<p>Roger Champagne Hydro-Quebec TransEnergie #1  Ralph Rufrano New York Power Authority #1  David Little Nova Scotia Power Inc. #1  David Kiguel Hydro One Networks #1  Michael Potishnak ISO-New England #2  Barry Gee National Grid USA #1  Dan Stosick ISO-New England #2  Fernando Saavedra ISO-New England #2  Greg Campoli New York ISO #2</p>	<ol style="list-style-type: none"> <li>2. NPCC (ISO-NE) also feels there is a lack of coordination between the standard drafting teams and has noted instances where one team felt an issue was addressed in a separate standard to later learn it was not. As an example, with respect to the Balancing Resources standard, transmission overloads that are caused by poor control are not covered by this standard unless they reach a high level IROL. It later was identified that where this was thought to have been covered, the Operate Within Limits Standard, it was not. We would suggest that there be technical oversight as we go forward with these processes to ensure there are no “gaps” or critical reliability issues that are not addressed in the resultant standards.</li>   <li>3. Establishment of the IROL should be done in the Facility Rating Standard because that is the standard that establishes Operating Limits otherwise the wording of the title should be changed to Establish IROL and Operate within Limits.</li>   <li>4. From a global perspective it might be a prudent action to place the NERC RS development in a moratorium until the investigation into the blackout cause is completed and determinations have been made. There could be new Reliability issues that need to be captured in the developing RS that need to be incorporated into the upcoming draft RS.</li>   <li>5. NPCC (ISO-NE) seeks explanation for drawing the line at addressing only instability, cascading outages and separation. For example, what standard, if any, will address the scenario where an entity operates their system to cause a sizable thermal overload on a transmission line in another entity’s system. (e.g. a transmission line burns down if the affected entity does not take corrective action)</li> </ol>
--	---

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard**  
**Other Questions**

1. Developing and modifying the sanctions table is outside the scope of the SDT.
2. Because these standards are being developed in parallel, and because each standard's development is guided by industry comments, it is not possible to 'guarantee' that the standards will not have 'gaps' that may need to be addressed through the submission of additional SARs to add or revise requirements. An oversight committee would not be able to 'add' any requirements to the standards – all work must be done in an open process. Where the SDTs identify gaps, they notify the Director-Standards, and the Director-Standards notifies the appropriate NERC committee. The Director-Standards has already sent notices to the Resources Subcommittee and the Operating Committee regarding possible gaps in the proposed standards.
3. IROLs are a subset of system operating limits and must be developed according to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard. Either standard could have addressed the development of IROLs, and as long as the compliance elements are only in one standard, no harm is done by including the identification of the IROLs in this standard.
4. The standards being developed can be revised, if needed. Unless the BOT notifies the SAC and the Director-Standards that they should curtail work on these standards, development will move forward.
5. The SAR's purpose defined the scope of this standard. The SDT sent a letter to the Director-Standards asking that consideration be given to the development of another SAR that addresses other system operating limits. The Director-Standards sent the request to the Operating Committee for its action.

Southern Co Transmission Planning #1

Todd Lucas     Southern Co  
 Joe Payne     Mississippi Power Company  
 Travis Koval   Southern Co  
 Bill Pope     Gulf Power Company

 David Johnson   Savannah Electric  
 Mike Miller     Southern Co  
 Jim Griffith     Southern Co  
 Monroe Landrum     Southern Co

This standard should not be brought to ballot until the Planning Authority is defined in the Functional Model since the Planning Authority is assigned requirements in this standard.

The standard was revised and there aren't any requirements assigned to the Planning Authority.

Richard Sikes   CenterPoint Energy #1

We are not convinced of the need for changing from Operations Security Limit and whether there was sufficient thought given to the implications of this change. There is some thought that a mention of coordination between the Reliability Authority and Transmission Operator is redundancy. We do not agree with this concept, but we do agree with removing redundancy. We believe that any action plans regarding the mitigation of events should be a coordinated effort between the Reliability Authority and Transmission Operator.

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard**  
**Other Questions**

Here is the history on the new term IROL: The Board of Trustees asked the Director-Compliance to investigate the reason(s) why there appeared to be an increase in the number of OSL violations. The investigation showed that there was no common understanding of what constituted an OSL violation. The OLDTF formed to conduct this investigation concluded that developing a new term with a more understandable definition would minimize confusion and may lead to greater consistency in reporting OSL-type violations. The OLDTF asked the SDT to adopt as much of their work as possible, including the new term. The SDT modified the OLDTF's term to clarify that these limits are not the same as the frequency limits being proposed by the Balance Resources and Demand SDT. Hence the change from IRL to IROL.

Coordination between the RA and the TOP was never a topic included in this standard – it was proposed for inclusion in another standard, similar to the draft standard under development called, "Coordinate Operations". The Coordinate Operations standard is focused on the coordination that takes place between RAs – and doesn't address the coordination that needs to take place between an RA and its supporting functions – and the Coordinate Operations Standard doesn't address the coordination that takes place between TOPs. The Coordinate Operations SAR DT sent a letter to the Director-Standards asking that these 'gaps' be addressed – and the Director-Standards informed the Operating Committee so that it can take action to investigate and submit SAR(s).

This standard does include the following specific language: "The plan shall identify and be coordinated with those entities responsible for acting and with those entities impacted by such actions. "

1. Please note that throughout the standard the Tv term is used but is not formatted the same (Tv vs. T<sub>v</sub>). This is a minor, formatting issue, but should be consistent throughout to reduce confusion.
2. Two definitions should be changed based on our comments:
  - Reliability Authority Area: A defined electrical system bounded by interconnection (tie -line) metering and telemetry **monitored by** a single reliability authority.
  - Tv: The violation time associated with a limit that is determined by the Transmission Owner(s) for equipment-based limits and by the Reliability Authority and the Planning Authority(ies) for system-based limits.
3. We are becoming increasingly concerned about this standard development process. This and other standards are being developed based on certain definitions and assumptions contained in the Functional Model. These "standards" will become fixed such that the industry will be held accountable to and measured by these standards. However, the Functional Model and the definitions contained in that revised model are changing and will not necessarily be the same as those used to develop the standards. What is the process for reviewing, revising and implementing changes to the Functional Model, and the impact of those changes on all these standards that have been developed based on the old Functional Model? Are the changes to the Functional Model being vetted by all industry participants before implementation? What is the process to revise these standards prior to

	implementing changes to the Functional Model?
<ol style="list-style-type: none"> <li>1. Agreed. We will try to do a better job of proofing before posting.</li> <li>2. The Reliability Authority Area definition was modified to reflect the intent of your suggestion, but the word, "direct" was used rather than monitor.</li> <li>3. The change to Tv was not made, because this does not conform with the delineation between facility limits and system operating limits established in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard (DFR Standard). In the DFR standard, the facility owners establish facility ratings, and provide these ratings to the RA, TOP and PA. The RA, TOP and PA have responsibility for establishing System Operating Limits that respect the Facility Ratings already established. While a facility rating may have a time component associated with it, this is not the same time component used by the RA when a system operating limit is labeled an IROL. The Tv associated with the IROL must respect the time component established by the facility owner, but the Tv may be shorter than the time component associated with the facility rating.</li> <li>4. Addressing comments about the need to clarify the Functional Model are beyond the scope of the SDT. You are encouraged to bring your concerns to the attention of the Functional Model Review Task Group.</li> </ol>	
Gerald Rheault Manitoba Hydro #1, 3, 5, 6	A NERC standard is a form of legal document – it spells out the standards, the measurements, the levels of compliance and the penalties for non-compliance. As such, there should be no ambiguity, so any term defined by NERC should be clearly identified in the standard (capitalized, bold, etc.) where it is used as a defined term, or NERC must certify that all uses of a defined word are a reference to the defined term.
<p>NERC's Vice President and Legal Counsel is responsible for making the final decision on the format of these new standards, and initially he did not support the practice of capitalizing defined terms. Over the past several months there have been so many comments submitted on SARs and draft Standards requesting that defined terms be capitalized, that this practice of capitalizing defined terms is being supported. In the revised standard, defined terms have been capitalized.</p>	
<p><u>FRCC Op, Eng &amp; Mkt Int</u>  Linda Campbell FRCC #2  Paul Elwing Lakeland Electric # 3  John Shaffer FPL #1  Bob Remley Clay Elec Coop #4  Patti Metro FRCC #2  Eirc Grant Progress Energy – FL #1  Joe Roos Ocala Electric Utility #3  Joe Krupar FL Muni Pwr Agency #3  Richard Gilbert Lakeland Electric #3  Bill Slater Progress Energy – FL #1  Amy Long Lakeland Electric #1  Roger Westphal Gainesville Regional Util #5</p>	<ol style="list-style-type: none"> <li>1. On the first page, the SDT has identified an "Effective Period". By using the term period, it implies that there will be an end time when the standard will no longer apply. Would it be more appropriate to just state an effective date?</li> <li>2. In the applicability paragraph, the SDT has referenced the functional model approved by the BOT in June 2001. This reference causes concern. We understand that including this reference and date identifies the version of the functional model so that the understanding of the functions are based on this particular document. But, what happens when the BOT approves a change to the model at a later date? Do we now have standards based on one set of functions or understanding of functions that are different than what is in the latest functional model? This will certainly cause confusion in the industry. But, on the other hand, if you remove the date reference, then anytime the BOT changes the model, they are effectively changing the standard without going through the SAR process. We do not want the BOT to be able to change who the standards apply to without going through due process either. How do we deal with this situation?</li> </ol>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard**  
**Other Questions**

<p>Bob Goss SEPA #5          Steve Wallace Seminore Electric Coop #4          Ted Hobson JEA #1</p>	<p>3. In the comment box on this first page, the SDT has stated that the terms BA, RA etc really apply to the entities performing the functions identified in the functional model. We understand and appreciate why the team did this, however, there is still a lot of confusion about functions vs entities in the functional model. We would suggest that the standard include the extra words to make this distinction. For example, in 1.1 of standard 201, it should read "The entities performing the reliability authority and planning authority functions shall.." This seems trivial, but we believe it is very important in helping the industry understand the functional model and how the standards apply to the entities performing the functions.</p> <p>4. Just a note for future comment forms, please provide a comment box after every question, not just at the end of the section on a particular standard. That way the comments and yes/no answers could be kept together.</p>
<p>1. Effective Date is a more appropriate phrase and has been adopted.</p> <p>2. The need for more clearly defined reliability standards is at the forefront of the push to develop new standards. There were many complaints about the lack of objectivity in the measures associated with the existing Operating Policies. If we were to wait until the Functional Model were approved before developing any new standards, we would not be achieving our goal of developing objective standards to support reliability as quickly as possible. If the Functional Model is changed and requires changes to already approved standards, then we will need to revise the standards.</p> <p>3. Phrases such as, 'the reliability authority' are being used because these are much shorter and therefore easier to read than the longer phrase, the entity performing the reliability authority function. We agree that the longer phrase is more accurate and if the Functional Model had been introduced using the longer phrases then we would also use the longer phrases. However, when the Functional Model was introduced to the industry, the shortcut phrases such as , 'the reliability authority' were used. Here is a sample sentence from page 33 of the approved version of the Functional Model: "The Purchasing-Selling Entity contacts the Generator and arranges for an energy purchase and contacts the Load-Serving Entity for the sale." If the longer version were used, this is how the same sentence would read: The entity performing the purchasing-selling entity function contacts the entity performing the generator function and arranges for an energy purchase and contacts the entity performing the load-serving entity for the sale.</p> <p>4. We've tried to experiment with different comment forms. In the past, several commenters inserted the same comment in every comment box for all comments related to a requirement. By having a single comment box for a requirement, the goal was to eliminate the need to duplicate comments.</p>	
<p>Alan Boesch NPPD #1</p>	<p>Not all System operating limits are being addressed in this standard. System operating limits in one area can be caused by the failure of another BA to balance generation and load. The RA will be getting the ACE values and should be responsible for assuring that imbalance situation does not cause a problem on the system. This situation is not addressed in the Balance Resource and Demand Standard because it allows unlimited imbalance if it is the opposite direction of frequency error. This situation needs to be addressed in a standard.</p>

**Draft Comments and Considerations for 2<sup>nd</sup> Posting for Operate Within IROLs Standard**  
**Other Questions**

<p>This standard does not address all system operating limits. The SAR DT sent a letter to the Director-Standards asking that additional attention be paid to this omission. The Operating Committee has been informed of this 'gap' in the standards, and has been encouraged to review the situation and submit a SAR if needed.</p>	
<p>Dan Boezio &amp; Raj Rana AEP #1, 3, 5, 6</p>	<p>In each of these Standards the 'tie-in' to the Sanctions Matrix is insufficient and unclear. For example if an entity is first occurrence, level 4 non compliant to Standard 206. The penalty is a Letter (B) and \$2000 OR \$2 per MW. Which penalty is being applied the fix or variable? If it is variable, what MW is the penalty based on? The RA's load, generator rating, something else?</p> <p>We request the SDT review the levels of non-compliance and take into account the timeliness of actions or data submitted, the completeness of actions or data submitted and the quality of actions or data submitted. We believe that some of the requirements, when properly measured will lend themselves to having additional levels of non-compliance, for the ramifications of non-compliance for some of the requirements is not so severe to actually have an adverse impact on the bulk transmission system.</p>
<p>The links to the sanctions table have been added. All infractions use the letters and flat dollar fines except for a level four non-compliance for requirement 204 – exceeding an IROL for time greater than T<sub>v</sub>. For this particular violation, the following language was added: Level four non-compliance sanctions shall be the greater of the fixed dollar sanctions listed in the matrix, or the number of Megawatts above the IROL multiplied by the dollar value for the number of times non-compliant.</p> <p>In developing the levels of non-compliance, the SDT tried to consider the actual or possible impact to reliability as well as the feasibility of measurement. Many things that would be 'good' to measure such as 'quality', are nearly impossible to measure objectively.</p>	
<p>Tony Jankowski We Energies #4</p>	<p>Please provide assessment of how this Standard will work with abnormal operations and emergency restoration. How is the line drawn. Use the August 14, 2003 event as an example for determining compliance and sanctions.</p>
<p>This standard does not address abnormal conditions or emergency restoration. Those topics are being addressed in other standards, and adding links between the standards is beyond the scope of the SDT.</p>

In the Northwest, where there isn't a RTO in place, there seems to be some confusion on what current entity would be the RA? Who makes the decision or assigns who is the RA? We have also heard that a RA can direct TOP or others to do operational planning analysis, but we have not been able to find it in the Functional Model or this document. If that is the intent then it should be included in the Functional Model or this document. If you could direct us in these matters it would greatly improve our understanding of the document. Thank you for your help.

Each entity must decide what function(s) it wants to perform. That entity will need to 'register' with NERC and then for entities that want to perform the RA, BA, IA or TOP functions, the entity must obtain certification to perform that function. If this standard is approved and is implemented prior to RA Certification, each control area would be responsible for compliance with this standard.

When the Functional Model was presented to the industry, presenters verbally indicated that an entity may delegate some of its responsibilities. This does not appear in the text of the Functional Model, and is not included in the SARs for certification, and is not included in the text of this standard. In the explanatory information drafted to accompany the latest draft of proposed changes to the Functional Model, this issue is addressed. You are encouraged to bring your concerns to the attention of the Functional Model Review Task Group.

Ed Davis    Entergy Services    #1

1. Two definitions should be changed based on our comments:
  - Reliability Authority Area: A defined electrical system bounded by interconnection (tie -line) metering and telemetry monitored by a single reliability authority.
  - T<sub>v</sub>: The violation time associated with a limit that is determined by the Transmission Owner for equipment-based limits and by the Reliability Authority and the Planning Authority for system-based limits.

## Questions & Answers About the Operate within Operate within IROLs Standard

---

### Introduction to Standard

This standard requires adherence to the subset of system operating limits<sup>1</sup> identified to prevent instability, uncontrolled separation or cascading outages that adversely impact the reliability of the bulk transmission system. These limits are called interconnection reliability operating limits and are under the authority of the entity performing the reliability authority function. (Note that there are many other system operating limits that are used by system operators working for entities performing the Reliability Authority function and for entities performing the Transmission Operator function. This standard only addresses Interconnection Reliability Operating Limits.)

This standard is aimed at preventing instances of exceeding IROLs – and for those rare occasions when an IROL may be exceeded, the standard is aimed at minimizing the impact of such an event.

The standard is subdivided into eight requirements. Each of the requirements addresses some aspect of monitoring or controlling the transmission system to operate within IROLs. Some of these requirements address underlying responsibilities that must be accomplished as a prerequisite to monitoring and controlling the transmission system relative to IROLs.

201 Interconnection Reliability Operating Limit Identification – requires identification of the facilities that are subject to IROLs, and requires RAs to be able to identify current IROLs. Each IROL must have a  $T_v$  and the  $T_v$  may not be greater than 30 minutes. The list of facilities subject to IROLs must be updated to reflect changes in topology and system conditions. Entities that share a facility must have an agreed upon process for determining whether that facility is subject to an IROL and for developing the IROL and its  $T_v$ . (The entity performing the Reliability Authority Function is responsible for this requirement.)

202 Monitoring – requires monitoring real time data and comparing the data to IROLs to determine if the RA Area is operating within its IROLs (The entity performing the Reliability Authority Function is responsible for this requirement.)

203 Analyses and Assessments – requires that an operational planning analyses be conducted at least once each day to look at the ‘day ahead’ and requires that real-time assessments be conducted at least once every 30 minutes. These analyses and assessments are done to see if the transmission system is expected to be operated within its IROLs and to see if the transmission system is operating within its IROLs. (The entity performing the Reliability Authority Function is responsible for this requirement.)

204 Actions – requires that actions be taken or directives issued to prevent or mitigate instances of exceeding IROLs. These actions and directives must be documented when an IROL is exceeded, and when an IROL is exceeded for a time greater than the IROL’s  $T_v$ , this event must be reported to the Compliance Monitor. The entity that issues a directive relative to an IROL must include a statement in the directive to clarify that the directive is related to an IROL. (The entity performing the Reliability Authority Function is responsible for this requirement.)

205 Data Specification & Collection – requires that a data specification be developed that identifies the data needed for monitoring real-time parameters against IROLs, and for conducting operational planning analyses and real-time assessments relative to operating within its reliability area’s IROLs. The Data Specification must be distributed to entities that are expected to provide data and needs to address what data to provide, a mutually agreeable format for the data, a timeframe and periodicity for providing data, and must address the data provision process to use when automated real-time system operating data is unavailable. The Reliability Authority must notify its Compliance

<sup>1</sup> System Operating Limits are established through the standard, “Determine Facility Ratings, Operating Limits and Transfer Capabilities”

## **Questions & Answers About the Operate within Operate within IROLs Standard**

---

Monitor if data is not provided as specified. (The entity performing the Reliability Authority Function is responsible for this requirement.)

206 Data Provision – requires that entities provide the Reliability Authority with data needed to monitor real-time parameters against IROLs, and to conduct operational planning analyses and real-time assessments relative to operating within its reliability area's IROLs. (The entities performing the following Functions are responsible for this requirement: Balancing Authorities, Generator Operators, Generator Owners, Load-serving Entities, Reliability Authorities, Transmission Operators, and Transmission Owners)

207 Processes, Procedures or Plans – requires that there be one or more processes, procedures or plans to address actions to take or directions to issue to prevent and mitigate instances of exceeding IROLs. The processes, procedures or plans must identify and be coordinated with all entities that have to take actions as part of the plan, and with entities that would be impacted by the actions taken in the plan. (The entity performing the Reliability Authority Function is responsible for this requirement.)

208 Reliability Authority Directives – requires that entities follow the Reliability Authority's directives issued to prevent or mitigate instances of exceeding IROLs. The directives issued and the actions taken in response to those directives must be documented. (The entities performing the following functions are responsible for this requirement: Balancing Authority, Interchange Authority, and Transmission Operator.)

### Expansion on Definitions

**Balancing Authority:** Integrates resource plans ahead of time, and maintains load-interchange-generation balance within its metered boundary and supports system frequency in real time.

*(Note – this term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.)*

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

*(Note – the original definition of this term was ‘circular’ and did not reference any voltage class. The definition was changed to include the reference to a measurable voltage class.)*

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

*(Note –this definition was developed to help provide some measurable basis for determining if a system operating limit is an Interconnection Reliability Operating Limit.)*

**Generator Operator:** Operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.

*Note – This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Generator Owner:** The entity that owns the generator.

*Note – This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Instability:** The inability of the transmission system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.

*(Note – this term was adapted from the term, Interconnection Reliability Limit, drafted by the Operating Limit Definition Task Force.)*

**Interconnection Reliability Operating Limit Event:** An instance of exceeding an interconnection reliability operating limit for any length of time.

*(Note – all IROL Events must be documented.)*

**Interconnection Reliability Operating Limit Event Duration:** The length of time an interconnection reliability operating limit is exceeded. The duration is measured from the point where the limit is first exceeded and ends when the value drops below the limit and remains below the limit for at least 30 seconds.

*(Note –graphics in next section of this Technical Reference shows the application of this 30-second rule.)*

## Questions & Answers About the Operate within Operate within IROLs Standard

---

**Load-serving Entity:** Secures energy and transmission (and related generation services) to serve the end user.

*(Note – this term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.)*

**Occurrence period:** The time period in which performance is measured and evaluated.

*(Note – this is a term used by the Compliance Monitors. When you look at the Sanctions Tables, note that the first table’s column headings reference the number of infractions within the Performance-reset period. As the number of infractions within a performance reset period increases, so does the severity of the sanctions.)*

**Operating Procedure** – A document that identifies specific steps or tasks that must be taken by one or more specific operating positions to achieve a single specific operating goal. The steps in an Operating Procedure must be followed in the order in which they are presented, and must be performed by the position(s) identified. A document that lists the specific steps to take in removing a specific transmission line from service is an example of an Operating Procedure.

*(Note – this is a term defined within the Coordinate Operations standard.)*

**Operating Process** – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon real-time conditions. A guideline for controlling high voltage is an example of an Operating Process.

*(Note – this is a term defined within the Coordinate Operations standard.)*

**Operating Plan-** A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

*(Note – this is a term defined within the Coordinate Operations standard.)*

### **Operational Planning Analysis:**

An analysis of the expected system conditions for the next day’s operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.)

*(Note – this standard requires that an operational planning analysis be conducted at least once each day, looking at the day ahead. This does not mean that operational planning analyses are limited to being conducted on a day-ahead basis. For example an operational planning analysis should be conducted as part of approving a transmission line outage – and this operational planning analysis may be conducted several months ahead of the day being reviewed.)*

**Performance-reset Period:** The time period that the entity being assessed must operate without any violations to reset the level of non-compliance to zero.

*(Note – this is a term used by the Compliance Monitors. When you look at the Sanctions Tables, note that the first table’s column headings reference the number of infractions within the Performance-reset period. As the number of infractions within a performance reset period increases, so does the severity of the sanctions.)*

## Questions & Answers About the Operate within Operate within IROLs Standard

---

**Real-time:** Present time as opposed to future time.

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**Real-time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values – may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

*(Note – this definition supports the concept that monitoring is an ‘active’ task. The system operator assigned to monitor system conditions should be prepared to answer questions about what he/she has been monitoring without any preparation time. Simple questions can be used to determine whether or not monitoring has taken place. For example, a system operator who has been monitoring real time data to see if the area under the operator’s direction is approaching or exceeding any IROLs should be able to answer the question, “ Are there any IROLs on your system that have been exceeded? If any have been exceeded, are you approaching or exceeding the IROL’s  $T_v$ ?”*

**Reliability Authority:** Ensures the reliability of the bulk power transmission system within its Reliability Authority Area.

*(Note – this term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.)*

**Reliability Authority Area:** The collection of generation, transmission, and loads within the boundaries of the Reliability Authority. Its boundary coincides with one or more Balancing Areas.

*Note – This is the definition proposed by the Functional Model Review Task Group for inclusion in the second version of the Functional Model.*

**Self-certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

*Note: This is a term used by the Compliance Monitors.*

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

*Note – Operating Policy 2 – Standard A.2 included the following requirement:*

*Following a contingency or other event that results in an OPERATING SECURITY LIMIT violation, the CONTROL AREA shall return its transmission system to within OPERATING SECURITY LIMITS soon as possible, but no longer than 30 minutes.*

*This new standard requires results within ‘ $T_v$ ’ minutes. Some IROLs are so critical that exceeding them for 30 minutes may be too long. See the charts in the next section for examples of how  $T_v$  is used to determine whether an instance of exceeding an IROL must be reported to the Compliance Monitor.*

## Questions & Answers About the Operate within Operate within IROLs Standard

---

**Transmission Operator:** The entity that operates the transmission facilities and executes switching orders.

*(Note – this term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.)*

**Transmission Owner:** Owns transmission facilities

*(Note – this term was defined in the NERC Functional Model approved by the NERC Board of Trustees, June 12, 2001.)*

**Uncontrolled Separation:** The unplanned break-up of an interconnection, or portion of an interconnection, that is not the result of automatic action by a special protection system or remedial action scheme operating correctly.

**Wide Area Impact:** The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked transmission load for a minimum of 15 minutes.

*(Note – this term was modified to provide a more measurable basis for determining whether a System Operating Limit should also be an Interconnection Reliability Operating Limit. The Standard Drafting Team adopted the threshold criteria used for reporting major incidents to the Department of Energy as the threshold for determining whether an event had a ‘wide area’ impact.)*

## Questions & Answers About the Operate within Operate within IROLs Standard

### Questions and Answers

#### *Who needs to comply with this standard?*

Each of the requirements in the standard assigns responsibility for that requirement to one or more ‘functions.’ The entities performing the listed functions are the entities that must comply with that requirement. Most of the requirements are applicable to entities that perform the Reliability Authority Function – but several functions are assigned responsibility for the Data Provision and RA Directives requirements.

Requirement	Entities that Perform these Functions Must Comply With the Requirements							
	Reliability Authority	Balancing Authority	Interchange Authority	Trans. Operator	Trans. Owner	Gen. Owner	Gen. Operator	Load Serving Entity
201 IROL Identification	X							
202 Monitoring	X							
203 Analyses & Assessments	X							
204 Actions	X							
205 Data Specification & Collection	X							
206 Data Provision	X	X		X	X	X	X	X
207 Processes, Procedures or Plans	X							
208 RA Directives		X	X	X				

### ***When does compliance with this standard start?***

Several things must be in place before entities are expected to come into full compliance with all of the requirements in this standard. Most importantly, the Operate within IROLs Standard can't be implemented until after the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard has been implemented. The methodology for developing system operating limits must be in place and the RA must identify system operating limits before the RA can be held accountable for identifying which of its system operating limits are IROLs. There are other parts of the standard that will take some time to put into place if they aren't already in place. Some entities performing the RA function may have a detailed data specification that could be used to meet the Data Specification requirement in this standard – but other entities may have handled this requirement on a more casual basis and may need some time to formalize their data specifications.

### ***For a System Operator - how does this new standard differ from Operating Policy 2 - Transmission?***

There are three significant differences between what is expected of system operators under Policy 2, and what is expected of system operators under Standard 200.

#### **Major Difference #1 – Term, 'OSLs' replaced with term, 'IROLs'**

The first difference is a terminology change. The NERC Director–Compliance reports on compliance violations at each NERC Board of Trustees Meeting. He noted an increase in the number of OSL violations, and was directed by the BOT to investigate the cause. The investigation results showed a widespread misunderstanding on what was/was not an OSL. The task force that worked on this problem, called the Operating Limits Definitions Task Force (OLDTF) recommended that the term, "Operating Security Limit" not be used in the future because of the widespread misunderstanding associated with this term. The new standard uses the term, 'Interconnection Reliability Operating Limit – IROL'.

From the Terms Used in the Operating Policies, here is the definition of an Operating Security Limit (OSL):

- The value of a system operating parameter (e.g. total power transfer across an interface) that satisfies the most limiting of prescribed pre- and post-contingency operating criteria as determined by equipment loading capability and acceptable stability and voltage conditions.

From the Operate within IROLs Standard, here is the definition of an Interconnection Reliability Operating Limit (IROL):

- A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.

**Major Difference #2 –Resolution time changed from a uniform ‘30-minutes’ for all OSLs to a ‘unique’  $T_v$  that can’t exceed 30 minutes for each IROL**

Policy 2 has a standard ‘30 minute’ response time for resolving any instance of exceeding an operating security limit. The 30 minutes was established to give system operators enough time to recognize the problem and take corrective actions. The new Operate within IROLs standard is designed from a perspective of system risk, and doesn’t have a standard ‘30 minute’ response time.

$T_v$  is the maximum amount of time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions.  $T_v$  is based on system risk – and recognizes that some IROLs shouldn’t be exceeded for longer than 10 minutes without causing an unacceptable risk to the interconnection. Each IROL may have its own  $T_v$  but no  $T_v$  may exceed 30 minutes.

*From Policy 2 – all OSLs addressed with the same 30-minute maximum resolution time*

← *Operate within IROLs Standard - each IROL may have its own  $T_v$ .*

*For IROLs that should never be exceeded,  $T_v$  may be zero minutes.*

**Major Difference #3 – New Report for IROL Violations**

Policy 2 requires that a NERC Preliminary Disturbance Report be completed for OSL Violations that exceed 30 minutes – The Preliminary Disturbance Report asks for a preliminary analysis to be conducted regarding the cause of the event – and is still needed. The new report is a compliance document and doesn’t require the same data that is required of the Preliminary Disturbance Report.

The data that is collected in the IROL Violations Report is data that should be readily available to the system operator shortly after an instance of exceeding an IROL. The report doesn’t ask for an analysis, just for a collection of the facts such as what limit was exceeded, how long was it exceeded, etc. The new report must be filed with the compliance monitor within 5 days of the event.

### ***What is an IROL?***

An IROL is a special type of system operating limit. While operating so that system operating limits aren't exceeded is always important, if an IROL is exceeded, there is an increased risk of voltage instability, cascading outages or uncontrolled separation that adversely impacts the interconnection.

System Operating Limits are monitored by system operators working for entities performing the Transmission Operator function and may also be monitored by system operators working for entities performing the Reliability Authority function.

IROLs are monitored by the Reliability Authority. The Reliability Authority may delegate this task to system operators working for entities performing the Transmission Operator function, but it is the Reliability Authority that is held accountable for ensuring that IROLs aren't exceeded.

### ***What is the IROL's $T_v$ ?***

$T_v$  is the maximum amount of time the system operator has to return to a state that is at or below the limit before being subjected to compliance sanctions.

The  $T_v$  associated with each IROL is a time value used to assess how quickly the interconnection may deteriorate if an IROL isn't mitigated. IROLs should never be exceeded – but if one is exceeded, the  $T_v$  represents the maximum amount of time the limit can be exceeded before the risk to the interconnection becomes unacceptable. Under this standard, if a  $T_v$  is exceeded, there are financial penalties and additional reporting requirements.

### ***Why don't all IROL's have the same $T_v$ ?***

The IROL's  $T_v$  is based on system risk – and recognizes that exceeding some IROLs is unacceptable for any length of time, while exceeding other IROLs can probably be tolerated for a longer period of time before there is an unacceptable risk to the interconnection. By establishing a  $T_v$  for each IROL, the RA has information needed to anticipate the negative results of exceeding an IROL. If an IROL can't be exceeded for any length of time, then the RA may choose to install a special protection scheme to control the risk of exceeding the limit in real time. Note that  $T_v$  may not exceed 30 minutes.

### ***If an RA installs a special protection scheme to reduce the probability of exceeding an IROL for time greater than the limit's $T_v$ , does this eliminate the IROL?***

No. The facility being protected by the special protection scheme would still need to be included in the list of facilities subject to IROLs, and the IROL would need to be listed with its  $T_v$ . Since special protection schemes don't always work as planned, it is important that system operators know where they have IROLs, know which facilities are subject to IROLs and know what the  $T_v$  is for each IROL. The system operator needs access to this data to make appropriate system operating decisions when special protection schemes don't work as planned.

### ***How do you develop a list of IROL's?***

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities standard includes a requirement that entities responsible for developing system operating limits document their methodology for developing these limits. The RA is responsible for developing the subset of system operating limits that are called IROLs. The RA must follow its methodology for developing system operating limits and then must identify whether or not exceeding that limit could cause voltage instability, cascading outages, or uncontrolled separation from the interconnected transmission system. If the system operating limit could lead to one or more of these dire consequences, then the limit is an IROL.

### **How do you establish a $T_v$ for an IROL?**

Each RA may use whatever system it wants for establishing a  $T_v$  for its IROLs. This gives each RA the latitude to be as conservative as it desires. Some RAs may choose to use a default  $T_v$  of 30 minutes – currently some entities have a default of 20 minutes for all limits that would be categorized as IROLs. Here are some ways of setting  $T_v$ :

- Use study results showing the impact of a loss of a unit or line
- Set  $T_v$  at or lower than ‘published’ acceptable time overloads for critical facilities and
- Reference relay settings that have time delays before tripping overloaded facilities

### **Which instances of exceeding an IROL need to be documented?**

All. Every instance of exceeding an IROL for any length of time must be documented. Most entities are expected to document the instance on a system operating log, but the standard does not require that the documentation be on an operating log, just that it be documented.

### **Does the standard require that exceeding an IROL be documented on the system operator’s daily log?**

No. Each entity can document IROL events using whatever documentation system works best for them. While each entity may use whatever system(s) it chooses to document instances of exceeding IROLs, the documentation must be retrievable so it can be shown to the Compliance Monitor. The data can be retrievable through computer screen displays, through paper or electronic logs, or other sources.

### **When you exceed an IROL, what do you have to document?**

When you exceed an IROL for any length of time, you need to document the following three things:

- Actions taken or directives issued
- Magnitude of the event
- Duration of the event

### **How many IROLs do you expect the ‘typical’ RA to have in a year?**

None! This standard focuses on preventing instances of exceeding an IROL. This standard requires the RA to use its tools to actively monitor and assess its Reliability Authority Area with respect to the current

## Questions & Answers About the Operate within IROLs Standard

and expected system conditions. For emerging system conditions, the RA is required to act to prevent exceeding an IROL. For unusual situations, such as a plane crash that knocks down 500kV lines, the RA is required to act to mitigate the instance within the IROL's  $T_v$ . Since most RA's can go many years without ever having a plane crash through their 500kV lines, most RAs won't experience any instances of exceeding an IROL for any length of time.

### **Which instances of exceeding an IROL need to be reported?**

Every instance of exceeding an IROL for time greater than the IROL's  $T_v$  is reported to the Compliance Monitor within five business days.

*The value being monitored exceeded its IROL for a time greater than the IROL's  $T_v$  and the event must be documented **and** reported.*

### **When you exceed an IROL for a time greater than the IROL's $T_v$ , what do you have to report?**

When you exceed an IROL for a time greater than the IROL's  $T_v$ , you have to report the following information to the Compliance Monitor:

- Date and time of the event
- Identification of which interconnection reliability operating limit was violated
- $T_v$  for that limit
- Magnitude and duration of exceeding the interconnection reliability operating limit
- Actions taken or directives issued
- Time actions or directives were initiated or issued,
- Explanation of results of actions or directives

There is a report called the IROL Violation Report that captures this information. This report is available from the NERC Web Site and is provided at the end of this document.

**How do you calculate the duration of an IROL event?**

The duration of an IROL event is measured from the point in time when the IROL is first exceeded to the point in time where the parameter being monitored has returned to a value that is at or below the IROL, providing the actual value remains at or below the IROL for at least 30 seconds.

The monitored parameter must remain at or below the IROL for 30 seconds or more.

The line for  $t_1$  shows the end of the IROL event, which is the point in time when the monitored value returns to a value that is at or below the IROL as long as the monitored value remains at or below the limit for at least 30 seconds. (From pt. A to pt. B is 30 seconds.)

The following example is shown in the chart below. The IROL that has been exceeded has a  $T_v$  of 10 minutes. The monitored value exceeds the IROL for 15 minutes, then the monitored value returns to a value that is below that IROL for just 20 seconds, then the monitored value exceeds the IROL for another 10 minutes – then the monitored value returns to a value that is below the IROL for 2 hours. The duration of the event that must be reported is:

- 25 minutes, 20 seconds

## Questions & Answers About the Operate within Operate within IROLs Standard

### *If you exceed an IROL for time greater than $T_v$ , how big is the sanction?*

This is the table used to determine the size of the sanction when an IROL is exceeded for time greater than  $T_v$ .

Example 1: There is an IROL set at 1000 MW with a  $T_v$  of 30 minutes. The IROL is exceeded for 35 minutes. During the time period after  $T_v$  was exceeded (the last 5 minutes of the event), the maximum value was 1100 MW. This is the first IROL violation for this RA.

$$\text{Max Val \%} = (1100 \text{ MW}/1000 \text{ MW} - 1) * 100 = 10$$

The event duration exceeded its  $T_v$  by 5 minutes

The level 4 \$ sanction for the first infraction is \$2000

The sanction would be  $10 * \$2000 = \$20,000$

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

## Questions & Answers About the Operate within Operate within IROLs Standard

Example 2: There is an IROL set at 1000 MW with a  $T_v$  of 20 minutes. The IROL is exceeded for 35 minutes. During the time period after  $T_v$  was exceeded (the last 5 minutes of the event), the maximum value was 1200 MW. This is the second IROL violation for this RA.

$$\text{Max Val \%} = (1200 \text{ MW}/1000 \text{ MW} - 1) * 100 = 20$$

The event duration exceeded its  $T_v$  by 15 minutes

The level 4 \$ sanction for the second infraction is \$4000

$$\text{The sanction would be } 30 * \$4000 = \$120,000$$

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

### ***What is the philosophy behind the sanction for exceeding an IROL for time greater than $T_v$ ?***

Most RAs will not exceed an IROL. If there is an ‘emerging’ system condition that is causing operations in the Reliability Authority Area to approach operations outside of the IROLs, then the RA should take actions to prevent the system from exceeding the IROL. This standard requires that the RA monitor and assess its Reliability Authority Area so that emerging system conditions are noted and corrected before an IROL can be exceeded. There are unusual circumstances that do occur – such as a plane crashing through a set of 500 kV lines – that will cause an IROL to be exceeded. When this does occur, the RA needs to take action without delay to remedy the situation. If the RA achieves its goals within  $T_v$ , then there is no sanction.

### ***Why isn't the sanction linked to the highest value over the course of the event?***

Because unusual circumstances occur without warning, the sanction isn't linked to the highest value during the event, the sanction is linked to the highest value during the time period after  $T_v$  has been exceeded. This seemed to be the fairest way of applying the sanction – it gives the RA some time to resolve the situation and allows for ‘credit’ to be given if the RA was able to move the system in the right direction, but wasn't able to achieve the goal of getting within the limits before  $T_v$ .

### ***What's the origin of the concept of these sanctions for exceeding IROLs?***

These sanctions are very similar to the sanctions used for Policy 2 and for the WECC RMS program. The sanction for violating Requirement 204 is linked to the magnitude and duration of the infraction and to the history of the entity with respect to prior similar violations – Policy 2's sanction is linked to magnitude and duration of the infraction and to the size of the company that is responsible for preventing the infraction.

### ***What are you expecting in the requirement for Processes, Procedures or Plans?***

The RA needs to anticipate what actions to take to prevent exceeding IROLs as well as the actions to take when an IROL has been exceeded. The RA has to have some type of document that outlines the actions the RA will take to control the situation. The document can be as specific as needed. It is important that the documents be coordinated with entities that will be involved if the process, procedure or plan is invoked. The Coordinate Operations Standard defines these terms as follows:

**Operating Procedure** – A document that identifies specific steps or tasks that must be taken by one or more specific operating positions to achieve a single specific operating goal. The steps in an Operating Procedure must be followed in the order in which they are presented, and must be performed by the position(s) identified. A document that lists the specific steps to take in removing a specific transmission line from service is an example of an Operating Procedure.

**Operating Process** – A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon real-time conditions. A guideline for controlling high voltage is an example of an Operating Process.

**Operating Plan**- A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

# Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits

---

## Implementation Plan Contents:

Prerequisite Approvals .....	2
Applicability During Transition to Functional Model .....	2
Retirement of Sections of Operating Policies .....	3
Policy Retirements or Revisions .....	5
Compliance with Standard .....	15
Functions that Must Comply With the Requirements .....	15
Phased-in Compliance .....	16

## **Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

---

### **Prerequisite Approvals**

The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard must be implemented before this standard can be implemented.

### **Applicability during Transition to Functional Model**

The requirements in Standard 200 apply to entities performing various electric system functions, as defined in the functional model approved by the NERC Board of Trustees in June 2001. NERC is now developing standards and procedures for the identification and certification of such entities. Until that identification and certification is complete, these standards apply to the existing entities (such as control areas, transmission owners and operators, and generation owners and operators) that are currently performing the defined functions.

## Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits

---

### Retirement of Sections of Operating Policies

Many elements contained in Standard 200 address the same or similar performance objectives as sections of Operating Policy 2, Operating Policy 4, Operating Policy 5 and Operating Policy 9. To eliminate duplication and minimize confusion, the following sections of existing Operating Policies should be retired when this standard is implemented. Justification for these retirements is provided in the tables on the following pages.

#### Operating Policy 2:

- Standard A.1
- Standard A.1.2
- Standard A.2
- Requirement A.1 (just last 2 bullets)
- Requirement A.1.1
- Requirement A.1.2
- Requirement B.5

#### Operating Policy 4:

- Requirement A.1
- Requirement B.3
- Requirement B.3.1
- Requirement B.4
- Requirement B.4.1
- Appendix 4BA

#### Operating Policy 5:

- Requirement 5.C.1
- Requirement 5.C.2

#### Operating Policy 9:

- Requirement A.1
- Requirement A.1.1
- Requirement A.1.2

#### Other Changes:

- Operating Policy 4, Requirement A.2 should be ‘tagged’ to note that the requirement is no longer applicable to system operators working for entities performing the Reliability Authority function, but is still applicable to system operators working for entities performing the Transmission Operator function.

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

**Policy Retirements or Revisions**

The following tables identify the sections of existing Operating Policies that shall be retired when this standard is implemented.

Policy 2 – Transmission Language in Policy	Standard 200 Replacement Requirement
<p><b>Standard A.1.</b>  <b>Basic reliability requirement regarding single contingencies.</b> All CONTROL AREAS shall operate so that instability, uncontrolled separation, or cascading outages will not occur as a result of the most severe single contingency.</p>	<p>204. 1.1 The Reliability Authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>
<p><b>Standard A .1 .2.</b>  <b>Operating Security Limits.</b> Operating Security Limits define the acceptable operating boundaries.</p>	<p>201.1 The Reliability Authority shall identify and document which facilities (or groups of facilities) in the Reliability Authority’s reliability area are subject to Interconnection Reliability Operating Limits.</p> <p>201.2 The Reliability Authority shall identify each Interconnection Reliability Operating Limit within the Reliability Authority’s reliability area.</p> <ul style="list-style-type: none"> <li>- The Reliability Authority shall identify a T<sub>v</sub> for each Interconnection Reliability Operating Limit.</li> </ul>
<p><b>Standard A.2.</b>  <b>Return from OPERATING SECURITY LIMIT Violation.</b> Following a contingency or other event that results in an OPERATING SECURITY LIMIT violation, the CONTROL AREA shall return its transmission system to within OPERATING SECURITY LIMITS soon as possible, but no longer than 30 minutes.</p>	<p>204.1.1 The Reliability Authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

Policy 2 – Transmission Language in Policy	Standard 200 Replacement
<p><b>Requirement A.1.</b> Policies for dealing with transmission security. CONTROL AREAS, individually and jointly, shall develop, maintain, and implement formal policies and procedures to provide for transmission security. These policies and procedures shall address the execution and coordination of activities that impact inter- and intra-Regional security, including:</p> <ul style="list-style-type: none"> <li>- Equipment ratings</li> <li>- Monitoring and controlling voltage levels and real and reactive power flows</li> <li>- Switching transmission elements</li> <li>- Planned outages of transmission elements</li> <li>- <b>Development of Operating Security Limits</b></li> <li>- <b>Responding to OPERATING SECURITY LIMIT violations.</b></li> </ul>	<p><i>(Only highlighted items should be retired.)</i></p> <p>201.1 The Reliability Authority shall identify and document which Facilities (or groups of Facilities) in its Reliability Authority Area are subject to Interconnection Reliability Operating Limits<sup>1</sup>.</p> <p>201.2 The Reliability Authority shall identify Interconnection Reliability Operating Limits for its Reliability Authority Area. Each Interconnection Reliability Operating Limit shall have a T<sub>v</sub> that is smaller than or equal to 30 minutes.</p> <p>201.3 All Reliability Authorities that share a Facility (or group of Facilities) subject to an Interconnection Reliability Operating Limit shall agree upon the process used to determine that Interconnection Reliability Operating Limit and its associated T<sub>v</sub></p> <p>207.1.1 The Reliability Authority shall have one or more processes, procedures or plans that identify actions it shall take or actions it shall direct others to take, for both prevention and mitigation of instances of exceeding its Interconnection Reliability Operating Limits.</p> <p><i>(Operating Security Limits that, when exceeded may cause instability and cascading outages on the bulk electric system have now been defined as Interconnection Reliability Operating Limits (IROLs) within this standard.)</i></p>
<p><b>Requirement A.1.1.</b> Responsibility for transmission security. When OPERATING SECURITY LIMIT violations occur, or are expected to occur, the CONTROL AREAS affected by and the CONTROL AREAS contributing to these violations shall implement established joint actions to restore transmission security.</p>	<p>204.1.1 The Reliability Authority shall, without delay, act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>

<sup>1</sup> Each IROL is developed by following the requirements in the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

Policy 2 – Transmission Language in Policy	Standard 200 Replacement
<p><b>Requirement A.1.2.</b> Action to keep transmission within limits. CONTROL AREAS shall take all appropriate action up to and including shedding of firm load in order to comply with Standard 2.A.2.</p>	<p>204.1.1 The Reliability Authority shall, without delay, act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul> <p>208.1.1 The Transmission Operator, Balancing Authority and Interchange Authority shall follow the Reliability Authority’s directives to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>
<p><b>Requirement B.5.</b> <b>Preventing Voltage Collapse.</b> The SYSTEM OPERATOR shall take corrective action, including load reduction, necessary to prevent voltage collapse when reactive resources are insufficient.</p>	<p>204.1.1 The Reliability Authority shall act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul> <p><i>(Note that IROLs may be voltage limits)</i></p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 4 – System Coordination</b></p> <p align="center"><b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>Section A – Monitoring System Conditions</b>  <b>Requirement A.1 Resources.</b> The system operator shall be kept informed of all generation and transmission resources available for use.</p>	<p><i>Keep for transmission operator’s system operators</i></p> <p>205.1.1 The Reliability Authority shall specify and collect the data it needs to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments conducted relative to operating within its reliability area’s Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Real-time Facility status to the Reliability Authority. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>- Balancing Authorities</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul>
<p><b>Requirement A.2 Transmission status and data.</b> System operators shall monitor transmission line status, MW and MVAR flows, voltage, LTC settings and status of rotating and static reactive resources</p>	<p><i>Keep for transmission operator’s system operators</i></p> <p>202.1.1 The Reliability Authority shall perform Real-time Monitoring of system operating parameters to determine if the Reliability Authority Area is operating within its Interconnection Reliability Operating Limits.</p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 4 – System Coordination</b></p> <p align="center"><b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>B3 – Data required from control areas</b></p> <p><b>3. Data required from Control Areas.</b> Each CONTROL AREA shall provide its SECURITY COORDINATOR(S) with the Electric System Security Data that is necessary to allow THE SECURITY COORDINATOR(S) to perform its operational security assessments and coordinate reliable operations.</p> <p><b>3.1 Data.</b> CONTROL AREAS shall provide the types of data as listed in Appendix 4B, “Electric System Security Data, Section A, Electric System Security Data”, unless otherwise agreed to by the CONTROL AREAS and their SECURITY COORDINATOR(S).</p>	<p>206.1.1 Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>- Balancing Authorities</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul>
<p><b>4. Data exchange among SECURITY COORDINATORS.</b> Upon request, SECURITY COORDINATORS shall, via the ISN, exchange with each other Electric Security Data that is necessary to allow the SECURITY COORDINATORS to perform their operational security assessments and coordinate their reliable operations.</p>	<p>206.1.1 Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>- Balancing Authorities</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul>

<p align="center"><b>Policy 4 – System Coordination</b></p> <p align="center"><b>Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>4.1. Data.</b> SECURITY COORDINATORS shall share with each other the types of data as listed in Appendix 4B, “Electric System Security Data, Section A, Electric System Security Data”, unless otherwise agreed to.</p>	<p>206.1.1 Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>- Balancing Authorities</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<p><b>Appendix 4BA</b></p>	<p>205.1.1 The Reliability Authority shall specify and collect the data it needs to support Real-Time Monitoring, Operational Planning Analyses And Real-Time Assessments conducted relative to operating within its Reliability Authority Area’s Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Real-time Facility status to the Reliability Authority. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>- Balancing Authorities</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul>
----------------------------	---

<p><b>Policy 5 – Emergency Operations Language in Policy</b></p>	<p><b>Standard 200 Replacement</b></p>
<p><b>Requirement 5.C.1. Relieving security limit violations.</b> Each CONTROL AREA experiencing or materially contributing to an OPERATING SECURITY LIMIT violation shall take immediate steps to relieve the condition.</p>	<p>204.1.1 The Reliability Authority shall, without delay, act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul> <p>208.1.1 The Transmission Operator, Balancing Authority and Interchange Authority shall follow the Reliability Authority’s directives to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> </ul>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

	<ul style="list-style-type: none"> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>
<p><b>Requirement 5.C.2 Operator authority and responsibility.</b>  SYSTEM OPERATORS having responsibility for the reliability of the transmission system within a CONTROL AREA, pool, etc. shall be given and shall exercise specific authority to alleviate OPERATING SECURITY LIMIT violations. The authority shall enable the SYSTEM OPERATOR to take timely and appropriate actions including curtailing transmission service or energy schedules, operating equipment (e.g., generators, phase shifters, breakers), shedding load, etc.</p>	<p>204.1.1 The Reliability Authority shall, without delay, act or direct others to act to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul> <p>208.1.1 The Transmission Operator, Balancing Authority And Interchange Authority shall follow the Reliability Authority’s directives to:</p> <ul style="list-style-type: none"> <li>- Prevent instances where Interconnection Reliability Operating Limits may be exceeded</li> <li>- Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded</li> </ul>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<p align="center"><b>Policy 9 – Security Coordinator Language in Policy</b></p>	<p align="center"><b>Standard 200 Replacement</b></p>
<p><b>Requirement A.1.</b> <b>Perform security analysis.</b> The RELIABILITY COORDINATORS shall ensure that next-day reliability analyses are performed simultaneously for all CONTROL AREAS and TRANSMISSION PROVIDERS in its RELIABILITY AREA to ensure that the bulk power system can be operated in anticipated normal and contingency conditions.</p>	<p>203.1.1 The Reliability Authority shall perform Operational Planning Analyses to assess whether the planned bulk electric system operations within its Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.</p> <p>203.1.2 The Reliability Authority shall perform Real-Time Assessments to determine if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.</p>
<p><b>1.1. Information sharing.</b> Each CONTROL AREA in the SECURITY AREA shall provide information required for system studies, such as critical facility status, load, generation, operating reserve projections, and known INTERCHANGE TRANSACTIONS. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection, and 1200 Pacific Standard Time for the Western Interconnection.</p>	<p>206.1.1 Each entity performing one of the following functions shall provide data, as specified, to the Reliability Authority(ies) with which it has a reliability relationship.</p> <ul style="list-style-type: none"> <li>- Balancing Authority</li> <li>- Generator Owners</li> <li>- Generator Operators</li> <li>- Reliability Authorities</li> <li>- Transmission Operators</li> <li>- Transmission Owners</li> <li>- Load Serving Entities</li> </ul> <p><i>(Note that this data is only a subset of the data addressed in Policy 9 Requirement A.1.1.1)</i></p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

---

<p><b>Requirement A.1.2.</b> <b>System Studies.</b> The RELIABILITY COORDINATORS shall conduct studies to identify potential interface and other OPERATING RELIABILITY LIMIT violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p>	<p>203.1.1 The Reliability Authority shall perform Operational Planning Analyses to assess whether the planned bulk electric system operations within its Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.</p> <p>203.1.2 The Reliability Authority shall Perform Real-Time Assessments to determine if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.</p>

## Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits

---

### *Phased-in Compliance*

The following table identifies the implementation date and the earliest compliance date for each requirement.

The implementation date is the date entities are expected to begin meeting the performance identified in this standard. Because this standard rests upon the communication of system operating limits as defined in Requirement 204 - 604 Communication of System Operating Limits, the compliance dates are fixed from that date. Additional time (preparation time) has been added to give entities time needed to fully comply with the requirements. The justification for the staggered effective dates is in the tables on the following pages.

<b>Requirement</b>	<b>Effective Date</b>	<b>Compliance Date</b>
201 - IROL Identification	3 months from BOT adoption	6 months from implementation of Requirement 604
202 – Monitoring	3 months from BOT adoption	6 months from implementation of Requirement 604
203 - Analyses and Assessments	3 months from BOT adoption	6 months from implementation of Requirement 604
204 - Actions	3 months from BOT adoption	6 months from implementation of Requirement 604
205 – Data Specification & Collection	3 months from BOT adoption	9 months from implementation of Requirement 604
206 – Data Provision	3 months from BOT adoption	12 months from implementation of Requirement 604
207 – Processes, Procedures or Plans	3 months from BOT adoption	6 months from implementation of Requirement 604
208 – Reliability Authority Directives	3 months from BOT adoption	9 months from implementation of Requirement 604

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 201 – IROL Identification</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
201.1	<p>The Reliability Authority shall have a list of Facilities (or group of Facilities) in its Reliability Authority Area that are subject to Interconnection Reliability Operating Limits.</p> <p>(i) The Reliability Authority shall have evidence it has reviewed and updated its list of Facilities (or groups of Facilities) to reflect changes in its Reliability Authority Area’s system topology.</p>	<p>This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy – only additional time needed would be to produce some evidence that list has been updated</p>
201.2	<p>The Reliability Authority shall be able to identify the current values of the Interconnection Reliability Operating Limits it monitors. Each of these Interconnection Reliability Operating Limits shall have a <math>T_v</math> that is smaller than or equal to 30 minutes.</p> <p>(i) The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated <math>T_v</math>.</p>	<p>Current policy has a 30-minute response time for all limits. Entities may need additional time to establish variable <math>T_v</math>s for IROLs. This should be done within 6 months.</p> <p>This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy – only additional time needed would be to put produce some evidence that list has been updated and this could be done in less than a week if needed.</p>
201.3	<p>The Reliability Authority shall be able to demonstrate that its Interconnection Reliability Operating Limit values and their <math>T_v</math> reflect current system conditions.</p>	<p>This should not require any additional work – if limits are being updated to reflect ‘current’ conditions today, then the ability exists.</p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 202 – Monitoring</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
202.1	The Reliability Authority shall have a list of Facilities (or groups of Facilities) subject to IROLs available for its operations personnel’s Real-time use.	This should already be done in some format to comply with current field testing of IRLs and to comply with existing Operating Policy – only additional time needed would be to produce some evidence that list has been updated
202.2.	The Reliability Authority shall have Interconnection Reliability Operating Limits available for its operations personnel’s Real-time use.	This should already be done in some format to comply with existing Operating Policy – only additional time needed would be to re-title the limits as IROLs.
202.3	The Reliability Authority shall have Real-time Data available in a form that system operators can compare to the Interconnection Reliability Operating Limits.	This should already be done in some format to comply with existing Operating Policy – only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s.
202..4	The Reliability Authority shall monitor real-time system operating parameters and compare these against its Interconnection Reliability Operating Limits.	This should already be done in some format to comply with existing Operating Policy – only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s.

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 203 – Analyses and Assessments</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
203..1	The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area’s ability to operate without exceeding any Interconnection Reliability Operating Limits.	This should already be done in some format to comply with existing Operating Policy – only additional time needed would be to let system operations personnel know that the limits are called IROLs and may have unique T <sub>v</sub> s.
203.1.i.	The Reliability Authority shall conduct an Operational Planning Analysis at least once each day, evaluating the next day’s projected system operating conditions.	This should already be done to comply with existing Operating Policy – current operating practice in many locations is to do the analysis each day for the day ahead only on weekdays, and to do the ‘weekend ahead’ on Friday. Many entities do not conduct an operational planning analysis on Saturday or Sunday for Sunday and Monday. Entities may need some time to train additional personnel so that the analysis could be conducted every day of the week.
203.1ii	The Reliability Authority shall conduct a Real-time Assessment periodically, but at least once every 30 minutes.	This should already be done to comply with existing Operating Policy – only additional time needed would be to let system operators know that the limits are called IROLs and may have unique T <sub>v</sub> s and to identify that the assessment must be conducted at least once every 30 minutes.

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 204 - Actions</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
204.1.1	<p>The Reliability Authority shall have documentation to support each instance where actions were taken or directives were issued to mitigate the magnitude and duration of exceeding an Interconnection Reliability Operating Limit.</p> <p>(i) The documentation shall include the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity’s energy management system, or may be from some other source.)</p>	<p>This requires that the system operators know which of their limits are IROLs. The actions are done today to comply with Operating Policy.</p>
204.2.	<p>The Reliability Authority shall report each instance of exceeding an Interconnection Reliability Operating Limit for time greater than <math>T_v</math>:</p> <p>(i) The Reliability Authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its Compliance Monitor within five business days of the initiation of the event. (The report includes the date and time of the event; identification of which Interconnection Reliability Operating Limit was violated and the <math>T_v</math> for that limit; magnitude and duration of exceeding the Interconnection Reliability Operating Limit after exceeding <math>T_v</math>; actions taken or directives issued and the time these were initiated or issued; explanation of results of actions or directives.)</p>	<p>This requires that the system operators know which of their limits are IROLs. The actions are done today to comply with Operating Policy.</p> <p>This also requires that the Compliance Enforcement Program accept the IROL Violation Report developed by the IROL SDT. The report collects only the information identified in the measure.</p> <p>This also requires that the RA know which entity is acting as its compliance monitor.</p> <p>This also requires that the IROL Violation Report be made available to the RAs.</p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 205 – Data Specification &amp; Collection</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
205..1	<p>The Reliability Authority shall have a documented specification for data needed to build and maintain models needed to support real time monitoring, operational planning analyses and real time assessments relative to Interconnection Reliability Operating Limits.</p> <p>(i) Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.</p>	<p>Many entities may not have a data specification in place. The data specification may be distributed in several other documents, and entities may need time to assemble this. Since the data needed is known, even if it is not formally documented, it should be possible to accomplish this documentation within 9 months – this includes time to come to ‘mutual agreement’ with other entities.</p>
205.1.ii	<p>Specification shall address the data provision process to use when automated real-time system operating data is unavailable.</p>	<p>This may not exist and may need to be developed. It should be possible to develop this within the 9 month period identified for developing the complete data specification.</p>
205.2	<p>The Reliability Authority shall have evidence that it has distributed its data specification to the entities that have Facilities monitored by the Reliability Authority and to entities that provide Real-time Facility status to the Reliability Authority.</p>	<p>This requires documentation that wouldn’t be available until after the data specification were completed. This should be done no later than 10 months after the standard is approved – this allows 9 months to develop the specification, and then a month to deliver it.</p>
205..3	<p>The Reliability Authority shall notify its Compliance Monitor when an entity that has Facilities monitored by the Reliability Authority, or an entity that provides Real-time Facility status to the Reliability Authority, does not provide data as specified and the Reliability Authority was unable to resolve the issue with the entity responsible for providing the data .</p>	<p>This requires that the data specification be developed and distributed. This should come into affect a year after the standard is approved. This allows entities some time to ‘field test’ their data specification before compliance is a factor.</p>
205..3.i	<p>If the Reliability Authority does not receive data as specified and is unable to resolve the situation, then the Reliability Authority shall notify its Compliance Monitor within five business days of discovering that the data is missing.</p>	<p>This also requires that the RA know which entity is acting as its compliance monitor.</p>

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

<b>Requirement 206 – Data Provision</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
206.2.1	The entity responsible shall have evidence that it has provided data, as specified, to the requesting Reliability Authority, within the time frame specified, in the mutually agreed upon format.	The Data Specification in requirement 205 needs to be in place before this can be implemented. There should be a 12 month delay in implementing compliance with this measure. This allows entities time to work with their RA to come to agreement with a ‘mutually acceptable format’ and gives the entities that must provide the RA with data a 3 month trial and error period for providing data before there is any compliance measurement.

<b>Requirement 207 – Processes, Procedures or Plans</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
207.2.1	The Reliability Authority shall have one or more documented processes, procedures, or plans that identify both preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits. The processes, procedures, or plans shall identify and be coordinated with those entities responsible for taking actions and with those entities impacted by such actions.	Entities should have this plan in place now. A six-month delay in compliance should allow everyone time to develop a plan if it doesn’t already exist.

**Implementation Plan for Standard 200 – Operate Within Interconnection Reliability Operating Limits**

---

<b>Requirement 208 – Reliability Authority Directives</b>		
<b>Measure</b>	<b>Description</b>	<b>Preparation</b>
208.2.1	<p>The responsible entity shall follow the Reliability Authority’s directives and shall document the directives and actions taken to meet the directives.</p> <p>The responsible entity shall document via an operations log or other data source, the following for each directive it receives relative to an Interconnection Reliability Operating Limit:</p> <ul style="list-style-type: none"><li>- Date and time of directive received</li><li>- Directive issued</li><li>- Actions taken in response to directive</li></ul>	<p>This should already be done and no additional time for preparation should be needed.</p>

### Definitions

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high-voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Generator Owner:** The entity that owns the generator.

