that this paragraph requires that the system operator be provided with action plans to use to prepare for the next contingency during the adjustment time period when an IROL has been exceeded but the system hasn’t been returned to a “stable” or “normal” state.

**Discussion:** None of the drafting team members participating in the call agreed with this interpretation of Paragraph 1601.

**SDT Resolution:** No adjustments are needed to the standards or to the implementation plan. Document the team’s understanding of 1601 when filing the standards for approval with regulatory authorities.

**Issue 9 – Reliability-related impact of retiring EOP-001 R2**

**FERC:** The drafting team needs to verify that when EOP-001 R2 is retired, there is still a requirement for the TOP to have load reduction plans that can be executed within a specific time frame – otherwise, the drafting team should consider whether the retirement of EOP-001 R2 could result in less reliability.

**Discussion:** The drafting team is recommending that EOP-001 R2 be retired when IRO-009-1 R1 and R2 become effective. The RC, not the TOP is responsible for developing plans to prevent and mitigate instances of exceeding identified IROLs. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL’s  $T_v$ , which can be shorter than 30 minutes.

**EOP-001 R2.** The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.

**SDT Resolution:** EOP-001 R3 and R4 require the TOP to have load reduction plans that can be executed within a specific timeframe – so the recommended retirement will not adversely impact reliability, and no change was made to the implementation plan.

**EOP-001**

**R3.** Each Transmission Operator and Balancing Authority shall:

**R3.1.** Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.

**R3.2.** Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.

**R3.3.** Develop, maintain, and implement a set of plans for load shedding.

**R3.4.** Develop, maintain, and implement a set of plans for system restoration.

**R4.** Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:

**R4.1.** Communications protocols to be used during emergencies.

**R4.2.** A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.

### A. Introduction

1. **Title:** **Emergency Operations Planning**
2. **Number:** EOP-001-1
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Dates:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

### B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- R2. Each Transmission Operator and Balancing Authority shall:
  - R2.1. Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - R2.2. Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - R2.3. Develop, maintain, and implement a set of plans for load shedding.
  - R2.4. Develop, maintain, and implement a set of plans for system restoration.
- R3. Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R3.1. Communications protocols to be used during emergencies.
  - R3.2. A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.
  - R3.3. The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.
  - R3.4. Staffing levels for the emergency.
- R4. Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.

- R5.** The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.
- R6.** The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:
  - R6.1.** The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.
  - R6.2.** The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.
  - R6.3.** The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)
  - R6.4.** The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

**C. Measures**

- M1.** The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2.** The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization.

**1.2. Compliance Monitoring Period and Reset Time Frame**

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

**1.3. Data Retention**

Current plan available at all times.

**1.4. Additional Compliance Information**

Not specified.

## Standard EOP-001-1 — Emergency Operations Planning

### 2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for less than 25% of the adjacent BAs. Or less than 25% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 25% to 50% of the adjacent BAs. Or 25 to 50% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 50% to 75% of the adjacent BAs. Or 50% to 75% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 75% or more of the adjacent BAs. Or more than 75% of those agreements do not contain provisions for emergency assistance.
R2	The Transmission Operator or Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator or Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with four (4) of the sub-components.
R2.1	The Transmission Operator or Balancing Authority's emergency plans to mitigate insufficient generating capacity are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of emergency plans to mitigate insufficient generating capacity emergency plans but the plans are not maintained.	The Transmission Operator or Balancing Authority's emergency plans to mitigate insufficient generating capacity emergency plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop emergency mitigation plans for insufficient generating capacity.
R2.2	The Transmission Operator or Balancing Authority's plans to mitigate transmission system emergencies are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of transmission system emergency plans but are not maintained.	The Transmission Operator or Balancing Authority's transmission system emergency plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement operating emergency mitigation plans for emergencies on the transmission system.

**Standard EOP-001-1 — Emergency Operations Planning**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R2.3	The Transmission Operator or Balancing Authority's load shedding plans are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's has demonstrated the existence of load shedding plans but are not maintained.	The Transmission Operator or Balancing Authority's load shedding plans are partially compliant with the requirement but are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement load shedding plans.
R2.4	The Transmission Operator or Balancing Authority's system restoration plans are missing minor details or minor program/procedural elements.	The Transmission Operator or Balancing Authority's system restoration plans are partially compliant with the requirement but are not maintained.	The Transmission Operator or Balancing Authority's restoration plans are neither maintained nor implemented.	The Transmission Operator or Balancing Authority has failed to develop, maintain, and implement operating emergency mitigation plans for system restoration.
R3	The Transmission Operator or Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator or Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator or Balancing Authority has failed to comply with all four (4) of the sub-components.
R3.1	The Transmission Operator or Balancing Authority's communication protocols included in the emergency plan are missing minor program/procedural elements.	N/A	N/A	The Transmission Operator or Balancing Authority has failed to include communication protocols in its emergency plans to mitigate operating emergencies.
R3.2	The Transmission Operator or Balancing Authority's list of controlling actions has resulted in meeting the intent of the requirement but is missing minor program/procedural elements.	N/A	The Transmission Operator or Balancing Authority provided a list of controlling actions, however the actions fail to resolve the emergency within NERC-established timelines.	The Transmission Operator or Balancing Authority has failed to provide a list of controlling actions to resolve the emergency.

**Standard EOP-001-1 — Emergency Operations Planning**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R3.3	The Transmission Operator or Balancing Authority has demonstrated coordination with Transmission Operators and Balancing Authorities but is missing minor program/procedural elements.	N/A	N/A	The Transmission Operator or Balancing Authority has failed to demonstrate the tasks to be coordinated with adjacent Transmission Operator and Balancing Authorities as directed by the requirement.
R3.4	The Transmission Operator or Balancing Authority's emergency plan does not include staffing levels for the emergency	N/A	N/A	N/A
R4	The Transmission Operator and Balancing Authority's emergency plan has complied with 90% or more of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with 70% to 90% of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with between 50% to 70% of the number of sub-components.	The Transmission Operator and Balancing Authority's emergency plan has complied with 50% or less of the number of sub-components
R5	The Transmission Operator and Balancing Authority is missing minor program/procedural elements.	The Transmission Operator and Balancing Authority has failed to annually review one of it's emergency plans	The Transmission Operator and Balancing Authority has failed to annually review two of its emergency plans or communicate with one of it's neighboring Balancing Authorities.	The Transmission Operator and Balancing Authority has failed to annually review and/or communicate any emergency plans with its Reliability Coordinator, neighboring Transmission Operators or Balancing Authorities.
R6	The Transmission Operator and/or the Balancing Authority failed to comply with one (1) of the sub-components.	The Transmission Operator and/or the Balancing Authority failed to comply with two (2) of the sub-components.	The Transmission Operator and/or the Balancing Authority has failed to comply with three (3) of the sub-components.	The Transmission Operator and/or the Balancing Authority has failed to comply with four (4) or more of the sub-components.

**Standard EOP-001-1 — Emergency Operations Planning**

Requirement	Lower	Moderate	High	Severe
R6.1	The Transmission Operator or Balancing Authority has failed to establish and maintain reliable communication between interconnected systems.	N/A	N/A	N/A
R6.2	The Transmission Operator or Balancing Authority has failed to arrange new interchange agreements to provide for emergency capacity or energy transfers with required entities when existing agreements could not be used.	N/A	N/A	N/A
R6.3	The Transmission Operator or Balancing Authority has failed to coordinate transmission and generator maintenance schedules to maximize capacity or conserve fuel in short supply.	N/A	N/A	N/A
R6.4	The Transmission Operator or Balancing Authority has failed to arrange for deliveries of electrical energy or fuel from remote systems through normal operating channels.	N/A	N/A	N/A

**E. Regional Differences**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>

**Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system's own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

**A. Introduction**

1. **Title:** **Reliability Coordination — Facilities**
2. **Number:** IRO 002-2
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

**B. Requirements**

- R1.** Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.
- R2.** Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.
- R3.** Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.
- R4.** Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.
- R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.
- R6.** Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.

- R7.** Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.
- R8.** Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

**C. Measures**

- M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 3.
- M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 3.
- M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.
- M4.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 6.
- M5.** Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 7)
- M6.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 8 Part 1.
- M7.** Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 8 Part 2.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1 through 7.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator has demonstrated communication facilities for both voice and data exist to all appropriate entities and that they are staffed and available but they are less than adequate.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with one appropriate entity or 2) Data links with one appropriate entity.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with two appropriate entities or 2) Data links with two appropriate entities.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with more than two appropriate entities or 2) Data links with more than two appropriate entities or 3) Communication facilities are not staffed or 4) Communication facilities are not ready.
R2	N/A	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with one of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with two of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with three of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.
R3	N/A	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to one of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to two or more of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to all of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with all neighboring Reliability Coordinators.

**Standard IRO-002-2 — Reliability Coordination — Facilities**

Requirement	Lower	Moderate	High	Severe
R4	The Reliability Coordinator's monitoring systems provide information in a way that is not easily understood and interpreted by the Reliability Coordinator's operating personnel or particular emphasis was not given to alarm management and awareness systems, automated data transfers and synchronized information systems.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that one potential or actual SOL or IROL violation is not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that two or more potential and actual SOL and IROL violations are not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real-time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that all potential and actual SOL and IROL violations are identified.
R5	The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in one SOL violations or 2) or operating reserves for a small portion of the Reliability Authority Area.	The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or to system restoration, 2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations, or 3) operating reserves.	The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing two or more IROLs; or one IROL and to system restoration, 2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations and operating reserves, or 3) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or system restoration and operating reserves.	The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all IROLs and to system restoration, or 2) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all SOL violations and operating reserves.

0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Deleted R2, M3 and associated compliance elements Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	Revised

**A. Introduction**

1. **Title:** **Reliability Coordination — Operations Planning**
2. **Number:** IRO-004-2
3. **Purpose:** Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
  - 4.3. Transmission Service Providers.
5. **Effective Date:** In those jurisdictions where no regulatory approval is required, the standard shall be retired on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall be retired effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

**B. Requirements**

- R1. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.

**C. Measures**

- M1. None

**D. Compliance**

**1. Compliance Monitoring Process**

Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on site audit, Reliability Coordinators will be asked to provide documentation showing that next-day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits, etc.

- 1.1. **Compliance Monitoring Responsibility**
- 1.2. **Compliance Monitoring Period and Reset Time Frame**
- 1.3. **Data Retention**
- 1.4. **Additional Compliance Information**

**2. Violation Severity Levels**

Requirement	Lower	Moderate	High	Severe
R1	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on one (1) occasion during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on two (2) to three (3) occasions during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on four (4) to five (5) occasions during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on more than five (5) occasions during a calendar month.

0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1		Replaced Levels of Non-compliance with the February 28, 2008 BOT approved Violation Severity Levels Retired R1 through R6, and associated Measures, Data Retention, and VSLs	Revision

## A. Introduction

1. **Title:** **Reliability Coordination — Current Day Operations**
2. **Number:** IRO-005-3
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.

5. **Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.
  - R1.6. Current ACE for all its Balancing Authorities.

- R1.7.** Current local or Transmission Loading Relief procedures in effect.
- R1.8.** Planned generation dispatches.
- R1.9.** Planned transmission or generation outages.
- R1.10.** Contingency events.
- R2.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- R3.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- R4.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R5.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.
- R6.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.
- R7.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- R8.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- R9.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
- R10.** In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- R11.** The Transmission Service Provider shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

- R12.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

**C. Measures**

- M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.
- M2.** If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2 and Requirement 10)
- M3.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 6)
- M4.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 7.
- M5.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 8 Part 1.
- M6.** The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 8 Part 2)
- M7.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or

DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 9 Part 1)

- M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 11 Part 1)
- M9.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 12)
- M10.** If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Part 2 of Requirement 13)
- M11.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.(Requirement 14 Part 2)
- M12.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 15 Part 1.
- M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 15 Part 2.
- M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 15 Part 3)

## **D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

For Measures 1 and 9, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures 2–8 and Measures 12 through 13, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure 6, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure 10, the Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure 11, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.
R1.1	The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.	N/A	N/A	N/A
R1.2	The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.3	The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A
R1.4	The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).	N/A	N/A	N/A
R1.5	The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.	N/A	N/A	N/A
R1.6	The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.	N/A	N/A	N/A
R1.7	The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.	N/A	N/A	N/A
R1.8	The Reliability Coordinator failed to monitor planned generation dispatches.	N/A	N/A	N/A
R1.9	The Reliability Coordinator failed to monitor planned transmission or generation outages.	N/A	N/A	N/A

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.10	The Reliability Coordinator failed to monitor contingency events.	N/A	N/A	N/A
R2	N/A	The Reliability Coordinator failed to direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities.	The Reliability Coordinator failed to issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	The Reliability Coordinator failed to monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves was provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements.
R3	N/A	N/A	The Reliability Coordinator ensured its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information, but failed to assist, when needed, in the development of any required response plans.	The Reliability Coordinator failed to ensure its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information.
R4	N/A	N/A	N/A	The Reliability Coordinator failed to disseminate information within its Reliability Coordinator Area, when required.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R5	N/A	N/A	The Reliability Coordinator monitored system frequency and its Balancing Authorities' performance but failed to direct any necessary rebalancing to return to CPS and DCS compliance.	The Reliability Coordinator failed to monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance or the responsible entity failed to utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R6	N/A	<p>The Reliability Coordinator coordinated with Transmission Operators, Balancing Authorities, and Generator Operators, as needed, to develop action plans to mitigate potential or actual SOL, CPS, or DCS violations but failed to implement said plans, or the Reliability Coordinator coordinated pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in the real-time reliability analysis timeframe but failed to coordinate pending generation and transmission maintenance outages in the next-day reliability analysis timeframe.</p>	<p>The Reliability Coordinator failed to coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations, or the Reliability Coordinator failed to coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real-time and next-day reliability analysis timeframes.</p>	<p>The Reliability Coordinator failed to coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations and the Reliability Coordinator failed to coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real-time and next-day reliability analysis timeframes.</p>
R7	N/A	N/A	N/A	<p>The Reliability Coordinator failed to assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities, when necessary.</p>

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R8	N/A	The Reliability Coordinator identified sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange and discussed corrective actions with the appropriate Balancing Authority but failed to direct the Balancing Authority to comply with CPS and DCS.	The Reliability Coordinator identified sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange but failed to discuss corrective actions with the appropriate Balancing Authority.	The Reliability Coordinator failed to identify sources of large Area Control Errors that were contributing to Frequency Error, Time Error, or Inadvertent Interchange.
R9	N/A	N/A	N/A	The Reliability Coordinator failed to be aware of the impact on inter-area flows of an inter-Balancing Authority or inter-Transmission Operator, following the operation of a Special Protection System that is armed (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation), or the Transmission Operator failed to immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.

**Standard IRO-005-3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R10	N/A	N/A	N/A	The responsible entity failed to operate the Bulk Electric System to the most limiting parameter in instances where there was a difference in derived limits.
R11	N/A	N/A	N/A	The Transmission Service Provider failed to respect SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
R12	N/A	The Reliability Coordinator failed to notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.	N/A	The Reliability Coordinator who foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area failed to issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area, or the receiving Reliability Coordinator failed to disseminate this information to its impacted Transmission Operators and Balancing Authorities.

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1		Retired R2, R3, R5; modified R9, R13 and R14; retired R16 and R17 Retired M2 and M3; modified M9 and M12; retired M13 Made conforming changes to data retention Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Retired VSLs associated with R2, R3, R5, R16 and R17; Modified VSLs associated with R9 and R13, and R14	Revised

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-1
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.
- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.

- R3.** Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4.** Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

**C. Measures**

- M1.** Evidence that the Generator Operator, Transmission Operator, and Balancing Authority reported and coordinated scheduled outage information as indicated in the requirements above.

**D. Compliance**

**1. Compliance Monitoring Process**

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

**1.1. Compliance Monitoring Responsibility**

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

**1.2. Compliance Monitoring Period and Reset Timeframe**

One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

One calendar year.

**1.4. Additional Compliance Information**

Not specified.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The Generator Operator failed to provide outage information, in accordance with its Transmission Operators established outage reporting requirements, to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW).
R1.1	N/A	N/A	N/A	The Transmission Operator failed to provide outage information, in accordance with its Reliability Coordinators established outage reporting requirement, to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.

**Standard-TOP-003-1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.2	The responsible entity failed to provide the information by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	N/A	N/A	N/A
R1.3	N/A	N/A	N/A	The responsible entity failed to plan or coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators when required.
R2	The responsible entity planned and coordinated scheduled outages of telemetering and control equipment and associated communication channels with its Reliability Coordinator, but failed to coordinate with affected neighboring Transmission Operators, Balancing Authorities, and Generator Operators.	N/A	N/A	The responsible entity failed to plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.

**Standard-TOP-003-1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R3	N/A	N/A	N/A	The Reliability Coordinator failed to resolve any scheduling of potential reliability conflicts.
R4	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 30 minutes but less than or equal to 35 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 35 minutes but less than or equal to 40 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 40 minutes but less than or equal to 45 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 45 minutes.

**E. Regional Variances**

None identified.

1		Modified R1.2 Modified M1 Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)	Revised

## A. Introduction

1. **Title:** **Operational Reliability Information**
2. **Number:** TOP-005-2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Purchasing Selling Entities.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”
- R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.
- R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

## C. Measures

- M1. Evidence that the Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

## D. Compliance

1. **Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

Not specified.

**1.4. Additional Compliance Information**

Not specified.

**2. Violation Severity Levels:**

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The ISN data recipient failed to sign the NERC Confidentiality Agreement for “Electric System Reliability Data”.
R2	The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.	N/A	N/A	The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.
R3	The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.	N/A	N/A	The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.

**E. Regional Variances**

## Attachment 1-TOP-005

### Electric System Reliability Data

This Attachment lists the types of data that Balancing Authorities, and Transmission Operators are expected to share with other Balancing Authorities and Transmission Operators.

1. The following information shall be updated at least every ten minutes:
  - 1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:
    - 1.1.1 Status.
    - 1.1.2 MW or ampere loadings.
    - 1.1.3 MVA capability.
    - 1.1.4 Transformer tap and phase angle settings.
    - 1.1.5 Key voltages.
  - 1.2. Generator data.
    - 1.2.1 Status.
    - 1.2.2 MW and MVAR capability.
    - 1.2.3 MW and MVAR net output.
    - 1.2.4 Status of automatic voltage control facilities.
  - 1.3. Operating reserve.
    - 1.3.1 MW reserve available within ten minutes.
  - 1.4. Balancing Authority demand.
    - 1.4.1 Instantaneous.
  - 1.5. Interchange.
    - 1.5.1 Instantaneous actual interchange with each Balancing Authority.
    - 1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.
    - 1.5.3 Interchange Schedules for the next 24 hours.
  - 1.6. Area Control Error and frequency.
    - 1.6.1 Instantaneous area control error.
    - 1.6.2 Clock hour area control error.
    - 1.6.3 System frequency at one or more locations in the Balancing Authority.
2. Other operating information updated as soon as available.
  - 2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.

- 2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.
- 2.3. Forecast peak demand for current day and next day.
- 2.4. Forecast changes in equipment status.
- 2.5. New facilities in place.
- 2.6. New or degraded special protection systems.
- 2.7. Emergency operating procedures in effect.
- 2.8. Severe weather, fire, or earthquake.
- 2.9. Multi-site sabotage.

## A. Introduction

1. **Title:** **Monitoring System Conditions**
2. **Number:** TOP-006-2
3. **Purpose:** To ensure critical reliability parameters are monitored in real-time.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Generator Operators.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.
  - R1.1. Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
  - R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
- R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.
- R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.
- R4. Each Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.
- R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.

- R6.** Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
- R7.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

**C. Measures**

- M1.** The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4.** Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

**D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### **1.3. Data Retention**

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.

Each Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

### **1.4. Additional Compliance Information**

None.

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The responsible entity failed to know the status of all generation and transmission resources available for use, even though said information was reported by the Generator Operator, Transmission Operator, or Balancing Authority.
R1.1	N/A	N/A	N/A	The Generator Operator failed to inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
R1.2	N/A	N/A	N/A	The responsible entity failed to inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
R2	N/A	The responsible entity monitors the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, but is not aware of the status of rotating and static reactive resources.	The responsible entity fails to monitor all of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of all rotating and static reactive resources.	The responsible entity fails to monitor any of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

Requirement	Lower	Moderate	High	Severe
R3	The responsible entity failed to provide any of the appropriate technical information concerning protective relays to their operating personnel.	N/A	N/A	The responsible entity failed to provide all of the appropriate technical information concerning protective relays to their operating personnel.
R4	N/A	N/A	The responsible entity has either weather forecasts or past load patterns, available to predict the system's near-term load pattern, but not both.	The responsible entity failed to have both weather forecasts and past load patterns, available to predict the system's near-term load pattern.
R5	N/A	N/A	The responsible entity used monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions, but does not have indication of the need for corrective action.	The responsible entity failed to use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions.
R6	N/A	N/A	N/A	The responsible entity failed to use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
R7	N/A	N/A	N/A	The responsible entity failed to monitor system frequency.

**E. Regional Variances**

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
2		Modified R4 Modified M4 Modified Data Retention for M4 Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)	Revised

## A. Introduction

1. **Title:** **Emergency Operations Planning**
2. **Number:** EOP-001-~~0~~1
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Dates:** April 1, 2005

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- ~~R2. The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.~~
- ~~R3.R2.~~ Each Transmission Operator and Balancing Authority shall:
  - ~~R3.1.R2.1.~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
  - ~~R3.2.R2.2.~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
  - ~~R3.3.R2.3.~~ Develop, maintain, and implement a set of plans for load shedding.
  - ~~R3.4.R2.4.~~ Develop, maintain, and implement a set of plans for system restoration.
- R4.R3. Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
  - R4.1.R3.1. Communications protocols to be used during emergencies.
  - R4.2.R3.2. A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.

## Standard EOP-001-0-1 — Emergency Operations Planning

~~R4.3.R3.3.~~ The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.

~~R4.4.R3.4.~~ Staffing levels for the emergency.

~~R5.R4.~~ Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.

~~R6.R5.~~ The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.

~~R7.R6.~~ The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:

~~R7.1.R6.1.~~ The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.

~~R7.2.R6.2.~~ The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.

~~R7.3.R6.3.~~ The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)

~~R7.4.R6.4.~~ The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

### C. Measures

- M1. The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2. The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

##### 1.3. Data Retention

Current plan available at all times.

Violation Severity Levels (VSLs) for this standard were not approved by their ballot pool but were approved by the BOT on February 28, 2008 and the VSLs replace the Levels of Non-compliance.

When the BOT approves new VSLs for this standard, the new VSLs will replace those shown below. The new VSLs for R2 will be retired when EOP-001-1 becomes effective.

**1.4. Additional Compliance Information**

Not specified.

**~~2. Levels of Non-Compliance~~**

~~**2.1. Level 1:** One of the applicable elements of Attachment 1 EOP-001-0 has not been addressed in the emergency plans.~~

~~**2.2. Level 2:** Two of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans.~~

~~**2.3. Level 3:** Three of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans.~~

~~**1.5. Level 4:** Four or more of the applicable elements of Attachment 1 EOP-001-0 have not been addressed in the emergency plans or a plan does not exist.~~

**Standard EOP-001-0.1 — Emergency Operations Planning**

**2. Violation Severity Levels:**

Requirement	Lower	Moderate	High	Severe
R1	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for less than 25% of the adjacent BAs. Or less than 25% of those agreements do not contain provisions for emergency assistance.	The Balancing Authority failed to demonstrate the existence of the necessary operating agreements for 25% to 50% of the adjacent BAs. **Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system’s own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** Reliability Coordination — Facilities
2. **Number:** IRO 002-~~12~~
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.

**5. Proposed Effective Date:** ~~January 1, 2007~~ First day of first quarter, three months after regulatory approvals.

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after Board of Trustee adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

**R1.** Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.

~~**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities, or adjacent Reliability Coordinators.~~

**R3.R2.** Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.

**R4.R3.** Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.

**R5.R4.** Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.

**R5.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric

System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.

**R7.R6.** Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.

**R8.R7.** Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.

**R9.R8.** Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

### C. Measures

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 3.

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 43.

~~**R10.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a letter to Transmission Operators, Balancing Authorities, Transmission Owners, Generator Owners, Generator Operators, and Load Serving Entities, or adjacent Reliability Coordinators, or other equivalent evidence that will be used to confirm that the Reliability Coordinator has requested the data required to support its reliability coordination tasks. (Requirement 2)~~

**M4.M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.

**M5.M4.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 76.

**M6.M5.** Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 87)

M7.M6. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 9-8 Part 1.

M8.M7. Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 9-8 Part 2.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1 through 87.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

#### 1.4. Additional Compliance Information

None.

~~2. Levels of Non-Compliance for a Reliability Coordinator~~

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in R3.~~

~~2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~2.3.1 Has not requested the data required to support its reliability coordination tasks. (Requirement 2)~~

~~2.4. Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (R7) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in R9.~~

~~2.5. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.5.1 Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and R4)~~

~~2.5.2 Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in R5.~~

~~1.4.1 Does not have a documented procedure for the use of its backup monitoring facilities. (R8)~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator has demonstrated communication facilities for both voice and data exist to all appropriate entities and that they are staffed and available but they are less than adequate.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with one appropriate entity or 2) Data links with one appropriate entity.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with two appropriate entities or 2) Data links with two appropriate entities.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with more than two appropriate entities or 2) Data links with more than two appropriate entities or 3) Communication facilities are not staffed or 4) Communication facilities are not ready.

Standard IRO-002-12 — Reliability Coordination — Facilities

Requirement	Lower	Moderate	High	Severe
R2	<p>The Reliability Coordinator demonstrated that it</p> <p>1) determined its data requirements and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators with a material impact on the Bulk Electric System in its Reliability Coordination Area but did not request the data from Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators with minimal impact on the Bulk Electric System in its Reliability Coordination Area or</p> <p>2) determined its data requirements necessary to perform its reliability functions with the exceptions of data that may be needed for administrative purposes such as data</p>	<p>The Reliability Coordinator demonstrated that it determined the majority but not all of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator demonstrated that it determined</p> <p>1) some but less than the majority of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators or</p> <p>2) all of its data requirements necessary to support its reliability coordination functions but failed to demonstrate that it requested data from two of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator failed to demonstrate that it</p> <p>1) determined its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators or</p> <p>2) requested the data from three or more of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities or Adjacent Reliability Coordinators.</p>

## A. Introduction

1. **Title:** Reliability Coordination — Operations Planning
2. **Number:** IRO-004-~~1~~2
3. **Purpose:** Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.

4. **Applicability**

~~4.1. Reliability Coordinators.~~

~~4.2.4.1. Balancing Authorities.~~

~~4.3.4.2. Transmission Operators.~~

~~4.4.4.3. Transmission Service Providers.~~

~~4.5. Transmission Owners.~~

~~4.6. Generator Owners.~~

~~4.7. Generator Operators.~~

~~4.8. Load-Serving Entities.~~

~~5. Effective Date: November 1, 2006~~

~~5. In those jurisdictions where no regulatory approval is required, the standard shall be retired on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.~~

~~In those jurisdictions where regulatory approval is required, the standard shall be retired effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.~~

## B. Requirements

~~R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.~~

~~R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.~~

~~R3. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.~~

~~R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide~~

~~information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.~~

~~R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.~~

~~R6. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.~~

~~R7.~~**R1.** Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.

## C. Measures

~~M1. Evidence that the Reliability Coordinator conducted next day contingency analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System could be operated reliably in anticipated normal and Contingency conditions. None~~

## D. Compliance

### 1. Compliance Monitoring Process

Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on site audit, Reliability Coordinators will be asked to provide documentation showing that next-day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits, etc.

#### 1.1. Compliance Monitoring Responsibility

~~Self-Certification: Each Reliability Coordinator must annually self-certify compliance to its Regional Reliability Organization with the completion of the studies and action plans in Requirements R1, R2 and R3.~~

~~Exception Reporting: Reliability Coordinators will prepare a monthly report to the Regional Reliability Organization for each month that system studies were not conducted, indicating the dates that studies were not done and the reason why.~~

#### 1.2. Compliance Monitoring Period and Reset Time Frame

~~One year without a violation from the time of the violation.~~

#### 1.3. Data Retention

~~Documentation shall be available for 3 months to provide verification that system studies were performed as required.~~

#### 1.4. Additional Compliance Information

~~None identified.~~

~~2. Levels of Non-Compliance~~

~~2.1. Level 1: System studies were not conducted for one day in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.2. Level 2: System studies were not conducted for 2-3 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.3. Level 3: System studies were not conducted for 4-5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

1.5. **Level 4:** System studies were not conducted for more than 5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.

**Standard IRO-004-1.2 — Reliability Coordination — Operations Planning**

**2. Violation Severity Levels**

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator failed to conduct next-day reliability analyses or contingency analysis for its Reliability Coordinator Area for one (1) day during a calendar month.	The Reliability Coordinator failed to conduct next-day reliability analyses or contingency analysis for its Reliability Coordinator Area for two (2) to three (3) days during a calendar month.	The Reliability Coordinator failed to conduct next-day reliability analyses or contingency analysis for its Reliability Coordinator Area for four (4) to five (5) days during a calendar month.	The Reliability Coordinator failed to conduct next-day reliability analyses or contingency analysis for its Reliability Coordinator Area for more than five (5) days during a calendar month.
R2	N/A	N/A	N/A	The Reliability Coordinator failed to monitor parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.
R3	The Reliability Coordinator, in conjunction with its Transmission Operators and Balancing Authorities, failed to develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs for one (1) day during a calendar month.	The Reliability Coordinator, in conjunction with its Transmission Operators and Balancing Authorities, failed to develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs for two (2) to three (3) days during a calendar month.	The Reliability Coordinator, in conjunction with its Transmission Operators and Balancing Authorities, failed to develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs for four (4) to five (5) days during a calendar month.	The Reliability Coordinator, in conjunction with its Transmission Operators and Balancing Authorities, failed to develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs for more than five (5) days during a calendar month.

Standard IRO-004-12 — Reliability Coordination — Operations Planning

Requirement	Lower	Moderate	High	Severe
R4	The responsible entity in the Reliability Coordinator Area provided the information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions, but said information was provided after the required time as stated in IRO-004-1 R4 for one (1) day during a calendar month.	The responsible entity in the Reliability Coordinator Area provided the information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions, but said information was provided after the required time as stated in IRO-004-1 R4 for two (2) to three (3) days during a calendar month.	The responsible entity in the Reliability Coordinator Area provided the information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions, but said information was provided after the required time as stated in IRO-004-1 R4 for four (4) to five (5) days during a calendar month.	The responsible entity in the Reliability Coordinator Area provided the information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions, but said information was provided after the required time as stated in IRO-004-1 R4 for more than five (5) days during a calendar month.
R5	The Reliability Coordinator failed to share the results of its system studies, when conditions warranted or was requested, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area for one (1) day during a calendar month.	The Reliability Coordinator failed to share the results of its system studies, when conditions warranted or was requested, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area for two (2) to three (3) days during a calendar month.	The Reliability Coordinator failed to share the results of its system studies, when conditions warranted or was requested, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area for four (4) to five (5) days during a calendar month.	The Reliability Coordinator failed to share the results of its system studies, when conditions warranted or was requested, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area for more than five (5) days during a calendar month.
R6	The Reliability Coordinator failed to direct action to address a potential SOL or IROL violation on one (1) occasion during a calendar month.	The Reliability Coordinator failed to direct action to address a potential SOL or IROL violation on two (2) to three (3) occasions during a calendar month.	The Reliability Coordinator failed to direct action to address a potential SOL or IROL violation on four (4) to five (5) occasions during a calendar month.	The Reliability Coordinator failed to direct action to address a potential SOL or IROL violation on more than five (5) occasions during a calendar month.

**Standard IRO-004-12 — Reliability Coordination — Operations Planning**

Requirement	Lower	Moderate	High	Severe
R7	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on one (1) occasion during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on two (2) to three (3) occasions during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on four (4) to five (5) occasions during a calendar month.	The responsible entity failed to comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events on more than five (5) occasions during a calendar month.

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
<u>1</u>		<u>Replaced Levels of Non-compliance with the February 28, 2008 BOT approved Violation Severity Levels</u> <u>Retired R1 through R6, and associated Measures, Data Retention, and VSLs</u>	<u>Revision</u>

## A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-~~2~~3
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Effective Date:** ~~January 1, 2007~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:
  - R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.
  - R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
  - R1.4. System real and reactive reserves (actual versus required).
  - R1.5. Capacity and energy adequacy conditions.
  - R1.6. Current ACE for all its Balancing Authorities.

**R1.7.** Current local or Transmission Loading Relief procedures in effect.

**R1.8.** Planned generation dispatches.

**R1.9.** Planned transmission or generation outages.

**R1.10.** Contingency events.

~~**R2.** Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Intereconnection.~~

~~**R3.** As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.~~

**R4.R2.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.

~~**R5.** Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.~~

**R6.R3.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.

**R7.R4.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.

**R8.R5.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

**R9.R6.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.

**R10.R7.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.

**R11.R8.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.

**R12.R9.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.

~~**R13.R10.** Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection.~~ In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.

~~**R14.R11.** Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide area view.~~ The Transmission Service Provider s shall respect ~~these~~ SOLs ~~or~~ and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

**R15.R12.** Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

~~**R16.** Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.~~

~~**R17.** When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.~~

## **C. Measures**

**M1.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS

availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.

~~M2. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Historical Tag Archive information, Interchange Transaction records, computer printouts, voice recordings or transcripts of voice recordings or equivalent evidence that will be used to confirm that it was aware of and made Interchange Transaction information available to all other Reliability Coordinators, as specified in Requirement 2.~~

~~M3. If a potential or actual IROL violation occurs, the Reliability Coordinator involved in the event shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, system event logs, operator action notes or equivalent evidence that will be used to determine if it initiated control actions or emergency procedures to relieve that IROL violation within 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~

M4.M2. If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2 and Requirement 10)

M5.M3. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 6)

M6.M4. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement 7.

M7.M5. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 8 Part 1.

M8.M6. The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 8 Part 2)

M9.M7. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS,

or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 9 Part 1)

**M10.M8.** If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 11 Part 1)

**M11.M9.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 12)

**M12.M10.** If there is an instance where there is a disagreement on a derived limit, the ~~Reliability Coordinator~~, Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Part 2 of Requirement 13)

~~M13. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it provided SOL and IROL information to Transmission Service Providers within its Reliability Coordinator Area. (Requirement 14, Part 1)~~

**M14.M11.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14 Part 2)

**M15.M12.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement 15 Part 1.

**M16.M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 15 Part 2.

M17.M14. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement 15 Part 3)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

For Measures 1 and ~~4~~9, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures ~~2-10~~8 and ~~Measure 13, and~~ Measures ~~15-12~~13 through ~~16~~13, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure ~~8~~6, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure ~~12~~10, the ~~Reliability Coordinator,~~ Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure ~~14~~11, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

~~**2. Levels of Non-Compliance for a Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider**~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Not applicable.~~

~~2.3. Level 3: Not applicable.~~

~~2.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.4.1 Did not follow the Reliability Coordinator's directives in accordance with R8 Part 2).~~

~~2.4.2 Did not operate to the most limiting parameter when a difference in derived limits existed. (R13 Part 2)~~

~~**3. Levels of Non-Compliance for a Reliability Coordinator:**~~

~~3.1. Level 1: Not applicable.~~

~~3.2. Level 2: Did not make Interchange Transaction information available to all other Reliability Coordinators in the Interconnection. (Requirement 2)~~

~~3.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~3.3.1 Did not communicate to each of its Balancing Authorities and Transmission Operators to make them aware of GMD forecast information or did not assist in the development of any required response plans to a predicted GMD. (Requirement 6)~~

~~3.3.2 Did not disseminate information within its Reliability Coordinator Area. (Requirement 7)~~

~~3.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~3.4.1 Does not meet one or more of the requirements as specified in requirement 1 (Requirements 1.1 through R1.9)~~

~~3.4.2 Did not make Interchange Transaction information available to all other Reliability Coordinators. (Requirement 2)~~

~~3.4.3~~ Did not initiate control actions or emergency procedures to relieve an IROL violation without delay, and no longer than 30 minutes. (Requirement 3 Part 2 and Requirement 5)

~~3.4.4~~ Did not direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 4 Part 2)

~~3.4.5~~ Did not monitor the system frequency or each of its Balancing Authorities performance or did not direct rebalancing to return to DCS and CPS compliance. (Requirement 8 Part 1)

~~3.4.6~~ Did not coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. (Requirement 9)

~~3.4.7~~ When it identified a source of large Area Control Errors, it did not initiate corrective actions with the appropriate Balancing Authority if the problem was inside its Reliability Coordinator Area. (Requirement 11 part 1)

~~3.4.8~~ Did not provide evidence that it was aware of the impact of the operation of a Special Protection System on inter-area flows. (Requirement 12)

~~3.4.9~~ Did not operate to the most limiting parameter when a difference in derived limits existed. (Requirement 13 Part 2)

~~3.4.10~~ Did not provide Transmission Service Providers with SOLs or IROLs (within the Reliability Coordinator's wide-area view) (Requirement 14 Part 1)

~~3.4.11~~ Did not issue alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area. (Requirement 15)

#### ~~4. Levels of Non-Compliance for a Transmission Service Provider~~

~~4.1. Level 1: Not applicable.~~

~~4.2. Level 2: Not applicable.~~

~~4.3. Level 3: Not applicable.~~

~~4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~4.4.1~~ Did not operate to the most limiting parameter when a difference in derived limits existed. (R13 Part 2)

~~1.4.1~~ Did not respect the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14 Part 2)

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.
R1.1	The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.	N/A	N/A	N/A
R1.2	The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.	N/A	N/A	N/A

**Standard IRO-005-2.3 — Reliability Coordination — Current Day Operations**

Requirement	Lower	Moderate	High	Severe
R1.3	The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.	N/A	N/A	N/A
R1.4	The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).	N/A	N/A	N/A
R1.5	The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.	N/A	N/A	N/A
R1.6	The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.	N/A	N/A	N/A
R1.7	The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.	N/A	N/A	N/A
R1.8	The Reliability Coordinator failed to monitor planned generation dispatches.	N/A	N/A	N/A
R1.9	The Reliability Coordinator failed to monitor planned transmission or generation outages.	N/A	N/A	N/A

Standard IRO-005-2.3 — Reliability Coordination — Current Day Operations

Requirement	Lower	Moderate	High	Severe
R1.10	The Reliability Coordinator failed to monitor contingency events.	N/A	N/A	N/A
<del>R2</del>	<del>N/A</del>	<del>N/A</del>	<del>The Reliability Coordinator was aware of all Interchange Transactions that wheeled through, sourced, or sunked in its Reliability Coordinator Area, but failed to make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</del>	<del>The Reliability Coordinator failed to be aware of all Interchange Transactions that wheeled through, sourced, or sunked in its Reliability Coordinator Area, and failed to make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</del>

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
<u>1</u>		<u>Retired R2, R3, R5; modified R9, R13 and R14; retired R16 and R17</u> <u>Retired M2 and M3; modified M9 and M12; retired M13</u> <u>Made conforming changes to data retention</u> <u>Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)</u> <u>Retired VSLs associated with R2, R3, R5, R16 and R17;</u> <u>Modified VSLs associated with R9 and R13, and R14</u>	<u>Revised</u>

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-01
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** April 1, 2005

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.
- R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

### C. Measures

- M1. Evidence that the Generator Operator, Transmission Operator, and Balancing Authority, ~~and Reliability Coordinator~~ reported and coordinated scheduled outage information as indicated in the requirements above.

### D. Compliance

#### 1. Compliance Monitoring Process

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

#### 1.1. Compliance Monitoring Responsibility

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

#### 1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year without a violation from the time of the violation.

#### 1.3. Data Retention

One calendar year.

**1.4. Additional Compliance Information**

Not specified.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

**2. Levels of Non-Compliance**

~~2.1. Level 1: Each entity responsible for reporting information under Requirements R1 and R3 has a process in place to provide information to their Reliability Coordinator but does not have a process in place (where permitted by legal agreements) to provide this information to the neighboring Balancing Authority or Transmission Operator.~~

~~2.2. Level 2: N/A.~~

~~2.3. Level 3: N/A.~~

~~1.5. Level 4: — There is no process in place to exchange outage information, or the entity responsible for reporting information under Requirements R1 to R3 does not follow the directives of the Reliability Coordinator to cancel or reschedule an outage.~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The Generator Operator failed to provide outage information, in accordance with its Transmission Operators established outage reporting requirements, to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW).

**Standard-TOP-003-0.1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.1	N/A	N/A	N/A	The Transmission Operator failed to provide outage information, in accordance with its Reliability Coordinators established outage reporting requirement, to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation.
R1.2	The responsible entity failed to provide the information by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.	N/A	N/A	N/A

**Standard-TOP-003-0.1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R1.3	N/A	N/A	N/A	The responsible entity failed to plan or coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators when required.
R2	The responsible entity planned and coordinated scheduled outages of telemetering and control equipment and associated communication channels with its Reliability Coordinator, but failed to coordinate with affected neighboring Transmission Operators, Balancing Authorities, and Generator Operators.	N/A	N/A	The responsible entity failed to plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
R3	N/A	N/A	N/A	The Reliability Coordinator failed to resolve any scheduling of potential reliability conflicts.

**Standard-TOP-003-0.1 — Planned Outage Coordination**

Requirement	Lower	Moderate	High	Severe
R4	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 30 minutes but less than or equal to 35 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 35 minutes but less than or equal to 40 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 40 minutes but less than or equal to 45 minutes.	The Transmission Operator entering an unknown operating state (i.e., any state for which valid operating limits have not been determined), failed to restore operations to respect proven reliable power system limits for more than 45 minutes.

E. Regional ~~Differences~~Variances

<u>1</u>		<u>Modified R1.2</u> <u>Modified M1</u> <u>Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs)</u>	<u>Revised</u>

## A. Introduction

1. **Title:** Operational Reliability Information
2. **Number:** TOP-005-1.2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - ~~4.3. Reliability Coordinators.~~
  - ~~4.4.3.~~ Purchasing Selling Entities.
5. **Proposed Effective Date:** November 1, 2006

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

~~R1. Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.~~

~~R1.1. Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.~~

R2.R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”

R3.R2. Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.

**R4.R3.** Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

### C. Measures

**M1.** Evidence that the ~~Reliability Coordinator~~, Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

##### 1.3. Data Retention

Not specified.

##### 1.4. Additional Compliance Information

Not specified.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

#### ~~2. Levels of Non-Compliance~~

~~2.1. Level 1: — Each entity responsible for reporting information under Requirements R1 to R5 is providing the requesting entities with the data required, in specified time intervals and format, but there are problems with consistency of delivery identified in the measuring process that need remedy (e.g., the data is not supplied consistently due to equipment malfunctions, or scaling is incorrect).~~

~~2.2. Level 2: N/A.~~

~~2.3. Level 3: N/A.~~

~~1.5. Level 4: — Each entity responsible for reporting information under Requirements R1 to R5 R3 is not providing the requesting entities with data with the specified content, timeliness, or format. The information missing is included in the requesting entity's list of data.~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
<del>R1</del>	<del>The responsible entity failed to provide all of the data requested by its Reliability Coordinator.</del>	<del>N/A</del>	<del>N/A</del>	<del>The responsible entity failed to provide all of the data requested by its Reliability Coordinator.</del>
<del>R1.1</del>	<del>N/A</del>	<del>N/A</del>	<del>N/A</del>	<del>The Reliability Coordinator failed to identify the data necessary to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.</del>
<del>R2R1</del>	<del>N/A</del>	<del>N/A</del>	<del>N/A</del>	<del>The ISN data recipient failed to sign the NERC Confidentiality Agreement for “Electric System Reliability Data”.</del>
<del>R3R2</del>	<del>The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.</del>	<del>N/A</del>	<del>N/A</del>	<del>The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.</del>
<del>R4R3</del>	<del>The responsible entity failed to provide any of the data requested by other Balancing Authorities or Transmission Operators.</del>	<del>N/A</del>	<del>N/A</del>	<del>The responsible entity failed to provide all of the data requested by its host Balancing Authority or Transmission Operator.</del>

**E. Regional DifferencesVariances**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
<u>1</u>		<u>Removed the Reliability Coordinator from the list of responsible functional entities</u> <u>Deleted R1 and R1.1</u> <u>Modified M1 to omit the reference to the Reliability Coordinator</u> <u>Deleted VSLs for R1 and R1.1</u>	<u>Revised</u>

**Attachment 1-TOP-005-0**

**Electric System Reliability Data**

This Attachment lists the types of data that ~~Reliability Coordinators~~, Balancing Authorities, and Transmission Operators are expected to ~~provide, and are expected to~~ share with ~~each~~ other Balancing Authorities and Transmission Operators.

1. The following information shall be updated at least every ten minutes:
  - 1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:
    - 1.1.1 Status.
    - 1.1.2 MW or ampere loadings.
    - 1.1.3 MVA capability.
    - 1.1.4 Transformer tap and phase angle settings.
    - 1.1.5 Key voltages.
  - 1.2. Generator data.
    - 1.2.1 Status.
    - 1.2.2 MW and MVAR capability.
    - 1.2.3 MW and MVAR net output.
    - 1.2.4 Status of automatic voltage control facilities.
  - 1.3. Operating reserve.
    - 1.3.1 MW reserve available within ten minutes.
  - 1.4. Balancing Authority demand.
    - 1.4.1 Instantaneous.
  - 1.5. Interchange.
    - 1.5.1 Instantaneous actual interchange with each Balancing Authority.
    - 1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.
    - 1.5.3 Interchange Schedules for the next 24 hours.
  - 1.6. Area Control Error and frequency.
    - 1.6.1 Instantaneous area control error.
    - 1.6.2 Clock hour area control error.
    - 1.6.3 System frequency at one or more locations in the Balancing Authority.
2. Other operating information updated as soon as available.

- 2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.
- 2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.
- 2.3. Forecast peak demand for current day and next day.
- 2.4. Forecast changes in equipment status.
- 2.5. New facilities in place.
- 2.6. New or degraded special protection systems.
- 2.7. Emergency operating procedures in effect.
- 2.8. Severe weather, fire, or earthquake.
- 2.9. Multi-site sabotage.

## A. Introduction

1. **Title:** Monitoring System Conditions

2. **Number:** TOP-006-1~~2~~

~~3.~~ **Purpose:**

3. To ensure critical reliability parameters are monitored in real-time.

4. **Applicability**

4.1. Transmission Operators.

4.2. Balancing Authorities.

4.3. Generator Operators.

4.4. Reliability Coordinators.

5. **Proposed Effective Date:** ~~January 1, 2007~~

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

**R1.** Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.

**R1.1.** Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.

**R1.2.** Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.

**R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**R3.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.

**R4.** Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.

**R5.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important

deviations in operating conditions and to indicate, if appropriate, the need for corrective action.

- R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
- R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

### C. Measures

- M1. The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

### D. Compliance

#### 1. Compliance Monitoring Process

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organizations shall be responsible for compliance monitoring.

**1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

**1.3. Data Retention**

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

**1.4. Additional Compliance Information**

None.

Violation Severity Levels for this standard were approved by the BOT on February 28, 2008 and they replace the Levels of Non-compliance.

~~2. Levels of Non-Compliance for Reliability Coordinators:~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Not applicable.~~

~~2.3. Level 3: Not applicable.~~

~~2.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.4.1 Does not monitor all of the applicable items listed in Requirement 2.~~

~~2.4.2 Did not have the information specified in R4.~~

~~2.4.3 Did not bring to the attention of its operators, important deviations in operating conditions and the need for corrective actions. (Requirement 5)~~

~~2.4.4 No evidence it monitors system frequency. (Requirement 7)~~

**3. Levels of Non-Compliance for Generator Operators:**

~~3.1. Level 1: Not applicable.~~

~~3.2. Level 2: Not applicable.~~

~~3.3. Level 3: Not applicable.~~

~~3.4. Level 4: Did not inform its Host Balancing Authority and/or the Transmission Operator of all generation resources available for use. (R1.1)~~

**4. Levels of Non-Compliance for Transmission Operators and Balancing Authorities:**

~~4.1. Level 1: Not applicable.~~

~~4.2. Level 2: Not applicable.~~

~~4.3. Level 3: Not applicable.~~

~~4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~4.4.1 Did not inform the Reliability Coordinator and/or other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use in accordance with R1.2.~~

~~4.4.2 Does not monitor all the applicable items listed in R2.~~

~~4.4.3 Did not have the information specified in R4.~~

~~4.4.4 Does not have monitoring to bring to the attention of operating personnel important deviations in operating conditions and the need for corrective actions as specified in R5.~~

~~4.4.5 No evidence it monitors system frequency. (R7).~~

2. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	N/A	N/A	N/A	The responsible entity failed to know the status of all generation and transmission resources available for use, even though said information was reported by the Generator Operator, Transmission Operator, or Balancing Authority.
R1.1	N/A	N/A	N/A	The Generator Operator failed to inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
R1.2	N/A	N/A	N/A	The responsible entity failed to inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
R2	N/A	The responsible entity monitors the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, but is not aware of the status of rotating and static reactive resources.	The responsible entity fails to monitor all of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of all rotating and static reactive resources.	The responsible entity fails to monitor any of the applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.

**Standard TOP-006-1.2— Monitoring System Conditions**

<b>Requirement</b>	<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
R3	The responsible entity failed to provide any of the appropriate technical information concerning protective relays to their operating personnel.	N/A	N/A	The responsible entity failed to provide all of the appropriate technical information concerning protective relays to their operating personnel.
R4	N/A	N/A	The responsible entity has either weather forecasts or past load patterns, available to predict the system's near-term load pattern, but not both.	The responsible entity failed to have both weather forecasts and past load patterns, available to predict the system's near-term load pattern.
R5	N/A	N/A	The responsible entity used monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions, but does not have indication of the need for corrective action.	The responsible entity failed to use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions.
R6	N/A	N/A	N/A	The responsible entity failed to use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.
R7	N/A	N/A	N/A	The responsible entity failed to monitor system frequency.

**E. Regional DifferencesVariances**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts revised standards and implementation plan for comment (March 26–April 25, 2008).

### **Description of Current Draft:**

This is the final draft of the proposed standard, posted for pre-ballot review.

### **Future Development Plan:**

#### **Anticipated Actions**

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### **Anticipated Date**

June 16–July 15, 2008  
July 16–July 25, 2008  
August 6–15, 2008  
To be determined  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## **A. Introduction**

- 1. Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
- 2. Number:** IRO-008-1
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
- 4. Applicability**
  - 4.1.** Reliability Coordinator.
- 5. Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## **B. Requirements**

- R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2.** Each Reliability Coordinator shall perform a Real-Time Assessment at least once every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3.** When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## **C. Measures**

- M1.** The Reliability Coordinator shall have, and make available upon request, the results of its Operational Planning Analyses.
- M2.** The Reliability Coordinator shall have, and make available upon request, evidence to show it conducted a Real-Time Assessment at least once every 30 minutes. This evidence could include, but is not limited to, dated computer log showing times the assessment was conducted, dated checklists, or other evidence.

- M3.** The Reliability Coordinator shall have and make available upon request, evidence to confirm that it shared the results of its Operational Planning Analyses or Real-Time Assessments with those entities expected to take actions based on that information. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated transcripts of voice records, dated facsimiles, or other evidence.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

#### **1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

The Reliability Coordinator shall retain evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days. The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months.