**Instability:** The inability of the transmission system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances.

**Interconnection Reliability Operating Limit:** A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.

**Interconnection Reliability Operating Limit Event:** An instance of exceeding an Interconnection Reliability Operating Limit for any length of time.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point where the limit is first exceeded and ends when the value drops below the limit and remains below the limit for at least 30 seconds.

**Occurrence Period:** The time period in which performance is measured and evaluated.

**Performance-reset Period:** The time period that the entity being assessed must operate without any violations to reset the level of non-compliance to zero.

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-time:** Present time as opposed to future time.

**Real-time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**Real-time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

## Operate Within Interconnection Reliability Operating Limits Standard

---

**Reliability Authority Area:** The collection of generation, transmission, and loads within the boundaries of the organization performing the Reliability Authority function. Its boundary coincides with one or more Balancing Authority areas.

**Self-certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Transmission Operator:** The entity that operates the transmission facilities and executes switching orders.

**Uncontrolled Separation:** The unplanned break-up of an interconnection, or portion of an interconnection, that is not the result of automatic action by a special protection system or remedial action scheme operating correctly.

**Wide-Area Impact:** The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

## 200 — Operate Within Interconnection Reliability Operating Limits

- 201 Interconnection Reliability Operating Limit Identification
- 202 Monitoring
- 203 Analyses and Assessments
- 204 Actions
- 205 Data Specification and Collection
- 206 Data Provision
- 207 Processes, Procedures, or Plans
- 208 Reliability Authority Directives

1. Purpose: To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.
2. Effective Date: This standard will become effective three months after the latter of either the date the NERC Board of Trustees votes to adopt the Determine Facility Ratings, System Operating Limits, and Transfer Capabilities Standard or three months after the date the NERC Board of Trustees votes to adopt this standard.

Initial Compliance with the individual requirements will be phased in as follows:

- 201 — Interconnection Reliability Operating Limit Identification — six months from implementation of Requirement 604.
- 202 — Monitoring — six months from implementation of Requirement 604.
- 203 — Analyses and Assessments — six months from implementation of Requirement 604.
- 204 — Actions — six months from implementation of Requirement 604.
- 205 — Data Specification & Collection — nine months from implementation of Requirement 604.
- 206 — Data Provision — 12 months from implementation of Requirement 604.
- 207 — Processes, Procedures, or Plans — six months from implementation of Requirement 604.
- 208 — Reliability Authority Directives — nine months from implementation of Requirement 604.

3. Applicability: These requirements apply to entities performing various electric system functions, as defined in the Functional Model. NERC is now developing standards and procedures for the identification and certification of such entities. Until that identification and certification is complete, this standard applies to the existing entities (such as control areas, transmission owners and operators, and generator owners) that are currently performing the defined functions.

In this standard, the terms Balancing Authority, Generator Operator, Generator Owner, Interchange Authority, Load-serving Entity, Reliability Authority, Transmission Operator, and

## **Operate Within Interconnection Reliability Operating Limits Standard**

---

Transmission Owner refer to the entities performing these functions as defined in the Functional Model.

## 201 — Interconnection Reliability Operating Limits Identification

### (a) Requirements

- (1) The Reliability Authority shall identify and document which Facilities (or groups of Facilities) in its Reliability Authority Area are subject to Interconnection Reliability Operating Limits<sup>1</sup>.
  - (i) All Reliability Authorities that share a Facility (or group of Facilities) shall agree on whether that Facility (or group of Facilities) is (are) subject to Interconnection Reliability Operating Limits.
- (2) The Reliability Authority shall identify Interconnection Reliability Operating Limits for its Reliability Authority Area. Each Interconnection Reliability Operating Limit shall have a  $T_v$  that is smaller than or equal to 30 minutes.
- (3) All Reliability Authorities that share a Facility (or group of Facilities) subject to an Interconnection Reliability Operating Limit shall agree upon the process used to determine that Interconnection Reliability Operating Limit and its associated  $T_v$ .

### (b) Measures

- (1) The Reliability Authority shall have a list of Facilities (or group of Facilities) in its Reliability Authority Area that are subject to Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall have evidence it has reviewed and updated its list of Facilities (or groups of Facilities) to reflect changes in its Reliability Authority Area's system topology.
- (2) The Reliability Authority shall be able to identify the current values of the Interconnection Reliability Operating Limits it monitors. Each of these Interconnection Reliability Operating Limits shall have a  $T_v$  that is smaller than or equal to 30 minutes.
  - (i) The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$ .
- (3) The Reliability Authority shall be able to demonstrate that its Interconnection Reliability Operating Limit values and their  $T_v$  reflect current system conditions.

### (c) Regional Differences

None identified.

---

<sup>1</sup> Each Interconnection Reliability Operating Limit is developed by following the requirements in the Determine Facility Ratings, System Operating Limits, and Transfer Capabilities Standard.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep data on facilities and limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - (i) List of Facilities (or group of Facilities) in its Reliability Authority Area that are subject to Interconnection Reliability Operating Limits. The list shall be contained on paper, displayed through an Energy Management System, or via another data source.
  - (ii) Evidence that the list of Facilities (or group of Facilities) subject to Interconnection Reliability Operating Limits was updated.
  - (ii) An agreed upon process for determining if a shared Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$ .
- (4) The Reliability Authority shall demonstrate that it can identify the current values of the Interconnection Reliability Operating Limits it monitors and shall show that each of these Interconnection Reliability Operating Limits shall have a  $T_v$  that is smaller than or equal to 30 minutes.

**(e) Levels of Noncompliance**

- (1) Level One: No process for determining if shared Facilities (or groups of Facilities) are subject to Interconnection Reliability Operating Limits and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$ .
- (2) Level Two: No evidence that a shared Facility (or group of Facilities) has an Interconnection Reliability Operating Limit with a  $T_v$  that has been agreed to by all Reliability Authorities that share the Facility (or group of Facilities).
- (3) Level Three: A level three noncompliance occurs if either of the following conditions are present:
  - (i) One or more Interconnection Reliability Operating Limits had a  $T_v$  that was greater than 30 minutes.
  - (ii) No evidence that the list of Facilities (or groups of Facilities) subject to Interconnection Reliability Operating Limits was updated.
- (4) Level Four: A level four noncompliance occurs if either of the following conditions are present:
  - (i) Could not identify the current values of the Interconnection Reliability Operating Limits for its Reliability Area.
  - (ii) No list of Facilities (or groups of Facilities) subject to Interconnection Reliability Operating Limits exists for the Reliability Authority Area.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## 202 — Monitoring

### (a) Requirements

- (1) The Reliability Authority shall perform Real-time Monitoring of system operating parameters to determine if its Reliability Authority Area is operating within its Interconnection Reliability Operating Limits.

### (b) Measures

- (1) The Reliability Authority shall have a list of Facilities (or groups of Facilities) subject to Interconnection Reliability Operating Limits available for its operations personnel's Real-time use.
- (2) The Reliability Authority shall have Interconnection Reliability Operating Limits available for its operations personnel's Real-time use.
- (3) The Reliability Authority shall have Real-time Data available in a form that system operators can compare to the Interconnection Reliability Operating Limits.
- (4) The Reliability Authority shall monitor system operating parameters and compare these against its Interconnection Reliability Operating Limits.

### (c) Regional Differences

None identified.

### (d) Compliance Monitoring Process

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep data on limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall demonstrate the following upon the request of the Compliance Monitor:
  - (i) System operators actively monitoring and comparing Real-time system operating parameters associated with Interconnection Reliability Operating Limits.

### (e) Levels of Noncompliance

- (1) Level One: Not applicable.
- (2) Level Two: List of Facilities (or groups of Facilities) subject to Interconnection Reliability Operating Limits not available to operations personnel for Real-time use.
- (3) Level Three: Not applicable.

## Operate Within Interconnection Reliability Operating Limits Standard

---

- (4) Level Four: A level four noncompliance occurs if any of the following conditions are present:
- (i) Interconnection Reliability Operating Limits not available to operations personnel for Real-time use; or
  - (ii) Real-time Data not available in a form that can be compared to the Interconnection Reliability Operating Limits; or
  - (iii) System operating parameters not monitored and compared against Interconnection Reliability Operating Limits.

### **(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## 203 — Analyses and Assessments

### (a) Requirements

- (1) The Reliability Authority shall perform Operational Planning Analyses to assess whether the planned Bulk Electric System operations within its Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.
- (2) The Reliability Authority shall perform Real-time Assessments to determine if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

### (b) Measures

- (1) The Reliability Authority shall identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any Interconnection Reliability Operating Limits.
  - (i) The Reliability Authority shall conduct an Operational Planning Analysis at least once each day, evaluating the next day's projected system operating conditions.
  - (ii) The Reliability Authority shall conduct a Real-time Assessment periodically, but at least once every 30 minutes.

### (c) Regional Differences

None identified.

### (d) Compliance Monitoring Process

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall identify the following upon the request of the Compliance Monitor:
  - (i) The time the most recent Operational Planning Analysis was conducted.
  - (ii) Whether the planned Bulk Electric System operations within the Reliability Authority's Reliability Authority Area will exceed any of its Interconnection Reliability Operating Limits.
  - (iii) The time the most recent Real-time Assessment was conducted.
  - (iv) Whether the Real-time Assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

**(e) Levels of Noncompliance**

- (1) Level One: Not applicable.
- (2) Level Two: Not applicable.
- (3) Level Three: A level three noncompliance exists if any of the following conditions are present:
  - (i) No indication that an Operational Planning Analysis was conducted at least once each day.
  - (ii) No indication that a Real-time Assessment was conducted at least once each 30 minutes.
- (4) Level Four: A level four noncompliance exists if either of the following conditions are present:
  - (i) The Reliability Authority could not identify whether the planned Bulk Electric System operations within its Reliability Authority Area is expected to exceed any of its Interconnection Reliability Operating Limits, based on the results of the most recent Operational Planning Analysis.
  - (ii) The Reliability Authority could not identify whether the most recent Real-time Assessment identified if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where financial sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## 204 — Actions

### (a) Requirements

- (1) The Reliability Authority shall, without delay, act<sup>2</sup> or direct others to act to:
  - (i) Prevent instances where Interconnection Reliability Operating Limits may be exceeded.
  - (ii) Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded.
- (2) The Reliability Authority shall include a statement in each Interconnection Reliability Operating Limit-related directive, that informs the recipient that the directive is related to an Interconnection Reliability Operating Limit.
- (3) The Reliability Authority shall document instances of exceeding Interconnection Reliability Operating Limits and shall document and complete an Interconnection Reliability Operating Limit Violation Report for instances of exceeding Interconnection Reliability Operating Limits for time greater than  $T_v$ .

### (b) Measures

- (1) The Reliability Authority shall have documentation to support each instance where actions were taken or directives were issued to mitigate the magnitude and duration of exceeding an Interconnection Reliability Operating Limit.
  - (i) The documentation shall include the actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)
  - (i) The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of one minute.
- (2) The Reliability Authority shall report each instance of exceeding an Interconnection Reliability Operating Limit for time greater than  $T_v$ .
  - (i) The Reliability Authority shall complete an Interconnection Reliability Operating Limit Violation Report and shall file the report with its Compliance Monitor within five business days of the initiation of the event. (The report shall include the date and time of the event, identification of which Interconnection Reliability Operating Limit was violated and the  $T_v$  for that limit, magnitude and duration of exceeding the Interconnection Reliability Operating Limit, actions taken or directives issued and

---

<sup>2</sup> Note that the Reliability Authority is expected to act without delay and may choose to take 'no overt action' and this may be an acceptable action as long as it is documented. Taking 'no overt action' is not the same as ignoring the problem.

the time these were initiated or issued, and an explanation of results of actions or directives.)

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep Interconnection Reliability Operating Limit Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of its Compliance Monitor:
  - (i) Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an Interconnection Reliability Operating Limit and the actions or directives issued for each of these instances.
  - (ii) Interconnection Reliability Operating Limit Violation Reports.

**(e) Levels of Noncompliance<sup>3</sup>**

- (1) Level One: Interconnection Reliability Operating Limit exceeded for a time less than or equal to  $T_v$  and no documentation to indicate actions taken or directives issued to mitigate the instance.
- (2) Level Two: Not applicable.
- (3) Level Three: Not applicable.
- (4) Level Four: Interconnection Reliability Operating Limit exceeded for time greater than  $T_v$ .

---

<sup>3</sup> Note that the Reliability Authority is expected to act without delay and may choose to take 'no overt action' and this may be an acceptable action as long as it is documented. Taking 'no overt action' is not the same as ignoring the problem.

**Operate Within Interconnection Reliability Operating Limits Standard**

**(f) Sanctions**

(1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix.

- (i) Level one noncompliance sanctions shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.
- (ii) Level four noncompliance sanctions shall be the greater of the fixed dollar sanctions listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table:

If the Maximum Value % over the Limit (measured after the event duration exceeds $T_v$ ) is: <small>Max Value % = (Max Value/IROL limit - 1)*100</small>	And the event duration exceeds its $T_v$ by ___ minutes:	Then Multiply the Level 4 \$ sanction by:
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	$\text{Duration} > T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	$\text{Duration} > T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	$\text{Duration} > T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	$\text{Duration} > T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	$\text{Duration} > T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	$\text{Duration} > T_v + 15$ minutes	45

## 205 — Data Specification and Collection

### (a) Requirements

- (1) The Reliability Authority shall specify and collect the data it needs to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Real-time Facility status to the Reliability Authority. This includes specifying and collecting data from the following:
  - (i) Balancing Authorities
  - (ii) Generator Owners
  - (iii) Generator Operators
  - (iv) Load-serving Entities
  - (v) Reliability Authorities
  - (vi) Transmission Operators
  - (vii) Transmission Owners
- (2) The Reliability Authority shall specify when to supply data (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).
- (3) The Reliability Authority shall notify its Compliance Monitor when both of the following conditions are present:
  - (i) An entity that has data needed to support Real-time Monitoring, Operational Planning, or Real-time Assessments relative to operating within the Reliability Authority's Reliability Authority Area has not provided data as specified, and
  - (ii) The Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.

### (b) Measures

- (1) The Reliability Authority shall have a documented specification for data needed to build and maintain models needed to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments relative to Interconnection Reliability Operating Limits.
  - (i) Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.
  - (ii) Specification shall address the data provision process to use when automated Real-time system operating data is unavailable.
- (2) The Reliability Authority shall have evidence that it has distributed its data specification to entities that have Facilities monitored by the Reliability

Authority and to entities that provide Facility status to the Reliability Authority.

- (3) The Reliability Authority shall notify its Compliance Monitor when an entity that has Facilities monitored by the Reliability Authority, or an entity that provides Facility status to the Reliability Authority, does not provide data as specified and the Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.
  - (i) If the Reliability Authority does not receive data as specified, and is unable to resolve the situation, then the Reliability Authority shall notify its Compliance Monitor within five business days of discovering that the data is missing.

### **(c) Regional Differences**

None identified.

### **(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period shall be 12 months from the last violation. The Reliability Authority shall keep its data specification(s) for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The Reliability Authority shall have the following available upon the request of the Compliance Monitor:
  - (i) Data specification(s).
  - (ii) Proof of distribution of the data specification(s).

### **(e) Levels of Noncompliance**

- (1) Level One: Data specification incomplete (missing either the list of required data, a mutually agreeable format, a timeframe for providing data, or a data provision process to use when automated real-time system operating data is unavailable).
- (2) Level Two: No data specification or the specification not distributed to the entities that have Facilities monitored by the Reliability Authority and the entities that provide the Reliability Authority with Facility status.
- (3) Level Three: Not applicable.
- (4) Level Four: Not applicable.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**206 — Data Provision**

**(a) Requirements**

- (1) Each entity performing one of the following functions shall provide data and real-time Facility status, as specified, to the Reliability Authority(ies) with which it has a reliability relationship. The data is limited to data needed by the Reliability Authority to support Real-time Monitoring, Operational Planning Analyses, and Real-time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits.
  - (i) Balancing Authorities
  - (ii) Generator Owners
  - (iii) Generator Operators
  - (iv) Load-serving Entities
  - (v) Reliability Authorities
  - (vi) Transmission Operators
  - (vii) Transmission Owners

**(b) Measures**

- (1) The responsible entity shall have evidence that it has provided data, as specified, to the requesting Reliability Authority, within the timeframe specified, in the mutually agreed upon format.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The responsible entity shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The responsible entity shall keep data transmittal documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.
- (3) The responsible entity shall have the following available upon the request of the Compliance Monitor:
  - (i) Evidence indicating data was sent to the Reliability Authority or evidence that the entity responsible committed to providing the data identified in the specification.

**(e) Levels of Noncompliance**

- (1) Level One: Not applicable.
- (2) Level Two: Not applicable.
- (3) Level Three: Not applicable.
- (4) Level Four: Data was not provided to the Reliability Authority as specified and the situation was not resolved with the Reliability Authority.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

**207 — Processes, Procedures, or Plans for Preventing and Mitigating Interconnection Reliability Operating Limits**

**(a) Requirements**

- (1) The Reliability Authority shall have one or more processes, procedures, or plans that identify actions it shall take or actions it shall direct others to take, for both prevention and mitigation of instances of exceeding its Interconnection Reliability Operating Limits.

**(b) Measures**

- (1) The Reliability Authority shall have one or more documented processes, procedures, or plans that address both preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits. The processes, procedures, or plans shall identify and be coordinated with those entities responsible for taking actions and with those entities impacted by such actions.

**(c) Regional Differences**

None identified.

**(d) Compliance Monitoring Process**

- (1) The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The Reliability Authority shall keep its action plan for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- (3) The Reliability Authority shall make the following available for inspection by the Compliance Monitor upon request:
  - (i) Processes, procedures, or plans that address preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits.

**(e) Levels of Noncompliance**

- (1) Level One: Processes, procedures, or plans exist but weren't coordinated with all involved and impacted entities.
- (2) Level Two: Processes, procedures, or plans exist but weren't coordinated with any involved or any impacted entities.
- (3) Level Three: Processes, procedures, or plans exist but do not address both preventing and mitigating instances of exceeding Interconnection Reliability Limits.
- (4) Level Four: No processes, procedures, or plans exist addressing preventing and mitigating instances of exceeding Interconnection Reliability Operating Limits.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## 208 — Reliability Authority Directives

### (a) Requirements

- (1) The Transmission Operator, Balancing Authority, and Interchange Authority shall follow the Reliability Authority's directives to:
  - (i) Prevent instances where Interconnection Reliability Operating Limits may be exceeded.
  - (ii) Mitigate the magnitude and duration of instances where Interconnection Reliability Operating Limits have been exceeded.
- (2) The responsible entity shall document the Reliability Authority's directives and the actions taken.

### (b) Measures

- (1) The responsible entity shall follow the Reliability Authority's directives and shall document the directives and actions taken to meet the directives.
- (2) The responsible entity shall document via an operations log or other data source, the following for each directive it receives relative to an Interconnection Reliability Operating Limit:
  - (i) Date and time of directive received.
  - (ii) Directive issued.
  - (iii) Actions taken in response to directive.

### (c) Regional Differences

None identified.

### (d) Compliance Monitoring Process

- (1) The responsible entity shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint to assess performance.
- (2) The Performance-reset Period is 12 months from the last violation. The responsible entity shall keep its documentation for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.
- (3) The responsible entity shall make the following available for inspection by the Compliance Monitor upon request:
  - (i) Operations log or other data source(s) to show the following for each instance of being issued a Reliability Authority directive relative to an Interconnection Reliability Operating Limit:
    - 1) Date and time of each directive received.
    - 2) Directive issued.
    - 3) Actions taken in response to directive.

**(e) Levels of Noncompliance**

- (1) Level One: The responsible entity followed Reliability Authority's directives relative to preventing or mitigating instances of exceeding Interconnection Reliability Operating Limits but did not document the date and time of each directive received, the directive received, and the actions taken in response to the directive.
- (2) Level Two: Not applicable.
- (3) Level Three: Not applicable.
- (4) Level Four: The responsible entity did not follow the Reliability Authority's directives.

**(f) Sanctions**

- (1) Sanctions for noncompliance shall be applied consistent with the NERC Compliance and Enforcement Matrix. In places where sanctions are applied for noncompliance, these penalties shall be the fixed dollar sanctions listed in the matrix, not the dollars per megawatt sanctions.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

<b><i>Name</i></b>	<b><i>Company</i></b>	<b><i>Industry Segment #</i></b>

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments      The minimum voltage of a Bulk Electric System should be 100 KV.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes                       No  
 Comments      The definition of real-time data needs to make reference to how often it is collected (e.g. every 4 seconds) and how quickly it is reported (e.g. every 2 seconds).

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments      In the event that there are different ratings of the same facility, the lower rating should always be used.

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments              Some of the more serious violations seemed to have the lesser penalties and vice versa.

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                      X  No

X  Comments:

The parenthetical portion of the definition is too inclusive in specifying what makes up the “high voltage transmission system”. It requires all lines “above 35 kV or as approved in a tariff filed with FERC” to be included as part of the Bulk Electric System. Many lines that would fit this specification are indeed “transmission” rather than “distribution”, but they may not be part of the BULK transmission, i.e., the transmission that affects the overall reliability of the interconnected systems. Such “non-bulk” transmission lines could be called “subtransmission” or “underlying transmission” or “local transmission”. Many lines above 35 kV fall into this “non-bulk” category. Also, FERC tariff filings may limit lines to voltage levels above 35 kV, but may still contain many “non-bulk” transmission lines in order that such lines may receive proper regulatory treatment. In those cases, an entity would have no choice but to consider those “non-bulk” lines as part of the Bulk Electric System.

The definition should be corrected by either of the following:

- a. Delete the parenthetical portion, OR,
  - b. Change the parenthetical portion to the following –“(above 35 kV or as defined in a publicly available document)”. This would still allow the FERC filing to be used to limit and define the Bulk Electric System, IF APPROPRIATE. If further limiting is needed, this would allow an entity to produce, and make publicly available, another document to define the Bulk Electric System.
2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                      X  No

X  Comments:

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

The definition implies that Cascading Outages ALWAYS result in 300 MW of load loss for a minimum of 15 minutes. This result is likely, but not 100% sure.

The definition should be corrected by either of the following:

- a. End the sentence with "at any location." and delete the remainder, OR,
  - b. Same as a. above, and add the following sentence – "Cascading Outages will likely have a Wide-Area Impact". Note that Wide-Area Impact is separately defined to include the 300 MW / 15 minute criteria.
3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: The definition uses the expression "networked system load", which implies that "single source fed system load" is excluded. Therefore, we would conclude that the loss of 300 MW or more of "single source fed system load" does not have "Wide Area Impact". Is that the intent of the definition?

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No

Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

X  Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

X  Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

X  Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                      X  No

X  Comments: Public posting of IROLs is a market issue, which should be considered in any complementary NAESB standard.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments: Changing to 1 minute gives better assurance of good telemetry and allows for the system to settle more.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes                       No

Comments: The table can be simplified by making four columns for the four "event duration exceeds its  $T_v$ " segments, instead of repeating them six times. The table will then form a six by four grid with the multiplication factors filling the grid.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by                      ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

X  Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
X  No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
X  I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT. These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes

X No

X Comments

Reference to a voltage class is fine, but the correct voltage class should be referenced. In the Introduction Section of the NERC Planning Standards the definition of Bulk Electric System contains 100 kV as the qualifier. Shouldn't this definition be consistent with this long-standing definition?

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes

X No

X Comments

Using loss of load to imply a cascading event is not a logical link. If the point is to develop a limit for a reportable event, then call it a reportable event not a cascading outage. While this definition does set quantitative limits for cascading outages it doesn't really capture the link to cascading events. We would prefer the previous version of the definition, which while it was not as specific, captured the generic idea of cascading outages better. Trying to define cascading outages discretely may not be possible. Perhaps this definition is best left to the Determine Facility Ratings standard.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

X No

X Comments

If IROLs are truly significant interconnection events, then 30 minutes for  $T_v$  is probably a good value. However, if the definition of IROL stays with the proposed limits of 300 MW of load, then 30 minutes may be too short.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes

X  
No

X Comments

This term does not appear in the standard, why does it need to be defined here?

If it is felt that the definition must be included, then 300 MW is too small to be considered a wide area when compared to the interconnection.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                      X No

X Comments

The definition of an IROL Event Duration lists a reset time of 30 seconds. In 204(b)(1)(ii) the reset period is given as one minute. Whichever the case, 30 seconds or 1 minute is too short of a period for the reset. This should be on the order of 5 minutes or so in order to indicate that stable operating conditions have been attained.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

X Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes             No  
 Comments

8. Do you agree with the compliance monitoring process?

Yes                       No  
 Comments

We would suggest that the phrase in 201(d)(1) referring to on-site reviews every three years be replaced with on-site reviews as needed.

9. Do you agree with the levels of non-compliance?

Yes             No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments

This should be incorporated in the Coordinate Operations standard and doesn't need to be repeated here.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators: (a) The system conditions under which the Interconnection Reliability Operating Limit applies, (b) The contingency that is the basis for the limit, (c) The impact of exceeding the limit	<input checked="" type="checkbox"/> X Yes
	<input type="checkbox"/>

No  Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL	<input checked="" type="checkbox"/> X Yes
<input type="checkbox"/> No <input type="checkbox"/> Comments	

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

Keep the minimum of 30 seconds

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.	<input type="checkbox"/>
--	--------------------------

minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

Refer to our comment to Question 5. Something on the order of 5-10 minutes may be a better indicator of true system recovery.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes                      X No  
 Comments

There are no sanctions listed for a Maximum Value over 30%. The last stage should be set at equal to or greater than 25%.

The validity of the table is directly related to the definition of IROL. If an IROL is truly a significant interconnection event, similar in consequences to the August 14 event, then it doesn't matter if the IROL is violated for 5 minutes or 35 minutes, it was violated. If defined properly, a major portion of the interconnection would be jeopardized. If IROL were defined properly, the table would not be needed. Therefore a graduated table may be inappropriate. On the other hand, if IROL is defined as only 300 MW of load loss, then a graduated table may be more fitting.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- X Yes             No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- X Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
X No, I am not a member of the Ballot Pool for this standard  
X Comments

There were both members and non-members of the balloting pool.

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- X I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
X Comments

Depending upon the response to our comments and what revisions are made, we can agree or disagree with the technical content of this standard.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- X I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

An IROL of 300 MW of load loss is too small. Don't lose sight of the fact that an IROL is a significant threat to a large portion of the interconnection. By minimizing the defined threshold for an IROL, the number of IROLs will increase drastically and thereby dilute the significance of the event.

Section 203(b)(1)(ii) requires a real-time assessment at least every 30 minutes. This may be too frequent depending upon the complexity of the studies involved.

Consider reversing noncompliance Levels 3 and 4 in section 203(e). Which of the two levels is worse?

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

While FERC may approve nearly any voltage level as “transmission,” that does not qualify the facility as part of the bulk electric system. Regional practices and expected power flows can be used to distinguish between bulk and local electric facilities. The Regional Reliability Council should have authority to part of the bulk electric system if the facility owner does not voluntarily consider a facility to be such.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

Add the term “or has a Wide-Area Impact.”

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

One minute is a clearer indication that conditions have settled and that telemetry has kept up with actual conditions.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**List of Group Participants that Support These Comments:**

<b>Name</b>	<b>Company</b>	<b>Industry Segment #</b>

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments This definition, since it relates to IROLs, should not be tied to voltage, rather it should be based on function. I suggest the following: "An individual electric system facility is considered part of the Bulk Electric System if the availability of that element (whether it is in or out) impacts the capacity of an SOL or IROL."

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments This definition might be appropriate for the definition of an IROL but it does not fit with the other uses for the term (such as in the performance table). I suggest that this definition be removed and the words from this definition moved into the definition of an IROL in place of the words "cascading outages".

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                      x No

x Comments I do not agree that this is the appropriate definition of wide area impact. However I also do not see that this term is used anywhere in the document, so I suggest that it be removed entirely.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                       No

Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes                       No

Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes                       No

Comments

8. Do you agree with the compliance monitoring process?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: We feel that this definition could be interpreted as including all facilities at and above 35kV whether they are transmission or not. The Bulk Electric System should be defined as 100kV and above network transmission system or lower voltage facilities that pass the FERC seven factor test.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: Determining the amount of load loss and restoration time in a pre-contingency study is not possible with the current real-time analysis tools.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments: However, the standard needs to define acceptable risks.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: This definition would qualify the loss of a single industrial customer (greater than 300MWs) as a wide area impact. A wide area impact should be defined as the loss of multiple substations or facilities than result in multiple customer outages totaling 300MWs or greater.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments: Provided the RA operator can easily determine if the monitored value is within the limit or exceeds the limit and corrective action need to be taken.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201: To determine every scenario that would lead to an IROL's ahead of time is a problem.

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

- Yes                       No  
 Comments: However, under Requirements 203 or 204 would be a better place to include the addition.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments: Remove  $\leq 30\%$  from the last block.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No  
 Comments

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments -**For a large electric system that fluctuates between 15,000 MW to 29,000 MW in any given day, TVA feels that the loss of 300MW would not cause uncontrolled successive loss of system elements. We would prefer a Percentage of System Load rather than a hard number.**

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

**X Comments - See comments to question 2. Also, if "Wide Area " is implied and not used in this document, why have it at all?**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

**X Comments- Operational Planning Analysis which states "An analysis of the expected system conditions for the next day's operation and up to 12 months ahead."**

**Currently, Reliability Coordinators have responsibility for real-time through next day and Control Areas have Operational Planning responsibilities up to 12 months.**

**Page 6 of the "question and answers" address this definition and it says that the standard requires that an operational planning analysis be conducted at least once each day, looking ahead at the day ahead. But it appears to me that the definition implies more than next day. Maybe this is okay since the measure does limit it to next day.**

**Most of the SERC RCs have responsibility for multiple control areas. TVA for example does operational planning for several months for the TVA control area, but our scope as RC for AECL, BREC, EKPC is real-time through next day.**

**Scope for RC is real-time through next day.**

**There appears to be a shift in responsibility for this operational planning timeframe, if RC = RA.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No  
 Comments

8. Do you agree with the compliance monitoring process?

Yes       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes       No  
 Comment

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes       No -  
 Comments - **RAs should coordinate and reach agreements for IROLs on joint Facilities. RAs should communicate IROLs that could impact neighboring RAs.**

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes       No -  
 Comments **We see no value in posting this and it may pose a security risk.**

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

Yes       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments **"Duration" is ok, but magnitude (maximum value ) should be taken out**

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

Yes       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

**TVA would like to reserve the right to forward additional comments at a later date.**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments :

The (above 35 kV or as approved in a tariff filed with FERC) should be changed to (200kV and above or as determined by region). This will avoid including many lines that are not part of the Bulk Electric System, but if they are significant the Regions can add them into consideration for IROL's

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments:

There is a concern with some at BPA that the Definition of Cascading Outages will affect other standards. Specifically the use of "300 MW or more of networked system load for a minimum of 15 minutes" will not work with other standards. It has been suggested to use the current definition for Cascading Outages be used in the IROL definition.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$  :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments:

Remove definition if it is no longer used.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                       No

Comments

IROL: "system operating limit" should be capitalized.

IROL Event Duration: The time frame should match the standard, definition says 30 seconds, standard says 1 minute (204b1ii). There are two I in (204b1)

Please include the SOL definition.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes                       No

Comments

This should be covered in the coordinate operations standard (#100).

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes  No

Comments

It should be made clearer that the IROL facilities can be dynamic also. Some read this as only dynamic IROL values. Implementation plan will also need to change to reflect this update.

8. Do you agree with the compliance monitoring process?

Yes  No

Comments

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs.

Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments

This should be covered in the coordinate operations standard (#100).

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

Comments

BPAT believes there is no reliability-related reason to publicly post IROL's, in fact it may be a security issue.

12. Other comments about Requirement 201:

201 (d) & (e) (3) (ii) need to be changed to correspond more with (b) (1) (i). Which includes adding "to reflect changes in its Reliability Authority Area's system topology.

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

We agree if (c) is omitted. We believe it would be unrealistic to give the system operators the impact of exceeding the limit for every scenario.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

We agree with either 30 seconds or 1 minute, but 10 minutes is too long.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

We would agree with the table if the sanctions were applied to the appropriate entity. It seems unfair if the sanctions are applied to the RA if TOP did not follow the RA directive fast enough or not at all. One suggestion would require the RA to issue directive within 5 minutes. Below are some possible scenarios where IROL has been violated past  $T_v$ . These may be an over simplification, but it may be a good place to start.

Scenario 1: RA issues directive in 5 minutes, the TOP does not follow directive fast enough or not at all, TOP gets sanction.

Scenario 2: RA issues directive in 5 minutes, the TOP does follow directive fast enough, but directive did not solve problem, RA gets sanction.

Scenario 3: RA issues directive past 5 minutes, RA gets sanctions.

It has also been suggested in BPAT's group that a one time and one time only pass on the sanctions for the first ever offense, or some kind of phase in of the sanctions. This would be to recognize that there maybe some growing pains in implementing this standard for the first time

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

Question 19 Comments: BPAT may or may not vote against this standard based on changes to the Functional Model and based on the structure of the Financial Sanctions. BPAT has not determined this yet.

BPAT would like the system operator to be identified as RA system operators were applicable. 202(b)(3) & 202 (d)(3)(i)

In section 200 (2) please identify the name of section 604 where used.

Please add the standard number when other standards are mentioned.

Please include in 208 (d) (3)“(4) Time the actions were taken. This may be important to determine if directive were followed in a timely manner.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

### Questions about Definitions

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

This definition should be reliability-“performance based” and references to tariffs should be removed. The existing NPCC Definition for its **Bulk Power System** is;

“The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances can have significant adverse impact outside of the local area. Local areas are determined by the Council members.”

Furthermore NPCC CP9 members listed feel that in no instance should a BES criteria encompass facilities at voltage levels less than 115 kV and strongly urges the eventual adoption of a “performance based” definition not a “voltage based” one.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

An event characterized by one or more of the following phenomena:

- the loss of **power** system **stability**
- cascading outages of circuits
- oscillations; abnormal ranges of frequency or voltage or both.

NPCC participating members of CP9 feel it is not the threshold of 300 MW that qualifies an incident to be classified as a cascading outage. The loss of 300 MW of load may have nothing to do with cascading or uncontrolled successive losses, 300 MW of load may be lost under certain conditions, but it doesn’t necessarily pose a risk to the interconnection. We believe that the standard specify that the cascading outages not propagate beyond the local area (i.e. Control Area).Moreover, the definition of “Cascading Outage” as outlined in Standard 200 is different from

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

that defined in Standard 600 (Develop Facility Ratings, ...). It is recommended to follow a common definition as given in Std 600, including a minor modification, as follows. i.e.”

**“The uncontrolled successive loss of Bulk Electric System elements that propagate beyond a defined area (Balancing Area’s) boundaries.”**

In addition, specific examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

NPCC participating CP9 members participating agree that the  $T_v$  should be limited to 30 mins. However the last sentence should read  $T_v$  shall not be greater than 30 minutes.

Add discussion to Q&A document to give rationale as to why  $T_v$  under 30 minutes is required.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No  
 Comments

It is proposed that the definition of Widespread Area from NERC OLDTF Report (that was validated by RCWG at its December/03 meeting and was accepted by NERC OC at its March 2004 meeting) be used in the Standard 200 as well. It is stated as below:

**Widespread Area** An area that extends beyond any LOCAL AREA.

**Local Area** The portion of a WIDESPREAD AREA, whose boundaries are predetermined by appropriate analyses, where the impact of a CONTINGENCY or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond those predetermined boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a WIDESPREAD AREA indicates significant impact to the INTERCONNECTION.

OR an alternative option/suggestion is also proposed as follows:

“The impact of an incident resulting in uncontrolled successive loss of system elements in networked system and where the consequences of such significant adverse impact cannot be contained within a defined area that can be demonstrated by studies.

Wide area impact may also be defined correlating it to occurrences of event impacting more than one Reliability Authority.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No  
 Comments

The terms/definitions in the Standards should be consistent with the terms/definitions outlined in Functional Model (version 2). As an example, there is an inconsistency in definition of Transmission Operator, i.e. Definition of Transmission Operator should be updated to reflect definition stated in version 2 of the Functional Model – i.e. “operates or directs the operation”.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Definitions should be in one place not in each standard and definitely should not appear if they are in the Functional Model document.

The definition of IROL presently given in the recent modified template P2T1 (System Operating/Interconnected Reliability Operating Limits Violations) may better serve the purpose in Std 200 as well. It is suggested to use the same definition with few modifications, as follows:

**“ A subset of system operating limits, which if exceeded, could expose a Widespread Area of the Bulk Electrical system to instability, uncontrolled separations(s) or cascading outages.”**

### Questions about Requirement 201 — IROL Identification

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of ‘shared’ Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments

Concern exists that the process required may be too formalized and could be a simple email or telephone call that requires affirmation and a formal legal agreement should not be required.

### Questions about Requirement 201 — IROL Identification, continued

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLS can be dynamic. The SDT modified the requirement so that instead of requiring a ‘list’ of IROLS, the RA must be able to identify the ‘current value’ of its IROLS. Do you agree with this change?

- Yes                       No  
 Comments

While the standard considers the requirements that IROLS can be dynamic, it also needs to provide guidance to operators to identify IROLS as they occur. Also refer to comments given in question 13.

In addition, the System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

NPCC participating members of CP9 doesn’t agree with having a list of facilities.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Also, what constitutes evidence that a list was updated from an auditing perspective? The requirements need to be clear as to what exactly is needed.

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

What constitutes evidence that a list was updated from an auditing perspective?

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

There should be a mutual agreement on the process of coordination among RAs. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit of the different calculation results. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impacted facilities. Such requirements can be included in standard 600.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

Although this a desirable addition, it should consistently appear throughout the document.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

All directives should be acted on irrespective if they are IROL or not. Statements such as this perhaps might be better documented in the Coordinate Operation Standards.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

16. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes

No!

Comments

We support Mr. Gent's comments to the NERC BOT that monetary sanctions are ineffective to ensure compliance and that market mechanisms and letters of increasing severity are more effective.

There is an issue with the concept of a monetary sanction matrix and what its implications are. NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement "Plan B," a "voluntary" approach affording NERC the authority to perform these types of monetary sanctions. NPCC has indicated that any posted Standard, with such a matrix, will not be supported by NPCC, or its members. There are, however, proceedings at NERC by the Compliance Certification Committee (CCC) to address alternative sanction proposals and NPCC will continue to work to oppose monetary sanctions.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

17. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments

**Other Questions about this Standard(NPCC Members of CP9 expressed concern over these questions 18-19-and 20. The answers to them are more "process" related than standard related and seem inappropriate. Are differing weights assigned to persons, and their answers, who are not voting in the pool? These questions could raise issues about the process being open and inclusive.)**

18. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

20. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

21. Other Comments about this Standard:

The footnote on Std 201 states that each IROL is developed by following the requirements in “Determine Facility Ratings, SOLs & Transfer Capabilities” i.e. Std 600. Such requirements with respect to IROL are not mentioned in Std 600, and it is expected that upcoming revised standard shall include this requirement otherwise it is recommended to delete the keynote from this standard 200.

Owing to the fact that “ $T_v$ ” value can be smaller than 30 minutes, it is suggested to update the sub-section 203 (b) (ii) as follows: “ The Reliability authority shall conduct a Real-time Assessment periodically, once every 30 minutes or lesser as applicable in order to capture the allowable lesser duration  $T_v$ s.

General comment on the standard is it seems overly burdensome with documentation and less focused on performance.

Examples regarding the individual definitions might be helpful to be added in an accompanying document.

The Standard should address repeated, planned IROL violations that don't exceed or consistently approach  $T_v$  and preventing this/discouraging this mode of operation from reoccurring. **It is not OK to exceed IROLs** and there are entities that frequently exceed them for short periods of time for economic or other reasons, they are not reportable because they do not exceed  $T_v$ . This behavior must be discouraged through measurement of frequency and severity of IROL through the reporting mechanisms outlined in this standard, and as outlined in new template P2 T1 “*System Operating/IROL Violations*”. In addition, there were no IROL  $T_v$  violations reported to NERC as a result of the events occurring on August 14<sup>th</sup> 2003 which implies either more stringent reporting is required or the IROL and  $T_v$  limit needs to be reevaluated.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments We believe that 35 kV is too low for the Bulk Electric System. A more appropriate level would be 100 kV and above.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments The MW amount should not determine whether it is a cascading outage. New definition proposal: The uncontrolled successive loss of networked system elements triggered by an incident at any location.

In response to the second paragraph above for question 2, we do not believe that the 300 MW/15 minute criteria should be used to automatically determine IROL Violations. However, reporting requirements could be based on this criteria with after the fact analyses to determine if an actual IROL violation occurred.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No  
 Comments See comments above

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No  
 Comments Uncontrolled separation – Cascading outages (new proposed definition above) that lead to the unplanned break-up of an interconnection.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes             No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes             No  
 Comments It would be beneficial to stress that updating the list of facilities should be done continuously to reflect real-time conditions.

8. Do you agree with the compliance monitoring process?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20

	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments We are a group and some members represent members of the Ballot Pool.

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

Portions of the transmission system that are operated radially below 100 kV should be excluded to avoid excessive data reporting that may be required for other standards that use this definition.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

The definitions of SOL, IROL, Local Area and Widespread area used in the NERC Operating Limit Definitions and Reporting document approved at the March 23 NERC OC meeting should be used instead of incorporating DOE definitions.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

See comments associated with question 2.

5. The definitions of SOL, IROL, Local Area and Widespread area used in the NERC Operating Limit Definitions and Reporting document approved at the March 23 NERC OC meeting should be used instead of incorporating DOE definitions. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes       No  
 Comments

What is the maximum update interval for Real-time Data?

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

8. Do you agree with the compliance monitoring process?

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments:

There are inconsistencies, for instance IROL Identification –no list of facilities subject to IROLs is level 4; Monitoring- List of facilities subject to IROLs not available for Real-time use is level 2.

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments:

This would help all entities confirm that the correct value is being used. However, confirm that public posting means posting on the OASIS in an area that registered market participants can access. For national security reasons, these values should not be posted on a web site that any Internet user can access.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No
  Comments

There should be no dollar amounts in the sanctions.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments: Some are members of the ballot pool.

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments: This is not applicable to a group.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

The group cannot respond to this for the individuals.

20. Other Comments about this Standard:

We support the prerequisite approval provided on page 2 for the implementation plan of this Standard 200 in which Standard 600 Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard must be implemented before this standard can be implemented. However, we believe that another prerequisite approval is that the NERC SAC verify that this Standard 200 does not conflict with Standard 600. Otherwise, there will be problems in implementing the two standards. If the SAC determines there is a conflict, then the SAC should send one or both standards back to the drafting teams to be resolved.

The dollar sanctions should be removed from all sections of this standard. The sanctions sections should be replaced with:

- (1) Sanctions for noncompliance shall be applied consistent with the NERC compliance and enforcement matrix, but no financial penalties shall be enforced. Noncompliance sanctions shall consist of letters, issued in accordance with the matrix.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

### Questions about Definitions

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

This definition should be reliability “performance based” and references to tariffs should be removed. The existing NPCC definition for its **Bulk Power System** is:

“The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances can have significant adverse impact outside of the local area. Local areas are determined by the Council members.”

Furthermore, the New York State Reliability Council (NYSRC) feels that in no instance should a BES criterion encompass facilities at voltage levels less than 115 kV and strongly urges the eventual adoption of a “performance based” definition.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

An event characterized by one or more of the following phenomena:

- the loss of **power** system **stability**
- cascading outages of circuits
- oscillations; abnormal ranges of frequency or voltage, or both.

The NYSRC feels it is not the threshold of 300 MW that qualifies an incident to be classified as a cascading outage. The loss of 300 MW of load may have nothing to do with cascading or uncontrolled successive losses, 300 MW of load may be lost under certain conditions, but it doesn’t necessarily pose a risk to the interconnection. We believe that the standard specify that the cascading outages not propagate beyond the local area (i.e. Control Area). Moreover, the definition of “Cascading Outage” as outlined in Standard 200 is different from that defined in draft Standard

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

600 (Develop Facility Ratings, ...). It is recommended to follow a common definition as given in Standard 600, including a minor modification, as follows:

**“The uncontrolled successive loss of Bulk Electric System elements that propagate beyond a defined area (Balancing Area’s) boundaries.”**

In addition, specific examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

The NYSRC agrees that the  $T_v$  should be limited to 30 minutes. However, the last sentence should read “ $T_v$  shall not be greater than 30 minutes”.

We suggest that discussion in the Q&A document be added to include the rationale as to why  $T_v$  under 30 minutes is required.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

It is proposed that the definition of "Widespread Area" from the NERC OLDTF Report (that was validated by RCWG at its December 2003 meeting and was accepted by NERC OC at its March 2004 meeting) be used in Standard 200 as well. It is stated as below:

**Widespread Area** An area that extends beyond any LOCAL AREA.

**Local Area** The portion of a WIDESPREAD AREA, whose boundaries are predetermined by appropriate analyses, where the impact of a CONTINGENCY or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond those predetermined boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a WIDESPREAD AREA indicates significant impact to the INTERCONNECTION.

OR an alternative option/suggestion is also proposed as follows:

"The impact of an incident resulting in uncontrolled successive loss of system elements in networked system and where the consequences of such significant adverse impact cannot be contained within a defined area that can be demonstrated by studies."

Wide Area Impact may also be defined correlating it to occurrences of an event impacting more than one Reliability Authority.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes                       No  
 Comments

The terms/definitions in the Standards should be consistent with the terms/definitions outlined in Functional Model (version 2). As an example, there is an inconsistency in the definition of Transmission Operator, i.e., the definition of Transmission Operator should be updated to reflect the definition stated in version 2 of the Functional Model, i.e., "operates or directs the operation".

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Definitions should be in one place, not in each standard, and definitely should not appear if they are in the Functional Model document.

The definition of IROL presently given in the recent modified template P2T1 (System Operating/Interconnected Reliability Operating Limits Violations) may better serve the purpose in Standard 200 as well. It is suggested to use the same definition with few modifications, as follows:

**“A subset of system operating limits, which if exceeded, could expose a Widespread Area of the Bulk Electrical system to instability, uncontrolled separations(s) or cascading outages.”**

### Questions about Requirement 201 — IROL Identification

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of ‘shared’ Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments

Concern exists that the process required may be too formalized and could be a simple e-mail or telephone call that requires affirmation, and a formal legal agreement should not be required.

### Questions about Requirement 201 — IROL Identification, continued

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a ‘list’ of IROLs, the RA must be able to identify the ‘current value’ of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

While the standard considers the requirements that IROLs can be dynamic, it also needs to provide guidance to operators to identify IROLs as they occur. Also, refer to comments given in question 13.

In addition, the System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

The NYSRC doesn’t agree with having a list of facilities.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Also, what constitutes evidence that a list was updated from an auditing perspective? The requirements need to be clear as to what exactly is needed.

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

What constitutes evidence that a list was updated from an auditing perspective?

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

There should be a mutual agreement on the process of coordination among RAs. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit of the different calculation results. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impacted facilities. Such requirements can be included in Standard 600.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

Although this is a desirable addition, it should consistently appear throughout the document.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

All directives should be acted on irrespective if they are IROL or not. Statements such as this perhaps might be better documented in the Coordinate Operation Standard.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

16. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes

No!

Comments

The NYSRC is opposed to monetary sanctions as the only option for dealing with noncompliance as applied in this and other proposed NERC Standards. Unfortunately, direct monetary sanctions invite “gaming the system”, and encourage “business” decisions based on potential profits or savings versus potential penalties. Instead of monetary sanctions, the NYSRC prefers that NERC have the authority to issue letters of increasing degrees of severity to communicate noncompliance of mandatory standards. The NYSRC and NPCC now rely on a more stringent and mandatory process than monetary sanctions to assure compliance with reliability standards. Compliance is now mandatory through the contractual agreements and tariffs that all participants need in order to conduct business. The use by the NYSRC and NPCC of letters to regulatory agencies and other oversight bodies for reporting noncompliance has demonstrated that letter sanctions are a more effective tool for ensuring adherence to standards. Such letters establish the basis for liability in the event of a subsequent criterion violation, and in the case of market participant noncompliance, threaten the violator’s ability to do business with or through an ISO or RTO. Moreover, letters that communicate noncompliance best allow focus on the “root cause” of a violation, as well as its reliability impact.

Therefore, the NYSRC recommends that this and other NERC Standards expressly provide that letter sanctions be used in addition to or instead of monetary sanctions under circumstances in which they would be an equally or more effective enforcement mechanism.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> <small>Max Value % = (Max Value/ IROL limit -1)*100</small>	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	$\text{Duration} > T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	$\text{Duration} > T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	Duration > T <sub>v</sub> + 15 minutes	30
15% < Max Value % ≤ 20%	T <sub>v</sub> < Duration ≤ T <sub>v</sub> + 5 minutes	20
	T <sub>v</sub> + 5 minutes < Duration ≤ T <sub>v</sub> + 10 minutes	25
	T <sub>v</sub> + 10 minutes < Duration ≤ T <sub>v</sub> + 15 minutes	30

	T <sub>v</sub> + 5 minutes < Duration ≤ T <sub>v</sub> + 10 minutes	35
	T <sub>v</sub> + 10 minutes < Duration ≤ T <sub>v</sub> + 15 minutes	40
	Duration > T <sub>v</sub> + 15 minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

17. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

18. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

20. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

21. Other Comments about this Standard:

The footnote on Standard 201 states that each IROL is developed by following the requirements in “Determine Facility Ratings, SOLs & Transfer Capabilities”, i.e., Standard 600. Such requirements with respect to IROL are not mentioned in Standard 600, and it is expected that the upcoming revised standard will include this requirement; otherwise, it is recommended to delete the keynote from Standard 200.

Owing to the fact that the “T<sub>v</sub>” value can be smaller than 30 minutes, it is suggested to update the sub-section 203 (b) (ii) as follows: “The Reliability authority shall conduct a Real-Time Assessment periodically, once every 30 minutes or lesser, as applicable, in order to capture the allowable lesser duration T<sub>v</sub>s.

A general comment on the standard: It seems overly burdensome with documentation and less focused on performance.

Examples regarding the individual definitions might be helpful if added in an accompanying document.

The Standard should address repeated, planned IROL violations that don’t exceed or consistently approach T<sub>v</sub> and preventing this/discouraging this mode of operation from reoccurring. **It is not OK to exceed IROLs.** There are entities that frequently exceed them for short periods of time for economic or other reasons which are not reportable because they do not exceed T<sub>v</sub>. This behavior must be discouraged through measurement of frequency and severity of IROL through the reporting mechanisms outlined in this standard, and as outlined in new template P2 T1 “*System Operating/IROL Violations*”. In addition, there were no IROL T<sub>v</sub> violations reported to NERC as a result of the events occurring on August 14, 2003, which implies either more stringent reporting is required or the IROL and T<sub>v</sub> limit need to be reevaluated.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

The definition of Bulk Electric System seems to be hard to pin down. We suggest:

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical ~~generation resources and~~ high voltage transmission ~~system facilities above 100 kV and associated equipment, (above 35 kV or as approved in a tariff filed with FERC), and generation resources connected to that transmission system.~~

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

Cascading Outages is another term that is hard to define. Cascading Outage should be define in terms of the successive loss of system elements for which we suggest the definition be changed to:

**Cascading Outages:** The uncontrolled successive loss of networked system elements triggered by an incident at any location that results in the operation of more than 4 relays and the loss ~~of 300 MW or more~~ of networked system load for a minimum of 15 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No  
 Comments

We suggest the definition of Wide Area Impact should include a number of transmission providers, rather than MWs of load, and propose the following:

**Wide Area Impact:** The impact of a single incident resulting from the uncontrolled loss of networked system elements involving two or more transmission providers triggered by an incident at any location that results in the uncontrolled loss ~~of 300 MW or more~~ of networked system load for a minimum of 15 minutes.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes             No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes                       No  
 Comments

There have been several changes to the Requirements and Measures of 201 and we are unsure to which change this question refers. Therefore, we can not agree with the change at this time.

8. Do you agree with the compliance monitoring process?

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

Entergy agrees with multipliers, but they should only be applied to repeat offenders. NERC should use multipliers if the same event occurs without remediation, or if different events pop up with the same systemic cause.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes  No

**Comments:** By this definition, a Bulk Electric System could be as small as the transmission system covered by the OATT of the smallest "electric utility". This interpretation is not consistent with the usage of the term in the definition of IROL that appears in the revised Policy 9 currently being balloted by the Standing Committees.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes  No

**Comments:** The narrow definition may cause some issues for the operators, depending on how this standard is applied, and whether planned maintenance and a contingency becomes an issue under transfer conditions. The key will be if you can get out of the condition quickly-i.e. 30 minutes.

If the cascading outages definition trickles over to the Planning side or to other Operations Standards, it could mean extra expenditures for the company. There are a number of places where double contingencies can cause large loss of load, but not cascading as defined as follows:

**Cascading (planning definition/old ops definition):** The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies

This definition gives much leeway. As long as you studied it, and you can tell how far the interruption spreads, it is not cascading. We could lose Northern Virginia or South Hampton Roads and still be in compliance. The loss of both 500 kV feeds to Yadkin and Fentress would drop over 300 MW.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

- Comment: **See item 2 comments. Also, a dynamic instability can cause power system oscillations and equipment "swinging" over a large part of an interconnection and yet result in no loss of load. This situation could be caused by a single incident such as loss of a long line or a malfunction of a power system stabilizer and would definitely be considered to have a wide area impact on the reliability of the interconnection and the safety of interconnected equipment. The proposed definition is not applicable. The definition of Wide Area Impact is not consistent with the definition of Wide Area that appears in the revised Policy 9 currently being balloted by the Standing Committees.**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

- Comments: **The definition of IROL in this standard, "A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the bulk electric system.", is not consistent with the definition in the revised Policy 9 currently being balloted by the Standing Committees, "The value (such as MW, MVar, Amperes, Frequency or Volts) derived from, or a subset of the SYSTEM OPERATING LIMITS, which if exceeded, could expose a widespread area of the BULK ELECTRIC SYSTEM to instability, uncontrolled separation(s) or cascading outages". The definition in this standard loses the concept of wide area.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

**I agree with the levels for actual operating events, but don't agree with the concept that a newfound definition of an IROL would result in a level 4 under "IROL Identification." In fact, for first time offenses under the heading of "IROL Identification," there should be no monetary fines. My concern is based on disagreement with the definition proposed here.**

**I also disagree with the levels and associated fines under "Analyses and Assessments" since it implies that for one miss of a successful state estimator/contingency analysis run there could be a fine. I want NERC to issue minimum standards for the real-time analysis function that should specify a mean time between failures or to define a maximum allowable downtime for the operation. This is discussed in the US/Canada Task Force Recommendations under number 22. Requiring a maximum 30-minute failure, as this standard appears to do, is getting ahead of ourselves in establishing requirements.**

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments: **The Transmission Owner is responsible for establishing facility ratings for its equipment. The RA function is to monitor the**

**system according to the TO's System Operating Limits. There is no need to publicly post the IROLs.**

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10

	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

**See comments under items 1, 2, 4, 5, 9, and 11.**

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

**The Board approved a new compliance template that applies to the issues covered by this proposed standard on April 2, 2004. The compliance template that is now approved conflicts with the compliance presented here. I want to know where this is heading. Also see comments under item 9.**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: Please drop the parenthetical expression as it is not applicable in Canada – we would ask NERC and the industry to develop “standard” definitions of the common terms to be used by the all standard-drafting teams. Could we use the definition of transmission out of FERC Order 888?

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: The definition should read as follows: The uncontrolled successive loss of Bulk Power Transmission elements that propagate beyond a balancing area’s boundaries and have adverse impacts of system frequency, load served, or voltage.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: **Wide Area Impact should be defined in relation to a BA footprint. The measure should be that a wide area event occurs when an event has an impact in two or more BA areas.**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments: **A definition of "shared facilities" is requested.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No

Comments:

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

Comments

8. Do you agree with the compliance monitoring process?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments: **The CAISO supports financial penalties for non-compliance and recognizes that these penalties should be greater than any potential economic advantage to violating a standard.**

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments: **We feel that using a common number for a limit at a boundary or "joint facility" is basic to the reliability of the system. Having a path operated to two different numbers leads to one side potentially scheduling more than the other side can accommodate and can result in "real-time" disagreements and curtailments that should have been handled in the day-ahead scheduling process.**

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments: **What does "made public" mean? All RAs should be aware of all IROLs but this information may not be appropriate for the "general public". There is a concern over infrastructure security and some concern voiced by a CIPC member.**

12. Other comments about Requirement 201: **None**

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments: **All directives issued by an RA must be followed without question, no matter what the circumstances. The explanations can be provided after actions have been taken and the problem solved. While we agree that if time permits a reason should be provided, the directive must be followed whether or not a reason is provided.**

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments: **The CAISO would like to see a value remain below its limit for two minutes with the understanding that if the value remains below the limit for two**

minutes, the reported end of the event or violation occurs at the time the value actually dropped below the limit.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments:

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard:** Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

17. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes             No

Comments

Suggested Definition:

**Bulk Electric System:** A term commonly applied to the portion of the electric system used in the transport of power in inter-utility transactions.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes             No

Comments

Suggested Definition:

**Cascading Outages:** The uncontrolled successive loss of additional elements outside of normal relaying schemes triggered by an incident at any location that results in the loss of 300MW or more of FIRM customer load.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes             No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

When would the clock start? When the SOL is reported, after the RA determination that it is an IROL, or after the RA tells the reporting entity that it is an IROL? I recommend not starting the 30 minute clock until after the RA determines it is an IROL.

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes             No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes             No  
 Comments: There is no verbiage in the Requirements section to indicate this change, similar to the changes made in Measure (2) and Non-Compliance level 4(i).

8. Do you agree with the compliance monitoring process?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes       No

**X** Comments:

There should be some consistency across all the standards for time frames of “requested data”. Without it, the Compliance Monitor can not receive the necessary data for a month and the reporting entity can still be compliant.

9. Do you agree with the levels of non-compliance?

Yes       No

**X** Comments:

There should be some consistency across all the standards for time frames of “reviewing or updating”. Without it, an entity can only review its documents and programs “at will” and still be compliant.

10. Several balloters indicated a concern over coordination of IROLs between RAs.

Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes       No

Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes       No

**X** Comments:

This information can be considered secure Critical Infrastructure Information, as well as Market Sensitive, and should not be publicly posted.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

Yes       No

Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes

Comments:

Changes here may require looking at the sanctions table and the definition of  $T_v$ . **Two minutes** will ensure the IROL is truly mitigated and not the result of telemetry or integration errors. 5 or 10 minutes may result in exceeding  $T_v$  time limits when the IROL has been mitigated.

16. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be **the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.**

Do you agree with this table?

- Yes       No  
 Comments

Although I agree with the need to increase the penalty to coincide with the magnitude of the violation, these proposed quantities could result in fines that would significantly impact utility operating budgets, customer rates, and even solvency. The starting point is not defined, but a \$1,000 fine that could go to a \$40,000 fine or a \$4,000 fine going to a \$160,000 is a big jump. The reason the IROL was exceeded needs to be addressed. Was it exceeded due to an "Act of

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

God”, an N-2 event, a willful violation of procedures, or the refusal to invest in necessary system repairs and upgrades? The difference should be addressed, possibly with a maximum fine.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds T<sub>v</sub>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its T<sub>v</sub> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	T <sub>v</sub> < Duration ≤ T <sub>v</sub> + 5 minutes	5
	T <sub>v</sub> + 5 minutes < Duration ≤ T <sub>v</sub> + 10 minutes	10

	T <sub>v</sub> + 5 minutes < Duration ≤ T <sub>v</sub> + 10 minutes	30
	T <sub>v</sub> + 10 minutes < Duration ≤ T <sub>v</sub> + 15 minutes	35
	Duration > T <sub>v</sub> + 15 minutes	40
25% < Max Value % ≤ 30%	T <sub>v</sub> < Duration ≤ T <sub>v</sub> + 5 minutes	30
	T <sub>v</sub> + 5 minutes < Duration ≤ T <sub>v</sub> + 10 minutes	35
	T <sub>v</sub> + 10 minutes < Duration ≤ T <sub>v</sub> + 15 minutes	40
	Duration > T <sub>v</sub> + 15 minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

17. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

Yes       No  
 Comments

**Other Questions about this Standard**

18. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments: I agree with the technical content as amended by my comments. I will reserve judgment until I see how they are incorporated.

20. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

21. Other Comments about this Standard:

- The Compliance Monitoring Process for 202-208 requires that certain information be provided to the Compliance Monitor “upon request”. There should be some consistency across all the standards for time frames of “requested data”. Without it, the Compliance Monitor can get the run around for a month and the reporting entity can still be compliant.
- 203
  - Requirements and Measures - Although not specified in the Requirements, the Measures requires an Operational Planning Analysis at least once each day for the “projected system operating conditions”. This would preclude a “day ahead” analysis of the weekend (or holiday) from being performed on Friday. A provision should be made that would allow this. Trigger a required analysis if system conditions differed from the analyzed conditions. (i.e. a line was planned to be out Saturday only, but remains out on Sunday would trigger a new analysis. If the line was back in, it would not require an analysis be done on Saturday for Sunday, the analysis on Friday would remain valid.)
- 204
  - Requirements
    1. Who is responsible for implementing an IROL mitigation plan? Transmission Owner? RA? Does the RA develop the plan or the Transmission Owner?
    2. Footnote 2 indicates the no action “may be acceptable as long as it is documented”, what type of documentation is required?
    3. If “no overt action” is acceptable, is it an IROL?
- 205
  - Measure (3)(i) should be revised to indicate that the Compliance Monitor should be notified within five business days of determining the data issue could not be resolved.
  - Non-compliance levels – Why is there a Level 1 and Level 2, rather than Level 3 and Level 4. It appears that this information is very important to maintain a reliable system. In addition, if there is a measure for notifying the Compliance Monitor when data issues cannot be resolved, a level of non-compliance should be included when this notification is not provided.
- 206
  - Non-Compliance Level 4 - Should be revised to separate “not providing the data” from the “inability to resolve the issue”. The inability to send the data due to a technical problem that is being upgraded should be differentiated from the refusal to

provide the data (“inability to resolve”). This will allow a lower level of non-compliance while pursuing any necessary equipment or technology upgrades.

- 207
  - Requirements and Levels of Non-Compliance – from this it appears that the Reliability Authority will work with other entities to develop processes, procedures, and plans, but the levels of non-compliance indicated that these activities could be developed with no input. What good is this if an Reliability Authority can’t perform the mitigation? Seems very broad and burdensome to the Reliability Authority.
  - There should be some consistency across all the standards for time frames of “reviewing or updating”. Without it, an entity can only review its documents and programs “at will” and still be compliant
- 208
  - Requirements - The standard does not address seams issues. Although 201 requires Reliability Authorities that share facilities to develop IROL procedures and lists, there needs to be a requirement included that would allow one Reliability Authority to give directives to another Reliability Authority.
  - Levels of Non-Compliance – If an entity does not follow the Reliability Authority directive, and the Reliability Authority does not have the ability to take action, other than the financial penalty there is no way to make entities comply with directives and reliability will be jeopardized.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes       No

Comments:

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments:

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments: ***all are improved and acceptable***

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No

Comments : **This requirement seems to overlap the requirements in the Coordinate Operations standard. The two standards should be coordinated to avoid unnecessary repetition.**

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

Comments

8. Do you agree with the compliance monitoring process?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments : **The Standard already states that RAs that share a facility, having an IROL, will agree to a 'process' for determining if it qualifies and what the value should be. Being more prescriptive doesn't add anything here.**

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
x Comments: Certain limit information can be beneficial to the Wholesale Market. By including appropriate levels of viewing restrictions, passwords, and security screens, etc., it could be posted without harm to physical security.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments: **This helps to identify the message as to relate to an IROL.**

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
Comments;

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments:

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard: **We would like to express our appreciation to the SDT for taking the time and trouble to revisit the comments on this standard. We realize the time it takes to participate on these teams and the dedication to it. While the last version of this standard was voted down this version is greatly improved and should pass the test. Thank you all for your efforts to listen to the industry and the people who operate the power systems on a daily basis and making this a workable product. We applaud you.**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

**Comments**      The BES should be defined based on performance (impact) on the power system, not a pre-defined voltage level. Suggest using a definition similar to NPCC “BULK POWER SYSTEM – The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances have a significant adverse impact outside of the local area” (i.e. Control Area). If a pre-defined voltage level is necessary, at a minimum, it should not be less than a 115 kV threshold.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

**Comments**      This does not appropriately indicate that the losses are “cascading,” not localized, not BES, etc. Agreed with the concept of “uncontrolled successive loss,” but do not agree that the 300 MW is an appropriate measure. The loss of 300 MW of load has nothing to do with cascading or uncontrolled successive losses. You may lose over 300 MW of load, but it poses no risk to the interconnection. We believe that the standard should be that the cascading outages propagate beyond the local area (i.e. Control Area). Specific, hard, concrete examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes             No  
 Comments

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No

Comments

The definition should capture the concept of Interconnection impact. Agreed with the concept of "uncontrolled successive loss," but do not agree that the 300 MW is an appropriate measure. The loss of 300 MW of load has nothing to do with cascading or uncontrolled successive losses. You may lose over 300 MW of load, but it poses no risk to the interconnection. We believe that the standard should be that the cascading outages propagate beyond the local area (i.e. Control Area). Specific, hard, concrete examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No

Comments

Generator Owner definition is not needed in this standard.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes             No

Comments

We do have a concern about having a formal process. The process could be that both Areas calculate a separate limit for common facilities based upon the internal

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

transmission configuration. However, the Areas agree that they will operate to the more conservative limit.

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes  No

Comments There is reference in this section indicating "which facilities are subject to," "shall have a list," "evidence that the list was updated," etc.

It is ISO-NE's position that Standard 200 should clearly reflect the fact that IROL's can be dynamic in nature. While it may be possible that every possible configuration can be identified in advance to deal with this dynamic, the reality is that this list would be extremely large and difficult to maintain. To improve on the situation, this section should require that the RA operators have a base set of limits that include N-1 configurations, along with identifying the following:

- The boundary conditions for which the published limits are applicable;
- The critical contingency that drive the applicable limit; and
- An understanding of what the associated limit is designed to protect the system against (i.e. transient stability, voltage decline, etc.)

The System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.

8. Do you agree with the compliance monitoring process?

Yes  No

Comments

What constitutes "evidence that the list was updated"? For compliance monitoring, all requirements need to be clear as to what exactly is needed.

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

What constitutes "evidence that the list was updated"? For compliance monitoring, all requirements need to be clear as to what exactly is needed.

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments      We do have a concern about having a formal process. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes                       No  
 Comments      We agree that the directive should include notice that a potential or actual contingency requires actions to correct the problem. We do not think that the use of the specific term is required.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

- Keep the minimum of 30 seconds
- Change the minimum to 1 minute
- Change the minimum to 10 minutes

**Comments** Should be reset immediately when the Limit is cleared and sustained. Should be cleared based on last good telemetry value.

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
- No

**Comments** There is an issue with the concept of a monetary sanction matrix and what its implications are. ISO-NE, as well as NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement "Plan B," a "voluntary" approach affording NERC the authority to perform these types of monetary sanctions. ISO-NE has indicated that any posted Standard, with such a matrix, will not be supported by ISO-NE. There are, however, proceedings at NERC by the Compliance Certification Committee (CCC) to address alternative sanction proposals and ISO-NE will continue to work to oppose monetary sanctions.

If the Maximum Value % over the Limit (measured after the event duration exceeds $T_v$ ) is: <small>Max Value % = (Max Value/ IROL limit -1)*100</small>	And the event duration exceeds its $T_v$ by ___ minutes:	Then Multiply the Level 4 \$ sanction by:
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	10
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	15
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	20
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	25

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25

	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term ‘action plan’ that was used in the last version of this standard. Several other drafting teams have used the terms, ‘processes, procedures or plans’ to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, ‘action plan’ to ‘processes, procedures or plans’ throughout this requirement. Do you agree with this change?

Yes

No

Comments

Do not believe there should be a requirement for either. Operators should be appropriately trained and provided with strategies to take the correct actions necessary to operate a system reliably.

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard

No, I am not a member of the Ballot Pool for this standard

Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the ‘technical content’ of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.

I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.

I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.

Comments Example: 208 requires documentation of the RA’s directives and the actions taken. Also, although the levels of non-compliance are not considered as “technical content,” for the purpose of explaining the disagreement, we need to reference Level 1 non-compliance, which is directly related to the requirement. If the actions were taken and the directives were followed, why would an operator be found non-compliant for not documenting such actions and directives?

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

### 20. Other Comments about this Standard:

The standard seems to be measured more on documentation than performance. Our concern is that the requirements to document may delay action and response time, therefore adversely impacting reliability. The standard should focus on performance and not whether every log entry was made in the correct format.

The standard should be reviewed to ensure that all references to IROLs include the word “operating” if the definition will move forward as IROL vs. IRL (note that Attachment A to NERC’s recommendation 1 from August 14<sup>th</sup> uses IRL, not IROL). Consistency needs to be applied.

The Phased-in implementation in 200 does not make sense: if the data is not obtained for 12 months, how can the monitoring, actions, etc. begin in six months?

While ISO New England generally agrees with a quick implementation of the final approved Standard, there is a large amount of specific data that must be collected and stored to meet the full intent of the Standard. Depending upon what the final approved Standard is, this may require additional software and business processes to fully implement. For this reason we believe that an implementation plan must provide a development period for the responsible entities to fully implement the standard.

There is an issue with the concept of a monetary sanction matrix and what its implications are. ISO-NE, as well as NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement “Plan B,” a “voluntary” approach affording NERC the authority to perform these types of monetary sanctions. ISO-NE has indicated that any posted Standard, with such a matrix, will not be supported by ISO-NE. There are, however, proceedings at NERC by the Compliance Certification Committee (CCC) to address alternative sanction proposals and ISO-NE will continue to work to oppose monetary sanctions.

ISO New England believes that this standard should provide clear examples within this standard, describing in detail what constitutes a violation that must be reported along with clear examples of what constitutes and SOL and IROL. Examples should include contingency pair examples for both IROL and SOL thermal limits as well as examples concerning stability and voltage limits.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments:

We feel that the definition of BES should not be tied up with FERC tariff. It should be upto the Reliability Authority to determine whether the facilities are impactful to the neighbors or not.

It is suggested to remove the definition-item within parenthesis. Resulting definition is as below: **“A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system”**

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments:

It is not the threshold of 300 MW that qualifies an incident to cause a cascading outage. An option is to use a definition: **“The uncontrolled successive loss of Bulk Electric System elements that propagate beyond a defined area (balancing area's) boundaries”**

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes       No  
 Comments

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments:

It is proposed that definition of Widespread Area from NERC OLDTF Report (that was validated by RCWG at its December/03 meeting and was accepted by NERC OC at its March 2004 meeting) be used in the Standard 200 as well. It is stated as below:

**Widespread Area. An area that extends beyond any LOCAL AREA.**

**Local Area. . The portion of a WIDESPREAD AREA, whose boundaries are predetermined by appropriate analyses, where the impact of a CONTINGENCY or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond those predetermined boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a WIDESPREAD AREA indicates significant impact to the INTERCONNECTION.**

OR

An alternative recommended approach/measure is that a wide area impact be defined with respect to occurrence of event impacting more than two RAs or BAs areas.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes       No  
 Comments:

a. The terms/definitions in the Standards should be consistent with the terms/definitions outlined in Functional Model (version 2) as well as those within other standards. As an example, there is an inconsistency in definition of Transmission Operator, i.e. Definition of Transmission Operator should be updated to reflect definition stated in version 2 of the Functional Model – i.e. "operates or directs the operation".

b). The definition of IROL presently given in the recent modified template P2T1 (System Operating/Interconnected Reliability Operating Limits Violations) may better serve the purpose in Std 200 as well. It is suggested to use the same definition with few modifications, as follows:

**“A subset of system operating limits, which if exceeded, could expose a Widespread Area of the Bulk Electrical system to instability, uncontrolled separations(s) or cascading outages.”**

***Questions about Requirement 201 — IROL Identification***

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of ‘shared’ Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes  No

Comments: It is recommended that the standards should be supported by appropriate technical documentation that is allowed under the standards process to ensure a complete understanding of the standard and its consistent applications.

***Questions about Requirement 201 — IROL Identification, continued***

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLS can be dynamic. The SDT modified the requirement so that instead of requiring a ‘list’ of IROLS, the RA must be able to identify the ‘current value’ of its IROLS. Do you agree with this change?

Yes  No

Comments

While the standard considers the requirements that IROLS can be dynamic, it also needs to provide guidance to operators to identify IROLS as they occur. Also refer to comments given in question 13.

8. Do you agree with the compliance monitoring process?

Yes  No

Comments

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

10. Several balloters indicated a concern over coordination of IROLS between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLS?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes  No

Comments: We agree that there should be a mutual agreement on coordination among RAs. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impactful facilities. Such requirements can be included in standard 600.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

Comments

12 Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

Yes  No

Comments: We agree with these requirements and recommend that these should be specifically included in the standard 200.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes  No

Comments: All directives issued by an Reliability Authority must be followed.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds
- Change the minimum to 1 minute
- Change the minimum to 10 minutes

Comments: While the 30 seconds duration may be too short, and 10 minutes be too long, a duration of 2 minutes may be more appropriate.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**12.** Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments:

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term ‘action plan’ that was used in the last version of this standard. Several other drafting teams have used the terms, ‘processes, procedures or plans’ to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, ‘action plan’ to ‘processes, procedures or plans’ throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the ‘technical content’ of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

1. The footnote on Std 201 states that each IROL is developed by following the requirements in “Determine Facility Ratings, SOLs & Transfer Capabilities” i.e. Std 600. Such requirements with respect to IROL are not mentioned in existing standard Std 600, and it is expected that upcoming revised standard shall include this requirement otherwise it is recommended to delete the keynote from this standard 200.

2. The IMO supports the comments submitted by ISO/RTO Council- Standards Review Committee as well as the CP-9 Group.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

**SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

**Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

3. Analyses and Assessments			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
4. Actions			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes       No

Comments:

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: **We generally agree with the new definition. However, we want to point out that in some very large systems, such as Southern Company, that include large metropolitan areas there are substations that serve geographic areas with very large loads. There can be cases in such substations where a fault occurs and the breaker fails to operate. In this breaker-failure scenario, large loads can be dropped for a short period of time in a controlled fashion in order to prevent cascading outages or instability. Our concern relates to reporting this as a 'wide area impact' violation simply because it produces a loss of 300 MW, while being confined to a single substation or possibly even one or two large factories on a particular bus. We are aware that the cascading outage definition is 'magnitude and time' sensitive but we believe it should be tailored to allow rational management of local area outages of large substations if they are managed in a controlled manner.**

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes       No  
 Comments

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments: **Same concern as in #2 above.**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.
- Yes       No  
 Comments: **all are improved and acceptable**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes       No  
 Comments : **This requirement seems to overlap the requirements in the Coordinate Operations standard. The two standards should be coordinated to avoid unnecessary repetition.**

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments :

**The Standard already states that RAs that share a facility, having an IROL, will agree to a 'process' for determining if it qualifies and what the value should be. Being more prescriptive doesn't add anything here.**

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments:

**If "posting" means naming the specific limiting elements then we think critical information such as this does nothing to improve reliability and may be to the detriment of Homeland Security. If this is only a 'numeric value' then perhaps this can be accommodated.**

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments: **This helps to identify the message as to relate to an IROL.**

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments; **One additional thought is to employ a deadband on both ends of the IROL violation (so that a value must be outside IROL for thirty seconds before it becomes and IROL violation). This would help avoid metering system errors triggering either the beginning or ending of an IROL.**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments:

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard: **We would like to express our appreciation to the SDT for taking the time and trouble to revisit the comments on this standard. We realize the time it takes to participate on these teams and the dedication to it. While the last version of this standard was voted down this version is greatly improved and should pass the test. Thank you all for your efforts to listen to the industry and the people who operate the power systems on a daily basis and making this a workable product. We applaud you.**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b><i>STD Commenter Information (For Individual Commenters)</i></b>	
<b>Name</b>	<b>John Blazekovich</b>
<b>Organization</b>	<b>Exelon Corporation</b>
<b>Industry Segment #</b>	<b>1,2,5,6</b>
<b>Telephone</b>	<b>630-691-4777</b>
<b>E-mail</b>	<a href="mailto:john.blazekovich@exeloncorp.com">john.blazekovich@exeloncorp.com</a>

- Key to Industry Segment #'s:**
- 1 – Trans. Owners
  - 2 – RTO's, ISO's, RRC's
  - 3 – LSE's
  - 4 – TDU's
  - 5 - Generators
  - 6 - Brokers, Aggregators, and Marketers
  - 7 - Large Electricity End Users
  - 8 - Small Electricity Users
  - 9 - Federal, State, and Provincial  
Regulatory or other Govt. Entities

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No  
 Comments

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments – **This definition should be consistent with the definition used by the Determine Facility Ratings, System Operating Limits & Transfer Capability SDT.**

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments – **Allowing an "acceptable time" of a Interconnection Reliability Operating Limit appears to be inconsistent with the definition of an IROL. If an IROL leads to instability, uncontrolled separation or cascading outage it seems to be unacceptable to allow any time limits to be associated with an IROL violation (i.e. any time spent over an IROL should be a violation).**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

**X Comments – Interconnection Reliability Operating Limit - “that adversely impact the reliability of the bulk electric system” should be removed from the definition to make it consistent with the definition of a SOL, which it is.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

**X Comments – Although we agree with the need to monitor the condition of the bulk power electric system, and can reasonably expect that IROL type scenarios and conditions can be studied in the “planning mode”, we have concerns**

that this Standard may be impossible to comply with on a “real time basis”. It appears that compliance with this standard will require executing literally hundreds, perhaps thousands of scenarios, it is unlikely one can identify IROLs ahead of time. Especially since each day presents a different system, both from generation pattern perspective and from transmission topology perspective.

8. Do you agree with the compliance monitoring process?

Yes       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes       No

Comments – **We suspect the public postings of IROL’s would be a dream come true for any terrorist considering an attack against the bulk power infrastructure of the United States and Canada.**

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

Yes       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term ‘action plan’ that was used in the last version of this standard. Several other drafting teams have used the terms, ‘processes, procedures or plans’ to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, ‘action plan’ to ‘processes, procedures or plans’ throughout this requirement. Do you agree with this change?

Yes       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the ‘technical content’ of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.

Comments – **Before we determine how Exelon will cast it’s votes we would like to see revision to the definitions (as commented) and some direction on how compliance with this Standard will be accomplished on a “real time” basis.**

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes       No  
 Comments

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

In concept this is OK, however, in current practice, simulation methods do not usually stress the system to the point of loss of load. Some of the mechanisms that might result in loss of load, such as collapse of an isolated island, may not be demonstrated with current modeling techniques. Current study techniques simulate only single contingency. Actual events which result in loss of 300 MW or more of networked system load are usually due to several contingencies occurring prior to system adjustment. There are too many possible scenarios to identify with current study resources. Such an approach is not recommended. Therefore the proposed criterion may not be practical to apply in studies.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes       No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between ‘wide area impact’ and ‘local area’. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was ‘widespread’. (Note that while the term, ‘wide area impact’ is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes       No  
 Comments

The definition of “Interconnection Reliability Operating Limit” seems clear. However, addition explanation beyond the definition is required to shed light on the intended meaning and application of the term. NERC should consider the creation of a IROL reference document along the lines of the NERC “Transmission Transfer Capability” reference document. The impression is given that IROLs are simply a subset of SOLs as determined using current methods (e.g. study procedures). For some IROLs this will be true, i.e., where current methods demonstrate a specific transfer capability is limited by stability. However, in situations where thermal limits are lower than stability limits, it is not current practice (in MAPP) to expend additional effort to identify higher stability limits. A straight forward interpretation of the definition would require this additional effort. Is this NERC’s intent? If so, NERC is introducing an additional requirement beyond current practice. This raises some important questions. How much extra effort is required and is it justified? Will monitoring IROLs derived in this way be fully effective to prevent instability, uncontrolled separation, or cascading outages? For example, simultaneously exceeding several thermal limits (individually SOLs not IROLs) may be approaching a voltage instability condition but this condition might not be recognized using the proposed IROL monitoring methodology. This is a good example of how an IROL might exist which will not be identified by current methods. The implications of the proposed IROL methodology have not been sufficiently explored and documented to ensure effective understanding and application within the electrical industry

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of ‘shared’ Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

It is not clear how section 201 coordinates with Standard 600 (Determining limits) The requirement that IROLs should be current (reflect current system conditions, i.e. topology, loading, generation, etc.) is not mentioned under Requirements, it is only stated in item 3 of the measures. The difference between Measures (2) and (3) is not clear; they seem to be saying the same thing. The written structure of 201 might be improved by having a one-to-one correspondence between Requirements and Measures. Measure (1) (i) does not recognize that changes in topography in an adjacent RA area may impact the current IROL values.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

The requirements in item 3 of this section should be expanded to include evidence of agreed procedures to identify IROLs for facilities shared by RAs and to ensure that IROLs reflect current system conditions.

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

There should be a requirement that the RA obtain agreement from its adjacent RAs on which facilities in the combined RA Areas are subject to IROLs, however the Standard to address this requirement should be Standard 100 "Coordinate Operations" and not this Standard.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

There should be a requirement to provide information about IROLs to any affected entities particularly Transmission Operator, Balancing Authority and Interchange Authority.

12. Other comments about Requirement 201:

- There needs to be a reference in 201 that the determination of IROLs should be consistent with Standard 600. In Standard 600 it should be explicitly required for the RA to demonstrate it has the tools, procedures and trained staff to do the required studies.
- The link between an Interconnection Reliability Operating Limit and the limits defined in standard 600 is tenuous – especially as the term “system operating limits” is not capitalized nor is there a reference to standard 600 in the definitions. Without that link, an IROL could be seen as a limit even in steady state (there is no contingency clearly associated with the definition – the consideration of contingencies is buried in standard 603). Presumably the link is believed to be made by calling IROLs a subset of SOLs. While Manitoba Hydro still believes that such limits are not a subset of SOLs but, rather, new limits based on similar studies, but with different criteria for acceptable performance (i.e., limits may be exceeded but cascading, instability and uncontrolled separation are BARELY avoided) there is value in discussing the IROL concept as put forward by the OWL team.

In standard 600, SOLs are established through consideration of all next single contingencies and for some regions, all multiple contingencies and for others, a set of credible multiple contingencies. Universally, a SOL must be established to avoid cascading, instability and uncontrolled separation. The question for the OWL group to consider is – how does standard 200 deal with the fact that in thermally-limited systems the margin between the SOL and cascading, etc., may be very large, while in stability-limited systems, there will still be some reliability margin, likely not a large one, between the SOL and the onset of cascading, etc. Thus, the increased risk of a problem if an SOL is violated is a function of the nature of the limit itself – the risk associated with stability limits is likely higher than for thermal limits.

Of the list of nasty events, the risk of instability and uncontrolled separation will be fairly evident from stability studies but the risk of cascading is dependent on thermal ratings, thermal overload and operator action to some extent. Since the SOL definition allows for system readjustments, while requiring limits not be exceeded, the risk of cascading increases if the required adjustments are not undertaken – and these may not be automatic actions. Note that the Standard 600 assumes that qualified ratings will be provided for all facilities (i.e, the rating value will have an associated time period – perhaps 15 minute, 2 hour, etc.) so that facilities ratings are assumed to be respected – there could an exception in the case of credible multiple contingencies, where a region may tolerate some facility violation if it can be managed expeditiously and not lead to cascading – MAPP

presently does this although the ratings being exceeded in the checking process are likely the long term values, not the short term values).

Since the Q&A document talks about increased RISK of cascading, rather than occurrence of cascading, the OWL team needs to clarify this potential source of confusion – there will almost always be increased risk of a problem as loadings increase or are left unchanged – but that opens the door to IROL evaluation having to consider the impacts of failures of the operator, etc. As such, any limit in the system could be considered an IROL, since, for some combination of contingencies, the unacceptable consequences could be seen. In fact, you could even consider the definition of an IROL as a steady state limit.

If the OWL team is adamant that IROLs are a subset of SOLs then the rest of the Standard 200 should be reviewed to ensure that risks are properly considered in the measurements and compliance process – right now some entities might be penalized for low risk events.

One way to manage the discrepancy would be for IROLs to be established at a known margin from the nasty three events – so the IROL for a thermally-limited system might be significantly higher than the corresponding SOL.

Until there is more clarity on the definition of an IROL, the implementation plan is suspect when it addresses the current state – there is a good chance IROLs are not being identified and calculated now, as expected by the standard.

- Manitoba Hydro is greatly concerned relative to the statement in the Q&A document regarding special protection schemes since the response to the question indicates that the special protection system should basically be ignored. The reality in MAPP is that such systems are put in place with a high degree of reliability and with the expectation that they will not fail. If Manitoba Hydro had to live with the situation as outlined in the response, we would be in violation every time we export more than, perhaps, 500 MW rather than the 2000 MW we can export presently. Is that really what the response was meant to say; or is the response really saying that you should know what the limits are if the special protection is out of service and respect those limits?
-

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

The wording of (a) could be improved. Suggest: "The system conditions under which exceeding the Interconnection Reliability Operating Limit could lead to instability, uncontrolled separation or cascading outages." As is, the wording of (a) could be interpreted to mean that it is ok to exceed the IROL under other system conditions. Suggest also that stating these items be required in the determination of all System Operating Limits (applicable to Standard 600).

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Change the minimum to 10 minutes
- Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

Manitoba Hydro agrees with the sanctions listed in the table below; however we believe the multiplications factors should continue to increase for event durations beyond 15 minutes. For example, the sanction for an event duration of one hour should be more severe than for an event duration of 15 minutes and so on.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	10
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	15
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	20
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	25
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	30
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

Manitoba Hydro has technical concerns relative to the concept of IROL as referenced in this Standard. These concerns have been provided to the SDT in previous postings of this Standard and are further elaborated upon in question 12 of this comment document. If the SDT can satisfactorily address these concerns then Manitoba Hydro would support this Standard.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

Manitoba Hydro believes that this Standard should be field tested prior to implementation. This will ensure that all elements of the Standard are relevant to the operational reliability of the bulk electric system and can be implemented in a straightforward manner

In section 203 (d) Compliance Monitoring Process item (3) (i) it makes more sense that the RA provide evidence that Operational Planning Analysis occurs at least once a day and what the results were rather than indicating only the most recent analysis. Similar comment for 203 (d) (3) (iii). The evidence could be in the form of a log.

In section 205 (b) Measures, there is no measure to establish that the RA is notifying its Compliance Monitor when data is not provided or data collection issues are not resolved.

In section 205 (d) Compliance Monitoring Process, there is no check that the RA is notifying its Compliance Monitor when data is not provided or data collection issues are not resolved. There are no sanctions for not notifying

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

### Questions about Definitions

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes       No  
 Comments

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

**We generally agree with the new definition. However, we want to point out that in some very large systems, such as Southern Company, that include large metropolitan areas there are substations that serve geographic areas with very large loads. There can be cases in such substations where a fault occurs and the breaker fails to operate. In this breaker-failure scenario, large loads can be dropped for a short period of time in a controlled fashion in order to prevent cascading outages or instability. Our concern relates to reporting this as a 'wide area impact' violation simply because it produces a loss of 300 MW, while being confined to a single substation or possibly even one or two large factories on a particular bus. We are aware that the cascading outage definition is 'magnitude and time' sensitive but we believe it should be tailored to allow rational management of local area outages of large substations if they are managed in a controlled manner.**

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No  
 Comments **See No. 2 above.**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.
- Yes                       No  
 Comments **All definitions are acceptable.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                      X No  
 Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- X Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- X Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds
- Change the minimum to 1 minute
- Change the minimum to 10 minutes
- Comments

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes  No
- Comments

If the Maximum Value % over the Limit (measured after the event duration exceeds $T_v$ ) is: <small>Max Value % = (Max Value/ IROL limit -1)*100</small>	And the event duration exceeds its $T_v$ by ___ minutes:	Then Multiply the Level 4 \$ sanction by:
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	$\text{Duration} > T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	$\text{Duration} > T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	$\text{Duration} > T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- X Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- X Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- X I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**

Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

### Questions about Definitions

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: 35 kV is too low for inclusion in the bulk electric system definition. The rest of this definition is less descriptive than the current definition in the NERC Operating Manual and contradicts the definition used in the NERC Planning Standards since 1995. The current definition in the NERC Planning Standards should be used as a starting point. Also, any definition of the Bulk Electric System should include the concept that 'networked' facilities (as opposed to radial) make up the BES and generally operated at voltages 100 kV or greater. The definition of the BES should not confuse FERC accounting rules/definitions with the functionality of the facilities themselves.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: The proposed definition is unclear. Why the need to include load impacted and time requirements into the Cascading Outage definition? Is a 250 MW loss of load for 24 hours a cascading event? How about 1000 MW for 10 Minutes? The key thought of a Cascading Outage is that it is Unplanned and Uncontrolled outage over a wider area. The Facility Rating SDT is using as a definition of Cascading Outage is "The uncontrolled and unplanned successive loss of system elements triggered by an incident at any location." Is it really necessary to define cascading outage, if we can define as above when an SOL is to be considered an IROL? To be a cascading outage, multiple system elements must be involved and a series of uncontrolled events occur.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes             No

Comments: How do you consistently define what risk is acceptable and what risk is not? How do we ensure all the RA's evaluate risk using the same criteria and assessment process? The upper limit of 30 minutes is not a problem. However, why would any entity select a Tv less than 30 minutes? Shouldn't the Tv concept require you to take immediate action, if studies show that exceeding this IROL could lead to system instability or collapse? An entity should not be allowed to operate such that the occurrence of the next contingency results in a cascading blackout. Under such a scenario, the entity needs to take immediate action as soon as it is identified that they are in such a situation, not wait 30 minutes or wait until the contingency occurs. The problem with this Standard in its current form is that it has watered down an IROL event by tying it to loss of 300 MW of load. For a large system, that may be the loss of only 2 or 3 facilities or less. And it could include events that do not threaten the Interconnection. We would suggest that a Tv of no greater than 30 minutes is adequate for a SOL violation, but may be totally inadequate for a true IROL.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: The DOE threshold was never intended to imply that it defined a wide area impact. The definition for wide area impact needs to include the concept that multiple facilities are impacted, and exceeds a local geographic footprint. For a large entity, 300 MW can be as little as 1% of their peak load, arguably not a wide area impact for them. It make sense to set a quantative threshold. However, such threshold should not be so limiting as for larger systems to be able to be exceeded by a single local event.

What is missing in this Standard is the concept that we need to prevent events that put the interconnection at risk. Instead this Standard is focusing on events within a single Control Area or Transmission Operator footprint. For convenience, a 300 MW threshold has been suggested, but there is no reference to impact to the interconnection. I guess one can argue, that if we force such severely constrained operations at the local level, then we should never get to the point of placing risks on the Interconnection. Is that the point of this standard? If so, then this is not about operating to IROL's, but rather in operating well under SOL's so as to never approach an IROL.

This definition continues to miss the mark and remains unclear. If the SDT see a need to define a "Wide Area Impact" using a arbitrary load at risk level, may be acceptable. But under the current definition, is the loss of a 5000 MW load area for 12 minutes a wide area impact? Per definition the answer is no, practicality says 'yes'.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments The definition of an IROL Event Duration lists a reset time of 30 seconds. In 204(b)(1)(ii) the reset period is given as one minute. Whichever is the proper intent of the SDT, 30 seconds or 1 minute is too short of a period for the reset. This should be on the order of 5 minutes or so in order to indicate that stable operating conditions have been attained.

The definition of an IROL continues to be unclear. For example: If an SOL (System Operating Limit) is a maximum permissible value so as to not exceed a facility rating or

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

reliability criteria, then, if 'everyone' was doing their job there should never be an occurrence of an IROL. There should never be a situation where the outage of the next facility will lead to 'instability, uncontrolled separation, or cascading outages'. Therefore, for the system to be exposed to a IROL, a more restricting System Operating Limit must have already been exceeded, unidentified, or ignored.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes  No

Comments: As per changes being made to NERC Policy 9, the default is you operate to the most conservative position. Thus, if one RC says the facility has an IROL, all RCs need to respect and operate to that IROL.

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes  No

Comments

8. Do you agree with the compliance monitoring process?

Yes  No

Comments: The phrase in 201(d)(1) referring to on-site reviews every three years be replaced with on-site reviews as needed. No reason for the standard to lock into either a 3-year cycle or should leave room for the industry to change the frequency, by a shorter cycle.

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments: I suggest this standard adopt the concept included in the newly revised Policy 9, which requires RCs to respect each others limits and operate to the most conservative position when disagreements arise.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No

Comments: This is a bad idea with what should be obvious infrastructure security risks associated with it. However, the business community may want to see these limits posted. There should be mechanism for the commercial community to view such limits while observing the infrastructure security requirements.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments: Clear and concise communications is always the preference.

However, implied in this statement above, is that if the RC issues a directive and does not state it is related to an IROL, then the responsible RA is cleared of all fault, etc. if the RAI delays in following the directive. This is disturbing and part of the reason for some of the language change in the newly revised Policy 5 & 9.

**From newly revised Policy 5:**

**Complying with Reliability Coordinator directives.** The OPERATING AUTHORITY shall comply with RELIABILITY COORDINATOR directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances the OPERATING AUTHORITY must immediately inform the RELIABILITY COORDINATOR of the inability to perform the directive so that the RELIABILITY COORDINATOR can implement alternate remedial actions.

This type of language must find its way into the new Standards.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

Keep the minimum of 30 seconds

Change the minimum to 1 minute

Change the minimum to 10 minutes

Comments: Something on the order of 5-10 minutes may be a better indicator of true system recovery.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes  No  
 Comments:

There are no sanctions listed for a Maximum Value over 30%. The last stage should be set at equal to or greater than 25%.

The validity of the table is directly related to the definition of IROL. If an IROL is truly a significant interconnection event, similar in consequences to the August 14 event, then it doesn't matter if the IROL is violated for 30 minutes or 30 seconds, it was violated and it resulted in a blackout. If defined properly, a major portion of the interconnection would be jeopardized when an IROL is violated. If IROL were defined properly, the table would not be needed, as even exceeding the limit for a few minutes would be considered placing the Interconnection at extreme risk and thus subject to maximum penalty. Therefore a graduated table may be inappropriate. On the other hand, if IROL is defined as only 300 MW of load loss, then a graduated table may be more fitting.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	Duration > $T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	Duration > $T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	Duration > $T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	Duration > $T_v + 15 \text{ minutes}$	35

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                      9 No

9 Comments

Please delete the parenthesis and add, “the operation of which would impact the operation of the Interconnection System of the Region, or as approved by a tariff filed with FERC”. The operation of a Bulk Electric System should have impacts on the operation of the Regional Interconnected System. In most systems in WECC, 35 kV would be considered distribution voltage.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                      9 No

9 Comments:

Loss of 300 MW of load is not a measure or indication of cascading. Please change the definition to read, “The uncontrolled and unplanned successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies”.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

9 Yes  No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                      9 No

9 Comments: For some systems, it is not uncommon to have loads of 300 MW or more located in a small area. Loss of 300 MW is therefore not an indication of wide area impacts. If implemented, such criteria could significantly increase workload and take resources away from work needed to identify, analyze, monitor and mitigate problems concerning IROLs, the violation of which could truly lead to cascading.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                       No

Comments:

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

9 Yes                       No

Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

9 Yes                       No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments

8. Do you agree with the compliance monitoring process?

Yes  No

Comments

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

9 Comments: Publicly posting IROLs could introduce market distortion. The information should be shared *only* with entities responsible for the reliable operation of the electric transmission system. In addition, if the IROL is to be “dynamic”, this requirement may not be workable, or, even if workable, could be burdensome.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes  No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes  No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15

	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

9 Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard

- No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

9 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.

9 Comments: We would like to emphasize that we would agree with the technical content only if our comments on the definitions are addressed.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

9 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

This definition should be reliability-“performance based” and references to tariffs should be removed. For reference, we offer the existing NPCC Definition for its **Bulk Power System** is;

“The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances can have significant adverse impact outside of the local area. Local areas are determined by the Council members.”

The NYISO strongly urges the eventual adoption of a “performance based” definition not a “voltage based” one.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

An event characterized by one or more of the following phenomena:

- the loss of **power** system **stability**
- cascading outages of circuits
- oscillations; abnormal ranges of frequency or voltage or both.

The NYISO believes that the standard should specify that the cascading outages not propagate beyond the local area (i.e. Control Area or balancing area). A threshold of 300 MW does not qualify an incident to be classified as a cascading outage. The loss of 300 MW of load may have nothing to do with cascading or uncontrolled successive losses, 300 MW of load may be lost under certain conditions, but it doesn’t necessarily pose a risk to the interconnection. We note that the definition of “Cascading Outage” as outlined in Standard 200 is different from that defined in

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Standard 600 (Develop Facility Ratings, ...). We recommend adopting a common definition as given in Std 600, including a minor modification, as follows. i.e.”

**“The uncontrolled successive loss of Bulk Electric System elements that propagate beyond a defined area (Balancing Area’s) boundaries.”**

In addition, specific examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.

3. Several ballots indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most ballots indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

NYISO agrees that the  $T_v$  should be limited to 30 mins. We recommend the last sentence to read “ $T_v$  shall not be greater than 30 minutes.”

Add discussion to Q&A document to give rationale as to why  $T_v$  under 30 minutes is required.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several ballots indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

The NYISO agrees with the definition of Widespread Area from NERC OLDTF Report (that was validated by RCWG at its December/03 meeting and was accepted by NERC OC at its March 2004 meeting) be used in the Standard 200 as well. It is stated as below:

**Widespread Area** An area that extends beyond any LOCAL AREA.

**Local Area** The portion of a WIDESPREAD AREA, whose boundaries are predetermined by appropriate analyses, where the impact of a CONTINGENCY or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond those predetermined boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a WIDESPREAD AREA indicates significant impact to the INTERCONNECTION.

OR an alternative option/suggestion is also proposed as follows:

“The impact of an incident resulting in uncontrolled successive loss of system elements in networked system and where the consequences of such significant adverse impact cannot be contained within a defined area that can be demonstrated by studies.

Wide area impact may also be defined correlating it to occurrences of event impacting more than one Reliability Authority.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes                       No  
 Comments

The terms/definitions in the Standards should be consistent with the terms/definitions outlined in Functional Model (version 2). As an example, there is an inconsistency in definition of Transmission Operator, i.e. Definition of Transmission Operator should be updated to reflect definition stated in version 2 of the Functional Model – i.e. “operates or directs the operation”.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

Definitions should be in one place not in each standard and definitely should not appear if they are in the Functional Model document.

The definition of IROL presently given in the recent modified template P2T1 (System Operating/Interconnected Reliability Operating Limits Violations) may better serve the purpose in Std 200 as well. It is suggested to use the same definition with few modifications, as follows:

**“ A subset of system operating limits, which if exceeded, could expose a Widespread Area of the Bulk Electrical system to instability, uncontrolled separations(s) or cascading outages.”**

### Questions about Requirement 201 — IROL Identification

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of ‘shared’ Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes                       No  
 Comments

The wording should be clarified to only include those facilities that are subject to IROLs.

### Questions about Requirement 201 — IROL Identification, continued

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a ‘list’ of IROLs, the RA must be able to identify the ‘current value’ of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

While the standard considers the requirements that IROLS can be dynamic, it also needs to provide guidance to operators to identify IROLS as they occur. In addition, the System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

The requirements need to be clear as to what exactly is needed. For example, what constitutes evidence that a list was updated from an auditing perspective?

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

There should be a mutual agreement on the process of coordination among RAs. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit of the different calculation results. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impacted facilities. Such requirements can be included in standard 600.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments

All RAs should be aware of all IROLs but this information may not be appropriate for the “general public”. There is a concern over infrastructure security and issues related to CIPC.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

This is a desirable addition, and should appear consistently throughout the document.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

All directives should be acted on irrespective if they are IROL or not. Statements such as this perhaps might be better documented in the Coordinate Operation Standards.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

16. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

The NYISO agrees with the opinion, voiced by Mr. Gent's comments to the NERC BOT that monetary sanctions are ineffective to ensure compliance and that market mechanisms and letters of increasing severity are more effective.

There is an issue with the concept of a monetary sanction matrix and what its implications are. NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement "Plan B," a "voluntary" approach affording NERC the authority to perform these types of monetary sanctions. NPCC has indicated that any posted Standard, with such a matrix, will not be supported by NPCC, or its members.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20

20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

17. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**(Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?)

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

As indicated in our responses, the NYISO agrees with much of the technical content of this standard and offers suggestions and opinions on the portions we disagree with.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

The NYISO contributed to and fully supports the comments of the ISO/RTO Council.

The NYISO concurs with the following comments submitted by NPCC:

- The footnote on Std 201 states that each IROL is developed by following the requirements in “Determine Facility Ratings, SOLs & Transfer Capabilities” i.e. Std 600. Such requirements with respect to IROL are not mentioned in Std 600, and it is expected that upcoming revised standard shall include this requirement otherwise it is recommended to delete the keynote from this standard 200.
- Owing to the fact that “ $T_v$ ” value can be smaller than 30 minutes, it is suggested to update the sub-section 203 (b) (ii) as follows: “ The Reliability authority shall conduct a Real-time Assessment periodically, once every 30 minutes or lesser as applicable in order to capture the allowable lesser duration  $T_{v,s}$ .
- General comment on the standard is it seems overly burdensome with documentation and less focused on performance.
- Examples regarding the individual definitions might be helpful to be added in an accompanying document.
- The Standard should address repeated, planned IROL violations that don’t exceed or consistently approach  $T_v$  and preventing this/discouraging this mode of operation from reoccurring. **It is not OK to exceed IROLs** and there are entities that frequently exceed them for short periods of time for economic or other reasons, they are not reportable because they do not exceed  $T_v$ . This behavior must be discouraged through measurement of frequency and severity of IROL through the reporting mechanisms outlined in this standard, and as outlined in new template P2 T1 “*System Operating/IROL Violations*”. In addition, there were no IROL  $T_v$  violations reported to NERC as a result of the events occurring on August 14<sup>th</sup> 2003 which implies either more stringent reporting is required or the IROL and  $T_v$  limit needs to be reevaluated.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

<b><i>STD Commenter Information (For Individual Commenters)</i></b>	
<b>Name</b>	<b>Michael D. Zahorik</b>
<b>Organization</b>	<b>American Transmission Co</b>
<b>Industry Segment #</b>	<b>1</b>
<b>Telephone</b>	<b>(262) 506-6886</b>
<b>E-mail</b>	<b>mzahorik@atcllc.com</b>

- Key to Industry Segment #'s:**
- 1 – Trans. Owners
  - 2 – RTO's, ISO's, RRC's
  - 3 – LSE's
  - 4 – TDU's
  - 5 - Generators
  - 6 - Brokers, Aggregators, and Marketers
  - 7 - Large Electricity End Users
  - 8 - Small Electricity Users
  - 9 - Federal, State, and Provincial  
Regulatory or other Govt. Entities

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments 35 Kv seems rather low voltage. 50 or 100 Kv may be a better value.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments 300 mw is to low a value. There are instances that this amount of load can be lost and there are no network implications.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments Again 300 Mw is too low. There needs to be some definition of network impact. ATC has areas where 300 Mw can be lost and that loss will not affect the network.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No  
 Comments

8. Do you agree with the compliance monitoring process?

Yes       No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments Each RA should agree with the calling RA on the IRL.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

Comments They can not all be determined prior to the fact. They will change. A cascade event generally requires multi elements which will increase the possibilities in a factorial fashion.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments This information should be issued to the System Operator when the IRL is issued

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments Time of an event is not important until the violation of over 30 minutes has occurred. An IRL should be addressed ASAP, the solution should also be ASAP, with penalties after the 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments We call them contingency plans

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: Please drop the parenthetical expression – we would ask NERC and the industry to develop “standard” definitions of the common terms to be used by the all standard drafting teams.

2. Several balloters indicated that they didn’t know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, “Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident” as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: The definition should read as follows: The uncontrolled successive loss of Bulk Power Transmission elements that propagate beyond a balancing area's boundaries.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

$T_v$ : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes             No

Comments: **Wide Area Impact should be defined in relation to a BA or RA footprint. The measure should be that a wide area event occurs when an event has an impact in two or more BA or RA areas.**

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes             No

Comments: **A definition of "shared facilities" is requested.**

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes             No

Comments: **The wording should be clarified to only include those facilities that are subject to IROLs.**

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes             No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments: **There was no group consensus – financial penalties are an issue for some group members.**

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No  
 Comments: **What does “made public” mean? All RAs should be aware of all IROLs but this information may not be appropriate for the “general public”. There is a concern over infrastructure security and some concern voiced by a CIPC member.**

12. Other comments about Requirement 201: **None**

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments: **All directives issued by an RA must be followed without question, no matter what the circumstances. The explanations can be provided after actions have been taken and the problem solved.**

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments: **The SRC would like to see a value remain below its limit for two minutes with the understanding that if the value remains below the limit for two minutes, the reported end of the event or violation occurs at the time the value actually dropped below the limit.**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments: **The group did not reach consensus.**

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard:** We are all members of the ballot pool and intend to vote individually. There was no discussion of the remaining questions as a group response seemed inappropriate.

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

#### **Major Changes Requested to this Standard:**

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

#### **The SDT’s most significant changes include the following:**

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

#### **Changes outside the Scope of the SDT:**

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

#### ***Wait for the Functional Model***

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

The Functional Model defines tasks and relationships. To date the Functional Model's tasks and relationships remain virtually the same as they were in the original version. The addition of separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

#### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

#### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

#### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

#### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

#### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

#### Questions about Definitions

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes       No  
 Comments

Suggested Definition:

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the interconnected electrical generation resources and the interconnected high voltage transmission system **above 100 kV**. Radial transmission lines serving only load with one transmission source are not included in this definition.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes       No  
 Comments

This definition provides guidelines to the RA for establishing limits and implementation of mitigation plans. For clarification, If an entity (Reliability Authority, Balancing Authority, Transmission Operator, etc...) is going to report an SOL to the RA and the RA will make

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

the determination as to whether or not the SOL is indeed an IROL, should the clock not start until the determination is made by the RA? What happens if the RA takes 20-30 minutes trying to determine if an IROL exists?

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

definition for Wide Area Impact?

- Yes       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes       No  
 Comments

#### Questions about Requirement 201 — IROL Identification

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes       No  
 Comments

#### Questions about Requirement 201 — IROL Identification, continued

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes       No  
 Comments

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

It appears that this change is reflected in Measure (2) and Noncompliance level (4)(i). There should be a similar change made to the requirements section of 201.

8. Do you agree with the compliance monitoring process?

Yes  No

Comments

(3) indicates that the Reliability Authority must provide certain information upon request of the Compliance Monitor, but does not indicate how long the Reliability Authority has to provide the information. A possible revision could be that "upon request the Reliability Authority will provide the following information to the Compliance Monitor within 5 business days".

9. Do you agree with the levels of non-compliance?

Yes  No

Comments

Level 3 non-compliance indicates that the list must be updated as with the measurements some type of time period should be included.

10. Several balloters indicated a concern over coordination of IROLs between RAs.

Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

Comments

This type of information can be considered secure Critical Infrastructure Information as well as market sensitive and should not be publicly posted.

12. Other comments about Requirement 201:

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

#### Questions about Requirement 202 — Monitoring

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

Yes       No

Comments

It is very important for the system operator to have as much information available as possible to make decisions to ensure system reliability.

#### Questions about Requirement 204 — Actions

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes       No

Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

Keep the minimum of 30 seconds

Change the minimum to 1 minute

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Change the minimum to 10 minutes

Comments

16. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes

No

Comments

We had two members comment about the fixed sanction"

If the Maximum Value % over the Limit (measured after the event duration exceeds $T_v$ ) is: <small>Max Value % = (Max Value/ IROL limit -1)*100</small>	And the event duration exceeds its $T_v$ by __ minutes:	Then Multiply the Level 4 \$ sanction by:
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	10
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	15
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	20
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	25
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5$ minutes < Duration ≤ $T_v + 10$ minutes	30
	$T_v + 10$ minutes < Duration ≤ $T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

#### **Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

17. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

Yes       No

Comments

#### **Other Questions about this Standard**

18. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard

No, I am not a member of the Ballot Pool for this standard

Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.

I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.

I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.

Comments

20. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

#### 21. Other Comments about this Standard:

- The Compliance Monitoring Process for 202-208 requires that certain information be provided to the Compliance Monitor “upon request”, but does not indicate how long the Reliability Authority has to provide the information. A possible revision could be that “ upon request the Reliability Authority will provide the following information to the Compliance Monitor within 5 business days”.
- 204
  - Requirements
    1. Who is responsible for implementing an IROL mitigation plan? Transmission Owner? RA? Does the RA develop the plan or the Transmission Owner?
    2. Footnote 2 indicates the no action “may be acceptable as long as it is documented”, what type of documentation is required?
  - Non-Compliance Level 4 - Should be revised to indicate that the Reliability Authority is non-compliant because no actions were taken to mitigate an IROL or to document the violation.
- 205
  - Measure (3)(i) should be revised to indicate that the Compliance Monitor should be notified within five business days of determining the data issue could not be resolved.
  - Non-compliance levels – Why is there a Level 1 and Level 2, rather that Level 3 and Level 4. It appears that this information is very important to maintain a reliable system. In additions, if there is a measure for notifying the Compliance Monitor when data issues cannot be resolved, a level of non-compliance should be included when this notification is not provided.
- 207
  - Requirements and Levels of Non-Compliance – from this it appears that the Reliability Authority will work with other entities to develop processes, procedures, and plans, but the levels of non-compliance indicated that these activities could be developed with no input. What good is this if an Reliability Authority can’t perform the mitigation? Seems very broad and burdensome to the Reliability Authority.
- 208
  - Requirements - The standard does not address seams issues. Although 201 requires Reliability Authorities that share facilities to develop IROL procedures and lists there needs to be a requirement included that would allow one Reliability Authority to give directives to another Reliability Authority.

## FRCC Comments 4/14/04

### Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- Levels of Non-Compliance – If an entity does not follow the Reliability Authority directive, and the Reliability Authority does not have the ability to take action, other than the financial penalty there is no way to make entities comply with directives and reliability will be jeopardized.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

<b>Name</b>	<b>Company</b>	<b>Industry Segment #</b>

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

- Yes                       No  
 Comments

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes                       No  
 Comments

The threshold of 300 MW is to low. While it is understandable that the DOE requires that a loss of this size should be reported as a disturbance, it should not be the threshold of a cascading outage. A suggested MW level would be somewhere between 1000 and 5000 MW.

Could the group elaborate on the 15 minutes. How would an RA be able to determine if the load was going to be lost for more than 15 minutes? Consider whether an SOL, that is determined to be an IROL, go back to an SOL if an entity, through some process, stated that the load would be restored within 10 minutes.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

- Yes                       No  
 Comments

ATC support the position that an IROL should not be exceed by more than 30 minutes.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes             No  
 Comments

"Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL."

The term 'Wide area impact' is in the list of definitions but that term does not appear anywhere in the definition of an IROL. If is not used in the standard or in the definition of an IROL then should it not be removed from the definitions list?

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes             No  
 Comments

ATC brought up a concern during the last posting about the definition of Real-Time Assessment.

It seems the SDT is attempting to solve two situations with this one definition.

The first goal is to have the RA perform this assessment once every 30 minutes to determine if the current system, using that RA's pre-defined contingency list, is in an IROL situation.

The second goal is to project over the time between this assessment and the next scheduled assessment to determine if the RA's area may be approaching or potentially in an IROL.

The term Real-Time Assessment seems to support the first goal but, because of its name, does not seem to support the second goal. What if an RA only did the first goal of assessment and did not perform the second?

Suggestions would be to:

Remove the term 'expected system condition' from the definition.

Create a new term and standard addressing the requirement for the RA to look over the interval between Assessments and determine if the RA's system may be approaching or potentially in an IROL.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- Yes                       No  
 Comments

It's important that the RA's come to some type of commonality when determining if a shared facility should be subject to an IROL. This approach of an agreed upon process should be able to achieve that goal. Would this SDT put out a technical reference on how this type of an agreed upon process should read, with suggested inclusions and reasons for those suggestions?

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes                       No  
 Comments

Although the yes box has been check it does not mean that we support all of the revised changes. The question says the SDT modified the requirement "so that instead of requiring a 'list' of IROL's,..." but, in the measures, you require a list so a list is required. Our concern is not mainly of the list but the idea of how often the list needs to be updated. Since an IROL is a subset of SOL's, would it not be more efficient if the RA could identify those SOLs that are IROLs and show that they are monitoring them?

**Measures #3**

How does the SDT think that this measure can be demonstrated? In our opinion this may only be able to be demonstrated in front of the Compliance Monitor personally.

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

(2) Is difficult to understand, confusing. Would the SDT please provide greater clarification?

(3) i. It is our opinion that this should be a level 4 not level 3. This is a situation were an RA has blatantly ignored this standard and put the Interconnection at risk.

(3) ii. Suggestion would be to remove "updated" and replace it with "being reviewed."

(4) ii. This should be changed to something where there is no evidence that the RA is actively reviewing its SOL to determine whether it should be classified as an IROL. It seems possible that an RA at a given audit time my not have any IROL and, because of that, no list exists which shows any IROL, thus mandating a Level 4 Noncompliance. In Question 7 you stated that a list was not required in requirements.

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Comments

We are not convinced that a formal agreement has to be in place for adjacent RAs to determine if a facility should be subject to an IROL but there should be a mutually agreed upon process / procedure to identify and honor those facilities identified.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes

No

Comments

The RA should share those IROLs with its members and adjacent RA but public posting may prove to be overly burdensome to the RA's.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

- Yes                       No  
 Comments

We have not indicated a yes or no because the question is confusing. This addition does not appear in the 202 standard that this comment form accompanies. If you are asking if this should be added but has not been currently added to the standard, then ATC's opinion is that this should appear in the standard. The only suggestion is that item "(c)" is not needed. The idea behind moving an SOL into the IROL category is that it has a high potential to cause an adverse impact to the Interconnection.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term ‘action plan’ that was used in the last version of this standard. Several other drafting teams have used the terms, ‘processes, procedures or plans’ to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, ‘action plan’ to ‘processes, procedures or plans’ throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the ‘technical content’ of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

ATC agrees with some of the technical content of this standard but is concerned that this question requires us to agree to all of the technical content of this standard and if we do not, we should check “I do not agree”. The SDT is on the correct path in achieving approval of this standard but this latest version presents some problems / concerns.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

ATCs approach is to review each standard on its own merits.

### 20. Other Comments about this Standard:

#### 202 Monitoring

The SDT switches between the terms “operations personnel” and “system operators.” It seems that both of these terms refer to the same people. If so, could the SDT choose a single term to refer to that group? If not, could the SDT explain the difference?

#### Noncompliance

(4) i. This seems to be identical to (ii). Could the SDT clarify the difference?

(4) iii. How would this be reviewed? It seems that this is a subjective item, would the SDT please clarify?

#### 203 Analyses and Assessment

This goes back to our earlier comments about the definition of a Real-Time Assessment. It seems what the SDT is attempting to do is perform two different studies in this one requirement.

#### Compliance Monitoring Process

(3) ii. The Operational Planning Analysis is a study of the next day using forecasted data, transmission outage data, and generation outage data and can only attempt to see what may happen the next day. Given that statement, how can the RA be assured that it will exceed an IROL? Suggestion: change the “will exceed” to “may exceed.”

(3) iv. Remove the statement “or is expected to exceed any IROLs.” The Real-Time assessment should be limited to real-time time frame and should be extended to review the time between Real-Time Assessments.

#### Non Compliance

(3) i. Is the “time” that an Operational Planning Analysis or Real-Time Assessment was conducted sufficient enough indication that Operational Planning Analysis or Real-Time Assessment was conducted?

#### 204 Actions

(1) i. ATC is troubled by the term may be exceeded. How can an RA be required to perform action on a “may” situation? Suggestion would be to have the RA notify other RA along with members in the RA’s area that an IROL was not yet exceeded but the potential for an IROL to be exceeded was identified.

We would point out that there is no noncompliance level for the above concern so therefore should this may not be appropriate as a NERC standard.

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

***STD Commenter Information (For Groups Submitting Group Comments)***

**Name of Group:**

**Group Chair:**

**Chair Phone:**

**Chair Email:**

***List of Group Participants that Support These Comments:***

<b>Name</b>	<b>Company</b>	<b>Industry Segment #</b>

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes       No

Comments The Voltage level appears too low, but some criteria needed to be established.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

- Yes       No  
 Comments

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

- Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

- Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

- Yes       No  
 Comments

8. Do you agree with the compliance monitoring process?

- Yes       No  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

9. Do you agree with the levels of non-compliance?

Yes  No

Comments The analyses and assess. require once/dy. In some circumstances, where system conditions do not change and the IROL has ample operating room, the requirements do not acknowledge that mode explicitly.

10. Several balloters indicated a concern over coordination of IROLs between RAs.

Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes  No

Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes  No

Comments

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments Under dynamic conditions this is impossible to accomplish.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

Yes

No

Comments I agree with the concept, I think we need to spend some time on the multipliers.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>Requirements</b>	<b>First Offense</b>	<b>Second Offense</b>	<b>Reasoning</b>
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

<b>5. Data Specification</b>			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
<b>6. Data Provision</b>			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                      X  No

Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                       No

Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes                      X  No

Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

X  Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

X  Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

X  Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

X  Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                      X  No  
 Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

12. Other comments about Requirement 201: None

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes                       No  
 Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments: The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments: Propose sanctions are too severe. Suggest using multiples of 2's rather than 5's. I.e. the first group will be 2, 4, 6, 8 and the next group be 4, 6, 8, 10 etc.

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

X  Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

X  Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

X  I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

X  I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not 'stand-alone' — there are many inter-dependencies between these standards. It is not practical to 'wait' for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don't have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards 'one at a time' — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA's monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any 'emerging condition'. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT's reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments: We feel that this definition could be interpreted as including all facilities at and above 35kV whether they are transmission or not. The Bulk Electric System should be defined as 100kV and above network transmission system or lower voltage facilities that pass the FERC seven factor test.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments: Determining the amount of load loss and restoration time in a pre-contingency study is not possible with the current real-time analysis tools.

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments: This definition would qualify the loss of a single industrial customer (greater than 300MWs) as a wide area impact. A wide area impact should be defined as the loss of multiple substations or facilities than result in multiple customer outages totaling 300MWs or greater.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No

Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No

Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

8. Do you agree with the compliance monitoring process?

- Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

- Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

- Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

- Yes                       No

Comments: Identifying the most vulnerable points of the Interconnected transmission system is an invitation to sabotage. System operating limits are appropriate for posting, but that subset of limits that are IROLs should not be identified publicly. This should be confidential information.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes
  No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes  No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

## Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

Note – This form is to comment on version 3 of the Monitor and Assess Short-term Transmission Reliability – Operate Within Transmission Limits Standard (now called ‘Operate Within Interconnection Reliability Operating Limits’.)

The latest version of this Standard (OPER\_WITHN\_LMTS\_05\_03) is posted on the Standards website at: <http://www.nerc.com/~filez/standards/Monitor-Assess.html>

E-mail this form between March 1–April 14, 2004, to: [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with “Comments” in the subject line.

If you have any questions about this Standards draft comment form, please contact Gerry Cauley, the Director-Standards at 609-452-8060 or [Gerry.Cauley@nerc.net](mailto:Gerry.Cauley@nerc.net)

### Major Changes Requested to this Standard:

The Standards Drafting Team made several changes to this standard, based on the comments submitted during the first ballot of this standard. You can see the Standards Drafting Team’s consideration of every comment submitted with a ballot at:

<http://www.nerc.com/~filez/standards/Monitor-Assess.html>

### The SDT’s most significant changes include the following:

- Clarified the definitions of ‘widespread impact,’ ‘cascading outages’ and ‘bulk electric system’ so they are measurable.
- Modified the definition of  $T_v$  to align its definition with interconnection risk rather than sanctions and to indicate that  $T_v$  can’t exceed 30 minutes.
- Modified Requirement 201 for IROL Identification to better reflect the dynamic nature of IROLs
- Modified Requirement 201 to add language to ensure that RAs that share a Facility (or group of Facilities) have an agreed upon process for determining if the Facility is subject to IROLs and for developing the IROL and its  $T_v$
- Modified Requirement 204 for RA Actions to indicate that the RA must act ‘without delay’ to prevent or mitigate instances of exceeding IROLs
- Modified the sanction associated with operating outside an IROL for time greater than  $T_v$  to make the sanction proportional to both the magnitude and the duration of the incident.

### Changes outside the Scope of the SDT:

Several Balloters asked the SDT to make some changes that are outside the scope of the SDT.

These changes include the following:

- Wait until the Functional Model is modified, re-approved and/or better understood
- Wait until related Standards are approved
- Wait until Field Testing is conducted
- Expand the scope to include operating outside all System Operating Limits — not just those that could cause instability, cascading outages or uncontrolled separation

### *Wait for the Functional Model*

The SDT cannot guarantee that the Functional Model will never change. However, the SDT can state that the Functional Model is the approved basis for writing the current standards. NERC’s current Policies and Standards were based upon the concept of a control area. Recent events (such as the creation of GENCOs, TRANSCO and generation-only control areas) have shown that NERC’s vision of control area is no longer a valid basis for writing standards. The task-based Functional Model is the approved alternative.

The Functional Model defines tasks and relationships. To date the Functional Model’s tasks and relationships remain virtually the same as they were in the original version. The addition of

## **Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

separating the tasks between owner and operator did not invalidate the Functional Model. Neither did the inclusion of the Planning Functions invalidate the Functional Model. If new subdivisions of tasks are required, then the standards will have to be amended appropriately. However, to wait until everyone can agree on the future of our industry would commit NERC to permanent inaction.

### ***Wait for Related Standards***

These new standards are not ‘stand-alone’ — there are many inter-dependencies between these standards. It is not practical to ‘wait’ for one standard to be completed before finalizing another standard. Because we are developing these standards in parallel, rather than in series, the Standard Drafting Teams don’t have control over the completion of any other standard. The NERC BOT directed the teams to proceed with development of standards without delay — and that is what the drafting teams are trying to do. If NERC had more time to develop a new set of standards, then it would be better to develop the standards ‘one at a time’ — but the industry has an urgent need for a new set of standards to be in place as soon as possible.

### ***Wait for Field Testing***

The Director-Compliance is responsible for working with the Standards Authorization Committee in determine if there is a need to conduct field-testing of a standard. In this case, the Director-Standards recommended against field-testing, and this recommendation was supported by the Standards Authorization Committee. The decision to conduct field-testing is not within the scope of the SDT.