#### **1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except one of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except two of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except three of 30 days. (R1)	Missed performing an Operational Planning Analysis that covers all aspects of the requirement for four or more of 30 days. (R1)
<b>R2</b>	For any sample 24 hour period within the 30 day retention period, a Real-time Assessment was not conducted for one 30-minute period. within that 24-hour period (R2)	For any sample 24 hour period within the 30 day retention period, Real-time Assessments were not conducted for two 30-minute periods within that 24-hour period (R2)	For any sample 24 hour period within the 30 day retention period, Real-time Assessments were not conducted for three 30-minute periods within that 24-hour period (R2)	For any sample 24 hour period within the 30 day retention period, Real-time Assessments were not conducted for more than three 30-minute periods within that 24-hour period (R2)
<b>R3</b>		Shared the results with some but not all of the entities that were required to take action (R3)		Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability:**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2. For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3. When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R4. When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

- R5.** If unanimity cannot be reached on the value for an IROL or its  $T_v$ , each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

### **C. Measures**

- M1.** Each Reliability Coordinator shall have, and make available upon request, evidence to confirm that it has Operating Processes, Procedures, or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement R1 and Requirement R2. This evidence shall include a list of any IROLs (and each associated  $T_v$ ) identified in advance, along with one or more dated Operating Processes, Procedures, or Plans that that will be used.
- M2.** Each Reliability Coordinator shall have, and make available upon request, evidence to confirm that it acted or directed others to act in accordance with Requirement R3 and Requirement R4. This evidence could include, but is not limited to, Operating Processes, Procedures, or Plans from Requirement R1, dated operating logs, dated voice recordings, dated transcripts of voice recordings, or other evidence.
- M3.** For a situation where Reliability Coordinators disagree on the value of an IROL or its  $T_v$  the Reliability Coordinator shall have, and make available upon request, evidence to confirm that it used the most conservative of the values under consideration, without delay. Such evidence could include, but is not limited to, dated computer printouts, dated operator logs, dated voice recordings, dated transcripts of voice recordings, or other equivalent evidence. (R5)

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

##### **1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

Exception Reporting

**1.4. Data Retention**

The Reliability Coordinator, shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain evidence of Requirement R1, Requirement R2, and Measure M1, for a rolling 12 months.

The Reliability Coordinator shall retain evidence of Requirement R3, Requirement R4, Requirement R5, Measure M2, and Measure M3 for a rolling 12 months.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records, and all IROL Violation Reports submitted since the last audit.

**1.5. Additional Compliance Information**

**Exception Reporting:** For each instance of exceeding an IROL for time greater than IROL  $T_v$ , the Reliability Coordinator shall submit an IROL Violation Report to its Compliance Enforcement Authority within 30 days of the initiation of the event.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>				An IROL in its Reliability Coordinator Area was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to prevent exceeding that IROL. (R1)
<b>R2</b>				An IROL in its Reliability Coordinator Area was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to mitigate exceeding that IROL within the IROL's T <sub>v</sub> . (R2)
<b>R3</b>				An assessment of actual or expected system conditions predicted that an IROL in the Reliability Coordinator's Area would be exceeded, but no Operating Processes, Procedures, or Plans were implemented. (R3)
<b>R4</b>			Actual system conditions	Actual system conditions

**Standard IRO-009-1 — Reliability Coordinator Actions to Operate Within IROLs**

Requirement	Lower	Moderate	High	Severe
			<p>showed that there was an instance of exceeding an IROL in its Reliability Coordinator Area, and there was a delay of five minutes or more before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL, however the IROL was mitigated within the IROL <math>T_v</math>. (R4)</p>	<p>showed that there was an instance of exceeding an IROL in its Reliability Coordinator Area, and that IROL was not resolved within the IROL's <math>T_v</math>. (R4)</p>
<b>R5</b>	Not applicable.	Not applicable.	Not applicable.	<p>There was a disagreement on the value of the IROL or its <math>T_v</math> and the most conservative limit under consideration was not used. (R5)</p>

**E. Regional Variances**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts revised standards and implementation plan for comment (March 26–April 25, 2008).

### Description of Current Draft:

This is the final draft of the proposed standard, posted for pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### Anticipated Date

June 16–July 15, 2008  
July 16–July 25, 2008  
August 6–15, 2008  
To be determined  
To be determined

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:**           **Reliability Coordinator Data Specification and Collection**
2. **Number:**       IRO-010-1
3. **Purpose:**        To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.
  - R1.2. Mutually agreeable format.
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

- R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.
- R2.** The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
- R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### **C. Measures**

- M1.** The Reliability Coordinator shall have, and make available upon request, a documented data specification that contains all elements identified in Requirement R1.
- M2.** The Reliability Coordinator shall have, and make available upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. This evidence could include, but is not limited to, dated paper or electronic notice used to distribute its data specification showing recipient, and data or information requested or other equivalent evidence. (R2)
- M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and make available upon request, evidence to confirm that it provided data and information, as specified in Requirement R3. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated computer printouts, dated SCADA data, or other equivalent evidence.

### **D. Compliance**

#### **1. Compliance Monitoring Process**

##### **1.1. Compliance Enforcement Authority**

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

##### **1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner, shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force data specification for Requirement R1, Measure M1.

The Reliability Coordinator shall keep evidence of its most recent distribution of its data specification and evidence to show the data supplied in response to that specification for Requirement R2, Measure M2 and Requirement R3 Measure M3.

For data that is requested in accordance with Requirement R2, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Requirement R3 Measure M3 for the Reliability Coordinator's most recent data specification for a rolling 90 calendar days.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.5. Additional Compliance Information**

**1.5.1** None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	Data specification is complete with the following exception: Missing the mutually agreeable format. (R1.2)	Data specification is complete with the following exception – no process for data provision when automated Real-Time system operating data is unavailable. (R1.4)	Data specification incomplete (missing either the list of required data (R1.1), or the timeframe for providing data. (R1.3)	No data specification (R1)
<b>R2</b>	Distributed its data specification to greater than or equal to 95% but less than 100% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status.	Distributed its data specification to greater than or equal to 85% but less than 95% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)	Distributed its data specification to greater than or equal to 75% - but less than 85% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)	Data specification distributed to less than 75% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
<b>R3</b>	Provided greater than or equal to 95% but less than 100% of the data and information as specified. (R3)	Provided greater than or equal to 85% but less than 95% of the data and information as specified. (R3)	Provided greater than or equal to 75% but less than 85% of the data and information as specified. (R3)	Provided less than 75% of the data and information as specified. (R3)

## **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts revised standards and implementation plan for comment (March 26 – April 25, 2008).

### **Description of Current Draft:**

This is the final draft of the proposed standard, posted for pre-ballot review.

### **Future Development Plan:**

#### **Anticipated Actions**

#### **Anticipated Date**

- |   |                       |
|---|-----------------------|
| 1. Post for 30-day pre-ballot period.         | June 16–July 15, 2008 |
| 2. Conduct initial ballot of standards.       | July 16–July 25, 2008 |
| 3. Conduct recirculation ballot of standards. | August 6–15, 2008     |
| 4. Submit to BOT for adoption.                | To be determined      |
| 5. File for regulatory approvals.             | To be determined      |

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much ~~and up as to~~ 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning*)
- R2. Each Reliability Coordinator shall perform a Real-Time Assessment at least **once** every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R3. When a Reliability Coordinator determines that the results of an -Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Time Horizon: Real-time Operations or Same Day Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and **provide-make available** upon request, the results of its Operational Planning Analyses.
- M2. The Reliability Coordinator shall have, and **provide-make available** upon request, evidence to show it conducted a Real-Time Assessment at least once every 30 minutes. This evidence could include, but is not limited to, dated computer log showing times the assessment was conducted, dated checklists, or other evidence.

- M3. The Reliability Coordinator shall have and make available provide upon request, evidence to confirm that it shared the results of its Operational Planning Analyses or Real-Time Assessments with those entities expected to take actions based on that information. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated transcripts of voice records, dated facsimiles, or other evidence.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

#### **1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

#### **1.3. Compliance Monitoring and Enforcement Processes**

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

The Reliability Coordinator shall retain evidence for Requirement R1, Measure M1 and Requirement R2, Measure M2 for a rolling 30 days. The Reliability Coordinator shall keep evidence for Requirement R3, Measure M3 for a rolling three months.

#### **1.5. Additional Compliance Information**

None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except one of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except two of 30 days. (R1)	Performed an Operational Planning Analysis that covers all aspects of the requirement for all except three of 30 days. (R1)	Missed performing an Operational Planning Analysis that covers all aspects of the requirement for four or more of 30 days. (R1)
<b>R2</b>	<u>For any sample 24 hour period within the 30 day retention period.</u> Real-time Assessment was not conducted for one 30-minute period within <del>a</del> <u>that</u> 24-hour period (R2)	<u>For any sample 24 hour period within the 30 day retention period.</u> Real-time Assessments were not conducted for two 30-minute periods within <del>a</del> <u>that</u> 24-hour period (R2)	<u>For any sample 24 hour period within the 30 day retention period.</u> Real-time Assessments were not conducted for three 30-minute periods within <del>a</del> <u>that</u> 24-hour period (R2)	<u>For any sample 24 hour period within the 30 day retention period.</u> Real-time Assessments were not conducted for more than three 30-minute periods within <del>a</del> <u>that</u> 24-hour period (R2)
<b>R3</b>		Shared the results with some but not all of the entities that were required to take action (R3)		Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts revised standards and implementation plan for comment (March 26–April 25, 2008).

### Description of Current Draft:

This is the final draft of the proposed standard, posted for pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |   |                       |
|---|-----------------------|
| 1. Post for 30-day pre-ballot period.         | June 16–July 15, 2008 |
| 2. Conduct initial ballot of standards.       | July 16–July 25, 2008 |
| 3. Conduct recirculation ballot of standards. | August 6–15, 2008     |
| 4. Submit to BOT for adoption.                | To be determined      |
| 5. File for regulatory approvals.             | To be determined      |

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability:**
  - 4.1. Reliability Coordinator.
  - 4.2. ~~The IROLs covered in this standard are limited to those associated with contingencies studied under FAC-011 and FAC-014.~~
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. For ~~all each IROLs~~ IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies ~~identified~~ one or more days prior to the current day, ~~each the~~ Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R2. For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator ~~that is identified~~ identifies one or more days prior to the current day, ~~each the~~ Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>. (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning or Same Day Operations*)
- R3. When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

- R4.** When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)
- R5.** If unanimity cannot be reached on the value for an IROL or its  $T_v$ , each Reliability Coordinator that monitors that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration. (*Violation Risk Factor: High*) (*Time Horizon: Real-time Operations*)

### C. Measures

- M1.** Each Reliability Coordinator shall have, and ~~provide~~ make available upon request, evidence to confirm that it has Operating Processes, Procedures, or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement R1 and Requirement R2. This evidence shall include a list of any IROLs (and each associated  $T_v$ ) identified in advance, along with one or more dated Operating Processes, Procedures, or Plans that that will be used.
- M2.** Each Reliability Coordinator shall have, and make available~~provide~~ upon request, evidence to confirm that it acted or directed others to act in accordance with Requirement R3 and Requirement R4. This evidence could include, but is not limited to, Operating Processes, Procedures, or Plans from Requirement R1, dated operating logs, dated voice recordings, dated transcripts of voice recordings, or other evidence.
- M3.** For a situation where Reliability Coordinators disagree on the value of an IROL or its  $T_v$  the Reliability Coordinator shall have, and make available ~~provide~~ upon request, evidence to confirm that it used the most conservative of the values under consideration, without delay. Such evidence could include, but is not limited to, dated computer printouts, dated operator logs, dated voice recordings, dated transcripts of voice recordings, or other equivalent evidence. (R5)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

For Reliability Coordinators that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For Reliability Coordinators that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

##### 1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking  
Compliance Violation Investigations  
Self-Reporting  
Complaints  
Exception Reporting

#### **1.4. Data Retention**

The Reliability Coordinator, shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain evidence of Requirement R1, Requirement R2, and Measure M1, for a rolling 12 months.

The Reliability Coordinator shall retain evidence of Requirement R3, Requirement R4, Requirement R5, Measure M2, and Measure M3 for a rolling 12 months.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records, and all IROL Violation Reports submitted since the last audit.

#### **1.5. Additional Compliance Information**

**Exception Reporting:** For each instance of exceeding an IROL for time greater than IROL  $T_v$ , the Reliability Coordinator shall submit an IROL Violation Report to its Compliance Enforcement Authority within 30 days of the initiation of the event.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
R1				An IROL <u>in its Reliability Coordinator Area</u> was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to prevent exceeding that IROL. (R1)
R2				An IROL <u>in its Reliability Coordinator Area</u> was identified one or more days in advance <u>and the Reliability Coordinator</u> does not have an Operating Process, Procedure, or Plan that identifies actions to mitigate exceeding that IROL within the IROL’s T <sub>v</sub> . (R2)
R3			<del>An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but the Operating Processes, Procedures, or Plans that were implemented did not prevent exceeding the IROL. (R3)</del>	An assessment of actual or expected system conditions predicted that an IROL <u>in the Reliability Coordinator’s Area</u> would be exceeded, but no Operating Processes, Procedures, or Plans were implemented. (R3)
R4			Actual system conditions	<del>Actual system conditions</del>

Requirement	Lower	Moderate	High	Severe

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized (November 2004 through October 2006).
9. Drafting team posts drafts and implementation plan for comment (January 2–February 15, 2007)
10. Drafting team posts revised standards and implementation plan for comment (March 26–April 25, 2008).

### Description of Current Draft:

This is the final draft of the proposed standard, posted for pre-ballot review.

### Future Development Plan:

#### Anticipated Actions

1. Post for 30-day pre-ballot period.
2. Conduct initial ballot of standards.
3. Conduct recirculation ballot of standards.
4. Submit to BOT for adoption.
5. File for regulatory approvals.

#### Anticipated Date

June 16–July 15, 2008  
July 16–July 25, 2008  
August 6–15, 2008  
To be determined  
To be determined

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

None.

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:**

In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented ~~data~~-specification for data and information to build and maintain models to support Real-Time ~~time~~ Monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following: (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)
  - R1.1. List of required data and information: needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.
  - R1.2. Mutually agreeable format.
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

**R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.

**R2.** The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Low*) (*Time Horizon: Operations Planning*)

**R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. ~~The data and information is limited to data needed by the Reliability Coordinator to support Real Time Monitoring, Operational Planning Analyses, and Real Time Assessments.~~ (*Violation Risk Factor: Medium*) (*Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

### C. Measures

**M1.** The Reliability Coordinator shall have, and ~~provide~~ make available upon request, a documented data specification that contains all elements identified in Requirement R1.

**M2.** The Reliability Coordinator shall have, and make available~~provide~~ upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. This evidence could include, but is not limited to, dated paper or electronic notice used to distribute its data specification showing recipient, and data or information requested or other equivalent evidence. (R2)

**M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and make available~~provide~~ upon request, evidence to confirm that it provided data and information, as specified in Requirement R3. This evidence could include, but is not limited to, dated operator logs, dated voice recordings, dated computer printouts, dated SCADA data, or other equivalent evidence.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Enforcement Authority

For Reliability Coordinators and other functional entities that work for the Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

##### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

##### 1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

#### **1.4. Data Retention**

The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner, shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

The Reliability Coordinator shall retain its current, in force data specification for Requirement R1, Measure M1.

The Reliability Coordinator shall keep evidence of its most recent distribution of its data specification and evidence to show the data supplied in response to that specification -for Requirement R2, Measure M2 and Requirement R3 Measure M3.

For data that is requested ~~in advance of real time~~ in accordance with Requirement R2, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Requirement R3 Measure M3 for the Reliability Coordinator's most recent data specification for a rolling 90 calendar days.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.5. Additional Compliance Information**

**1.5.1** None.

2. Violation Severity Levels

Requirement	Lower	Moderate	High	Severe
<b>R1</b>	<p><del>Data specification is complete with the following exception—no process for data provision when automated Real-Time system operating data is unavailable. # Standards Announcement

## Ballot Pools and Pre-ballot Windows Open

### June 20–July 21, 2008

Now available at: <https://standards.nerc.net/BallotPool.aspx>

#### Ballot Pools and Pre-ballot Windows for IRO-008-1, IRO-009-1, and IRO-010-1

The following [Interconnection Reliability Operating Limit](#) (IROL) standards, implementation plan, and a report identifying how the drafting team addressed relevant directives from FERC Order 693 are posted for a 30-day, pre-ballot review starting **June 20, 2008**:

- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1 — Reliability Coordinator Actions to Operate within IROLs
- IRO-010-1 — Reliability Coordinator Data Specification and Collection

These standards require the Reliability Coordinator to take actions to keep the bulk electric system operating within IROLs.

There are three separate [ballot pools](#) for this set of IROL standards — and any member of the Registered Ballot Body may join as many or as few of the ballot pools as desired — a member wanting to ballot all three of the IROL standards must join all three of the ballot pools. The ballot for each of the IROL standards includes the retirement or revision of associated requirements from some already approved standards as identified in the table below. The IROL [implementation plan](#) contains the justification for the recommended retirements and revisions.

Three Ballots for IROL Standards		
Ballot Pool (List Server)	Ballot for New Standard	Includes Modifications to Associated Approved Standards
IROL Standard — IRO-008_in <a href="mailto:bp-IRO-008_in@nerc.com">bp-IRO-008_in@nerc.com</a>	IRO-008	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R1 and R2</li> </ul>
IROL Standard — IRO-009_in <a href="mailto:bp-IRO-009_in@nerc.com">bp-IRO-009_in@nerc.com</a>	IRO-009	EOP-001-0 — Emergency Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
		IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R3 and R6</li> </ul>
		IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>▪ Retire R3, R5, R16, R17;</li> <li>▪ Modify R9, R13 and R14</li> </ul>
IROL Standard — IRO-010_in <a href="mailto:bp-IRO-010_in@nerc.com">bp-IRO-010_in@nerc.com</a>	IRO-010	IRO-002-1 — RC – Facilities <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
		IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R4, R5</li> </ul>
		IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>

		TOP-003-0 — Planned Outage Coordination <ul style="list-style-type: none"> <li>▪ Modify R1.2</li> </ul>
		TOP-005-1 — Operational Reliability Information <ul style="list-style-type: none"> <li>▪ Retire R1, R1.1</li> </ul>
		TOP-006-1 — Monitoring System Conditions <ul style="list-style-type: none"> <li>▪ Modify R4</li> </ul>

During the pre-ballot window, members of the ballot pool may communicate with one another by using their “ballot pool list server.”<sup>1</sup> (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pools will remain open up until **8 a.m. (EDT), Monday, July 21, 2008**.

<sup>1</sup>For assistance in using a list server, contact Barbara Bogenrief at 609-452-8060.

**Now available at: <https://standards.nerc.net/BallotPool.aspx>**

### Five Pre-ballot Windows and Ballot Pools for Project 2006-07 — ATC/TTC and CBM/TRM

The following standards related to the determination of [Available Transfer Capability \(ATC\)](#), Total Transfer Capability (TTC), and Transmission Reliability Margin (TRM) and associated [implementation plans](#), are posted for a 30-day, pre-ballot review beginning **June 20, 2008**:

- MOD-001 — Available Transfer Capability
- MOD-008 — Transmission Reliability Margin
- MOD-028 — Area Interchange Methodology
- MOD-029 — Rated System Path Methodology
- MOD-030 — Flowgate Methodology

This set of [ATC-related standards](#) requires consistency in the calculation and documentation of TRM, TTC, AFC, and ATC.

Note that there is another standard in this set, MOD-004-1 — Capacity Benefit Margin (CBM), that is still undergoing revisions and is not ready for ballot. The Standards Committee considered whether to wait until the revisions to MOD-004-1 were complete before moving the entire set of six standards forward to ballot. The committee concluded that the interests of NERC and its stakeholders are best served by proceeding with the ballot for the five standards that are ready. Since there are approved standards in place that address CBM, the five new ATC-related standards can be implemented effectively without the new MOD-004-1.

There are five separate [ballot pools](#) for this set of ATC standards — and any member of the Registered Ballot Body may join as many or as few of the ballot pools as desired — a member wanting to ballot all five of the ATC-related standards must join all five of the ballot pools. (Note: these are **new ballot pools** — the ballot pools used to conduct the ATC-related ballots that took place earlier this year have been retired.)

The ballot for each of the standards includes the retirement of associated approved standards as identified in the table below. The [implementation plans](#) contain the justification for the recommended retirements.

Five Ballots for ATC Standards		
Standard	Ballot Pool (List Server)	Ballot Includes Retirement of Associated Approved Standards
MOD-001-1 Available Transfer Capability	ATC et al Standards — MOD-001 <a href="mailto:bp-MOD-001_R1_in@nerc.com">bp-MOD-001_R1_in@nerc.com</a>	MOD-001-0 FAC-012-1, FAC-013-1

MOD-008-1 Transmission Reliability Margin	ATC et al Standard — MOD-008 <a href="mailto:bp-MOD-008_R1_in@nerc.com">bp-MOD-008_R1_in@nerc.com</a>	MOD-008-0, MOD-009-0
MOD-028-1 Area Interchange Methodology	ATC et al Standard — MOD-028 <a href="mailto:bp-MOD-028_R1_in@nerc.com">bp-MOD-028_R1_in@nerc.com</a>	FAC-012-1, FAC-013-1
MOD-029-1 Rated System Path Methodology	ATC et al Standard — MOD-029 <a href="mailto:bp-MOD-029_R1_in@nerc.com">bp-MOD-029_R1_in@nerc.com</a>	FAC-012-1, FAC-013-1
MOD-030 Flowgate Methodology	ATC et al Standard — MOD-030 <a href="mailto:bp-MOD-030_R1_in@nerc.com">bp-MOD-030_R1_in@nerc.com</a>	FAC-012-1, FAC-013-1

During the 30-day, pre-ballot window, members of a ballot pool may communicate with one another by using their “ballot pool list server.”<sup>1</sup> (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pools will remain open up until **8 a.m. (EDT), Monday, July 21, 2008.**

<sup>1</sup>For assistance in using a list server, contact Barbara Bogenrief at 609-452-8060.

### Standards Development Process

The [Reliability Standards Development Procedure Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Maureen Long,  
Standards Process Manager, at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or at (813) 468-5998.*

# Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards (IRO-008–IRO-10)

## Introduction

This implementation plan is associated with the following Interconnection Reliability Operating Limit (IROL) standards:

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

These three standards are “new” standards, not revisions to Version 0 standards. These standards do, however address some of the same topics as addressed in some of the Version 0 standards.

The ballot for each of the IROL standards includes the retirement of associated requirements from some already approved standards and effective dates identified in this implementation plan.

# Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

## Implementation Plan Contents:

Prerequisite Approvals .....	3
Conforming Changes to Requirements in Already Approved Standards .....	3
Revisions or Retirements to Already Approved Standards .....	5
EOP-001-0 .....	5
IRO-002-1 .....	6
IRO-004-1 .....	7
IRO-005-2 .....	10
TOP-003-0 .....	18
TOP-005-1 .....	19
TOP-006-1 .....	22
Functions that Must Comply with the Requirements in the Standards.....	23
Effective Dates .....	23

## **Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

### **Prerequisite Approvals**

There are no SARs or standards under development that need to be effective before this set of standards becomes effective:

- IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection

### **Conforming Changes to Requirements in Already Approved Standards**

Many elements contained in the set of proposed “Operate within IROL Standards” address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the IROL SDT recommends that the retirement or revision of the following requirements in Version 0 Standards coincident with the implementation of the proposed standards. Justification for these revisions and retirements is provided in the tables on the following pages.

- EOP-001-0 — Emergency Operations Planning
  - Retire R2
- IRO-002-1 — Reliability Coordination – Facilities
  - Retire R2
- IRO-004-1 — Reliability Coordination – Operations Planning
  - Retire R1 through R6
- IRO-005-2 — Reliability Coordination – Current Day Operations
  - Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17
- TOP-003-0 — Planned Outage Coordination
  - Modify R1.2
- TOP-005-1 — Operational Reliability Information
  - Retire R1 and R1.1
  - Modify Attachment 1
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control
  - Modify R4

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

<p align="center"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p align="center"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>EOP-001-0</b></p> <p><b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p><b>R1.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's <math>T_v</math>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirements are more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008 becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 and R2 require the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R3 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<b>Already Approved Standard</b> (text in blue is recommended for retirement)	<b>Proposed Replacement Requirement(s)</b>
--	--

**IRO-004-1**

**R4.** Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

**R5.** Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.

**IRO-005-2**

**R2.** Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.

**IRO-010-1**

**R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

**R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**R1.2.** Mutually agreeable format.

**R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

**R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.

**R2.** The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.

**R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**IRO-008-1**

**R3.** When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions.

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-008-1 and IRO-010-1 become effective, IRO-004-1 R4 and R5 should be retired.
- IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4. There are two different requirements in IRO-004-1 R5 – to share data with other Reliability Coordinators and for the Reliability Coordinator to share data with entities in its Reliability Coordinator Area. While the first part of IRO-004-1 R5 is replaced by the R3 in IRO-010-1 (requires Reliability Coordinators to provide data to other Reliability Coordinators), the second part of the requirement is replaced by IRO-008-1 R3 (requires the Reliability Coordinator to share the results of its analyses with entities within its Reliability Coordinator Area if those analyses meet certain conditions).
- When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.
- IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a  $T_v$  that is much shorter than 30 minutes.
- IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p align="center"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p align="center"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, <del>IROL</del>, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's <math>T_v</math>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p> <p><b>R5.</b> If unanimity cannot be reached on the value for an IROL or its <math>T_v</math>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration.</p>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-009-1 becomes effective, IRO-005-2 R13 should be revised.
- IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.
- The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-009-1 R5 has a similar requirement that is applicable totally to the Reliability Coordinator and focused solely on IROLs.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b></p> <p>(text in blue is recommended for deletion or retirement – the red text is an addition to the text that already exists in the requirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these SOLs or</del> and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's <math>T_v</math>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-003-0</b>  <b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p style="padding-left: 20px;"><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p style="padding-left: 20px;"><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. ## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

**Notes:**

- When IRO-010-1 becomes effective, 'Attachment 1-TOP-005-0 Electric System Reliability Data' should be modified to omit the reference to the Reliability Coordinator. The Reliability Coordinator's requirement to share data with other Reliability Coordinators is addressed in IRO-010-1 R3.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-006-1</b>  <b>R4.</b> Each <del>Reliability Coordinator</del>, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system’s near-term load pattern.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:  <b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.  <b>R1.2.</b> Mutually agreeable format.  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.  <b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.  <b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-006-1 R4 should be modified.</li> <li>▪ The information identified in TOP-006-1 R4 is not inclusive, and is addressed more globally for the Reliability Coordinator in IRO-010-1 R1 and R3.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Functions that Must Comply with the Requirements in the Standards**

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-008-1 Analyses & Assessments	X							
IRO-009-1 Actions to Operate within IROLs	X							
IRO-010-1 Data Specification & Collection	X	X	X	X	X	X	X	X

**Effective Dates**

In those jurisdictions where no regulatory approval is required, the standards shall all become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standards shall all become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards (IRO-008–IRO-10)

### Introduction

This implementation plan is associated with the following Interconnection Reliability Operating Limit (IROL) standards:

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

These three standards are “new” standards, not revisions to Version 0 standards. These standards do, however address some of the same topics as addressed in some of the Version 0 standards.