### ***Expand the scope to include all System Operating Limits (SOLs)***

The scope of this standard was limited to the subset of SOLs that are IROLs. The SDT recognizes that exceeding **any** SOL is unacceptable, but adding requirements to this standard that address exceeding SOLs is outside the scope of the associated SAR. The SDT is drafting another SAR to address monitoring and operating within SOLs.

### **SDT Assumptions about the RA’s monitoring and directing actions to prevent exceeding an IROL**

The SDT developed this standard with an assumption that entities would act honorably and with integrity. This standard requires that IROLs have both a magnitude and a duration component ( $T_v$ ). The SDT assumes that RAs following this standard will not exceed any IROL for any ‘emerging condition’. RAs should be constantly monitoring their RA Area and should take pre-emptive actions to prevent ever exceeding an IROL. Emerging situations should never result in an instance of exceeding an IROL. However, if a plane hits a set of transmission lines, an IROL may be exceeded and actions need to be taken without delay. For the unusual situation such as the plane crash, an IROL may be exceeded but not for a time greater than its  $T_v$ .

### **Levels of Non-compliance**

Several balloters asked that additional levels of non-compliance be added to the standard. Where this seemed reasonable, additional levels were added. The table on the following pages provides a comparison of the levels of non-compliance for all the requirements in this standard, with the SDT’s reasoning for the assignments.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Requirements	First Offense	Second Offense	Reasoning
<b>1. IROL Identification</b>			
(Level1) No process for addressing 'shared' Facilities	Letter to VP	Letter to VP	Shared facilities require cooperation between RAs. Not documenting a process for addressing these shared facilities is not as bad as not having any evidence that the RAs have agreed on which Facilities are subject to IROLs. Not having 'joint' agreement on which shared Facilities are subject to IROLs is a less severe infraction than not having a list of Facilities subject to IROLs for the RA's own Reliability Area.
(Level 2) No evidence that the RAs with a shared Facility have agreed on whether that Facility is subject to an IROL	Letter to VP	Letter to CEO \$1,000	
(Level 3) One or more IROLs had a T <sub>v</sub> greater than 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Having a T <sub>v</sub> greater than 30 minutes may pose an unacceptable risk to the interconnection.
(Level 3) List of Facilities subject to IROLs not updated	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	The System Operators need to know this information – having an out of date list is not good, but it is better than not having any of the data
(Level 4) No list of facilities subject to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	The System Operators need this information – without knowing what facilities are subject to IROLs, the System Operators may allow a limit to be exceeded for so long that it causes a cascading outage . . .
(Level 4) Unable to produce current IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>2. Monitoring</b>			
(Level 2) List of Facilities subject to IROLs not available for Real-time use	Letter to VP	Letter to CEO \$1,000	This information is needed for situational awareness. If operations personnel are aware of the facilities subject to IROLs they will pay closer attention to these facilities. However, not having this information is not as bad as not having current IROLs for real-time use.
(Level 4) IROLs not available to system operators for real time use	Letter to CEO \$2,000	Letter to CEO \$4,000	System Operators need to constantly monitor real time data and compare this against IROLs. If this isn't done, then there is a risk that a critical limit will be approached or exceeded and the system operator won't be aware of the condition – if left unknown, the limit could cause a cascading outage, . . .
(Level 4) Real-time data can't be compared to IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	
(Level 4) System Operators not monitoring real-time data against IROLs	Letter to CEO \$2,000	Letter to CEO \$4,000	

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>3. Analyses and Assessments</b>			
(Level 3) Can't show that an operational planning analysis was done once/day	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	Conducting the analyses and assessments is critical to identifying conditions that exist or may exist in the near future. If some analyses were 'skipped', this is not acceptable — the entity was 'lucky' and the sanction is a warning.
(Level 3) Can't show that a real-time assessment was done every 30 minutes	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	
(Level 4) Didn't do an operational planning analysis or a real-time assessment well enough to know if there are any actual or potential instances of exceeding an IROL.	Letter to CEO \$2,000	Letter to CEO \$4,000	Analyses and assessments need to result in the system operator KNOWING whether there is an actual or potential problem — if the analyses and assessments don't result in the system operator KNOWING whether there is an actual or potential problem, then this is the same as not having done the analysis or assessment.
<b>4. Actions</b>			
(Level 1) IROL exceeded for a time less than or equal to $T_v$ and no documentation to indicate actions taken or directives issued to mitigate the instance.	Letter to VP	Letter to VP	All instances of exceeding an IROL are serious. The Compliance Monitor needs to use the RA's documentation as a reference in auditing other entities to verify that the RA's Directives have been followed. Data relative to IROLs must be collected so that it is available for reliability studies.
(Level 4) Exceeded an IROL's magnitude and duration components.	Letter to CEO Variable \$\$ fine	Letter to CEO Variable \$\$ fine	This is the worst possible violation in this standard — and carries the harshest sanction. If an IROL is exceeded, then the interconnection has been placed in an unacceptable risk.

5. Data Specification			
(Level 1) Specification incomplete	Letter to CEO	Letter to CEO	<p>The data specification needs to be complete. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction recognizes that some data that is supplied may not be documented on a specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p> <p>The RA is strongly motivated to perform well and is required to meet stringent certification requirements so the RA will most certainly request the data it needs.</p>
(Level 2) Specification not distributed	Letter to VP	Letter to CEO \$1,000	<p>The data specification needs to be distributed so other entities can provide the needed data. Most entities already exchange data, and some entities may not have a 'complete' data specification. A lower level sanction was applied in recognition that some entities may already be exchanging data without a documented data specification, and there may need to be some 'warnings' to motivate the RA to improve its documentation.</p>
6. Data Provision			
(Level 4) Data not provided as specified and situation not resolved	Letter to CEO \$2,000	Letter to CEO \$4,000	<p>If data is needed and specified in a written document, then it does need to be provided. Not providing data that has been formally requested is serious because it can jeopardize the RA's ability to accurately monitor and assess its Reliability Area. In most cases, the Compliance Monitor only finds out about this violation if the RA tries to resolve the discrepancy, but the RA is unable to obtain the data it needs.</p>

<b>7. Procedures, Processes or Plans for Preventing and Mitigating Instances of Exceeding IROLs</b>			
(Level 1) Exist but not coordinated with all with all other RAs	Letter to VP	Letter to VP	If an entity has a document, then that entity has gone through the process of determining appropriate actions and has provided the document to its system operators for real time use. If the document isn't coordinated with other entities that need to act as part of that document, then there needs to be some sanction to motivate the involved entities to 'sign on the dotted line'. Without some formal agreement between all involved entities, there is no assurance that everyone involved will act as needed without unnecessary delays. These sanctions recognize that involving some of the other entities that need to act as part of the 'plan' is not as unacceptable as not involving any of the other entities that need to act as part of the 'plan'.
(Level 2) Exist but not coordinated with any other RAs	Letter to VP	Letter to CEO \$1,000	
(Level 3) Documents exist but don't address both preventing and mitigating IROLs	Letter to CEO \$1,000 fine	Letter to CEO \$2,000 fine	These sanctions recognize that having some documents is better than having no documents — but every RA should have documents that can be followed so that the RA's staff will be prepared.
(Level 4) Documents do not exist	Letter to CEO \$2,000	Letter to CEO \$4,000	
<b>8. RA Directives</b>			
(Level 1) Documentation incomplete	Letter to VP	Letter to VP	All operations involving IROLs are serious. The Compliance Monitor needs to review the documentation in concert with the RA's documentation for the same incident, to verify that the RA's Directives have been followed.
(Level 4) Didn't follow directives	Letter to CEO \$2,000	Letter to CEO \$4,000	This is an extremely serious violation since not following the RA's directives can jeopardize the reliability of the interconnection.

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments Above 35 kV is OK, but I would prefer that the limit be above 59 kV.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments I would suggest the definition be changed to: The uncontrolled or unplanned successive loss of system elements triggered by an incident at any location. Cascading Outages result in Wide-Area Impacts, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes       No

Comments This definition does not contain any energy values. Taking this definition literally would mean if a system lost 10,000 MW and was able to restore it in 14 minutes (admittedly, a highly unlikely occurrence), the outage would not be considered to have a wide area impact. A better definition would include an energy component, for example, 75 MWh. The revised definition would read: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes or the loss of 75 MWh or more during a time interval of 15 minutes or less.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes       No  
 Comments

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

Yes                       No  
 Comments

8. Do you agree with the compliance monitoring process?

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments Public posting should not be necessary as long as all entities that have a need to know the IROLs can have access to them.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

(i) The RA shall provide the following information to its system operators:  
(a) The system conditions under which the Interconnection Reliability Operating Limit applies,  
(b) The contingency that is the basis for the limit,  
(c) The impact of exceeding the limit

- Yes                       No  
 Comments

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

- Yes                       No  
 Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
$0\% < \text{Max Value \%} \leq 5\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	15
	$\text{Duration} > T_v + 15 \text{ minutes}$	20
$5\% < \text{Max Value \%} \leq 10\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	20
	$\text{Duration} > T_v + 15 \text{ minutes}$	25
$10\% < \text{Max Value \%} \leq 15\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	25
	$\text{Duration} > T_v + 15 \text{ minutes}$	30
$15\% < \text{Max Value \%} \leq 20\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	30
	$\text{Duration} > T_v + 15 \text{ minutes}$	35
$20\% < \text{Max Value \%} \leq 25\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	35
	$\text{Duration} > T_v + 15 \text{ minutes}$	40
$25\% < \text{Max Value \%} \leq 30\%$	$T_v < \text{Duration} \leq T_v + 5 \text{ minutes}$	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10 \text{ minutes}$	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15 \text{ minutes}$	40
	$\text{Duration} > T_v + 15 \text{ minutes}$	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

20. Other Comments about this Standard:

**Questions about Definitions**

1. The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

Yes                       No

Comments I agree with OPS that 35kv is too low. This definition should define the level as 100 kV and above.

2. Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments:

I like this definition. Although 300 is an arbitrary number (why not 500 for example), I like the fact that it is quantitative and easily measurable – after the fact at

3. Several balloters indicated a preference for a definition of  $T_v$  that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to  $T_v$ . Do you agree with the revised definition?

**$T_v$ :** The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable.  $T_v$  may not be greater than 30 minutes.

Yes                       No

Comments

I agree with this definition. I would only add that we should try and focus on consistency. I think  $T_v$  is being used in other standards, so I would recommend that these definitions are either coordinated or that different variables are used.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

4. Several balloters indicated a continued misunderstanding of the difference between 'wide area impact' and 'local area'. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was 'widespread'. (Note that while the term, 'wide area impact' is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

Wide Area Impact: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

Yes                       No

Comments Having agreed with the definition above, I am inclined to agree here as well.

5. Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

Yes                       No

Comments

I recommend that the drafting team stays away from defining terms that are already defined. For example, I think that Generator Owner, Reliability Authority Area, and Transmission owner are already defined in the functional model. Also, I recommend that the drafting team communicate with other drafting teams and make sure that the definitions used here are consistent throughout the standards – Performance-reset Period for example

**Questions about Requirement 201 — IROL Identification**

6. Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

Yes                       No

Comments

I agree with this in principle, but real life has shown that agreements on limits and processes are not always possible. I recommend that the drafting team adds a clause directing the RAs to use the process that results in the lower value for the limit if agreement can not be reached. They should keep using that limit until agreement is reached.

**Questions about Requirement 201 — IROL Identification, continued**

7. Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a 'list' of IROLs, the RA must be able to identify the 'current value' of its IROLs. Do you agree with this change?

Yes                       No  
 Comments

I agree with this, but that was not the way I understood it when I read the standard. The "current value" to me means what this value is right now. I recommend the word "current" be changes to something like "set"

8. Do you agree with the compliance monitoring process?

Yes                       No  
 Comments

9. Do you agree with the levels of non-compliance?

Yes                       No  
 Comments

10. Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

Yes                       No  
 Comments I recommend that the drafting team adds a clause directing the RAs to use the process that results in the lower value for the limit if agreement can not be reached. They should keep using that limit until agreement is reached. They should push for agreement.

11. Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

Yes                       No  
 Comments

NO. I agree with the SDT that there is no reliability reason to support this.

12. Other comments about Requirement 201:

**Questions about Requirement 202 — Monitoring**

13. Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
- (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

Yes  No

Comments I agree with providing the system controllers with as much information as possible without overloading them. If the SDT believes that this information aggregated with all the other information System controllers get would not be too much to handle then I'll agree with this requirements.

**Questions about Requirement 204 — Actions**

14. Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

Yes  No

Comments

15. Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

- Keep the minimum of 30 seconds  
 Change the minimum to 1 minute  
 Change the minimum to 10 minutes  
 Comments

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

I believe the 1 minute limit is reasonable and stays in line with other standards under development.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

12. Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's  $T_v$  be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

- Yes                       No  
 Comments

<b>If the Maximum Value % over the Limit (measured after the event duration exceeds <math>T_v</math>) is:</b> Max Value % = (Max Value/ IROL limit -1)*100	<b>And the event duration exceeds its <math>T_v</math> by ___ minutes:</b>	<b>Then Multiply the Level 4 \$ sanction by:</b>
0% < Max Value % ≤ 5%	$T_v < \text{Duration} \leq T_v + 5$ minutes	5
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	10
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	15
	Duration > $T_v + 15$ minutes	20
5% < Max Value % ≤ 10%	$T_v < \text{Duration} \leq T_v + 5$ minutes	10
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	15
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	20
	Duration > $T_v + 15$ minutes	25
10% < Max Value % ≤ 15%	$T_v < \text{Duration} \leq T_v + 5$ minutes	15
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	20
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	25
	Duration > $T_v + 15$ minutes	30
15% < Max Value % ≤ 20%	$T_v < \text{Duration} \leq T_v + 5$ minutes	20
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	25
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	30
	Duration > $T_v + 15$ minutes	35
20% < Max Value % ≤ 25%	$T_v < \text{Duration} \leq T_v + 5$ minutes	25
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	30
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	35
	Duration > $T_v + 15$ minutes	40
25% < Max Value % ≤ 30%	$T_v < \text{Duration} \leq T_v + 5$ minutes	30
	$T_v + 5 \text{ minutes} < \text{Duration} \leq T_v + 10$ minutes	35
	$T_v + 10 \text{ minutes} < \text{Duration} \leq T_v + 15$ minutes	40
	Duration > $T_v + 15$ minutes	45

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

16. Several balloters asked for more clarification on the term 'action plan' that was used in the last version of this standard. Several other drafting teams have used the terms, 'processes, procedures or plans' to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, 'action plan' to 'processes, procedures or plans' throughout this requirement. Do you agree with this change?

- Yes                       No  
 Comments

**Other Questions about this Standard**

17. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?

- Yes, I am a member of the Ballot Pool, or I represent a member of the Ballot Pool for this standard  
 No, I am not a member of the Ballot Pool for this standard  
 Comments

18. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists **solely** of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are **not** considered part of the 'technical content' of the standard.

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do agree** with the Technical Content of this standard.  
 I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I do not agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do agree** with the Technical Content of this standard.  
 I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool for this standard. **I do not agree** with the Technical Content of this standard.  
 Comments : I'm not sure that the Requirements of this standard represent technical content, but since I pretty much agree with the requirements so I checked box 1.

19. If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process? This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

**Comment Form for 3<sup>rd</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote on this standard based solely on its content**
- I am a member of the Ballot Pool or I represent a member of the Ballot Pool and **I will vote against this standard until other standards-related issues are resolved.**
- Not applicable – I am not a member of the Ballot Pool nor do I represent a member of the Ballot Pool

I agree with the requirements of RAs as defined by this standard as long as my organization becomes an RA. If we cannot receive RA certification then I would not agree with the requirement because state regulatory issues do not allow my organization to transfer to someone else the RA responsibility defined here that we currently do..

20. Other Comments about this Standard:

See my comment to question 19. This is a major issue for us. Until I know who is and who isn't an RA, I will have trouble voting.

## Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

### Introduction:

The SDT received comments from 138 different people, as shown on the next pages. These people represent more than 70 different companies, all NERC Regions and 6 of the 9 Industry Segments. The Operate Within Limits SDT (OWL SDT) thanks all who participated for their time and efforts in providing valuable input to the refinement of this new standard. The SDT believes that the technical issues associated with this standard that were raised during the first ballot of this standard, have now been resolved.

### Changes Made to Bring a Common Understanding to the Identification of IROLs :

The OWL SDT met jointly with members of the Operating Limits Definition-Task Force and the Determine Facility Ratings (DFR) SDT at the request of the NERC Operating Committee to reach common agreement on the definition of IROLs and a generalized methodology for identifying which SOLs are further classified as IROLs. During this meeting, participants determined that the identification of IROLs is most easily accomplished when the SOLs are developed. The IROL-related information the industry indicated it wanted provided to real time operations personnel is typically identified during the various activities designed to identify SOLs.. Based on these observations, the participants in the joint meeting recommended moving the IROL identification and communication requirements from the Operate Within IROLs Standard to the DFR Standard and recommended soliciting industry feedback on the appropriateness of this move. In addition, the OLD-TF agreed to align its activities associated with SOLs and IROLs to that proposed in the revised DFR Standard.

The participants in the joint meeting agreed that the criteria used to determine whether an SOL is also an IROL is the same for both the planning and the operating horizon:

If exceeding the SOL results (or could result) in one of the following, then that SOL is also an IROL.

- Instability
- Uncontrolled separation
- Initiation of cascading outages

The DFR SDT has agreed to solicit feedback on the appropriateness of moving the requirement to identify and communicate IROLs from this standard to the DFR Standard.

### Balloting:

The SDT believes that this standard, or any other new standard, will not receive sufficient approval because many members of the Registered Ballot Pool voted 'no' on this standard for one of the following reasons, and many of these balloters have indicated that they will continue to vote 'no' until these issues have been resolved.

- **Continued Ambiguity about the Future of the Reliability Coordinator**

The Reliability Coordinator does not appear in the Functional Model, but the Functional Model Technical Document indicates that the Reliability Coordinator is expected to continue to exist. (From page 38 of the Functional Model Technical Document:

“As this paper explains, the lack of the Reliability Coordinator in the Functional Model should not imply that the RC won't exist. In fact, we expect it to.”

Having both Reliability Coordinators and Reliability Authorities with similar sets of rules is confusing and may lead to unclear lines of authority during real-time operations.

- **Financial Sanctions for Non-compliance Aren't Fully Supported**

## Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

---

While some Regional Compliance Programs use financial sanctions and feel that these are good tools for motivating compliance with NERC Standards, at least one Region is using letters without financial sanctions, and the member of that Region feel that the letters, by themselves, are good tools for motivating compliance with NERC Standards.

- **Field Testing**

The Compliance Templates for Operating Policies and Planning Standards all received field testing before they were implemented. Some industry participants expect that all new standards should be field tested before being implemented. There appear to be misunderstandings surrounding the responsibility for determining whether field testing should be conducted, as well as misunderstandings about the purpose of field testing as applied to new standards.

The OWL SDT will post the revised OWL Standard for review with the DFR Standard, but will delay balloting the OWL Standard until the above issues are resolved and the industry has reached consensus on the content of the DFR Standard.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**Questions about Definitions**

**1. Bulk Electric System**

The SDT revised the definition of Bulk Electric System to clarify what portion of the electric system was included. Do you agree with the revised definition?

**Original Definition: Bulk Electric System:** A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system (above 35 kV or as approved in a tariff filed with FERC).

**Summary Consideration:** The industry comments clearly indicated that using '35 kV' as a threshold for the bulk electric system was aiming too low. There were many suggestions for improvements to this definition, and the suggestions to use the definition embedded in the 'Introduction to the Planning Standards' seems to meet most commenters' suggestions, with the addition of a sentence to indicate that specific types of radial transmission lines are not part of the bulk electric system.

**Bulk Electric System:** The bulk electric system is a term commonly applied to that portion of an electric utility system, which encompasses the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission lines serving only load with one transmission source are not included in this definition.

<b>'Yes' Responses</b>	
Michael Zahorik; ATC; #1	35 Kv seems rather low voltage. 50 or 100 Kv may be a better value.
Most commenters agreed with this observation. The revised definition uses 100 kV or higher as a threshold.	
Mark Fidrych; WAPA; #1	The Voltage level appears too low, but some criteria needed to be established.
Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold.	
R. Peter Mackin; TRANC; #1	Above 35 kV is OK, but I would prefer that the limit be above 59 kV.
Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold. This is the threshold already adopted for use in Planning Standards.	
Roman Carter; SCGEM; #5, 6 Joel Dison; SCGEM; #5, 6 Tony Reed; SCGEM; #5, 6 Lloyd Barnes; SCGEM; #5, 6 Clifford Shepard; SCGEM; #5, 6 Lucius Burris; SCGEM; #5, 6 Roger Green; SCGEM; #5, 6

A more appropriate level would be 100 kV and above.
Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold.	
Lee Xanthakos; SCE&G; #1	I agree with OPS that 35kv is too low. This definition should define the level as 100 kV and above.
Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold.	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

threshold.	
Ken Githens; Allegheny Energy 5	We feel that this definition could be interpreted as including all facilities at and above 35kV whether they are transmission or not. The Bulk Electric System should be defined as 100kV and above network transmission system or lower voltage facilities that pass the FERC seven factor test.
<p>Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold.</p> <p>The FERC seven factor test which you provided to the SDT is a good guideline for distinguishing between distribution systems and systems that are other than distribution. The SDT will pass this recommendation on to the other SDT's that might be able to use the seven factor test.</p> <ol style="list-style-type: none"> <li>(1) Local distribution facilities are normally in close proximity to retail customers.</li> <li>(2) Local distribution facilities are primarily radial in character.</li> <li>(3) Power flows into local distribution systems; it rarely, if ever, flows out.</li> <li>(4) When power enters a local distribution system, it is not reconsigned or transported on to some other market.</li> <li>(5) Power entering a local distribution system is consumed in a comparatively restricted geographical area.</li> <li>(6) Meters are based at the transmission/local distribution interface to measure flows into the local distribution system.</li> <li>(7) Local distribution systems will be of reduced voltage.</li> </ol>	
Raj Rana; AEP; 1,3,5,6	35 kV is too low for inclusion in the bulk electric system definition. The rest of this definition is less descriptive than the current definition in the NERC Operating Manual and contradicts the definition used in the NERC Planning Standards since 1995. The current definition in the NERC Planning Standards should be used as a starting point. Also, any definition of the Bulk Electric System should include the concept that 'networked' facilities (as opposed to radial) make up the BES and generally operated at voltages 100 kV or greater. The definition of the BES should not confuse FERC accounting rules/definitions with the functionality of the facilities themselves.
<p>Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold. Note that the documents called, "Terms Used in Planning Standards" that was approved by the NERC BOT on Feb 20, 2002 and the document called, "Additional Terms and their Definitions as Used in the NERC Planning Standards" that was approved by the NERC BOT on June 14, 2002 did not include a definition for the term, 'Bulk Electric System". A different commenter submitted a comment indicating that there is a definition of Bulk Electric System embedded in the Introduction to the Planning Standards, dated July 1997. Had the SDT been aware of its existence, the SDT would have used this definition since it would have been the most recently approved NERC definition. The definition provided in the Introduction to the NERC Planning Standards is provided here. Note that this definition would not meet your needs of including a distinction between radial and networked facilities.</p> <p><b>Bulk Electric System:</b> The bulk electric system is a term commonly applied to that portion of an electric utility system, which encompasses the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher.</p> <p>The following definition is from the NERC Glossary of Terms, approved by the NERC EC and OC on July 16, 1996 and is the exact definition the IROL SDT posted with the 2<sup>nd</sup> and 3<sup>rd</sup> versions of this standard:</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p><b>Bulk Electric System:</b> A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and bulk transmission system.</p>	
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, but added a sentence to the end of the definition to clarify that radial transmission lines are not considered part of the bulk electric system. This change supports your suggestions.</p>

<b>distribution and non-distribution.</b>	
Ed Davis; Entergy Services; #1	The definition of Bulk Electric System seems to be hard to pin down. We suggest: Bulk Electric System: A term commonly applied to the portion of an electric utility system that encompasses the electrical high voltage transmission facilities above 100 kV and associated equipment, or as approved in a tariff filed with FERC, and generation resources connected to that transmission system.
Most commenters agreed that 35 kV is too low. The revised definition uses 100 kV or higher as a threshold.	
Several commenters objected to inclusion of any reference to a 'tariff' in the definition. Note that the SDT revised the standard so this term is no longer used, and the term has been removed from the list of defined terms associated with this standard.	
John Swanson; NPDD; 2 Darrick Moe; WAPA; 2 Lloyd Linke; WAPA; 2 Paul Koskela; MP; 2 Larry Larson; OTP; 2 Dick Pursley; GRE; 2 Martin Trencce; XCEL; 2 Todd Gosnell; OPPD; 2 Robert Coish; MH; 2 Joe Knight; MAPPCOR; 2 Tom Mielnik; MEC; 2 Dave Jacobson; MH; 2 Delyn Helm; GRE; 2 Jason Weiers; OTP; 2 Dennis Kimm; MEC; 2	Portions of the transmission system that are operated radially below 100 kV should be excluded to avoid excessive data reporting that may be required for other standards that use this definition.
Agreed. The revised definition uses 100 kV or higher as a threshold and includes a sentence to clarify that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system.	
Dan Boezio; AEP; #1 Ron Ciesiel; SPP; #2 Bob Cochran; SPS; #1 Mike Gammon; KCP&L; #1 Allen Klassen; Westar; #1 Peter Kuebeck; OG&E; #1 Mike Stafford; GRDA; #1 Robert Rhodes; SPP; #2 Scott Moore; AEP; #1	Reference to a voltage class is fine, but the correct voltage class should be referenced. In the Introduction Section of the NERC Planning Standards the definition of Bulk Electric System contains 100 kV as the qualifier. Shouldn't this definition be consistent with this long-standing definition?
The SDT would have used this definition if they had been aware of its existence. Unfortunately, when the SDT did a 'search' with the NERC search engine of the NERC web site, seeking existing NERC defined terms, the search did not link to the definition of Bulk Electric System that appears in the Planning Standards. The definition in the Planning Standards is embedded in the document's Introduction, and isn't included in the official list of defined terms in either the "Terms Used in Planning Standards" that was approved by the NERC BOT on Feb 20, 2002 or the document called, "Additional Terms and their Definitions as Used in the NERC Planning Standards" that was approved by the NERC	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p><b>BOT on June 14, 2002.</b></p> <p>The revised definition starts with the definition of Bulk Electric System from the Introduction to the Planning Standards and includes a sentence to clarify that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system.</p>	
<p>Dale McMaster; AESO; #2 Ed Riley; CAISO; #2 Sam Jones; ERCOT; #2 Don Tench ; IMO; #2 Dave LaPlante; ISO_NE; #2 William Phillips; MISO; #2 Karl Tammar; NYISO; #2 Bruce Balmat; PJM; #2 Carl Monroe; SPP ; #2</p>	<p>Please drop the parenthetical expression – we would ask NERC and the industry to develop “standard” definitions of the common terms to be used by the all standard drafting teams.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system.</p> <p>Because the SDT’s are working in parallel, and because the standards are being developed in a serial rather than sequential order, it is not practical to have a pre-defined set of terms for use by all SDT’s. The SDT’s have advised the SAC of the need to ensure coordination of terminology and definitions between SDT’s.</p>	
<p>Anita Lee; AESO; #2</p>	<p>The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.</p>
<p><b>Please see the response provided to the ISO/RTO members.</b></p>	
<p>Chifong Thomas; PG&amp;E; #1 Glenn Rounds; PG&amp;E; #1 Ben Morris; PG&amp;E; #1</p>	<p>Please delete the parenthesis and add, “the operation of which would impact the operation of the Interconnection System of the Region, or as approved by a tariff filed with FERC”. The operation of a Bulk Electric System should have impacts on the operation of the Regional Interconnected System. In most systems in WECC, 35 kV would be considered distribution voltage.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p> <p>Most commenters agreed with you that 35 kV was too low.</p>	
<p>James Murphy; BPAT;#1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1</p>	<p>The (above 35 kV or as approved in a tariff filed with FERC) should be changed to (200kV and above or as determined by region). This will avoid including many lines that are not part of the Bulk Electric System, but if they are significant the Regions can add them into consideration for IROL’s.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. The existing NPCC Definition for its Bulk Power System is; “The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances can have significant adverse impact outside of the local area. Local areas are determined by the Council members.” Furthermore NPCC CP9 members listed feel that in no instance should a BES criteria encompass facilities at voltage levels less than 115 kV and strongly urges the eventual adoption of a “performance based” definition not a “voltage based” one.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Greg Campoli; NYISO; #2 James Castle; NYISO; #2 John Ravalli; NYISO; #2 Karl Tammar; NYISO; #2 Robert Waldele; NYISO; #2 Michael Calimano; NYISO; #2</p>	<p>This definition should be reliability-“performance based” and references to tariffs should be removed. For reference, we offer the existing NPCC Definition for its Bulk Power System is; “The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances can have significant adverse impact outside of the local area. Local areas are determined by the Council members.” The NYISO strongly urges the eventual adoption of a “performance based” definition not a “voltage based” one.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Khaqan Khan; IMO; #2</p>	<p>We feel that the definition of BES should not be tied up with FERC tariff. It should be upto the Reliability Authority to determine whether the facilities are impactive to the neighbors or not.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>It is suggested to remove the definition-item within parenthesis. Resulting definition is as below: "A term commonly applied to the portion of an electric utility system that encompasses the electrical generation resources and high voltage transmission system"</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>The BES should be defined based on performance (impact) on the power system, not a pre-defined voltage level. Suggest using a definition similar to NPCC "BULK POWER SYSTEM – The interconnected electrical systems within northeastern North America comprising generation and transmission facilities on which faults or disturbances have a significant adverse impact outside of the local area" (i.e. Control Area). If a pre-defined voltage level is necessary, at a minimum, it should not be less than a 115 kV threshold.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Jalal Babik; Dominion VA Power; #1          Craig Crider; Dominion VA Power; #1          Jack Kerr; Dominion VA Power; #1          Bill Thompson; Dominion VA Power; #1</p>	<p>By this definition, a Bulk Electric System could be as small as the transmission system covered by the OATT of the smallest "electric utility". This interpretation is not consistent with the usage of the term in the definition of IROL that appears in the revised Policy 9 currently being balloted by the Standing Committees.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Alan Gale; City of Tallahassee; #5          Rusty Foster; City of Tallahassee; #3</p>	<p>Suggested Definition:          Bulk Electric System: A term commonly applied to the portion of the electric system used in the transport of power in inter-utility transactions.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Richard Kafka, Pepco #3</p>	<p>While FERC may approve nearly any voltage level as "transmission," that does not qualify the facility as part of the bulk electric system. Regional practices and expected power flows can be used to distinguish between bulk and local electric facilities. The Regional Reliability Council should have authority to part of the bulk electric system if the facility owner does not voluntarily consider a facility to be such.</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>John Horakh; MAAC; #2</p>	<p>The parenthetical portion of the definition is too inclusive in specifying what makes up the “high voltage transmission system”. It requires all lines “above 35 kV or as approved in a tariff filed with FERC” to be included as part of the Bulk Electric System. Many lines that would fit this specification are indeed “transmission” rather than “distribution”, but they may not be part of the BULK transmission, i.e., the transmission that affects the overall reliability of the interconnected systems. Such “non-bulk” transmission lines could be called “subtransmission” or “underlying transmission” or “local transmission”. Many lines above 35 kV fall into this “non-bulk” category. Also, FERC tariff filings may limit lines to voltage levels above 35 kV, but may still contain many “non-bulk” transmission lines in order that such lines may receive proper regulatory treatment. In those cases, an entity would have no choice but to consider those “non-bulk” lines as part of the Bulk Electric System.</p> <p>The definition should be corrected by either of the following:</p> <ul style="list-style-type: none"> <li>a. Delete the parenthetical portion, OR,</li> <li>b. Change the parenthetical portion to the following – “(above 35 kV or as defined in a publicly available document)”. This would still allow the FERC filing to be used to limit and define the Bulk Electric System, IF APPROPRIATE. If further limiting is needed, this would allow an entity to produce, and make publicly available, another document to define the Bulk Electric System.</li> </ul>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p>	
<p>Ed Riley; CA-ISO; #2</p>	<p>Please drop the parenthetical expression as it is not applicable in Canada – we would ask NERC and the industry to develop “standard” definitions of the common terms to be used by the all standard-drafting teams. Could we use the definition of transmission out of FERC Order 888?</p>
<p>The SDT adopted the definition of Bulk Electric System that was used in the Introduction to the Planning Standards, and added a qualifying sentence to indicate that radial transmission lines serving only load with one transmission source are not considered part of the bulk electric system. This definition uses 100kV as a threshold for bulk power.</p> <p>Because the SDT’s are working in parallel, and because the standards are being developed in a serial rather than sequential order, it is not practical to have a pre-defined set of terms for use by all SDT’s. The SDT’s have advised the SAC of the need to ensure coordination of terminology and definitions between SDT’s.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**2. Cascading Outage**

Several balloters indicated that they didn't know if a studied event would meet the old definition of a cascading outage. The SDT adopted criteria currently used by the Department of Energy as the threshold for disturbance reporting. DOE uses, "Uncontrolled loss of 300 MW or more of firm system loads for more than 15 minutes from a single incident" as one of its thresholds for reporting disturbances.

If a study shows that exceeding an SOL will result in the uncontrolled successive loss of 300 MW or more of networked system load for 15 minutes or more — then that SOL is considered an IROL. Do you agree with the revised definition?

**Original Definition: Cascading Outages:** The uncontrolled successive loss of system elements triggered by an incident at any location that results in the loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Summary Consideration:** Because we've agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. All comments on the draft definition have been forwarded to the Determine Facility Ratings SDT for consideration by that SDT.

<b>'Yes' Responses</b>

However, we want to point out that in some very large systems, such as Southern Company, that include large metropolitan areas there are substations that serve geographic areas with very large loads. There can be cases in such substations where a fault occurs and the breaker fails to operate. In this breaker-failure scenario, large loads can be dropped for a short period of time in a controlled fashion in order to prevent cascading outages or instability. Our concern relates to reporting this as a 'wide area impact' violation simply because it produces a loss of 300 MW, while being confined to a single substation or possibly even one or two large factories on a particular bus. We are aware that the cascading outage definition is 'magnitude and time' sensitive but we believe it should be tailored to allow rational management of local area outages of large substations if they are managed in a controlled manner.
Note that the Determine Facility Ratings SDT (DFR SDT) has taken over the task of trying to get industry consensus on the definition of Cascading Outages. The DFR SDT is adding the phrase, 'unplanned' to the definition, and removing the reference to a specific # of MW. These changes look like they support your position.	
Lee Xanthakos; SCE&G; #1	I like this definition. Although 300 is an arbitrary number (why not 500 for example), I like the fact that it is quantitative and easily measurable – after the fact at
Note that the Determine Facility Ratings SDT (DFR SDT) has taken over the task of trying to get industry consensus on the definition of Cascading Outages. The DFR SDT, and most industry commenters, do not support the inclusion of any # of MW in the definition of Cascading Outages.	
Gerald Rheault; Manitoba Hydro; #1,3,5,6	In concept this is OK, however, in current practice,

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>simulation methods do not usually stress the system to the point of loss of load. Some of the mechanisms that might result in loss of load, such as collapse of an isolated island, may not be demonstrated with current modeling techniques. Current study techniques simulate only single contingency. Actual events which result in loss of 300 MW or more of networked system load are usually due to several contingencies occurring prior to system adjustment. There are too many possible scenarios to identify with current study resources. Such an approach is not recommended. Therefore the proposed criterion may not be practical to apply in studies.</p>
<p>Note that the Determine Facility Ratings SDT (DFR SDT) has taken over the task of trying to get industry consensus on the definition of Cascading Outages. Also note that the DFR SDT asked the industry if there was a need to study credible multiple contingencies and the industry commenters indicated this is done today, and there is a need to continue to study these. Therefore, the assumption that most study techniques are limited to single contingency scenarios may not be correct.</p>

<b>'No' Responses</b>	
<p>John Swanson; NPDD; 2  Darrick Moe; WAPA; 2  Lloyd Linke; WAPA; 2  Paul Koskela; MP; 2  Larry Larson; OTP; 2  Dick Pursley; GRE; 2  Martin Trencce; XCEL; 2  Todd Gosnell; OPPD; 2  Robert Coish; MH; 2  Joe Knight; MAPPCCOR; 2  Tom Mielnik; MEC; 2  Dave Jacobson; MH; 2  Delyn Helm; GRE; 2  Jason Weiers; OTP; 2  Dennis Kimm; MEC; 2</p>	<p>The definitions of SOL, IROL, Local Area and Widespread area used in the NERC Operating Limit Definitions and Reporting document approved at the March 23 NERC OC meeting should be used instead of incorporating DOE definitions.</p>
<p>Although these terms were accepted by the OC, they did not receive the same level of industry debate that the new reliability standards process requires. In addition, the OLDTF's definitions do not match the definitions included in the Compliance Templates adopted by the NERC BOT.</p>	
John Blazekovich; Exelon; 1,2,5,6	<p>This definition should be consistent with the definition used by the Determine Facility Ratings, System Operating Limits &amp; Transfer Capability SDT.</p>
<p>Agreed. Because we've agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT.</p>	
Raj Rana; AEP; 1,3,5,6	<p>The proposed definition is unclear. Why the need to include load impacted and time requirements into the Cascading Outage definition? Is a 250 MW loss of load for 24 hours a cascading event? How about 1000 MW for 10 Minutes? The key thought of a Cascading Outage is that it is Unplanned and Uncontrolled outage over a wider area. The Facility Rating SDT is using as a definition of Cascading Outage is "The uncontrolled and unplanned successive loss of system elements triggered by an incident at any location." Is it really necessary to define cascading outage, if we can define as above when an SOL is to be considered an IROL? To be a cascading outage, multiple system elements must be involved and a series of uncontrolled events occur.</p>
<p>The SDT was trying to move the industry towards consensus on this term – in prior postings, industry commenters indicated a need to have objective elements that each RA could use to determine if an SOL should be classified as an IROL. The SDT was trying to add those objective elements.</p>	
<p>Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

forwarded the comments on this definition to the DFR SDT and asked them to consider including the 'wide area' concept in their definition.	
James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	There is a concern with some at BPA that the Definition of Cascading Outages will affect other standards. Specifically the use of "300 MW or more of networked system load for a minimum of 15 minutes" will not work with other standards. It has been suggested to use the current definition for Cascading Outages be used in the IROL definition.
Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
Michael Zahorik; ATC; #1	300 mw is to low a value. There are instances that this amount of load can be lost and there are no network implications.
Agreed. Most commenters indicated that 300 MW was too low a threshold value.	
Dale McMaster; AESO; #2 Ed Riley; CAISO; #2 Sam Jones; ERCOT; #2 Don Tench ; IMO; #2 Dave LaPlante; ISO_NE; #2 William Phillips; MISO; #2 Karl Tammar; NYISO; #2 Bruce Balmat; PJM; #2 Carl Monroe; SPP ; #2	The definition should read as follows: The uncontrolled successive loss of Bulk Power Transmission elements that propagate beyond a balancing area's boundaries.
Because the Functional Model assigns the RA and TOP responsibility for monitoring and operating within limits, the SDT was trying to find a definition that would align with the RA and TOP, rather than the Balancing Authority. In trying to determine if its limit will impact entities outside its boundaries, the TOP will be looking at its own boundaries, not those of the Balancing Authority.	
Chifong Thomas; PG&E; #1 Glenn Rounds; PG&E; #1 Ben Morris; PG&E; #1	Loss of 300 MW of load is not a measure or indication of cascading. Please change the definition to read, "The uncontrolled and unplanned successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies".
Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
Khaqan Khan; IMO; #2	It is not the threshold of 300 MW that qualifies an incident to cause a cascading outage. An option is to use a definition: "The uncontrolled successive loss of Bulk Electric System elements that propagate beyond a defined area (balancing area's) boundaries"

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Because the Functional Model assigns the RA and TOP responsibility for monitoring and operating within limits, the SDT was trying to find a definition that would align with the RA and TOP, rather than the Balancing Authority. In trying to determine if its limit will impact entities outside its boundaries, the TOP will be looking at its own boundaries, not those of the Balancing Authority.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>This does not appropriately indicate that the losses are “cascading,” not localized, not BES, etc. Agreed with the concept of “uncontrolled successive loss,” but do not agree that the 300 MW is an appropriate measure. The loss of 300 MW of load has nothing to do with cascading or uncontrolled successive losses. You may lose over 300 MW of load, but it poses no risk to the interconnection. We believe that the standard should be that the cascading outages propagate beyond the local area (i.e. Control Area). Specific, hard, concrete examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.</p>
<p>Because the Functional Model assigns the RA and TOP responsibility for monitoring and operating within limits, and for establishing those limits for use in real-time operations, the SDT was trying to find a definition that would align with the RA and TOP, rather than the Balancing Authority (or control area). In trying to determine if its limit will impact entities outside its boundaries, the TOP will be looking at its own boundaries, not those of the Balancing Authority or Control Area.</p> <p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard will require that the RA and PA have a methodology for developing SOL's that includes identification of which SOLs are also IROLs. The subset of SOL's that are to be considered IROLs are those that, if exceeded, could cause cascading outages, uncontrolled separation or instability.</p>	
<p>R. Peter Mackin; TRANC; #1</p>	<p>I would suggest the definition be changed to: The uncontrolled or unplanned successive loss of system elements triggered by an incident at any location. Cascading Outages result in Wide-Area Impacts, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies</p>
<p>Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. **Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	such that the whole industry can understand what an IROL is.
<p>Because the Functional Model assigns the RA and TOP responsibility for monitoring and operating within limits, and for establishing those limits for use in real-time operations, the SDT was trying to find a definition that would align with the RA and TOP, rather than the Balancing Authority (or control area). In trying to determine if its limit will impact entities outside its boundaries, the TOP will be looking at its own boundaries, not those of the Balancing Authority or Control Area.</p>	
<p>Most commenters indicated that 300 MW was too low a threshold value.</p>	
<p>The Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard) will require that the RA and PA have a methodology for developing SOL's. The DFR Standard also requires that the SOL development methodology include the process used to identify the subset of SOL's that are also IROLs. The subset of SOL's that are to be considered IROLs are those that, if exceeded, could cause cascading outages, uncontrolled separation or instability.</p>	
<p>Jalal Babik; Dominion VA Power; #1                  Craig Crider; Dominion VA Power; #1                  Jack Kerr; Dominion VA Power; #1                  Bill Thompson; Dominion VA Power; #1</p>	<p>The narrow definition may cause some issues for the operators, depending on how this standard is applied, and whether planned maintenance and a contingency becomes an issue under transfer conditions. The key will be if you can get out of the condition quickly-i.e. 30 minutes.</p> <p>If the cascading outages definition trickles over to the Planning side or to other Operations Standards, it could mean extra expenditures for the company. There are a number of places where double contingencies can cause large loss of load, but not cascading as defined as follows:</p> <p>Cascading (planning definition/old ops definition):                  The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread service interruption, which cannot be restrained from sequentially spreading beyond an area predetermined by appropriate studies</p> <p>This definition gives much leeway. As long as you studied it, and you can tell how far the interruption spreads, it is not cascading. We could lose Northern Virginia or South Hampton Roads and still be in compliance. The loss of both 500 kV feeds to Yadkin and Fentress would drop over 300 MW.</p>
<p>The SDT working on the Determine Facility Ratings Standard and the SAR DT working on the Transmission Planning SAR have both indicated that the definition of cascading outages that was posted with this standard is not suitable for their use.</p>	
<p>Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>William Smith; Allegheny Power; #1 Ken Githens; Allegheny Energy 5</p>	<p>Determining the amount of load loss and restoration time in a pre-contingency study is not possible with the current real-time analysis tools.</p>
<p>Most commenters did not agree with the proposed definition. Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.</p>	
<p>Dan Boezio; AEP; #1 Ron Ciesiel; SPP; #2 Bob Cochran; SPS; #1 Mike Gammon; KCP&amp;L; #1 Allen Klassen; Westar; #1 Peter Kuebeck; OG&amp;E; #1 Mike Stafford; GRDA; #1 Robert Rhodes; SPP; #2 Scott Moore; AEP; #1</p>	<p>Using loss of load to imply a cascading event is not a logical link. If the point is to develop a limit for a reportable event, then call it a reportable event not a cascading outage. While this definition does set quantitative limits for cascading outages it doesn't really capture the link to cascading events. We would prefer the previous version of the definition, which while it was not as specific, captured the generic idea of cascading outages better. Trying to define cascading outages discretely may not be possible. Perhaps this definition is best left to the Determine Facility Ratings standard.</p>
<p>Most commenters did not agree with the proposed definition. Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.</p>	
<p>Carter Edge; SEPA ; #4 &amp; 5 William Gaither; SC Public Svc Auth; #1 Ken Skroback; AL Elec Coop ; #1 Roger Brand; Muni Elec Auth of GA; #1 Phil Creech; Progress Energy - Carolinas; #1 Gene Delk; SCE&amp;G; #1 Al McMeekin; SCE&amp;G; #1 Randy Hunt; Dominion – VA Pwr; #1 Doug Newbauer; GA System Ops; #1 Mike Clements; TVA; #1 Don Reichenbach; Duke Energy; #1 Lynna Estep; SERC; #2</p>	<p>The MW amount should not determine whether it is a cascading outage. New definition proposal: The uncontrolled successive loss of networked system elements triggered by an incident at any location.  In response to the second paragraph above for question 2, we do not believe that the 300 MW/15 minute criteria should be used to automatically determine IROL Violations. However, reporting requirements could be based on this criteria with after the fact analyses to determine if an actual IROL violation occurred.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Dan Kay; S Mississippi Elec Pwr Assoc; #1          Matt Ansley; Southern Company; #1          Uma Gangadharan; Entergy; #1</p>	
<p>Most commenters disagreed as you did with the 300 MW thresholds, and they have been removed.          Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.</p>	
<p>Ed Riley; CA-ISO; #2</p>	<p>The definition should read as follows: The uncontrolled successive loss of Bulk Power Transmission elements that propagate beyond a balancing area's boundaries and have adverse impacts of system frequency, load served, or voltage.</p>
<p>Because the Functional Model assigns the RA and TOP responsibility for monitoring and operating within limits, and for establishing those limits for use in real-time operations, the SDT was trying to find a definition that would align with the RA and TOP, rather than the Balancing Authority (or control area). In trying to determine if its limit will impact entities outside its boundaries, the TOP will be looking at its own boundaries, not those of the Balancing Authority or Control Area.          Most commenters indicated that 300 MW was too low a threshold value.</p>	
<p>Peter Burke; ATC; #1</p>	<p>The threshold of 300 MW is to low. While it is understandable that the DOE requires that a loss of this size should be reported as a disturbance, it should not be the threshold of a cascading outage. A suggested MW level would be somewhere between 1000 and 5000 MW.          Could the group elaborate on the 15 minutes. How would an RA be able to determine if the load was going to be lost for more than 15 minutes? Consider whether an SOL, that is determined to be an IROL, go back to an SOL if an entity, through some process, stated that the load would be restored within 10 minutes.</p>
<p>Most commenters indicated that 300 MW was too low a threshold value. Both the references to 300 MW and 15 minutes have been removed from the standard.</p>	
<p>John Horakh; MAAC; #2</p>	<p>The definition implies that Cascading Outages ALWAYS result in 300 MW of load loss for a minimum of 15 minutes. This result is likely, but not 100% sure.          The definition should be corrected by either of the following:          a. End the sentence with "at any location." and delete the remainder, OR,          b. Same as a. above, and add the following sentence – "Cascading Outages will likely have a Wide-Area Impact". Note that Wide-Area Impact is separately defined to include the 300 MW / 15 minute criteria.</p>
<p>Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
Richard Kafka; Pepco; #3	Add the term "or has a Wide-Area Impact."
Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
Anita Lee; AESO; #2	The AESO supports comments of the Standards Review Committee of the ISO/RTO Council.
Please review the response to the ISO/RTO Council's comments.	
Ed Davis; Entergy Services; #1	Cascading Outages is another term that is hard to define. Cascading Outage should be define in terms of the successive loss of system elements for which we suggest the definition be changed to:  Cascading Outages: The uncontrolled successive loss of <u>networked</u> system elements triggered by an incident at any location that results in <u>the operation of more than 4 relays and the loss 300 MW or more of networked system load</u> for a minimum of 15 minutes.
Most industry commenters disagreed with the thresholds (300 MW for 15 min) suggested in the last version of the standard.  Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
Marv Landauer; BPA; #1	This definition might be appropriate for the definition of an IROL but it does not fit with the other uses for the term (such as in the performance table). I suggest that this definition be removed and the words from this definition moved into the definition of an IROL in place of the words "cascading outages".
Most industry commenters disagreed with the thresholds (300 MW for 15 min) suggested in the last version of the standard. Members of the Transmission Plans SAR DT and the Determine Facility Ratings SDT have indicated that the definition of Cascading Outages in the last posting of this standard will not meet their needs.  Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.	
<b>Other Comments</b>	
Al Corbet; TVA Jerry Landers; TVA Jennifer Weber; TVA Edd Forsythe; TVA Larry Goins; TVA	For a large electric system that fluctuates between 15,000 MW to 29,000 MW in any given day, TVA feels that the loss of 300MW would not cause uncontrolled successive loss of system elements. We would prefer a Percentage of System Load rather than a hard number.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

Most industry commenters disagreed with the thresholds (300 MW for 15 min) suggested in the last version of the standard.

Note that because the IROL SDT has agreed to delay balloting this IROL standard until after the Determine Facility Ratings (DFR) standard has been balloted, the IROL SDT has transferred responsibility for refining the definition of Cascading Outages to the DFR SDT. Note that we've forwarded the comments on this definition to the DFR SDT and asked them to consider these comments in making their revisions to their definitions.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**3. T<sub>v</sub>**

Several balloters indicated a preference for a definition of T<sub>v</sub> that referenced a link to risk rather than a link to a sanction. Most balloters indicated a preference for an upper limit to T<sub>v</sub>. Do you agree with the revised definition?

**Original Definition:** T<sub>v</sub> : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable. T<sub>v</sub> may not be greater than 30 minutes.

**Summary Consideration:** Most industry commenters supported this revision. There were some suggestions for minor changes, and these have been adopted. The SDT added the phrase, "Interconnection Reliability Operating Limit" in front of, "T<sub>v</sub>" to clarify that the T<sub>v</sub> being defined is just the T<sub>v</sub> used with IROLs. This will enable the Balance Resources and Demand SDT to use the T<sub>v</sub> concept for frequency-related limits. The SDT also replaced the word, 'may' with 'shall.'

**Revised Definition:** IROL T<sub>v</sub> : The maximum time that an Interconnection Reliability Operating Limit can be exceeded before the risk to the interconnection becomes greater than acceptable. T<sub>v</sub> may (shall) not be greater than 30 minutes.

Note that the requirement to identify the subset of SOLs that are IROLs was moved to the 'Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard'. The definition of IROL T<sub>v</sub> was modified as noted above to conform to the industry's suggestions for improvements, and was then transferred to the DFR Standard.

<b>'Yes' Responses</b>	
Peter Burke; ATC; #1	ATC supports the position that an IROL should not be exceeded by more than 30 minutes.
<b>Most industry commenters agreed with this change.</b>	
Lee Xanthakos; SCE&G; #1	I would only add that we should try and focus on consistency. I think T <sub>v</sub> is being used in other standards, so I would recommend that these definitions are either coordinated or that different variables are used.
<b>Agreed. The definition of T<sub>v</sub> has been modified so that its concept can be used by other SDT's. The revised definition uses the phrase, "IROL T<sub>v</sub>", rather than just "T<sub>v</sub>".</b>

Delyn Helm; GRE; 2 Jason Weiers; OTP; 2 Dennis Kimm; MEC; 2	
Although these terms were accepted by the OC, they did not receive the same level of industry debate that the new standards process requires. In addition, the OLDTF's definitions do not match the definitions included in the Compliance Templates adopted by the NERC BOT.	
Alan Gale; City of Tallahassee; #5 Rusty Foster; City of Tallahassee; #3	When would the clock start? When the SOL is reported, after the RA determination that it is an IROL, or after the RA tells the reporting entity that it is an IROL? I recommend not starting the 30 minute clock until after the RA determines it is an IROL.
The RA is expected to have the capability of observing real-time values against IROLs, so the RA should always know whether a limit is an IROL. The definition of an IROL has been modified to make it easier to identify IROLs. The duration of an IROL event starts when a limit has been exceeded for a minimum of 30 seconds, this is to preclude penalties associated with telemetry errors.	
Ken Githens; Allegheny Energy 5	However, the standard needs to define acceptable risks.
The requirement to identify which SOLs are also IROLs was moved to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard). The DFR Standard includes a requirement that the methodology for determining SOLs (and for determining which subset of SOLs are IROLs), be shared with other RAs and also requires the methodology owner to be responsive to any technical comments received on that methodology. This should facilitate RAs working together to determine what constitutes 'acceptable risk'.

<b>'No' Responses</b>	
Dan Boezio; AEP; #1 Ron Ciesiel; SPP; #2 Bob Cochran; SPS; #1 Mike Gammon; KCP&L; #1 Allen Klassen; Westar; #1 Peter Kuebeck; OG&E; #1 Mike Stafford; GRDA; #1 Robert Rhodes; SPP; #2 Scott Moore; AEP; #1	If IROLs are truly significant interconnection events, then 30 minutes for Tv is probably a good value. However, if the definition of IROL stays with the proposed limits of 300 MW of load, then 30 minutes may be too short.
Agreed. Many commenters indicated that the definition of an IROL needed modification – and it has been changed to focus on the possible impact to the bulk electric system, rather than a quantity of MW. This change supports the concept of 'wide area' as defined in the newly approved compliance templates.	
John Blazekovich; Exelon; 1,2,5,6	Allowing an "acceptable time" of a Interconnection Reliability Operating Limit appears to be inconsistent with the definition of an IROL. If an IROL leads to instability, uncontrolled separation or cascading outage it seems to be unacceptable to allow any time limits to be associated with an IROL violation (i.e. any time spent over an IROL should be a violation).
Agreed. The intent of the standard is to prevent ever exceeding an IROL for any length of time. The SDT recognizes that there may be two different types of IROLs – those that result from an incident (such as an airplane that takes out a series of parallel transmission lines) and those that result from evolving conditions (such as the gradual increase in voltage limits resulting from heavy loads). The RA is	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

expected to prevent exceeding IROLs that may result from evolving conditions – and the RA is expected to mitigate an incident of exceeding an IROL that results from an incident. This change should make it easier for an RA to identify its IROLs.

Raj Rana; AEP; 1,3,5,6

How do you consistently define what risk is acceptable and what risk is not? How do we ensure all the RA's evaluate risk using the same criteria and assessment process? The upper limit of 30 minutes is not a problem. However, why would any entity select a  $T_v$  less than 30 minutes? Shouldn't the  $T_v$  concept require you to take immediate action, if studies show that exceeding this IROL could lead to system instability or collapse? An entity should not be allowed to operate such that the occurrence of the next contingency results in a cascading blackout. Under such a scenario, the entity needs to take immediate action as soon as it is identified that they are in such a situation, not wait 30 minutes or wait until the contingency occurs. The problem with this Standard in its current form is that it has watered down an IROL event by tying it to loss of 300 MW of load. For a large system, that may be the loss of only 2 or 3 facilities or less. And it could include events that do not threaten the Interconnection. We would suggest that a  $T_v$  of no greater than 30 minutes is adequate for a SOL violation, but may be totally inadequate for a true IROL.

The requirement to identify which SOLs are also IROLs was moved to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard). The DFR Standard includes a requirement that the methodology for determining SOLs (and for determining which subset of SOLs are IROLs), be shared with other RAs and also requires the methodology owner to be responsive to any technical comments received on that methodology. This should facilitate RAs working together to determine what constitutes 'acceptable risk'.

The DFR Standard includes a list of criteria that all System Operating Limits must meet. This should ensure that all SOLs (and IROLs) are established in a manner that ensures that, as long as the system is operated within the specified limits, the system will not suffer instability, cascading outages, or uncontrolled separation. The criteria for establishing SOLs includes things such as the number and types of contingencies that must be considered, definition of assumptions used in establishing SOLs, etc.

The DFR Standard includes a requirement that the methodology for determining SOLs (and for determining which subset of SOLs are IROLs), be shared with other RAs and also requires the methodology owner to be responsive to any technical comments received on that methodology. This should facilitate RAs working together to determine what constitutes 'acceptable risk'.

WECC already has many IROL's that are set at 20 minutes. The  $T_v$  for these limits is set to ensure that the system operators respond before the impact to reliability is unacceptable. In the WECC region, a technical committee establishes the 'base' set of IROLs for the entire interconnection – and the  $T_v$  is based on the risk to the interconnection of exceeding the IROL.

Note that there was not support for using the threshold of a loss of 300 MW of load for 15 minutes. The revised standard reflects adoption of the definition of widespread that was included in the templates just approved by the NERC BOT.

This standard doesn't suggest that anyone wait 30 minutes to resolve an instance of exceeding an IROL – this standard requires that actions be taken to Prevent instances of exceeding an IROL.

The industry has indicated that they do not want any IROL  $T_v$  greater than 30 minutes, and that language is reflected in this standard.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**4. Wide Area Impact**

Several balloters indicated a continued misunderstanding of the difference between ‘wide area impact’ and ‘local area’. The SDT modified the definition in an attempt to make the definition more objective. The Department of Energy currently requires that any single incident involving the uncontrolled loss of 300 MW or more of firm system loads be reported on form DOE EIA 417. The SDT adopted this criterion as the threshold for determining whether the impact of an event was ‘widespread’. (Note that while the term, ‘wide area impact’ is not used in this standard, it is used in the definition of an IROL.) Do you agree with the revised definition for Wide Area Impact?

**Original Definition: Wide Area Impact:** The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes.

**Summary Consideration:** The SDT endorses the definition of Wide Area that was recently approved by the NERC BOT with the new compliance templates, but recommends deleting the last phrase of the definition and substituting RA for RC. (The last phrase of the definition provides one use of the term ‘wide area’ – but the use cited is not the only use of the term ‘wide area’.)

**Revised Definition: Wide-Area:** The entire Reliability Authority Area as well as that critical flow and status information from adjacent Reliability Authority Areas as determined by detailed system analysis or studies.

The measure should be that a wide area event occurs when an event has an impact in two or more BA or RA areas.
The SDT adopted the definition approved by the NERC BOT in the recently approved compliance templates, with minor modifications – and the new definition supports your recommendation.	
Peter Burke; ATC; #1	“Note that while the term, ‘wide area impact’ is not used in this standard, it is used in the definition of an IROL.”  The term ‘Wide area impact’ is in the list of definitions but that term does not appear anywhere in the definition of an IROL. If is not used in the standard or in the definition of an IROL then should it not be removed from the definitions list?
Many commenters asked that the term be defined because an understanding of ‘widespread’ or ‘wide area impact’ was critical to determining whether an SOL should be considered an IROL. Note that the term, ‘wide area’ is used in the revised standard.	
Chifong Thomas; PG&E; #1 Glenn Rounds; PG&E; #1 Ben Morris; PG&E; #1	For some systems, it is not uncommon to have loads of 300 MW or more located in a small area. Loss of 300 MW is therefore not an indication of wide area impacts. If implemented, such criteria could significantly increase workload and take resources away from work needed to identify, analyze, monitor and mitigate problems concerning IROLs, the violation of which could truly lead to cascading.
Agreed. Most commenters indicated that the suggested thresholds were too low and would be impractical and they have been dropped from the revised standard.	
William Smith; Allegheny Power; #1	This definition would qualify the loss of a single industrial customer (greater than 300MWs) as a wide area impact. A wide area impact should be defined as the loss of multiple substations or facilities than result in multiple customer outages totaling 300MWs or greater.
Agreed. Most commenters indicated that the suggested thresholds were too low and would be

<b>Although these terms were accepted by the OC, they did not receive the same level of industry debate that the new standards process requires. The SDT adopted the definitions included in the Compliance Templates adopted by the NERC BOT, with slight modifications to make them align with the Functional Model.</b>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Greg Campoli; NYISO; #2  James Castle; NYISO ;#2  John Ravalli; NYISO; #2  Karl Tammar; NYISO; #2  Robert Waldele; NYISO; #2  Michael Calimano; NYISO; #2  Ralph Rufrano; NYPA; #1  David Kiguel; Hydro One Networks Inc.; #1  Roger Champagne; H-Q TransÉnergie; #1  Greg Campoli; New York ISO (NYISO); #2  Peter Lebro; National Grid; #1  Kathleen Goodman; ISO-NE; #2  Dan Stosick; ISO-NE;#2  Al Adamson; NYSRC;#2  Khagan Khan; The IMO Ontario; #2  Brian Hogue; NPCC;#2  Guy Zito; NPCC;#2  Lawrence Hochberg; NYSRC; #2  Khaqan Khan; IMO; #2</p>	<p>The NYISO agrees with the definition of Widespread Area from NERC OLDTF Report (that was validated by RCWG at its December/03 meeting and was accepted by NERC OC at its March 2004 meeting) be used in the Standard 200 as well. It is stated as below:</p> <p>Widespread Area An area that extends beyond any Local Area.</p> <p>Local Area The portion of a Widespread Area, whose boundaries are predetermined by appropriate analyses, where the impact of a Contingency or other event will not cause instability, uncontrolled separations or cascading outages to propagate beyond those predetermined boundaries (i.e., will not impact the overall reliability of a major portion of the Interconnection.) Impact to a Widespread Area indicates significant impact to the Interconnection.</p> <p>OR an alternative option/suggestion is also proposed as follows:</p> <p>“The impact of an incident resulting in uncontrolled successive loss of system elements in networked system and where the consequences of such significant adverse impact cannot be contained within a defined area that can be demonstrated by studies.</p> <p>Wide area impact may also be defined correlating it to occurrences of event impacting more than one Reliability Authority.</p>
<p>Although these terms were accepted by the OC, they did not receive the same level of industry debate that the new standards process requires. The SDT adopted the definition of Wide Area included in the Compliance Templates adopted by the NERC BOT, with slight modifications to align with the Functional Model.</p>	
<p>Khaqan Khan; IMO; #2</p>	<p>An alternative recommended approach/measure is that a wide area impact be defined with respect to occurrence of event impacting more than two RAs or BAs areas.</p>
<p>This is the concept supported by the definition of Wide Area adopted by the NERC BOT in the newly approved compliance templates – and has been endorsed by the SDT for this standard.</p>	
<p>Michael Zahorik; ATC; #1</p>	<p>Again 300 Mw is too low. There needs to be some definition of network impact. ATC has areas where 300 Mw can be lost and that lost will not affect the network.</p>
<p>Agreed. Most commenters indicated that 300 MW was too low a threshold. The revised standard does not include any MW threshold.</p>	
<p>Raj Rana; AEP; 1,3,5,6</p>	<p>The DOE threshold was never intended to imply that it defined a wide area impact. The definition for wide area impact needs to include the concept that multiple facilities are impacted, and exceeds a large geographic footprint. For a large entity, 300 MW can</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>be as little as 1% of their peak load, arguably not a wide area impact for them. It make sense to set a quantitative threshold. However, such threshold should not be so limiting as for larger systems to be able to be exceeded by a single event.</p> <p>What is missing in this Standards is the concept that we need to prevent events that put the interconnection at risk. Instead this Standards is focusing on events within a single Control Area or Transmission Operator footprint. For convenience, a 300 MW threshold has been suggested, but there is no reference to impact to the interconnection. I guess one can argue, that if we force such severely constrained operations at the local level, then we should never get to the point of placing risks on the Interconnection. Is that the point of this standard? If so, then this is not about operating to IROL's but rather in operating well under SOL's so as to never approach an IROL.</p> <p>The definition continues to miss the mark and remains unclear. If the SDT see a need to define a "Wide Area Impact" using a arbitrary load at risk level, may be acceptable. But under the current definition, is the loss of a 5000 MW load area for 12 minutes a wide area impact? Per definition the answer is no, practicality says 'yes'.</p>
<p>The SDT adopted the definition of Wide Area included in the Compliance Templates adopted by the NERC BOT, with slight modifications to align with the Functional Model.</p>	
<p>This standard includes several elements aimed at supporting the Prevention of exceeding an IROL.</p>	
<p>Marv Landauer; BPA; #2</p>	<p>I do not agree that this is the appropriate definition of wide area impact. However I also do not see that this term is used anywhere in the document, so I suggest that it be removed entirely.</p>
<p>The SDT adopted the definition of Wide Area included in the Compliance Templates adopted by the NERC BOT, with slight modifications to align with the Functional Model.</p>	
<p>Many commenters requested that this definition be included because understanding whether exceeding a limit will have 'wide area' impact is critical to determining whether that limit should be an IROL. In addition, the revised standard does use the term, 'wide area'.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>The definition should capture the concept of Interconnection impact. Agreed with the concept of "uncontrolled successive loss," but do not agree that the 300 MW is an appropriate measure. The loss of 300 MW of load has nothing to do with cascading or uncontrolled successive losses. You may lose over 300 MW of load, but it poses no risk to the interconnection. We believe that the standard should be that the cascading outages propagate beyond the local area (i.e. Control Area). Specific, hard, concrete examples about how IROLs are calculated, including specific contingency pair examples for things like thermal limits, are needed such that the whole industry can understand what an IROL is.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Agreed. The SDT adopted the definition of Wide Area included in the Compliance Templates adopted by the NERC BOT, with slight modifications to align with the Functional Model.</p> <p>The requirement to have a documented methodology for determining SOLs (and the subset of SOLs that are IROLs) has been moved to the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard. The revised Standard 603 includes a set of criteria for establishing SOLs and consequently for establishing IROLs.</p>	
<p>Carter Edge; SEPA ; #4 &amp; 5                  William Gaither; SC Public Svc Auth; #1                  Ken Skroback; AL Elec Coop ; #1                  Roger Brand; Muni Elec Auth of GA; #1                  Phil Creech; Progress Energy - Carolinas; #1                  Gene Delk; SCE&amp;G; #1                  Al McMeekin; SCE&amp;G; #1                  Randy Hunt; Dominion – VA Pwr; #1                  Doug Newbauer; GA System Ops; #1                  Mike Clements; TVA; #1                  Don Reichenbach; Duke Energy; #1                  Lynna Estep; SERC; #2                  Dan Kay; S Mississippi Elec Pwr Assoc; #1                  Matt Ansley; Southern Company; #1                  Uma Gangadharan; Entergy; #1</p>	<p>See comments above</p>
<p>See responses to prior comments.</p>	
<p>R. Peter Mackin; TRANC; #1</p>	<p>This definition does not contain any energy values. Taking this definition literally would mean if a system lost 10,000 MW and was able to restore it in 14 minutes (admittedly, a highly unlikely occurrence), the outage would not be considered to have a wide area impact. A better definition would include an energy component, for example, 75 MWh. The revised definition would read: The impact of a single incident resulting in the uncontrolled loss of 300 MW or more of networked system load for a minimum of 15 minutes or the loss of 75 MWh or more during a time interval of 15 minutes or less.</p>
<p>The SDT adopted the definition of Wide Area included in the Compliance Templates adopted by the NERC BOT, with slight modifications to align with the Functional Model.</p>	
<p>Jalal Babik; Dominion VA Power; #1                  Craig Crider; Dominion VA Power; #1                  Jack Kerr; Dominion VA Power; #1                  Bill Thompson; Dominion VA Power; #1</p>	<p>See item 2 comments. Also, a dynamic instability can cause power system oscillations and equipment “swinging” over a large part of an interconnection and yet result in no loss of load. This situation could be caused by a single incident such as loss of a long line or a malfunction of a power system stabilizer and would definitely be considered to have a wide area impact on the reliability of the interconnection and the safety of interconnected equipment. The proposed definition is not applicable.</p> <p>The definition of Wide Area Impact is not consistent with the definition of Wide Area that appears in the</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	revised Policy 9 currently being balloted by the Standing Committees.
The SDT adopted the definition of Wide Area that was approved by the Standing Committees and adopted by the NERC BOT in the new compliance templates. This is a minor modification to the definition included in Policy 9.	
Dan Boezio; AEP; #1 Ron Ciesiel; SPP; #2 Bob Cochran; SPS; #1 Mike Gammon; KCP&L; #1 Allen Klassen; Westar; #1 Peter Kuebeck; OG&E; #1 Mike Stafford; GRDA; #1 Robert Rhodes; SPP; #2 Scott Moore; AEP; #1	This term does not appear in the standard, why does it need to be defined here?  If it is felt that the definition must be included, then 300 MW is too small to be considered a wide area when compared to the interconnection.
The definition does appear in the revised standard. Many commenters indicated that using the 300 MW threshold was not appropriate and this reference has been dropped. The SDT has adopted the definition of Wide Area that was approved by the Standing Committees and adopted by the NERC BOT in the new compliance templates, with minor modifications to conform to the Functional Model.	
Ed Riley; CA-ISO; #2	Wide Area Impact should be defined in relation to a BA footprint. The measure should be that a wide area event occurs when an event has an impact in two or more BA areas.
The SDT has adopted the definition of Wide Area that was approved by the Standing Committees and adopted by the NERC BOT in the new compliance templates, with minor modifications to conform to the Functional Model.	
Ken Githens; Allegheny Energy 5	This definition would qualify the loss of a single industrial customer (greater than 300MWs) as a wide area impact. A wide area impact should be defined as the loss of multiple substations or facilities than result in multiple customer outages totaling 300MWs or greater.
The SDT has adopted the definition of Wide Area that was approved by the Standing Committees and adopted by the NERC BOT in the new compliance templates, with minor modifications to conform to the Functional Model.	
Ed Davis; Entergy Services; #1	We suggest the definition of Wide Area Impact should include a number of transmission providers, rather than MWs of load, and propose the following:  Wide Area Impact: The impact of a single incident resulting from the uncontrolled loss of networked system elements involving two or more transmission providers triggered by an incident at any location that results in the uncontrolled loss of 300 MW of networked system load for a minimum of 15 minutes.
The SDT has adopted the definition of Wide Area that was approved by the Standing Committees and adopted by the NERC BOT in the new compliance templates, with minor modifications to conform to the Functional Model.

**5. Other Definitions**

Several other definitions had minor changes. Please identify any definitions you feel need to be revised, and if possible suggest a revision.

**Summary Consideration:** The requirement to identify IROLs was shifted to the DFR Standard, and the definition of IROL is now being refined by the DFR SDT. The definition has been modified as follows and the DFR SDT is collecting comments on this definition:

**Interconnection Reliability Operating Limit** - a System Operating Limit, which, if violated, could result in instability, uncontrolled separation, or Cascading Outages affecting the bulk electric system.

Several commenters asked that a definition of 'shared facility' be provided, and the SDT revised the language in the standard so this term is not used, but its intent is clarified. A shared facility was intended to be a facility that crosses over one or more RA boundaries – so that multiple RAs have a portion of that facility within their RA Area.

Comments	
Karl Kohlrus; City Water, Light & Power; # 5	The definition of real-time data needs to make reference to how often it is collected (e.g. every 4 seconds) and how quickly it is reported (e.g. every 2 seconds).
As used in this standard, real-time data may be collected manually as well as through automatic collection systems. Requirements for tools are expected to be addressed in the Certification Standards.

As used in this standard, real-time data may be collected manually as well as through automatic collection systems. Requirements for tools are expected to be addressed in the Certification Standards.	
John Blazekovich; Exelon; 1,2,5,6	Interconnection Reliability Operating Limit - “that adversely impact the reliability of the bulk electric system” should be removed from the definition to make it consistent with the definition of a SOL, which it is.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>The definition of IROL is now being updated by the Determine Facility Ratings, System Operating Limits and Transfer Capabilities SDT.</p>	
<p>Raj Rana; AEP; 1,3,5,6</p>	<p>The definition of an IROL Event Duration lists a reset time of 30 seconds. In 204(b)(1)(iii) the reset period is given as one minute. Whichever is the proper intent of the SDT, 30 seconds or 1 minute is too short of a period for the reset. This should be on the order of 5 minutes or so in order to indicate that stable operating conditions have been attained.</p> <p>The definition of an IROL continues to be unclear. For example: If an SOL (system Operating Limit) is a maximum permissible value so as to not exceed a facility rating or reliability criteria, then if 'everyone' was doing their job there should never be an occurrence of an IROL. There should never be a situation where the outage of the next facility will lead to 'instability, uncontrolled separation, or cascading outages'. Therefore, for the system to be exposed to a IROL, a more restricting System Operating Limit must have already been exceeded, unidentified, or ignored.</p>
<p>The reset time is 30 seconds and has been modified so it is constant in both places. The intent of the reset period was not to ensure that the system was 'stable' – the intent of the reset time was to ensure that any telemetry error was excluded.</p> <p>The definition of an IROL is now being updated by the Determine Facility Ratings, System Operating Limits and Transfer Capabilities SDT</p>	
<p>Gerald Rheault; Manitoba Hydro; #1,3,5,6</p>	<ol style="list-style-type: none"> <li>1. The definition of "Interconnection Reliability Operating Limit" seems clear. However, addition explanation beyond the definition is required to shed light on the intended meaning and application of the term. NERC should consider the creation of a IROL reference document along the lines of the NERC "Transmission Transfer Capability" reference document.</li> <li>2. The impression is given that IROLs are simply a subset of SOL's as determined using current methods (e.g. study procedures). For some IROLS this will be true, i.e., where current methods demonstrate a specific transfer capability is limited by stability. However, in situations where thermal limits are lower than stability limits, it is not current practice (in MAPP) to expend additional effort to identify higher stability limits. A straight forward interpretation of the definition would require this additional effort. Is this NERC's intent?</li> <li>3. If so, NERC is introducing an additional requirement beyond current practice. This raises some important questions. How much extra effort is required and is it justified? Will monitoring IROLs derived in this way be fully</li> </ol>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>effective to prevent instability, uncontrolled separation, or cascading outages? For example, simultaneously exceeding several thermal limits (individually SOL's not IROLs ) may be approaching a voltage instability condition but this condition might not be recognized using the proposed IROL monitoring method. This is a good example of how an IROL might exist which will not be identified by current methods. The implications of the proposed IROL methodology have not been sufficiently explored and documented to ensure effective understanding and application within the electrical industry.</p>
<p>1. The IROL definition is now being updated by the Determine Facility Ratings, System Operating Limits and Transfer Capabilities SDT and that SDT is developing a Technical Reference to identify how to identify IROLs.</p> <p>2. Yes, this is the intent.</p> <p>3. Existing Reliability Coordinators are expected to calculate and operate within IROLs today.</p>	
<p>Dale McMaster; AESO; #2 Ed Riley; CAISO; #2 Sam Jones; ERCOT; #2 Don Tench ; IMO; #2 Dave LaPlante; ISO_NE; #2 William Phillips; MISO; #2 Karl Tammar; NYISO; #2 Bruce Balmat; PJM; #2 Carl Monroe; SPP ; #2 Anita Lee; AESO; #2</p>	<p>A definition of "shared facilities" is requested</p>
<p>The SDT modified the standard so the term, 'shared facilities' is no longer used. A shared facility was intended to be a facility that crosses over one or more RA boundaries – so that multiple RAs have a portion of that facility within their RA Area.</p>	
<p>Peter Burke; ATC; #1</p>	<p>ATC brought up a concern during the last posting about the definition of Real-Time Assessment. It seems the SDT is attempting to solve two situations with this one definition.</p> <p>The first goal is to have the RA perform this assessment once every 30 minutes to determine if the current system, using that RA's pre-defined contingency list, is in an IROL situation.</p> <p>The second goal is to project over the time between this assessment and the next scheduled assessment to determine if the RA's area may be approaching or potentially in an IROL.</p> <p>The term Real-Time Assessment seems to support the first goal but, because of its name, does not seem to support the second goal. What if an RA only did the first goal of assessment and did not perform the second?</p> <p>Suggestions would be to:</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>Remove the term 'expected system condition' from the definition.</p> <p>Create a new term and standard addressing the requirement for the RA to look over the interval between Assessments and determine if the RA's system may be approaching or potentially in an IROL.</p>
<p>The definition of a Real-time Assessment is:  An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.</p> <p>The requirement for conducting a real-time assessment includes the following:  The Reliability Authority shall perform Real-time Assessments every 30 minutes to determine if its Reliability Authority Area is exceeding any Interconnection Reliability Operating Limits or is expected to exceed any Interconnection Reliability Operating Limits.</p> <p>The comments received from the industry have indicated support for both the definition and the requirement. Both clearly indicate that the assessment has two purposes – to determine if the RA's RA Area is exceeding any IROLs or is expected to exceed any IROLs. Part of developing an 'expectation' is to make a judgment about 'trends' from having conducted assessments every 30 minutes. For example, an RA is expected to notice if three successive Real-time Assessments indicate that a Facility subject to an IROL is creeping towards its IROL.</p>	
<p>Greg Campoli; NYISO; #2  James Castle; NYISO; #2  John Ravalli; NYISO; #2  Karl Tammar; NYISO; #2  Robert Waldele; NYISO; #2  Michael Calimano; NYISO; #2  Ralph Rufrano; NYPA; #1  David Kiguel; Hydro One Networks Inc.; #1  Roger Champagne; H-Q TransÉnergie; #1  Greg Campoli; New York ISO (NYISO); #2  Peter Lebro; National Grid; #1  Kathleen Goodman; ISO-NE; #2  Dan Stosick; ISO-NE; #2  Al Adamson; NYSRC; #2  Khagan Khan; The IMO Ontario; #2  Brian Hogue; NPCC; #2  Guy Zito; NPCC; #2  Lawrence Hochberg; NYSRC; #2</p>	<p>The terms/definitions in the Standards should be consistent with the terms/definitions outlined in Functional Model (version 2). As an example, there is an inconsistency in definition of Transmission Operator, i.e. Definition of Transmission Operator should be updated to reflect definition stated in version 2 of the Functional Model – i.e. "operates or directs the operation". Definitions should be in one place not in each standard and definitely should not appear if they are in the Functional Model document.</p> <p>The definition of IROL presently given in the recent modified template P2T1 (System Operating/Interconnected Reliability Operating Limits Violations) may better serve the purpose in Std 200 as well. It is suggested to use the same definition with few modifications, as follows:</p> <p>" A subset of system operating limits, which if exceeded, could expose a Widespread Area of the Bulk Electrical system to instability, uncontrolled separations(s) or cascading outages."</p>
<p>The SDT dropped the terms already defined in the Functional Model from the list of terms defined for this standard.</p> <p>The definition of an IROL is now being updated by the Determine Facility Ratings, System Operating Limits and Transfer Capabilities SDT.</p>	
<p>Jalal Babik; Dominion VA Power; #1  Craig Crider; Dominion VA Power; #1  Jack Kerr; Dominion VA Power; #1</p>	<p>The definition of IROL in this standard, "A system operating limit which, if exceeded, could lead to instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Bill Thompson; Dominion VA Power; #1</p>	<p>bulk electric system.", is not consistent with the definition in the revised Policy 9 currently being balloted by the Standing Committees, "The value (such as MW, MVar, Amperes, Frequency or Volts) derived from, or a subset of the SYSTEM OPERATING LIMITS, which if exceeded, could expose a widespread area of the BULK ELECTRIC SYSTEM to instability, uncontrolled separation(s) or cascading outages". The definition in this standard loses the concept of wide area.</p>
<p>The definition of an IROL is now being updated by the Determine Facility Ratings, System Operating Limits and Transfer Capabilities SDT</p>	
<p>Al Corbet; TVA                  Jerry Landers; TVA                  Jennifer Weber; TVA                  Edd Forsythe; TVA                  Larry Goins; TVA                  Mark Creech; TVA                  Kathy Davis; TVA</p>	<p>Operational Planning Analysis which states "An analysis of the expected system conditions for the next day's operation and up to 12 months ahead."                  Currently, Reliability Coordinators have responsibility for real-time through next day and Control Areas have Operational Planning responsibilities up to 12 months.                  Page 6 of the "question and answers" address this definition and it says that the standard requires that an operational planning analysis be conducted at least once each day, looking ahead at the day ahead. But it appears to me that the definition implies more than next day. Maybe this is okay since the measure does limit it to next day.                  Most of the SERC RCs have responsibility for multiple control areas. TVA for example does operational planning for several months for the TVA control area, but our scope as RC for AEIC, BREC, EKPC is real-time through next day.                  Scope for RC is real-time through next day.                  There appears to be a shift in responsibility for this operational planning timeframe, if RC = RA.</p>
<p>The standard requires the RA to do an operational analysis each day for the day ahead. Other standards may be developed that require the RA to conduct an operational analysis that looks further ahead. The definition was intended to be useful to all standards that may be developed.                  There may be a need for another standard to address Operational Planning that takes place in an operating horizon that covers the timeframe between next day and 12 months.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>Generator Owner definition is not needed in this standard.</p>
<p>Agreed. The SDT removed all the definitions from the Functional Model.</p>	
<p>James Murphy; BPAT; #1                  Mike Viles; BPAT; #1                  Richard Spence; BPAT; #1                  Don Watkins; BPAT; #1                  Don Gold; BPAT; #1                  Marv Landauer; BPAT; #1</p>	<p>IROL "system operating limit" should be capitalized.                  IROL Event Duration: The time frame should match the standard, definition says 30 seconds, standard says 1 minute (204b1ii)                  Please include the SOL definition.</p>
<p>Agreed – the term, "system operating limit" has been capitalized in the revised standard.                  Agreed – the standard was modified to conform to the definition which states that the time frame is 30</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

seconds.	
The Determine Facility Ratings SDT has developed a definition of SOL that has reached industry consensus. We will include it in the revised posting, but will also include a note to indicate that the definition was developed as part of the DFR Standard, and the OWL SDT will not revise this definition.	
Ed Riley; CA-ISO; #2	A definition of "shared facilities" is requested.
The standard has been revised so the term is no longer used. A shared facility was intended to be a facility that crosses over one or more RA boundaries – so that multiple RAs have a portion of that facility within their RA Area.	
Carter Edge; SEPA ; #4 & 5 William Gaither; SC Public Svc Auth; #1 Ken Skroback; AL Elec Coop ; #1 Roger Brand; Muni Elec Auth of GA; #1 Phil Creech; Progress Energy - Carolinas; #1 Gene Delk; SCE&G; #1 Al McMeekin; SCE&G; #1 Randy Hunt; Dominion – VA Pwr; #1 Doug Newbauer; GA System Ops; #1 Mike Clements; TVA; #1 Don Reichenbach; Duke Energy; #1 Lynna Estep; SERC; #2 Dan Kay; S Mississippi Elec Pwr Assoc; #1 Matt Ansley; Southern Company; #1 Uma Gangadharan; Entergy; #1	Uncontrolled separation – Cascading outages (new proposed definition above) that lead to the unplanned break-up of an interconnection.
The SDT's are trying to limit the number of defined terms to those that could be reasonably interpreted to mean different things to different entities. Uncontrolled separation seems to be self-evident. If other entities suggest that this term be defined, your definition will be suggested.	
Dan Boezio; AEP; #1 Ron Ciesiel; SPP; #2 Bob Cochran; SPS; #1 Mike Gammon; KCP&L; #1 Allen Klassen; Westar; #1 Peter Kuebeck; OG&E; #1 Mike Stafford; GRDA; #1 Robert Rhodes; SPP; #2 Scott Moore; AEP; #1	The definition of an IROL Event Duration lists a reset time of 30 seconds. In 204(b)(1)(ii) the reset period is given as one minute. Whichever the case, 30 seconds or 1 minute is too short of a period for the reset. This should be on the order of 5 minutes or so in order to indicate that stable operating conditions have been attained.
The reset time is 30 seconds and has been modified so it is constant in both places. The intent of the reset period was not to ensure that the system was 'stable' – the intent of the reset time was to ensure that any telemetry error was excluded.	
Lee Xanthakos; SCE&G; #1	I recommend that the drafting team stays away from defining terms that are already defined. For example, I think that Generator Owner, Reliability Authority Area, and Transmission owner are already defined in the functional model. Also, I recommend that the drafting team communicate with other drafting teams and make sure that the definitions used here are consistent throughout the standards – Performance-reset Period for example

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Agreed. The definitions from the Functional Model have been dropped. The Director-Standards is trying to ensure that definitions are shared between drafting teams.</p>	
<p>William Pope; Gulf Power Co; #3</p>	<p>All definitions are acceptable.</p>
<p>Roman Carter; SCGEM; #5, 6          Joel Dison; SCGEM; #5, 6          Tony Reed; SCGEM; #5, 6          Lloyd Barnes; SCGEM; #5, 6          Clifford Shepard; SCGEM; #5, 6          Lucius Burris; SCGEM; #5, 6          Roger Green; SCGEM; #5, 6</p>	<p>All are improved and acceptable</p>

**Questions about Requirement 201 — IROL Identification**

**6. IROLs for shared facilities**

Do you agree with the following new measure developed to support the requirement that addresses the handling of 'shared' Facilities?

**201(b)(2)(i)** The Reliability Authorities that share a Facility (or group of Facilities) shall have an agreed upon process for determining if that Facility (or group of Facilities) is subject to an Interconnection Reliability Operating Limit and for determining the value of that Interconnection Reliability Operating Limit and its associated  $T_v$

**Consideration of Comments:** While many industry commenters agreed with this change, several commenters indicated this should be addressed in the Coordinate Operations Standard. The Coordinate Operations Standard does include the following requirement that RAs have a process, procedure or plan for activities that require coordination of actions involving more than one RA, and this should include establishing limits for 'shared' facilities:

(Coordinate Operations Standard 101 - Requirement 1)The Reliability Authority shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Authorities to support interconnection reliability. These Operating Procedures, Processes or Plans shall address Scenarios that affect other Reliability Authority Areas as well as those developed in coordination with other Reliability Authorities.

Several commenters also indicated that language in the newly approved Policies includes a requirement that if two RAs (RCs in current Policy) can't agree on a limit, they should both operate to the most limiting parameter. This change is within the scope of the SAR and has been included in the revised standard.

There were other comments asking for a definition of 'shared facilities'. With the transfer of the requirement to identify and communicate IROLs to the DFR Standard, this Operate within IROLs Standard does not include the term, 'shared' facilities.

<b>'Yes' Responses</b>	
Karl Kohlrus; City Water, Light & Power; # 5	In the event that there are different ratings of the same facility, the lower rating should always be used.
This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard. Requirement 201 has been modified to reflect your suggestion.	
Raj Rana; AEP; 1,3,5,6	As per changes being made to NERC Policy 9, the default is you operate to the most conservative position. Thus if one RC says the facility has an IROL, all RCs need to respect and operate to that IROL.
This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard. Requirement 201 has been modified to reflect your suggestion.	
Lee Xanthakos; SCE&G; #1	I agree with this in principle, but real life has shown that agreements on limits and processes are not

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>always possible. I recommend that the drafting team adds a clause directing the RAs to use the process that results in the lower value for the limit if agreement can not be reached. They should keep using that limit until agreement is reached.</p>
<p>This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard. Requirement 201 has been modified to reflect your suggestion.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>We do have a concern about having a formal process. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit.</p>
<p>This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard.</p>	
<p>Ralph Rufrano; NYPA; #1 David Kiguel; Hydro One Networks Inc.; #1 Roger Champagne; H-Q TransÉnergie; #1 Greg Campoli; New York ISO (NYISO); #2 Peter Lebro; National Grid; #1 Kathleen Goodman; ISO-NE; #2 Dan Stosick; ISO-NE; #2 Al Adamson; NYSRC; #2 Khagan Khan; The IMO Ontario; #2 Brian Hogue; NPCC; #2 Guy Zito; NPCC; #2 Lawrence Hochberg; NYSRC; #2</p>	<p>Concern exists that the process required may be too formalized and could be a simple email or telephone call that requires affirmation and a formal legal agreement should not be required.</p>
<p>This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard.</p>	
<p>Peter Burke; ATC; #1</p>	<p>It's important that the RA's come to some type of commonality when determining if a shared facility should be subject to an IROL. This approach of an agreed upon process should be able to achieve that goal. Would this SDT put out a technical reference on how this type of an agreed upon process should read, with suggested inclusions and reasons for those suggestions?</p>
<p>This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Marc Butts; Southern Company Svcs; #1  Raymond Vice; Southern Company Svcs; #1  Dan Baisden; Southern Company Svcs; #1  Jim Griffith; Southern Company Svcs; #1  Phil Winston; Georgia Power Company; #3  Jim Viikinsalo; Southern Company Svcs; #1  Mike Miller; Southern Company Svcs; #1  Monroe Landrum; Southern Company Svcs; #1  Gwen Frazier; Southern Company Svcs; #1  Steve Williamson; Southern Company Svcs; #1  Rod Hardiman; Southern Company Svcs; #1  Jonathan Glidewell; Southern Company Svcs; 1  Dan Richards; Southern Company Svcs; #1  Mike Hardy; Southern Company Svcs; #1  David Majors; Georgia Power Company; #3  Roman Carter; SCGEM; #5, 6  Joel Dison; SCGEM; #5, 6  Tony Reed; SCGEM; #5, 6  Lloyd Barnes; SCGEM; #5, 6  Clifford Shepard; SCGEM; #5, 6  Lucius Burris; SCGEM; #5, 6  Roger Green; SCGEM; #5, 6</p>	<p>This requirement seems to overlap the requirements in the Coordinate Operations standard. The two standards should be coordinated to avoid unnecessary repetition.</p>
<p>Agreed. It does appear that this requirement will be adequately addressed in the Coordinate Operations Standard's requirement 101 which requires RAs have a process, procedure or plan to address situations where coordination between RAs is required, and this should include establishing limits for 'shared' facilities.</p>

<b>'No' Responses</b>	
Khaqan Khan; IMO; #2	It is recommended that the standards should be supported by appropriate technical documentation that is allowed under the standards process to ensure a complete understanding of the standard and its consistent applications.
The SDT agrees with this concept. Supporting documents may be developed at any time, and are not part of the technical content that is balloted with the standard, nor are they used for determining compliance.	
James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	This should be covered in the coordinate operations standard (#100).
Agreed. This requirement seems to be adequately addressed by the Coordinate Operations Standard.	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<b>and has been dropped from this standard.</b>	
Dale McMaster; AESO; #2 Ed Riley; CAISO; #2 Sam Jones; ERCOT; #2 Don Tench ; IMO; #2 Dave LaPlante; ISO_NE; #2 William Phillips; MISO; #2 Karl Tammar; NYISO; #2 Bruce Balmat; PJM; #2 Carl Monroe; SPP ; #2 Anita Lee; AESO; #2 Greg Campoli; NYISO; #2 James Castle; NYISO ;#2 John Ravalli; NYISO; #2 Karl Tammar; NYISO; #2 Robert Waldele; NYISO; #2 Michael Calimano; NYISO; #2	The wording should be clarified to only include those facilities that are subject to IROLs.
<b>This requirement seems to be adequately addressed by the Coordinate Operations Standard, and has been dropped from this standard. Requirement 201 The Coordinate Operations Standard requires RAs to have a process, procedure or plan to address situations that require coordination of actions involving more than one RA.</b>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**7. Identify ‘current’ value of IROLs as replacement for ‘list’ of IROLs**

Several balloters asked that the SDT to change this requirement to better reflect that IROLs can be dynamic. The SDT modified the requirement so that instead of requiring a ‘list’ of IROLs, the RA must be able to identify the ‘current value’ of its IROLs. Do you agree with this change?

**Consideration of Comments:** While most industry commenters agreed with this change, this requirement has been transferred to the Determine Facility Ratings (DFR) Standard. As shown below, the DFR Standard achieves the same objective by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is then required to provide the limits according to the schedule.

(Determine Facility Ratings Standard 604, Requirement 4) The Reliability Authority, Planning Authority and Transmission Planner shall each provide its System Operating Limits (and Interconnection Reliability Operating Limits) to those entities that have a reliability-related need for those limits and provide a written request that includes a schedule for delivery of those limits as follows:

‘Yes’ Responses	
Gerald Rheault; Manitoba Hydro; #1,3,5,6	<p>It is not clear how section 201 coordinates with Standard 600 (Determining limits) The requirement that IROLs should be current(reflect current system conditions, i.e. topology, loading, generation, etc.) is not mentioned under Requirements, it is only stated in item 3 of the measures.</p> <p>The difference between Measures (2) and (3) is not clear; they seem to be saying the same thing.</p> <p>The written structure of 201 might be improved by having a one-to-one correspondence between Requirements and measures. Measure (1)(i) does not recognize that changes in topography in an adjacent RA area may impact the current IROL values.</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p>	
James Murphy; BPAT;#1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	<p>It should be made clearer that the IROL facilities can be dynamic also. Some read this as only dynamic IROL values. Implementation plan will also need to change to reflect this update.</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Peter Burke; ATC; #1</p>	<p>Although the yes box has been check it does not mean that we support all of the revised changes. The question says the SDT modified the requirement “so that instead of requiring a ‘list’ of IROL’s,...” but, in the measures, you require a list so a list is required. Our concern is not mainly of the list but the idea of how often the list needs to be updated. Since an IROL is a subset of SOL’s, would it not be more efficient if the RA could identify those SOL’s that are IROLs and show that they are monitoring them?</p> <p>Measures #3</p> <p>How does the SDT think that this measure can be demonstrated? In our opinion this may only be able to be demonstrated in front of the Compliance Monitor personally.</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p>	
<p>Patti Metro; FRCC; #2 Linda Campbell ;FRCC ;#2 Steve Wallace; Seminole Electric Coop ;#4 Amy Long; Lakeland Electric; #1 Richard Gilbert; Lakeland Electric; #3 Ron Donahey; Tampa Electric Company; #3 Beth Young; Tampa Electric Company ;#3 Roger Hunnicutt ; Gainesville Reg Utl; #5 Roger Westphal ;City of Gainesville; #3 Greg Woessner ;Kissimmee Utility Auth;#3 Ben Sharma ;Kissimmee Utility Auth;#3 Garry Baker; JEA ;#1 Ed DeVarona; Florida Power &amp; Light Co. ;#1 Preston Pierce; Progress Energy Florida ;#1 Bob Remley; Clay Electric Cooperative; #4 Joe Krupar; FMPA; #3 Paul Elwing; Lakeland Electric; #5 Joe Roos; Ocala Electric Utility ;#3</p>	<p>It appears that this change is reflected in Measure (2) and Noncompliance level (4)(i). There should be a similar change made to the requirements section of 201.</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p>	
<p>Khaqan Khan; IMO; #2</p>	<p>While the standard considers the requirements that IROLS can be dynamic, it also needs to provide guidance to operators to identify IROLS as they occur. Also refer to comments given in question 13.</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>developer of those limits is required to provide the limits according to the schedule.</p>	
<p>Alan Gale; City of Tallahassee; #5 Rusty Foster; City of Tallahassee; #3</p>	<p>There is no verbiage in the Requirements section to indicate this change, similar to the changes made in Measure (2) and Non-Compliance level 4(i).</p>
<p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>There is reference in this section indicating “which facilities are subject to,” “shall have a list,” “evidence that the list was updated,” etc.</p> <p>It is ISO-NE’s position that Standard 200 should clearly reflect the fact that IROL’s can be dynamic in nature. While it may be possible that every possible configuration can be identified in advance to deal with this dynamic, the reality is that this list would be extremely large and difficult to maintain. To improve on the situation, this section should require that the RA operators have a base set of limits that include N-1 configurations, along with identifying the following:</p> <p>The boundary conditions for which the published limits are applicable;</p> <p>The critical contingency that drive the applicable limit; and</p> <p>An understanding of what the associated limit is designed to protect the system against (i.e. transient stability, voltage decline, etc.)</p> <p>The System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.</p>
<p>The standard doesn’t dictate how many IROLs any RA may have. The industry has agreed that RAs need to identify facilities subject to IROLs, in advance, so that system operators have the situational awareness needed to be responsive to system changes most likely to affect those facilities.</p> <p>The standard does not place a limit on how many or how few IROLs there may be in a Region – but no matter how many IROLS there are, they all need to be identified and monitored. This standard does require that the IROLS be identified so they can be used by system operators, but the standard does not require that the IROLS be identified on a ‘list’.</p> <p>This requirement has been transferred to the DFR Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule. Note that the DFR Standard does indicate that the methodology for developing SOLs (and for identifying the subset of SOLs that are also IROLS) include identification of the three elements you’ve indicated – boundary conditions critical contingency, and purpose.</p>	
<p>Greg Campoli; NYISO; #2 James Castle; NYISO ;#2</p>	<p>While the standard considers the requirements that IROLS can be dynamic, it also needs to provide guidance to operators to identify IROLS as they</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>John Ravalli; NYISO; #2          Karl Tammar; NYISO; #2          Robert Waldele; NYISO; #2          Michael Calimano; NYISO; #2</p>	<p>occur. In addition, the System Operators must have the tools, training and information to deal with unforeseen circumstances and make the proper decisions to secure the system in an expeditious and orderly manner following a contingency or other event.</p>
<p>This requirement has been transferred to the Determine Facility Ratings Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p> <p>As documented in the recent NERC Operating Committee Operating Limit Definition Task Force Survey, there are many different systems employed for identifying IROLS. The Determine Facility Ratings Standard does not require all RAs to follow the same SOL (and IROL) development process – but does require that each SOL development methodology meet a minimum set of criteria; therefore the standard will not provide guidance to operators on identifying IROLS as they occur. This is considered company-specific training.</p> <p>The scopes of the SAR associated with this standard (and the Determine Facility Ratings Standard) do not address tools or training. Having plans in place to address emergencies is expected to be addressed in other standards. This standard is focused on operating within IROLS – and does require that there be plans in place to both prevent and mitigate instances of exceeding IROLS – these plans are intended to provide system operators with the information needed to make appropriate responses to IROL-related scenarios.</p>

<b>'No' Responses</b>	
Ed Davis; Entergy Services; #1	There have been several changes to the Requirements and Measures of 201 and we are unsure to which change this question refers. Therefore, we can not agree with the change at this time.
It would have been helpful if you could have provided guidance on whether the requirement and its measures, as changed, is acceptable.	
<b>Other Comments:</b>	
John Blazekovich; Exelon; 1,2,5,6	Although we agree with the need to monitor the condition of the bulk power electric system, and can reasonably expect that IROL type scenarios and conditions can be studied in the "planning mode", we have concerns that this Standard may be impossible to comply with on a "real time basis". It appears that compliance with this standard will require executing literally hundreds, perhaps thousands of scenarios, it is unlikely one can identify IROLs ahead of time. Especially since each day presents a different system, both from generation pattern perspective and

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

	from transmission topology perspective.
<p>The definition of IROL was changed to conform to the definition provided in the recently approved Compliance Templates, updated to use the same language as the Functional Model.</p> <p>This requirement has been transferred to the Determine Facility Ratings Standard. In that standard, the same objective is achieved by requiring that end-users provide a schedule for delivery of the limits it needs. The developer of those limits is required to provide the limits according to the schedule.</p> <p>If the RA can't update IROLs to reflect real-time conditions, then the RA needs to have conservative operating limits that already include certain system outages or reconfigurations. Note that the Determine Facility Ratings standard includes a set of criteria that must be addressed in establishing SOLs and in identifying the subset of SOLs that are also IROLs. This should help minimize the number of scenarios that must be addressed in establishing operating limits.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**8. Do you agree with the compliance monitoring process?**

**Summary Consideration:** While most industry commenters agreed with the revised compliance monitoring process, the associated requirement has been absorbed into the Determine Facility Ratings Standard, and this question is no longer relevant. The SDT did not attempt to answer the responses to this question.

Yes Responses	
Alan Gale; City of Tallahassee; #5 Rusty Foster; City of Tallahassee; #3	There should be some consistency across all the standards for time frames of “requested data”. Without it, the Compliance Monitor can not receive the necessary data for a month and the reporting entity can still be compliant.
Gerald Rheault; Manitoba Hydro; #1,3,5,6	The requirements in item 3 of this section should be expanded to include evidence of agreed procedures to identify IROLs for facilities shared by RAs and to ensure that IROLs reflect current system conditions.
Greg Campoli; NYISO; #2 James Castle; NYISO; #2 John Ravalli; NYISO; #2 Karl Tammar; NYISO; #2 Robert Waldele; NYISO; #2 Michael Calimano; NYISO; #2	The requirements need to be clear as to what exactly is needed. Mark Fidrych; WAPA; #1	The analyses and assess. require once/dy. In some circumstances, where system conditions do not change and the IROL has ample operating room, the requirements do not acknowledge that mode explicitly.
Jalal Babik; Dominion VA Power; #1 Craig Crider; Dominion VA Power; #1 Jack Kerr; Dominion VA Power; #1 Bill Thompson; Dominion VA Power; #1	I agree with the levels for actual operating events, but don't agree with the concept that a newfound definition of an IROL would result in a level 4 under "IROL Identification." In fact, for first time offenses under the heading of "IROL Identification," there should be no monetary fines. My concern is based on disagreement with the definition proposed here.  I also disagree with the levels and associated fines under "Analyses and Assessments" since it implies that for one miss of a successful state estimator/contingency analysis run there could be a fine. I want NERC to issue minimum standards for the real-time analysis function that should specify a mean time between failures or to define a maximum allowable downtime for the operation. This is discussed in the US/Canada Task Force Recommendations under number 22. Requiring a

**10. Agreement on Facilities subject to IROLs**

Several balloters indicated a concern over coordination of IROLs between RAs. Do you think the standard should include a requirement that the RA obtain agreement from its adjacent RAs on which Facilities in the combined RA Areas are subject to IROLs?

**Summary Consideration:** While most industry commenters agreed that this is necessary, some commenters indicated this should be addressed by the Coordinate Operations Standard.

The Coordinate Operations Standard does require RAs to have a process, procedure or plan for activities that require coordination of actions involving more than one RA and this should include agreeing on which Facilities in the combined RA Areas are subject to IROLs.

(Coordinate Operations Standard 101, Requirement 1) The Reliability Authority shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Authorities to support interconnection reliability. These Operating Procedures, Processes or Plans shall address Scenarios that affect other Reliability Authority Areas as well as those developed in coordination with other Reliability Authorities.

Several commenters also suggested that this standard should include the language in Policy 9 which states that if two RAs (RCs in current Policy) can't agree on a limit, they should both operate to the most limiting parameter. This change is within the scope of the SAR and has been included in the revised standard.

Yes Responses	
Ed Riley; CA-ISO; #2	We feel that using a common number for a limit at a boundary or "joint facility" is basic to the reliability of the system. Having a path operated to two different numbers leads to one side potentially scheduling more than the other side can accommodate and can result in "real-time" disagreements and curtailments that should have been handled in the day-ahead scheduling process.
The requirement to coordinate the setting of limits at a boundary is covered in the first requirement of the Coordinate Operations Standard, and was removed from this standard.	
Ralph Rufrano; NYPA; #1 David Kiguel; Hydro One Networks Inc.; #1 Roger Champagne; H-Q TransÉnergie; #1 Greg Campoli; New York ISO (NYISO); #2 Peter Lebro; National Grid; #1 Kathleen Goodman; ISO-NE; #2 Dan Stosick; ISO-NE; #2 Al Adamson; NYSRC; #2 Khagan Khan; The IMO Ontario; #2 Brian Hogue; NPCC; #2 Guy Zito; NPCC; #2	There should be a mutual agreement on the process of coordination among RAs. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit of the different calculation results. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impacted facilities. Such requirements can be included in standard 600.

<p>Agreed. Several commenters made the same suggestion, and this requirement was removed from this standard.</p>	
<p>Gerald Rheault; Manitoba Hydro; #1,3,5,6</p>	<p>There should be a requirement that the RA obtain agreement from its adjacent RAs on which facilities in the combined RA Areas are subject to IROLs, however the Standard to address this requirement should be Standard 100 "Coordinate Operations" and not this Standard.</p>
<p>Agreed. Several commenters made the same suggestion, and this requirement was removed from this standard.</p>	
<p>Peter Burke; ATC; #1</p>	<p>We are not convinced that a formal agreement has to be in place for adjacent RAs to determine if a facility should be subject to an IROL but there should be a mutually agreed upon process / procedure to identify and honor those facilities identified.</p>
<p>Agreed. Several commenters indicated that this requirement is already covered in the Coordinate Operations Standard's first requirement, which requires RAs to have a process, procedure or plan to address situations involving more than one RA. Under the Coordinate Operations Standard, the procedure, process or plan does not need to be a formal agreement.</p>	
<p>Marc Butts; Southern Company Svcs; #1 Raymond Vice; Southern Company Svcs; #1 Dan Baisden; Southern Company Svcs; #1 Jim Griffith; Southern Company Svcs; #1 Phil Winston; Georgia Power Company; #3 Jim Viikinsalo; Southern Company Svcs; #1 Mike Miller; Southern Company Svcs; #1 Monroe Landrum; Southern Company Svcs; #1 Gwen Frazier; Southern Company Svcs; #1 Steve Williamson; Southern Company Svcs; #1 Rod Hardiman; Southern Company Svcs; #1 Jonathan Glidewell; Southern Company Svcs; 1 Dan Richards; Southern Company Svcs; #1 Mike Hardy; Southern Company Svcs; #1 David Majors; Georgia Power Company; #3 Roman Carter; SCGEM; #5, 6</p>	<p>The Standard already states that RAs that share a facility, having an IROL, will agree to a 'process' for determining if it qualifies and what the value should be. Being more prescriptive doesn't add anything here.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Joel Dison; SCGEM; #5, 6          Tony Reed; SCGEM; #5, 6          Lloyd Barnes; SCGEM; #5, 6          Clifford Shepard; SCGEM; #5, 6          Lucius Burris; SCGEM; #5, 6          Roger Green; SCGEM; #5, 6</p>	
<p>The commenters who supported this addition wanted there to be something formal in place so that the RA could review the IROLs of its adjacent RAs – the intent was to ensure that there was peer review to help prevent one RA from developing its IROLs in a manner that would adversely impact its adjacent RAs.</p>	
<p>Al Corbet; TVA          Jerry Landers; TVA          Jennifer Weber; TVA          Edd Forsythe; TVA          Larry Goins; TVA          Mark Creech; TVA          Kathy Davis; TVA</p>	<p>RAs should coordinate and reach agreements for IROLs on joint Facilities. RAs should communicate IROLs that could impact neighboring RAs.</p>
<p>Agreed. However, both of these actions are addressed in the Coordinate Operations Standard. Standard 101 requires the RA to have a process, procedure or plan to address situations involving more than one RA – and Standard 102 requires the RA to notify other RAs of situations in its RA Area that may impact other RA Areas.</p>	
<p>Michael Zahorik; ATC; #1</p>	<p>Each RA should agree with the calling RA on the IRL.</p>
<p>If two RAs can't agree on an IROL, the standard now requires that the RAs operate to the most conservative limit.</p>	
<p>Raj Rana; AEP; 1,3,5,6</p>	<p>I suggest this standard adopt the concept included in the newly revised Policy 9, which requires the RCs to respect each others limits and operate to the most conservative position when disagreements arise.</p>
<p>This concept has been adopted and is reflected in the revised standard.</p>	
<p>William Pope; Gulf Power Co; #3</p>	
<p><b>Other Responses</b></p>	
<p>Lawrence Hochberg; NYSRC; #2</p>	<p>There should be a mutual agreement on the process of coordination among RAs. The process could be that both Areas calculate a separate limit for common facilities based upon the internal transmission configuration. However, the Areas agree that they will operate to the more conservative limit of the different calculation results. Furthermore, it is expected that a need for appropriate analysis/studies shall be outlined that could identify such common impacted facilities. Such requirements can be included in Standard 600.</p>
<p>The Determine Facility Ratings Standard does require the RA to share its SOL development methodology and the process used to identify the subset of IROLs with other RAs, and does require that RAs be responsive to comments received on the methodology used to develop IROLs. **11. Public posting of IROLs**

Several balloters requested that the SDT change the standard to include a requirement that RAs publicly post their IROLs. The SDT could not identify a reliability-related reason to support this. Do you want the standard to require public posting of IROLs?

**Summary Consideration:** Most industry commenters did not support the public posting of IROLs, so this change was not incorporated into the revised standard.

Yes Responses

All RAs should be aware of all IROLs but this information may not be appropriate for the "general public". There is a concern over infrastructure security and some concern voiced by a CIPC member.</p>
<p>The term, 'made public' was suggested by several commenters, not by the SDT – and the SDT did not define this term. The SDT assumed that the commenters were suggesting that the limits be posted through OASIS or a similar tool. Most commenters were opposed to this addition and indicated that posting would not serve a reliability-related purpose.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**12. Other comments about Requirement 201:**

**Summary Consideration:** Requirement 201 has been removed from this standard and absorbed into the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard.

Ken Githens; Allegheny Energy; #5	To determine every scenario that would lead to an IROL's ahead of time is a problem.
This requirement has been absorbed into the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard). The DFR Standard includes specific criteria for establishing SOLs and identifying the subset of SOLs that are also IROLs. This should minimize the number of scenarios that must be considered in determining whether an SOL is also an IROL.	
James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	201(d) & (e) (3) (ii) need to be changed to correspond more with (b) (1) (i). Which includes adding "to reflect changes in its Reliability Authority Area's system topology.
This requirement has been absorbed into the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard). The DFR Standard requires that SOLs (and identification of which SOLs are also IROLs) be developed according to a methodology that meets specific criteria – and one of the criteria is that the limits reflect changes to system topology.	
Gerald Rheault; Manitoba Hydro; #1,3,5,6	<p>1. There needs to be a reference in 201 that the determination of IROLs should be consistent with Standard 600. In Standard 600 it should be explicitly required for the RA to demonstrate it has the tools, procedures and trained staff to do the required studies.</p> <p>The link between an Interconnection Reliability Operating Limit and the limits defined in standard 600 is tenuous – especially as the term "system operating limits" is not capitalized nor is there a reference to standard 600 in the definitions. Without that link, an IROL could be seen as a limit even in steady state (there is no contingency clearly associated with the definition – the consideration of contingencies is buried in standard 603). Presumably the link is believed to be made by calling IROLs a subset of SOL's. While Manitoba Hydro still believes that such limits are not a subset of SOL's but, rather, new limits based on similar studies, but with different criteria for acceptable performance (i.e., limits may be exceeded but cascading, instability and uncontrolled separation are BARELY avoided) there is value in discussing the IROL concept as put forward by the OWL team.</p> <p>2. In standard 600, SOL's are established through consideration of all next single contingencies and for some regions, all multiple contingencies and for others, a set of credible multiple contingencies. Universally, a SOL must be established to avoid cascading, instability and uncontrolled separation. The question for the OWL group to consider is – how</p>

Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard

	<p>does standard 200 deal with the fact that in thermally-limited systems the margin between the SOL and cascading, etc., may be very large, while in stability-limited systems, there will still be some reliability margin, likely not a large one, between the SOL and the onset of cascading, etc. Thus the risk of a problem if an SOL is violated is a function of the nature of the limit itself- the risk associated with stability limits is likely higher than for thermal limits.</p> <p>3. Of the list of nasty events, the risk of instability and uncontrolled separation will be fairly evident from stability studies but the risk of cascading is dependent on thermal ratings, thermal overload and operator action to some extent. Since the SOL definition allows for system readjustments, while requiring limits not be exceeded, the risk of cascading increases if the required adjustments are not undertaken – and these may not be automatic actions. Note that the Standard 600 assumes that qualified ratings will be provided for all facilities (i.e., the rating value will have an associated time period – perhaps 15 minute, 2 hour, etc.) so that facilities ratings are assumed to be respected – there could be an exception in the case of credible multiple contingencies, where a region may tolerate some facility violation if it can be managed expeditiously and not lead to cascading – MAPP presently does this although the ratings being exceeded in the checking process are likely the long term values, not the short term values).</p> <p>Since the Q&amp;A document talks about increased RISK of cascading, rather than occurrence of cascading, the OWL team needs to clarify this potential source of confusion – there will almost always be increased risk of a problem as loadings increase or are left unchanged – but that opens the door to IROL evaluation having to consider the impacts of failures of the operator, etc. As such, any limit in the system could be considered an IROL, since, for some combination of contingencies, the unacceptable consequences could be seen. In fact, you could even consider the definition of an IROL as a steady state limit.</p> <p>4. If the OWL team is adamant that IROLs are a subset of SOL's then the rest of Standard 200 should be reviewed to ensure that risks are properly considered in the measurements and compliance process – right now some entities might be penalized for low risk events.</p> <p>One way to manage the discrepancy would be for</p>
--	---

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>IROLs to be established at a known margin from the nasty three events – so the IROL for a thermally-limited system might be significantly higher than the corresponding SOL.</p> <p>5. Until there is more clarity on the definition of an IROL, the implementation plan is suspect when it addresses the current state – there is a good chance IROLs are not being identified and calculated now, as expected by the standard.</p> <p>6. Manitoba Hydro is greatly concerned relative to the statement in the Q&amp;A document regarding special protection schemes since the response to the question indicates that the special protection system should basically be ignored.</p> <p>The reality in MAPP is that such systems are put in place with a high degree of reliability and with the expectation that they will not fail. If Manitoba Hydro had to live with the situation as outlined in the response, we would be in violation every time we export more than, perhaps 500 MW rather than the 2000 MW we can export presently. Is that really what the response was meant to say; or is the response really saying that you should know what the limits are if the special protection is out of service and respect those limits?</p>
<p>1. This requirement has been absorbed into the Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard (DFR Standard). The DFR Standard requires that SOLs (and identification of which SOLs are also IROLs) be developed according to a methodology that meets specific criteria.</p> <p>2. The SDT recognizes that there are different types of IROLs, and that some systems may be more thermally-rated than others. The intent is not to 'equalize' all IROLs across systems, but to ensure that no system operates such that exceeding a limit could cause cascading outages, etc. Each RA has flexibility in setting <math>T_v</math> to an appropriate value for the associated limit. In some Regions, some IORLs have a 20 minute <math>T_v</math>, while other IORLs have a <math>T_v</math> of 30 minutes. This variation in time recognizes that stability-related limits may need a response time that is different from thermally-related limits.</p> <p>3. Each RA and Planning Authority is allowed to design its own SOL development methodology. The individual methodologies are expected to be appropriate for the associated systems. An RA that is responsible for a system that is stability-limited may require additional studies beyond those that are required in the methodology used for a thermally-limited system. There is nothing in Standard 600 to preclude this – Standard 600 was designed to allow this flexibility in SOL development methodologies. All methodologies must, however, result in limits that meet the specified criteria.</p> <p>4. The SDT revised the standard to remove the phrase, "loss of 300 MW ... for 15 minutes." With this change, the measures do not seem to be inappropriate.</p> <p>5. Reliability Coordinators have been field-testing the reporting of IRL violations for several months. Most recently, the OLDTF conducted a survey to determine how each RC is developing its IORLs, and it was clear from the responses that there is no standard methodology, but that each RC does have a methodology for identifying its IORLs.</p> <p>6. This standard neither requires nor precludes the use of an SPS to resolve an IROL within <math>T_v</math>. The reference was intended to say that the system operator needs to know that if the SPS doesn't work, the IROL will be exceeded and the system operator needs to be prepared to take action or to direct others to act without delay.</p>	

**Questions about Requirement 202 — Monitoring**

**13. Provide system operators with additional data on each IROL**

Several balloters recommended the following addition to this requirement. Do you agree with this addition?

- (i) The RA shall provide the following information to its system operators:
  - (a) The system conditions under which the Interconnection Reliability Operating Limit applies,
  - (b) The contingency that is the basis for the limit,
  - (c) The impact of exceeding the limit

**Summary Consideration:** Most industry commenters agreed with this addition. Some commenters questioned the feasibility of providing this information to system operators in 'real-time'. With the transfer of the requirement to identify and communicate IROLs to the Determine Facility Ratings (DFR) Standard, the OWL Standard does not include the above language. The DFR Standard did absorb the requirement to provide supporting information for each IROL – however the DFR Standard does not specifically state that IROLs must be updated in 'real-time'. The DFR Standard requires that entities needing IROLs make a request that includes a schedule for delivery – and requires the RA to deliver the limits according to that schedule.

Standard 604 – Requirement 4 (i) The Reliability Authority shall provide its System Operating Limits (including the subset of System Operating Limits that are Interconnection Reliability Operating Limits) to adjacent Reliability Authorities and Reliability Authorities who indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Service Providers and Planning Authorities within its Reliability Authority Area. For each Interconnection Reliability Operating Limit, the Reliability Authority shall provide the following supporting information:

- A) Identification and status of the associated Facility (or group of Facilities) that is (are) critical to the derivation of the Interconnection Reliability Operating Limit.
- B) The value of the Interconnected Reliability Operating Limit and its associated  $T_v$ .
- C) The associated contingency(ies).
- D) The type of limitation represented by the Interconnection Reliability Operating Limit (e.g., voltage collapse, angular stability).

<b>'Yes' Responses</b>	
Ken Githens; Allegheny Energy; #5	However, under Requirements 203 or 204 would be a better place to include the addition.
<b>This requirement to provide this information with each IROL has been transferred to the DFR Standard.</b>	
Gerald Rheault; Manitoba Hydro; #1,3,5,6	The wording of (a) could be improved. Suggest: "The system conditions under which exceeding the Interconnection Reliability Operating Limit could lead to instability, uncontrolled separation or cascading outages." As is, the wording of (a) could be interpreted to mean that it is ok to exceed the IROL under other system conditions. Suggest also that stating these items be required in the determination of all System Operating Limits (applicable to Standard 600).

The data does not need to be provided as part of a paper document – this may be provided electronically.	
James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	We agree if (c ) is omitted. We believe it would be unrealistic to give the system operators the impact of exceeding the limit for every scenario.
This requirement was transferred to the DFR Standard. Additional language was added to clarify (c ).	
<b>Other Comments</b>	
Peter Burke; ATC; #1	We have not indicated a yes or no because the question is confusing. This addition does not appear in the 202 standard that this comment form accompanies. If you are asking if this should be

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

	<p>added but has not been currently added to the standard, then ATC's opinion is that this should appear in the standard. The only suggestion is that item "(c)" is not needed. The idea behind moving an SOL into the IROL category is that it has a high potential to cause an adverse impact to the Interconnection.</p>
<p>The SDT wasn't sure if the industry would support this addition, so it was not added to the version of the standard that was posted for comment.</p> <p>In category (c), the entities that currently provide this information to their system operators indicate whether exceeding the IROL will lead to transient stability, voltage decline, etc. The entities currently providing this information to their system operators feel that this information helps the system operator make appropriate decisions.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**Questions about Requirement 204 — Actions**

**14. Indicate that directive is related to an IROL**

Several balloters commented about the level of documentation required in this standard. The SDT noted that without additional clarification, the entity that receives an RA's directive may not realize that the directive is related to an IROL. To improve the 'situational awareness' of directives related to IROLs, the SDT added this requirement. Do you agree with the addition of this requirement?

Each directive issued relative to an IROL shall include a statement to inform the recipient that the directive is related to an IROL

**Summary Consideration:** Most industry commenters agreed with this addition. Those commenters who disagreed felt that this addition might be interpreted as implying that some RA directives are more important and should be followed more closely than other RA directives. This was not the intent of this requirement.

Yes Responses

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**15. Measuring duration of an IROL event**

Some balloters suggested that the SDT modify the criteria for determining the duration of an IROL event. The language currently in the standard is shown below. One balloter suggested that the '30 seconds' be modified to '1 minute' – another balloter suggested that a longer duration should be required and suggested 10 minutes. The 30 seconds was intended to represent the maximum duration associated with a 'bad telemetry scan.'

The duration of the event shall be measured from the point when the limit is exceeded to the point when the system has returned to a state that is within the Interconnection Reliability Operating Limit for a minimum of 30 seconds.

**Summary Consideration:** There was no consensus in response to this question. Some commenters responded to this question by indicating the maximum duration of a telemetry error – others responded to the question by indicating how long before the RA's system were considered to be 'stable'. While there was no consensus, more commenters selected 30 seconds than any other timeframe, so the SDT did not change this in the standard. There were commenters who indicated the duration should have a 'deadband' at the beginning as well as at the end of the duration, and the standard was modified to reflect this suggestion.

Keep minimum of 30 seconds	
Marc Butts; Southern Company Svcs; #1 Raymond Vice; Southern Company Svcs; #1 Dan Baisden; Southern Company Svcs; #1 Jim Griffith; Southern Company Svcs; #1 Phil Winston; Georgia Power Company; #3 Jim Viikinsalo; Southern Company Svcs; #1 Mike Miller; Southern Company Svcs; #1 Monroe Landrum; Southern Company Svcs; #1 Gwen Frazier; Southern Company Svcs; #1 Steve Williamson; Southern Company Svcs; #1 Rod Hardiman; Southern Company Svcs; #1 Jonathan Glidewell; Southern Company Svcs; 1 Dan Richards; Southern Company Svcs; #1 Mike Hardy; Southern Company Svcs; #1 David Majors; Georgia Power Company; #3	One additional thought is to employ a deadband on both ends of the IROL violation (so that a value must be outside IROL for thirty seconds before it becomes and IROL violation). This would help avoid metering system errors triggering either the beginning or ending of an IROL.
The SDT adopted this concept and it is reflected in the revised standard.

<p>Most commenters indicated a preference for 30 seconds, so this is what was used in the standard. The duration of the event would be measured as you've indicated, except that it would end at the point in time when the value reached the limit – there isn't a requirement to drop below the limit.</p>	
<p>Khaqan Khan; IMO; #2</p>	<p>While the 30 seconds duration may be too short, and 10 minutes be too long, a duration of 2 minutes may be more appropriate.</p>
<p>Most commenters indicated a preference for 30 seconds, so this is what was used in the standard.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>Should be reset immediately when the Limit is cleared and sustained. Should be cleared based on last good telemetry value.</p>
<p>Most commenters indicated a preference for 30 seconds, so this is what was used in the standard. The duration of the event would be measured as you've indicated.</p>	
<p>Alan Gale; City of Tallahassee; #5 Rusty Foster; City of Tallahassee; #3</p>	<p>Changes here may require looking at the sanctions table and the definition of Tv. Two minutes will ensure the IROL is truly mitigated and not the result of telemetry or integration errors. 5 or 10 minutes may result in exceeding Tv time limits when the IROL has been mitigated.</p>
<p>Most commenters indicated a preference for 30 seconds, so this is what was used in the standard.</p>	
<p>Michael Zahorik; ATC; #1</p>	<p>Time of an event is not important until the violation of over 30 minutes has occurred. An IRL should be addressed ASAP, the solution should also be ASAP, with penalties after the 30 minutes.</p>
<p>Most commenters indicated a preference for 30 seconds, so this is what was used in the standard. The penalties are for exceeding the IROL for time greater than Tv, and some IROLs are expected to have a Tv that is smaller than 30 minutes. WECC, for example has some IORLs that have a Tv of 20 minutes.</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**16. Sanctions for exceeding an IROL for time greater than T<sub>v</sub>**

Several balloters requested that the sanction for exceeding an IROL for time greater than the IROL's T<sub>v</sub> be modified so that the sanction is proportional to both the magnitude and the duration of the event. The SDT modified the sanction so that it would be the greater of the fixed dollar sanction listed in the matrix, or the dollar amount that corresponds to the magnitude and duration of the event as highlighted in the following table.

Do you agree with this table?