The ballot for each of the IROL standards includes the retirement of associated requirements from some already approved standards and effective dates identified in this implementation plan.

TOP-005-1 .....	19
TOP-006-1 .....	22
Functions that Must Comply with the Requirements in the Standards.....	23
Effective Dates .....	23

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Prerequisite Approvals

There are no SARs or standards under development that need to be effective before this set of standards becomes effective:

- IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection

### Conforming Changes to Requirements in Already Approved Standards

Many elements contained in the set of proposed “Operate within IROL Standards” address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the IROL SDT recommends that the retirement or revision of the following requirements in Version 0 Standards coincident with the implementation of the proposed standards. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire ~~entire standard~~ (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- ~~Convert~~ Modify Attachment 1 ~~into a reference~~

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify R4

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

<p><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p><b>Proposed Replacement Requirement(s)</b></p>
<p><b>EOP-001-0</b></p> <p><b>R2.</b> The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p><b>R1.</b> For <u>each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies all IROLs identified</u> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's T<sub>v</sub>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments <u>of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages</u>. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirements are more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008 becomes effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For <u>each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies</u> <del>all IROLs identified</del> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL <u>(in its Reliability Coordinator Area) that the Reliability Coordinator identifies that is identified</u> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL <u>in its Reliability Coordinator Area</u> will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans <u>(not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1)</u> to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 and R2 require the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R3 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

<b>Already Approved Standard</b> (text in blue is recommended for retirement)	<b>Proposed Replacement Requirement(s)</b>
--	--

**IRO-004-1**

**R4.** Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

**R5.** Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.

**IRO-005-2**

**R2.** Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.

**IRO-010-1**

**R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

**R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**R1.2.** Mutually agreeable format.

**R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

**R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.

**R2.** The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.

**R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**IRO-008-1**

**R3.** When a Reliability Coordinator determines that the results of an Operational Planning Analysis or Real-Time Assessment indicates the need for specific operational actions to prevent or mitigate an instance of exceeding an IROL, the Reliability Coordinator shall share its results with those entities that are expected to take those actions.

**Notes:**

- When IRO-008-1 and IRO-010-1 become effective, IRO-004-1 R4 and R5 should be retired.
- IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4. There are two different requirements in IRO-004-1 R5 – to share data with other Reliability Coordinators and for the Reliability Coordinator to share data with entities in its Reliability Coordinator Area. While the first part of IRO-004-1 R5 is replaced by the R3 in IRO-010-1 (requires Reliability Coordinators to provide data to other Reliability Coordinators), the second part of the requirement is replaced by IRO-008-1 R3 (requires the Reliability Coordinator to share the results of its analyses with entities within its Reliability Coordinator Area if those analyses meet certain conditions).
- When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For <u>each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies</u> <del>all IROLs identified</del> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL <u>(in its Reliability Coordinator Area) that the Reliability Coordinator identifies</u> <del>that is identified</del> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL <u>in its Reliability Coordinator Area</u> will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans <u>(not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1)</u> to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL <u>in its Reliability Coordinator Area</u>, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>.</p>

**Notes:**

- When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.
- IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a  $T_v$  that is much shorter than 30 minutes.
- IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, <del>IROL</del>, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For <u>each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies</u> <del>all IROLs identified</del> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL (<u>in its Reliability Coordinator Area</u>) <del>that the Reliability Coordinator identifies that is identified</del> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL <u>in its Reliability Coordinator Area</u> will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans (<u>not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1</u>) to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL <u>in its Reliability Coordinator Area</u>, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> For <u>each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies all IROLs identified</u> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.</p> <p><b>R2.</b> For each IROL <u>(in its Reliability Coordinator Area) that the Reliability Coordinator identifies that is identified</u> one or more days prior to the current day, <del>each the</del> Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>.</p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL <u>in its Reliability Coordinator Area</u> will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans <u>(not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1)</u> to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL <u>in its Reliability Coordinator Area</u>, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>.</p> <p><b>R5.</b> If unanimity cannot be reached on the value for an IROL or its T<sub>v</sub>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values (the value with the least impact on reliability) under consideration.</p>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-009-1 becomes effective, IRO-005-2 R13 should be revised.
- IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.
- The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-009-1 R5 has a similar requirement that is applicable totally to the Reliability Coordinator and focused solely on IROLs.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b></p> <p>(text in blue is recommended for deletion or retirement – the red text is an addition to the text that already exists in the requirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>IRO-005-2</b>  <b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these SOLs or</del> and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R3.</b> When an assessment of actual or expected system conditions predicts that an IROL- <u>in its Reliability Coordinator Area</u> will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures, or Plans <u>(not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1)</u> to prevent exceeding that IROL.</p> <p><b>R4.</b> When actual system conditions show that there is an instance of exceeding an IROL <u>in its Reliability Coordinator Area</u>, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's T<sub>v</sub>.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T<sub>v</sub> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for deletion)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-003-0</b>  <b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p style="padding-left: 20px;"><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p style="padding-left: 20px;"><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator, and to</del> affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments <u>of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages.</u> The specification shall include the following:</p> <p style="padding-left: 20px;"><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p> <p style="padding-left: 20px;"><b>R1.2.</b> Mutually agreeable format.</p> <p style="padding-left: 20px;"><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p style="padding-left: 20px;"><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ -When IRO-010-1 becomes effective, TOP-003-0 R1.2 should be modified. <u>The certification process should include a requirement for the Reliability Coordinator to have a procedure for coordinating outages that includes identification of reliability-related lead times.</u></li> <li>▪ IRO-010-1 requires the Reliability Coordinator to provide data to other Reliability Coordinators in accordance with the data specifications it has received from those other Reliability Coordinators. Daily outage data is one of the types of data that is expected to be identified on the Reliability Coordinator’s documented data specification since this is data needed to maintain real-time models.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p style="text-align: center;"><b>Already Approved Standard</b> (text in blue is recommended for retirement)</p>	<p style="text-align: center;"><b>Proposed Replacement Requirement(s)</b></p>
<p><b>TOP-005-1</b>  <b>R1.</b> Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.</p> <p style="padding-left: 40px;"><b>R1.1</b> Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments <u>of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages</u>. The specification shall include the following:</p> <p style="padding-left: 40px;"><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p> <p style="padding-left: 40px;"><b>R1.2.</b> Mutually agreeable format.</p> <p style="padding-left: 40px;"><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p style="padding-left: 40px;"><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-005-1 R1 and R1.1 should be retired.</li> <li>▪ Under IRO-010-1 each Reliability Coordinator must document what data and information it needs and entities must provide that data. The data needed by the Reliability Coordinator is needed for more than just reliability assessments – some of the data is used for real-time monitoring. Several entities, beyond the Transmission Operator and Balancing Authority (the only responsible entities identified in R1 of TOP-005-1) have data and information needed by the Reliability Coordinator.</li> </ul>

## Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

### Notes:

- When IRO-010-1 becomes effective, 'Attachment 1-TOP-005-0 Electric System Reliability Data' should be ~~translated into a Technical Reference. This data is only a partial list of data and information that the Reliability Coordinator needs to support reliable operations~~modified to omit the reference to the Reliability Coordinator. The Reliability Coordinator's requirement to share data with other Reliability Coordinators is addressed in IRO-010-1 R3. The reference should include the operational status of special protection systems and the operational status of power system stabilizers to comply with one of the FERC directives in Order 693.

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

<p><b>TOP-006-1</b>  <b>R4.</b> Each <del>Reliability Coordinator</del>, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system’s near-term load pattern.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments <u>of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages</u>. The specification shall include the following:  <b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.  <b>R1.2.</b> Mutually agreeable format.  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.   <b>R2.</b> The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.   <b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-006-1 R4 should be modified.</li> <li>▪ The information identified in TOP-006-1 R4 is not inclusive, and is addressed more globally for the Reliability Coordinator in IRO-010-1 R1 and R3.</li> </ul>	

**Functions that Must Comply with the Requirements in the Standards**

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-008-1 Analyses & Assessments	X							
IRO-009-1 Actions to Operate within IROLs	X							
IRO-010-1 Data Specification & Collection	X	X	X	X	X	X	X	X

**Effective Dates**

In those jurisdictions where no regulatory approval is required, the standards shall all become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.

In those jurisdictions where regulatory approval is required, the standards shall all become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.

## FERC Directives in Order 693 Addressed in IROL Implementation Plan

The following Interconnection Reliability Operating Limit (IROL) standards were under development when the Version 0 project was initiated:

IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments

IRO-009 — Reliability Coordinator Actions to Operate Within IROLs

IRO-010 — Reliability Coordinator Data Specification and Collection

While these three standards are “new” standards, not revisions to Version 0 standards, the new standards do address some of the same topics as addressed in some of the Version 0 standards that were addressed in Order 693. The implementation plan for the new IROL standards calls for modifications or deletions to the following standards:

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire R1 through R6

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Modify Attachment 1

TOP-006-1 — Monitoring System Conditions

- Modify R4

The drafting team did not identify any directives in Order 693 relative to IRO-002 Requirement R2, TOP-003 Requirement R1.2, TOP-005 R1, R1.1, or TOP-006 Requirement R4.

## EOP-001-0 — Emergency Operations Planning

The IROL Implementation Plan calls for replacing EOP-001 R2 with IRO-009 R1 and R2:

**EOP-001 R2.** The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.

**IRO-009 R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.

**IRO-009 R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ .

Summary of FERC Directives from Order 693 Relative to EOP-001:

Paragraph 566. Accordingly, the Commission concludes that Reliability Standard EOP-001-0 is just, reasonable, not unduly discriminatory or preferential and in the public interest and approves it as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to EOP-001-0 through the Reliability Standards development process that: (1) includes the reliability coordinator as an applicable entity with responsibilities as described above; (2) clarifies the 30-minute requirement in Requirement R2 of the Reliability Standard to state that load shedding should be capable of being implemented as soon as possible but in no more than 30 minutes; (3) includes definitions of system states to be used by the operators, such as transmission-related “normal,” “alert” and “emergency” states, provides criteria for entering into these states, and identifies the authority that will declare these states and (4) clarifies that the actual emergency plan elements, and not the “for consideration” elements of Attachment 1, should be the basis for compliance. Further, the Commission directs the ERO to consider a pilot program for system states, as discussed above.

*The first directive is further clarified in Paragraph 547:*

... Given the importance NERC attributes to the reliability coordinator in connection with matters covered by EOP-001-0, the Commission is persuaded that specific responsibilities for the reliability coordinator in the development and coordination of emergency plans must be included as part of this Reliability Standard.

### Discussion:

(1) Include the reliability coordinator as an applicable entity with responsibilities as described above.

Modifying the entire standard is outside the scope of the IROL SDT. The IROL SDT did modify the responsibility for Requirement R2 so that instead of assigning the TOP the responsibility for having load reduction plans for resolving IROLs, the RC is responsible for having action plans that will prevent and/or mitigate instances of exceeding IROLs. The TOP is not required to have the wide area view

necessary for developing action plans relative to IROLs. The proposed requirements (R1 and R2) in IRO-009 meet the intent of the first directive.

(2) **Clarify the 30-minute requirement in Requirement R2 of the Reliability Standard to state that load shedding should be capable of being implemented as soon as possible but in no more than 30 minutes**

When developing the IROL standard, the IROL drafting team determined that there are some IROLs that must be resolved in a timeframe that is shorter than 30 minutes. FAC-010 and FAC-011 require that each IROL have an associated  $T_v$  – with  $T_v$  defined as follows:

The maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's  $T_v$  shall be less than or equal to 30 minutes.

IRO-009 R2 requires that each action plan developed to resolve an IROL must be capable of being executed such that the IROL is relieved within the IROL's  $T_v$ .

While the drafting team did include a reference to load shedding, the team did not highlight this as the only means of resolving an IROL.

IRO-009 R4 requires the RC to act, without delay, when actual system conditions show that there is an instance of exceeding an IROL.

As shown below, EOP-001 R4, which is not recommended for retirement by the IROL SDT, requires the TOP to have load reduction plans that can be executed within a specific timeframe.

**EOP-001 R4.** Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:

**R4.1.** Communications protocols to be used during emergencies.

**R4.2.** A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.

The Violation Severity Levels penalize the RC for not having action plans for IROLs identified at least a day ahead, for delays in acting to prevent exceeding an IROL, and for failure to resolve an IROL within the IROL's  $T_v$ .

The proposed requirements achieve the objective of the second directive.

Directives 3 and 4 are outside the scope of the IROL SDT.

**IRO-002 — Reliability Coordination – Facilities**

The IROL Implementation Plan calls for replacing IRO-002 R2 with IRO-010 R1.

**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.

**IRO-010-1**

**R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

- R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.
- R1.2.** Mutually agreeable format.
- R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).
- R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.

908. As we stated in the NOPR,<sup>295</sup> Reliability Standard IRO-002-1 serves an important purpose in ensuring that reliability coordinators have the information, tools and capabilities to perform their functions. The Measures and Levels of Non-Compliance submitted by NERC further enhance the Reliability Standard. Accordingly, the Commission approves Reliability Standard IRO-002-1 as mandatory and enforceable. In addition we direct the ERO to develop a modification to IRO-002-1 through the Reliability Standards development process that requires a minimum set of tools that should be made available to reliability coordinators.

**Discussion:** The certification process is expected to specify the minimum set of tools that should be made available to reliability coordinators. Tools that are used on a routine basis are needed to meet other performance-based requirements in reliability standards and allocating resources to verifying that the tools are in use is not the best use of limited resources. Addressing the directive to require a minimum set of tools that should be made available to reliability coordinators in the certification process is an equally efficient and effective method of achieving the intent of the directive.

**IRO-004**

**The IROL Implementation Plan calls for the retirement of all requirements in IRO-004.**

IRO-004 R1 and R3 are the requirements for conducting a next-day reliability analyses and developing associated action plans – these were replaced with IRO-008 R1 and IRO-009 R1 and R2:

**IRO-004 R1.** Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.

**IRO-004 R3.** Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.

**IRO-008 R1. R1.** Each Reliability Coordinator shall perform an Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.

**IRO-009 R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.

**IRO-009 R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ .

935. Accordingly, we approve Reliability Standard IRO-004-1 as mandatory and enforceable. Further, we direct the ERO to modify IRO-004-1 through the Reliability Standards development process to require the next-day analysis to identify control actions that can be implemented and effective within 30 minutes after a contingency.

**Discussion:** When developing the IROL standard, the IROL drafting team determined that there are some IROLs that must be resolved in a timeframe that is shorter than 30 minutes. FAC-010 and FAC-011 require that each IROL have an associated  $T_v$  – with  $T_v$  defined as follows:

The maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's  $T_v$  shall be less than or equal to 30 minutes.

IRO-009 R2 requires that each action plan developed to resolve an IROL must be capable of being executed such that the IROL is relieved within the IROL's  $T_v$ . The proposed requirement meets the intent of the directive.

During discussions with FERC staff, the drafting team was advised to address how the IROL standards achieve the intent of the directive in Order 693, paragraph 1601, which is relative to next-day analyses.

1601. . . .Therefore, we direct the ERO to modify Reliability Standard TOP-002-2 to require the next-day analysis for all IROLs to identify and communicate control actions to system operators that can be implemented within 30 minutes following a contingency to return the system to a reliable operating state and prevent cascading outages.

**Discussion:** FERC staff advised the drafting team that paragraph 1601 requires that the system operator be provided with action plans to use to prepare for the next contingency during the adjustment time period when an IROL has been exceeded but the system hasn't been returned to a "stable" or "normal" state. The plans should address every possible second contingency and should include specific control actions.

All drafting team members interpreted paragraph 1601 as requiring the development of action plans that can be implemented in time to resolve the IROL within the IROL's  $T_v$  and this is required, as noted above, in IRO-009-1 Requirements R1 and R2.

### IRO-005

**The IROL Implementation Plan calls for the retirement of the R2, R3, R5, R16 and R17 and the modification of R6, R13 and R14 in IRO-005.**

IRO-005-2 ensures energy balance and transmission reliability for the current day by identifying tasks that reliability coordinators must perform throughout the day. IRO-005-1 includes 17 requirements, covering a wide range of reliability coordination activities, assigned primarily to the Reliability Coordinator. Some of the requirements in IRO-005 are recommended for retirement when IRO-009 and IRO-010 become effective. The proposed revisions to IRO-005 include retiring R2, R3, R5, R16 and R17 – and modifying R9, R13, and R14.

The directives relative to IRO-005 were aimed at adding the missing measures and levels of non-compliance (now Violation Severity Levels) and at ensuring that the penalties for exceeding IROLs were commensurate with the magnitude, duration, frequency and causes of the violations and whether these occur during normal or contingency conditions.

For the requirements in IRO-005 that have been recommended for retirement, the following address instances of exceeding IROLs:

**IRO-005 R3.** As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.

**IRO-005 R5.** Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.

**IRO-009 R1.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*)

**IRO-009 R2.** For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's  $T_v$ . (*Violation Risk Factor: Medium*)

**IRO-009 R3.** When an assessment of actual or expected system conditions predicts that an IROL in its Reliability Coordinator Area will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans (not limited to the Operating Processes, Procedures, or Plans developed for Requirements R1) to prevent exceeding that IROL. (*Violation Risk Factor: High*)

**IRO-009 R4.** When actual system conditions show that there is an instance of exceeding an IROL in its Reliability Coordinator Area, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL within the IROL's  $T_v$ . (*Violation Risk Factor: High*)

**IRO-009 Violation Severity Levels:**

**There is a high VSL for the following:**

- Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five minutes or more before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL in its Reliability Coordinator Area, however the IROL was mitigated within the IROL  $T_v$ . (R4)

951. Accordingly, the Commission approves Reliability Standard IRO-005-1 as mandatory and enforceable. Further, because IRO-005-1 has no Measures or Levels of Non-Compliance, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to IRO-005-1 through the Reliability Standards development process that includes Measures and Levels of Non-Compliance. The Commission further directs that the Measures and Levels of Non-Compliance specific to IROL violations must be commensurate with the magnitude, duration, frequency and causes of the violations and whether these occur during normal or contingency conditions. Finally, the Commission directs the ERO to conduct a survey on IROL practices and actual operating experiences by requiring reliability coordinators to report any violations of IROL, their causes, the date and time, the durations and magnitudes in which actual operations exceeds IROLs to the ERO on a monthly basis for one year beginning two months after the effective date of the Final Rule. We may propose further modifications to IRO-005-1 based on the survey results.

**Discussion:**

The Violation Severity Levels, in conjunction with the Violation Risk Factors form the starting point for the determination of a penalty or sanction. The requirements associated with having action plans are assigned a “Medium” VRF – and the requirements associated with acting to prevent or mitigate instances of exceeding an IROL are assigned a “High” VRF.

**There is a high violation severity level for the following:**

- Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay of five minutes or more before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL, however the IROL was mitigated within the IROL  $T_v$ . (R4)

**There is a severe violation severity level for any of the following:**

- An IROL was identified one or more days in advance and the Reliability Coordinator does not have an Operating Process, Procedure, or Plan that identifies actions to prevent exceeding that IROL. (R1)
- An IROL identified one or more days in advance does not have an Operating Process, Procedure, or Plan that identifies actions to mitigate exceeding that IROL within the IROL's  $T_v$ . (R2)
- An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures, or Plans were implemented. (R3)
- Actual system conditions showed that there was an instance of exceeding an IROL, and that IROL was not resolved within the IROL's  $T_v$ . (R4)

## **FERC Directives in Order 693 Addressed in IROL Implementation Plan**

---

A delay in acting to mitigate an instance of exceeding an IROL but resolving the IROL within its  $T_v$  is assigned a “High” VSL. A total violation of any of these four requirements to have plans or take actions results in a “Severe” VSL. Applying the violation of the requirements to the sanctions table:

- The violation of a Medium VRF with a Severe VSL has a sanction starting point of \$10-\$335k (failure to have action plans)
- The violation of a High VRF with a Medium VSL has a sanction starting point of \$12-\$625k (delay in acting to mitigate but resolved within  $T_v$ )
- The violation of a High VRF with a Severe VSL has a sanction starting point of \$20-\$1,000k (exceeded IROL for time greater than  $T_v$ )

The Sanctions Guidelines give the Compliance Enforcement Authority the ability to increase or decrease the size of the penalty based on other factors, such as the number of violations, etc.

The levels of noncompliance have been replaced with violation severity levels. The combination of violation risk factors and violation severity levels meet the intent of the directive.

## TOP-003-0 — Planned Outage Coordination

The IROL Implementation Plan calls for revising TOP-003-0 Requirement R1.2 when IRO-010 becomes effective.

**R1.** Generator Operators and Transmission Operators shall provide planned outage information.

**R1.1** Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.

**R1.2** Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~

1626. Planned outage coordination is a necessary element of reliable operations, and TOP-003-0 promotes that goal. Accordingly, the Commission approves the Reliability Standard as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to TOP-003-0 through the Reliability Standards development process that: (1) includes a new requirement to communicate longer term outages well in advance to ensure reliability and accuracy of ATC calculation; (2) makes any facility below the voltage thresholds that, in the opinion of the transmission operator, balancing authority, or reliability coordinator, will have a direct impact on the operation of Bulk-Power System, subject to Requirement R1 for planned outage coordination and (3) incorporates an appropriate lead time for planned outages as discussed above.

**Discussion:** There are three directives, the first one applies to the ATC standards – and seems to be addressed in the proposed ATC standards. The second directive should be addressed by the Real-time BA/TOP SDT and the third directive should be addressed in the certification process for the Reliability Coordinator. Requiring the entity applying for certification produce its procedure for coordinating planned outages ensures that the procedure exists at the point in time when the entity begins operating as a Reliability Coordinator. The proposed requirement in the certification process includes:

- Require the prospective Reliability Coordinator to have a procedure for coordination of planned generation and transmission outages that includes the following:
  - Identification of a lead time for planned outages that provides sufficient time for reliability-related coordination
  - Identification of the criteria used to determine which outages to approve when there are multiple requests for outages and they can't all be approved

This is an equally efficient and effective method of meeting the intent of this directive.

## TOP-005

The IROL Implementation Plan calls for modifying Attachment 1 of TOP-005-1 to omit the references to the Reliability Coordinator, and calls for replacing R1 and R1.1 with IRO-010-1 R1 and R3:

**TOP-005 R1.** Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.

**R1.1** Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.

### TOP-005-1 Attachment 1-TOP-005-0 - Electric System Reliability Data

This Attachment lists the types of data that ~~Reliability Coordinators~~, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with ~~each~~ other ~~Balancing Authorities and Transmission Operators~~.

**IRO-010 R1. R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

- R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments.
- R1.2.** Mutually agreeable format
- R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
- R1.4.** Process for data provision when automated Real-time system operating data is unavailable.

**IRO-010 R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments.

1651. Accordingly, the Commission approves Reliability Standard TOP-005-1. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to TOP-005-1 through the Reliability Standards development process that: (1) includes information about the operational status of special protection systems and power system stabilizers in Attachment 1 and (2) deletes references to confidentiality agreements, but addresses the issue separately to ensure that necessary protections are in place related to confidential information.

**Discussion:** The directives are not relative to the proposed modifications to TOP-005. The attachment referenced is TOP-005-1 Requirement R3 references Attachment 1 and R3 is not being retired by the IROL SDT.

## TOP-006

The IROL Implementation Plan calls for the modification of R4 in TOP-006 when IRO-010-1 becomes effective.

### TOP-006-1

**R4.** Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.

**IRO-010 R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

- R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments.
- R1.2.** Mutually agreeable format
- R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
- R1.4.** Process for data provision when automated Real-time system operating data is unavailable.

**IRO-010 R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments.

1665. Accordingly, the Commission approves Reliability Standard TOP-006-1. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to TOP-006-1 through the Reliability Standards development process that: (1) includes a new requirement related to the provision of minimum capabilities that are necessary to enable operators to deal with real-time situations and to ensure reliable operation of the Bulk-Power System and (2) clarifies the meaning of "appropriate technical information" concerning protective relays.

**Discussion:** The drafting team does not believe that either of these directives is applicable to the modification proposed for R4. The directive to specify minimum capabilities is being addressed through the certification process as an equally efficient and effective method of achieving the intent of the directive. The second directive is relative to TOP-006-1 R3 which is not being modified by the IROL SDT.