**Summary Consideration:** Most industry commenters are opposed to this sanctions table. Some of the commenters that opposed this table indicated that the last row of the table doesn't include a sanction for a maximum value greater than 30% and suggested the last stage should be set at equal to or greater than 25% and this change was implemented. Most of the commenters who oppose the table are opposed to all financial sanctions, and removing the sanctions is outside the scope of the SDT.

<b>'Yes' Responses</b>	
Gerald Rheault; Manitoba Hydro; #1,3,5,6	Manitoba Hydro agrees with the sanctions listed in the table below; however we believe the multiplications factors should continue to increase for event durations beyond 15 minutes. For example, the sanction for an event duration of one hour should be more severe than for an event duration of 15 minutes and so on.
Agreed. There were several commenters who made the same suggestion, and this has been adopted in the revised standard.	
John Horakh; MAAC; #2	The table can be simplified by making four columns for the four "event duration exceeds its T <sub>v</sub> " segments, instead of repeating them six times. The table will then form a six by four grid with the multiplication factors filling the grid.
This will be a simplification and we will adopt your suggestion.

<b>'No' Responses</b>	
Ken Githens; Allegheny Energy; #5	Remove ≤ 30% from the last block.
Agreed. The table has been revised to reflect your suggestion.	
Raj Rana; AEP; 1,3,5,6	There are no sanctions listed for a Maximum Value over 30%. The last stage should be set at equal to or greater than 25%.  The validity of the table is directly related to the definition of IROL. If an IROL is truly a significant interconnection event, similar in consequence to the August 14 event, then it doesn't matter if the IROL is violated for 30 minutes or 30 seconds, it was violated and it resulted in a blackout. If defined properly, a major portion of the interconnection would be jeopardized when an IROL is violated. If IROL were defined properly, the table would not be needed, as even exceeding the limit for a few minutes would be considered placing the interconnection at extreme risk and thus subject to maximum penalty. Therefore a graduated table may be inappropriate. On the other hand, if IROL is defined as only 300 MW of load loss, then a graduated table may be more fitting.
Agreed. The table has been revised to reflect your suggestion. The definition of an IROL has been revised. If an IROL would result in a cascading outage if left unintended for 30 seconds, then the IROL should not have a Tv of 30 minutes – there should be some special protection system installed to prevent exceeding the IROL and the IROL should have a Tv that is

<p>Al Corbet; TVA Jerry Landers; TVA</p>	<p>“Duration” is ok, but magnitude (maximum value ) should be taken out</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Jennifer Weber; TVA Edd Forsythe; TVA Larry Goins; TVA Mark Creech; TVA Kathy Davis; TVA</p>	
<p>During the last posting of this standard, many commenters indicated that since IROLs have both a magnitude and a duration component, the sanction should be linked to the magnitude of exceeding both the magnitude and the duration of the IROL.</p>	
<p>Alan Gale; City of Tallahassee; #5 Rusty Foster; City of Tallahassee; #3</p>	<p>Although I agree with the need to increase the penalty to coincide with the magnitude of the violation, these proposed quantities could result in fines that would significantly impact utility operating budgets, customer rates, and even solvency. The starting point is not defined, but a \$1,000 fine that could go to a \$40,000 fine or a \$4,000 fine going to a \$160,000 is a big jump. The reason the IROL was exceeded needs to be addressed. Was it exceeded due to an "Act of God", an N-2 event, a willful violation of procedures, or the refusal to invest in necessary system repairs and upgrades? The difference should be addressed, possibly with a maximum fine.</p>
<p>Agreed. As shown on August 14, the impact of a cascading outage can be quite large. The intent of the sanctions is to motivate people to operate in a manner such that an IROL is not exceeded – and if there are circumstances that cause an IROL to be temporarily exceeded, then the RA should have plans in place to quickly mitigate the IROL before Tv is exceeded.</p>	
<p>Ed Davis; Entergy Services; #1</p>	<p>Entergy agrees with multipliers, but they should only be applied to repeat offenders. NERC should use multipliers if the same event occurs without remediation, or if different events pop up with the same systemic cause.</p>
<p>The multipliers are intended to reflect that allowing the RA's Area to be operated in a manner such that an IROL is exceeded by 20% of its value is more potentially impactful to the interconnection than operating in a manner such that an IROL is exceeded by 3% of its value.</p>	
<p>James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1</p>	<p>We would agree with the table if the sanctions were applied to the appropriate entity. It seems unfair if the sanctions are applied to the RA if TOP did not follow the RA directive fast enough or not at all. One suggestion would require the RA to issue directive within 5 minutes. Below are some possible scenarios where IROL has been violated past Tv. These may be an over simplification, but it may be a good place to start.</p> <p>Scenario 1: RA issues directive in 5 minutes, the TOP does not follow directive fast enough or not at all, TOP gets sanction.</p> <p>Scenario 2: RA issues directive in 5 minutes, the TOP does follow directive fast enough, but directive did not solve problem, RA gets sanction.</p> <p>Scenario 3: RA issues directive past 5 minutes, RA gets sanctions.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>It has also been suggested in BPAT's group that a one time and one time only pass on the sanctions for the first ever offense, or some kind of phase in of the sanctions. This would be to recognize that there maybe some growing pains in implementing this standard for the first time.</p>
<p>There is nothing to preclude the RA from having a formal agreement with its TOPs that allows the RA to pass on any sanction associated with non-compliance of its TOPs. However, these new standards are set up so that the sanctions are assessed to those who are responsible for meeting the requirement – and in this case, the RA is responsible for ensuring that its RA Area is operated so that no IROLs are exceeded. There is another requirement in this standard that sanctions the TOP (or other entities) who do not comply with the RA's directives.</p>	
<p>John Swanson; NPDD; 2  Darrick Moe; WAPA; 2  Lloyd Linke; WAPA; 2  Paul Koskela; MP; 2  Larry Larson; OTP; 2  Dick Pursley; GRE; 2  Martin Trencce; XCEL; 2  Todd Gosnell; OPPD; 2  Robert Coish; MH; 2  Joe Knight; MAPPCOR; 2  Tom Mielnik; MEC; 2  Dave Jacobson; MH; 2  Delyn Helm; GRE; 2  Jason Weiers; OTP; 2  Dennis Kimm; MEC; 2</p>	<p>There should be no dollar amounts in the sanctions.</p>
<p>The SDT does not have the authority to remove financial sanctions from the sanctions table.</p>	
<p>Lawrence Hochberg; NYSRC; #2</p>	<p>The NYSRC is opposed to monetary sanctions as the only option for dealing with noncompliance as applied in this and other proposed NERC Standards. Unfortunately, direct monetary sanctions invite “gaming the system”, and encourage “business” decisions based on potential profits or savings versus potential penalties. Instead of monetary sanctions, the NYSRC prefers that NERC have the authority to issue letters of increasing degrees of severity to communicate noncompliance of mandatory standards. The NYSRC and NPCC now rely on a more stringent and mandatory process than monetary sanctions to assure compliance with reliability standards. Compliance is now mandatory through the contractual agreements and tariffs that all participants need in order to conduct business. The use by the NYSRC and NPCC of letters to regulatory agencies and other oversight bodies for reporting noncompliance has demonstrated that letter sanctions are a more effective tool for ensuring adherence to standards. Such letters establish the</p>

	<p>basis for liability in the event of a subsequent criterion violation, and in the case of market participant noncompliance, threaten the violator’s ability to do business with or through an ISO or RTO. Moreover, letters that communicate noncompliance best allow focus on the “root cause” of a violation, as well as its reliability impact.</p> <p>Therefore, the NYSRC recommends that this and other NERC Standards expressly provide that letter sanctions be used in addition to or instead of monetary sanctions under circumstances in which they would be an equally or more effective enforcement mechanism.</p>
<p>The SDT does not have the authority to remove financial sanctions from the sanctions table.</p>

**Questions about Requirement 207 — Processes, Procedures or Plans for Preventing and Mitigating IROLs**

**17. Replace ‘action plan’ with ‘process, procedure or plan’**

Several balloters asked for more clarification on the term ‘action plan’ that was used in the last version of this standard. Several other drafting teams have used the terms, ‘processes, procedures or plans’ to clarify that the document required may be general in nature or very specific, as long as the document addresses the required topic. In response, the SDT changed the phrase, ‘action plan’ to ‘processes, procedures or plans’ throughout this requirement. Do you agree with this change?

**Summary Consideration:** All commenters but one were in favor of this addition.

Kathleen Goodman; ISO-NE; #2	Do not believe there should be a requirement for either. Operators should be appropriately trained and provided with strategies to take the correct actions necessary to operate a system reliably.  (Checked both Yes and No)
One of the best training tools is a well-planned document that outlines appropriate actions for various scenarios. Agreed that system operators should be trained and provided with strategies – and this standard requires that the strategies be documented as processes, procedures or plans.

***Other Questions about this Standard***

**18. Are you a member of the Ballot Pool (or do you represent a member of the Ballot Pool) for this standard?**

**Summary Consideration:**

The SDT asked questions 18-20 to determine if there was a reason to ballot this standard before issues related to the standards development process, but outside the scope of the SDT, were addressed. When this standard was balloted the first time, most of the reasons for not approving the standard were related to either the Functional Model, Field Testing or Financial Sanctions. The SDT cannot make changes to any of these items. The SDT does not want to ballot the standard and have it fail because of these issues which are outside the technical content of the standard. Many of the balloters who voted against the standard, have declined to answer these questions, so the SDT does not know if these balloters have changed their mind and will vote on the standard based on technical content rather than on an understanding of the Functional Model, Financial Sanctions, or Field Testing.

**19. Do you agree with the Technical Content**

If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), do you agree with the technical content of this standard? Note that the technical content of the standard consists solely of the individual Requirements and their associated Measures — the Compliance Monitoring Process, Levels of Non-compliance and Sanctions are not considered part of the 'technical content' of the standard.

Member & agree with Technical Content

<p>Gerald Rheault; Manitoba Hydro; #1,3,5,6</p>	<p>Manitoba Hydro has technical concerns relative to the concept of IROL as referenced in this Standard. These concerns have been provided to the SDT in previous postings of this Standard and are further elaborated upon in question 12 of this comment document. If the SDT can satisfactorily address these concerns, then Manitoba Hydro would support this Standard.</p>
<p>The SDT has tried to address your technical concerns.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>Example: 208 requires documentation of the RA's directives and the actions taken. Also, although the levels of non-compliance are not considered as "technical content," for the purpose of explaining the disagreement, we need to reference Level 1 non-compliance, which is directly related to the requirement. If the actions were taken and the directives were followed, why would an operator be found non-compliant for not documenting such actions and directives?</p>
<p>If the actions aren't documented, how will anyone know if the directives were followed? The documentation required, is simply the same documentation that is typically captured in most control room operating logs. The language in the standard allows the RA to choose any method of documentation – the intent isn't to require new systems be installed or implemented – the intent is to ensure that all involved recognize the seriousness of operating within IROLs – and there needs to be a method of ensuring that the work practices that support this behavior can be assessed.</p>

Khaqan Khan; IMO; #2	Checked both agree and disagree with technical content– member of Ballot Pool -

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**20. Vote based on technical content**

If you are a member of the Ballot Pool (or if you represent a member of the Ballot Pool), will you vote on this standard based on its content (requirements, measures, compliance monitoring process and levels of non-compliance), or will you withhold your approval based on factors related to the standards process?

This would include factors such as changes to the Functional Model, the removal of Financial Sanctions from the Compliance Enforcement Program, or the inclusion of Field Testing.

<b>Member &amp; will vote based on Content</b>	
Peter Burke; ATC; #1	ATCs approach is to review each standard on its own merits
James Murphy; BPAT; #1 Mike Viles; BPAT; #1 Richard Spence; BPAT; #1 Don Watkins; BPAT; #1 Don Gold; BPAT; #1 Marv Landauer; BPAT; #1	BPAT may or may not vote against this standard based on changes to the Functional Model and based on the structure of the Financial Sanctions. BPAT has not determined this yet.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

**21. Other Comments about this Standard**

<p>John Swanson; NPDD; 2  Darrick Moe; WAPA; 2  Lloyd Linke; WAPA; 2  Paul Koskela; MP; 2  Larry Larson; OTP; 2  Dick Pursley; GRE; 2  Martin Trence; XCEL; 2  Todd Gosnell; OPPD; 2  Robert Coish; MH; 2  Joe Knight; MAPP COR; 2  Tom Mielnik; MEC; 2  Dave Jacobson; MH; 2  Delyn Helm; GRE; 2  Jason Weiers; OTP; 2  Dennis Kimm; MEC; 2</p>	<p>We support the prerequisite approval provided on page 2 for the implementation plan of this Standard 200 in which Standard 600 Determine Facility Ratings, System Operating Limits and Transfer Capabilities Standard must be implemented before this standard can be implemented. However, we believe that another prerequisite approval is that the NERC SAC verify that this Standard 200 does not conflict with Standard 600. Otherwise, there will be problems in implementing the two standards. If the SAC determines there is a conflict, then the SAC should send one or both standards back to the drafting teams to be resolved.</p> <p>The dollar sanctions should be removed from all sections of this standard. The sanctions sections should be replaced with:</p> <p>(1) Sanctions for noncompliance shall be applied consistent with the NERC compliance and enforcement matrix, but no financial penalties shall be enforced. Noncompliance sanctions shall consist of letters, issued in accordance with the matrix.</p>
<p>The SAC does not get involved in a technical review of the standards. The SAC's function is to ensure that the standards process is being followed. It is up to the industry to comment on any disconnects between standards.</p>	
<p>The SDT does not have the authority to remove financial sanctions. The SDT has informed the SAC that there are many industry participants who are opposed to financial sanctions, and has asked the SAC to address this issue before this standard is balloted.</p>	
<p>Marc Butts; Southern Company Svcs; #1  Raymond Vice; Southern Company Svcs; #1  Dan Baisden; Southern Company Svcs; #1  Jim Griffith; Southern Company Svcs; #1  Phil Winston; Georgia Power Company; #3  Jim Viikinsalo; Southern Company Svcs; #1  Mike Miller; Southern Company Svcs; #1  Monroe Landrum; Southern Company Svcs; #1  Gwen Frazier; Southern Company Svcs; #1  Steve Williamson; Southern Company Svcs; #1  Rod Hardiman; Southern Company Svcs; #1  Jonathan Glidewell; Southern Company Svcs; 1  Dan Richards; Southern Company Svcs; #1  Mike Hardy; Southern Company Svcs; #1  David Majors; Georgia Power Company; #3</p>	<p>We would like to express our appreciation to the SDT for taking the time and trouble to revisit the comments on this standard. We realize the time it takes to participate on these teams and the dedication to it. While the last version of this standard was voted down this version is greatly improved and should pass the test. Thank you all for your efforts to listen to the industry and the people who operate the power systems on a daily basis and making this a workable product. We applaud you.</p>

<p><b>The SDT very much appreciates your support.</b></p>	
<p>Khaqan Khan; IMO; #2</p>	<p>1. The footnote on Std 201 states that each IROL is developed by following the requirements in “Determine Facility Ratings, SOL’s &amp; Transfer Capabilities” i.e. Std 600. Such requirements with respect to IROL are not mentioned in existing standard Std 600, and it is expected that upcoming revised standard shall include this requirement otherwise it is recommended to delete the keynote from this standard 200.</p> <p>2. The IMO supports the comments submitted by ISO/RTO Council- Standards Review Committee as well as the CP-9 Group.</p>
<p>The footnote on Requirement 201 was placed at the request of many industry commenters who wanted a specific reference to Standard 600 included in this standard. Since the requirement to identify IROLs was transferred to the Determine Facility Ratings Standard, the footnote is not in the revised standard. Please see the SDT’s consideration of the ISO/RTO Council Standards Review Committee and the SDT’s consideration of the comments submitted by the NPCC CP-9 Group.</p>	
<p>Peter Burke; ATC; #1</p>	<p>202 Monitoring</p> <p>1. The SDT switches between the terms “operations personnel” and “system operators.” It seems that both of these terms refer to the same people. If so, could the SDT choose a single term to refer to that group? If not, could the SDT explain the difference?</p> <p>2. Noncompliance</p> <p>(4) i. This seems to be identical to (ii). Could the SDT clarify the difference?</p> <p>(4) iii. How would this be reviewed? It seems that this is a subjective item, would the SDT please clarify?</p> <p>203 Analyses and Assessment</p> <p>3. This goes back to our earlier comments about the definition of a Real-Time Assessment. It seems what the SDT is attempting to do is perform two different studies in this one requirement.</p> <p>Compliance Monitoring Process</p> <p>(3) ii. The Operational Planning Analysis is a study of the next day using forecasted data, transmission outage data, and generation outage data and can</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>only attempt to see what may happen the next day. Given that statement, how can the RA be assured that it will exceed an IROL? Suggestion: change the “will exceed” to “may exceed.”</p> <p>(3) iv. Remove the statement “or is expected to exceed any IROLs.” The Real-Time assessment should be limited to real-time time frame and should be extended to review the time between Real-Time Assessments.</p> <p>Non Compliance</p> <p>(3) i. Is the “time” that an Operational Planning Analysis or Real-Time Assessment was conducted sufficient enough indication that Operational Planning Analysis or Real-Time Assessment was conducted?</p> <p>204 Actions</p> <p>(1) i. ATC is troubled by the term may be exceeded. How can an RA be required to perform action on a “may” situation? Suggestion would be to have the RA notify other RA along with members in the RA’s area that an IROL was not yet exceeded but the potential for an IROL to be exceeded was identified.</p> <p>We would point out that there is no noncompliance level for the above concern so therefore should this may not be appropriate as a NERC standard.</p>
--	---

**202 Monitoring**

1. The term, ‘Operations Personnel’ was originally intended to include a group of people who work in the area of system operations, but was not intended to be limited to system operators. System Operators are the on-shift personnel assigned to monitor and control the system. Other commenters also requested clarification of the use of these terms. The standard has been changed to use just the term, ‘system operators.’

4 (i) indicates that the system operators don’t have information to let them know what their IROLs are – 4(ii) indicates that the system operators don’t have the ability to look at real-time data and compare it to IROLs.

The data has to be accessible in real-time and that availability can be observed by the Compliance Monitor.

**203 Analyses and Assessment**

3.ii - The system operator is expected to notice if real-time assessments conducted every 30 minutes show that limits are being approached. The system operator is expected to interpret the real-time assessments in context of the day’s operations, and is expected to notice changes over time so actions can be taken to prevent exceeding any IROL. The standard doesn’t specify specific real-time assessment methodology – each RA has a unique system, and may be looking for different specifics based on its current conditions.

3.iv – The real-time assessment isn’t done in isolation, it is part of an overall process of conducting real-time assessments every 30 minutes. The results of these assessments should indicate to the RA when emerging conditions are such that an IROL is being approached – and the RA is expect to act before the IROL is exceeded. The existing language accurately represents what was intended by this requirement.

Noncompliance level 3i - The Compliance Monitoring process provides a list of questions that the Compliance Monitor will use to determine if the system operator has been interpreting the results of the analyses and assessments with respect to IROLs. The responses to those questions will show the Compliance Monitor whether an analysis or an assessment was conducted. If the system operator

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>conducted an assessment but doesn't remember what it showed, then that was not effective enough to meet this requirement.</p> <p>This has to be assessed in context of the summary of all the questions that are asked of the real-time system operator. This is not a one-for-one alignment between the first question and an associated level of non-compliance. This has been modified to clarify what was intended.</p> <p>204 Actions</p> <p>1i - The SDT thinks 'may' is the right word – one of the focuses of this standard is to try and identify situations that may lead to exceeding an IROL and to take action to prevent exceeding that IROL. The industry commenters have supported this position.</p> <p>If the RA takes preventive action, then there is no non-compliance because the RA has achieved its objective of operating within IROLs. The system operator needs to take proactive actions to prevent exceeding an IROL for an 'emerging' condition.</p>	
<p>James Murphy; BPAT; #1                  Mike Viles; BPAT; #1                  Richard Spence; BPAT; #1                  Don Watkins; BPAT; #1                  Don Gold; BPAT; #1                  Marv Landauer; BPAT; #1</p>	<p>BPAT would like the system operator to be identified as RA system operators where applicable. 202(b)(3) &amp; 202(d)(3)(i)</p> <p>In section 200 (2) please identify the name of section 604 where used.</p> <p>Please add the standard number when other standards are mentioned.</p> <p>Please include in 208 (d) (3) "(4) Time the actions were taken. This may be important to determine if directive were followed in a timely manner.</p>
<ol style="list-style-type: none"> <li>1. The word, 'its' has been added to the 202(b)(3) and 202(d)(3)(i) to clarify that the system operators are the RA's system operators.</li> <li>2. The reference to Standard 600 has been deleted because the requirement to identify IROLs has been transferred to Standard 600.</li> <li>3. Logging the date and time is considered, 'good utility practice' and shouldn't have to be specifically proscribed.</li> </ol>	
<p>Patti Metro; FRCC; #2                  Linda Campbell ;FRCC ;#2                  Steve Wallace; Seminole Electric Coop ;#4                  Amy Long; Lakeland Electric; #1                  Richard Gilbert; Lakeland Electric; #3                  Ron Donahey; Tampa Electric Company; #3                  Beth Young; Tampa Electric Company ;#3                  Roger Hunnicutt ; Gainesville Reg Utl; #5                  Roger Westphal ;City of Gainesville; #3                  Greg Woessner ;Kissimmee Utility Auth;#3                  Ben Sharma ;Kissimmee Utility Auth;#3                  Garry Baker; JEA ;#1                  Ed DeVarona; Florida Power &amp; Light Co. ;#1                  Preston Pierce; Progress Energy Florida ;#1                  Bob Remley; Clay Electric Cooperative; #4                  Joe Krupar; FMPA; #3                  Paul Elwing; Lakeland Electric; #5</p>	<p>1. The Compliance Monitoring Process for 202-208 requires that certain information be provided to the Compliance Monitor "upon request", but does not indicate how long the Reliability Authority has to provide the information. A possible revision could be that " upon request the Reliability Authority will provide the following information to the Compliance Monitor within 5 business days".</p> <p>204</p> <p>Requirements</p> <p>2. Who is responsible for implementing an IROL mitigation plan? Transmission Owner? RA? Does the RA develop the plan or the Transmission Owner?</p> <p>3. Footnote 2 indicates the no action "may be acceptable as long as it is documented", what type of documentation is required?</p> <p>4. Non-Compliance Level 4 - Should be revised to indicate that the Reliability Authority is non-compliant because no actions were taken to mitigate an IROL or to document the violation.</p> <p>205</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Joe Roos; Ocala Electric Utility ;#3</p>	<p>5. Measure (3)(i) should be revised to indicate that the Compliance Monitor should be notified within five business days of determining the data issue could not be resolved.</p> <p>6. Non-compliance levels – Why is there a Level 1 and Level 2, rather that Level 3 and Level 4. It appears that this information is very important to maintain a reliable system. In additions, if there is a measure for notifying the Compliance Monitor when data issues cannot be resolved, a level of non-compliance should be included when this notification is not provided.</p> <p>207</p> <p>7. Requirements and Levels of Non-Compliance – from this it appears that the Reliability Authority will work with other entities to develop processes, procedures, and plans, but the levels of non-compliance indicated that these activities could be developed with no input. What good is this if an Reliability Authority can't perform the mitigation? Seems very broad and burdensome to the Reliability Authority.</p> <p>208</p> <p>8. Requirements - The standard does not address seams issues. Although 201 requires Reliability Authorities that share facilities to develop IROL procedures and lists there needs to be a requirement included that would allow one Reliability Authority to give directives to another Reliability Authority.</p> <p>9. Levels of Non-Compliance – If an entity does not follow the Reliability Authority directive, and the Reliability Authority does not have the ability to take action, other than the financial penalty there is no way to make entities comply with directives and reliability will be jeopardized.</p>
---	--

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

1. The term, "on request" was intended to mean during an audit. The standard has been changed to indicate this more clearly.
  2. The RA is responsible for having the processes, procedures or plans and for implementing them. The standard is silent on who needs to develop the plan. Currently, at least one of the regions has a technical committee that develops some of these documents for use in a sub-region or region-wide basis.
  3. The documentation in footnote 2 is the operator log or other data source addressed in measure 204(b)(1)(i).
  4. The purpose of this standard is to prevent an IROL from ever being exceeded. There are two ways an IROL can be exceeded – as a result of an emerging event that the RA failed to control – or as a result of a serious incident where the RA wasn't able to direct actions quickly enough to resolve the incident within the IROL's Tv. The industry was asked to endorse this approach in an earlier posting, and the most industry commenters agreed that the RA should be held accountable for the results of actions.
  5. Your suggestion was implemented and is reflected in the revised standard.
  6. The SDT could not identify a method for determining that data hadn't been provided and the Compliance Monitor hadn't been notified.
  6. Since most commenters indicated support for these levels of non-compliance, the SDT did not change them.
  7. If the processes, procedures or plans are developed without coordination with entities that are required to take actions, then the RA is non-compliant. The RA needs to ensure that the entities that are expected to take actions under specified conditions (with respect to IROLs) are aware, in advance, of the conditions and the actions that need to be taken.
  8. Under the Functional Model, all RAs are created equal. Developing a requirement that gives one RA the authority to direct the actions of another RA is outside the scope of the Functional Model. However, under the processes, procedures and plans, there may be documents that outline a process agreed upon by all involved RAs.
- There is another standard, Coordinate Operations between RAs that addresses the more complex coordination that takes place between RAs in support of interconnection reliability. This standard's focus is on the actions the RA takes to control its own RA Area with respect to monitoring and operating so that no IROLs are exceeded. The SDT modified Requirement 201 to better address the seams issues when establishing which Facilities are subject to IROLs, and when establishing IROLs for those Facilities.
9. Agreed. Financial sanctions are intended to provide incentive to follow the RA's directives. If an entity doesn't take the actions requested, the RA needs to be ready to direct other actions to protect the reliability of the interconnection - up to and including issuing a directive to drop firm load. The RA needs to have the authority to issue directives and have those directives followed. Each RA may have agreements with entities under its direction that include language that addresses the 'passing on' of any financial sanctions due to lack of compliance with the RAs directives. Ensuring reliability is the RA's objective.

 Al Adamson; NYSRC; #2

1. The footnote on Std 201 states that each IROL is developed by following the requirements in "Determine Facility Ratings, SOL's & Transfer Capabilities" i.e. Std 600. Such requirements with respect to IROL are not mentioned in Std 600, and it is expected that upcoming revised standard shall include this requirement otherwise it is recommended to delete the keynote from this standard 200.
2. Owing to the fact that "Tv" value can be smaller than 30 minutes, it is suggested to update the sub-section 203 (b) (ii) as follows: " The Reliability authority shall conduct a Real-time Assessment

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Khagan Khan; The IMO Ontario; #2          Brian Hogue; NPCC;#2          Guy Zito; NPCC;#2          Greg Campoli; NYISO; #2          James Castle; NYISO ;#2          John Ravalli; NYISO; #2          Karl Tammar; NYISO; #2          Robert Waldele; NYISO; #2          Michael Calimano; NYISO; #2</p>	<p>periodically, once every 30 minutes or lesser as applicable in order to capture the allowable lesser duration Tvs.</p> <p>3. General comment on the standard is it seems overly burdensome with documentation and less focused on performance.</p> <p>4. Examples regarding the individual definitions might be helpful to be added in an accompanying document.</p> <p>5. The Standard should address repeated, planned IROL violations that don't exceed or consistently approach Tv and preventing this/discouraging this mode of operation from reoccurring. It is not OK to exceed IROLs and there are entities that frequently exceed them for short periods of time for economic or other reasons, they are not reportable because they do not exceed Tv. This behavior must be discouraged through measurement of frequency and severity of IROL through the reporting mechanisms outlined in this standard, and as outlined in new template P2 T1 "System Operating/IROL Violations". In addition, there were no IROL Tv violations reported to NERC as a result of the events occurring on August 14th 2003 which implies either more stringent reporting is required or the IROL and Tv limit needs to be reevaluated.</p>
<p>1. The footnote was added at the request of many industry commenters and has been modified to reference the specific requirement in standard 600. Since the requirement to identify IROLs was transferred to the Determine Facility Ratings Standard, the footnote is not in the revised standard.</p> <p>2. The frequency of real-time assessments was not intended to be tied to T<sub>v</sub>.</p> <p>This standard does not preclude an RA from conducting a real-time assessment more frequently than once every 30 minutes.</p> <p>Some IROLs may have a very short T<sub>v</sub> - T<sub>v</sub> could be as short as a minute or less – and requiring a real-time assessment to be conducted this frequently would not be practical.</p> <p>3. Please be more specific about which aspects you feel are burdensome.</p> <p>4. Please be more specific about what examples you feel should be added.</p> <p>5. While entities do exceed SOL's, there is little evidence to support the statement that entities routinely exceed IROLs. If an entity is aware of an RA that allows IROLs to be routinely exceeded, the Compliance Monitor should be notified so that an investigation can be conducted.</p> <p>The revised standard requires more coordination with adjacent RAs, and this should help put better controls over the amount of risk tolerated.</p> <p>There were many different violations that occurred on August 14.</p>	
<p>Kathleen Goodman; ISO-NE; #2</p>	<p>1. The standard seems to be measured more on documentation than performance. Our concern is that the requirements to document may delay action and response time, therefore adversely impacting reliability. The standard should focus on performance and not whether every log entry was made in the correct format.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>2. The standard should be reviewed to ensure that all references to IROLs include the word “operating” if the definition will move forward as IROL vs. IRL (note that Attachment A to NERC’s recommendation 1 from August 14th uses IRL, not IROL). Consistency needs to be applied.</p> <p>3. The Phased-in implementation in 200 does not make sense: if the data is not obtained for 12 months, how can the monitoring, actions, etc. begin in six months?</p> <p>4. While ISO New England generally agrees with a quick implementation of the final approved Standard, there is a large amount of specific data that must be collected and stored to meet the full intent of the Standard. Depending upon what the final approved Standard is, this may require additional software and business processes to fully implement. For this reason we believe that an implementation plan must provide a development period for the responsible entities to fully implement the standard.</p> <p>5. There is an issue with the concept of a monetary sanction matrix and what its implications are. ISO-NE, as well as NPCC, has expressed concern over its inclusion and maintains that the use of market mechanisms where possible, as well as, letters of increasing degrees of severity and notifications to regulatory agencies are more effective in ensuring compliance. Failure of NERC to gain authority through reliability legislation could result in NERC pursuing actions to implement “Plan B,” a “voluntary” approach affording NERC the authority to perform these types of monetary sanctions. ISO-NE has indicated that any posted Standard, with such a matrix, will not be supported by ISO-NE. There are, however, proceedings at NERC by the Compliance Certification Committee (CCC) to address alternative sanction proposals and ISO-NE will continue to work to oppose monetary sanctions.</p> <p>6. ISO New England believes that this standard should provide clear examples within this standard, describing in detail what constitutes a violation that must be reported along with clear examples of what constitutes and SOL and IROL. Examples should include contingency pair examples for both IROL and SOL thermal limits as well as examples concerning stability and voltage limits.</p>
<p>1. Please be more specific in identifying areas where you feel the documentation required is inappropriate. The SDT does not believe that the documentation requirements in this standard are more involved than what should be currently documented.</p> <p>2. The SDT did not write the NERC’s recommendations on the August 14<sup>th</sup> events.</p> <p>3. The standard assumes that the RA functions are already being performed by some entity, and some entity is already monitoring and collecting data. The reason the SDT suggested a longer implementation</p>	

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>time for compliance with the data spec requirement was to recognize that some entities may need some time to formalize their data specifications.</p> <p>4. The standard assumes that the RA functions are already being performed by some entity, and some entity is already monitoring and collecting data. Additional time has been allowed for creating specifications – the standard doesn't require any software or business processes that aren't already required to meet current Operating Policies.</p> <p>5. The SDT has no authority to remove financial sanctions from the Sanctions Table.</p> <p>6. The format of the new standards, approved with the Reliability Standards Process Manual, requires very clear, succinct topical sections. Please reference the RSPM pages ---- to see what is required. The VP-General Counsel for NERC has advised the SDT's to refrain from adding material to the standards that exceeds the topics identified in the RSPM.</p>	
<p>Ralph Rufrano; NYPA; #1                  David Kiguel; Hydro One Networks Inc.; #1                  Roger Champagne; H-Q TransÉnergie; #1                  Greg Campoli; New York ISO (NYISO); #2                  Peter Lebro; National Grid; #1                  Kathleen Goodman; ISO-NE; #2                  Dan Stosick; ISO-NE;#2                  Al Adamson; NYSRC;#2                  Khagan Khan; The IMO Ontario; #2                  Brian Hogue; NPCC;#2                  Guy Zito; NPCC;#2</p>	<p>(NPCC Members of CP9 expressed concern over these questions 18-19-and 20. The answers to them are more "process" related than standard related and seem inappropriate. Are differing weights assigned to persons, and their answers, who are not voting in the pool? These questions could raise issues about the process being open and inclusive.)</p>
<p>The intent of asking these questions was to see if there were enough industry balloters who would oppose any standard based on issues outside the SDT's control so that the SDT could decide whether to delay balloting until these issues (i.e. the future of the Reliability Coordinator, the difference between the RC and the RA, financial sanctions, field testing) are resolved.</p>	
<p>Al Corbet; TVA                  Jerry Landers; TVA                  Jennifer Weber; TVA                  Edd Forsythe; TVA                  Larry Goins; TVA                  Mark Creech; TVA                  Kathy Davis; TVA</p>	<p>TVA would like to reserve the right to forward additional comments at a later date.</p>
<p>Jalal Babik; Dominion VA Power; #1                  Craig Crider; Dominion VA Power; #1                  Jack Kerr; Dominion VA Power; #1                  Bill Thompson; Dominion VA Power; #1</p>	<p>The Board approved a new compliance template that applies to the issues covered by this proposed standard on April 2, 2004. The compliance template that is now approved conflicts with the compliance presented here. I want to know where this is heading. Also see comments under item 9.</p>
<p>The SDT understands that the compliance templates were short-term 'fixes' to provide FERC and the industry with a set of 'measurable' elements needed to support reliability. These templates did not go through the same level of 'due process' required by the ANSI accredited NERC Reliability Standards Development Process and were not intended to supersede these new standards. When this standard is approved, adopted, and implemented, the associated compliance templates will be retired. When the NERC BOT approved the templates, the BOT also directed that the SDT's continue to develop the new</p>

---

reliability standards, following the ANSI process.

See response under question 9.

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

<p>Dan Boezio; AEP; #1                  Ron Ciesiel; SPP; #2                  Bob Cochran; SPS; #1                  Mike Gammon; KCP&amp;L; #1                  Allen Klassen; Westar; #1                  Peter Kuebeck; OG&amp;E; #1                  Mike Stafford; GRDA; #1                  Robert Rhodes; SPP; #2                  Scott Moore; AEP; #1</p>	<p>1. An IROL of 300 MW of load loss is too small. Don't lose sight of the fact that an IROL is a significant threat to a large portion of the interconnection. By minimizing the defined threshold for an IROL, the number of IROLs will increase drastically and thereby dilute the significance of the event.</p> <p>2. Section 203(b)(1)(ii) requires a real-time assessment at least every 30 minutes. This may be too frequent depending upon the complexity of the studies involved.</p> <p>3. Consider reversing noncompliance Levels 3 and 4 in section 203(e). Which of the two levels is worse?</p>
<p>1. Agreed. The SDT modified the standard to respect this concept.</p> <p>2. The industry was asked to identify whether 30 minutes was appropriate, and there was consensus on requiring that these be conducted at least once every 30 minutes. This is an assessment, and not necessarily a 'study'.</p> <p>3. The SDT modified these levels of non-compliance to clarify what was intended. As revised, it should be clear that level 4 is worse than level 3.</p>	
<p>Alan Gale; City of Tallahassee; #5                  Rusty Foster; City of Tallahassee; #3</p>	<p>1. The Compliance Monitoring Process for 202-208 requires that certain information be provided to the Compliance Monitor "upon request". There should be some consistency across all the standards for time frames of "requested data". Without it, the Compliance Monitor can get the run around for a month and the reporting entity can still be compliant.</p> <p>203</p> <p>2. Requirements and Measures - Although not specified in the Requirements, the Measures requires an Operational Planning Analysis at least once each day for the "projected system operating conditions". This would preclude a "day ahead" analysis of the weekend (or holiday) from being performed on Friday. A provision should be made that would allow this. Trigger a required analysis if system conditions differed from the analyzed conditions. (i.e. a line was planned to be out Saturday only, but remains out on Sunday would trigger a new analysis. If the line was back in, it would not require an analysis be done on Saturday for Sunday, the analysis on Friday would remain valid.)</p> <p>204</p> <p>Requirements</p> <p>3. Who is responsible for implementing an IROL mitigation plan? Transmission Owner? RA? Does the RA develop the plan or the Transmission Owner?</p> <p>4. Footnote 2 indicates the no action "may be acceptable as long as it is documented", what type of documentation is required?</p> <p>5. If "no overt action" is acceptable, is it an IROL?</p> <p>205</p> <p>6. Measure (3)(i) should be revised to indicate that the Compliance Monitor should be notified within five business days of determining the data issue could not be resolved.</p> <p>7. Non-compliance levels – Why is there a Level 1 and Level 2, rather than Level 3 and Level 4. It appears that this information is very important to maintain a reliable system. In additions, if there is a measure for notifying the Compliance Monitor when data issues cannot be resolved, a level of non-compliance should be included when this notification is not provided.</p>

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

---

	<p>206</p> <p>8. Non-Compliance Level 4 - Should be revised to separate “not providing the data” from the “inability to resolve the issue”. The inability to send the data due to a technical problem that is being upgraded should be differentiated from the refusal to provide the data (“inability to resolve”). This will allow a lower level of non-compliance while pursuing any necessary equipment or technology upgrades.</p> <p>207</p> <p>9. Requirements and Levels of Non-Compliance – from this it appears that the Reliability Authority will work with other entities to develop processes, procedures, and plans, but the levels of non-compliance indicated that these activities could be developed with no input. What good is this if an Reliability Authority can’t perform the mitigation? Seems very broad and burdensome to the Reliability Authority.</p> <p>10. There should be some consistency across all the standards for time frames of “reviewing or updating”. Without it, an entity can only review its documents and programs “at will” and still be compliant</p> <p>208</p> <p>11. Requirements - The standard does not address seams issues. Although 201 requires Reliability Authorities that share facilities to develop IROL procedures and lists, there needs to be a requirement included that would allow one Reliability Authority to give directives to another Reliability Authority.</p> <p>12. Levels of Non-Compliance – If an entity does not follow the Reliability Authority directive, and the Reliability Authority does not have the ability to take action, other than the financial penalty there is no way to make entities comply with directives and reliability will be jeopardized.</p>
--	---

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

1. The term, "on request" was intended to mean during an audit. The standard has been changed to indicate this more clearly.
2. The standard doesn't specify how detailed each of these analyses and assessments needs to be – but they should be done to verify the expected conditions – the operational analysis should be done at least once a day – and the real-time assessment should be done at least once every 30 minutes.  
The operational planning analysis does not need to include a stability analysis unless – whether or not a stability analysis should be conducted is left up to the RA. It would be unrealistic to expect the RA to conduct a stability study each day, and this is not what was intended.
3. The RA is responsible for having the processes, procedures or plans and for implementing them. The standard is silent on who needs to develop the plan. Currently, at least one of the regions has a technical committee that develops some of these documents for use in a sub-region or region-wide basis.
4. The documentation in footnote 2 is the operator log or other data source addressed in measure 204(b)(1)(i).
5. If an RA sees that a planned action, such as the addition of another unit, is scheduled to occur, and the addition of the unit will reduce loading on a line that is approaching its IROL, the RA may elect to take 'no action' because the RA knows that if all goes as planned, the limit won't be exceeded. – but the IROL would still be an IROL.
6. Your suggestion was implemented and is reflected in the revised standard.
7. The SDT could not identify a method for determining that data hadn't been provided and the Compliance Monitor hadn't been notified.
8. The standard allows the RA the flexibility of determining when the issue needs the intervention of the Compliance Monitor. It also allows for alternative methods for collecting data.
9. If the processes, procedures or plans are developed without coordination with entities that are required to take actions, then the RA is non-compliant. The RA needs to ensure that the entities that are expected to take actions under specified conditions (with respect to IROLs) are aware, in advance, of the conditions and the actions that need to be taken.
10. Since the new standards are being developed in parallel, and the importance of requirements are not equal from standard to standard, mandating that all standards contain the same review periods doesn't seem practical – and implementing such a system is outside the control of the SDT.
11. Under the Functional Model, all RAs are created equal. Developing a requirement that gives one RA the authority to direct the actions of another RA is outside the scope of the Functional Model. However, under the processes, procedures and plans, there may be documents that outline a process agreed upon by all involved RAs.  
There is another standard, Coordinate Operations between RAs that addresses the more complex coordination that takes place between RAs in support of interconnection reliability. This standard's focus is on the actions the RA takes to control its own RA Area with respect to monitoring and operating so that no IROLs are exceeded. The SDT modified Requirement 201 to better address the seams issues when establishing which Facilities are subject to IROLs, and when establishing IROLs for those Facilities.
12. Agreed. Financial sanctions are intended to provide incentive to follow the RA's directives. If an entity doesn't take the actions requested, the RA needs to be ready to direct other actions to protect the reliability of the interconnection - up to and including issuing a directive to drop firm load. The RA needs to have the authority to issue directives and have those directives followed. Each RA may have agreements with entities under its direction that include language that addresses the 'passing on' of any financial sanctions due to lack of compliance with the RAs directives. Ensuring reliability is the RA's objective.

Gerald Rheault; Manitoba Hydro; #1,3,5,6	1. Manitoba Hydro believes that this Standard should be field tested prior to implementation. This will ensure that all elements of the Standards are relevant to the operational reliability of the bulk
--	---

**Consideration of Comments on 4<sup>th</sup> Posting of Operate within Interconnection Reliability Operating Limits Standard**

	<p>electric system and can be implemented in a straightforward manner.</p> <p>2. In section 203 (d) Compliance Monitoring Process item (3) (i) it makes more sense that the RA provide evidence that Operational Planning Analysis occurs at least once a day and what the results were rather than indicating only the most recent analysis. Similar comments for 203 (d) (3) (iii). The evidence could be in the form of a log.</p> <p>3. In section 205 (b) Measures, there is no measure to establish that the RA is notifying its Compliance Monitor when data is not provided or data collection issues are not resolved.</p> <p>In section 205 (d) Compliance Monitoring Process, there is no check that the RA is notifying its Compliance Monitor when data is not provided or data collection issues are not resolved. There are no sanctions for not complying.</p>
<p>1. The determination of whether field testing is needed is made by the SAC in consultation with the VP-Director-Compliance. The SDT does not have any authority over whether field testing is conducted.</p> <p>2. The SDT asked the industry for support of the compliance monitoring, and most industry commenters indicated they do support the language in the standard, so this was not changed.</p> <p>3. Agreed – the SDT couldn't identify a way to measure non-compliance with this requirement, but the requirement is needed to 'trigger' an investigation by the Compliance Monitor to motivate whatever entity is not providing the necessary data.</p>	
<p>Lee Xanthakos; SCE&amp;G; #1</p>	<p>I agree with the requirements of RAs as defined by this standard as long as my organization becomes an RA. If we cannot receive RA certification then I would not agree with the requirement because state regulatory issues do not allow my organization to transfer to someone else the RA responsibility defined here that we currently do.</p>
<p>The SDT has no control over which entity will/will not become an RA. We do appreciate the many comments you provided on this standard.</p>	

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting Team posts Draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting Team posts Drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting Team posts Drafts for comment (March 1–April 14, 2004).

**Description of Current Draft:**

This informational draft includes revisions based on industry comments received during the posting of Draft 4 and reflects the transfer of the IROL identification requirement to the Determine Facility Ratings standard. The Drafting Team is not soliciting comments during this posting.

**Future Development Plan:**

**Anticipated Actions**

1. Post for 45-day comment period.
2. Post for 30-day pre-ballot period.
3. First ballot of Version 0 standards.
4. Recirculation ballot of Version 0 standards.
5. 30-day posting before board adoption.
6. Board adopts Version 0 standards.
7. Effective date.

**Anticipated Date**

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

**A. Introduction**

1. **Title:** **Monitoring the Wide Area**
2. **Number:** **IRO-007-1**
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Authority
5. **Effective Date:** Three months after Board of Trustee Adoption

**B. Requirements**

- R1. The Reliability Authority shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Authorities who monitor that Facility (or group of Facilities) shall use the most conservative of the values under consideration.

**C. Measures**

- M1. The Reliability Authority shall have IROLs available for its System Operators.
  - M1.1 These limits shall include those that are associated with Facilities (or groups of Facilities) in the Wide Area monitored by the Reliability Authority.
- M2. The Reliability Authority shall have Real-Time Data available in a form that its System Operators can compare to the IROLs.
  - M2.1 The data shall be for the Reliability Authority's Area and from the other Reliability Authority Areas.
- M3. The Reliability Authority shall monitor system operating parameters in its Wide Area and shall compare these operating parameters against their associated IROLs.
  - M3.1 For IROLs without agreed-upon limits, the Reliability Authority shall have evidence it operated to the most conservative of the values under consideration.

**D. Compliance**

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Reliability Authority shall keep data on limits for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Authority shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Authority shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

- 1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** A level four noncompliance occurs if either of the following conditions are present:

- 2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

- 2.4.2** There was a disagreement on the IROL and the most conservative limit under consideration was not used.

**E. Regional Differences**

- 1.** None identified.

**Version History**

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**A. Introduction**

1. **Title:** **Reliability Authority Operational Analyses and Real-Time Assessments**
2. **Number:** **IRO-008-1**
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Authority
5. **Effective Date:** Three months after Board of Trustee Adoption.

**B. Requirements**

- R1. The Reliability Authority shall perform Operational Planning Analyses to assess whether the planned operations within its Wide Area, including other Reliability Authority Areas, will exceed any of its Interconnection Reliability Operating Limits (IROLs).
- R2. The Reliability Authority shall perform Real-Time Assessments every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs.
- R3. When the results of the Reliability Authority's Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Authority shall share its results with those entities that are expected to take those actions.

**C. Measures**

- M1. The Reliability Authority shall be able to identify operating situations or events that impact its Reliability Authority Area's ability to operate without exceeding any IROLs as a result of the following.
  - M1.1 The Reliability Authority shall have conducted an Operational Planning Analysis at least once each day, evaluating the next day's projected system operating conditions.
  - M1.2 The Reliability Authority shall have conducted a Real-Time Assessment periodically, but at least once every 30 minutes.
- M2. The Reliability Authority shall be able to show evidence that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information. Evidence can be an operating log, voice recorder, fax, or other type of record.

**D. Compliance**

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Authority shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, and investigations upon complaint, to assess performance.

The Reliability Authority shall identify the following to its Compliance Monitor to inspect as part of a scheduled on-site review or as part of an investigation upon complaint:

- 1.4.1** The time the most recent Operational Planning Analysis was conducted.
- 1.4.2** Whether the planned operations within the Reliability Authority’s Reliability Authority Area may exceed any of its IROLs.
- 1.4.3** The time the most recent Real-Time Assessment was conducted.
- 1.4.4** Whether the Real-Time Assessment identified if its Reliability Authority Area is exceeding any IROLs or is expected to exceed any IROLs.

**2. Levels of Non-Compliance**

- 2.1. Level 1:** Not applicable.
- 2.2. Level 2:** Not applicable.
- 2.3. Level 3:** A level three noncompliance exists if Operational Planning Analyses and Real-Time Assessments were conducted but not as frequently as required.
- 2.4. Level 4:** A level four noncompliance exists if the Reliability Authority could not identify whether the planned operations within its Reliability Authority Area were expected to exceed any of its IROLs.

**E. Regional Differences**

- 1. None identified.

**Version History**

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Interconnection Reliability Operating Limit Event:** Any instance of exceeding an Interconnection Reliability Operating Limit for a minimum of 30 continuous seconds.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point in time where the limit is first exceeded for at least 30 continuous seconds and ends at the beginning of the continuous 30 seconds in which the value returns to within the Interconnection Reliability Operating Limit.

**Occurrence Period:** The time period in which performance is measured and evaluated.

**A. Introduction**

1. **Title:** **Reliability Authority Actions to Operate Within IROLs**
2. **Number:** **IRO-009-1**
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding IROLs.
4. **Applicability**
  - 4.1. Reliability Authority
5. **Effective Date:** Three months after Board of Trustee Adoption.

**B. Requirements**

- R1. The Reliability Authority shall, without delay, act or direct others to act to:
  - R1.1. Prevent instances of exceeding Interconnection Reliability Operating Limits (IROLs).
  - R1.2. Mitigate the magnitude and duration of instances of exceeding IROLs.
  - R1.3. The Reliability Authority shall include a statement in each IROL-related directive to inform the recipient that the directive is related to an IROL.
  - R1.4. The Reliability Authority shall document each instance of exceeding an IROL and shall document and complete an IROL Violation Report for each instance of exceeding an IROL for time greater than that limit's  $T_v$ . The Reliability Authority shall file each IROL Violation Report with its Compliance Monitor within five business days of the initiation of the event.
- R2. If the Reliability Authority directs a modification to an Implemented Interchange, the Reliability Authority shall direct the Interchange Authority to update the Arranged Interchange.

**C. Measures**

- M1. The Reliability Authority shall have documentation to support each instance where actions were taken or directives were issued to mitigate the magnitude and duration of exceeding an IROL.
- M2. The documentation shall include the date and time of the event, actions taken or directives issued, the magnitude of the event, and the duration of the event. (This data may be from an operating log, may be from the entity's energy management system, or may be from some other source.)
- M3. The duration of the event shall be measured from the point when the limit is exceeded for a minimum of thirty seconds to the point when the system has returned to a state that is within the IROL for a minimum of thirty seconds.
- M4. The Reliability Authority shall have a completed IROL Violation Report for each instance where it exceeded an IROL for time greater than that limit's  $T_v$ .
- M5. The IROL Violation Report shall include the date and time of the event, identification of which IROL was violated and the  $T_v$  for that limit, magnitude, and duration of exceeding the IROL, actions taken or directives issued and the time these were initiated or issued, and an explanation of results of those actions or directives.

**M5.1** The Reliability Authority shall have evidence it filed a completed IROL Violation Report with its Compliance Monitor within five business days of the initiation of the IROL event.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

**1.2. Compliance Monitoring Period and Reset Timeframe**

The Performance-Reset Period shall be 12 months from the last violation.

**1.3. Data Retention**

The Reliability Authority shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Reliability Authority shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Authority shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

**2. Levels of Non-Compliance**

**2.1. Level 1:** IROL exceeded for a time less than or equal to  $T_v$  and no documentation to indicate actions taken or directives issued to mitigate the instance.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** IROL exceeded for time greater than  $T_v$ .

**E. Regional Differences**

1. None identified.

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting Team posts Draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting Team posts Drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting Team posts Drafts for comment (March 1–April 14, 2004).

**Description of Current Draft:**

This informational draft includes revisions based on industry comments received during the posting of Draft 4 and reflects the transfer of the IROL identification requirement to the Determine Facility Ratings standard. The Drafting Team is not soliciting comments during this posting.

**Future Development Plan:**

**Anticipated Actions**

1. Post for 45-day comment period.
2. Post for 30-day pre-ballot period.
3. First ballot of Version 0 standards.
4. Recirculation ballot of Version 0 standards.
5. 30-day posting before board adoption.
6. Board adopts Version 0 standards.
7. Effective date.

**Anticipated Date**

- To be determined
- To be determined
- To be determined
- To be determined
- To be determined

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

**A. Introduction**

1. **Title:** **Reliability Authority Data Specification and Collection**
2. **Number:** **IRO-010-1**
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Authority has the data it needs to monitor and assess the operation of its Reliability Authority Area.
4. **Applicability**
  - 4.1. Reliability Authority
5. **Effective Date:** Three months after Board of Trustee Adoption.

**B. Requirements**

- R1. The Reliability Authority shall specify and collect the data and information it needs to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments conducted relative to operating within its Reliability Authority Area's Interconnection Reliability Operating Limits. The Reliability Authority shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Authority, and from entities that provide Real-Time Facility status to the Reliability Authority. This includes specifying and collecting data from the following:
  - R1.1. Balancing Authorities
  - R1.2. Generator Owners
  - R1.3. Generator Operators
  - R1.4. Interchange Authority
  - R1.5. Load-Serving Entities
  - R1.6. Reliability Authorities
  - R1.7. Transmission Operators
  - R1.8. Transmission Owners
- R2. The Reliability Authority shall specify when to supply data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).
- R3. The Reliability Authority shall notify its Compliance Monitor (within five business days of being unable to resolve the issue) when both of the following conditions are present:
  - R3.1. An entity that has data needed to support Real-Time Monitoring, Operational Planning, or Real-Time Assessments relative to operating within the Reliability Authority's Reliability Authority Area has not provided data as specified, and
  - R3.2. The Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.

**C. Measures**

- M1. The Reliability Authority shall have a documented specification for data needed to build and maintain models needed to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments relative to Interconnection Reliability Operating Limits.

- M1.1** Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.
- M1.2** Specification shall address the data provision process to use when automated Real-Time system operating data is unavailable.
- M2.** The Reliability Authority shall have evidence that it has distributed its data specification to entities that have Facilities monitored by the Reliability Authority and to entities that provide Facility status to the Reliability Authority.
- M3.** The Reliability Authority shall have evidence it notified its Compliance Monitor when an entity that has Facilities monitored by the Reliability Authority, or an entity that provides Facility status to the Reliability Authority, does not provide data as specified, and the Reliability Authority was unable to resolve the issue with the entity responsible for providing the data.
  - M3.1** If the Reliability Authority does not receive data as specified, and is unable to resolve the situation, then the Reliability Authority shall notify its Compliance Monitor within five business days of discovering that the issue of the missing data could not be resolved.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

#### **1.2. Compliance Monitoring Period and Reset Timeframe**

The Performance-Reset Period shall be 12 months from the last violation.

#### **1.3. Data Retention**

The Reliability Authority shall keep its data specification(s) for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

#### **1.4. Additional Compliance Information**

The Reliability Authority shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

Text The Reliability Authority shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint:

**1.4.1** Data specification(s).

**1.4.2** Proof of distribution of the data specification(s).

### **2. Levels of Non-Compliance**

**2.1. Level 1:** Data specification incomplete (missing either the list of required data, a mutually agreeable format, a timeframe for providing data, or a data provision process to use when automated Real-Time system operating data is unavailable).

**2.2. Level 2:** No data specification or the specification not distributed to the entities that have Facilities monitored by the Reliability Authority and the entities that provide the Reliability Authority with Facility status.

2.3. **Level 3:** Not applicable.

2.4. **Level 4:** Not applicable.

**E. Regional Differences**

1. None identified.

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

**A. Introduction**

- 1. Title:** **Providing Reliability–Related Data to the Reliability Authority**
- 2. Number:** **IRO-011-1**
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Authority has the data it needs to monitor and assess the operation of its Reliability Authority Area.
- 4. Applicability**
  - 4.1.** Balancing Authority
  - 4.2.** Generator Owner
  - 4.3.** Generator Operator
  - 4.4.** Interchange Authority
  - 4.5.** Load-Serving Entity
  - 4.6.** Reliability Authority
  - 4.7.** Transmission Operator
  - 4.8.** Transmission Owner
- 5. Effective Date:** Three months after Board of Trustee Adoption.

**B. Requirements**

- R1.** Each entity performing one of the following functions shall provide data, and information, as specified, to the Reliability Authority(ies) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Authority to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments conducted relative to operating within its Reliability Authority Area’s Interconnection Reliability Operating Limits.
  - R1.1.** Balancing Authority
  - R1.2.** Generator Owner
  - R1.3.** Generator Operator
  - R1.4.** Interchange Authority
  - R1.5.** Load-serving Entity
  - R1.6.** Reliability Authority
  - R1.7.** Transmission Operator
  - R1.8.** Transmission Owner

**C. Measures**

- M1.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Authority, Transmission Operator, and Transmission Owner shall each have the following:
  - M1.1** Evidence that it provided data and information, as specified, to the requesting Reliability Authority, within the timeframe specified, in the mutually agreed upon format, or
  - M1.2** Evidence that it committed to providing the data identified in the specification.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

**1.2. Compliance Monitoring Period and Reset Timeframe**

The Performance-reset Period is 12 months from the last violation.

**1.3. Data Retention**

The responsible entity shall keep data transmittal documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-Serving Entity, Reliability Authority, Transmission Operator, and Transmission Owner (Responsible Entity) shall each demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Responsible Entity shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint:

**1.4.1** Evidence indicating data was sent to the Reliability Authority or evidence that the Responsible Entity committed to providing the data identified in the specification.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Data was not provided to the Reliability Authority as specified and the situation was not resolved with the Reliability Authority.

**E. Regional Differences**

1. None identified.

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Authority Processes, Procedures, or Plans for Preventing and Mitigating Interconnection Reliability Operating Limits
2. **Number:** IRO-012-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that there are processes, procedures or plans for foreseeable instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Authority
5. **Effective Date:** Three months after Board of Trustee Adoption.

## B. Requirements

- R1. The Reliability Authority shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention and mitigation of instances of exceeding its IROLs.

## C. Measures

- M1. The Reliability Authority shall have one or more documented Operating Processes, Procedures, or Plans that address both preventing and mitigating instances of exceeding IROLs. There shall be evidence that the Reliability Authority coordinated the development of these Operating Procedures, Processes or Plans with those entities responsible for taking actions and with those entities impacted by such actions.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Timeframe

The Performance-Reset Period is 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Authority shall keep its action plan for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Authority shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Authority shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint.

- 1.4.1 Processes, procedures, or plans that address preventing and mitigating instances of exceeding IROLs.

**2. Levels of Non-Compliance**

- 2.1. Level 1:** Operating Processes, Procedures, or Plans for both preventing and mitigating instances of exceeding IROs exist, but these documents weren't coordinated with all involved and impacted entities.
- 2.2. Level 2:** Operating Processes, Procedures, or Plans for both preventing and mitigating instances of exceeding IROs exist, but these documents weren't coordinated with any involved or any impacted entities.
- 2.3. Level 3:** Operating Processes, Procedures, or Plans exist but do not address both preventing and mitigating instances of exceeding IROs.
- 2.4. Level 4:** No Operating Processes, Procedures, or Plans exist addressing preventing and mitigating instances of exceeding IROs.

**E. Regional Differences**

- 1. None identified.

**DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

**A. Introduction**

- 1. Title:** Reliability Authority Directives Relative to Interconnection Reliability Operating Limits
- 2. Number:** IRO-013-1
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Reliability Authority's directives are followed.
- 4. Applicability**
  - 4.1.** Balancing Authority
  - 4.2.** Interchange Authority
  - 4.3.** Transmission Operator
- 5. Effective Date:** Three months after Board of Trustee Adoption.

**B. Requirements**

- R1.** The Balancing Authority, Interchange Authority, and Transmission Operator shall each follow its Reliability Authority's directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Balancing Authority, Interchange Authority, or Transmission Operator shall immediately inform the Reliability Authority of its inability to perform the directive so that the Reliability Authority can implement alternate remedial actions. The directives covered by this requirement shall be those that:
  - R1.1.** Prevent instances of exceeding Interconnection Reliability Operating Limits (IROLs).
  - R1.2.** Mitigate the magnitude and duration of instances of exceeding IROLs.
- R2.** The Balancing Authority, Interchange Authority, and Transmission Operator shall notify its Reliability Authority when the actions associated with a directive have been completed.
  - R2.1.** The Balancing Authority, Interchange Authority, and Transmission Operator shall each document the Reliability Authority's directives and its actions taken.

**C. Measures**

- M1.** The Responsible Entity shall have the following documentation in an operations log or other data source(s), to show that it followed each directive it received relative to an IROL:
  - M1.1** Date and time of each Reliability Authority directive received.
  - M1.2** Directive issued by the Reliability Authority.
  - M1.3** Actions taken in response to the Reliability Authority's directive.

**D. Compliance**

- 1. Compliance Monitoring Process**
  - 1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. Compliance Monitoring Period and Reset Timeframe**

The Performance-Reset Period is 12 months from the last violation.

**1.3. Data Retention**

The Balancing Authority, Interchange Authority, and Transmission Operator shall keep its documentation for three calendar years. The Compliance Monitor shall keep audit records for three calendar years.

**1.4. Additional Compliance Information**

The Balancing Authority, Interchange Authority, and Transmission Operator shall each demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint to assess performance.

The Balancing Authority, Interchange Authority, and Transmission Operator shall each make the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint:

**1.4.1** Operations log or other data source(s) to show the following for each instance of being issued a Reliability Authority directive relative to an IROL:

**1.4.1.1** Date and time of each Reliability Authority directive received.

**1.4.1.2** Directive issued by the Reliability Authority.

**1.4.1.3** Actions taken in response to Reliability Authority’s directive.

**2. Levels of Non-Compliance**

**2.1. Level 1:** The Reliability Authority’s directives relative to preventing or mitigating instances of exceeding IROLs were followed but the documentation did not include the date and time of each directive received, the directive received, the actions taken, in response to the directive.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** Not applicable.