## Standards Announcement

Eight Initial Ballot Windows Open July 21, 2008

Now available at: <https://standards.nerc.net/CurrentBallots.aspx>

### Initial Ballot Windows for IRO-008-1, IRO-009-1 and IRO-010-1 Open July 21, 2008

The [initial ballots](#) for the following [Interconnection Reliability Operating Limit](#) (IROL) standards and their associated implementation plan open at 8 a.m. (EDT) on Monday, July 21, 2008:

- [IRO-008-1](#) — Reliability Coordinator Operational Analyses and Real-time Assessments
- [IRO-009-1](#) — Reliability Coordinator Actions to Operate within IROLs
- [IRO-010-1](#) — Reliability Coordinator Data Specification and Collection

These standards require the Reliability Coordinator (RC) to take actions to keep the bulk electric system operating within IROLs.

The ballot for each standard includes the retirement or revision of associated requirements from some already-approved standards as identified in the table below. The IROL [implementation plan](#) contains the justification for the recommended retirements and revisions.

Three Ballots for IROL Standards	
Ballot for New Standard	Includes Modifications to Associated Approved Standards
IRO-008 — RC Operational Analyses and Real-time Assessments	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R1 and R2</li> </ul>
IRO-009 — RC Actions to Operate within IROLs	EOP-001-0 — Emergency Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R3 and R6</li> </ul>
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>▪ Retire R3, R5, R16, R17;</li> <li>▪ Modify R9, R13 and R14</li> </ul>
IRO-010 — RC Data Specification and Collection	IRO-002-1 — RC – Facilities <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R4, R5</li> </ul>
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
	TOP-003-0 — Planned Outage Coordination <ul style="list-style-type: none"> <li>▪ Modify R1.2</li> </ul>
	TOP-005-1 — Operational Reliability Information <ul style="list-style-type: none"> <li>▪ Retire R1, R1.1</li> </ul>
	TOP-006-1 — Monitoring System Conditions <ul style="list-style-type: none"> <li>▪ Modify R4</li> </ul>

The initial ballot for each of the above standards will **close** at 8 p.m. (EDT) on Wednesday, **July 30, 2008**.

**Five Initial Ballot Windows for Project 2006-07 — ATC/TRM and CBM/TRM Open July 21, 2008**

The [initial ballots](#) for the following [ATC-related standards](#) and their associated implementation plans open at 8 a.m. (EDT) on Monday, July 21, 2008:

- [MOD-001](#) — Available Transfer Capability
- [MOD-008](#) — Transmission Reliability Margin
- [MOD-028](#) — Area Interchange Methodology
- [MOD-029](#) — Rated System Path Methodology
- [MOD-030](#) — Flowgate Methodology

This set of standards requires consistency in the calculation and documentation of Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). (Note that the ATC-related standard for Capacity Benefit Margin is not included in this set of ballots.)

The ballot for each standard includes the retirement of associated approved standards as identified in the table below. The [implementation plans](#) contain the justification for the recommended retirements.

Five Ballots for ATC-related Standards	
Ballot for New Standard	Includes Retirement of Associated Approved Standards
MOD-001-1 — Available Transfer Capability	MOD-001-0 — Documentation of TTC and ATC Calculation Methodologies FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-008-1 — Transmission Reliability Margin	MOD-008-0 — Documentation and Content of Each Regional TRM Methodology MOD-009-0 — Procedure for Verifying TRM Values
MOD-028-1 — Area Interchange Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-029-1 — Rated System Path Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-030-1 — Flowgate Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs

The initial ballot for each of the above standards will **close** at 8 p.m. (EDT) on Wednesday, **July 30, 2008**.

**Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Initial Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

#### Initial Ballot Results for Three IROL-related Standards and Associated Implementation Plans

The initial ballots for the following Interconnection Reliability Operating Limit ([IROL](#)) related standards (and the associated retirements and revisions identified in their implementation plans) were conducted from July 21 through July 30, 2008 and the results are shown in the table below.

Three Ballots for IROL-related Standards		
Ballot for New Standard	Includes Modifications to Associated Approved Standards	Initial Ballot Results
IRO-008 — RC Operational Analyses and Real-time Assessments	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R1 and R2</li> </ul>	Quorum: 92.67 Approval: 91.71
IRO-009 — RC Actions to Operate within IROLs	EOP-001-0 — Emergency Operations Planning <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	Quorum: 92.63 Approval: 89.44
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R3 and R6</li> </ul>	
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>Retire R3, R5, R16, R17;</li> <li>Modify R9, R13 and R14</li> </ul>	
IRO-010 — RC Data Specification and Collection	IRO-002-1 — RC – Facilities <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	Quorum: 92.71 Approval: 88.40
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R4, R5</li> </ul>	
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	
	TOP-003-0 — Planned Outage Coordination <ul style="list-style-type: none"> <li>Modify R1.2</li> </ul>	
	TOP-005-1 — Operational Reliability Information <ul style="list-style-type: none"> <li>Retire R1, R1.1</li> </ul>	
	TOP-006-1 — Monitoring System Conditions <ul style="list-style-type: none"> <li>Modify R4</li> </ul>	

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The [Ballot Results](#) standards web page provides a link to the detailed results of each of these ballots. Each of the ballots received some negative votes with comments, and the drafting team will review the comments before determining its next step.

#### Initial Ballot Results for Five ATC-related Standards and Associated Implementation Plans (Project 2006-07)

The initial ballots for five [ATC-related standards](#) (and the associated retirements identified in their implementation plans) were conducted from July 21 through July 30, 2008 and the results are shown in the table below. Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and

- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The [Ballot Results](#) standards web page provides a link to the detailed results of each of these ballots. Each of the ballots received some negative votes with comments, and the drafting team will review the comments before determining its next step.

Five Ballots for ATC-related Standards		
Ballot for New Standard	Includes Retirement of Associated Approved Standards	Initial Ballot Results
MOD-001-1 Available Transfer Capability	MOD-001-0 — Documentation of TTC and ATC Calculation Methodologies FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 94.02 Approval: 75.97
MOD-008-1 Transmission Reliability Margin	MOD-008-0 — Documentation and Content of Each Regional TRM Methodology MOD-009-0 — Procedure for Verifying TRM Values	Quorum: 94.27 Approval: 80.44
MOD-028-1 Area Interchange Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 94.64 Approval: 79.47
MOD-029-1 Rated System Path Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 94.67 Approval: 92.62
MOD-030-1 Flowgate Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 94.37 Approval: 56.56

### Standards Development Procedure

**Initial Ballot Comments — Project for IROL Standard — IRO-008-1**

Entity	Segment	Vote	Comment
American Electric Power	1	Negative	AEP votes No. this proposed Standard calls for the Reliability Coordinator to specify the real-time data and information they require to support real-time monitoring, operational planning analyses, and real-time assessments without restriction. This allows for the Reliability Coordinator to ask for the addition of a significant amount of SCADA installations at the expense of the transmission owners in transmission areas that are not pertinent to the purpose of IRO-010-1 which is preventing the instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection. The Standard should tie the specification of data and information requirements solely to the needs for monitoring and analyzing the control of IROLs.
Bonneville Power Administration	1	Negative	We do not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools.
Duke Energy Carolina	1	Negative	Duke Energy appreciates the opportunity to vote and comment on this proposed Standard. IRO-010-1 Requirement R3 requires that “Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship”. We are unsure what the phrase “with which it has a reliability relationship” means. IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. “Operations Planning”, “Same Day Operations” and “Real-time Operations” are used to identify time horizons for requirements.
FirstEnergy Energy Delivery	1	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General</p> <ul style="list-style-type: none"> <li>• The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows “R7” instead of “R1” IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4</li> <li>• There is no measure associated with this requirement - Measures do not include evidence of “planning” of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</li> </ul>
Great River Energy	1	Negative	IRO-010 does a good job of stating the requirements of the Reliability Coordinator. However, the standard gives the appearance of having taken away the TOP and BA ability to obtain study data from the RC unless they are specifically involved with the mitigation of an IROL. It is GRE's opinion that entities should be able to obtain data from the Reliability Coordinator upon request as they are able to now. GRE understands that the Reliability Coordinator's responsibility to share data was moved in part to IRO-008-1_R3. The new requirement however does not make is sufficiently transparent that the TOP and BA can request the Assessment results if they choose.

Initial Ballot Comments — Project for IROL Standard — IRO-008-1

Entity	Segment	Vote	Comment
Hydro One Networks, Inc.	1	Affirmative	Hydro One Networks is casting an affirmative vote on the IRO-010 Standard. However, we believe that Requirement R3. should be modified at the earliest possible time when the standard is revised. Requirement R3. must be clear that when referring to data specifications it is within the parameters specified in Requirement R1. Consequently, R3 should read: R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship.
Minnesota Power, Inc.	1	Negative	<p>1. On page 10 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R4 &amp; R5 and IRO-005-2 R2 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3. Minnesota Power's comment to IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3 is, "The SDT has taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now."</p> <p>2. On page 18 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-003-0 R1 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3. Minnesota Power's comment is, "Minnesota Power believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer."</p> <p>3. On page 19 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-0 R1 while the proposed replacement requirement is IRO-010-1 R1. Minnesota Power's comment is, "Interchange transaction data should be added to the new IRO-010-1 R1."</p> <p>4. On page 20 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-1 Attachment 1-TOP-005-0 Electric System Data Reliability Data while the proposed replacement requirement is IRO-010-1 R3. Minnesota Power's comment is, "Agree — Data requirements will be more detailed in new standard. However, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1.</p> <p>5. On page 22 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-006-1 R4 while the proposed replacement requirement is IRO-010-1 R1 R2, &amp; R3. Minnesota Power's comment to TOP-006-1 R4 is, "Minnesota Power don't agree with removing reliability coordinator from the requirement. — Including the Reliability Coordinator in the statement that the RC, TO &amp; BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity."</p>

Initial Ballot Comments — Project for IROL Standard — IRO-008-1

Entity	Segment	Vote	Comment
National Grid	1	Affirmative	<p>National Grid agrees with the comments suggested by NPCC with regard to Requirement R3. We suggest that the wording be revised at a later date to include a reference to Requirement R1. The suggested wording is as follows:</p> <p>“R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)”</p>
Northeast Utilities	1	Affirmative	<p>Insert in R3, "as specified in R1," after "... shall provide data and information, ...".</p>
Bonneville Power Administration	3	Negative	<p>BPA does not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools</p>
Consolidated Edison Co. of New York	3	Affirmative	<p>R3 may be revised at a later date to include a reference to R1 as follows:</p> <p>“R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)”</p>
FirstEnergy Solutions	3	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General</p> <ul style="list-style-type: none"> <li>• The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows “R7” instead of “R1” IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4.</li> <li>• There is no measure associated with this requirement - Measures do not include evidence of “planning” of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</li> </ul>
Hydro One Networks, Inc.	3	Affirmative	<p>Hydro One Networks is casting an affirmative vote on the IRO-010 Standard. However, we believe that Requirement R3. should be modified at the earliest possible time when the standard is revised. Requirement R3. must be clear that when referring to data specifications it is within the parameters specified in Requirement R1. Consequently, R3 should read: R3. Entity	Segment	Vote	Comment
Administration			awareness and using on-line reliability tools.â
Entergy Services, Inc.	6	Affirmative	Agree with the content changes, however the format of the Requirements deleted in other standards has resulted in a reassignment of Requirement numbering and thus created an undesirable administrative/logistical situation of entities having to revise associations with Requirement numbers to Requirement verbiage. This also applies to NERC processes as well since, for example, a reference "R2" in an RSAW or a matrix may now be skewed and really be "R1 or R3" if a Requirement was deleted or added.
FirstEnergy Solutions	6	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. ## Consideration of Comments on Initial Ballot of IRO-008 – Reliability Coordinator Operational Analyses and Real-time Assessments

**Summary Consideration:** The drafting team corrected the typographical error in the red line version of IRO-004 – it showed “R7” instead of “R1”.

The SDT also updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.

The drafting team did not make any other modifications based on comments submitted with the initial ballot for this standard.

<b>Organization:</b>	Duke Energy Carolina
<b>Member:</b>	Douglas E. Hils
<b>Comment:</b>	<p>Duke Energy appreciates the opportunity to vote and comment on IRO-008-1. The proposed standard introduces a new defined term “Operational Planning Analysis”, which states that an analysis of the expected system conditions for the next day’s operation may be performed either a day ahead or as much as 12 months ahead. Duke Energy believes that allowing a year is too long.</p> <p>IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. “Operations Planning”, “Same Day Operations” and “Real-time Operations” are used to identify time horizons for requirements.</p>
<b>Response:</b>	<p>In the Functional Model, the distinction between planning for operations and planning for system additions is the “one year” mark. The proposed definition for Operational Planning Analysis was supported by most commenters.</p> <p>The definitions used in the “Time Horizons” are not in the NERC Glossary but were posted with the standard when Time Horizons were added to the standard. Here is a link to that comment form:  <a href="http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc">http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc</a></p> <p>Note that the definitions for the terms used in defining “Time Horizons” have been posted for stakeholder reference when each drafting team has added “Time Horizons” to requirements. Here are the definitions:</p> <ul style="list-style-type: none"> <li>- Long-term Planning: a planning horizon of one year or longer.</li> <li>- Operations Planning: operating and resource plans from day-ahead up to and including seasonal.</li> <li>- Same-day Operations: routine actions required within the timeframe of a day, but not real-time.</li> <li>- Real-time Operations: actions required within one hour or less to preserve the reliability of the bulk</li> </ul>

**Consideration of Comments on Initial Ballot of IRO-008 – Reliability Coordinator Operational Analyses and Real-time Assessments**

	<p>electric system.</p> <ul style="list-style-type: none"> <li>- Operations Assessment: follow-up evaluations and reporting of real time operations.</li> </ul>
<b>Organization:</b>	Great River Energy
<b>Member:</b>	Gordon Pietsch
<b>Comment:</b>	GRE recognizes the need to have measurable requirements. However, it is GRE's opinion that the revised IRO-008-1_R1 language does not adequately address the need for the Reliability Coordinator to pay attention to how the actions they take for their area can affect their neighboring Reliability Coordinator areas. GRE recommends that measurable language that addressing this be added back into the standard.
<b>Response:</b>	<p>Stakeholder consensus is that R2 in IRO-004-1 is un-measurable - it is difficult to measure terms such as, "pay particular attention to" or "undue burden" in an objective manner.</p> <p>Project 2006-06 - Reliability Coordination addresses requirements for coordination between Reliability Coordinators. There is an existing set of requirements (IRO-014-2) for Reliability Coordinators to coordinate with their actions with other Reliability Coordinators. In addition, there are other requirements for the Reliability Coordinator to coordinate with other Reliability Coordinators.</p>
<b>Organization:</b>	FirstEnergy Energy Delivery, FirstEnergy Solutions
<b>Member:</b>	Robert Martinko, Joanne Kathleen Borrell, Kenneth Dresner, Mark S Travaglianti
<b>Comment:</b>	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-008-1 and ask that the SDT consider our enclosed comments.</p> <p>Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006:</p> <p>General – The Violation Risk Factors should be added to the text of all of the standards.</p> <p>IRO-004 - VSL table shows "R7" instead of "R1"</p> <p>IRO-005 - Several Measures reference the incorrect requirement numbers</p> <p>TOP-003 - R4 – There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</p>
<b>Response:</b>	<p>VRFs will be added to all approved standards as part of another administrative activity.</p> <p>The 'redline' version of IRO-004 did show R7 instead of R1 for the VSL and this has been corrected.</p> <p>The SDT has updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.</p>

**Consideration of Comments on Initial Ballot of IRO-008 – Reliability Coordinator Operational Analyses and Real-time Assessments**

	The SDT is limited in what it can modify in TOP-003. The modifications are limited to revisions and retirements associated with the requirements in the new standards. Other modifications, such as adding missing measures or modifying compliance information, will be addressed by other drafting teams.
<b>Organization:</b>	Lincoln Electric System
<b>Member:</b>	Bruce Merrill, Eric Ruskamp
<b>Comment:</b>	IRO-008-1 and IRO-010-1 R1, R2, & R3. The SDT has taken away the ability of entities to obtain study data from the RC unless the entitie's area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they do now.
<b>Response:</b>	Note that the implementation plan for IRO-008 only calls for retirement of IRO-004-1, Requirements R1 and R2 – and these requirements do not address data. The comment provided is relevant only to the ballot for IRO-010-1, and is not relevant to the ballot for IRO-008-1. IRO-010-1 does not preclude LES or any other entity from asking for and obtaining data. To the extent the Reliability Coordinator is held accountable for any and all IROLs then the Reliability Coordinator <b>must</b> get what data it needs. If other entities need study data, then this should be addressed in a corollary standard.
<b>Organization:</b>	MidAmerican Energy Co.
<b>Member:</b>	Thomas C. Mielnik
<b>Comment:</b>	Unacceptable or undue Burden requirement needs to be clarified.
<b>Response:</b>	This ballot is for the approval of IRO-008-1 and for the retirement of Requirements R1 and R2 in IRO-004-1 — Reliability Coordination – Operations Planning. The drafting team is not proposing any requirements that include the phrase, “unacceptable or undue burden.”
<b>Organization:</b>	Entergy Services, Inc.
<b>Member:</b>	William Franklin
<b>Comment:</b>	Agree with the content changes, however the format of the Requirements deleted in other standards has resulted in a reassignment of Requirement numbering and thus created an undesirable administrative/logistical situation of entities having to revise associations with Requirement numbers to Requirement verbiage. This also applies to NERC processes as well since, for example, a reference "R2" in an RSAW or a matrix may now be skewed and really be "R1 or R3" if a Requirement was deleted or added.
<b>Response:</b>	This is an administrative issue, outside the drafting team’s scope. The team will forward your comment to

**Consideration of Comments on Initial Ballot of IRO-008 – Reliability Coordinator Operational Analyses and Real-time Assessments**

	the Director of Standards for his consideration.
<b>Organization:</b>	Midwest Reliability Organization
<b>Member:</b>	Larry Brusseau
<b>Comment:</b>	<p>The MRO understands, IRO-004-1 R2 will be retired. Can this requirement be moved to IRO-008-1 (perhaps call it R2)? If this requirement is kept perhaps the "unacceptable or undue Burden" criteria could be clarified. A measurable task would be that the RC has research evidence that it could present plus, it could have measurable evidence like its communication with the local regional reliability organization.</p> <p>For the MRO comments: IRO-008-1 and IRO-010-1 R1, R2, &amp; R3, the SDT have taken away the ability of entities to obtain study data from the RC unless entities area is specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now.</p>
<b>Response:</b>	<p>The implementation plan for IRO-008-1 does include the retirement of IRO-004-1 Requirements R1 and R2. Requirement R2 states:</p> <p style="padding-left: 40px;">Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p> <p>Stakeholder consensus is that R2 in IRO-004-1 is un-measurable - it is difficult to measure terms such as, "pay particular attention to" or "undue burden" in an objective manner.</p> <p>Project 2006-06 - Reliability Coordination addresses requirements for coordination between Reliability Coordinators. There is an existing set of requirements (IRO-014-2) for Reliability Coordinators to coordinate with their actions with other Reliability Coordinators. In addition, there are other requirements for the Reliability Coordinator to coordinate with other Reliability Coordinators.</p>
<b>Organization:</b>	Minnesota Power, Inc.

<b>Comment:</b>	<p>1. On page 7 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R1 and R2 while the proposed replacement requirement is IRO-008-1 R1. From what Minnesota Power understands, IRO-004-1 R2 will be retired. Why couldn't this requirement be moved to IRO-008-1 (perhaps call it R2)? If this requirement is kept perhaps the "unacceptable or undue Burden" criteria could be clarified. A measurable task would be that the RC has research evidence that it could present plus, it could have measurable evidence like its communication with the local regional reliability organization.</p> <p>2. On page 10 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability</p>

**Consideration of Comments on Initial Ballot of IRO-008 – Reliability Coordinator Operational Analyses and Real-time Assessments**

	<p>Operating Limits Standards”, the already approved standard requirements are IRO-004-1 R4 &amp; R5 and IRO-005-2 R2 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3. Minnesota Power’s comment to IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3 is, “The SDT has taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now.”</p>
<p><b>Response:</b></p>	<p>Project 2006-06 - Reliability Coordination addresses coordination between Reliability Coordinators. There is an existing set of requirements (IRO-014-2) for Reliability Coordinators to coordinate with their actions with other Reliability Coordinators. Stakeholder consensus is that R2 in IRO-004 is un-measurable - it is difficult to measure terms such as, "pay particular attention to" in an objective manner. In addition, there are other requirements for the Reliability Coordinator to coordinate with other Reliability Coordinators.</p> <p>These IRO standards do not preclude MP or any other entity from asking for and obtaining data. To the extent the Reliability Coordinator is held accountable for any and all IROLs then the Reliability Coordinator must get what data it needs. If the Transmission Operator and Balancing Authority need study data, then this should be addressed in a corollary standard. A Balancing Authority has no study functions regarding IROLS, the only involvement of a Balancing Authority with IROLs is to follow the directive of its Transmission Operators and Reliability Coordinator.</p>

Entity	Segment	Vote	Comment
Ameren Services Company	1	Affirmative	Include Measurement for each requirement; that is, M1 for R1 and M2 for R2, etc.
Duke Energy Carolina	1	Negative	Duke Energy appreciates the opportunity to vote and comment on this proposed Standard. IRO-009-1 Requirements R1 and R3 indicate that actions shall be implemented to prevent exceeding an IROL. This is an issue of much debate currently within the industry — whether or not IROLs may be exceeded with or without a contingency. It's unclear whether these requirements are consistent with current industry practice. The VSL for IRO-009-1 Requirement R4 introduces a new requirement that an operator document within five minutes of exceeding an IROL that some action was taken to mitigate the magnitude and duration of the event. While we agree with R4 that the operator should act without delay to mitigate the event, we are concerned that this five minute documentation requirement could distract the operator. IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. "Operations Planning", "Same Day Operations" and "Real-time Operations" are used to identify time horizons for requirements.
FirstEnergy Energy Delivery	1	Affirmative	FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-009-1 and ask that the SDT consider our enclosed comments. Requirements R1 and R2 FirstEnergy suggests that the SDT consider the proposed edits to requirements R1 and R2 as shown below to address a potential unintended interpretation of the requirements. We believe the suggested changes remove a level of ambiguity that presently exists and helps clarify the SDT's desired outcome. In requirements R1 and R2 the text uses the phrase "For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day ...". Our concern is that the wording "one or more days" is unlimited in timeframe and when performing month ahead, week ahead reviews of requested planned maintenance outages there may be potential IROL conditions identified for system configurations that in actuality never make it to the operating day, based on one or more planned outage requests being denied. Conversely, there may be instances within the day prior to the next operating day, where unexpected forced outages of bulk power facilities trigger the need for re-study. Therefore, it should be clear that the only documented Operating Processes, Procedures, or Plans that are in effect and required by the standard should reflect the most recent system information available prior to the start of the current operating day. FE assumes that there is no expectation that any and all "hypothetical" system configurations reviewed by the Reliability Coordinator would be the basis of any documented Operating Processes, Procedures, or Plans. The standard should be clear in its intent to require IROL mitigation plans be in place based on the most recent projected operating conditions for the next operating day. Therefore, we suggest the addition of the proposed sub-requirement R1.1 and that R2 be deleted and covered by our proposed sub-requirement R1.2. If adopted, some adjustments will also be needed in the text of measures and VSLs. Thank you for your consideration. R1 For each IROL (in its Reliability Coordinator Area) that

Initial Ballot Comments — Project for IROL Standard — IRO-009-1

Entity	Segment	Vote	Comment
			<p>the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. R1.1 The applicable Operating Processes, Procedures, or Plans in effect shall be revised as needed during the 24-hour period preceding the start of the current day period to reflect up to date projected system conditions. R1.2 The applicable Operating Processes, Procedures, or Plans in effect shall mitigate the magnitude and duration of exceeding an IROL such that the IROL is relieved within the IROL's Tv. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General "The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows "R7" instead of "R1" IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4 " There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</p>
Great River Energy	1	Negative	<p>GRE does not agree with the removal of the references to coordinating with the TOP and BA. GRE understands that under some instances the Reliability Coordinator may not have time to coordinate with the TOP and/or the BA. GRE recommends that the SDT add language that would acknowledge that this coordination must take place during the Operations Planning Time Horizon. In addition, the revised language does not make it sufficiently clear that the BA and TOP in conjunction with the Reliability Coordinator need to be involved in the development of IROL mitigation plans for their systems.</p>
Minnesota Power, Inc.	1	Negative	<p>1. On page 8 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R3 &amp; R6 while the proposed replacement requirements are IRO-009-1 R1, R2, &amp; R3. Minnesota Power's comment to IRO-009-1 R2 is, "Any reference to coordinating with the TOP's and BA's has been removed. The TOP's and BA's have the most knowledge of their systems, and Minnesota Power believes they should be involved in mitigation plans, which would include plans for load shedding. They are also the first to be aware of any new SOL's or IROL's."</p> <p>2. On page 8 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R3 &amp; R6 while the proposed replacement requirements are IRO-009-1 R1, R2, &amp; R3. Minnesota Power's comment to IRO-009-1 R3 is, "the SDT has removed references to directing the TOP, BA, and TSP to take actions. Minnesota Power believes this should remain."</p>
Consumers Energy	3	Negative	<p>IRO-009-1 discusses having plans or procedures in place when an IROL violation is forecasted before the fact. No where in the Standard does it direct the Reliability Coordinator to inform or communicate with facilities that may be part of such plans or procedures. Failure to coordinate with such facilities could easily invalidate the plans or procedures the RC is putting in place. Generation owners may schedule work or actions at a facility that would render the facility ineffectual if the RC actually implements the plan. No plan is complete without coordination.</p>

FirstEnergy Solutions	3	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-009-1 and ask that the SDT consider our enclosed comments. Requirements R1 and R2 FirstEnergy suggests that the SDT consider the proposed edits to requirements R1 and R2 as shown below to address a potential unintended interpretation of the requirements. We believe the suggested changes remove a level of ambiguity that presently exists and helps clarify the SDT's desired outcome. In requirements R1 and R2 the text uses the phrase "For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day ...". Our concern is that the wording "one or more days" is unlimited in timeframe and when performing month ahead, week ahead reviews of requested planned maintenance outages there may be potential IROL conditions identified for system configurations that in actuality never make it to the operating day, based on one or more planned outage requests being denied. Conversely, there may be instances within the day prior to the next operating day, where unexpected forced outages of bulk power facilities trigger the need for re-study. Therefore, it should be clear that the only documented Operating Processes, Procedures, or Plans that are in effect and required by the standard should reflect the most recent system information available prior to the start of the current operating day. FE assumes that there is no expectation that any and all "hypothetical" system configurations reviewed by the Reliability Coordinator would be the basis of any documented Operating Processes, Procedures, or Plans. The standard should be clear in its intent to require IROL mitigation plans be in place based on the most recent projected operating conditions for the next operating day. Therefore, we suggest the addition of the proposed sub-requirement R1.1 and that R2 be deleted and covered by our proposed sub-requirement R1.2. If adopted, some adjustments will also be needed in the text of measures and VSLs. Thank you for your consideration. R1 For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs. R1.1 The applicable Operating Processes, Procedures, or Plans in effect shall be revised as needed during the 24-hour period preceding the start of the current day period to reflect up to date projected system conditions. R1.2 The applicable Operating Processes, Procedures, or Plans in effect shall mitigate the magnitude and duration of exceeding an IROL such that the IROL is relieved within the IROL's Tv. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General — The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows "R7" instead of "R1" IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4 — There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</p>

			of their systems, and LES would think the TOP's and BA's should be involved in mitigation plans, which would include plans for load shedding. They are also the first to be aware of any new SOL's or IROL's. LES does not agree with the removal of references directing the TOP, BA, and Transmission Service Provider (TSP) to take actions.
MidAmerican Energy Co.	3	Negative	Reference to coordinating with TOPs and BAs has been removed from this standard. I believe these entities should be involved in mitigation plans.
Alliant Energy Corp. Services, Inc.	4	Negative	The TOP's and BA's have the most knowledge of their system, and should not be removed from the coordination of mitigation plans.
Consumers Energy	4	Negative	IRO-009-1 discusses having plans or procedures in place when an IROL violation is forecasted before the fact. No where in the Standard does it direct the Reliability Coordinator to inform or communicate with facilities that may be part of such plans or procedures. Failure to coordinate with such facilities could easily invalidate the plans or procedures the RC is putting in place. Generation owners may schedule work or actions at a facility that would render the facility ineffectual if the RC actually implements the plan. No plan is complete without coordination.
City of Tallahassee	5	Negative	R1 and R2 contradict each other. R1 says "to prevent exceeding those IROL". R2 says "to mitigate the magnitude and duration of exceeding that IROL" So R2 says it is okay to violate R1. If that is the case, R1 should not be a standard since it is not needed for the reliability of the BES.
FirstEnergy Solutions	5	Affirmative	FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-009-1 and ask that the SDT consider our enclosed comments. Requirements R1 and R2 FirstEnergy suggests that the SDT consider the proposed edits to requirements R1 and R2 as shown below to address a potential unintended interpretation of the requirements. **Consideration of Comments on Initial Ballot of IRO-009 — Reliability Coordinator Actions to Operate Within IROLs**

**Summary Consideration:** The drafting team corrected the typographical error in the red line version of IRO-004 – it showed “R7” instead of “R1”.  
 The SDT also updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.  
 The drafting team did not make any other modifications based on comments submitted with the initial ballot for this standard.

<b>Organization:</b>	Ameren Services Company
<b>Member:</b>	Kirit S. Shah
<b>Comment:</b>	Include Measurement for each requirement; that is, M1 for R1 and M2 for R2, etc.
<b>Response:</b>	The standards process requires that there be a measurement for each requirement, but does not require that there be a unique measure for each requirement. There are measures for every requirement in IRO-009. The Measures for R1 & R2 are the same; and the measures for R3 & R4 are the same. The associated requirements are specifically identified in the measures.
<b>Organization:</b>	Duke Energy Carolina
<b>Member:</b>	Douglas E. Hils
<b>Comment:</b>	Duke Energy appreciates the opportunity to vote and comment on this proposed Standard. IRO-009-1 Requirements R1 and R3 indicate that actions shall be implemented to prevent exceeding an IROL. This is an issue of much debate currently within the industry – whether or not IROLs may be exceeded with or without a contingency. It’s unclear whether these requirements are consistent with current industry practice. The VSL for IRO-009-1 Requirement R4 introduces a new requirement that an operator document within five minutes of exceeding an IROL that some action was taken to mitigate the magnitude and duration of the event. While we agree with R4 that the operator should act without delay to mitigate the event, we are concerned that this five minute documentation requirement could distract the operator.  IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. “Operations Planning”, “Same Day Operations” and “Real-time Operations” are used to identify time horizons for requirements.

**Consideration of Comments on Initial Ballot of IRO-009 — Reliability Coordinator Actions to Operate Within IROLs**

<p><b>Response:</b></p>	<p>There has not been a single proposal that received unanimous approval from the commenters. It is clear that the Industry wants immediate action when the system is over a limit. There is recognition that in the absence of conditions related to R3 (which states that the RC that observes a pending IROL must take action) an operator must be given some finite time to assess the situation. In some cases taking no action is a proper response; in other cases any delay can be catastrophic. The standard mandates “without delay” but the severity is based on having no documented action for more than 5 minutes. Note that if an RC determines that actions already taken will resolve an IROL and no additional actions are needed, the RC can document this using any means available to it – and this would be evidence that the RC had taken action. The documentation does not need to be developed within 5 minutes – there just needs to be evidence that some action was taken within 5 minutes. This was a consensus solution.</p> <p>The definitions used in the “Time Horizons” are not in the NERC Glossary but were posted with the standard when Time Horizons were added to the standard. Here is a link to that comment form: <a href="http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc">http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc</a></p> <p>Note that the definitions for the terms used in defining “Time Horizons” have been posted for stakeholder reference when each drafting team has added “Time Horizons” to requirements. Here are the definitions:</p> <ul style="list-style-type: none"> <li>- Long-term Planning: a planning horizon of one year or longer.</li> <li>- Operations Planning: operating and resource plans from day-ahead up to and including seasonal.</li> <li>- Same-day Operations: routine actions required within the timeframe of a day, but not real-time.</li> <li>- Real-time Operations: actions required within one hour or less to preserve the reliability of the bulk electric system.</li> <li>- Operations Assessment: follow-up evaluations and reporting of real time operations.</li> </ul>
<p><b>Organization:</b></p>	<p>FirstEnergy Energy Delivery, FirstEnergy Solutions</p>

SDT's desired outcome. In requirements R1 and R2 the text uses the phrase "For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day ...". Our concern is that the wording "one or more days" is unlimited in timeframe and when performing month ahead, week ahead reviews of requested planned maintenance outages there may be potential IROL conditions identified for system configurations that in actuality never make it to the operating day, based on one or more planned outage requests being denied. Conversely, there may be instances within the day prior to the next operating day, where unexpected forced outages of bulk power facilities trigger the need for re-study. Therefore, it should be clear that the only documented Operating Processes, Procedures, or Plans that are in effect and required by the standard should reflect the most recent system information available prior to the start of the current operating day. FE assumes that there is no expectation that any and all "hypothetical" system configurations reviewed by the Reliability Coordinator would be the basis of any documented Operating Processes, Procedures, or Plans. The standard should be clear in its intent to require IROL mitigation plans be in place based on the most recent projected operating conditions for the next operating day. Therefore, we suggest the addition of the proposed sub-requirement R1.1 and that R2 be deleted and covered by our proposed sub-requirement R1.2. If adopted, some adjustments will also be needed in the text of measures and VSLs. Thank you for your consideration.

R1 For each IROL (in its Reliability Coordinator Area) that the Reliability Coordinator identifies one or more days prior to the current day, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) that can be implemented in time to prevent exceeding those IROLs.

R1.1 The applicable Operating Processes, Procedures, or Plans in effect shall be revised as needed during the 24-hour period preceding the start of the current day period to reflect up to date projected system conditions.

R1.2 The applicable Operating Processes, Procedures, or Plans in effect shall mitigate the magnitude and duration of exceeding an IROL such that the IROL is relieved within the IROL's Tv.

Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General – The Violation Risk Factors should be added to the text of all of the standards.

**Consideration of Comments on Initial Ballot of IRO-009 — Reliability Coordinator Actions to Operate Within IROLs**

	<p>IRO-004 - VSL table shows "R7" instead of "R1" IRO-005 – Several Measures reference the incorrect requirement numbers</p> <p>TOP-003 - R4 – There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</p>
<b>Response:</b>	<p>The SDT has been asked to draft the RSAWs for this set of standards and will include language in the RSAW for IRO-009 to address your comment.</p> <p>The VRFs are in the text of each new standard and will be added to all approved standards as part of another administrative activity.</p> <p>The 'redline' version of IRO-004 did show R7 instead of R1 for the VSL and this has been corrected. The SDT has updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.</p> <p>The scope of this standard did not include revising the compliance elements for TOP standards.</p>
<b>Organization:</b>	Consumers Energy
<b>Member:</b>	David A. Lapinski, David Frank Ronk
<b>Comment:</b>	IRO-009-1 discusses having plans or procedures in place when an IROL violation is forecasted before the fact. No where in the Standard does it direct the Reliability Coordinator to inform or communicate with facilities that may be part of such plans or procedures. Failure to coordinate with such facilities could easily invalidate the plans or procedures the RC is putting in place. Generation owners may schedule work or actions at a facility that would render the facility ineffectual if the RC actually implements the plan. No plan is complete without coordination.
<b>Response:</b>	IRO-008-1 Requirement R3 does require the Reliability Coordinator to share its analysis results with those entities that are expected to take associated actions.
<b>Organization:</b>	Great River Energy
<b>Member:</b>	Gordon Pietsch
<b>Comment:</b>	GRE does not agree with the removal of the references to coordinating with the TOP and BA. GRE

**Consideration of Comments on Initial Ballot of IRO-009 — Reliability Coordinator Actions to Operate Within IROLs**

	understands that under some instances the Reliability Coordinator may not have time to coordinate with the TOP and/or the BA. GRE recommends that the SDT add language that would acknowledge that this coordination must take place during the Operations Planning Time Horizon. In addition, the revised language does not make it sufficiently clear that the BA and TOP in conjunction with the Reliability Coordinator need to be involved in the development of IROL mitigation plans for their systems.
<b>Response:</b>	The use of the word, “coordination” is ambiguous and puts the Reliability Coordinator in a position where its authority is not clear. The Reliability Coordinator is not granted any excuse for failing to do whatever it needs to do to ensure that IROL-related action plans are in place. The standard does not preclude the Reliability Coordinator from coordinating with other entities.
<b>Organization:</b>	MidAmerican Energy Co.
<b>Member:</b>	Thomas C. Mielnik
<b>Comment:</b>	Reference to coordinating with TOPs and BAs has been removed from this standard. I believe these entities should be involved in mitigation plans.

Initial Ballot Comments — Project for IROL Standard — IRO-010-1

Entity	Segment	Vote	Comment
American Electric Power	1	Negative	AEP votes No. this proposed Standard calls for the Reliability Coordinator to specify the real-time data and information they require to support real-time monitoring, operational planning analyses, and real-time assessments without restriction. This allows for the Reliability Coordinator to ask for the addition of a significant amount of SCADA installations at the expense of the transmission owners in transmission areas that are not pertinent to the purpose of IRO-010-1 which is preventing the instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection. The Standard should tie the specification of data and information requirements solely to the needs for monitoring and analyzing the control of IROLs.
Bonneville Power Administration	1	Negative	We do not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools.
Duke Energy Carolina	1	Negative	Duke Energy appreciates the opportunity to vote and comment on this proposed Standard. IRO-010-1 Requirement R3 requires that "Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship". We are unsure what the phrase "with which it has a reliability relationship" means. IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. "Operations Planning", "Same Day Operations" and "Real-time Operations" are used to identify time horizons for requirements.
FirstEnergy Energy Delivery	1	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General</p> <ul style="list-style-type: none"> <li>- The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows "R7" instead of "R1" IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4</li> <li>- There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</li> </ul>
Great River Energy	1	Negative	IRO-010 does a good job of stating the requirements of the Reliability Coordinator. However, the standard gives the appearance of having taken away the TOP and BA ability to obtain study data from the RC unless they are specifically involved with the mitigation of an IROL. It is GRE's opinion that entities should be able to obtain data from the Reliability Coordinator upon request as they are able to now. GRE understands that the Reliability Coordinator's responsibility to share data was moved in part to IRO-008-1_R3. The new requirement however does not make is sufficiently transparent that the TOP and BA can request the Assessment results if they choose.

**Initial Ballot Comments — Project for IROL Standard — IRO-010-1**

Hydro One Networks, Inc.	1	Affirmative	Hydro One Networks is casting an affirmative vote on the IRO-010 Standard. However, we believe that Requirement R3. should be modified at the earliest possible time when the standard is revised. Requirement R3. must be clear that when referring to data specifications it is within the parameters specified in Requirement R1. Consequently, R3 should read: R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship.
Minnesota Power, Inc.	1	Negative	<p>1. On page 10 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R4 &amp; R5 and IRO-005-2 R2 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3. Minnesota Power's comment to IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3 is, "The SDT has taken away the ability of entities to obtain study data from the RC unless entities are specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now."</p> <p>2. On page 18 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-003-0 R1 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3. Minnesota Power's comment is, "Minnesota Power believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer."</p> <p>3. On page 19 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-0 R1 while the proposed replacement requirement is IRO-010-1 R1. Minnesota Power's comment is, "Interchange transaction data should be added to the new IRO-010-1 R1."</p> <p>4. On page 20 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-1 Attachment 1-TOP-005-0 Electric System Data Reliability Data while the proposed replacement requirement is IRO-010-1 R3. Minnesota Power's comment is, "Agree — Data requirements will be more detailed in new standard. However, RC should still be required to share this data with the TOs and BAs. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1"</p> <p>5. On page 22 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-006-1 R4 while the proposed replacement requirement is IRO-010-1 R1 R2, &amp; R3. Minnesota Power's comment to TOP-006-1 R4 is, Minnesota Power don't agree with removing reliability coordinator from the requirement.</p> <p>–Including the Reliability Coordinator in the statement that the RC, TO &amp; BAs shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides</p>

**Initial Ballot Comments — Project for IROL Standard — IRO-010-1**

			clarity.”
National Grid	1	Affirmative	National Grid agrees with the comments suggested by NPCC with regard to Requirement R3. We suggest that the wording be revised at a later date to include a reference to Requirement R1. The suggested wording is as follows:  “R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations).”
Northeast Utilities	1	Affirmative	Insert in R3, "as specified in R1," after "... shall provide data and information, ...".
Bonneville Power Administration	3	Negative	BPA does not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools
Consolidated Edison Co. of New York	3	Affirmative	R3 may be revised at a later date to include a reference to R1 as follows: “R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)”
FirstEnergy Solutions	3	Affirmative	FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General  –“The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows “R7” instead of “R1” IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4 – There is no measure associated with this requirement - Measures do not include evidence of “planning” of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements
Hydro One Networks, Inc.	3	Affirmative	Hydro One Networks is casting an affirmative vote on the IRO-010 Standard. However, we believe that Requirement R3. should be modified at the earliest possible time when the standard is revised. Requirement R3. must be clear that when referring to data specifications it is within the parameters specified in Requirement R1. Consequently, R3 should read: R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship.
Lincoln Electric System	3	Negative	Comments: IRO-010-1 R1, R2, & R3 and IRO-008-1. The Standard Drafting Team has taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now. LES believes TOP-003-0

**Initial Ballot Comments — Project for IROL Standard — IRO-010-1**

			should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer. LES believes that the Interchange transaction data should be added to the new IRO-010-1 R1. LES believes that the data requirements will be more detailed in new standard. However, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1. LES does agree with removing Reliability Coordinator from the requirement. - Including the Reliability Coordinator in the statement that the RC, TO & BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity.
MidAmerican Energy Co.	3	Negative	Interchange transaction data should be added to the standard. Reliability Coordinator should still be required to share reliability data with TOs and BAs.
Alliant Energy Corp. Services, Inc.	4	Negative	Entities should be able to obtain study data upon request to the RC, rather than when expected to take action for an IROL.
AEP Service Corp.	5	Negative	AEP suggests that this standard tie the specification of data and information requirements solely to the needs for monitoring and analyzing the control of IROLs.
FirstEnergy Solutions	5	Affirmative	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General</p> <p>–The Violation Risk Factors should be added to the text of all of the standards. Lincoln Electric System	5	Negative	IRO-010-1 R1, R2, & R3. The Standard Drafting Team has taken away the ability of entities to obtain study data from the RC unless entities are specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now.
AEP Marketing	6	Negative	AEP suggests that IRO-010-1 tie the specification of data and information requirements solely to the needs for monitoring and analyzing the control of IROLs.
Bonneville Power Administration	6	Negative	We do not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools.
Entergy Services, Inc.	6	Affirmative	Agree with the content changes, however the format of the Requirements deleted in other standards has resulted in a reassignment of Requirement numbering and thus created an undesirable administrative/logistical situation of entities having to revise associations with Requirement numbers to Requirement verbiage. This also applies to NERC processes as well since, for example, a reference "R2" in an RSAW or a matrix may now be skewed and really be "R1 or R3" if a Requirement was deleted or added.
FirstEnergy	6	Affirmative	FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of

**Initial Ballot Comments — Project for IROL Standard — IRO-010-1**

Solutions			<p>reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now. LES believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer. LES believes that the Interchange transaction data should be added to the new IRO-010-1 R1. LES believes that the data requirements will be more detailed in new standard. However, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1. LES does agree with removing Reliability Coordinator from the requirement. - Including the Reliability Coordinator in the statement that the RC, TO &amp; BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity.</p>
Midwest Reliability Organization	10	Negative	<p>For the MRO comments: IRO-010-1 R1, R2, &amp; R3 and IRO-008-1, the SDT have taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now. The MRO believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer. The MRO believes that the Interchange transaction data should be added to the new IRO-010-1 R1. The MRO believes that the data requirements will be more detailed in this new standard; however, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1. The MRO does not agree with removing Reliability Coordinator from the requirement. - Including the Reliability Coordinator in the statement that the RC, TO &amp; BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity.</p>

## Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection

**Summary Consideration:** The drafting team corrected the typographical error in the red line version of IRO-004 – it showed “R7” instead of “R1”.  
 The SDT also updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.  
 The drafting team did not make any other modifications based on comments submitted with the initial ballot for this standard.

<b>Organization:</b>	Duke Energy Carolina
<b>Member:</b>	Douglas E. Hils
<b>Comment:</b>	<p>Duke Energy appreciates the opportunity to vote and comment on this proposed Standard. IRO-010-1 Requirement R3 requires that “Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship”. We are unsure what the phrase “with which it has a reliability relationship” means.</p> <p>IRO-008-1, IRO-009-1 and IRO-010-1 all introduce new terms that are not defined in the NERC Glossary. “Operations Planning”, “Same Day Operations” and “Real-time Operations” are used to identify time horizons for requirements.</p>
<b>Response:</b>	<p>The phrase “with which it has a reliability relationship” relates to parties directly involved (i.e. has a relationship) in a given RC’s plans “to prevent instability, uncontrolled separation, and cascading outages” (i.e. reliability) (see IRO-008 R3).</p> <p>The definitions used in the “Time Horizons” are not in the NERC Glossary but were posted with the standard when Time Horizons were added to the standard. Here is a link to that comment form: <a href="http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc">http://www.nerc.com/docs/standards/sar/IROL_Comment_Form_02Jan07.doc</a></p> <p>Note that the definitions for the terms used in defining “Time Horizons” have been posted for stakeholder reference when each drafting team has added “Time Horizons” to requirements. Here are the definitions:</p> <ul style="list-style-type: none"> <li>- Long-term Planning: a planning horizon of one year or longer.</li> <li>- Operations Planning: operating and resource plans from day-ahead up to and including seasonal.</li> <li>- Same-day Operations: routine actions required within the timeframe of a day, but not real-time.</li> </ul>

**Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection**

	<ul style="list-style-type: none"> <li>- Real-time Operations: actions required within one hour or less to preserve the reliability of the bulk electric system.</li> <li>- Operations Assessment: follow-up evaluations and reporting of real time operations.</li> </ul>
<b>Organization:</b>	American Electric Power
<b>Member:</b>	Paul B. Johnson
<b>Comment:</b>	AEP votes No. this proposed Standard calls for the Reliability Coordinator to specify the real-time data and information they require to support real-time monitoring, operational planning analyses, and real-time assessments without restriction. This allows for the Reliability Coordinator to ask for the addition of a significant amount of SCADA installations at the expense of the transmission owners in transmission areas that are not pertinent to the purpose of IRO-010-1 which is preventing the instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection. The Standard should tie the specification of data and information requirements solely to the needs for monitoring and analyzing the control of IROs.
<b>Response:</b>	<p>IRO-010-1 is limited to requests for data and information needed to support analyses “to prevent instability, uncontrolled separation, and cascading outages.” If the data request is not associated with an IROL, then that request is not covered by this standard.</p> <p>Transmission Operators are further protected from unreasonable requests by the fact that they have the option to question the validity of the Reliability Coordinator’s request to: its Regional Entity; NERC and FERC. The SDT agrees with AEP that the data requirements relate solely to monitoring and analyzing system to prevent and control IROs. “To prevent instability, uncontrolled separation, and cascading outages” is the definition of what an IROL is designed to effect.</p>

<b>Comment:</b>	We do not believe that the IRO-010-1 C.M3 has text that is sufficient to be able to know what is adequate to confirm that we provided data, particularly data such as continually updated ICCP data used for situational awareness and using on-line reliability tools.
<b>Response:</b>	IRO-010-1 does not address the data quality / bad data issue except to require an alternative process when an automated system is unavailable (and that alternative may be to do nothing). IRO-010-1 Requirement R1 and its sub-requirements do define the data quantity issue within the constructs of sample times and formats. The Reliability Coordinator’s list required in R1.1 is sufficient enough for responsible entities to know explicitly what data must be provided; and the responsible entity is expected to confirm that it has complied with the request, using whatever means it chooses. The measure intentionally allows the responsible entity to provide whatever evidence it has – this allows entities to demonstrate compliance without mandating that every entity provide exactly the same type

**Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection**

	of evidence as that would force some entities to modify current practices without necessarily leading to an improvement in reliability.
<b>Organization:</b>	FirstEnergy Energy Delivery, FirstEnergy Solutions
<b>Member:</b>	Robert Martinko, Joanne Kathleen Borrell, Kenneth Dresner, Mark S Travaglianti
<b>Comment:</b>	<p>FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-010-1 and ask that the SDT consider our enclosed comments.</p> <p>Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006:            General – The Violation Risk Factors should be added to the text of all of the standards.            IRO-004 - VSL table shows "R7" instead of "R1"            IRO-005 - Several Measures reference the incorrect requirement numbers            TOP-003 - R4 – There is no measure associated with this requirement - Measures do not include evidence of "planning" of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements</p>
<b>Response:</b>	<p>VRFs will be added to all approved standards as part of another administrative activity.</p> <p>The 'redline' version of IRO-004 did show R7 instead of R1 for the VSL and this has been corrected.</p> <p>The SDT has updated the references in the measures for IRO-005 to ensure they reference the correct requirements, using the new requirement numbers.</p> <p>The SDT is limited in what it can modify in TOP-003. The modifications are limited to revisions and retirements associated with the requirements in the new standards. Other modifications, such as adding missing measures or modifying compliance information, will be addressed by other drafting teams.</p>
<b>Organization:</b>	Great River Energy
<b>Member:</b>	Gordon Pietsch
<b>Comment:</b>	<p>IRO-010 does a good job of stating the requirements of the Reliability Coordinator. However, the standard gives the appearance of having taken away the TOP and BA ability to obtain study data from the RC unless they are specifically involved with the mitigation of an IROL. It is GRE's opinion that entities should be able to obtain data from the Reliability Coordinator upon request as they are able to now. GRE understands that the Reliability Coordinator's responsibility to share data was moved in part to IRO-008-1_R3. The new requirement however does not make is sufficiently transparent that the TOP and BA can request the Assessment results if they choose.</p>
<b>Response:</b>	<p>These IRO standards do not preclude any other entity from asking for and obtaining data.</p> <p>To the extent the Reliability Coordinator is held accountable for any and all IROLs then the Reliability</p>

**Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection**

	Coordinator must get what data it needs. If the Transmission Operator and Balancing Authority need study data, then this should be addressed in a corollary standard. A Balancing Authority has no study functions regarding IROLs, the only involvement of a Balancing Authority with IROLs is to follow the directive of its Transmission Operators and Reliability Coordinator.
<b>Organization:</b>	Hydro One Networks, Inc.
<b>Member:</b>	Ajay Garg
<b>Comment:</b>	Hydro One Networks is casting an affirmative vote on the IRO-010 Standard. However, we believe that Requirement R3. should be modified at the earliest possible time when the standard is revised. Requirement R3. must be clear that when referring to data specifications it is within the parameters specified in Requirement R1. Consequently, R3 should read: R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship.
<b>Response:</b>	The SDT appreciates the added clarity suggested by the comment. The SDT is going to draft the Reliability Standard Audit Worksheets (RSAWs) for this set of standards and will include this language in the RSAW that is drafted for IRO-010-1.
<b>Organization:</b>	National Grid
<b>Member:</b>	Michael J Ranalli
<b>Comment:</b>	National Grid agrees with the comments suggested by NPCC with regard to Requirement R3. We suggest that the wording be revised at a later date to include a reference to Requirement R1. The suggested wording is as follows: "R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified in R1, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)"
<b>Response:</b>	The SDT appreciates the added clarity suggested by the comment. The SDT is going to draft the Reliability Standard Audit Worksheets (RSAWs) for this set of standards and will include this language in the RSAW that is drafted for IRO-010-1.
<b>Organization:</b>	Northeast Utilities
<b>Member:</b>	David H. Boguslawski
<b>Comment:</b>	Insert in R3, "as specified in R1," after "... shall provide data and information, ...".
<b>Response:</b>	The SDT appreciates the added clarity suggested by the comment. The SDT is going to draft the Reliability Standard Audit Worksheets (RSAWs) for this set of standards and will include this language in the RSAW that is drafted for IRO-010-1.

**Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection**

<b>Organization:</b>	Midwest Reliability Organization
<b>Member:</b>	Larry Brusseau
<b>Comment:</b>	<p>For the MRO comments: IRO-010-1 R1, R2, &amp; R3 and IRO-008-1, the SDT have taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now.</p> <p>The MRO believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer. The MRO believes that the Interchange transaction data should be added to the new IRO-010-1 R1. The MRO believes that the data requirements will be more detailed in this new standard; however, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1. The MRO does not agree with removing Reliability Coordinator from the requirement. - Including the Reliability Coordinator in the statement that the RC, TO &amp; BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity.</p>
<b>Response:</b>	<p>These IRO standards do not preclude any other entity from asking for and obtaining data. To the extent the Reliability Coordinator is held accountable for any and all IROLs then the Reliability Coordinator must get what data it needs. If the Transmission Operator and Balancing Authority need study data, then this should be addressed in a corollary standard. A Balancing Authority has no study functions regarding IROLs, the only involvement of a Balancing Authority with IROLs is to follow the directive of its Transmission Operators and Reliability Coordinator.</p> <p>Both NERC and FERC have requested that the standards be cleaned up and that includes removing redundancies. Outage reporting need only be covered once – the SDT simplified the data provision requirements by ensuring that there would be a single requirement for a specification that identified all data and information that needed to be provided to the Reliability Coordinator.</p>
<b>Organization:</b>	Lincoln Electric System

<b>Organization:</b>	Entergy Services, Inc.
<b>Member:</b>	William Franklin
<b>Comment:</b>	<p>Agree with the content changes, however the format of the Requirements deleted in other standards has resulted in a reassignment of Requirement numbering and thus created an undesirable administrative/logistical situation of entities having to revise associations with Requirement numbers to Requirement verbiage. This also applies to NERC processes as well since, for example, a reference "R2" in an RSAW or a matrix may now be skewed and really be "R1 or R3" if a Requirement was deleted or added.</p>
<b>Response:</b>	<p>This is an administrative issue, outside the drafting team's scope. The team will forward your comment to the Director of Standards for his consideration.</p>
<b>Organization:</b>	Minnesota Power, Inc.
<b>Member:</b>	Carol Gerou
<b>Comment:</b>	<p>1. On page 10 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirements are IRO-004-1 R4 &amp; R5 and IRO-005-2 R2 while the proposed replacement requirements are IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3. Minnesota Power's comment to IRO-010-1 R1, R2, &amp; R3 and IRO-008-1 R3 is, "The SDT has taken away the ability of entities to obtain study data from the RC unless entities area specifically expected to take actions for an IROL. The current standard says that we may obtain this data upon request at any time. Entities should be allowed to obtain data from the RC upon request as they have now."</p>

**Response:** These IRO standards do not preclude any other entity from asking for and obtaining data. To the extent the Reliability Coordinator is held accountable for any and all IROs then the Reliability Coordinator must get what data it needs. If the Transmission Operator and Balancing Authority need study data, then this should be addressed in a corollary standard. A Balancing Authority has no study functions regarding IROs, the only involvement of a Balancing Authority with IROs is to follow the directive of its Transmission Operators and Reliability Coordinator.

2. On page 18 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-003-0 R1 while the proposed replacement requirements are IRO-010-1 R1, R2, & R3. Minnesota Power's comment is, "Minnesota Power believes TOP-003-0 should remain as it stands. Having the requirement to report outage data to the RC in two places is better than not having it in TOP-003-0. Having it listed as a data requirement only and not in the standard does not make it clearer."

**Response:** Both NERC and FERC have requested that the standards be cleaned up and that includes removing redundancies. Outage reporting need only be covered once – the SDT simplified the data provision requirements by ensuring that there would be a single requirement for a specification that identified all data and information that needed to be provided to the Reliability Coordinator.

3. On page 19 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-0 R1 while the proposed replacement requirement is IRO-010-1 R1. Minnesota Power's comment is, "Interchange transaction data should be added to the new IRO-010-1 R1."

**Response:** IRO-010-1 Requirement R1 provides the Reliability Coordinator the flexibility to request whatever data it needs which is why there is not a list of ad hoc items and no inclusion of Interchange Transactions. Interchange Transactions will be included if needed, and omitted if they are not needed.

4. On page 20 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-005-1 Attachment 1- TOP-005-0 Electric System Data Reliability Data while the proposed replacement requirement is IRO-010-1 R3. Minnesota Power's comment is, "Agree – Data requirements will be more detailed in new standard. However, RC should still be required to share this data with the TO's and BA's. This information should not be lost from this requirement by removing the RC from TOP-005-1 attachment 1."

**Response:** The requirements remaining in TOP-005 require Balancing Authorities and Transmission Operators to share data with other Balancing Authorities and Transmission Operators. IRO-008-1 Requirement R3 requires the Reliability Coordinator to share the data under specified conditions. The new standard does not preclude any other entity from asking for and obtaining data.

## Consideration of Comments on Initial Ballot of IRO-010 — Reliability Coordinator Data Specification and Collection

---

5. On page 22 of 23 of the redlined "Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards", the already approved standard requirement is TOP-006-1 R4 while the proposed replacement requirement is IRO-010-1 R1 R2, & R3. Minnesota Power's comment to TOP-006-1 R4 is, "Minnesota Power don't agree with removing reliability coordinator from the requirement. – Including the Reliability Coordinator in the statement that the RC, TO & BA's shall have information including weather forecasts and past load patterns available to predict near-term load patterns provides clarity."

**Response:** The adopted paradigm is to provide flexibility and define the objective not the procedure. Listing data items can lead to including data that is not needed and omitting data that is needed. If a Reliability Coordinator needs data including such items as weather forecasts and load patterns, then the Reliability Coordinator will include that item in its list to the entity involved; and if the Reliability Coordinator doesn't need the item then the Reliability Coordinator will not ask for it. The concept is that the Reliability Coordinator is obligated to comply with IROLs and that the Reliability Coordinator will not be excused if it did not ask for data that it needed to ensure IROL compliance.

## Standards Announcement

### Eight Recirculation Ballot Windows Open August 12, 2008

**Now available at:** <https://standards.nerc.net/CurrentBallots.aspx>

#### Recirculation Ballot Windows for IRO-008-1, IRO-009-1 and IRO-010-1 Open August 12, 2008

The [recirculation ballots](#) for the following [Interconnection Reliability Operating Limit](#) (IROL) standards and their associated implementation plan open at 8 a.m. (EDT) on Tuesday, August 12, 2008:

- IRO-008-1— Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1— Reliability Coordinator Actions to Operate within IROLs
- IRO-010-1— Reliability Coordinator Data Specification and Collection

These standards require the Reliability Coordinator (RC) to take actions to keep the bulk electric system operating within IROLs.

The ballot for each standard includes the retirement or revision of associated requirements from some already approved standards as identified in the table below. The IROL [implementation plan](#) contains the justification for the recommended retirements and revisions.

Note that during the initial ballot window, balloters identified some typographical errors in IRO-004 and IRO-005 and these have been corrected. A redline version of IRO-004 and IRO-005 has been posted to identify, with yellow highlighting, the corrections made. The corrections include the following:

- IRO-004 – changed the reference from “R7” to “R1” for the identification of the first set of VSLs
- IRO-005 – corrected the measures to reference the new requirement numbers

Three Ballots for IROL Standards	
Ballot for New Standard	Includes Modifications to Associated Approved Standards
IRO-008 — RC Operational Analyses and Real-time Assessments	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R1 and R2</li> </ul>
IRO-009 — RC Actions to Operate within IROLs	EOP-001-0 — Emergency Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R2</li> </ul>
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>▪ Retire R3 and R6</li> </ul>
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>▪ Retire R3, R5, R16, R17;</li> <li>▪ Modify R9, R13 and R14</li> </ul>

IRO-010 — RC Data Specification and Collection	IRO-002-1 — RC – Facilities ▪ Retire R2
	IRO-004-1 — RC – Operations Planning ▪ Retire R4, R5
	IRO-005-2 — RC – Current Day Operations ▪ Retire R2
	TOP-003-0 — Planned Outage Coordination ▪ Modify R1.2
	TOP-005-1 — Operational Reliability Information ▪ Retire R1, R1.1
	TOP-006-1 — Monitoring System Conditions ▪ Modify R4

The recirculation ballot for each of the above standards will **close** at 8 p.m. (EDT) on Thursday, **August 21, 2008**.

**Five Recirculation Ballot Windows for Project 2006-07 — ATC/TTC and CBM/TRM Open August 12, 2008**

The [recirculation ballots](#) for the following [ATC-related standards](#) and their associated implementation plans open at 8 a.m. (EDT) on Tuesday, August 12, 2008:

- MOD-001-1 — Available Transfer Capability
- MOD-008-1 — Transmission Reliability Margin
- MOD-028-1 — Area Interchange Methodology
- MOD-029-1 — Rated System Path Methodology
- MOD-030-1 — Flowgate Methodology

This set of standards requires consistency in the calculation and documentation of Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). (Note that the ATC-related standard for Capacity Benefit Margin is not included in this set of ballots).

The ballot for each standard includes the retirement of associated approved standards as identified in the table below. The [implementation plans](#) contain the justification for the recommended retirements.

Note that during the initial ballot window, balloters identified some typographical errors in MOD-030 and these have been corrected. The errors include the following:

- Applicability 4.1.1 - added a space between "(AFCs)" and "on"
- R1 - replaced the “period” with a “colon” following "(ATCID)"
- R2.1.2 - changed "analyses" to “analysis”
- Added "R"s to all "fourth-tier" requirements (e.g., changed “2.1.1.1” to “R2.1.1.1”)

A redline version of MOD-030 has been posted to identify, with yellow highlighting, the corrections made. In addition, all of the ATC-related standards were missing the “Regional Variances” and “Version History” sections of the standard and these have been added to all five of the standards.

During the initial ballot window, several balloters provided suggestions for additional improvements to MOD-030-1. (The suggested improvements are aimed at allowing additional methods of achieving the same reliability objective – the suggested improvements are not aimed at correcting any errors in MOD-030-1.) Under the existing standards development process, if the drafting team makes these changes to MOD-030-1, then the standard must be posted for an additional comment period, and then the balloting must begin again. This delay would mean that the standard would not be ready to file with FERC before its due date.

To remedy this problem, the drafting team has submitted a SAR to initiate modifications to MOD-030-1, and has received Standards Committee authorization to post the SAR and a proposed version of MOD-030-2 that reflects consideration of comments submitted with the initial ballot of MOD-030-1. The SAR and proposed MOD-030-2 are currently posted for stakeholder review and comment. As envisioned, MOD-030-2 will move through the standards development process and will be filed with governmental authorities before MOD-030-1 becomes effective.

Five Ballots for ATC-related Standards	
Ballot for New Standard	Includes Retirement of Associated Approved Standards
MOD-001-1 — Available Transfer Capability	MOD-001-0 — Documentation of TTC and ATC Calculation Methodologies FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-008-1 — Transmission Reliability Margin	MOD-008-0 — Documentation and Content of Each Regional TRM Methodology MOD-009-0 — Procedure for Verifying TRM Values
MOD-028-1 — Area Interchange Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-029-1 — Rated System Path Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs
MOD-030-1 — Flowgate Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs

The recirculation ballot for each of the above standards will **close** at 8 p.m. (EDT) on Thursday, **August 21, 2008**.

## Standards Announcement

### Final Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

#### Final Ballot Results for Three IROL-related Standards and Associated Implementation Plans

The final ballots for the following Interconnection Reliability Operating Limit ([IROL](#)) related standards (and the associated retirements and revisions identified in their implementation plans) were conducted from August 12, 2008 through August 21, 2008. The ballots were approved, and the results are shown in the table below:

Three Ballots for IROL-related Standards		
Ballot for New Standard	Includes Modifications to Associated Approved Standards	Final Ballot Results
IRO-008 — RC Operational Analyses and Real-time Assessments	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R1 and R2</li> </ul>	Quorum: 93.72 % Approval: 89.49 %
IRO-009 — RC Actions to Operate within IROLs	EOP-001-0 — Emergency Operations Planning <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	Quorum: 93.68 % Approval: 86.53 %
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R3 and R6</li> </ul>	
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>Retire R3, R5, R16, R17;</li> <li>Modify R9, R13 and R14</li> </ul>	
IRO-010 — RC Data Specification and Collection	IRO-002-1 — RC – Facilities <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	Quorum: 93.75 % Approval: 85.95 %
	IRO-004-1 — RC – Operations Planning <ul style="list-style-type: none"> <li>Retire R4, R5</li> </ul>	
	IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>Retire R2</li> </ul>	
	TOP-003-0 — Planned Outage Coordination <ul style="list-style-type: none"> <li>Modify R1.2</li> </ul>	
	TOP-005-1 — Operational Reliability Information <ul style="list-style-type: none"> <li>Retire R1, R1.1</li> </ul>	
	TOP-006-1 — Monitoring System Conditions <ul style="list-style-type: none"> <li>Modify R4</li> </ul>	

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The [Ballot Results](#) standards web page provides a link to the detailed results of each of these ballots.

## Final Ballot Results for Five ATC-related Standards and Associated Implementation Plans (Project 2006-07)

The final ballots for five [ATC-related standards](#) (and the associated retirements identified in their implementation plans) were conducted from August 12, 2008 through August 21, 2008. The ballots were approved, and the results are shown in the table below:

Five Ballots for ATC-related Standards		
Ballot for New Standard	Includes Retirement of Associated Approved Standards	Final Ballot Results
MOD-001-1 Available Transfer Capability	MOD-001-0 — Documentation of TTC and ATC Calculation Methodologies FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 94.87% Approval: 76.83%
MOD-008-1 Transmission Reliability Margin	MOD-008-0 — Documentation and Content of Each Regional TRM Methodology MOD-009-0 — Procedure for Verifying TRM Values	Quorum: 95.15% Approval: 81.49%
MOD-028-1 Area Interchange Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 95.54 % Approval: 79.34 %
MOD-029-1 Rated System Path Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 95.56 % Approval: 92.24 %
MOD-030-1 Flowgate Methodology	FAC-012-1 — TC Methodology FAC-013-1 — Establish and Communicate TCs	Quorum: 95.24 % Approval: 74.26 %

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

The [Ballot Results](#) standards web page provides a link to the detailed results of each of these ballots.

## Standards Development Process

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## **Exhibit E**

Record of Development of Proposed IRO-010-1 Interpretation

## Project 2009-11

### Interpretation – IRO-010-1, R1.2 and R3 – Reliability Coordinator Data Specification and Collection by WECC Reliability Coordination Subcommittee

#### Related Files

**Status:** A request for an interpretation of IRO-010-1, Requirement R1.2 and R3 has been submitted by the WECC Reliability Coordination Subcommittee. The ballot pool approved the standards revisions. The revised standards will be submitted to the NERC Board of Trustees for adoption.

**Summary:**

The request asks to clarify the following:

- Does the phrase, “as specified” in Requirement R3 reference the documented data and information specification in IRO-010-1 Requirement R1, or is the data and information in Requirement R3 “any” data and information that the Reliability Coordinator might request?
- Is the intent of Requirement R3 to have each responsible entity provide its own data and information to its Reliability Coordinator, or is the intent to have responsible entities provide aggregated data (collected and compiled from other entities at the direction of the Reliability Coordinator) to the Reliability Coordinator?
- Under Requirement R1.2, what actions (on the part of the Reliability Coordinator) are expected to support the “mutually acceptable format” for submission of data and information?

**Interpretation Process:**

In accordance with the Reliability Standards Development Procedure, the interpretation must be posted for a 30-day pre-ballot review, and then balloted. There is no public comment period for an interpretation. Balloting will be conducted following the same method used for balloting standards. If the interpretation is approved by its ballot pool, then the interpretation will be appended to the standard and will become effective when adopted by the NERC Board of Trustees and approved by the applicable regulatory authorities. The interpretation will remain appended to the standard until the standard is revised through the normal standards development process. When the standard is revised, the clarifications provided by the interpretation will be incorporated into the revised standard.

Request for an Interpretation of a Reliability Standard	
<b>Date submitted:</b>	February 10, 2009
<b>Contact information for person requesting the interpretation:</b>	
<b>Name:</b>	Nancy Bellows
<b>Organization:</b>	WECC Reliability Coordination Subcommittee
<b>Telephone:</b>	970-461-7246
<b>E-mail:</b>	bellows@wapa.gov
<b>Identify the standard that needs clarification:</b>	
<b>Standard Number:</b>	IRO-010-1
<b>Standard Title:</b>	Reliability Coordinator Data Specification and Collection
<b>Identify specifically what needs clarification (If a category is not applicable, please leave it blank):</b>	
<b>Requirement Number and Text of Requirement:</b>	
<b>IRO-010-1</b>	
<p><b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability</p>	

Coordinator(s) with which it has a reliability relationship.

**Clarification needed:**

1. Does the phrase, "as specified" in Requirement R3 reference the documented data and information specification in IRO-010-1 Requirement R1, or is the data and information in Requirement R3 "any" data and information that the Reliability Coordinator might request?
2. Is the intent of Requirement R3 to have each responsible entity provide its own data and information to its Reliability Coordinator, or is the intent to have responsible entities provide aggregated data (collected and compiled from other entities at the direction of the Reliability Coordinator) to the Reliability Coordinator?
3. Under Requirement R1.2, what actions (on the part of the Reliability Coordinator) are expected to support the "mutually acceptable format" for submission of data and information?

**Identify the material impact associated with this interpretation:**

**Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this standard.**

If responsible entities are required to supply the Reliability Coordinator with any data requested by the Reliability Coordinator at any time, including data and information collected and aggregated for the Reliability Coordinator, then the responsible entities will need additional resources to meet the requirements in this standard.

Similarly, if the phrase, "mutually acceptable" does not require that the Reliability Coordinator "negotiate" an acceptable format for receipt of data and information, then the entities providing the data and information may need additional resources to convert their data into a format specified by the Reliability Coordinator. The RC may need additional resources if the phrase "mutually acceptable format" requires negotiation.

**Project 2009-11: Response to Request for an Interpretation of IRO-010-1 for Requirements R1.2 and R3**

The following interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1 and R3, was developed by the IROL Standards Drafting Team.

**Requirement Number and Text of Requirement**

**R1.** The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:

**R1.1.** List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.

**R1.2.** Mutually agreeable format.

**R1.3.** Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).

**R1.4.** Process for data provision when automated Real-Time system operating data is unavailable.

**R3.** Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship.

### Question #1

Does the phrase, "as specified" in Requirement R3 reference the documented data and information specification in IRO-010-1 Requirement R1, or is the data and information in Requirement R3 "any" data and information that the Reliability Coordinator might request?

### Response to Question #1

The data to be supplied in Requirement R3 applies to the documented specification for data and information referenced in Requirement R1.

### Question #2

Is the intent of Requirement R3 to have each responsible entity provide its own data and information to its Reliability Coordinator, or is the intent to have responsible entities provide aggregated data (collected and compiled from other entities at the direction of the Reliability Coordinator) to the Reliability Coordinator?

### Response to Question #2

The intent of Requirement R3 is for each responsible entity to ensure that its data and information (as stated in the documented specification in Requirement R1) are provided to the Reliability Coordinator.

Another entity may provide that data or information to the Reliability Coordinator on behalf of the responsible entity, but the responsibility remains with the responsible entity. There is neither intent nor obligation for any entity to compile information from other entities and provide it to the Reliability Coordinator.

### Question #3

Under Requirement R1.2, what actions (on the part of the Reliability Coordinator) are expected to support the "mutually acceptable format" for submission of data and information?

### Response to Question #3

Requirement R1.2 mandates that the parties will reach a mutual agreement with respect to the format of the data and information. If the parties can not mutually agree on the format, it is expected that they will negotiate to reach agreement or enter into dispute resolution to resolve the disagreement.

Note: an Interpretation cannot be used to change a standard.

Request for an Interpretation of a Reliability Standard	
<b>Date submitted:</b>	February 10, 2009
<b>Contact information for person requesting the interpretation:</b>	
<b>Name:</b>	Nancy Bellows
<b>Organization:</b>	WECC Reliability Coordination Subcommittee
<b>Telephone:</b>	970-461-7246
<b>E-mail:</b>	bellows@wapa.gov
<b>Identify the standard that needs clarification:</b>	
<b>Standard Number:</b>	IRO-010-1
<b>Standard Title:</b>	Reliability Coordination - Operations Planning, Reliability Coordinator Data Specification and Collection, Planned Outage Coordination
<b>Identify specifically what needs clarification (If a category is not applicable, please leave it blank):</b>	
<b>Requirement Number and Text of Requirement:</b>	
<b>IRO-010-1</b>	
<p><b>R1.</b> The Reliability Coordinator shall have a documented specification for data and information to build and maintain models to support Real-time monitoring, Operational Planning Analyses, and Real-time Assessments of its Reliability Coordinator Area to prevent instability, uncontrolled separation, and cascading outages. The specification shall include the following:</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</li> <li><b>R1.2.</b> Mutually agreeable format.</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability</p>	

Coordinator(s) with which it has a reliability relationship.

**Clarification needed:**

1. Does the phrase, "as specified" in Requirement R3 reference the documented data and information specification in IRO-010-1 Requirement R1, or is the data and information in Requirement R3 "any" data and information that the Reliability Coordinator might request?
2. Is the intent of Requirement R3 to have each responsible entity provide its own data and information to its Reliability Coordinator, or is the intent to have responsible entities provide aggregated data (collected and compiled from other entities at the direction of the Reliability Coordinator) to the Reliability Coordinator?
3. Under Requirement R1.2, what actions (on the part of the Reliability Coordinator) are expected to support the "mutually acceptable format" for submission of data and information?

**Identify the material impact associated with this interpretation:**

**Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this standard.**

If responsible entities are required to supply the Reliability Coordinator with any data requested by the Reliability Coordinator at any time, including data and information collected and aggregated for the Reliability Coordinator, then the responsible entities will need additional resources to meet the requirements in this standard.

Similarly, if the phrase, "mutually acceptable" does not require that the Reliability Coordinator "negotiate" an acceptable format for receipt of data and information, then the entities providing the data and information may need additional resources to convert their data into a format specified by the Reliability Coordinator. The RC may need additional resources if the phrase "mutually acceptable format" requires negotiation.

## Standards Announcement

### Ballot Pool and Pre-ballot Window

March 24–April 22, 2009

Now available at: <https://standards.nerc.net/BallotPool.aspx>

### **Interpretation of IRO-010-1 for the WECC Reliability Coordination Subcommittee (Project 2009-11)**

An interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1.2 and R3, for the Western Electricity Coordinating Council (WECC) Reliability Coordination Subcommittee is posted for a 30-day pre-ballot review. Registered Ballot Body members may join the ballot pool to be eligible to vote on this interpretation **until 8 a.m. EDT on April 22, 2009**.

During the pre-ballot window, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list server for this ballot pool is: [bp-2009-11 RFI WECC RCS in](#).

### **Project Background**

The WECC Reliability Coordination Subcommittee is seeking clarification on 1) the type of data to be supplied to the Reliability Coordinator, 2) which entities are ultimately responsible for ensuring data are provided, and 3) what actions are expected of the Reliability Coordinator regarding a “mutually acceptable format.” The request and interpretation can be found on the project page:

[http://www.nerc.com/filez/standards/Project2009-11\\_Interpretation\\_IRO-010-1\\_WECC\\_RCS.html](http://www.nerc.com/filez/standards/Project2009-11_Interpretation_IRO-010-1_WECC_RCS.html)

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

Initial Ballot Window Open

April 22–May 1, 2009

Now available at: <https://standards.nerc.net/CurrentBallots.aspx>

### **Interpretation of IRO-010-1 for the WECC Reliability Coordination Subcommittee (Project 2009-11)**

An initial ballot window for an interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1.2 and R3, for the Western Electricity Coordinating Council (WECC) Reliability Coordination Subcommittee is now open **until 8 p.m. EDT on May 1, 2009**.

### **Project Background**

The WECC Reliability Coordination Subcommittee is seeking clarification on 1) the type of data to be supplied to the Reliability Coordinator, 2) which entities are ultimately responsible for ensuring data are provided, and 3) what actions are expected of the Reliability Coordinator regarding a “mutually acceptable format.” The request and interpretation can be found on the project page:

[http://www.nerc.com/filez/standards/Project2009-11\\_Interpretation\\_IRO-010-1\\_WECC\\_RCS.html](http://www.nerc.com/filez/standards/Project2009-11_Interpretation_IRO-010-1_WECC_RCS.html)

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Initial Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

#### **Interpretation of IRO-010-1 for the WECC Reliability Coordination Subcommittee (Project 2009-11)**

Since at least one negative ballot was submitted with a comment, a recirculation ballot will be held. The recirculation ballot will be held after the drafting team responds to voter comments submitted during this ballot.

The initial ballot for an interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1.2 and R3, for the Western Electricity Coordinating Council (WECC) Reliability Coordination Subcommittee ended May 1, 2009. The ballot results are shown below. The [Ballot Results](#) Web page provides a link to the detailed results.