**2.4. Level 4:** Did not follow the Reliability Authority’s directives.

**E. Regional Differences**

1. None identified.

**Version History**

Version	Date	Action	Change Tracking
---------	------	--------	-----------------

**Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted (December 18, 2003 - January 6, 2004)
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

**Description of Current Draft:**

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

**Future Development Plan:**

<b>Anticipated Actions</b>	<b>Anticipated Date</b>
1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period.	To be determined
2. Post for 30-day pre-ballot period.	To be determined
3. First ballot of Version 0 standards.	To be determined
4. Recirculation ballot of Version 0 standards.	To be determined
5. 30-day posting before board adoption.	To be determined
6. Board adopts Version 0 standards.	To be determined
7. Effective date.	To be determined

## DEFINITIONS OF TERMS USED IN STANDARD

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., interconnection control area communication protocol or SCADA data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** **Monitoring the Wide Area**
2. **Number:** IRO-007-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the bulk electric system is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** Three months after Board of Trustee Adoption

## B. Requirements

- R1. The reliability coordinator shall perform real-time monitoring of system operating parameters within its wide area to determine if operating parameters are within their associated interconnection reliability operating limits (IROLs).
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all reliability coordinators who monitor that Facility (or group of facilities) shall use the most conservative of the values under consideration.

## C. Measures

- M1. The reliability coordinator shall have IROLs available for its system operators.
  - M1.1 These limits shall include those that are associated with facilities (or groups of facilities) in the wide area monitored by the reliability coordinator.
- M2. The reliability coordinator shall have real-time data available in a form that its system operators can compare to the IROLs.
  - M2.1 The data shall be for the reliability coordinator's area and from the other reliability coordinator areas.
- M3. The reliability coordinator shall monitor system operating parameters in its wide area and shall compare these operating parameters against their associated IROLs.
  - M3.1 For IROLs without agreed-upon limits, the reliability coordinator shall have evidence it operated to the most conservative of the values under consideration.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The performance-reset period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The reliability coordinator shall keep data on limits for three calendar years. The Compliance monitor shall keep audited data for three calendar years.
  - 1.4. **Additional Compliance Information**

The reliability coordinator shall demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The reliability coordinator shall demonstrate the following to its compliance monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its system operators actively monitor and compare real-time system operating parameters associated with IROLs.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Not Applicable

**2.2. Level 2:** Not Applicable

**2.3. Level 3:** Not Applicable

**2.4. Level 4:** A level four noncompliance occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in real-time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL and the most conservative limit under consideration was not used.

**E. Regional Differences**

None identified

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted December 18, 2003 - January 6, 2004
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

### Description of Current Draft:

This informational draft reflects the Standard Authorization Committee's directive to change the 'reliability authority' to the 'reliability coordinator'. The Drafting Team is not soliciting comments during this posting.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |  |                  |
|--|------------------|
| 1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period. | To be determined |
| 2. Post for 30-day pre-ballot period.  | To be determined |
| 3. First ballot of Version 0 standards.  | To be determined |
| 4. Recirculation ballot of Version 0 standards.  | To be determined |
| 5. 30-day posting before board adoption.   | To be determined |
| 6. Board adopts Version 0 standards.   | To be determined |
| 7. Effective date.   | To be determined |

## DEFINITIONS OF TERMS USED IN STANDARD

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

## A. Introduction

1. **Title:** Reliability Coordinator Operational Analyses and Real-Time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the bulk electric system is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** Three months after Board of Trustee Adoption.

## B. Requirements

- R1. The reliability coordinator shall perform operational planning analyses to assess whether the planned operations within its wide area, including other reliability coordinator areas, will exceed any of its interconnection reliability operating limits (IROLs).
- R2. The reliability coordinator shall perform real-time assessments every 30 minutes to determine if its wide area is exceeding any IROLs or is expected to exceed any IROLs.
- R3. When the results of the reliability coordinator's operational planning analyses or real-time assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the reliability coordinator shall share its results with those entities that are expected to take those actions.

## C. Measures

- M1. The reliability coordinator shall be able to identify operating situations or events that impact its reliability coordinator area's ability to operate without exceeding any IROLs as a result of the following.
  - M1.1 The reliability coordinator shall have conducted an operational planning analysis at least once each day, evaluating the next day's projected system operating conditions.
  - M1.2 The reliability coordinator shall have conducted a real-time assessment periodically, but at least once every 30 minutes.
- M2. The reliability coordinator shall be able to show evidence that it shared the results of its operational planning analyses and real-time assessments with those entities expected to take actions based on that information. Evidence can be an operating log, voice recorder, fax, or other type of record.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The performance-reset period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The compliance monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The reliability coordinator shall demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews once every three years, and investigations upon complaint, to assess performance.

The reliability coordinator shall identify the following to its compliance monitor to inspect as part of a scheduled on-site review or as part of an investigation upon complaint.

- 1.4.1 The time the most recent operational planning analysis was conducted.
- 1.4.2 Whether the planned operations within the reliability coordinator’s reliability coordinator area may exceed any of its IROLs.
- 1.4.3 The time the most recent real-time assessment was conducted.
- 1.4.4 Whether the real-time assessment identified if its reliability coordinator area is exceeding any IROLs or is expected to exceed any IROLs.

**2. Levels of Non-Compliance**

- 2.1. **Level 1:** Not applicable
- 2.2. **Level 2:** Not applicable
- 2.3. **Level 3:** A level three noncompliance exists if operational planning analyses and real-time assessments were conducted but not as frequently as required.
- 2.4. **Level 4:** A level four noncompliance exists if the reliability coordinator could not identify whether the planned operations within its reliability coordinator area were expected to exceed any of its IROLs.

**E. Regional Differences**

None identified

**Version History**

Version	Date	Action	Change Tracking

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted December 18, 2003 - January 6, 2004
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

#### **Description of Current Draft:**

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

#### **Future Development Plan:**

##### **Anticipated Actions**

##### **Anticipated Date**

- |  |                  |
|--|------------------|
| 1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period. | To be determined |
| 2. Post for 30-day pre-ballot period.  | To be determined |
| 3. First ballot of Version 0 standards.  | To be determined |
| 4. Recirculation ballot of Version 0 standards.  | To be determined |
| 5. 30-day posting before board adoption.   | To be determined |
| 6. Board adopts Version 0 standards.   | To be determined |
| 7. Effective date.   | To be determined |

## DEFINITIONS OF TERMS USED IN STANDARD

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Interconnection Reliability Operating Limit Event:** Any instance of exceeding an interconnection reliability operating limit for a minimum of 30 continuous seconds.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an interconnection reliability operating limit is exceeded. The duration is measured from the point in time where the limit is first exceeded for at least 30 continuous seconds and ends at the beginning of the continuous 30 seconds in which the value returns to within the interconnection reliability operating limit.

**Occurrence Period:** The time period in which performance is measured and evaluated.

**A. Introduction**

- 1. Title:** Reliability Coordinator Actions to Operate Within IROLs
- 2. Number:** IRO-009-1
- 3. Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding IROLs.
- 4. Applicability**
  - 4.1.** Reliability Coordinator
- 5. Proposed Effective Date:** Three months after Board of Trustee adoption.

**B. Requirements**

- R1.** The reliability coordinator shall, without delay, act or direct others to act to:
  - R1.1.** Prevent instances of exceeding interconnection reliability operating limit s (IROLs).
  - R1.2.** Mitigate the magnitude and duration of instances of exceeding IROLs.
  - R1.3.** The reliability coordinator shall include a statement in each IROL-related directive to inform the recipient that the directive is related to an IROL.
  - R1.4.** The reliability coordinator shall document each instance of exceeding an IROL and shall document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit’s  $T_v$ . The reliability coordinator shall file each IROL violation report with its compliance monitor within five business days of the initiation of the event.
- R2.** If the reliability coordinator directs a modification to an Implemented Interchange, the reliability coordinator shall direct the interchange authority to update the arranged interchange.

**C. Measures**

- M1.** The reliability coordinator shall have documentation to support each instance where actions were taken or directives were issued to mitigate the magnitude and duration of exceeding an IROL.
- M2.** The documentation shall include the date and time of the event, actions taken or directives issued, the magnitude of the event, and the duration of the event (This data may be from an operating log, may be from the entity’s energy management system, or may be from some other source).
- M3.** The duration of the event shall be measured from the point when the limit is exceeded for a minimum of thirty seconds to the point when the system has returned to a state that is within the IROL for a minimum of thirty seconds.
- M4.** The reliability coordinator shall have a completed IROL violation report for each instance where it exceeded an IROL for time greater than that limit’s  $T_v$ .
- M5.** The IROL violation report shall include the date and time of the event, identification of which IROL was violated and the  $T_v$  for that limit, magnitude and duration of exceeding the IROL, actions taken or directives issued and the time these were initiated or issued, and an explanation of results of those actions or directives.

**M5.1** The reliability coordinator shall have evidence it filed a completed IROL Violation Report with its Compliance Monitor within five business days of the initiation of the IROL event.

**D. Compliance**

**1. Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

**1.2. Compliance Monitoring Period and Reset Timeframe**

The performance-reset period shall be 12 months from the last violation.

**1.3. Data Retention**

The reliability coordinator shall keep IROL violation reports, operations logs, or other documentation for three calendar years. The compliance monitor shall keep audited data for three calendar years.

**1.4. Additional Compliance Information**

The reliability coordinator shall demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The reliability coordinator shall have the following available for its compliance monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances

**1.4.2** IROL violation reports

**2. Levels of Non-Compliance**

**2.1. Level 1:** IROL exceeded for a time less than or equal to  $T_v$  and no documentation to indicate actions taken or directives issued to mitigate the instance.

**2.2. Level 2:** Not Applicable

**2.3. Level 3:** Not Applicable

**2.4. Level 4:** IROL exceeded for time greater than  $T_v$ .

**E. Regional Differences**

None identified

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted (December 18, 2003 - January 6, 2004)
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

### Description of Current Draft:

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

### Future Development Plan:

#### Anticipated Actions

1. Post for 45-day comment period
2. Post for 30-day pre-ballot period.
3. First ballot of Version 0 standards.
4. Recirculation ballot of Version 0 standards.
5. 30-day posting before board adoption.
6. Board adopts Version 0 standards.
7. Effective date.

#### Anticipated Date

To be determined  
To be determined

### **DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the reliability coordinator has the data it needs to monitor and assess the operation of its reliability coordinator area.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** Three months after Board of Trustee adoption.

## B. Requirements

- R1. The reliability coordinator shall specify and collect the data and information it needs to support real-time monitoring, operational planning analyses, and real-time assessments conducted relative to operating within its reliability coordinator area's interconnection reliability operating limits(IROLs). The reliability coordinator shall collect this data from the entities performing functions that have facilities monitored by the reliability coordinator, and from entities that provide real-time facility status to the reliability coordinator. This includes specifying and collecting data from the following:
  - R1.1. Balancing authorities
  - R1.2. Generator owners
  - R1.3. Generator operators
  - R1.4. Interchange authority
  - R1.5. Load-serving entities
  - R1.6. Reliability coordinators
  - R1.7. Transmission operators
  - R1.8. Transmission owners
- R2. The reliability coordinator shall specify when to supply data and information (based on its hardware and software requirements, and the time needed to do its operational planning analyses).
- R3. The reliability coordinator shall notify its compliance monitor (within 5 business days of being unable to resolve the issue) when both of the following conditions are present:
  - R3.1. An entity that has data needed to support real-time monitoring, perational planning, or real-time assessments relative to operating within the reliability coordinator's reliability coordinator area has not provided data as specified, and
  - R3.2. The reliability coordinator was unable to resolve the issue with the entity responsible for providing the data.

## C. Measures

- M1. The reliability coordinator shall have a documented specification for data needed to build and maintain models needed to support real-time monitoring, operational planning analyses, and real-time assessments relative to interconnection reliability operating limits.

- M1.1** Specification shall include a list of required data, a mutually agreeable format, and timeframe and periodicity for providing data.
- M1.2** Specification shall address the data provision process to use when automated real-time system operating data is unavailable.
- M2.** The reliability coordinator shall have evidence that it has distributed its data specification to entities that have Facilities monitored by the reliability coordinator and to entities that provide facility status to the reliability coordinator.
- M3.** The reliability coordinator shall have evidence it notified its compliance monitor when an entity that has facilities monitored by the reliability coordinator, or an entity that provides facility status to the reliability coordinator, does not provide data as specified and the reliability coordinator was unable to resolve the issue with the entity responsible for providing the data.
  - M3.1** If the reliability coordinator does not receive data as specified, and is unable to resolve the situation, then the reliability coordinator shall notify its compliance monitor within five business days of discovering that the issue of the missing data could not be resolved.

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

Regional Reliability Organization

#### **1.2. Compliance Monitoring Period and Reset Timeframe**

The performance-reset period shall be 12 months from the last violation.

#### **1.3. Data Retention**

The reliability coordinator shall keep its data specification(s) for three calendar years. The compliance monitor shall keep audited data for three calendar years.

#### **1.4. Additional Compliance Information**

The reliability coordinator shall demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance. The reliability coordinator shall have the following available for its compliance monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Data specification(s)

**1.4.2** Proof of distribution of the data specification(s)

### **2. Levels of Non-Compliance**

- 2.1. Level 1:** Data specification incomplete (missing either the list of required data, a mutually agreeable format, a timeframe for providing data, or a data provision process to use when automated real-time system operating data is unavailable).
- 2.2. Level 2:** No data specification or the specification not distributed to the entities that have Facilities monitored by the reliability coordinator and the entities that provide the reliability coordinator with facility status.
- 2.3. Level 3:** Not Applicable

2.4. Level 4: Not Applicable

**E. Regional Differences**

None identified

**Version History**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted (December 18, 2003 - January 6, 2004)
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

### Description of Current Draft:

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |  |                  |
|--|------------------|
| 1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period. | To be determined |
| 2. Post for 30-day pre-ballot period.  | To be determined |
| 3. First ballot of Version 0 standards.  | To be determined |
| 4. Recirculation ballot of Version 0 standards.  | To be determined |
| 5. 30-day posting before board adoption.   | To be determined |
| 6. Board adopts Version 0 standards.   | To be determined |
| 7. Effective date.   | To be determined |

## DEFINITIONS OF TERMS USED IN STANDARD

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** **Providing Reliability–Related Data to the Reliability Coordinator**
2. **Number:** IRO-011-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the reliability coordinator has the data it needs to monitor and assess the operation of its reliability coordinator area.
4. **Applicability**
  - 4.1. Balancing Authority
  - 4.2. Generator Owner
  - 4.3. Generator Operator
  - 4.4. Interchange Authority
  - 4.5. Load-Serving Entity
  - 4.6. reliability coordinator
  - 4.7. Transmission Operator
  - 4.8. Transmission Owner
5. **Proposed Effective Date:** Three months after Board of Trustee adoption.

## B. Requirements

- R1. Each entity performing one of the following functions shall provide data, and information, as specified, to the reliability coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the reliability coordinator to support real-time monitoring, operational planning analyses, and real-time assessments conducted relative to operating within its reliability coordinator area’s interconnection reliability operating limits (IROLs).
  - R1.1. Balancing Authority
  - R1.2. Generator Owner
  - R1.3. Generator Operator
  - R1.4. Interchange Authority
  - R1.5. Load-serving Entity
  - R1.6. Reliability Coordinator
  - R1.7. Transmission Operator
  - R1.8. Transmission Owner

## C. Measures

- M1. The balancing authority, generator owner, generator operator, load-serving entity, reliability coordinator, transmission operator and transmission owner shall each have the following:
  - M1.1 Evidence that it provided data and information, as specified, to the requesting reliability coordinator, within the timeframe specified, in the mutually agreed upon format, or
  - M1.2 Evidence that it committed to providing the data identified in the specification.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Timeframe

The performance-reset period is 12 months from the last violation.

#### 1.3. Data Retention

The responsible entity shall keep data transmittal documentation for three calendar years. The compliance monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The balancing authority, generator owner, generator operator, interchange authority, load-serving entity, reliability coordinator, transmission operator and transmission owner (responsible entity) shall each demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The responsible entity shall have the following available for its compliance monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Evidence indicating data was sent to the reliability coordinator or evidence that the responsible entity committed to providing the data identified in the specification.

### 2. Levels of Non-Compliance

**2.1. Level 1:** Not Applicable

**2.2. Level 2:** Not Applicable

**2.3. Level 3:** Not Applicable

**2.4. Level 4:** Data was not provided to the reliability coordinator as specified and the situation was not resolved with the reliability coordinator.

## E. Regional Differences

None identified

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC approves SAR for posting (March 10, 2002)
2. Drafting Team posts Draft SAR for comment (April 2 - May 3, 2002) (August 20 – September 29, 2002)
3. SAC approves development of standard (November 20, 2003)
4. JIC assigns development of standard to NERC (January 10, 2003)
5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted (December 18, 2003 - January 6, 2004)
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

### Description of Current Draft:

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |   |                  |
|---|------------------|
| 1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period | To be determined |
| 2. Post for 30-day pre-ballot period.   | To be determined |
| 3. First ballot of Version 0 standards.   | To be determined |
| 4. Recirculation ballot of Version 0 standards.   | To be determined |
| 5. 30-day posting before board adoption.  | To be determined |
| 6. Board adopts Version 0 standards.  | To be determined |
| 7. Effective date.  | To be determined |

### **DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Processes, Procedures, or Plans for Preventing and Mitigating Interconnection Reliability Operating Limits
2. **Number:** IRO-012-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that there are processes, procedures or plans for foreseeable instances of exceeding interconnection reliability operating limits (IROs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** Three months after Board of Trustee Adoption.

## B. Requirements

- R1. The reliability coordinator shall have one or more operating processes, procedures, or plans that identify actions it shall take or actions it shall direct others to take, for both prevention and mitigation of instances of exceeding its IROs.

## C. Measures

- M1. The reliability coordinator shall have one or more documented operating processes, procedures, or plans that address both preventing and mitigating instances of exceeding IROs. There shall be evidence that the reliability coordinator coordinated the development of these operating procedures, processes, or plans with those entities responsible for taking actions and with those entities impacted by such actions.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The performance-reset period is 12 months from the last violation.
  - 1.3. **Data Retention**

The reliability coordinator shall keep its action plan for three calendar years. The compliance monitor shall keep audit records for three calendar years.
  - 1.4. **Additional Compliance Information**

The reliability coordinator shall demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The reliability coordinator shall have the following available for its compliance monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint.

    - 1.4.1 Processes, procedures, or plans that address preventing and mitigating instances of exceeding IROs.

**2. Levels of Non-Compliance**

- 2.1. Level 1:** Operating processes, procedures, or plans for both preventing and mitigating instances of exceeding IROs exist, but these documents weren't coordinated with all involved and impacted entities.
- 2.2. Level 2:** Operating processes, procedures, or plans for both preventing and mitigating instances of exceeding IROs exist but these documents weren't coordinated with any involved or any impacted entities.
- 2.3. Level 3:** Operating processes, procedures, or plans exist but do not address both preventing and mitigating instances of exceeding IROs.
- 2.4. Level 4:** No operating processes, procedures, or plans exist addressing preventing and mitigating instances of exceeding IROs.

**E. Regional Differences**

None identified

5. Drafting Team posts Drafts for comment (February 18 – April 2, 2003) (July 1 – August 29, 2003)
6. Balloted (December 18, 2003 – January 6, 2004)
7. Drafting Team posts Drafts for comment (March 1 – April 14, 2004)

### Description of Current Draft:

This informational draft reflects the Standard Authorization Committee’s directive to change the ‘reliability authority’ to the ‘reliability coordinator’. The drafting team is not soliciting comments during this posting.

### Future Development Plan:

#### Anticipated Actions

#### Anticipated Date

- |  |                  |
|--|------------------|
| 1. Post revised Implementation Plan and recommendations for Version 0 revisions/retirements for 45 day comment period. | To be determined |
| 2. Post for 30-day pre-ballot period.  | To be determined |
| 3. First ballot of Version 0 standards.  | To be determined |
| 4. Recirculation ballot of Version 0 standards.  | To be determined |
| 5. 30-day posting before board adoption.   | To be determined |
| 6. Board adopts Version 0 standards.   | To be determined |
| 7. Effective date.   | To be determined |

### **DEFINITIONS OF TERMS USED IN STANDARD**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Directives Relative to Interconnection Reliability Operating Limits
2. **Number:** IRO-013-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the reliability coordinator’s directives are followed.
4. **Applicability**
  - 4.1. Balancing Authority
  - 4.2. Interchange Authority
  - 4.3. Transmission Operator
5. **Proposed Effective Date:** Three months after Board of Trustee adoption.

## B. Requirements

- R1. The balancing authority, interchange authority, and transmission operator shall each follow its reliability coordinator’s directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances the balancing authority, interchange authority or transmission operator shall immediately inform the reliability coordinator of its inability to perform the directive so that the reliability coordinator can implement alternate remedial actions. The directives covered by this requirement shall be those that:
  - R1.1. Prevent instances of exceeding interconnection reliability operating limits (IROLs).
  - R1.2. Mitigate the magnitude and duration of instances of exceeding IROLs.
- R2. The balancing authority, interchange authority, and transmission operator shall notify its reliability coordinator when the actions associated with a directive have been completed.
  - R2.1. The balancing authority, interchange authority, and transmission operator shall each document the reliability coordinator’s directives and its actions taken.

## C. Measures

- M1. The Responsible Entity shall have the following documentation in an operations log or other data source(s), to show that it followed each directive it received relative to an IROL:
  - M1.1 Date and time of each reliability coordinator directive received
  - M1.2 Directive issued by the reliability coordinator
  - M1.3 Actions taken in response to the reliability coordinator’s directive

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Regional Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Timeframe**

The performance-reset period is 12 months from the last violation.

**1.3. Data Retention**

The balancing authority, interchange authority, and transmission operator shall keep its documentation for three calendar years. The compliance monitor shall keep audit records for three calendar years.

**1.4. Additional Compliance Information**

The balancing authority, interchange authority, and transmission operator shall each demonstrate compliance through self-certification submitted to its compliance monitor annually. The compliance monitor may also use scheduled on-site reviews every three years, and investigations upon complaint to assess performance.

The balancing authority, interchange authority and transmission operator shall each make the following available for its compliance monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations log or other data source(s) to show the following for each instance of being issued a reliability coordinator directive relative to an IROL:

**1.4.1.1** Date and time of each reliability coordinator directive received.

**1.4.1.2** Directive issued by the reliability coordinator.

**1.4.1.3** Actions taken in response to reliability coordinator’s directive.

**2. Levels of Non-Compliance**

**2.1. Level 1:** The reliability coordinator’s directives relative to preventing or mitigating instances of exceeding IROLs were followed but the documentation did not include the date and time of each directive received, the directive received, the actions taken, in response to the directive.

**2.2. Level 2:** Not Applicable

**2.3. Level 3:** Not Applicable

**2.4. Level 4:** Did not follow the reliability coordinator’s directives.

**E. Regional Differences**

None identified

**Version History**

Version	Date	Action	Change Tracking
---------	------	--------	-----------------

## A. Introduction

1. **Title:** Emergency Operations Planning
2. **Number:** EOP-001-~~0~~1
3. **Purpose:** Each Transmission Operator and Balancing Authority needs to develop, maintain, and implement a set of plans to mitigate operating emergencies. These plans need to be coordinated with other Transmission Operators and Balancing Authorities, and the Reliability Coordinator.
4. **Applicability**
  - 4.1. Balancing Authorities.
  - 4.2. Transmission Operators.
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals April 1, 2005

## B. Requirements

- R1.** Balancing Authorities shall have operating agreements with adjacent Balancing Authorities that shall, at a minimum, contain provisions for emergency assistance, including provisions to obtain emergency assistance from remote Balancing Authorities.
- ~~**R2.**The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.~~
- ~~**R3.R2.**~~ Each Transmission Operator and Balancing Authority shall:
- ~~**R3.1.R2.1.**~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies for insufficient generating capacity.
- ~~**R3.2.R2.2.**~~ Develop, maintain, and implement a set of plans to mitigate operating emergencies on the transmission system.
- ~~**R3.3.R2.3.**~~ Develop, maintain, and implement a set of plans for load shedding.
- ~~**R3.4.R2.4.**~~ Develop, maintain, and implement a set of plans for system restoration.
- ~~**R4.R3.**~~ Each Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plans shall include:
- ~~**R4.1.R3.1.**~~ Communications protocols to be used during emergencies.
- ~~**R4.2.R3.2.**~~ A list of controlling actions to resolve the emergency. Load reduction, in sufficient quantity to resolve the emergency within NERC-established timelines, shall be one of the controlling actions.
- ~~**R4.3.R3.3.**~~ The tasks to be coordinated with and among adjacent Transmission Operators and Balancing Authorities.
- ~~**R4.4.R3.4.**~~ Staffing levels for the emergency.
- ~~**R5.R4.**~~ Each Transmission Operator and Balancing Authority shall include the applicable elements in Attachment 1-EOP-001-0 when developing an emergency plan.

## Standard EOP-001-~~0~~1 — Emergency Operations Planning

---

**R6.R5.** The Transmission Operator and Balancing Authority shall annually review and update each emergency plan. The Transmission Operator and Balancing Authority shall provide a copy of its updated emergency plans to its Reliability Coordinator and to neighboring Transmission Operators and Balancing Authorities.

**R7.R6.** The Transmission Operator and Balancing Authority shall coordinate its emergency plans with other Transmission Operators and Balancing Authorities as appropriate. This coordination includes the following steps, as applicable:

**R7.1.R6.1.** The Transmission Operator and Balancing Authority shall establish and maintain reliable communications between interconnected systems.

**R7.2.R6.2.** The Transmission Operator and Balancing Authority shall arrange new interchange agreements to provide for emergency capacity or energy transfers if existing agreements cannot be used.

**R7.3.R6.3.** The Transmission Operator and Balancing Authority shall coordinate transmission and generator maintenance schedules to maximize capacity or conserve the fuel in short supply. (This includes water for hydro generators.)

**R7.4.R6.4.** The Transmission Operator and Balancing Authority shall arrange deliveries of electrical energy or fuel from remote systems through normal operating channels.

### C. Measures

- M1.** The Transmission Operator and Balancing Authority shall have its emergency plans available for review by the Regional Reliability Organization at all times.
- M2.** The Transmission Operator and Balancing Authority shall have its two most recent annual self-assessments available for review by the Regional Reliability Organization at all times.

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

##### 1.2. Compliance Monitoring Period and Reset Timeframes

The Regional Reliability Organization shall review and evaluate emergency plans every three years to ensure that the plans consider the applicable elements of Attachment 1-EOP-001-0.

The Regional Reliability Organization may elect to request self-certification of the Transmission Operator and Balancing Authority in years that the full review is not done.

Reset: one calendar year.

##### 1.3. Data Retention

Current plan available at all times.

##### 1.4. Additional Compliance Information

Not specified.

#### 2. Levels of Non-Compliance

- 2.1. Level 1:** One of the applicable elements of Attachment 1-EOP-001-0 has not been addressed in the emergency plans.

## Standard EOP-001-~~0~~1— Emergency Operations Planning

---

- 2.2. Level 2:** Two of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.
- 2.3. Level 3:** Three of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans.
- 2.4. Level 4:** Four or more of the applicable elements of Attachment 1-EOP-001-0 have not been addressed in the emergency plans or a plan does not exist.

### E. Regional Differences

None identified.

### Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

**Attachment 1-EOP-001-0**

**Elements for Consideration in Development of Emergency Plans**

1. Fuel supply and inventory — An adequate fuel supply and inventory plan that recognizes reasonable delays or problems in the delivery or production of fuel.
2. Fuel switching — Fuel switching plans for units for which fuel supply shortages may occur, e.g., gas and light oil.
3. Environmental constraints — Plans to seek removal of environmental constraints for generating units and plants.
4. System energy use — The reduction of the system's own energy use to a minimum.
5. Public appeals — Appeals to the public through all media for voluntary load reductions and energy conservation including educational messages on how to accomplish such load reduction and conservation.
6. Load management — Implementation of load management and voltage reductions, if appropriate.
7. Optimize fuel supply — The operation of all generating sources to optimize the availability.
8. Appeals to customers to use alternate fuels — In a fuel emergency, appeals to large industrial and commercial customers to reduce non-essential energy use and maximize the use of customer-owned generation that rely on fuels other than the one in short supply.
9. Interruptible and curtailable loads — Use of interruptible and curtailable customer load to reduce capacity requirements or to conserve the fuel in short supply.
10. Maximizing generator output and availability — The operation of all generating sources to maximize output and availability. This should include plans to winterize units and plants during extreme cold weather.
11. Notifying IPPs — Notification of cogeneration and independent power producers to maximize output and availability.
12. Requests of government — Requests to appropriate government agencies to implement programs to achieve necessary energy reductions.
13. Load curtailment — A mandatory load curtailment plan to use as a last resort. This plan should address the needs of critical loads essential to the health, safety, and welfare of the community. Address firm load curtailment.
14. Notification of government agencies — Notification of appropriate government agencies as the various steps of the emergency plan are implemented.
15. Notifications to operating entities — Notifications to other operating entities as steps in emergency plan are implemented.

## A. Introduction

1. **Title:** Reliability Coordination — Facilities
2. **Number:** IRO 002-~~12~~
3. **Purpose:** Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.
4. **Applicability**
  - 4.1. Reliability Coordinators.
5. **Proposed Effective Date:** ~~January 1, 2007~~ First day of first quarter, three months after regulatory approvals.

## B. Requirements

**R1.** Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.

~~**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities, or adjacent Reliability Coordinators.~~

**R3.R2.** Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.

**R4.R3.** Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.

**R5.R4.** Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.

~~**R6.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.~~

R7.R5. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.

R8.R6. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.

R9.R7. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages.

### C. Measures

**M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 43.

**M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data-link facility description document, computer print-out, training-document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 43.

~~**M3.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a letter to Transmission Operators, Balancing Authorities, Transmission Owners, Generator Owners, Generator Operators, and Load Serving Entities, or adjacent Reliability Coordinators, or other equivalent evidence that will be used to confirm that the Reliability Coordinator has requested the data required to support its reliability coordination tasks. (Requirement 2)~~

M4.M3. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.

M5.M4. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 57.

**M6.M5.** Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement **86**)

**M7.M6.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement **9-7** Part 1.

**M8.M7.** Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement **9-7** Part 2.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance. Monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

Each Reliability Coordinator shall have current in-force documents used to show compliance with Measures 1 through **87**.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

None.

**2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in ~~R3~~R2.

~~2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~2.3.1 Has not requested the data required to support its reliability coordination tasks. (Requirement 2)~~

~~2.3.2.2.3.~~ Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (~~R7~~R5) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in ~~R9~~R7.

**2.4. Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

**2.4.1** Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and ~~R4~~R3)

**2.4.2** Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in ~~R5~~R4.

**2.4.3** Does not have a documented procedure for the use of its backup monitoring facilities. (~~R8~~R6)

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking

**Standard IRO-002-1~~2~~ — Reliability Coordination — Facilities**

---

		Date	
1	November 1, 2006	Adopted by Board of Trustees	Revised

Retire entire standard

## A. Introduction

1. **Title:** ~~Reliability Coordination — Wide Area View~~
2. **Number:** ~~IRO-003-2~~
3. **Purpose:** ~~The Reliability Coordinator must have a wide-area view of its own Reliability Coordinator Area and that of neighboring Reliability Coordinators.~~
4. **Applicability**  
~~4.1. Reliability Coordinators.~~
5. **Effective Date:** ~~January 1, 2007~~ When IRO-007-1 becomes effective.

## B. Requirements

- ~~R1. Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~
- ~~R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.~~

## C. Measures

- ~~M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~
  - 1.2. **Compliance Monitoring and Reset Time Frame**

~~One or more of the following methods will be used to assess compliance:~~

    - ~~– Self-certification (Conducted annually with submission according to schedule.)~~
    - ~~– Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~

- ~~–Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~–Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case by case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

### **1.3. Data Retention**

~~Each Reliability Coordinator shall have current in force documents used to show compliance with Measure 1.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

### **1.4. Additional Compliance Information**

~~None.~~

## **2. Levels of Non-Compliance for a Reliability Coordinator**

**2.1. Level 1:** ~~Not applicable.~~

**2.2. Level 2:** ~~Not applicable.~~

**2.3. Level 3:** ~~Not applicable.~~

**2.4. Level 4:** ~~Did not produce acceptable evidence to confirm that it monitors adjacent Reliability Coordinator Areas as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.~~

## **E. Regional Differences**

~~None identified.~~

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	February 7, 2006	Adopted by Board of Trustees	Revised
2	November 1, 2006	Adopted by Board of Trustees	Revised

Retire Entire Standard

**A. Introduction**

1. **Title:** ~~Reliability Coordination — Operations Planning~~
2. **Number:** ~~IRO-004-1~~
3. **Purpose:** ~~Each Reliability Coordinator must conduct next-day reliability analyses for its Reliability Coordinator Area to ensure the Bulk Electric System can be operated reliably in anticipated normal and Contingency conditions. System studies must be conducted to highlight potential interface and other operating limits, including overloaded transmission lines and transformers, voltage and stability limits, etc. Plans must be developed to alleviate System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) violations.~~
4. **Applicability**
  - ~~4.1. Reliability Coordinators.~~
  - ~~4.2. Balancing Authorities.~~
  - ~~4.3. Transmission Operators.~~
  - ~~4.4. Transmission Service Providers.~~
  - ~~4.5. Transmission Owners.~~
  - ~~4.6. Generator Owners.~~
  - ~~4.7. Generator Operators.~~
  - ~~4.8. Load-Serving Entities.~~
5. **Effective Date:** First day of first quarter, three months after regulatory approvals~~November 1, 2006~~

**B. Requirements**

- ~~R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.~~
- ~~R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.~~
- ~~R3-R1. \_\_\_\_\_ Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.~~
- ~~R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.~~

~~R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.~~

~~R6.R2. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.~~

~~R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.~~

### C. Measures

~~M1. Evidence that the Reliability Coordinator conducted next day contingency analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System could be operated reliably in anticipated normal and Contingency conditions.~~

### D. Compliance

#### 1. Compliance Monitoring Process

~~Entities will be selected for an on-site audit at least every three years. For a selected 30-day period in the previous three calendar months prior to the on-site audit, Reliability Coordinators will be asked to provide documentation showing that next-day reliability analyses were conducted each day to ensure the bulk power system could be operated in anticipated normal and Contingency conditions; and that they identified potential interface and other operating limits including overloaded transmission lines and transformers, voltage and stability limits; etc.~~

##### 1.1. Compliance Monitoring Responsibility

~~Self-Certification: Each Reliability Coordinator must annually self-certify compliance to its Regional Reliability Organization with the completion of the studies and action plans in Requirements R1, R2 and R3.~~

~~Exception Reporting: Reliability Coordinators will prepare a monthly report to the Regional Reliability Organization for each month that system studies were not conducted, indicating the dates that studies were not done and the reason why.~~

##### 1.2. Compliance Monitoring Period and Reset Time Frame

~~One year without a violation from the time of the violation.~~

##### 1.3. Data Retention

~~Documentation shall be available for 3 months to provide verification that system studies were performed as required.~~

##### 1.4. Additional Compliance Information

~~None identified.~~

#### 2. Levels of Non-Compliance

~~2.1. Level 1: System studies were not conducted for one day in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.2.2.1. Level 2: System studies were not conducted for 2–3 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.3.2.2. Level 3: System studies were not conducted for 4–5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

~~2.4.2.3. Level 4: System studies were not conducted for more than 5 days in a calendar month and/or the action plans were not developed to maintain transmission loading within acceptable limits for potential interface and other IROL violations.~~

**E. Regional Differences**

~~None identified.~~

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-~~2~~3
3. **Purpose:** The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.
4. **Applicability**
  - 4.1. Reliability Coordinators.
  - 4.2. Balancing Authorities.
  - 4.3. Transmission Operators.
  - 4.4. Transmission Service Providers.
  - 4.5. Generator Operators.
  - 4.6. Load-Serving Entities.
  - 4.7. Purchasing-Selling Entities.
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals~~January 1, 2007~~

## B. Requirements

- ~~R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:~~
- ~~R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.~~
  - ~~R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.~~
  - ~~R1.3. Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.~~
  - ~~R1.4. System real and reactive reserves (actual versus required).~~
  - ~~R1.5. Capacity and energy adequacy conditions.~~
  - ~~R1.6. Current ACE for all its Balancing Authorities.~~
  - ~~R1.7. Current local or Transmission Loading Relief procedures in effect.~~
  - ~~R1.8. Planned generation dispatches.~~
  - ~~R1.9. Planned transmission or generation outages.~~
  - ~~R1.10. Contingency events.~~
- R2.R1. Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that

~~Interchange Transaction information available to all Reliability Coordinators in the Interconnection.~~

~~R3. As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.~~

R4.R2. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.

~~R5. Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.~~

R6.R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.

R7.R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.

R8.R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

R9.R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.

R10.R7. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.

R11.R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.

~~R12.R9.~~ Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.

~~R10.~~ ~~Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection.~~ In instances where there is a difference in derived limits, the ~~Reliability Coordinator and its~~ Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.

**R11.** Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs ~~or~~ and IROLs within its wide-area view. The Transmission Service Providers shall respect ~~these~~ SOLs ~~or~~ and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.

~~R15.R12.~~ Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

~~R16.~~ ~~Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.~~

~~R17.~~ ~~When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.~~

### C. Measures

~~M1.~~ ~~The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.~~

~~M2.M1.~~ ~~The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Historical Tag Archive information, Interchange Transaction records, computer printouts, voice recordings or transcripts of voice recordings or equivalent evidence that will be used to confirm that it was aware of and made Interchange~~

Transaction information ~~available to all other Reliability Coordinators~~, as specified in Requirement ~~2~~1.

~~M3.~~ If a potential or actual IROL violation occurs, the Reliability Coordinator involved in the event shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, system event logs, operator action notes or equivalent evidence that will be used to determine if it initiated control actions or emergency procedures to relieve that IROL violation within 30 minutes. (Requirement 3 Part 2 and Requirement 5)

~~M4.M2.~~ If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement ~~4~~2 Part 2 and Requirement ~~4~~7)

~~M5.M3.~~ The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement ~~6~~3)

~~M6.M4.~~ The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it disseminated information within its Reliability Coordinator Area in accordance with Requirement ~~7~~4.

~~M7.M5.~~ The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement ~~8~~5 Part 1.

~~M8.M6.~~ The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement ~~8~~5 Part 2)

~~M9.M7.~~ The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement ~~9~~6 Part 1)

~~M10.M8.~~ If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs,

voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement ~~11.8~~ Part 1)

**M11.M9.** If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement ~~12.9~~)

**M10.** If there is an instance where there is a disagreement on a derived limit, the ~~Reliability Coordinator,~~ Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (~~Part 2 of~~ Requirement ~~13.10~~)

**M13.M11.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it provided SOL and IROL information to Transmission Service Providers within its Reliability Coordinator Area. (Requirement ~~14.11~~, Part 1)

**M14.M12.** The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement ~~14.11~~ Part 2)

**M15.M13.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area as specified in Requirement ~~15.12~~ Part 1.

**M16.M14.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement ~~15.12~~ Part 2.

**M17.M15.** The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has been mitigated. (Requirement ~~15.12~~ Part 3)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

#### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### 1.3. Data Retention

For Measures ~~1-9 and 11~~, each Reliability Coordinator shall have its current in-force documents as evidence.

For Measures ~~21-10-8 and~~ 21-10-8 and ~~Measure 1311~~, and Measures ~~15-13~~ through 1615, the Reliability Coordinator shall keep 90 days of historical data (evidence).

For Measure ~~68~~, the Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

For Measure ~~1210~~, the ~~Reliability Coordinator~~, Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

For Measure ~~1412~~, the Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

#### 1.4. Additional Compliance Information

None.

2. **Levels of Non-Compliance for a Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider**
  - 2.1. **Level 1:** Not applicable.
  - 2.2. **Level 2:** Not applicable.
  - 2.3. **Level 3:** Not applicable.
  - 2.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:
    - 2.4.1 Did not follow the Reliability Coordinator's directives in accordance with ~~R8-R5~~ Part 2).
    - 2.4.2 Did not operate to the most limiting parameter when a difference in derived limits existed. (~~R13-R10~~Part 2)
3. **Levels of Non-Compliance for a Reliability Coordinator:**
  - 3.1. **Level 1:** Not applicable.
  - 3.2. **Level 2:** ~~Did not make Interchange Transaction information available to all other Reliability Coordinators in the Interconnection. (Requirement 2)~~Not applicable.
  - 3.3. **Level 3:** There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:
    - 3.3.1 Did not communicate to each of its Balancing Authorities and Transmission Operators to make them aware of GMD forecast information or did not assist in the development of any required response plans to a predicted GMD. (Requirement ~~6~~3)
    - 3.3.2 Did not disseminate information within its Reliability Coordinator Area. (Requirement ~~7~~4)
  - 3.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:
    - ~~3.4.1 Does not meet one or more of the requirements as specified in requirement 1 (Requirements 1.1 through R1.9)~~
    - ~~3.4.2 Did not make Interchange Transaction information available to all other Reliability Coordinators. (Requirement 2)~~
    - ~~3.4.3 Did not initiate control actions or emergency procedures to relieve an IROL violation without delay, and no longer than 30 minutes. (Requirement 3 Part 2 and Requirement 5)~~
    - 3.4.3.4.1 Did not direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement ~~4~~2 Part 2)
    - ~~3.4.5~~3.4.2 Did not monitor the system frequency or each of its Balancing Authorities performance or did not direct rebalancing to return to DCS and CPS compliance. (Requirement ~~8~~5 Part 1)
    - ~~3.4.6~~3.4.3 Did not coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to

## Standard IRO-005-~~2.3~~ — Reliability Coordination — Current Day Operations

mitigate potential or actual SOL, ~~IROL~~, CPS, or DCS violations. (Requirement ~~96~~)

~~3.4.73.4.4~~ When it identified a source of large Area Control Errors, it did not initiate corrective actions with the appropriate Balancing Authority if the problem was inside its Reliability Coordinator Area. (Requirement ~~11-8~~ part 1)

~~3.4.83.4.5~~ Did not provide evidence that it was aware of the impact of the operation of a Special Protection System on inter-area flows. (Requirement ~~129~~)

~~3.4.9~~ Did not operate to the most limiting parameter when a difference in derived limits existed. (Requirement ~~13 Part 2~~)

~~3.4.10~~ Did not provide Transmission Service Providers with SOLs or IROLs (within the Reliability Coordinator's wide-area view) (Requirement ~~14 Part 1~~)

~~3.4.113.4.6~~ Did not issue alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area. (Requirement ~~1512~~)

### 4. Levels of Non-Compliance for a Transmission Service Provider

4.1. Level 1: Not applicable.

4.2. Level 2: Not applicable.

4.3. Level 3: Not applicable.

4.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

4.4.1 Did not operate to the most limiting parameter when a difference in derived limits existed. (~~R13-R10~~Part 2)

4.4.2 Did not respect the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 14-~~Part-12~~)

### E. Regional Differences

None identified.

### Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata

## A. Introduction

1. **Title:** **Planned Outage Coordination**
2. **Number:** TOP-003-~~01~~
3. **Purpose:** Scheduled generator and transmission outages that may affect the reliability of interconnected operations must be planned and coordinated among Balancing Authorities, Transmission Operators, and Reliability Coordinators.
4. **Applicability**
  - 4.1. Generator Operators.
  - 4.2. Transmission Operators.
  - 4.3. Balancing Authorities.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** ~~April 1, 2005~~ First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. Generator Operators and Transmission Operators shall provide planned outage information.
  - R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.
  - R1.2. Each Transmission Operator shall provide outage information daily to ~~its Reliability Coordinator, and to~~ affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. ~~The Reliability Coordinator shall establish the outage reporting requirements.~~
  - R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.
- R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.
- R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.
- R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.

**C. Measures**

- M1.** Evidence that the Generator Operator, Transmission Operator, and Balancing Authority, ~~and Reliability Coordinator~~ reported and coordinated scheduled outage information as indicated in the requirements above.

## D. Compliance

### 1. Compliance Monitoring Process

Each Regional Reliability Organization shall conduct a review every three years to ensure that each responsible entity has a process in place to provide planned generator and/or bulk transmission outage information to their Reliability Coordinator, and with neighboring Transmission Operators and Balancing Authorities.

Investigation: At the discretion of the Regional Reliability Organization or NERC, an investigation may be initiated to review the planned outage process of a monitored entity due to a complaint of non-compliance by another entity. Notification of an investigation must be made by the Regional Reliability Organization to the entity being investigated as soon as possible, but no later than 60 days after the event. The form and manner of the investigation will be set by NERC and/or the Regional Reliability Organization.

#### 1.1. Compliance Monitoring Responsibility

A Reliability Coordinator makes a request for an outage to “not be taken” because of a reliability impact on the grid and the outage is still taken. The Reliability Coordinator must provide all its documentation within three business days to the Regional Reliability Organization. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

#### 1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year without a violation from the time of the violation.

#### 1.3. Data Retention

One calendar year.

#### 1.4. Additional Compliance Information

Not specified.

### 2. Levels of Non-Compliance

**2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 and R3 has a process in place to provide information to their Reliability Coordinator but does not have a process in place (where permitted by legal agreements) to provide this information to the neighboring Balancing Authority or Transmission Operator.

**2.2. Level 2:** N/A.

**2.3. Level 3:** N/A.

**2.4. Level 4:** There is no process in place to exchange outage information, or the entity responsible for reporting information under Requirements R1 to R3 does not follow the directives of the Reliability Coordinator to cancel or reschedule an outage.

## E. Regional Differences

None identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

## A. Introduction

1. **Title:** Operational Reliability Information
2. **Number:** TOP-005-~~1~~2
3. **Purpose:** To ensure reliability entities have the operating data needed to monitor system conditions within their areas.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - ~~4.3. Reliability Coordinators.~~
  - ~~4.4.3.~~ Purchasing Selling Entities.
5. **Proposed Effective Date:** ~~November 1, 2006~~First day of first quarter, three months after regulatory approvals.

## B. Requirements

~~R1.~~ Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.

~~R1.1.~~ Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1 TOP 005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.

~~R2.R1.~~ As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”

~~R3.R2.~~ Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1-TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.

~~R4.R3.~~ Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.

## C. Measures

- M1. Evidence that the ~~Reliability Coordinator~~, Balancing Authority, Transmission Operator, and Purchasing-Selling Entity is providing the information required, within the time intervals specified, and in a format agreed upon by the requesting entities.

## D. Compliance

1. **Compliance Monitoring Process**

**1.1. Compliance Monitoring Responsibility**

Self-Certification: Entities shall annually self-certify compliance to the measures as required by its Regional Reliability Organization.

Exception Reporting: Each Region shall report compliance and violations to NERC via the NERC compliance reporting process.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Periodic Review: Entities will be selected for operational reviews at least every three years. One calendar year without a violation from the time of the violation.

**1.3. Data Retention**

Not specified.

**1.4. Additional Compliance Information**

Not specified.

**2. Levels of Non-Compliance**

**2.1. Level 1:** Each entity responsible for reporting information under Requirements R1 to ~~R5~~R3 is providing the requesting entities with the data required, in specified time intervals and format, but there are problems with consistency of delivery identified in the measuring process that need remedy (e.g., the data is not supplied consistently due to equipment malfunctions, or scaling is incorrect).

**2.2. Level 2:** N/A.

**2.3. Level 3:** N/A.

**2.4. Level 4:** Each entity responsible for reporting information under Requirements R1 to ~~R5~~R3 is not providing the requesting entities with data with the specified content, timeliness, or format. The information missing is included in the requesting entity’s list of data.

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

**Attachment 1-TOP-005-0**

**Electric System Reliability Data**

This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.

1. The following information shall be updated at least every ten minutes:
  - 1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:
    - 1.1.1 Status.
    - 1.1.2 MW or ampere loadings.
    - 1.1.3 MVA capability.
    - 1.1.4 Transformer tap and phase angle settings.
    - 1.1.5 Key voltages.
  - 1.2. Generator data.
    - 1.2.1 Status.
    - 1.2.2 MW and MVAR capability.
    - 1.2.3 MW and MVAR net output.
    - 1.2.4 Status of automatic voltage control facilities.
  - 1.3. Operating reserve.
    - 1.3.1 MW reserve available within ten minutes.
  - 1.4. Balancing Authority demand.
    - 1.4.1 Instantaneous.
  - 1.5. Interchange.
    - 1.5.1 Instantaneous actual interchange with each Balancing Authority.
    - 1.5.2 Current Interchange Schedules with each Balancing Authority by individual Interchange Transaction, including Interchange identifiers, and reserve responsibilities.
    - 1.5.3 Interchange Schedules for the next 24 hours.
  - 1.6. Area Control Error and frequency.
    - 1.6.1 Instantaneous area control error.
    - 1.6.2 Clock hour area control error.
    - 1.6.3 System frequency at one or more locations in the Balancing Authority.
2. Other operating information updated as soon as available.
  - 2.1. Interconnection Reliability Operating Limits and System Operating Limits in effect.
  - 2.2. Forecast of operating reserve at peak, and time of peak for current day and next day.
  - 2.3. Forecast peak demand for current day and next day.
  - 2.4. Forecast changes in equipment status.

- 2.5. New facilities in place.
- 2.6. New or degraded special protection systems.
- 2.7. Emergency operating procedures in effect.
- 2.8. Severe weather, fire, or earthquake.
- 2.9. Multi-site sabotage.

## A. Introduction

1. **Title:** Monitoring System Conditions
2. **Number:** TOP-006-~~1~~2
3. **Purpose:**  
To ensure critical reliability parameters are monitored in real-time.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Generator Operators.
  - 4.4. Reliability Coordinators.
5. **Proposed Effective Date:** ~~January 1, 2007~~First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.
  - R1.1. Each Generator Operator shall inform its Host Balancing Authority and the Transmission Operator of all generation resources available for use.
  - R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.
- R2. Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall monitor applicable transmission line status, real and reactive power flows, voltage, load-tap-changer settings, and status of rotating and static reactive resources.
- R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall provide appropriate technical information concerning protective relays to their operating personnel.
- R4. Each ~~Reliability Coordinator~~, Transmission Operator, and Balancing Authority shall have information, including weather forecasts and past load patterns, available to predict the system's near-term load pattern.
- R5. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use monitoring equipment to bring to the attention of operating personnel important deviations in operating conditions and to indicate, if appropriate, the need for corrective action.
- R6. Each Balancing Authority and Transmission Operator shall use sufficient metering of suitable range, accuracy and sampling rate (if applicable) to ensure accurate and timely monitoring of operating conditions under both normal and emergency situations.

- R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.

### C. Measures

- M1. The Generator Operator shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Host Balancing Authority and Transmission Operator of all generation resources available for use. (Requirement 1.1)
- M2. Each Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, operator logs, voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it informed its Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use. (Requirement 1.2)
- M3. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, computer printouts or other equivalent evidence that will be used to confirm that it monitored each of the applicable items listed in Requirement 2.
- M4. Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, printouts, training documents, description documents or other equivalent evidence that will be used to confirm that it has weather forecasts and past load patterns, available to predict the system's near-term load pattern. (Requirement 4)
- M5. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a description of its EMS alarm capability, training documents, or other equivalent evidence that will be used to confirm that important deviations in operating conditions and the need for corrective actions will be brought to the attention of its operators. (Requirement 5)
- M6. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include but is not limited to, a list of the frequency monitoring points available to the shift-operators or other equivalent evidence that will be used to confirm that it monitors system frequency. (Requirement 7)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

##### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

### 1.3. Data Retention

Each Generator Operator shall keep 90 days of historical data (evidence) for Measure 1.

Each Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence) for Measure 2.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence for Measure 3, 5 and 6.:

Each Reliability Coordinator, shall have current documents as evidence for Measure 5 and 6.

Each ~~Reliability Coordinator~~, Transmission Operator and Balancing Authority shall have current documents as evidence of compliance to Measure 4.

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all supporting compliance data

### 1.4. Additional Compliance Information

None.

## 2. Levels of Non-Compliance for Reliability Coordinators:

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

2.4.1 ~~Does not monitor all of the applicable items listed in Requirement 2. Not applicable.~~

2.4.2 ~~Did not have the information specified in R4. Not applicable.~~

2.4.3 Did not bring to the attention of its operators, important deviations in operating conditions and the need for corrective actions. (Requirement 5)

2.4.4 No evidence it monitors system frequency. (Requirement 7)

3. **Levels of Non-Compliance for Generator Operators:**

3.1. **Level 1:** Not applicable.

3.2. **Level 2:** Not applicable.

3.3. **Level 3:** Not applicable.

3.4. **Level 4:** Did not inform its Host Balancing Authority and/or the Transmission Operator of all generation resources available for use. (R1.1)

4. **Levels of Non-Compliance for Transmission Operators and Balancing Authorities:**

4.1. **Level 1:** Not applicable.

4.2. **Level 2:** Not applicable.

4.3. **Level 3:** Not applicable.

4.4. **Level 4:** There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:

4.4.1 Did not inform the Reliability Coordinator and/or other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use in accordance with R1.2.

4.4.2 Does not monitor all the applicable items listed in R2.

4.4.3 Did not have the information specified in R4.

4.4.4 Does not have monitoring to bring to the attention of operating personnel important deviations in operating conditions and the need for corrective actions as specified in R5.

4.4.5 No evidence it monitors system frequency. (R7).

**E. Regional Differences**

None identified.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

**Standard TOP-006-~~1~~2— Monitoring System Conditions**

0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized. (November 2004 through October 2006).

#### **Description of Current Draft:**

This draft reflects changes made to bring this set of standards into alignment with the format used with other standards. This draft is being posted, along with its implementation plan, for a 45-day comment period from January 2–February 15, 2006.

#### **Future Development Plan:**

##### **Anticipated Actions**

##### **Anticipated Date**

- |  |                     |
|--|---------------------|
| 1. Post for 30-day pre-ballot period.    | March 1–30, 2007    |
| 2. First ballot of standards.            | April 2–11, 2007    |
| 3. Recirculation ballot of standards.    | April 16–26, 2007   |
| 4. 30-day posting before board adoption. | April 2–May 1, 2007 |
| 5. Board adopts standards.               | May 2, 2007         |

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Real-Time Data:** Real-Time measured values, state estimator values derived from the measured values, or other calculated values derived from the measured values — may include directly monitored data, Inter-utility data exchange (e.g., Interconnection Control Area Communication Protocol or SCADA Data), and manually collected data.

**Real-Time Monitoring:** The act of scanning data and drawing conclusions about what the data indicates.

**Self-Certification:** A process by which an entity does a self-evaluation to determine if it is compliant with the specific requirements for a reliability standard.

## A. Introduction

1. **Title:** **Monitoring the Reliability Coordinator Wide Area**
2. **Number:** **IRO-007-1**
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is continuously monitored.
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs). (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Real-time Operations*)
- R2. If unanimity cannot be reached on the value for an IROL or its  $T_v$ , all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration. (*Violation Risk Factor: High*) (*Mitigation Time Horizon: Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have Real-Time Data for system operating parameters within its Wide Area available in a form that its System Operators can compare to its IROLs as evidence of real-time monitoring.
- M2. For an IROL or its  $T_v$  without agreement between Reliability Coordinators, the Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence to confirm that it used the most conservative of the values under consideration.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Electric Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Reliability Coordinator shall have evidence of compliance with M1 upon request.

The Reliability Coordinator shall keep evidence to show compliance with M2 for three calendar years

The Compliance Monitor shall keep audited data for three calendar years.
  - 1.4. **Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall demonstrate the following to its Compliance Monitor to inspect during a scheduled, on-site review or as part of an investigation upon complaint:

**1.4.1** Its System Operators actively monitoring and comparing Real-Time system operating parameters associated with IROLs.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Not applicable.

**2.3. High:** Not applicable.

**2.4. Severe:** A severe violation occurs if either of the following conditions are present:

**2.4.1** System operating parameters not monitored in Real-Time and compared against IROLs.

**2.4.2** There was a disagreement on the IROL or its  $T_v$  and the most conservative limit under consideration was not used.

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized. (November 2004 through October 2006).

#### **Description of Current Draft:**

This draft reflects changes made to bring this set of standards into alignment with the format used with other standards. This draft is being posted, along with its implementation plan, for a 45-day comment period from January 2–February 15, 2006.

#### **Future Development Plan:**

##### **Anticipated Actions**

1. Post for 30-day pre-ballot period.
2. First ballot of standards.
3. Recirculation ballot of standards.
4. 30-day posting before board adoption.
5. Board adopts standards.

##### **Anticipated Date**

March 1–30, 2007  
April 2–11, 2007  
April 16–26, 2007  
April 2–May 1, 2007  
May 2, 2007

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Operational Planning Analysis:** An analysis of the expected system conditions for the next day's operation and up to 12 months ahead. Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).

**Real-Time Assessment:** An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data.

**A. Introduction**

1. **Title:** Reliability Coordinator Operational Analyses and Real-time Assessments
2. **Number:** IRO-008-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring that the Bulk Electric System is assessed during the operations horizon.
4. **Applicability**
  - 4.1. Reliability Coordinator.
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals.

**B. Requirements**

- R1. The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning*)
- R2. The Reliability Coordinator shall perform Real-Time Assessments at least every 30 minutes to determine if its Wide Area is exceeding any IROLs or is expected to exceed any IROLs. (*Violation Risk Factor: High*) (*Mitigation Time Horizon: Real-time Operations*)
- R3. When the results of the Reliability Coordinator’s Operational Planning Analyses or Real-Time Assessments indicate the need for specific operational actions to prevent or mitigate instances of exceeding IROLs, the Reliability Coordinator shall share its results with those entities that are expected to take those actions. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Same Day Operations*)

**C. Measures**

- M1. The Reliability Coordinator shall have, and provide upon request, the results of its latest Operational Planning Analysis.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to computer output, operator logs, checklists, or other evidence to show it conducted a Real-Time Assessment at least once every 30 minutes.
- M3. The Reliability Coordinator shall have and provide upon request, evidence that could include, but is not limited to operating logs, voice recordings, transcripts of voice records, facsimiles, or other equivalent evidence that will be used to confirm that it shared the results of its Operational Planning Analyses and Real-Time Assessments with those entities expected to take actions based on that information.

**D. Compliance**

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Electric Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.
  - 1.3. **Data Retention**

The Compliance Monitor shall keep audited data for three calendar years.

The Reliability Coordinator shall keep its latest day-ahead Operational Planning Analysis.

The Reliability Coordinator shall keep evidence for M2 for the most recent two days.

The Reliability Coordinator shall keep evidence for M3 for one month.

**1.4. Additional Compliance Information**

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews once every three years, investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

**2. Violation Severity Levels**

**2.1. Lower:** Not applicable.

**2.2. Moderate:** Shared the results with some but not all of the entities that were required to take action (R3).

**2.3. High:** Real-Time Assessments were conducted but not as frequently as required (R2).

**2.4. Severe:** A severe violation exists if any of the following conditions are present:

**2.4.1** Did not perform an Operational Planning Analysis for the next day in accordance with R1.

**2.4.2** Did not perform any Real-time Assessments for any continuous eight-hour period (R2).

**2.4.3** Did not share the results of its analyses or assessments with any of the entities that were required to take action (R3).

**E. Regional Differences**

None

**F. Associated Documents**

None

**Version History**

Version	Date	Action	Change Tracking

### **Standard Development Roadmap**

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### **Development Steps Completed:**

1. SAC approves SAR for posting (March 10, 2002).
2. Drafting team posts draft SAR for comment (April 2–May 3, 2002) (August 20–September 29, 2002).
3. SAC approves development of standard (November 20, 2003).
4. JIC assigns development of standard to NERC (January 10, 2003).
5. Drafting team posts drafts for comment (February 18–April 2, 2003) (July 1–August 29, 2003).
6. Balloted December 18, 2003–January 6, 2004.
7. Drafting team posts drafts for comment (March 1–April 14, 2004).
8. Informational posting to allow the Determine Facility Ratings, System Operating Limits and Transfer Capabilities standards a chance to be finalized. (November 2004 through October 2006).

#### **Description of Current Draft:**

This draft reflects changes made to bring this set of standards into alignment with the format used with other standards. This draft is being posted, along with its implementation plan, for a 45-day comment period from January 2–February 15, 2006.

#### **Future Development Plan:**

##### **Anticipated Actions**

##### **Anticipated Date**

- |  |                     |
|--|---------------------|
| 1. Post for 30-day pre-ballot period.    | March 1–30, 2007    |
| 2. First ballot of standards.            | April 2–11, 2007    |

| 4. 30-day posting before board adoption. | April 2–May 1, 2007 |
| 5. Board adopts standards.               | May 2, 2007         |

### Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Interconnection Reliability Operating Limit Event:** Any instance of exceeding an Interconnection Reliability Operating Limit for a minimum of 30 continuous seconds.

**Interconnection Reliability Operating Limit Event Duration:** The length of time an Interconnection Reliability Operating Limit is exceeded. The duration is measured from the point in time where the limit is first exceeded for at least 30 continuous seconds and ends at the beginning of the continuous 30 seconds in which the value returns to within the Interconnection Reliability Operating Limit.

**Occurrence Period:** The time period in which performance is measured and evaluated.

## A. Introduction

1. **Title:** Reliability Coordinator Actions to Operate Within IROLs
2. **Number:** IRO-009-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring prompt action to prevent or mitigate instances of exceeding Interconnection Reliability Operating Limits (IROLs).
4. **Applicability**
  - 4.1. Reliability Coordinator
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning*)
- R2. For each IROL that is identified in advance of Real-time, the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shed) to mitigate the magnitude and duration of exceeding that IROL such that the IROL is relieved within the IROL's T<sub>v</sub>. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning*)
- R3. When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL. (*Violation Risk Factor: High*) (*Mitigation Time Horizon: Real-time Operations*)
- R4. When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL. (*Violation Risk Factor: High*) (*Mitigation Time Horizon: Real-time Operations*)

## C. Measures

- M1. The Reliability Coordinator shall have, and provide upon request, one or more documented Operating Processes, Procedures, or Plans that that will be used to confirm that it has Operating Processes, Procedures or Plans to address both preventing and mitigating instances of exceeding IROLs in accordance with Requirement 1 and Requirement 2.
- M2. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, operating logs, voice recordings, transcripts of voice recordings, or other equivalent evidence that will be used to confirm that it acted or directed others to act in accordance with Requirement 3 and Requirement 4.

## D. Compliance

1. **Compliance Monitoring Process**
  - 1.1. **Compliance Monitoring Responsibility**

Electric Reliability Organization
  - 1.2. **Compliance Monitoring Period and Reset Time Frame**

The Performance-Reset Period shall be 12 months from the last violation.

### 1.3. Data Retention

The Reliability Coordinator shall keep IROL Violation Reports, operations logs, or other documentation for three calendar years. The Compliance Monitor shall keep audited data for three calendar years.

### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually and reporting by exception. If an IROL is exceeded for time greater than  $T_v$ , the Reliability Coordinator shall complete and submit to its Compliance Monitor within five days, an IROL Violation Report.

The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations upon complaint, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Operations logs or other documentation indicating the magnitude and duration of each instance of exceeding an IROL and the actions or directives issued for each of these instances.

**1.4.2** IROL Violation Reports.

## 2. Violation Severity Levels

**2.1. Low:** Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.2. Moderate** Between 85% to 94% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.3. High:** **There shall be a high violation severity level if any of the following conditions exist:**

**2.3.1** Between 70% to 84% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.3.2** Actual system conditions showed that there was an instance of exceeding an IROL, and there was a delay before acting or directing others to act to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

**2.4. Severe:** **There shall be a severe violation severity level if any of the following conditions exist:**

**2.4.1** Less than 70% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs. (R1 and R2)

**2.4.2** An assessment of actual or expected system conditions predicted that an IROL would be exceeded, but no Operating Processes, Procedures or Plans were implemented to prevent exceeding that IROL. (R3)

**2.4.3** Actual system conditions showed that there was an instance of exceeding an IROL, and no actions or directions were given to mitigate the magnitude and duration of the instance of exceeding that IROL (R4)

**E. Regional Differences**

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*None introduced in this standard.*

## A. Introduction

1. **Title:** Reliability Coordinator Data Specification and Collection
2. **Number:** IRO-010-1
3. **Purpose:** To prevent instability, uncontrolled separation, or cascading outages that adversely impact the reliability of the interconnection by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability**
  - 4.1. Reliability Coordinator.
  - 4.2. Balancing Authority.
  - 4.3. Generator Owner.
  - 4.4. Generator Operator.
  - 4.5. Interchange Authority.
  - 4.6. Load-Serving Entity.
  - 4.7. Transmission Operator.
  - 4.8. Transmission Owner.
5. **Proposed Effective Date:** First day of first quarter, three months after regulatory approvals.

## B. Requirements

- R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning*)
  - R1.1. List of required data and information
  - R1.2. Mutually agreeable format
  - R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)
  - R1.4. Process for data provision when automated Real-Time system operating data is unavailable.
- R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning*)
- R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (*Violation Risk Factor: Medium*) (*Mitigation Time Horizon: Operations Planning; Same-day Operations; Real-time Operations*)

## C. Measures

- M1.** The Reliability Coordinator shall have, and provide upon request, a documented data specification that contains all elements identified in Requirement 1.
- M2.** The Reliability Coordinator shall have, and provide upon request, evidence that it distributed its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator.
- M3.** The Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall each have, and provide upon request, evidence that could include but is not limited to, operator logs, voice recordings, computer printouts, SCADA data, or other equivalent evidence that will be used to confirm that it provided data and information, as specified in Requirement 3.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Monitoring Responsibility

Electric Reliability Organization

#### 1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be 12 months from the last violation.

#### 1.3. Data Retention

The Reliability Coordinator shall keep its most current data specification.

The Reliability Coordinator shall keep evidence to show compliance with Measure 2

For data that is requested in advance of real-time, the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner shall keep evidence used to show compliance with Measure 3 for 3 months.

The Compliance Monitor shall keep audited data for three calendar years.

#### 1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through Self-Certification submitted to its Compliance Monitor annually. The Compliance Monitor may also use scheduled on-site reviews every three years, and investigations initiated in response to a complaint, or other methods as provided for in the Compliance Monitoring Enforcement Program, to assess performance.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within 5 days of a request as part of an investigation upon complaint:

**1.4.1** Data specification(s).

**1.4.2** Proof of distribution of the data specification(s).

### 2. Violation Severity Levels for the Reliability Coordinator

- 2.1. Lower:** There shall be a lower violation severity level if any of the following conditions exist:

- 2.1.1 Distributed its data specification to 95-99% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
    - 2.1.2 Provided 95-99% of the data and information to other Reliability Coordinators as specified. (R3)
  - 2.2. **Moderate: There shall be a moderate violation severity level of any of the following conditions exist:**
    - 2.2.1 Distributed its data specification to 85-94% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
    - 2.2.2 Provided 85-94% of the data and information to other Reliability Coordinators as specified. (R3)
  - 2.3. **High: There shall be a high violation severity level of any of the following conditions exist:**
    - 2.3.1 Data specification incomplete (missing one of the following: list of required data, a mutually agreeable format, a timeframe for providing data, a data provision process to use when automated Real-Time system operating data is unavailable). (R1)
    - 2.3.2 Distributed its data specification to 70-84% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
    - 2.3.3 Provided 70-84% of the data and information to other Reliability Coordinators as specified. (R3)
  - 2.4. **Severe: There shall be a severe violation severity level of any of the following conditions exist:**
    - 2.4.1 No data specification (R1)
    - 2.4.2 Data specification distributed to less than 70% of the entities that have Facilities monitored by the Reliability Coordinator and the entities that provide the Reliability Coordinator with Facility status. (R2)
    - 2.4.3 Provided less than 70% of the data and information to other Reliability Coordinators as specified. (R3)
- 3. **Violation Severity Levels for the Balancing Authority, Generator Owner, Generator Operator, Load-Serving Entity, Reliability Coordinator, Transmission Operator and Transmission Owner**
  - 3.1. **Lower:** Provided 95-99% of the data and information to the Reliability Coordinator as specified. (R3)
  - 3.2. **Moderate:** Provided 85-94% of the data and information to the Reliability Coordinator as specified. (R3)
  - 3.3. **High:** Provided 70-84% of the data and information to the Reliability Coordinator as specified. (R3)
  - 3.4. **Severe:** Provided less than 70% of the data and information to the Reliability Coordinator as specified. (R3)

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

**Announcement: Comment Periods Open for Balance Resources and Demand Standards and Operate within Interconnection Reliability Operating Limits Standards**

**The Standards Committee (SC) announces the following standards actions:**

**Balance Resources and Demand Standards Posted for 30-day Comment Period (January 2–31, 2007)**

The “Version 1” [Balance Resources and Demand standards](#), an associated implementation plan, and recommended changes to already-approved standards, are all posted for a 30-day comment period. This set of Version 1 standards requires Balancing Authorities and Reliability Coordinators to maintain interconnection frequency within predefined frequency limits under all conditions.

The drafting team modified the standards and implementation plan based on stakeholder comments submitted with the initial ballot of these standards. The drafting team also made changes to bring the standards into conformance with the Reliability Standards Development Procedure, Version 6, which was approved November 1, 2006 by the NERC Board of Trustees, and to bring the standards into conformance with the ERO Rules of Procedure.

Please use this [comment form](#) to provide comments on this set of standards and the associated implementation plan and conforming changes to already approved standards.

**Interconnection Reliability Operating Limits Standards Posted for 45-day Comment Period (January 2–February 15, 2007)**

The “Version 1” [Operate within Interconnection Reliability Operating Limits \(IROL\) standards](#), an associated implementation plan, and recommended changes to already approved standards, are all posted for a 45-day comment period.

This set of Version 1 standards requires the Reliability Coordinator to monitor its wide area, to have plans in place to prevent and mitigate instances of exceeding IROLs, to direct actions in support of operating within IROLs and to specify and collect data needed to support these activities to prevent instability, uncontrolled separation or cascading outages.

The standard drafting team has not made any changes to these standards for two years while waiting for other related standards to be finalized. The changes made to these Version 1 IROL standards bring the standards into conformance with the Reliability Standards Development Procedure, Version 6, which was approved November 1, 2006 by the NERC Board of Trustees, and bring the standards into conformance with the ERO Rules of Procedure.

Please use this [comment form](#) to provide comments on this set of standards and the associated implementation plan and conforming changes to already approved standards.

### **Standards Development Process**

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or [maureen.long@nerc.net](mailto:maureen.long@nerc.net).

Sincerely,

*Maureen E. Long*

# Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards

---

## Implementation Plan Contents:

Prerequisite Approvals.....	2
Conforming Changes to Requirements in Already Approved Standards .....	2
Revisions or Retirements to Already Approved Standards.....	3
EOP-001-0 .....	3
IRO-002-1 .....	4
IRO-003-2 .....	6
IRO-004-1 .....	7
IRO-005-2 .....	10
TOP-003-0 .....	15
TOP-005-1 .....	16
TOP-006-1 .....	19
Functions that Must Comply with the Requirements in the Standards .....	20
Effective Dates.....	20

### Prerequisite Approvals

There are no SARs or standards in progress that need to be approved before this set of standards can be approved:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection

### Conforming Changes to Requirements in Already Approved Standards

Many elements contained in the set of proposed ‘Operate within IROL Standards’ address the same or similar performance objectives as requirements in already approved standards. To eliminate duplication and minimize confusion, the following requirements in Version 0 Standards should be revised or retired when the proposed standards are implemented. Justification for these revisions and retirements is provided in the tables on the following pages.

EOP-001-0 — Emergency Operations Planning

- Retire R2

IRO-002-1 — Reliability Coordination – Facilities

- Retire R2 and R6

IRO-003-2 — Reliability Coordination – Wide Area View

- Retire entire standard (R1 and R2)

IRO-004-1 — Reliability Coordination – Operations Planning

- Retire entire standard (R1 through R6)

IRO-005-2 — Reliability Coordination – Current Day Operations

- Retire R1, convert most of R1 into a reference; retire R2, R3, and R5; modify R9, R13 and R14; retire R16 and R17

TOP-003-0 — Planned Outage Coordination

- Modify R1.2

TOP-005-1 — Operational Reliability Information

- Retire R1 and R1.1
- Convert Attachment 1 into a reference

TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control

- Modify R2 and R4

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

**Revisions or Retirements to Already Approved Standards**

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>EOP-001-0</b></p> <p>R2. The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. The plan shall include the details on how the Transmission Operator will implement load reduction in sufficient amount and time to mitigate the IROL violation before system separation or collapse would occur. The load reduction plan must be capable of being implemented within 30 minutes.</p>	<p><b>IRO-009-1 R1.</b></p> <p>R1. The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, EOP-001-0 R2 should be retired.</li> <li>▪ The Reliability Coordinator, not the Transmission Operator, is responsible for developing plans for mitigating IROLs. There are no measures or levels of non-compliance that need to be revised or retired when EOP-001-0 R2 is deleted. Mitigation plans need to be implemented so that the instance of exceeding the IROL is mitigated within the IROL's <math>T_v</math>, which can be shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p><b>R2.</b> Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall specify and collect the data and information it needs to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. The Reliability Coordinator shall collect this data from the entities performing functions that have Facilities monitored by the Reliability Coordinator, and from entities that provide Real-Time Facility status to the Reliability Coordinator. This includes specifying and collecting data from the following:</p> <ul style="list-style-type: none"> <li>R1.1 Balancing Authorities</li> <li>R1.2 Generator Owners</li> <li>R1.3 Generator Operators</li> <li>R1.4 Interchange Authority</li> <li>R1.5 Load-Serving Entities</li> <li>R1.6 Reliability Coordinators</li> <li>R1.7 Transmission Operators</li> <li>R1.8 Transmission Owners</li> </ul>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-002-1 R2 should be retired.</li> <li>▪ IRO-010-1 R1 requires the Reliability Coordinator to develop and distribute a data specification to ensure that entities provide data as needed to support monitoring, analyses and assessments. The proposed requirement is more explicit than the associated requirement in IRO-002-0.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>IRO-002-1</b></p> <p><b>R6.</b> Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-002-1 R6 should be retired.</li> <li>▪ IRO-002-1 R6 identifies some, but not all of the parameters to be monitored by the Reliability Coordinator and can be misleading. A list of elements to be monitored (from IRO-005-2) has been converted into a Technical Reference.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-003-2</b></p> <p><b>R1.</b> Each Reliability Coordinator shall monitor all Bulk Electric System facilities, which may include sub-transmission information, within its Reliability Coordinator Area and adjacent Reliability Coordinator Areas, as necessary to ensure that, at any time, regardless of prior planned or unplanned events, the Reliability Coordinator is able to determine any potential System Operating Limit and Interconnection Reliability Operating Limit violations within its Reliability Coordinator Area.</p> <p><b>R2.</b> Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.</p>	<p><b>IRO-007-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 becomes effective, IRO-003-2 should be retired.</li> <li>▪ The Transmission Operator, not the Reliability Coordinator, is responsible for operating within System Operating Limits. The Reliability Coordinator is responsible for operating within IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

---

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R1.</b> Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p><b>R2.</b> Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p>	<p><b>IRO-008-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall perform Operational Planning Analysis to assess whether the planned operations for the next day within its Wide Area, will exceed any of its Interconnection Reliability Operating Limits (IROLs) during anticipated normal and Contingency event conditions.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-004-1 R1 and R2 should be retired.</li> <li>▪ IRO-008 R1 requires the Reliability Coordinator to look at its 'Wide Area' rather than its 'Reliability Coordinator Area' in conducting its Operational Planning Analyses.</li> <li>▪ IRO-004-1 R2 is not measurable and rather than retain it as the last remaining requirement in this standard, it should be retired when IRO-008, IRO-009, and IRO-010 become effective.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R3.</b> Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p><b>R6.</b> If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within Tv up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-004-1 R3 and R6 should be retired.</li> <li>▪ IRO-009-1 R1 requires the Reliability Coordinator to have plans to prevent and mitigate instances of exceeding IROLs – under some conditions, the Reliability Coordinator may not have time to ‘coordinate’ the development of these plans with all of its Transmission Operators and Balancing Authorities.</li> <li>▪ IRO-009-1 R2 includes language that is more explicit than the language in IRO-004-1 R6: ‘results of these studies’ is not as specific as ‘when an assessment of actual or expected system conditions’.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-004-1</b></p> <p><b>R4.</b> Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p><b>R5.</b> Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p><b>IRO-005-2</b></p> <p><b>R2.</b> Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection.</p>	<p><b>IRO-010-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <ul style="list-style-type: none"> <li><b>R1.1.</b> List of required data and information</li> <li><b>R1.2.</b> Mutually agreeable format</li> <li><b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)</li> <li><b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</li> </ul> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, IRO-004-1 R4 and R5 should be retired.</li> <li>▪ IRO-010-1 is based on the philosophy that the Reliability Coordinator needs to know, in advance, what data and information it needs and what data and information it needs to share. The periodicity for collecting the data is addressed in IRO-010-1 R1.3. Only a fraction of the reliability-related data needed by the Reliability Coordinator and shared by the Reliability Coordinator is addressed in IRO-004-1 R4 and R5.</li> <li>▪ When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R1.</b> Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:</p> <ul style="list-style-type: none"> <li><b>R1.1</b> Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.</li> <li><b>R1.2</b> Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.3</b> Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan’s viability and scope.</li> <li><b>R1.4</b> System real and reactive reserves (actual versus required).</li> <li><b>R1.5</b> Capacity and energy adequacy conditions.</li> <li><b>R1.6</b> Current ACE for all its Balancing Authorities.</li> <li><b>R1.7</b> Current local or Transmission Loading Relief procedures in effect.</li> <li><b>R1.8</b> Planned generation dispatches.</li> <li><b>R1.9</b> Planned transmission or generation outages.</li> <li><b>R1.10</b> Contingency events.</li> </ul>	<p><b>IRO-007-1</b>  <b>R1.</b> The Reliability Coordinator shall perform Real-Time Monitoring of system operating parameters within its Wide Area to determine if operating parameters are within their associated Interconnection Reliability Operating Limits (IROLs).</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-008-1 becomes effective, IRO-005-2 R1 should be retired and R1.1 through R1.10 should be converted into a Technical Reference. IRO-005-2 R1 is duplicated with IRO-007-1 R1. The list of parameters to monitor (IRO-005 -2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R3.</b> As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation.</p> <p><b>R5.</b> Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R3, and R5 should be retired.</li> <li>▪ IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> <li>▪ IRO-005 R5 can lead the Compliance Monitor to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b></p> <p><b>R9.</b> The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p><b>IRO-009-1</b></p> <p><b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.</p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R9 should be modified.</li> <li>▪ IRO-005 R9 includes two requirements – one for coordinating outages, and one for coordinating the mitigation of IROLs and other limits. IRO-009-1 focuses includes requirements to have and execute action plans to prevent and mitigate instances of exceeding IROLs.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R13.</b> Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p><b>IRO-009-1</b>  <b>R1.</b> The Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take, for both prevention of exceeding IROLs and mitigation of instances of exceeding its IROLs within <math>T_v</math> up to and including load shed.  <b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.  <b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p> <p><b>IRO-007-1</b>  <b>R2.</b> If unanimity cannot be reached on the value for an IROL or its <math>T_v</math>, all Reliability Coordinators who monitor that Facility (or group of Facilities) shall, without delay, use the most conservative of the values under consideration.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-007-1 and IRO-009-1 become effective, IRO-005-2 R13 should be retired.</li> <li>▪ IRO-005 R13 has two requirements – one to direct actions to ensure SOLs and IROLs are not exceeded, and one requirement to operate to the most limiting parameter in situations where there is disagreement on a limit. The first requirement in IRO-015 R13 assumes that the Reliability Coordinator can see all System Operating Limits, and this is not always true. The Reliability Coordinator is responsible for seeing IROLs and controlling operations within its Reliability Coordinator Area so as to prevent instances of exceeding IROLs.</li> <li>▪ The second part of IRO-005 R13 requires entities to operate to the most limiting parameter when there is a difference in derived limits. This should be revised so that it is not applicable to the Reliability Coordinator – IRO-007-1 R2 has a similar requirement that is applicable totally to the Reliability Coordinator.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Already Approved Standard	Proposed Replacement Requirement(s)
<p><b>IRO-005-2</b>  <b>R14.</b> Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect <del>these</del> SOLs <del>or</del> and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p> <p><b>R16.</b> Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times.</p> <p><b>R17.</b> When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL.</p>	<p><b>IRO-009-1</b></p> <p><b>R2.</b> When an assessment of actual or expected system conditions predicts that an IROL will be exceeded, the Reliability Coordinator shall implement one or more Operating Processes, Procedures or Plans to prevent exceeding that IROL.</p> <p><b>R3.</b> When actual system conditions show that there is an instance of exceeding an IROL, the Reliability Coordinator shall, without delay, act or direct others to act to mitigate the magnitude and duration of the instance of exceeding that IROL.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-009-1 becomes effective, IRO-005-2 R14 should be modified and R16 and R17 should be retired.</li> <li>▪ IRO-005-2 R14 part 1 should be retired and part 2 should be modified as it is not correct. Notifying the Transmission Service Provider of SOLs and IROLs is already addressed under FAC-014 R5.1. The Transmission Service Provider should respect both SOLs and IROLs – R14 implies that the Transmission Service Provider may respect ‘either’ SOLs or IROLs.</li> <li>▪ IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</li> <li>▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a <math>T_v</math> that is much shorter than 30 minutes.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-003-0</b>  <b>R1.</b> Generator Operators and Transmission Operators shall provide planned outage information.</p> <p><b>R1.1</b> Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p><b>R1.2</b> Each Transmission Operator shall provide outage information daily to <del>its Reliability Coordinator</del>, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. <del>The Reliability Coordinator shall establish the outage reporting requirements.</del></p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)</p> <p><b>R1.1.</b> List of required data and information  <b>R1.2.</b> Mutually agreeable format  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments.</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-003-0 R1.2 should be modified.</li> <li>▪ IRO-010-1 requires the Reliability Coordinator to provide data to other Reliability Coordinators in accordance with the data specifications it has received from those other Reliability Coordinators. Daily outage data is one of the types of data that is expected to be identified on the Reliability Coordinator’s documented data specification since this is data needed to maintain real-time models.</li> </ul>	

**Implementation Plan for Operate Within Interconnection Reliability Operating Limits Standards**

Version 0 Standards	Proposed Replacement Requirement(s)
<p><b>TOP-005-1</b>  <b>R1.</b> Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area.</p> <p><b>R1.1</b> Each Reliability Coordinator shall identify the data requirements from the list in Attachment 1-TOP-005-0 “Electric System Reliability Data” and any additional operating information requirements relating to operation of the bulk power system within the Reliability Coordinator Area.</p>	<p><b>IRO-010-1</b>  <b>R1.</b> The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-time Assessments. (Risk Factor: Medium) (Mitigation Time Horizons: Operations Planning)  <b>R1.1.</b> List of required data and information  <b>R1.2.</b> Mutually agreeable format  <b>R1.3.</b> Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses)  <b>R1.4.</b> Process for data provision when automated Real-Time system operating data is unavailable.</p> <p><b>R3.</b> Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments..</p>
<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When IRO-010-1 becomes effective, TOP-005-1 R1 and R1.1 should be retired.</li> <li>▪ Under IRO-010-1 each Reliability Coordinator must document what data and information it needs and entities must provide that data. The data needed by the Reliability Coordinator is needed for more than just reliability assessments – some of the data is used for real-time monitoring. Several entities, beyond the Transmission Operator and Balancing Authority (the only responsible entities identified in R1 of TOP-005-1) have data and information needed by the Reliability Coordinator.</li> </ul>	

Version 0 Standards	Proposed Replacement
<p><b>TOP-005-1 Attachment 1-TOP-005-0 - Electric System Reliability Data</b></p> <p>This Attachment lists the types of data that Reliability Coordinators, Balancing Authorities, and Transmission Operators are expected to provide, and are expected to share with each other.</p> <ol style="list-style-type: none"> <li>1. The following information shall be updated at least every ten minutes:               <ol style="list-style-type: none"> <li>1.1. Transmission data. Transmission data for all Interconnections plus all other facilities considered key, from a reliability standpoint:                   <ol style="list-style-type: none"> <li>1.1.1 Status.</li> <li>1.1.2 MW or ampere loadings.</li> <li>1.1.3 MVA capability.</li> <li>1.1.4 Transformer tap and phase angle settings.</li> <li>1.1.5 Key voltages.</li> </ol> </li> <li>1.2. ### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

**Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

**1. Modified the format of the “Proposed Effective Dates”**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

**2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

7. The latest version of the Reliability Standards Development Procedure requires that each standard include “violation severity levels” rather than “levels of non-compliance.” “Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

## Comment Form — IROL Standards

---

Comments:

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

**Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

**1. Modified the format of the “Proposed Effective Dates”**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

**2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

(i) We agree with the VRFs for IRO-008, IRO-009 and IRO-010.

(ii) For IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to unreliable operation.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

(i) We agree with the mitigation time horizons for IRO-007, -008 and -010.

(ii) For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

(i) We agree with the violation severity levels for IRO-007 and IRO-008.

(ii) For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?

To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.

Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times that, for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.

(iii) For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when a SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:
- IRO-002-1 — RC – Facilities; Retire R6
  - IRO-003-2 — RC – Wide Area View; Retire R1 and R2

## Comment Form — IROL Standards

---

- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(i) We agree that R3, R5 and R9 of IRO-005-2 can be retired. Note that R2 in IRO-009-1 stipulates that "...such that the IROL is relieved within the IROL's Tv." For consistency, we suggest that "within the IROL's Tv" be inserted in R4 to reiterate the time limit requirement of an IROL.

(ii) We agree that part 1 of R13, and R16 and R17 of IRO-005-2 can be deleted.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5

**Comment Form — IROL Standards**

- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

- I agree with the proposed conforming changes
- I do not agree with the following conforming changes:

Comments:

- (i) We agree with retiring R2 of IRO-002-1.
- (ii) We do not agree with removing R1.2 from TOP-003-1. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that may affect interconnected system reliability. There should not be any prejudgment as to which outage has an impact on SOL only.
- (iii) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

- No known conflicts or unnecessary adverse impacts
- Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities <ul style="list-style-type: none"> <li>- Retire R6</li> </ul> IRO-003-2 — RC – Wide Area View <ul style="list-style-type: none"> <li>- Retire R1 and R2</li> </ul> IRO-005-2 — RC – Current Day Operations <ul style="list-style-type: none"> <li>- Retire R1; Convert R1.1 into a Reference; Modify R13 part 2</li> </ul> TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control <ul style="list-style-type: none"> <li>- Modify R2</li> </ul>
IRO-008	IRO-004-1 — RC – Operations Planning

**Comment Form — IROL Standards**

	- Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

(i) The requirement to monitor, or at least be aware of the impacts on, critical parameters in other RC's areas, as proposed for IRO-007 (M2.1) and IRO-008 (R1) in the previous draft set of standards posted on March 1, 2004, is missing. This monitoring capability is essential for identifying potential reliability impact on other RC areas due to operation plans and real-time operations in one RC area. Note that IRO-010 has this requirement (implicit in R3).

(ii) R2 of IRO-008 requires that Real-Time Assessments be performed at least every 30 minutes. The definition of Real-Time Assessment leaves open how far into the future the assessments must cover.

(iii) R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct" be inserted after "...the Reliability Coordinator shall share its results with" in R3.

(iv) Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?

(v) In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay.

(vi) In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. This requirement is missing in the new version. We feel that this requirement should be stated in this standard.

(vii) We do not have any comments on the proposed measures. However, from a process viewpoint, none of the questions asked in this comment form seek concurrence or comments on any of the measures proposed. Since these measures did not exist in any of the current standards, and have been revised since the last draft versions (posted on March 1, 2004), the industry needs to have an opportunity to offer its view.

**Comment Form — IROL Standards**

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

**Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

**1. Modified the format of the “Proposed Effective Dates”**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

**2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

NPCC Participating Members agree with the VRFs for IRO-008, IRO-009 and -010.

NPCC Participating Members suggest that for IRO-007, the VRF for R1 should be HIGH. Real-time monitoring of system conditions to determine if system parameters are within IROLs is critical to ensuring interconnected system reliability. Lack of or insufficient monitoring would expose a system to potential unreliable operation.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

NPCC Participating members agree with the mitigation time horizons for IRO-007, -008 and -010.

For IRO-009, however, R1 and R2 should also be assigned a Same Day Operation time horizon since "identified in advance of real time" may include day at hand assessments.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

NPCC participating members agree with the violation severity levels for IRO-007 and -008.

For IRO-009, the violation level is subject to interpretation. For example, "Between 95% to 99% of the IROLs identified in advance of real-time have Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding those IROLs." Does the 95% to 99% range apply to the number of IROLs identified, or to the total time that any IROLs are identified? In other words, is it the percentage of time that for all IROLs identified, there are Operating Processes, Procedures, or Plans that identify actions to prevent or mitigate instances of exceeding any IROLs?

To put the violation severity level in a more proper context, the SDT may want to consider putting the range in a "negative sense", i.e., the percentage of time that the requirements are not met, whichever the base of the above interpreted measurements turn out to be.

Better still, we suggest the SDT consider adopting violation severity levels based on the number of times that R1 or R2 is not met, i.e. the number of times for any IROLs that are identified in advance of real-time, there lacks operating processes, procedures, or plans that identify actions to prevent or mitigate instances of exceeding these IROLs. This way, assessment of violations can be made much more easily. Further, the severity level will be independent of the total number of IROLs identified, which can eliminate the skewed assessment due to a small of number of IROLs identified in an RC area. For example, under the as written % assessment structure, an RC could be found 0% compliant (and hence assessed a severe violation level) for just one incident of not meeting R1 or R2 if it had only one IROL identified.

For IRO-010, we agree with the measures as they are based on numbers, not a combination of number and duration. However, the same comment on "negative context" as provided for IRO-009 also apply here. In other words, we suggest turning the % meeting requirements to % failing to meet requirements (hence violation).

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: There are a number of requirements in the posted IRO-005-3 that still hold the RC responsible for being aware of and directing actions when SOL is being approached or violated. The drafting team's proposed approach would require that corresponding changes be made to IRO-005-3.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:
- IRO-002-1 — RC – Facilities; Retire R6
  - IRO-003-2 — RC – Wide Area View; Retire R1 and R2

## Comment Form — IROL Standards

---

- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

EOP-001 R2 requires that a TOP have an emergency load reduction plan for all identified IROLs. The intent of this requirement is for the TOP to be ready to implement load reduction as directed by the RC to mitigate IROL violation when other control actions have been or are in parallel being implemented. Unless this requirement is covered elsewhere, it needs to be retained to assure TOP's readiness, which is in a different context than what the requirements in IRO-009 implies. The RC does not own or operate any load reduction scheme. It must rely on the operators of these schemes - the TOP and DP, as directed by the TOP, to implement load reduction.

NPCC participating members agree with retiring R6 of IRO-004-1, but suggest that a part of R3 in IRO-004-1 which requires that the RC develop action plans in conjunction with the TOPs, be reflected in this standard.

NPCC participating members believe the key requirement in R3 and R5 is for the RC to correct an IROL violation as soon as possible and within 30 minutes. This needs to be retained somewhere, preferably in this standard. Not having a time limit to correct IROL violation can result in an IROL being exceeded for an indefinite period of time, subjecting the system to prolonged risks of instability and potential cascade tripping. The 30 minutes also serves as the threshold that if an IROL violation cannot be corrected by adjusting generation and interchange, reconfiguration, reducing interruptible load, voltage reduction, etc. within that time frame, curtailment of firm load must also be implemented to correct the violation immediately.

NPCC participating members believe the concept of the RC approving outages needs to be retained somewhere in the standards, retiring R9 should be conditional on having this coordination/approval requirement covered by this (IRO-009) or another standard.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

(i) We agree with retiring R2 of IRO-002-1.

(ii) We do not agree with removing R1.2 from TOP-003-2. Providing transmission outage information to the RC is essential for ensuring the RC is aware of system changes that may affect interconnected system reliability. There should not be any prejudice as to which outage has an impact on SOL only.

(iii) We agree with the proposed deletions/changes to IRO-005-2, TOP-005-1 and TOP-006-1.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

**Comment Form — IROL Standards**

---

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

R2 of IRO-008 requires clarification or the definition of Real-Time Assessments needs to be revised to capture that an assessment needs to be done every thirty minutes and specific made as to how far into the future the assessments must cover.

R3 of IRO-008 requires sharing of results to prevent or mitigate exceeding an IROL. We feel that this should also require an RC to direct taking necessary actions to prepare for correcting the situation. We therefore suggest that "and direct" be inserted after "...the Reliability Coordinator shall share its results with" in R3. This may clarify the IRO-008 standard but may introduce some redundancy with IRO-009 R3 and R4.

Two new terms are defined in IRO-009: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in this standard; so what is the reason for having these terms defined?

In IRO-009, Violation Severity Levels, Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. The term "delay" is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay perhaps specifying a timeframe in the Requirements section R4. Also missing is the requirement to document, with a complete violation report, whenever an IROL violation has been exceeded beyond Tv.

In the previous draft standard IRO-009, there was a requirement (R1.4) for the RC to document IROL violation incidents. This requirement is missing in the new version. NPCC Participating members believe that this requirement should be stated in this standard.

NPCC participating members have also expressed concern about these same standards appearing in NERC's Reliability Coordinator SAR project. Coordination of the comments is a major concern especially when the standards will be under revision here and also in that project concurrently.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments: The project in question should have been posted with the package. The quality of responses to this item will likely be impaired as many will not have reviewed the intent of the plan.

We agree that clear communications are important and should be part of an operators overall training program. We have some concern about developing measures for the sake of having measures, particularly when they appear to require significant administration to track.

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

## Comment Form — IROL Standards

---

No

Comments: Since the drafting team is not yet formed and has not seen the final product, it is premature to set a short implementation date.

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments: We strongly disagree with the violation severity levels of attribute (yes/no go/no-go) requirements being arbitrarily placed in the Severe category. This places late reports in the same category as failure to correct an IROL. We don't treat jaywalking the same as grand theft. The sanctions matrix needs to be changed to have another level for attribute requirements. The sanctions need to be based on impact to reliability.

We also disagree with the default approach to assigning severity levels to scalable standards (only 5% in the Low area, 70% of observations in the Severe category). This is the equivalent as applying the following highway speeding rules to cars that have a typical top end of 100MPH:

65 MPH or less	Pass
66 MPH	Low
67-69 MPH	Moderate
70-74 MPH	High
75-100 MPH or higher	Severe

Scalable standards should be assigned severity levels that approach quartiles of the observed or expected range of performance.

This approach to assigning violation severity levels to attribute and scalable requirements doesn't appear to have been presented for official comment in any stakeholder forum.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments: The meaning of Operations Assessment needs to be clarified. There is no indication of the relative impacts the drafting team considered for each mitigation time horizon. I would assume that a violation of a standard in the Real-Time Operations horizon would be considered worst than a violation in the Operations Planning Horizon. If this is the case, the standard needs to specify this. How does the team see Operations Assessment horizon fitting in?

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance."

## Comment Form — IROL Standards

---

“Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: The compliance percentage leaves gaps from 94-95% and from 84-85%. What is the justification for these percentages?

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

Comments:

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: Requirement R11 in Standard IRO-005-3 contradicts question 8 in the comment form. It requires the RCs to notify TPs of "SOLs and IROLs within its wide-area view". Question 8 recognizes that RCs may not have all the information for SOLs so how can they be held accountable to communicate it? This requirement needs to be eliminated.

## Comment Form — IROL Standards

---

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: Transmission operators will not have to communicate outage information to the RC with these changes. The requirement to communicate the outage to the RC should not be removed from the transmission operator.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please

**Comment Form — IROL Standards**

identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

## Comment Form — IROL Standards

---

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: IRO-007-1 - Tv is a term that is not defined. Measures do not specify if temporary loss of ICCP or telemetry is an exception or if it is still considered a violation. It should not be considered a violation.

IRO-008-1 - R2 requires that Real-Time Assessments be performed at least every 30 minutes. The definition of Real-Time Assessment leaves open how far into the future the assessments must cover. R3 requires sharing of results to prevent or mitigate exceeding an IROL. It seems like this should require an RC directive to correct the situation. Violation severities do not address temporary loss of ICCP, telemetry or state estimation. They should not be violations.

IRO-009-1 - Two new terms are defined for inclusion in the glossary: Interconnection Reliability Operating Limit Event and Interconnection Reliability Operating Limit Event Duration. Neither are used in the standard. Section 2.3.2 establishes a high violation severity if an IROL was actually exceeded and there was a delay before taking action. Delay is not defined. This leaves this term open for interpretation and will result in inconsistent enforcement. The standard needs to define what is meant by delay. Additionally, we wonder how will the ERO track a given percent of "IROLs identified in advance of real-time" against the number of operating procedures?

IRO-010-1 - Does R3 create the requirement for a entity to add metering if it does not already exist at a location, if a measurement is requested? This needs to be made clear. Data anomalies such as those caused by a bad RTU are not addressed and need to be made exceptions in the violations severity section.

While we agree with the concept of consolidating the IROL-related standards, there is more work to do. Requirements regarding IROLs can be boiled down to:

1. Have IROLs pre-defined (preparedness).
2. Train and prepare for IROLs (preparedness).
3. Update limits based on conditions (performance).
4. Monitor for and respond quickly to IROLs and correct them within 30 minutes (performance).
5. Communicate reaching IROLs to others (performance).
6. Report violations of the IROL standard (administrative).

The acronym IROL shows up 168 times in the present standards. The vast majority of these are restatements of the 6 core requirements in different standards or explanatory information that should not be assigned risk factors or measures.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments: ATC agrees with the decision to combine standards IRO-010 and IRO-011 into a single standard.

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments: ATC agrees with the decision to combine standards IRO-009 and IRO-012 into a single standard.

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments: ATC believes that all standards and conforming changes should become effective the first day of the first quarter, six months after regulatory approvals.

## Comment Form — IROL Standards

---

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

7. The latest version of the Reliability Standards Development Procedure requires that each standard include "violation severity levels" rather than "levels of non-compliance." "Violation severity levels" identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the "Violation Risk Factor" appended to each requirement.) Note that these severity levels are "guidelines" and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments: Many of the requirements need to be clarified before we can determine the appropriateness of the violation severity levels.

See our comments under question 15.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator's accountability for real-time actions relative to SOLs. Do you agree with the drafting team's approach?

I agree the drafting team's approach

I do not agree with the drafting team's approach

Comments: ATC does not agree with the proposed modifications to existing NERC standards. It's our opinion that Reliability Coordinators should monitor both SOLs and IROLs within their area. The Reliability Coordinators provide an additional level of system oversight that ensures the reliable operations of the bulk power system. A strict interpretation by Reliability Coordinators would lead them to only monitor pre-determined IROLs and they would be unable to determine if an SOL becomes an IROL in real-time.

ATC does not believe that the proposed changes to existing standards have anything to do with these standards. The proposed standards are not replacing the requirements in the existing standards but are only adding on new requirements that address IROLs. The SDT is overstepping the spirit of the IROL SAR and seems to be adjusting existing standards for some unexplained reason. If the SDT believes that these changes are appropriate then they should sponsor a SAR and allow for full industry participation.

It's our opinion that the propose changes to existing standards will leave that bulk power system in a less reliable state, and we ask that the SDT abandon this effort and move the proposed changes to a SAR. Once in a SAR the industry will be able to better exam the effects of the changes.

Lastly ATC believes that changes in monitoring of SOL may impact the ability of Reliability Coordinators to call TLRs. If they are not required to monitor SOLs then identification will be the sole responsibility of Transmission Operators with no confirmation from RCs before a TLR is started.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: IRO-007 states that Reliability Coordinators should monitor IROLs within their area.

ATC does not believe that the changes to the four listed requirements have anything to do with IRO-007. In other words IRO-007 is not replacing the existing requirements, therefore the SDT has no authority to delete these requirements.

## Comment Form — IROL Standards

---

It's ATC opinion that the SDT should only modify existing requirements that are in direct alignment with their work. In other words they should only alter those existing requirements that are being replaced with new requirements.

If the SDT disagrees with ATC then they need to explain how IRO-007 is replacing the above listed requirements.

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: If Reliability Coordinators only have to monitor IROLs then they will have no ability to identify a SOL that becomes an IROL is real-time. It is the responsibility of the Reliability Coordinators to provide oversight of the bulk power system, therefore insuring reliable operations.

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments: ATC does not believe that a Reliability Coordinator will be able to identify an SOL that becomes an IROL in real-time if they are not required to monitor SOLs. Additionally ATC does not see the connection between IRO-009 and these three existing standards. IRO-009 is not replacing these requirements therefore they should not be changed.

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2

**Comment Form — IROL Standards**

---

- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

- I agree with the proposed conforming changes
- I do not agree with the following conforming changes:

Comments: Please see our comments to question 8.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

- No known conflicts or unnecessary adverse impacts
- Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities

**Comment Form — IROL Standards**

---

	- Retire R2
IRO-004-1 — RC – Operations Planning	- Retire R4, R5
IRO-005-2 — RC – Current Day Operations	- Retire R2
TOP-003-0 — Planned Outage Coordination Modify R1.2	
TOP-005-1 — Operational Reliability Information	- Retire R1, R1.1; Convert Attachment A to a Reference
TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control	- Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments: These four standards should be voted on in a single ballot. The nature of this set of standards and the proposed modification to existing standards are such that a failure of one would cause a major disconnection in NERC standards. For this reason ATC strongly requests that the four standards be balloted as one.

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments: This effort must produce a clear definition of what an IROL is and the outcome being avoided by classifying an SOL as an IROL. The definition should include both Real-Time Operations and planning horizon perspectives. There is wide discretion between what everyone believes an IROL is and what events could reasonably be predicted to identify a triggering event that should be classified as an IROL. A clear definition is required in order to identify an IROL in Real-Time Operations and planning studies.

IRO-007 Requirement R2

Has the group discussed the possible situation in which the RCs do not agree that an IROL exists? This requirement gives the impression that an IROL has been agreed to by the RCs but the limit and/or Tv is in dispute. Because the definition of IROL is subjective two RCs could have variations of what SOLs should be classified as IROLs in Real-time.

IRO-010

Requirements 1.1, 1.3 and 1.4 seem to be a fill in the blank requirements for the RCs. This group should develop the data specification requirements.

Requirement 1.2 should be deleted and replaced with the following:

Industry standard protocol or mutually agreeable format

**Comment Form — IROL Standards**

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
- **Same-day Operations:** routine actions required within the timeframe of a day, but not real-time.
- **Real-time Operations:** actions required within one hour or less to preserve the reliability of the bulk electric system.
- **Operations Assessment:** follow-up evaluations and reporting of real time operations.

### 4. Changed the identification of the Compliance Monitor

The drafting team modified all references to the Regional Reliability Organization as the Compliance Monitor, and replaced these references with, "Electric Reliability Organization."

### 5. Deleted Levels of Non-compliance – Added Violation Severity Levels

The drafting team deleted "levels of non-compliance" and added "violation severity levels" to comply with the revised Reliability Standards Development Procedure. Compliance personnel assisted the drafting team in using the following criteria from the manual to establish violation severity levels:

- **Lower:** mostly compliant with minor exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more minor details. Equivalent score: 95% to 99% compliant.
- **Moderate:** mostly compliant with significant exceptions — The responsible entity is mostly compliant with and meets the intent of the requirement but is deficient with respect to one or more significant elements. Equivalent score: 85% to 94% compliant.
- **High:** marginal performance or results — The responsible entity has only partially achieved the reliability objective of the requirement and is missing one or more significant elements. Equivalent score: 70% to 84% compliant.
- **Severe:** poor performance or results — The responsible entity has failed to meet the reliability objective of the requirement. Equivalent score: less than 70% compliant.

### 6. Added 'Associated Documents' where applicable

The drafting team added a section "F" to the standard called, "Associated Documents" to list items such as forms, related standards, reports, etc.

On the following pages, the drafting team will ask for your feedback on the appropriateness of the changes it made to this set of standards. Because the changes made to the set of standards included a great deal of consolidation, a red line version will not be posted as it is not distinguish the content changes from the format changes when comparing the two versions.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team consolidated the requirements for *IRO-010— Reliability Coordinator Data Specification and Collection* and *IRO-011— Providing Data to the Reliability Coordinator* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

2. The drafting team consolidated the requirements for *IRO-009 — Reliability Coordinator Actions to Operate within IROLs* and *IRO-012— Procedures, Processes or Plans for Preventing and Mitigating IROLs* into a single standard to eliminate the cross-reference between the two standards. Do you agree with consolidating the requirements into a single standard? If not, please explain.

Yes

No

Comments:

3. The drafting team recommends moving the requirements from *IRO-013 —Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed under the single *Project 2007-02 – Operating Personnel Communication Protocols*. Do you agree with moving the requirements from IRO-013 into Project 2007-02? If not, please explain.

Yes

No

Comments:

4. The drafting team is proposing that all standards and conforming changes become effective the first day of the first quarter, three months after regulatory approvals. Do you agree that the proposed effective date will give entities time to become fully compliant? If not, please explain.

Yes

No

Comments:

5. The drafting team added a Violation Risk Factor for each requirement.

Do you agree with the Violation Risk Factor for each requirement in the proposed standards? If not, please identify any requirement with a violation risk factor you feel is incorrect.

I agree with the proposed Violation Risk Factors

I do not agree with the following Violation Risk Factors:

Comments:

IRO-008-1 R3 has two conditions: one the results of an Operational Planning Analysis, and one the results of a Real-Time Assessment. The Violation Risk Factor should be different for each of these two conditions. The VRF for the results of an Operational Planning Analysis should be MEDIUM, while the VRF for the results of a Real-Time Assessment should be HIGH.

IRO-010-1 R1 requires the development of a documented specification for data and information while R2 requires distribution of that specification. Both R1 and R2 have VRFs of Medium. We suggest these two requirements be changed to LOWER. The development and distribution of a data specification is not a High or Medium risk factor.

6. The drafting team added a Mitigation Time Horizon for each requirement.

Do you agree with the Mitigation Time Horizon for each requirement in the proposed standards? If not, please identify any requirement with a time horizon you feel is incorrect.

I agree with the proposed Mitigation Time Horizons

I do not agree with the following Mitigation Time Horizons:

Comments:

IRO-008-1 R3 has two conditions: one the results of an Operational Planning Analysis, and one the results of a Real-Time Assessment. The Mitigation Time Horizon should be different for each of these two conditions. The MTH for the results of an Operational Planning Analysis should be Operations Planning, while the MTH for the results of a Real-Time Assessment should be Real-Time Operations.

IRO-010-1 R1 requires the development of a documented specification for data and information while R2 requires distribution of that specification. Both R1 and R2 have MTHs of Operations Planning. We suggest these two requirements be changed to Long-term Planning. The development and distribution of a specification should be developed and distributed long before it is needed.

7. The latest version of the Reliability Standards Development Procedure requires that each standard include “violation severity levels” rather than “levels of non-compliance.” “Violation severity levels” identify how badly an entity violated each requirement, and are not linked to the reliability-related impact of violating a requirement. (The reliability-related impact of violating a requirement is now identified in the “Violation Risk Factor” appended to each requirement.) Note that these severity levels are “guidelines” and variations from the above categories are acceptable.

Do you agree with the violation severity levels for each of the proposed standards? If you disagree with any of the violation severity levels for the proposed standards, please identify the standard and requirement you feel has an incorrect violation severity level.

I agree with the violation severity levels

I do not agree with the following violation severity levels:

Comments:

The VSLs in IRO-009 and IRO-010 have gaps between the low end of LOW (e.g. 95%) and the high end of MODERATE (e.g. 94%) with a similar gap in other VSLs. Why is there this gap? If the argument is that the ranges are whole numbers then it may be OK. However, it seems there should not be a gap and we suggest closing those gaps by writing the VSL with - greater than and equal to - and - less than - specifications.

8. The implementation plan modifies several requirements in already approved standards because compliance with those requirements does not seem practical. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits — yet there are requirements that hold the Reliability Coordinator accountable for identifying the cause of any actual or potential SOL. The drafting team reviewed these requirements and made proposed modifications to limit the Reliability Coordinator’s accountability for real-time actions relative to SOLs. Do you agree with the drafting team’s approach?

I agree the drafting team’s approach

I do not agree with the drafting team’s approach

Comments:

We agree that the RC should not be held responsible to identify the cause of any actual or potential SOL for which he is not monitoring the information. However, if he is monitoring the parameters associated with a SOL he does have an obligation to act on that information and should be held accountable. Therefore, a blanket reprieve for not acting on known information is not acceptable.

9. The drafting team is recommending that when IRO-007-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R6
- IRO-003-2 — RC – Wide Area View; Retire R1 and R2
- IRO-005-2 — RC – Current Day Operations; Retire R1; Convert R1.1 into a Reference; Modify R13 part 2
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R2

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

IRO-007-1 R1 contains the requirement that the RC - ... perform Real-Time Monitoring of system operating parameters ... Given the propensity of industry participants to re-interpret meanings to their own interpretation, we strongly suggest the term CONTINUOUS be added to the requirement so R1 would read - ... perform CONTINUOUS Real-Time Monitoring of system operating parameters ...

We believe there should be a minimum set of information required to be monitored by the Reliability Coordinator and that minimum set should be specified in the standards. This version, V7, of these IRO standards would remove all specification of any parameters to be monitored by the RC and place a list of some information in a Technical Reference. In addition, it is our understanding that Technical References and information contained in those References are not mandatory on the industry. The reason given for not including the list in the standard is "The list of parameters to monitor (IRO-005-2 R1.1 through R1.10) does not identify all parameters to monitor and can be misleading." The wording in IRO-005-2 R1 contains the phrase INCLUDING BUT NOT LIMITED TO THE FOLLOWING. A person must have some objective in mind other than conforming to the standard if he claims to not understand the meaning of, or can be misled by, the phrase INCLUDING BUT NOT LIMITED TO THE FOLLOWING.

Therefore, we suggest deleting the Technical Reference and adding the following list and common English usage phrases back into the standards at the end of IRO-007-1 R1:

THOSE SYSTEM OPERATING PARAMETERS INCLUDE, BUT ARE NOT LIMITED TO THE FOLLOWING:

R1.1 Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.

R1.2 Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.

R1.3 Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.

R1.4 System real and reactive reserves (actual versus required).

R1.5 Capacity and energy adequacy conditions.

R1.6 Current ACE for all its Balancing Authorities.

R1.7 Current local or Transmission Loading Relief procedures in effect.

R1.8 Planned generation dispatches.

R1.9 Planned transmission or generation outages.

R1.10 Contingency events.

10. The Drafting Team is recommending that when IRO-008-1 is approved, conforming changes be made to the following standard:

- IRO-004-1 — RC – Operations Planning; Retire R1 and R2

## Comment Form — IROL Standards

---

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

11. The Drafting Team is recommending that when IRO-009-1 is approved, conforming changes be made to the following standards:

- EOP-001-0 — Emergency Operations Planning; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R3 and R6
- IRO-005-2 — RC – Current Day Operations; Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

IRO-009-1 R1 requires the RC to develop one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to prevent exceeding those IROLs. IRO-004-1 R3 (to be deleted) requires the RC to develop action plans - IN CONJUNCTION WITH ITS TRANSMISSION OPERATORS AND BALANCING AUTHORITIES - (IRO-004-1 R3: Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.)

IRO-005-2 R16 (to be retired) requires the RC to discuss options to mitigate IROLs which also is not include in these revised draft standards.

The reasoning given in the Implementation Plan for not requiring the RC to develop - in conjunction - the Operating Process, Procedures or Plans with TOPs and BAs is that - under some conditions the Reliability Coordinator may not have time to 'coordinate' the development of these plans with all of its Transmission Operators and Balancing Authorities -. We suggest the RC be required to coordinate the development of all Operating Process, Procedures or Plans with TOPs and BAs. Only in the rarest of instances when a sudden system change requires the RC to develop a new Operating Process, Procedure or Plan in real-time may RCs be exempt from developing these Operating Process, Procedures or Plans in conjunction with TOPs and BAs.

In addition, there are several requirements on TOPs and BAs (for example see TOP-002-2, TOP-004-1 R1, TOP-008-1 R1 and R2) for them to plan and operate to meet all IROLs. The TOPs and BAs must be informed of the IROLs in order to plan and operate around them.

RCs should continue to develop processes, procedures or plans in conjunction with TOPs and BAs as required in the existing IRO-004 R3, and discuss options to mitigate IROLs as required in IRO-005-2 R16. The requirement to develop in - conjunction with - should be put into IRO-009-1 R1.

Therefore we suggest IRO-009-1 R1 be changed from - ... PLANS THAT .. - to - ... PLANS DEVELOPED IN CONJUCTION WITH TRANSMISSION OPERATORS AND BALANCING AUTHORITIES THAT ... - .

IRO-009-1 R2 requires the RC to develop one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take to mitigate the magnitude and duration of exceeding all IROLs. The discussion above for IRO-009-1 R1 applies here. Therefore we suggest IRO-009-1 R2 be changed from - ... PLANS THAT .. - to - ... PLANS DEVELOPED IN CONJUCTION WITH TRANSMISSION OPERATORS AND BALANCING AUTHORITIES THAT ... - .

IRO-005-2 R5 (to be deleted) requires the RC to identify the cause of any potential or actual IROL violations. That requirement is not in these new IROs. We suggest that requirement be added back in to IRO-009-1 R3 (addressing an assessment of actual or expected system conditions) by changing - .. shall implement one or more .. - to - .. shall IDENTIFY THE CAUSE OF ANY POTENTIAL OR ACTUAL IROL VIOLATIONS and shall implement one or more ...

RO-005-2 R5 (to be deleted) requires the RC to identify the cause of any potential or actual IROL violations. That requirement is not in these new IROs. We suggest that requirement be added back in to IRO-009-1 R4 (addressing actual system conditions) by changing - .. shall, without delay, act or direct others .. - to - .. shall, without delay, IDENTIFY THE CAUSE OF EXCEEDING AN IROL, AND SHALL act or direct others ...

## Comment Form — IROL Standards

---

12. The drafting team is recommending that when IRO-010-1 is approved, conforming changes be made to the following standards:

- IRO-002-1 — RC – Facilities; Retire R2
- IRO-004-1 — RC – Operations Planning; Retire R4, R5
- IRO-005-2 — RC – Current Day Operations; Retire R2
- TOP-003-0 — Planned Outage Coordination; Modify R1.2
- TOP-005-1 — Operational Reliability Information; Retire R1, R1.1; Convert Attachment A to a Reference
- TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control; Modify R4

Do you agree with these proposed conforming changes? If not, please identify any conforming change you feel is incorrect.

I agree with the proposed conforming changes

I do not agree with the following conforming changes:

Comments:

IRO-010-1 R3 contains the requirement that the RC provide data and information to other RCs. However, IRO-015-1 R3 already contains that requirement: IRO-015-1 R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators.

Therefore either the Reliability Coordinator should be deleted from the list of entities specified in IRO-010-1 R3, or, IRO-015 -1 R3 should be deleted from that standard.

13. If you are aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement please identify the conflict here. Similarly, if you believe that any requirement in this set of standards has an unnecessary adverse impact on energy markets, please identify the requirement and its adverse impact here.

No known conflicts or unnecessary adverse impacts

Known conflict:

Unnecessary adverse impact on markets:

14. The drafting team is recommending that these standards be balloted with **four separate ballots**, according to the following table. There would be a single ballot for

**Comment Form — IROL Standards**

IRO-007-1 that would include approval of IRO-007-1 and approval of the retirement of IRO-002-1 R6, and approval of retirement of IRO-003-2 R1 and R2, etc.

Ballot for:	Includes Associated Changes to Already Approved Standards:
IRO-007	IRO-002-1 — RC – Facilities - Retire R6 IRO-003-2 — RC – Wide Area View - Retire R1 and R2 IRO-005-2 — RC – Current Day Operations - Retire R1; Convert R1.1 into a Reference; Modify R13 part 2 TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R2
IRO-008	IRO-004-1 — RC – Operations Planning - Retire R1 and R2
IRO-009	EOP-001-0 — Emergency Operations Planning - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R3 and R6
	IRO-005-2 — RC – Current Day Operations Retire R3, R5, R9; Delete R13 part 1; Modify R14; Retire R16, R17
IRO-010	IRO-002-1 — RC – Facilities - Retire R2
	IRO-004-1 — RC – Operations Planning - Retire R4, R5
	IRO-005-2 — RC – Current Day Operations - Retire R2
	TOP-003-0 — Planned Outage Coordination Modify R1.2
	TOP-005-1 — Operational Reliability Information - Retire R1, R1.1; Convert Attachment A to a Reference
	TOP-006-1 — Monitoring System Conditions Voltage and Reactive Control - Modify R4

I agree with balloting these standards using four separate ballots

I do not agree balloting these standards using four separate ballots:

Comments:

15. If you have any other comments on this set of standards or its implementation plan that you have not already submitted above, please provide them here.

No additional comments

Comments:

The industry has determined that NERC reliability standards need to be more definitive as to which entities the standards are Applicable. Therefore, Entergy strongly suggests that all Applicability assignments in ALL standards and requirements be changed to be very specific. Therefore, we suggest the Applicability of each standard be changed to - ALL REGISTERED xxx, NO ADDITIONAL CONDITIONS NOR LIMITATIONS WILL BE ADDED TO THE APPLICABILITY OF THIS STANDARD, where xxx is the functional entity to whom the standard applies. Therefore, the Applicability of IRO-007-1 should not be Reliability Coordinator but should be changed to - ALL REGISTERED RELIABILITY COORDINATORS, NO ADDITIONAL CONDITIONS NOR LIMITATIONS WILL BE ADDED TO THE APPLICABILITY OF THIS STANDARD. The Applicability of all other standards should be configured in a similar manner for all entities to whom that particular standard applies.

Version 6 of IRO-009 contained the requirement:

R1.4. The reliability coordinator shall document each instance of exceeding an IROL and shall document and complete an IROL violation report for each instance of exceeding an IROL for time greater than that limit's Tv. The reliability coordinator shall file each IROL violation report with its compliance monitor within five business days of the initiation of the event.

This requirement that a RC must document exceeding an IROL and report each IROL violation has not been included in the current draft, V7, of any of these drafts IRO-007 - 010 and does not seem to be required in any other NERC standards. We suggest it be included in IRO-009-1 as R5 along with appropriate Measures, Compliance requirements, VSL, VRF, and MTH.

## Comment Form — IROL Standards

Please use this form to submit comments on the proposed IROL standards. Comments must be submitted by **February 15, 2007**. You may submit the completed form by e-mail to [sarcomm@nerc.com](mailto:sarcomm@nerc.com) with the acronym "IROL" in the subject line. If you have questions please contact Maureen Long at [maureen.long@nerc.net](mailto:maureen.long@nerc.net) or by telephone at 609-452-8060.

### Background Information:

The IROL standards were placed in a holding pattern for two years while waiting for the completion of the standards that require entities to document and use their methodology for developing SOLs and IROLs. FAC-010-1 — System Operating Limits Methodology for the Planning Horizon, FAC-011-1 — System Operating Limits Methodology for the Operations Horizon, and FAC-014-1 — Establish and Communicate System Operating Limits, were all adopted by the NERC Board of Trustees on November 1, 2006. While waiting for these standards to be approved by applicable regulatory authorities, the drafting team has been given the authority to move ahead in refining the set of IROL standards.

### Changes to Set of Standards

When last posted, there were seven standards in this set of IROL standards:

- IRO-007 — Monitoring the Wide Area
- IRO-008 — Reliability Coordinator Analyses and Assessments
- IRO-009 — Reliability Coordinator Actions to Operate Within IROLs
- IRO-010 — Reliability Coordinator Data Specification and Collection
- IRO-011 — Providing Data to the Reliability Coordinator
- IRO-012 — Procedures, Processes or Plans for Preventing and Mitigating IROLs
- IRO-013 — Reliability Coordinator Directives Relative to IROLs

### Consolidation of Related Requirements

The revised set of standards posted for comment includes only IRO-007 through IRO-010. The drafting team is recommending the following changes to the original set of standards for the reasons stated below:

- Consolidate IRO-010 and IRO-011 into a single standard
- Consolidate IRO-009 and IRO-012 into a single standard
- Transfer IRO-013 to Project 2007-02 — Operating Personnel Communications Protocols

Many stakeholders have indicated that splitting requirements for related tasks across multiple standards leads to cross-referencing between standards that can be confusing — for this reason the drafting team is proposing that the related IROL standards be consolidated to eliminate cross-referencing.

During the drafting work done by the Missing Measures and Compliance Elements Standards Drafting Team, stakeholders indicated that duplication of requirements should be eliminated. In support of these comments, the drafting team recommends moving the requirements from *IRO-013 — Reliability Coordinator Directives Relative to IROLs* into the project that will address communication protocols so that all requirements related to directives will be comprehensively addressed without duplication under the single *Project 2007-02 — Operating Personnel Communication Protocols*.

### Conforming Changes to Already Approved Standards

The drafting team reviewed already-approved standards that include requirements for the Reliability Coordinator relative to operating within SOLs or IROLs and is recommending conforming changes to those already-approved standards. The implementation plan provides the justification for each of these recommended changes.

- The drafting team is recommending retirement of most of the requirements assigned to the Reliability Coordinator for real-time operation within SOLs — they should be assigned to the Transmission Operator. Every facility in the Transmission Operator's area has a System Operating Limit, but the Reliability Coordinator isn't required to see all these limits and may not have information to determine the cause of instances of exceeding these limits.
- The drafting team is recommending that requirements that describe possible types of acceptable behavior be replaced with requirements that identify the required performance, as in the case of recommending that IRO-005-2 R3 be retired when IRO-009-1 becomes effective.
- In many cases the drafting team would have recommended additional changes to the requirements in already approved standards, but doing so would be outside the scope of the SAR assigned to this drafting team and the changes can be accomplished when the standards are updated as part of the *Reliability Standards Development Plan: 2007–2009*.

### **Conforming Changes to Bring Standards into Alignment with Reliability Standards Development Procedure V6 and ERO Rules of Procedure**

A new version of the Reliability Standards Development Procedure was approved by the NERC Board of Trustees on November 1, 2006. The drafting team made the following changes to the standards to bring them into conformance with the revised manual or other changes needed to conform to the ERO Rules of Procedure:

#### **1. Modified the format of the "Proposed Effective Dates"**

The drafting team modified the proposed effective dates to reflect that the standards cannot become effective until approved by applicable regulatory authorities. The drafting team estimated that it will take approximately three months following Board of Trustee adoption, to obtain regulatory approval from FERC and Canadian authorities.

#### **2. Added Violation Risk Factors to each requirement**

Violation risk factors identify the potential impact to reliability when the associated requirement has been violated. The following categories of violation risk factors were approved with the latest version of the Reliability Standards Development Procedure:

##### ***A High Risk Factor requirement:***

(a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

##### ***A Medium Risk Factor requirement***

(a) is a requirement that, if violated, could the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk power system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**A Lower Risk Factor requirement** is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.

The drafting team added violation risk factors for each requirement. (For this set of BAL standards, the violation risk factors drafting team provided the violation risk factors already identified by stakeholders. If stakeholders indicate that some of the risk factors posted November 2 through December 1, 2006 need modification, the Balance Resources and Demand Standards Drafting Team will make conforming changes to the risk factors in these standards.)

### 3. Added a Mitigation Time Horizon to each requirement

The ERO Rules of Procedure include the use of Mitigation Time Horizons as one element used to determine the size of sanctions. The drafting team used the following guidelines in developing mitigation time horizons for each requirement:

- **Long-term Planning:** a planning horizon of one year or longer.
- **Operations Planning:** operating and resource plans from day-ahead up to and including seasonal.