Quorum:	88.64%
Approval:	84.77%

#### **Ballot Criteria**

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

#### **Project Background**

The WECC Reliability Coordination Subcommittee is seeking clarification on 1) the type of data to be supplied to the Reliability Coordinator, 2) which entities are ultimately responsible for ensuring data are provided, and 3) what actions are expected of the Reliability Coordinator regarding a “mutually acceptable format.” The request and interpretation can be found on the project page:

<http://www.nerc.com/filez/standards/Project2009-11 Interpretation IRO-010-1 WECC RCS.html>

#### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Consideration of Comments for Initial Ballot of Interpretation of IRO-010-1 Requirements R1.2 and R3 for the WECC Reliability Coordination Subcommittee (Project 2009-11)

**Summary Consideration:** Many who submitted comments indicated disagreement with the drafting team’s response to Question 3. The IROL standards drafting team (SDT) did not intend for the interpretation to dictate there be only one mutually agreeable format for all data and information exchange. If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity must do, not “how” to do it. The statement “The WECC RC staff believes that the current formats are reasonable, and that they work with the current processes and tools” is the intent of the interpretation. Others offering comments asked for clarification on the dispute resolution process. The SDT did not think it appropriate to dictate a dispute resolution process in the interpretation. In many cases, the entities in dispute will be from the same Region; therefore, that Region’s dispute resolution process would be appropriate. However, some disputes will cross Regions or even involve more than two Regions. In those cases, the parties could agree to abide by any involved Region’s dispute resolution process.

The IROL SDT did not make any changes based on the comments received. If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

Voter	Entity	Segment	Vote	Comment
Scott Kinney	Avista Corp.	1	Negative	I support interpretation 1 and 2 but feel interpretation 3 is still ambiguous. The RC staff is required to collect and utilize a considerable amount of data. The language of the interpretation may mean that there can be many different negotiated methods that may or may not be a format that is in use now. The language of the interpretation may also mean there needs to be ONE agreement with all parties in the region as to what constitutes an agreeable format. Interpretation 3 still needs clarity in order for the RC staff to perform their duties.

<sup>1</sup> The appeals process is in the Reliability Standards Development Procedure: [http://www.nerc.com/files/RSDP\\_V6\\_1\\_12Mar07.pdf](http://www.nerc.com/files/RSDP_V6_1_12Mar07.pdf).

Voter	Entity	Segment	Vote	Comment
<p><b>Response: The IROL SDT thanks you for your comment. A “mutually agreeable format” does not necessarily require negotiations. However, if a proposed format is not mutually agreeable, it is each entity’s obligation to negotiate an acceptable format. The IROL SDT language means format differences are recognized by our industry and allows for flexibility of technology, agreeable methods, and reasoned discourse to close the gap of formatting. Certainly it would be incumbent upon the RC to seek common industry applications and practices for sharing data and information.</b></p>				
Gordon Rawlings	BC Transmission Corporation	1	Negative	"R1.2 of the standard is acceptable as approved and no interpretation is necessary. Responsible parties are able to work out a "mutually acceptable format" for themselves. The interpretation may be interpreted by some to limit or require the determination of a "mutually acceptable format" to negotiations and dispute resolution."
Phil Park	British Columbia Transmission Corporation	2	Negative	R1.2 of the standard is acceptable as approved and no interpretation is necessary. Responsible parties are able to work out a "mutually acceptable format" for themselves. The interpretation may be interpreted by some to limit or require the determination of a "mutually acceptable format" to negotiations and dispute resolution.
<p><b>Response: The IROL SDT thanks you for your comment. We agree. A “mutually agreeable format” does not necessarily require negotiations. However, if a proposed format is not mutually agreeable, it is each entity’s obligation to negotiate an acceptable format.</b></p>				
Robert Kondziolka	Salt River Project	1	Negative	Requirement R1.2 mandates that the parties will reach a mutual agreement with respect to the format of the data and information. If the parties can not mutually agree on the format, it is expected that they will negotiate to reach agreement or enter into dispute resolution to resolve the disagreement. However, it is not reasonable to expect the Reliability Coordinator to negotiate with every entity to achieve consistent a consistent format. Dispute resolution is not a good option for this type of issue and is not timely.
<p><b>Response: The IROL SDT thanks you for your comment. It is not anticipated or expected that an RC will need to negotiate with each entity for a “mutually agreeable format.” The IROL SDT language means format differences are recognized by our industry and allows for</b></p>				

Voter	Entity	Segment	Vote	Comment
<p><b>flexibility of technology, agreeable methods, and reasoned discourse to close the gap of formatting. Certainly it would be incumbent upon the RC to seek common industry applications and practices for sharing data and information.</b></p>				
Shaun Jensen	Idaho Power Company	3	Negative	<p>The WECC RC staff currently receives data from approximately 45 entities in the Western Interconnection. The response to question 3 does not provide any clarity to address the ambiguity associated with the language of Requirement 1.2. The language of the interpretation may mean that there can be as many as 45 different negotiated methods that may or may not be a format that is in use now. The language of the interpretation may also mean there needs to be ONE agreement with all parties in the region as to what constitutes an agreeable format. The WECC RC staff is concerned over the impact of any change with current formats. The most significant problem would be the interpretation that each entity is required to have a formal documented agreeable format. The WECC RC department is not staffed to manage this nor is it in the interest of continuity of service (which equates to reliability) if the sending entity chooses to not send data until the agreeable format is resolved. The WECC RC staff believes that the current formats are reasonable, and that they work with the current processes and tools. They further believe that the WECC RC department should have only one agreement with entities under its jurisdiction if a format change is required.</p>
<p><b>Response: The IROL SDT thanks you for your comment. If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity must do, not “how” to do it. The statement “The WECC RC staff believes that the current formats are reasonable, and that they work with the current processes and tools” is the intent of the interpretation.</b></p>				
Terry L Baker	Platte River Power Authority	3	Negative	<p>PRPA agrees with the answers the proposed Interpretation provides for Questions #1 and #2. However, we do not agree with the answer provided for Question #3. The proposed Interpretation states If the parties can not mutually agree on the format, it is expected that they will negotiate to reach agreement or enter into dispute resolution to resolve the disagreement. The WECC Reliability Coordination offices gather system reliability data from approximately 45 different Balancing</p>

Voter	Entity	Segment	Vote	Comment
				<p>Authorities and Transmission Operators. PRPA understands that each of these entities may not want to be forced to use a data exchange format that is costly to implement. However, the Interpretation suggests that the Reliability Coordination function could potentially have to negotiation a different mutually acceptable format with each of the 45 entities within its footprint. In addition, the Interpretation suggests that the entities enter into the dispute resolution to resolve the disagreement. Dispute Resolution processes are time consuming and not conducive to achieving the system reliability objectives of the NERC Standards. PRPA suggests that the Interpretation be modified to recommend a mutually agreeable format that can be determined by the Regional Reliability Organization.</p>
<p><b>Response: The IROL SDT thanks you for your comment. Thomas J. Bradish	Reliant Energy Services	5	Negative	<p>Reliant votes NO for the reasons cited in the WECC position paper on this matter namely: The WECC Reliability Coordination (RC) staff was asked to provide their perspective on the IRO-010-1 interpretation. The WECC RC staff provided the following information regarding the recommendation to vote NO: 1. The WECC Reliability Coordination staff agrees with the interpretation language for the response to question number 1. 2. The proposed interpretation for question 2 provides clarity. However, the result is more work on the part of the WECC RC staff. This is due to the original assumption that the WECC RC department would receive the bulk of data from balancing authorities as it has in the past. This interpretation may result in an increase in the number of entities that perceive an obligation under this interpretation to provide their data directly. The WECC RC staff is not opposed to this interpretation but regrets the inefficiencies in managing data request obligations on a much more granular level. This will have a direct impact on WECC RC staffing needs. 3. The WECC RC staff finds the language in the proposed interpretation for question 3 to be ambiguous and problematic in several key areas. Currently the WECC RC staff receives data in four significant formats as follows: a) ICCP (Inter Control Center Communication Protocol) “Used for transmitting large amounts of real-time data from measurements around the interconnection for real-time displays, tools, and advanced applications. b) EIDE data (Electric Industry Data Exchange) “Used for entities to transmit schedule type data such as load forecast, interchange schedules, unit commitment, etc., for RC next-day studies. c) Coordinated Outage System (COS)</p>

Voter	Entity	Segment	Vote	Comment
				<p>‘ Used for outages planned for the next-day study process and RC situational awareness. d) Topology updates (model updates) of data from around the interconnection ‘ Used as a foundation for real-time applications, situational awareness, and a host of tools to facilitate analyses of the RC staff. The format is in specific templates and information. There are other requests that involve no specific format (single-line displays, e-mail notifications, etc.). The WECC RC staff currently receives data from approximately 45 entities in the Western Interconnection. The response to question 3 does not provide any clarity to address the ambiguity associated with the language of Requirement 1.2. The language of the interpretation may mean that there can be as many as 45 different negotiated methods that may or may not be a format that is in use now. The language of the interpretation may also mean there needs to be ONE agreement with all parties in the region as to what constitutes an agreeable format. The WECC RC staff is concerned over the impact of any change with current formats. The most significant problem would be the interpretation that each entity is required to have a formal documented agreeable format. The WECC RC department is not staffed to manage this nor is it in the interest of continuity of service (which equates to reliability) if the sending entity chooses to not send data until the agreeable format is resolved. The WECC RC staff believes that the current formats are reasonable, and that they work with the current processes and tools. They further believe that the WECC RC department should have only one agreement with entities under its jurisdiction if a format change is required. An interpretation cannot be used to change a standard. If the interpretation is approved by its ballot pool, then the interpretation will be appended to the standard and will become effective when adopted by the NERC Board of Trustees, and approved by the applicable regulatory authorities, including FERC. The interpretation will remain appended to the standard until the standard is revised through the normal standards development process. When the standard is revised, the clarifications provided by the interpretation will be incorporated into the revised standard.</p>

Voter	Entity	Segment	Vote	Comment
<p><b>Response:</b> The IROL SDT thanks you for your comment.</p>				
<p><b>Question 2.</b> The interpretation of this question simply states that each entity is responsible for supplying the RC with its data. If that entity has another entity that satisfactorily supplies the data to the RC, then that is acceptable. The requirement still applies to the obligated entity.</p>				
<p><b>Question 3.</b> A “mutually agreeable format” does not necessarily require negotiations. However, if a proposed format is not mutually agreeable, it is each entity’s obligation to negotiate an acceptable format. The IROL SDT language means format differences are recognized by our industry and allows for flexibility of technology, agreeable methods, and reasoned discourse to close the gap of formatting. Certainly it would be incumbent upon the RC to seek common industry applications and practices for sharing data and information. If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity must do, not “how” to do it.</p>				
Jerome Murray	Oregon Public Utility Commission	9	Negative	<p>The response to question 3 does not provide any clarity to address the ambiguity associated with the language of Requirement 1.2. The language of the interpretation may mean that there can be as many as 45 different negotiated methods that may or may not be a format that is in use now. The language of the interpretation may also mean there needs to be ONE agreement with all parties in the region as to what constitutes an agreeable format. The WECC RC staff is concerned over the impact of any change with current formats. <p><b>designed to require “what” an entity must do, not “how” to do it. The statement “The WECC RC staff believes that the current formats are reasonable, and that they work with the current processes and tools” is the intent of the interpretation.</b></p>				
Louise McCarren	Western Electricity Coordinating Council	10	Negative	Historically WECC RCs have received data from the BAs. This interpretation may result in an increase in the number of entities that perceive an obligation to provide their data directly to the RC. The response to question 3 does not provide the clarity required to address the ambiguity associated with the language of Requirement 1.2. The language of the interpretation may mean that there can be as many different negotiated methods as there are entities providing data to the RC. Alternatively the interpretation may mean there needs to be ONE agreement describing what constitutes a mutually agreeable format with all parties in the region. The most significant problem with these two potential interpretations would be that each entity is required to have a formal documented mutually agreeable format. This may create a volume of work that the WECC RC department is not staffed to accommodate. In addition, it is not in the interest of continuity of service (which equates to reliability) if the sending entity chooses to not send data until this term is defined.
<p><b>Response: The IROL SDT thanks you for your comment.</b></p> <p><b>The interpretation Question 2 simply states that each entity is responsible for supplying the RC with its data. If the responsible entity has another entity that satisfactorily supplies the data to the RC, then that is acceptable. However, if a proposed format is not mutually agreeable, it is each entity’s obligation to negotiate an acceptable format. The IROL SDT language means format differences are recognized by our industry and allows for flexibility of technology, agreeable methods, and reasoned discourse to close the gap of formatting. Certainly it would be incumbent upon the RC to seek common industry applications and practices for sharing data and information. If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity must do, not “how” to do it.</b></p>				
Brandy A Dunn	Western Area Power	1	Affirmative	COMMENTS REGARDING QUESTION #2: Transferring the responsibility of Transmission Operator reporting to the Balancing Authority places the Balancing Authority into a position of being between the Reliability Coordinator and the

Voter	Entity	Segment	Vote	Comment
	Administration			<p>Transmission Operator. This could have compliance obligations that would impact the Balancing Authority. Also, the Balancing Authority would become the entity that the Reliability Coordinator would go to with questions about the data. The Balancing Authority would become an extra, unnecessary link in communication between the Reliability Coordinator and the Transmission Operator. It is unclear when any direct communication between the Reliability Coordinator and the Transmission Operator would occur. This could lead to Balancing Authorities receiving directives from the Reliability Coordinator for Transmission Operator real-time issues. The functional responsibility should remain with the functional model entity assigned that responsibility. Saving resources for the Reliability Coordinator means having to commit more resources by the Balancing Authority. The responsibility of coordinating with the Transmission Operator lies with the Reliability Coordinator. This cost of doing Reliability Coordinator business should not be passed on to the Balancing Authorities. If more resources are required by the Reliability Coordinator to meet these obligations, then that is what should be done. COMMENTS REGARDING QUESTIONS #3: The Reliability Coordinator should work with entities to determine the method of data and information transfer, not dictate the method to be used. This should be a collaborative process. Receiving data "requests" from the Reliability Coordinator that are not perceived as "reasonable" does not build collaborative relationships between the functional entities and the Reliability Coordinator. There should be a sense of working together to solve issues of data and information transfer, not a feeling that a requirement is dictated without any process for stakeholder input.</p>

**Response:** The IROL SDT thanks you for your comment.

**Question 2 Comment:** The interpretation of this question simply states that each entity is responsible for supplying the RC with its data. If that entity has another entity that satisfactorily supplies the data to the RC, then that is acceptable. The requirement still applies to the obligated entity. The requirement is not dictating the method for data exchange, only that the data be exchanged.

**Question 3:** If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity

Voter	Entity	Segment	Vote	Comment
<b>must do, not “how” to do it.</b>				
Chifong L. Thomas	Pacific Gas and Electric Company	1	Negative	<p>1. PG&amp;E agrees with the interpretation language for the response to question number 1. 2. PG&amp;E is not opposed to interpretation of question number 2. However, we are concerned about the resulting inefficiencies in managing data request obligations on a much more granular level. This interpretation will have a direct impact on WECC RC staffing needs with no increase in reliability. Though the proposed interpretation for question number 2 provides clarity, the result is more work on the part of the WECC RC staff. The WECC RC department would receive the bulk of data from balancing authorities; this interpretation may result in an increase in the number of entities that perceive an obligation under this interpretation to provide their data directly. 3. PG&amp;E finds the language in the proposed interpretation for question number 3 to be ambiguous and problematic in several key areas. Currently the WECC RC staff receives data in four significant formats in addition to other requests that involve no specific format (single-line displays, e-mail notifications, etc.). The WECC RC staff currently receives data from approximately 45 entities in the Western Interconnection. The response to question number 3 does not provide any clarity to address the ambiguity associated with the language of Requirement 1.2. The language of the interpretation may mean that there can be as many as 45 different negotiated methods that may or may not be a format that is in use now. The language of the interpretation may also mean there needs to be ONE agreement with all parties in the region as to what constitutes an agreeable format. We are also concerned over the impact of any change with current formats. The most significant problem would be the interpretation that each entity is required to have a formal documented agreeable format. This interpretation would not help continuity of service (which equates to reliability) if the sending entity chooses to not send data until the agreeable format is resolved.</p>

**Response:** The IROL SDT thanks you for your comment.

**2:** The interpretation of this question simply states that each entity is responsible for supplying the RC with its data. If that entity has

Voter	Entity	Segment	Vote	Comment
<p>another entity that satisfactorily supplies the data to the RC, then that is acceptable. The requirement still applies to the obligated entity. The requirement is not dictating the method for data exchange, only that the data be exchanged.</p>				
<p>3: A “mutually agreeable format” does not necessarily require negotiations. However, if a proposed format is not mutually agreeable, it is each entity’s obligation to negotiate an acceptable format. The IROL SDT language means format differences are recognized by our industry and allows for flexibility of technology, agreeable methods, and reasoned discourse to close the gap of formatting. Certainly it would be incumbent upon the RC to seek common industry applications and practices for sharing data and information. If the RC has a current data exchange format or formats with any entity or entities with which they have a reliability relationship, then that is acceptable. Many formats for data exchange exist today. The standard is designed to require “what” an entity must do, not “how” to do it.</p>				
Benjamin Church	FPL Energy	5	Negative	<p>Interpretation fails to answer Question #1. The issue of "any" data is critical and should be explained as requested by the Interpretation. Response to Question #3 creates additional ambiguity. Standard requires for parties to reach a "mutually agreed upon format." The response to Question #3 then adds the term "information" to the agreement. Format and information are very different terms and it is not clear if the respondents are intending to include content as well as structure in the consensus agreement. Also, the response to Question #3 introduces the concept of a "dispute resolution" process that is not clearly defined in the Rules of Procedure. This creates additional ambiguity and further obscures the standard.</p>
<p><b>Response:</b> The IROL SDT thanks you for your comment.</p>				
<p><b>Question 1:</b> The interpretation states that the data to be supplied in Requirement R3 applies to the documented specification for data and information referenced in Requirement R1. The second part of the question (relating to “any data”) is moot because the interpretation applies only to the data specified in R1.</p>				
<p><b>Question 3:</b> R1 states “...shall have a documented specification for data and information...”; the drafting team did not add the term “information” to the requirement. R1.2 specifies that the specification will include “mutually agreeable format.”</p>				
<p>The SDT did not think it appropriate to dictate a dispute resolution process. In many cases, the entities in dispute will be from the same Region; therefore, that Region’s dispute resolution process would be appropriate. However, some disputes will cross Regions or even involve more than two Regions. In those cases, the parties could agree to abide by any involved Region’s dispute resolution process.</p>				

Voter	Entity	Segment	Vote	Comment
Tony Kroskey	Brazos Electric Power Cooperative, Inc.	1	Negative	Response to Question #2 needs further consideration for instances where an RC provides data to another RC. Do the responsible entities to the first RC also need to "ensure" that the second RC has received the "specified" data? Response to Question #3 needs further clarity. Also what compliance issue does this raise during the time that negotiations are in progress?
<p><b>Response: The IROL SDT thanks you for your comment.</b></p> <p><b>Question 2: Each responsible entity has only one RC and is therefore only required to provide data and information to that RC. If two or more RC's are sharing data, the responsible entity is not required to provide the data or information to the second RC.</b></p> <p><b>Question 3: We can not assess your issue for question 3 that it needs "further clarity" without further explanation of the context of your comment. We can not speak for NERC or Regional Compliance regarding compliance issues "during the time negotiations are in progress."</b></p>				
Joanne Kathleen Borrell	FirstEnergy Solutions	3	Affirmative	In regards to question 1 - we agree with the response provided. However, this interpretation response should trigger a revision to standard IRO-010, requirement R3 for clarity. The phrase "as specified" should be replaced with "as specified and developed per requirement R1." In regards to question 2 - we agree with the response provided. In regards to question 3 - we agree with the response but the question raised points to some adjusting needed in the standard for clarity. A potential problem from a compliance standpoint is that requirement R1 is only explicitly applicable to the RC. This could cause compliance issues for an RC who can not come to an agreement with one or more entities. Either R1.2 should be expanded or a new sub-requirement of R1 should be added that requires the RC to document a "dispute resolution mechanism" (similar to NUC-001-1 R9.1.4) to protect both its own interest and the interest of the entities that it monitors. The suggested changes could be captured in the 5-year review cycle required by NERC for all of its reliability standards.

Douglas Hohlbaugh	Ohio Edison Company	4	Affirmative	<p>In regards to question 1 - we agree with the response provided. However, this interpretation response should trigger a revision to standard IRO-010, requirement R3 for clarity. The phrase "as specified" should be replaced with "as specified and developed per requirement R1." In regards to question 2 - we agree with the response provided. In regards to question 3 - we agree with the response but the question raised points to some adjusting needed in the standard for clarity. A potential problem from a compliance standpoint is that requirement R1 is only explicitly applicable to the RC. This could cause compliance issues for an RC who can not come to an agreement with one or more entities. Either R1.2 should be expanded or a new sub-requirement of R1 should be added that requires the RC to document a "dispute resolution mechanism" (similar to NUC-001-1 R9.1.4) to protect both its own interest and the interest of the entities that it monitors. The suggested changes could be captured in the 5-year review cycle required by NERC for all of its reliability standards.</p>

**Response:** The IROL SDT thanks you for your comment. We will submit your comment to the NERC Manager of Standards Development as input to the NERC standards issues database for consideration during the next revision of this standard.

Voter	Entity	Segment	Vote	Comment
Anita Lee	Alberta Electric System Operator	2	Abstain	The AESO would like to cast an "abstention" vote to the overall ballot, but would also like to indicate our support to the interpretation to Q3. We do not, however, hold a position regarding the interpretation to either Q1 or Q2.
<b>Response: The IROL SDT thanks you for your comment.</b>				
Kenneth Goldsmith	Alliant Energy Corp. Services, Inc.	4	Affirmative	Please define the Dispute Resolution process as requested in question 3.
<b>Response: The IROL SDT thanks you for your comment. The SDT did not think it appropriate to dictate a dispute resolution process. In many cases, the entities in dispute will be from the same Region; therefore, that Region's dispute resolution process would be appropriate. However, some disputes will cross Regions or even involve more than two Regions. In those cases, the parties could agree to abide by any involved Region's dispute resolution process.</b>				
Thomas C. Mielnik	MidAmerican Energy Co.	3	Affirmative	Please define the Dispute Resolution Process in response to Question 3. Note: Unable to find information on the Dispute Resolution Process for Standards in the NERC Rules of Procedure.
<b>Response: The IROL SDT thanks you for your comment. The SDT did not think it appropriate to dictate a dispute resolution process. In many cases, the entities in dispute will be from the same Region; therefore, that Region's dispute resolution process would be appropriate. However, some disputes will cross Regions or even involve more than two Regions. In those cases, the parties could agree to abide by any involved Region's dispute resolution process.</b>				
Russell A Noble	Cowlitz County PUD	3	Affirmative	The SDT has adequately provided an interpretation. However, I believe there are gaps in the standards in general in providing the means by which reasonable required modeling data is established, and a realistic time frame for obtaining the data values. MOD-012-0 is a prime example of this problem. I have great hopes that the current revision process will address this problem. Thank you for the clear and concise interpretation.

## Standards Announcement Recirculation Ballot Window Open May 26–June 5, 2009

Now available at: <https://standards.nerc.net/CurrentBallots.aspx>

### **Interpretation of IRO-010-1 for the WECC Reliability Coordination Subcommittee (Project 2009-11)**

A recirculation ballot window for an interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1.2 and R3, for the Western Electricity Coordinating Council (WECC) Reliability Coordination Subcommittee is now open **until 8 p.m. EDT on June 5, 2009**.

### **Project Background**

The WECC Reliability Coordination Subcommittee is seeking clarification on 1) the type of data to be supplied to the Reliability Coordinator, 2) which entities are ultimately responsible for ensuring data are provided, and 3) what actions are expected of the Reliability Coordinator regarding a “mutually acceptable format.” The request and interpretation can be found on the project page:

[http://www.nerc.com/filez/standards/Project2009-11\\_Interpretation\\_IRO-010-1\\_WECC\\_RCS.html](http://www.nerc.com/filez/standards/Project2009-11_Interpretation_IRO-010-1_WECC_RCS.html)

### **Recirculation Ballot Process**

The Standards Committee encourages all members of the Ballot Pool to review the consideration of comments submitted with the initial ballots. In the recirculation ballot, votes are counted by exception only — if a Ballot Pool member does not submit a revision to that member’s original vote, the vote remains the same as in the first ballot. Members of the ballot pool may:

- Reconsider and change their vote from the first ballot.
- Vote in the second ballot even if they did not vote on the first ballot.
- Take no action if they do not want to change their original vote.

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement Final Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

### **Interpretation of IRO-010-1 for the Western Electricity Coordinating Council (WECC) Reliability Coordination Subcommittee (Project 2009-11)**

The ballot pool approved the standards revisions. The revised standards will be submitted to the NERC Board of Trustees for adoption.

The recirculation ballot for an interpretation of IRO-010-1 — Reliability Coordinator Data Specification and Collection, Requirements R1.2 and R3, for the WECC Reliability Coordination Subcommittee ended June 5, 2009. The final ballot results are shown below. The [Ballot Results](#) Web page provides a link to the detailed results.

Quorum:	90.45%
Approval:	85.76%

### **Ballot Criteria**

Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and nonresponses.

### **Project Background**

The WECC Reliability Coordination Subcommittee is seeking clarification on 1) the type of data to be supplied to the Reliability Coordinator, 2) which entities are ultimately responsible for ensuring data are provided, and 3) what actions are expected of the Reliability Coordinator regarding a “mutually acceptable format.” The request and interpretation are posted on the project page:

<http://www.nerc.com/filez/standards/Project2009-11 Interpretation IRO-010-1 WECC RCS.html>

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.
